Description and Extent of Change:

Eliminate paper spacer which is placed between base plate and housing in the packaging tray:

1. The paper spacer is used originally to prevent the base plate and housing from latching together
2. Currently the base plate being positioned reverse side (upside down) then only place the housing on top, latching between base plate and the housing will not happen. The paper spacer is redundant and can be removed.

3. Environmental-friendly as the paper will be scrapped at the customer assembly side.

Spacer

Packing Method	Photo	Full Tray
<p>Current practice: Base plate with upside down → place the spacer on top base plate → place the housing</p>		
<p>New proposal: Base plate with upside down → place the housing</p>		

1. Based on the packing verification above (with base plate placing on the reverse side), the base-plate & housing will not latch with or without spacer
2. It is proven that the spacer is redundant and can be eliminated without any issue at the customer assembly

Reasons for Change:

The paper spacer in final tray packaging can be eliminated by placing the base-plate reverse side (upside down) and will not latch with the opposite housing inside tray. The paper spacer in the packaging is redundant. With the paper spacer removal, It will also help in the environmental friendly goal.

Effect of Change on Fit, Form, Function, Quality, or Reliability:

There is no impact to the product form, fit, function, quality or reliability at end customer by removing the paper spacer in the final tray packaging.

Effective Date of Change:

Product shipment using this change will commence on or around December 2016.
