Electrical Durability and Load Limit Curves

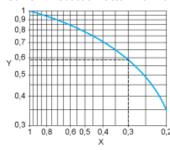

AC Load

Curve 1: Electrical durability of contacts on resistive load in millions of operating cycles

- X Current broken in A
- Y Millions of operating cycles

Curve 2: Reduction factor k for inductive loads (applies to values taken from durability Curve 1)

- X Power factor on breaking (cos ϕ)
- Y Reduction factor K

Example: An LC1-F185 contactor supplied with 115 V/50 Hz for a consumption of 55 VA or a current consumption equal to 0.5 A and $\cos \varphi = 0.3$

For 0.5 A, curve 1 indicates a durability of approximately 1.5 million operating cycles.

As the load is inductive, it is necessary to apply a reduction coefficient k to this number of cycles as indicated by curve 2.

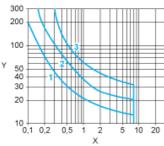

For $\cos \varphi = 0.3$: k = 0.6

The electrical durability therefore becomes:

 1.5×10^6 operating cycles x $0.6 = 900\ 000$ operating cycles

DC Load

Load limit curve

- X Current in A
- Y Voltage in V
- 1 L/R = 20 ms
- 2 L/R with load protection diode
- 3 Resistive load

Relay status: black color = energized.

NOTE: Hysteresis is adjustable between 5 and 30%: for overcurrent h = (IS1 - IS2) / IS1. A measuring cycle lasts only 80 ms, which allows rapid detection of changes in current.

- (1) Measurement
- (2) U drop < 1 V
- (3) Load

NOTE: The measurement ranges can be extended by means of a current transformer, the secondary of which is connected to the measuring terminals of the RM4 relay, or by means of a resistor connected in parallel with the measuring input.
