Features
• Very Low Dropout Voltage
• 800mA Output Current
• High Output Voltage Accuracy
• Standard or Custom Output Voltages
• Over Current and Over Temperature Protection

Applications
• Battery Operated Systems
• Portable Computers
• Medical Instruments
• Instrumentation
• Cellular/GSM/PHS Phones
• Linear Post-Regulators for SMPS
• Pagers

General Description
The TC1264 is a fixed output, high accuracy (typically ±0.5%) CMOS low dropout regulator. Designed specifically for battery-operated systems, the TC1264’s CMOS construction eliminates wasted ground current, significantly extending battery life. Total supply current is typically 80µA at full load (20 to 60 times lower than in bipolar regulators).

TC1264 key features include ultra low noise operation, very low dropout voltage (typically 450mV at full load), and fast response to step changes in load.

The TC1264 incorporates both over temperature and over current protection. The TC1264 is stable with an output capacitor of only 1µF and has a maximum output current of 800mA. It is available in 3-Pin SOT-223, 3-Pin TO-220 and 3-Pin DDPAK packages.

Typical Application
1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings*

Input Voltage .........................................................6.5V
Output Voltage ......................................................(VSS – 0.3V) to (VIN + 0.3V)
Power Dissipation .................................................Internally Limited (Note 8)
Maximum Voltage on Any Pin ............VIN +0.3V to -0.3V
Operating Temperature Range...... -40°C < TJ < 125°C
Storage Temperature .....................-65°C to +150°C

*Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operation sections of the specifications is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

</tbody>
</table>

Note 1: VR is the regulator output voltage setting.
2: The minimum VIN has to justify the conditions: VIN ≥ VR + VDROP and VIN ≥ 2.7V for I L = 0.1mA to IOUTMAX.
3: This accuracy represents the worst case over the entire output current and temperature range.
4: TC VOUT = VOUTMAX – VOUTMIN × 106
5: Regulation is measured at a constant junction temperature using low duty cycle pulse testing. Load regulation is tested over a load range from 0.1mA to the maximum specified output current. Changes in output voltage due to heating effects are covered by the thermal regulation specification.
6: Dropout voltage is defined as the input to output differential at which the output voltage drops 2% below its nominal value measured at a 1.5V differential.
7: Thermal Regulation is defined as the change in output voltage at a time T after a change in power dissipation is applied, excluding load or line regulation effects. Specifications are for a current pulse equal to ILMAX at VIN = 6V for T = 10 msec.
8: The maximum allowed power dissipation is a function of ambient temperature, the maximum allowed junction temperature and the thermal resistance from junction-to-air (i.e., TA, TJ, RJA). Exceeding the maximum allowable power dissipation causes the device to initiate thermal shutdown. Please see Section 4.0 Thermal Considerations for more details.
2.0 PIN DESCRIPTIONS

</tr>
</tbody>
</table>

3.0 DETAILED DESCRIPTION

The TC1264 is a precision, fixed output LDO. Unlike bipolar regulators, the TC1264's supply current does not increase with load current. In addition, V₈ₒᵤ₅ remains stable and within regulation over the entire 0mA to I₈ₒᵤ₅ₐ₅₉ load current range (an important consideration in RTC and CMOS RAM battery back-up applications).

Figure 3-1 shows a typical application circuit.

3.1 Output Capacitor

A 1μF (min) capacitor from V₈ₒᵤ₅ to ground is required. The output capacitor should have an effective series resistance greater than 0.1Ω and less than 5Ω. A 1μF capacitor should be connected from V₈ᵢ₅ to GND if there is more than 10 inches of wire between the regulator and the AC filter capacitor, or if a battery is used as the power source. Aluminum electrolytic or tantalum capacitor types can be used. (Since many aluminum electrolytic capacitors freeze at approximately -30°C, solid tantalums are recommended for applications operating below -25°C.) When operating from sources other than batteries, supply-noise rejection and transient response can be improved by increasing the value of the input and output capacitors and employing passive filtering techniques.

![Typical Application Circuit](image)
4.0 THERMAL CONSIDERATIONS

4.1 Thermal Shutdown

Integrated thermal protection circuitry shuts the regulator off when die temperature exceeds 160°C. The regulator remains off until the die temperature drops to approximately 150°C.

4.2 Power Dissipation

The amount of power the regulator dissipates is primarily a function of input and output voltage, and output current. The following equation is used to calculate worst case actual power dissipation:

**EQUATION 4-1:**

\[
P_D \approx (V_{IN\text{MAX}} - V_{OUT\text{MIN}})I_{LOAD\text{MAX}}
\]

Where:

- \(P_D\) = Worst case actual power dissipation
- \(V_{IN\text{MAX}}\) = Maximum voltage on \(V_i\)
- \(V_{OUT\text{MIN}}\) = Minimum regulator output voltage
- \(I_{LOAD\text{MAX}}\) = Maximum output (load) current

The maximum allowable power dissipation (Equation 4-2) is a function of the maximum ambient temperature (\(T_{AMAX}\)), the maximum allowable die temperature (\(T_{JMAX}\)) and the thermal resistance from junction-to-air (\(\theta_{JA}\)).

**EQUATION 4-2:**

\[
P_{DMAX} = \frac{(T_{JMAX} - T_{AMAX})}{\theta_{JA}}
\]

Where all terms are previously defined.

Table 4-1 and Table 4-2 show various values of \(\theta_{JA}\) for the TC1264 packages.

<td>35°C/W</td>
</tr>
</tbody>
</table>

*Tab of device attached to topside copper

Equation 4-1 can be used in conjunction with Equation 4-2 to ensure regulator thermal operation is within limits. For example:

Given:

- \(V_{IN\text{MAX}}\) = 3.3V ± 10%
- \(V_{OUT\text{MIN}}\) = 2.7V ± 0.5%
- \(I_{LOAD\text{MAX}}\) = 275mA
- \(T_{JMAX}\) = 125°C
- \(T_{AMAX}\) = 95°C
- \(\theta_{JA}\) = 59°C/W (SOT-223)

Find:
1. Actual power dissipation
2. Maximum allowable dissipation

Actual power dissipation:

\[
P_D \approx (V_{IN\text{MAX}} - V_{OUT\text{MIN}})I_{LOAD\text{MAX}}
\]

\[
= [(3.3 \times 1.1) - (2.7 \times 0.995)]275 \times 10^{-3}
\]

\[= 260mW\]

Maximum allowable power dissipation:

\[
P_{DMAX} = \frac{(T_{JMAX} - T_{AMAX})}{\theta_{JA}}
\]

\[= (125 - 95) \div 59\]

\[= 508mW\]

In this example, the TC1264 dissipates a maximum of 260mW; below the allowable limit of 508mW. In a similar manner, Equation 4-1 and Equation 4-2 can be used to calculate maximum current and/or input voltage limits. For example, the maximum allowable \(V_{IN}\), is found by substituting the maximum allowable power dissipation of 508mW into Equation 4-1, from which \(V_{IN\text{MAX}} = 4.6V\).
5.0 TYPICAL CHARACTERISTICS

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.
