

Features

- Covers the 315Hz to 640Hz Range (Common Call Progress)
- Sensitivity to -38dBm
- Dynamic Range Over 38 dB
- 40ms Minimum Detect
- 8-Pin DIP or 16-Pin SOIC
- Single Supply CMOS (Low Power)
- Supply Range 2.8VDC to 5.5VDC
- Inexpensive 3.58MHz Time Base
- Low Power Consumption ($\leq 15\text{mW}$ at 3V)

Applications

- Automatic Dialers
- Dialing Modems
- Traffic Measurement Equipment
- Test Equipment
- Service Evaluation
- Billing Systems

Pin Configuration

Description

The M-980-02 is an integrated circuit tone detector for general purpose use in automatic following of switched telephone calls. The circuit uses low-power CMOS techniques to provide the complete filtering and control required for this function. The basic timing of the M-980-02 is designed to permit operation with almost any progress tone system.

The use of integrated circuit techniques allows the M-980-02 to pack the complete frequency and amplitude portion of call progress following into a single 8-pin DIP or 16-pin SOIC. A 3.58 MHz crystal-controlled time base guarantees accuracy and repeatability. 3V/5V operation increases customer flexibility, improves reliability, and minimizes power consumption.

Ordering Information

Part	Description
M-980-02P	8-pin plastic DIP
M-980-02S	16-pin SOIC
M-980-02T	16-pin SOIC, Tape and Reel

Block Diagram

1 Specifications

1.1 Absolute Maximum Ratings

Symbol	Ratings	Units
DC Supply Voltage ($V_{DD}-V_{SS}$)	6	V
Voltage on SIGIN	$V_{DD}+0.5$ to $V_{SS}-12V$	V
Voltage on any Pin Except SIGIN	$V_{DD}+0.5$ to $V_{SS}-0.5V$	V
Operating Temperature	- 40 to +85	°C
Storage Temperature Range	- 65 to +150	°C

Absolute maximum ratings are stress ratings. Stresses in excess of these ratings can cause permanent damage to the device. Functional operation of the device at conditions beyond those indicated in the operational sections of this data sheet is not implied.

1.2 Electrical Characteristics

Parameter			Minimum	Maximum	Units	Notes
Supply Current			-	5	mA	10-
Signal Detection	Level (5V)		- 38	0	dBm	1, 2
	Level (3V)		- 40	0	dBm	-
	Duration		40	-	ms	-
Signal Rejection	Level	Inband (5V)	-	- 50	dBm	1, 2
		Inband (3V)	-	- 55	dBm	-
		Outband	-	0	dBm	1, 3
Quiet Interval Detect	Duration		40	-	ms	8
			85	-	ms	9
“Detect” Output Pin	Logic “0”		-	0.5	V	4
	Logic “1”		V _{DD} -0.5	-		4
“Enable,” “XIN,” Input Pin	Logic “0”		V _{SS}	V _{SS} +0.2	V	5
	Logic “1”		V _{DD} -0.2	V _{DD}		5
“XIN” Duty Cycle			40	60	%	6
“XOUT” Loading			-	10	pF	-
“VREF” Output Pin	Deviation		- 2	+2	%	7
	Resistance		3.25	6.75	kΩ	-
“SIGIN” Input Pin	AC + DC Level		V _{SS} -5V	V _{DD}	V	-
	Impedance (500Hz)		80	-	kΩ	-
Power Consumption	3V Operation		-	15	mW	-
	5V Operation		-	25		-

Unless otherwise noted, $V_{DD} - V_{SS} = 2.8V$ to $5.5V$ and $T_A = 25^\circ C$

Notes:

1. 0 dBm = $0.775 V_{rms}$.
2. $f = 315Hz$ to $640Hz$.
3. $f > 1025Hz$, $< 190Hz$.
4. Output current = 1mA, $V_{SS} - V_{DD} - 3V$.
5. Input current -10mA max.
6. External clock.
7. Nominal = $(V_{DD} + V_{SS})/2$.
8. Signal dropping from -38dBm to -65dBm.
9. Signal dropping from -10dBm to -65dBm.

2 Pin Descriptions

Pin	Description
SIGIN	Signal input AC or DC coupled (see level limitations elsewhere).
DETECT	Active output indicating signal detection. Activated by ENABLE.
ENABLE	Enables DETECT output. Used to mask signal activity.
V _{DD}	Most positive power supply pin.
V _{REF}	Internally generated reference voltage. (V _{SS} + V _{DD}) / 2 volts.
V _{SS}	Most negative power supply pin.
XIN, XOUT	Crystal attachment pins. XIN may be used as the input for an external 3.58 MHz clock.

Signal Timing

3 Call Progress Tone Detection

Call progress tones are audible tones sent from switching systems to calling parties to show the status of calls. Calling parties can identify the success of a call placed by what is heard after dialing. The type of tone used and its timing vary from system to system, and though intended for human ears these signals can provide valuable information for automated calling systems.

The M-980-02 is a signal detector sensitive to the frequencies most often used for these progress tones. Electronic equipment monitoring the DETECT output of the M-980-02 can determine the nature of signals present by measuring their duty cycle. See "Telephone Line Circuit Application" for a diagram of a circuit that could be used to permit a microcomputer to directly monitor tones on the telephone line. Much of the character of the progress tones is in their duty cycle or cadence (sometimes referred to as interruption rate). This information, coupled with level and frequency indication from the M-980-02, can be used to decide what progress tones have been encountered.

See table "Call Progress Tones" for some call progress tones with on/off times; 0.25/0.25 being 250 ms on, 250 ms off on a repeating basis. For example, dial tones as shown in the table are usually "on" continuously and last until the first dial digit is received by the switching system. Line Busy, on the other hand, is turned off and on at a rate of 1 Hz with a 50% duty cycle, or an interruption rate of 60 times per minute (60 IPM). The tones can be distinguished in this way.

It should be noted that while such techniques will usually be effective, there are some circumstances in which the M-980-02 cannot be accurately used. Examples include situations where ringback tone may be short or not even encountered. Ringback may be provided at ringing voltage frequency (20 or 30 Hz) with some harmonics and may not fall in the detect range, and speech or other strong noise may obscure tones making cadence measurement difficult.

Detection of "answer" is most difficult for many reasons. One way to determine if a called party has answered is by looking for a short burst of DETECT indications without a cadence match (produced by a

click and “hello” at the far end). Some applications will require special methods like speech detection, but most can be reliably handled with the M-980-02 and simple cadence measurement.

As can be seen, the tones used for the same purposes in different systems may not be the same. Standards do exist and should be consulted for your

particular application. In North America, AT&T’s “Notes on the Network” or EIA’s RS-464 PBX standard, should be reviewed. In Europe, tone plans may vary with locale, in which case the CEPT administration in each country must be consulted. Outside these areas, national PTT organizations can provide information on the systems within their borders.

Device Timing

Time	Value	Significance
t_{MD}	40ms	A valid tone will always be detected if it is at least 40ms long.
t_{ID}	40ms @ -38dBm	Inter-tone gaps must be detected if greater than this duration.
	85ms @ -10dBm	
t_B	18ms	Drop-outs of valid tone of up to 18ms will be ignored.

Note: Application or removal of high level signals outside the must-detect range may cause momentary detection, which may be filtered by time guarding the output.

Call Progress Tones

Frequency 1	Frequency 2	On / Off	Use
350	+440	Continuous	Dial Tones
425	-	-	-
600	X 120	-	-
400	-	-	-
480	+620	0.5 / 0.5s	Line Busy Tones
600	X 120	-	-
480	+620	0.25 / 0.25s	Reorder Tones
600	X 120	-	-
440	+480	2.0 / 4.0s	Audible Ringing
500	X 40	-	-
440	-	0.5s burst	Various

Input Signal Configuration

4 Manufacturing Information

4.1 ESD Sensitivity

This product is **ESD Sensitive**, and should be handled according to the industry standard **JESD-625**.

4.2 Reflow Profile

This product has a maximum body temperature and time rating as shown below. All other guidelines of **J-STD-020** must be observed.

Device	Maximum Temperature x Time
M-980-02P / M-980-02S	250°C for 30 seconds

4.3 Board Wash

IXYS Integrated Circuits Division recommends the use of no-clean flux formulations. However, board washing to remove flux residue is acceptable, and the use of a short drying bake may be necessary. Chlorine-based or Fluorine-based solvents or fluxes should not be used. Cleaning methods that employ ultrasonic energy should not be used.

4.4 Mechanical Dimensions

4.4.1 M-980-02P 8-Pin DIP Package

Tolerances
