

VOLTAGE CONVERTER

■ GENERAL DESCRIPTION

The NJU7662 is a voltage converter incorporated CR oscillator, voltage-level-shifter and power-MOS, which generates a polarity-converted negative voltage or twofold voltage of an operating voltage ranging from +1.5 to +10V.

The application circuit of negative voltage converter requires only two capacitors, and positive twofold voltage converter requires two capacitors, two resistors and one diode as external components.

The oscillation frequency of the internal oscillator is 10kHz and the negative voltage converter (on no-load condition) achieves extremely high-efficiency voltage conversion rate of 99.9%.

■ MEASUREMENT CIRCUIT

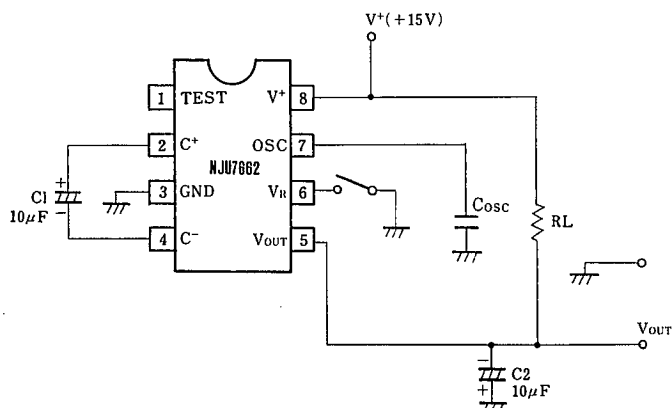

The measurement circuit diagram of negative voltage converter is shown below.

No. 6 terminal must connect to GND or Open according to the operating voltage as follows :

$V^+ < 6V$Connect to GND

$V^+ \geq 6V$OPEN

The oscillation frequency can be lowered by connecting external capacitor on the No.7 terminal, furthermore it can be also driven by external clock generator.
