### 1 Introduction

The AS399x UHF RFID Reader System Demo Kit supports the **ISO 18000-6b** and **EPC Generation 2** standards. The aim of the development kit is to demonstrate the performance and the features of the AS399x UHF RFID reader chip and to enable customers to develop their own application fast.

The AS399x UHF RFID Reader System is a single PCB solution offering two configurations:

- A UHF RFID reader stand alone operation aided by the on board microcontroller
- A direct access operation for development purposes with disabled MCU where the host system directly controls the AS399x using a pin header interface. The operational RF part can be used to develop customized software for controlling the AS399x. An access to the IO pins for an external microcontroller is provided to speed up the design phase of an UHF RFID reader application.

### 1.1 Key Features

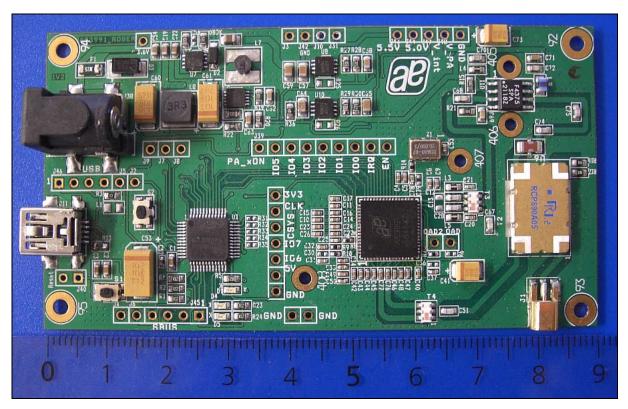

- Reading and writing UHF RFID tags
- Communication with host computer using the USB-HID or UART interface
- USB HID device (automatically installed on host side)
- Low cost 8- bit micro controller is used
- Controller software written in C which can easily ported to a different controller type.
- Host software (AS399x Reader Suite) written in C++ and MFC

# **2 Short Description**

The "ROGER" UHF RFID Reader System is designed for medium range tag detection and is optimized regarding PCB area and power consumption. To minimize costs no special RF connectors are required. The connection to the antenna is established by a MMCX connector.

For powering up the UHF RFID Reader System an auxiliary power supply is used. For the communication with the host system the USB interface is used. After power up the internal registers of the reader chip are configured with default values which enables the reader system to be functional right from the beginning.

### 2.1 Port Definitions

# 2.1.1 Detailed Description

Pin	Signal	Description
P0.0	-	Not used
P0.1	-	Not used
P0.2	-	Not used
P0.3	IRQ	External Interrupt Input
P0.4	TX	UART Transmit Pin
P0.5	RX	UART Receive Pin
P0.6	-	Not used
P0.7	SCLK	System Clock Input

Table 1: Port 0

Pin	Signal	Description
P1.0	IO0	IO Data, Address and Ctrl Bit
P1.1	IO1	IO Data, Address and Ctrl Bit
P1.2	IO2	IO Data, Address and Ctrl Bit
P1.3	IO3	IO Data, Address and Ctrl Bit
P1.4	IO4	IO Data, Address and Ctrl Bit
P1.5	IO5	IO Data, Address and Ctrl Bit
P1.6	IO6	IO Data, Address and Ctrl Bit
P1.7	IO7	IO Data, Address and Ctrl Bit

Table 2: Port 1

Pin	Signal	Description
P2.0	CLK	Interface CLK Output
P2.1	EN	Device Enable Output
P2.2	LED	LED Output
P2.3	-	Not used
P2.4	-	Not used
P2.5	-	Not used
P2.6	-	Not used
P2.7	-	Not used

Table 3: Port 2

Note: Port 3 is not used.

Pin	Signal	Description
P4.0	-	Not used
P4.1	-	Not used
P4.2	-	Not used
P4.3	-	Not used
P4.4	-	Not used
P4.5	-	Not used
P4.6	-	Not used
P4.7	RESET	Output for resetting the MCU

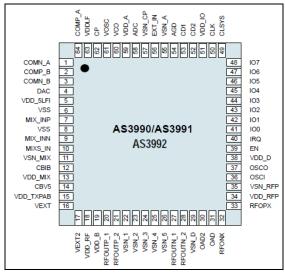

Table 4: Port 4

Pin	Signal	Description
7	GND	GND Pin
8	D+	USB Data + Signal
9	D-	USB Data - Signal
10	VDD	VDD Pin
11	REGIN	Not used
12	VBUS	USB Power In
13	RST	Reset Pin
14	C2D	Debugging Interface

Table 5: Other uC Pins

#### 2.2 **AS399X Pinout:**

Pinout of AS399x

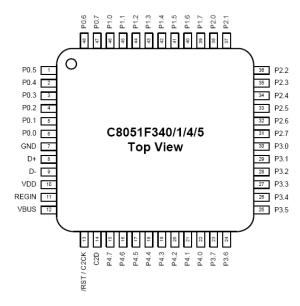

Picture 2: AS399x Pinout

#### 2.3 C8051F340 Pin out

The pinout from Silabs microcontroller C8051F340 is shown below.

Picture 3: C8051F340 Pin out [Silabs 2006]

#### 2.4 Power Supply

3.6 V power jack (2.1X5.5MM). The supply is guarded by a polyswitch (1.5A).

#### 2.5 USB Connector

USB is used for communication with the host. No external matching and pull down resistors are needed, since all parts are integrated in the microcontroller.

#### 2.6 RS232 Connector

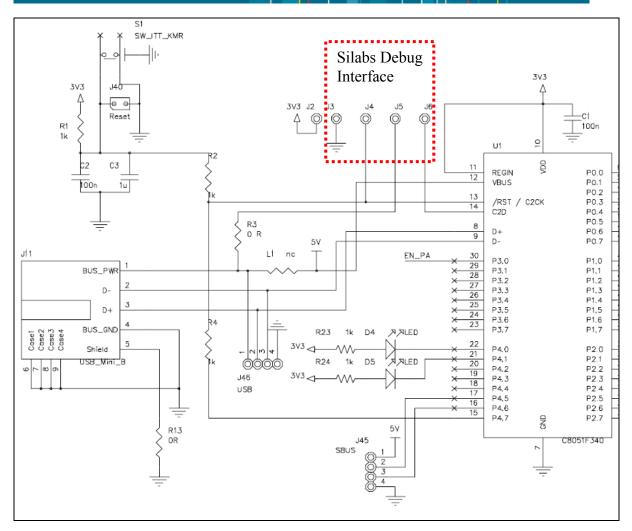

For debugging, the controller board has solder pads to connect an external RS232 circuit. Power for the external circuit is delivered through the connector.

#### 2.7 Debugging Connector

In the following picture a special interface is highlighted which is used to directly connect the Silabs USB Debug Adapter. The circuit is taken from the Silabs Development Kit data sheet [SilabsDK 2006].

The resistor R3 can be used to supply the board via the debugging connector.

Picture 4: Schematic - Debug Interface

#### 2.8 Supply Concept

To filter out noise on the USB supply voltage a ferrite (L1) and two capacitors (C52, C53) are used. Additionally, each AS399X V<sub>DD</sub> pin is featured with two capacitors (10 nF & 2.2 µF). The microcontroller supply VDD (pin 10) only needs one 100nF capacitor (C1).

During power down mode the majority of the AS399x reader chip is switched off but still generates a 3.3V supply voltage ( $VDD_D = pin 38$ ) which supplies the microcontroller unit (MCU). This mode is configured by the resistor  $R7 (10k\Omega)$  at OAD2 (pin 30) to GND. After start up the microcontroller has to pull the AS399X enable pin (EN = pin 39) to high in order to start the operation of the AS399X finalizing the power up sequence.

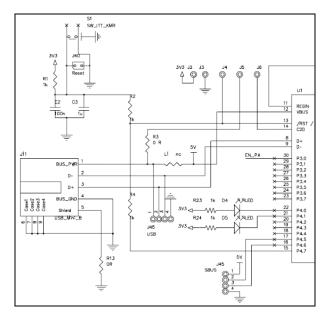

4 different voltages are generated on the ROGER Demo Kit:

- 1. 3.3 V (generated by Silabs MCU)
- 2. 4.5 V (generated by AMS AS1364 LDO)
- 3. 5.0 V (generated by AMS AS1326A DCDC Step Up Converter)
- 4. 5.5 V (generated by AMS AS1340 Boost Converter)

#### 2.9 Microcontroller Reset Circuit

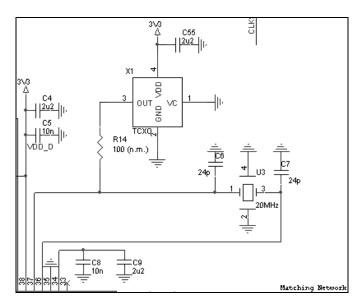

The reset circuit needs only two capacitors (C2, C3) for power on reset. A pull-up resistor (R1), a series resistor (R2) and a push button (S1) for resetting during normal operation is used (see Picture 5). To enable a reset trough the software, resistor R4 is connected between port pin P4.7 and the reset pin (RST = pin 13). If the microcontroller needs to be reset, the software has to write a logic zero to P4.7.

Picture 5: Reset Circuit

#### 2.10 Oscillator Circuit

The AS399X can be used with a conventional quartz crystal or a TCXO. The crystal should have an accuracy of 10ppm. Most crystals do not provide this high accuracy for this reason a TCXO is recommended. Besides good frequency stability a TCXO inherently provides better temperature stability.

Picture 6: Schematic - Oscillator Circuit

#### 2.11 VCO Concept.

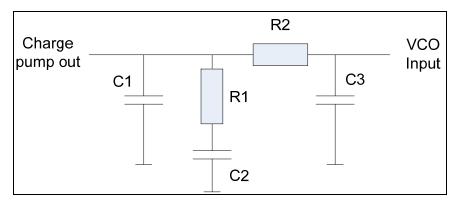

To generate the high frequency carrier signal for the communication with the tag (840 MHz – 960 MHz) the internal VCO is used and thus only a few passive components are needed. The external loop filter components need to be calculated for each parameter set of loop filter current, reference frequency and charge pump current. For this particular reference design following settings was used:

- 915 MHz
- 1.2 mA charge pump current
- 50 kHz reference frequency
- Internal VCO

In following table, one can also find other settings for reference:

vco	Reference Frequency [kHz]	Charge Pump Current [mA]	C1 [pF]	R1 [kΩ]	C2 [nF]	R2 [kΩ]	C3 [pF]
20 MHz / V	50	1.2	220	27	3.3	56	110
20 MHz / V	50	0.6	120	56	1.5	110	56
20 MHz / V	100	1.2	150	27	1.8	47	68

Table 6: Loop Filter Reference Settings

Picture 7: Loop Filter Circuit

#### 2.12 LED

For an easy and fast functional check, an external LED with a current limitation resistor is included. During normal operation, the LED is continuously flashing.

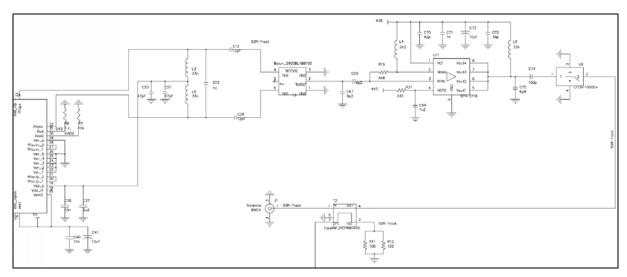

#### 2.13 Serial RS232 Interface

For debugging an external RS232 interface may be used.

#### 2.14 High Frequency RFID Output

The 0 dBm differential outputs (Rfopx, Rfonx) are used. The differential outputs need to be converted to single- ended outputs. This is done by a Balun (Balanced/ Unbalanced). The output signal is then routed to the external GaAs power amplifier (U11) SPA-2118. In order to attenuate high order intermods a ceramic low pass filter (U6) is placed in the Tx path.

Picture 8: Schematic - UHF RFID Output Path

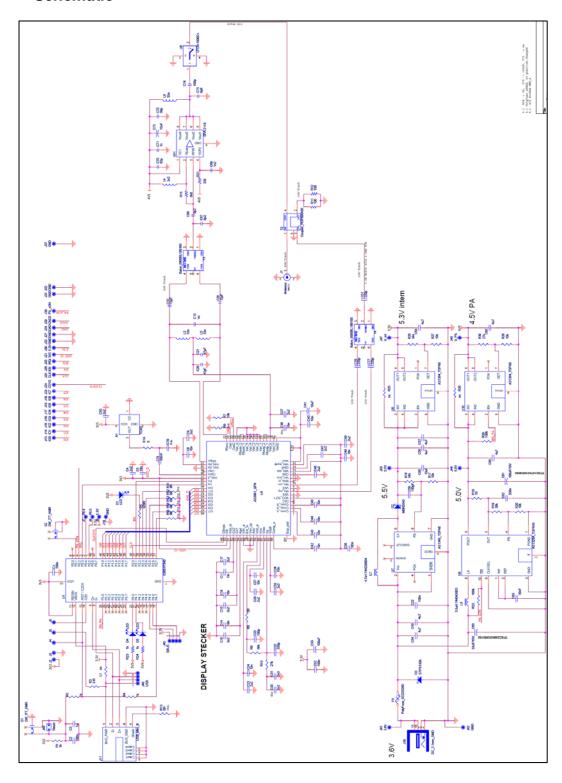

#### 2.15 Decoupling Tx/Rx

To separate transmit and receive path a directional coupler (RCP890A05) is used.

Table 7: BOM

# 4 PCB Layer Information

Name AS399x UHF Board

**Dimensions** 90 x 49 mm **Edges** milled

PCB Material FR4 Dielectric DE117

PCB Strength 0.51 mm

Layer Count 2

Attached files

Format Gerber RS274x / Excellon

Gerber files Top Side Layer: Layer 01 ROGER\_1V2.top

Bottom Side Layer: Layer 04
Solder Stop Top
Solder Stop Bottom
Silk Screen Top
Dimension, Print Info

ROGER\_1V2.bot
ROGER\_1V2.smt
ROGER\_1V2.smb
ROGER\_1V2.sst
ROGER\_1V2.drd

**Drill Files** Data for Drills und Holes

Thruhole thruhole.tap

**PCB layer setup** Top Side Layer 01 (36) 43μm thickness

Core Material 500µm thickness Dielectric Constant 4.7

Bottom Side Layer 4 (36) 43µm thickness

Material	Thickness [μm]	Layer	Layer Name	Comments
Copper Plated	36 (43 final thickness)		*.top	Top Side Layer 1
Pre Preg	500			DE117 Dielectric constant 4,7
Copper plated	36 (43 final thickness)		*.bot	Bottom Side Layer 4

### 5 Disclaimer

Devices sold by austriamicrosystems AG are covered by the warranty and patent identification provisions appearing in its Term of Sale. austriamicrosystems AG makes no warranty, express, statutory, implied, or by description regarding the information set forth herein or regarding the freedom of the described devices from patent infringement, austriamicrosystems AG reserves the right to change specifications and prices at any time and without notice. Therefore, prior to designing this product into a system, it is necessary to check with austriamicrosystems AG for current information. This product is intended for use in normal commercial applications. Applications requiring extended temperature range, unusual environmental requirements, or high reliability applications, such as military, medical life-support or life-sustaining equipment are specifically not recommended without additional processing by austriamicrosystems AG for each application. The information furnished here by austriamicrosystems AG is believed to be correct and accurate. However, austriamicrosystems AG shall not be liable to recipient or any third party for any damages, including but not limited to personal injury, property damage, loss of profits, loss of use, interruption of business or indirect, special, incidental or consequential damages, of any kind, in connection with or arising out of the furnishing, performance or use of the technical data herein. No obligation or liability to recipient or any third party shall arise or flow out of austriamicrosystems AG rendering of technical or other services.
