

RE: Packaging of AVX Interconnect Product.

To Whom It May Concern,

AVX Interconnect product is packed to internal standards that ensure the product quality during transit and storage to the end customer.

All connectors are packed in Moisture Barrier Bags, with desiccant to ensure that moisture ingress is not an issue. The level of the Moisture Barrier Bag protection is determined by the design of the product and therefore the risk of Moisture Ingress. Metallised bags are used for product most at risk. Product that has a low risk uses a HDPE Moisture Barrier Bag.

Please note the MSL level 3 is determined by the Material alone. Most plastics suitable for SMT products are designated as MSL level 3 however the design of the product can have a significant affect on moisture and the resultant issues seen.

At this point AVX Interconnect procedures do not require the implementation of full JEDEC standards for the products. To my current knowledge we have no contractual obligation to supply product packed to the JEDEC standard J-STD-033C.

N. Webb,
Quality Manager,
AVX Interconnect
