7.2 Interface & Control Signals

The PWOK_L open collector outputs of all modules are interconnected within the shelf and fed to the signal connector. The same applies to SMB_ALERT_L module and shelf signals. Sink current must not exceed 4 mA on each of these signals.

The internal INOK_L signal of individual modules are fed to microcontroller for modules synchronized AC startup. This allows the shelf to start up with load > 3000W during AC application. The microcontroller provide the INOK_L output signal.

A pull up resistor of 10k Ω to 3.3V within the shelf provides the high level voltage on PWOK_L, INOK_L and SMB_ALERT_L signals.

PWOK_L is low when there is at least one module in operation. INOK_L is low when there is at least one module supplied with correct input voltage.

ISHARE signal can be used when shelf are configured for redundant operation.

I2C Interface and Signal Connector (RJ45) Pin Out

1 ⁷	SCL	I2C clock signal line
2 ⁷	SDA	I2C data signal line

Note: ⁷ External Pull-up resistor should be 2 – 5k Ω to ensure SMBUS compliant signal rise times

7.3 I2C Communication

The PSU Modules are set to a fixed I2C Address (0x20). PMBus communication for the PSU Modules are described in more detail in BCA.00070.

The I2C communication to the PSU Modules are routed thru an I2C Multiplexer. The I2C MUX Control Register MUX needs to be configured so that the I2C frames are routed to the correct PSU Module. Refer to the I2C MUX datasheet for additional information.

The I2C MUX Address is configurable (via DIP Switch) to allow parallel configuration of several shelves.

The I2C MUX has a RESET input which can be used to recover from an I2C bus fault. A logic low signal on this pin resets the I2C MUX. If not used, this pin should be left floating.

7.4 I2C Addressing (Shelf)

The shelf default MUX address is 0xEE and Controller address is 0x5E.
When DIP switch (SW1) is in "ON" position means 0, "OFF" Position means 1.

7.5 Control LEDs

Each PSU front-end module has 2 LEDs to indicate status condition. LED number one is green and indicates AC power is on or off, while LED number two is bi-colored: green and yellow, and indicates DC power presence or fault situations.

PARAMETER	DESCRIPTION / CONDITION	LED SIGNALING
AC LED	AC Line within range	Solid Green
	AC Line UV condition	Off
DC LED⁸	Normal Operation	Solid Green
	PSON_L High	Blinking Yellow (1:1)
	V_I or V_{SB} out of regulation	Solid Yellow
	Over temperature shutdown	
	Output over voltage shutdown (V_I or V_{SB})	
	Output under voltage shutdown (V_I or V_{SB})	
	Output over current shutdown (V_I or V_{SB})	Blinking Yellow/Green (2:1)
	Over temperature warning	
	Minor fan regulation error (>5%, <15%)	

Note: ⁸ The order of the criteria in the table corresponds to the testing precedence in the controller.

7.6 USB Connector Type B

WARNING:

The USB interface is NOT galvanic isolated and referenced to the +12V_RTN / SGND lines.

Preferably, use a battery operated laptop to avoid earth loop issue.

If a Desktop Computer is being used, there is a risk of generating earth loop currents, therefore USB Isolators should be used.

7.7 +12VSB Connector

+12VSB output is capable of delivering 5A. The output is protected by a PTC (16R900GF from Littelfuse).

PIN OUTS	FUNCTION	DESCRIPTION
1	VSB_GND	+12VSB return
2	VSB	+12VSB output
3	VSB_GND	+12VSB return
