RSCAN0	Receive buffer data field 0 register 40	RSCAN0RMDF040	<RSCAN0_base> + 0888_H

Table 22.13 Registers (11/19)

Module	Register	Symbol	Address
RSCAN0	Receive buffer data field 1 register 40	RSCAN0RMDF140	<RSCAN0_base> + $088C_H$
RSCAN0	Receive buffer ID register 41	RSCAN0RMID41	<RSCAN0_base> + 0890_H
RSCAN0	Receive buffer pointer register 41	RSCAN0RMPTR41	<RSCAN0_base> + 0894_H
RSCAN0	Receive buffer data field 0 register 41	RSCAN0RMDF041	<RSCAN0_base> + 0898_H
RSCAN0	Receive buffer data field 1 register 41	RSCAN0RMDF141	<RSCAN0_base> + $089C_H$
RSCAN0	Receive buffer ID register 42	RSCAN0RMID42	<RSCAN0_base> + $08A0_H$
RSCAN0	Receive buffer pointer register 42	RSCAN0RMPTR42	<RSCAN0_base> + $08A4_H$
RSCAN0	Receive buffer data field 0 register 42	RSCAN0RMDF042	<RSCAN0_base> + $08A8_H$
RSCAN0	Receive buffer data field 1 register 42	RSCAN0RMDF142	<RSCAN0_base> + $08AC_H$
RSCAN0	Receive buffer ID register 43	RSCAN0RMID43	<RSCAN0_base> + $08B0_H$
RSCAN0	Receive buffer pointer register 43	RSCAN0RMPTR43	<RSCAN0_base> + $08B4_H$
RSCAN0	Receive buffer data field 0 register 43	RSCAN0RMDF043	<RSCAN0_base> + $08B8_H$
RSCAN0	Receive buffer data field 1 register 43	RSCAN0RMDF143	<RSCAN0_base> + $08BC_H$
RSCAN0	Receive buffer ID register 44	RSCAN0RMID44	<RSCAN0_base> + $08C0_H$
RSCAN0	Receive buffer pointer register 44	RSCAN0RMPTR44	<RSCAN0_base> + $08C4_H$
RSCAN0	Receive buffer data field 0 register 44	RSCAN0RMDF044	<RSCAN0_base> + $08C8_H$
RSCAN0	Receive buffer data field 1 register 44	RSCAN0RMDF144	<RSCAN0_base> + $08CC_H$
RSCAN0	Receive buffer ID register 45	RSCAN0RMID45	<RSCAN0_base> + $08D0_H$
RSCAN0	Receive buffer pointer register 45	RSCAN0RMPTR45	<RSCAN0_base> + $08D4_H$
RSCAN0	Receive buffer data field 0 register 45	RSCAN0RMDF045	<RSCAN0_base> + $08D8_H$
RSCAN0	Receive buffer data field 1 register 45	RSCAN0RMDF145	<RSCAN0_base> + $08DC_H$
RSCAN0	Receive buffer ID register 46	RSCAN0RMID46	<RSCAN0_base> + $08E0_H$
RSCAN0	Receive buffer pointer register 46	RSCAN0RMPTR46	<RSCAN0_base> + $08E4_H$
RSCAN0	Receive buffer data field 0 register 46	RSCAN0RMDF046	<RSCAN0_base> + $08E8_H$
RSCAN0	Receive buffer data field 1 register 46	RSCAN0RMDF146	<RSCAN0_base> + $08EC_H$
RSCAN0	Receive buffer ID register 47	RSCAN0RMID47	<RSCAN0_base> + $08F0_H$
RSCAN0	Receive buffer pointer register 47	RSCAN0RMPTR47	<RSCAN0_base> + $08F4_H$
RSCAN0	Receive buffer data field 0 register 47	RSCAN0RMDF047	<RSCAN0_base> + $08F8_H$
RSCAN0	Receive buffer data field 1 register 47	RSCAN0RMDF147	<RSCAN0_base> + $08FC_H$
RSCAN0	Receive FIFO buffer access ID register 0	RSCAN0RFID0	<RSCAN0_base> + $0E00_H$
RSCAN0	Receive FIFO buffer access pointer register 0	RSCAN0RFPTR0	<RSCAN0_base> + $0E04_H$
RSCAN0	Receive FIFO buffer access data field 0 register 0	RSCAN0RFDF00	<RSCAN0_base> + $0E08_H$
RSCAN0	Receive FIFO buffer access data field 1 register 0	RSCAN0RFDF10	<RSCAN0_base> + $0E0C_H$
RSCAN0	Receive FIFO buffer access ID register 1	RSCAN0RFID1	<RSCAN0_base> + $0E10_H$
RSCAN0	Receive FIFO buffer access pointer register 1	RSCAN0RFPTR1	<RSCAN0_base> + $0E14_H$
RSCAN0	Receive FIFO buffer access data field 0 register 1	RSCAN0RFDF01	<RSCAN0_base> + $0E18_H$
RSCAN0	Receive FIFO buffer access data field 1 register 1	RSCAN0RFDF11	<RSCAN0_base> + $0E1C_H$
RSCAN0	Receive FIFO buffer access ID register 2	RSCAN0RFID2	<RSCAN0_base> + $0E20_H$
RSCAN0	Receive FIFO buffer access pointer register 2	RSCAN0RFPTR2	<RSCAN0_base> + $0E24_H$
RSCAN0	Receive FIFO buffer access data field 0 register 2	RSCAN0RFDF02	<RSCAN0_base> + $0E28_H$
RSCAN0	Receive FIFO buffer access data field 1 register 2	RSCAN0RFDF12	<RSCAN0_base> + $0E2C_H$
RSCAN0	Receive FIFO buffer access ID register 3	RSCAN0RFID3	<RSCAN0_base> + $0E30_H$
RSCAN0	Receive FIFO buffer access pointer register 3	RSCAN0RFPTR3	<RSCAN0_base> + $0E34_H$
RSCAN0	Receive FIFO buffer access data field 0 register 3	RSCAN0RFDF03	<RSCAN0_base> + $0E38_H$

Table 22.13 Registers (12/19)

Module	Register	Symbol	Address
RSCAN0	Receive FIFO buffer access data field 1 register 3	RSCAN0RFDF13	<RSCAN0_base> + $0E3C_H$
RSCAN0	Receive FIFO buffer access ID register 4	RSCAN0RFID4	<RSCAN0_base> + $0E40_H$
RSCAN0	Receive FIFO buffer access pointer register 4	RSCAN0RFPTR4	<RSCAN0_base> + $0E44_H$
RSCAN0	Receive FIFO buffer access data field 0 register 4	RSCAN0RFDF04	<RSCAN0_base> + $0E48_H$
RSCAN0	Receive FIFO buffer access data field 1 register 4	RSCAN0RFDF14	<RSCAN0_base> + $0E4C_H$
RSCAN0	Receive FIFO buffer access ID register 5	RSCAN0RFID5	<RSCAN0_base> + $0E50_H$
RSCAN0	Receive FIFO buffer access pointer register 5	RSCAN0RFPTR5	<RSCAN0_base> + $0E54_H$
RSCAN0	Receive FIFO buffer access data field 0 register 5	RSCAN0RFDF05	<RSCAN0_base> + $0E58_H$
RSCAN0	Receive FIFO buffer access data field 1 register 5	RSCAN0RFDF15	<RSCAN0_base> + $0E5C_H$
RSCAN0	Receive FIFO buffer access ID register 6	RSCAN0RFID6	<RSCAN0_base> + $0E60_H$

RSCAN0	Transmit/receive FIFO buffer access pointer register 0	RSCAN0CFPTR0	<RSCAN0_base> + $0E84_H$
RSCAN0	Transmit/receive FIFO buffer access data field 0 register 0	RSCAN0CFDF00	<RSCAN0_base> + $0E88_H$
RSCAN0	Transmit/receive FIFO buffer access data field 1 register 0	RSCAN0CFDF10	<RSCAN0_base> + $0E8C_H$
RSCAN0	Transmit/receive FIFO buffer access ID register 1	RSCAN0CFID1	<RSCAN0_base> + $0E90_H$
RSCAN0	Transmit/receive FIFO buffer access pointer register 1	RSCAN0CFPTR1	<RSCAN0_base> + $0E94_H$
RSCAN0	Transmit/receive FIFO buffer access data field 0 register 1	RSCAN0CFDF01	<RSCAN0_base> + $0E98_H$
RSCAN0	Transmit/receive FIFO buffer access data field 1 register 1	RSCAN0CFDF11	<RSCAN0_base> + $0E9C_H$
RSCAN0	Transmit/receive FIFO buffer access ID register 2	RSCAN0CFID2	<RSCAN0_base> + $0EA0_H$
RSCAN0	Transmit/receive FIFO buffer access pointer register 2	RSCAN0CFPTR2	<RSCAN0_base> + $0EA4_H$
RSCAN0	Transmit/receive FIFO buffer access data field 0 register 2	RSCAN0CFDF02	<RSCAN0_base> + $0EA8_H$
RSCAN0	Transmit/receive FIFO buffer access data field 1 register 2	RSCAN0CFDF12	<RSCAN0_base> + $0EAC_H$
RSCAN0	Transmit/receive FIFO buffer access ID register 3	RSCAN0CFID3	<RSCAN0_base> + $0EB0_H$
RSCAN0	Transmit/receive FIFO buffer access pointer register 3	RSCAN0CFPTR3	<RSCAN0_base> + $0EB4_H$
RSCAN0	Transmit/receive FIFO buffer access data field 0 register 3	RSCAN0CFDF03	<RSCAN0_base> + $0EB8_H$
RSCAN0	Transmit/receive FIFO buffer access data field 1 register 3	RSCAN0CFDF13	<RSCAN0_base> + $0EBC_H$
RSCAN0	Transmit/receive FIFO buffer access ID register 4	RSCAN0CFID4	<RSCAN0_base> + $0EC0_H$
RSCAN0	Transmit/receive FIFO buffer access pointer register 4	RSCAN0CFPTR4	<RSCAN0_base> + $0EC4_H$
RSCAN0	Transmit/receive FIFO buffer access data field 0 register 4	RSCAN0CFDF04	<RSCAN0_base> + $0EC8_H$
RSCAN0	Transmit/receive FIFO buffer access data field 1 register 4	RSCAN0CFDF14	<RSCAN0_base> + $0ECC_H$
RSCAN0	Transmit/receive FIFO buffer access ID register 5	RSCAN0CFID5	<RSCAN0_base> + $0ED0_H$
RSCAN0	Transmit/receive FIFO buffer access pointer register 5	RSCAN0CFPTR5	<RSCAN0_base> + $0ED4_H$
RSCAN0	Transmit/receive FIFO buffer access data field 0 register 5	RSCAN0CFDF05	<RSCAN0_base> + $0ED8_H$
RSCAN0	Transmit/receive FIFO buffer access data field 1 register 5	RSCAN0CFDF15	<RSCAN0_base> + $0EDC_H$
RSCAN0	Transmit/receive FIFO buffer access ID register 6	RSCAN0CFID6	<RSCAN0_base> + $0EE0_H$
RSCAN0	Transmit/receive FIFO buffer access pointer register 6	RSCAN0CFPTR6	<RSCAN0_base> + $0EE4_H$
RSCAN0	Transmit/receive FIFO buffer access data field 0 register 6	RSCAN0CFDF06	<RSCAN0_base> + $0EE8_H$

Table 22.13 Registers (13/19)

Module	Register	Symbol	Address
RSCAN0	Transmit/receive FIFO buffer access data field 1 register 6	RSCAN0CFDF16	<RSCAN0_base> + $0EEC_H$
RSCAN0	Transmit/receive FIFO buffer access ID register 7	RSCAN0CFID7	<RSCAN0_base> + $0EF0_H$
RSCAN0	Transmit/receive FIFO buffer access pointer register 7	RSCAN0CFPTR7	<RSCAN0_base> + $0EF4_H$
RSCAN0	Transmit/receive FIFO buffer access data field 0 register 7	RSCAN0CFDF07	<RSCAN0_base> + $0EF8_H$
RSCAN0	Transmit/receive FIFO buffer access data field 1 register 7	RSCAN0CFDF17	<RSCAN0_base> + $0EFC_H$
RSCAN0	Transmit/receive FIFO buffer access ID register 8	RSCAN0CFID8	<RSCAN0_base> + $0F00_H$
RSCAN0	Transmit/receive FIFO buffer access pointer register 8	RSCAN0CFPTR8	<RSCAN0_base> + $0F04_H$
RSCAN0	Transmit/receive FIFO buffer access data field 0 register 8	RSCAN0CFDF08	<RSCAN0_base> + $0F08_H$
RSCAN0	Transmit/receive FIFO buffer access data field 1 register 8	RSCAN0CFDF18	<RSCAN0_base> + $0F0C_H$
RSCAN0	Transmit buffer ID register 0	RSCAN0TMID0	<RSCAN0_base> + 1000_H
RSCAN0	Transmit buffer pointer register 0	RSCAN0TMPTR0	<RSCAN0_base> + 1004_H
RSCAN0	Transmit buffer data field 0 register 0	RSCAN0TMDF00	<RSCAN0_base> + 1008_H
RSCAN0	Transmit buffer data field 1 register 0	RSCAN0TMDF10	<RSCAN0_base> + $100C_H$
RSCAN0	Transmit buffer ID register 1	RSCAN0TMID1	<RSCAN0_base> + 1010_H
RSCAN0	Transmit buffer pointer register 1	RSCAN0TMPTR1	<RSCAN0_base> + 1014_H
RSCAN0	Transmit buffer data field 0 register 1	RSCAN0TMDF01	<RSCAN0_base> + 1018_H
RSCAN0	Transmit buffer data field 1 register 1	RSCAN0TMDF11	<RSCAN0_base> + $101C_H$
RSCAN0	Transmit buffer ID register 2	RSCAN0TMID2	<RSCAN0_base> + 1020_H
RSCAN0	Transmit buffer pointer register 2	RSCAN0TMPTR2	<RSCAN0_base> + 1024_H
RSCAN0	Transmit buffer data field 0 register 2	RSCAN0TMDF02	<RSCAN0_base> + 1028_H
RSCAN0	Transmit buffer data field 1 register 2	RSCAN0TMDF12	<RSCAN0_base> + $102C_H$
RSCAN0	Transmit buffer ID register 3	RSCAN0TMID3	<RSCAN0_base> + 1030_H
RSCAN0	Transmit buffer pointer register 3	RSCAN0TMPTR3	<RSCAN0_base> + 1034_H
RSCAN0	Transmit buffer data field 0 register 3	RSCAN0TMDF03	<RSCAN0_base> + 1038_H
RSCAN0	Transmit buffer data field 1 register 3	RSCAN0TMDF13	<RSCAN0_base> + $103C_H$
RSCAN0	Transmit buffer ID register 4	RSCAN0TMID4	<RSCAN0_base> + 1040_H
RSCAN0	Transmit buffer pointer register 4	RSCAN0TMPTR4	<RSCAN0_base> + 1044_H
RSCAN0	Transmit buffer data field 0 register 4	RSCAN0TMDF04	<RSCAN0_base> + 1048_H
RSCAN0	Transmit buffer data field 1 register 4	RSCAN0TMDF14	<RSCAN0_base> + $104C_H$
RSCAN0	Transmit buffer ID register 5	RSCAN0TMID5	<RSCAN0_base> + 1050_H
RSCAN0	Transmit buffer pointer register 5	RSCAN0TMPTR5	<RSCAN0_base> + 1054_H
RSCAN0	Transmit buffer data field 0 register 5	RSCAN0TMDF05	<RSCAN0_base> + 1058_H
RSCAN0	Transmit buffer data field 1 register 5	RSCAN0TMDF15	<RSCAN0_base> + $105C_H$
RSCAN0	Transmit buffer ID register 6	RSCAN0TMID6	<RSCAN0_base> + 1060_H
RSCAN0	Transmit buffer pointer register 6	RSCAN0TMPTR6	<RSCAN0_base> + 1064_H
RSCAN0	Transmit buffer data field 0 register 6	RSCAN0TMDF06	<RSCAN0_base> + 1068_H
RSCAN0	Transmit buffer data field 1 register 6	RSCAN0TMDF16	<RSCAN0_base> + $106C_H$
RSCAN0	Transmit buffer ID register 7	RSCAN0TMID7	<RSCAN0_base> + 1070_H
RSCAN0	Transmit buffer pointer register 7	RSCAN0TMPTR7	<RSCAN0_base> + 1074_H
RSCAN0	Transmit buffer data field 0 register 7	RSCAN0TMDF07	<RSCAN0_base> + 1078_H
RSCAN0	Transmit buffer data field 1 register 7	RSCAN0TMDF17	<RSCAN0_base> + $107C_H$
RSCAN0	Transmit buffer ID register 8	RSCAN0TMID8	<RSCAN0_base> + 1080_H
RSCAN0	Transmit buffer pointer register 8	RSCAN0TMPTR8	<RSCAN0_base> + 1084_H
RSCAN0	Transmit buffer data field 0 register 8	RSCAN0TMDF08	<RSCAN0_base> + 1088_H

Table 22.13 Registers (14/19)

Module	Register	Symbol	Address
RSCAN0	Transmit buffer data field 1 register 8	RSCAN0TMDF18	<RSCAN0_base> + $108C_H$
RSCAN0	Transmit buffer ID register 9	RSCAN0TMID9	<RSCAN0_base> + 1090_H
RSCAN0	Transmit buffer pointer register 9	RSCAN0TMPTR9	<RSCAN0_base> + 1094_H
RSCAN0	Transmit buffer data field 0 register 9	RSCAN0TMDF09	<RSCAN0_base> + 1098_H
RSCAN0	Transmit buffer data field 1 register 9	RSCAN0TMDF19	<RSCAN0_base> + $109C_H$
RSCAN0	Transmit buffer ID register 10	RSCAN0TMID10	<RSCAN0_base> + $10A0_H$
RSCAN0	Transmit buffer pointer register 10	RSCAN0TMPTR10	<RSCAN0_base> + $10A4_H$
RSCAN0	Transmit buffer data field 0 register 10	RSCAN0TMDF010	<RSCAN0_base> + $10A8_H$
RSCAN0	Transmit buffer data field 1 register 10	RSCAN0TMDF110	<RSCAN0_base> + $10AC_H$
RSCAN0	Transmit buffer ID register 11	RSCAN0TMID11	<RSCAN0_base> + $10B0_H$
RSCAN0	Transmit buffer pointer register 11	RSCAN0TMPTR11	<RSCAN0_base> + $10B4_H$
RSCAN0	Transmit buffer data field 0 register 11	RSCAN0TMDF011	<RSCAN0_base> + $10B8_H$
RSCAN0	Transmit buffer data field 1 register 11	RSCAN0TMDF111	<RSCAN0_base> + $10BC_H$
RSCAN0	Transmit buffer ID register 12	RSCAN0TMID12	<RSCAN0_base> + $10C0_H$
RSCAN0	Transmit buffer pointer register 12	RSCAN0TMPTR12	<RSCAN0_base> + $10C4_H$
RSCAN0	Transmit buffer data field 0 register 12	RSCAN0TMDF012	<RSCAN0_base> + $10C8_H$
RSCAN0	Transmit buffer data field 1 register 12	RSCAN0TMDF112	<RSCAN0_base> + $10CC_H$
RSCAN0	Transmit buffer ID register 13	RSCAN0TMID13	<RSCAN0_base> + $10D0_H$
RSCAN0	Transmit buffer pointer register 13	RSCAN0TMPTR13	<RSCAN0_base> + $10D4_H$
RSCAN0	Transmit buffer data field 0 register 13	RSCAN0TMDF013	<RSCAN0_base> + $10D8_H$
RSCAN0	Transmit buffer data field 1 register 13	RSCAN0TMDF113	<RSCAN0_base> + $10DC_H$
RSCAN0	Transmit buffer ID register 14	RSCAN0TMID14	<RSCAN0_base> + $10E0_H$
RSCAN0	Transmit buffer pointer register 14	RSCAN0TMPTR14	<RSCAN0_base> + $10E4_H$
RSCAN0	Transmit buffer data field 0 register 14	RSCAN0TMDF014	<RSCAN0_base> + $10E8_H$
RSCAN0	Transmit buffer data field 1 register 14	RSCAN0TMDF114	<RSCAN0_base> + $10EC_H$
RSCAN0	Transmit buffer ID register 15	RSCAN0TMID15	<RSCAN0_base> + $10F0_H$
RSCAN0	Transmit buffer pointer register 15	RSCAN0TMPTR15	<RSCAN0_base> + $10F4_H$
RSCAN0	Transmit buffer data field 0 register 15	RSCAN0TMDF015	<RSCAN0_base> + $10F8_H$
RSCAN0	Transmit buffer data field 1 register 15	RSCAN0TMDF115	<RSCAN0_base> + $10FC_H$
RSCAN0	Transmit buffer ID register 16	RSCAN0TMID16	<RSCAN0_base> + 1100_H
RSCAN0	Transmit buffer pointer register 16	RSCAN0TMPTR16	<RSCAN0_base> + 1104_H
RSCAN0	Transmit buffer data field 0 register 16	RSCAN0TMDF016	<RSCAN0_base> + 1108_H
RSCAN0	Transmit buffer data field 1 register 16	RSCAN0TMDF116	<RSCAN0_base> + $110C_H$
RSCAN0	Transmit buffer ID register 17	RSCAN0TMID17	<RSCAN0_base> + 1110_H
RSCAN0	Transmit buffer pointer register 17	RSCAN0TMPTR17	<RSCAN0_base> + 1114_H
RSCAN0	Transmit buffer data field 0 register 17	RSCAN0TMDF017	<RSCAN0_base> + 1118_H
RSCAN0	Transmit buffer data field 1 register 17	RSCAN0TMDF117	<RSCAN0_base> + $111C_H$
RSCAN0	Transmit buffer ID register 18	RSCAN0TMID18	<RSCAN0_base> + 1120_H
RSCAN0	Transmit buffer pointer register 18	RSCAN0TMPTR18	<RSCAN0_base> + 1124_H
RSCAN0	Transmit buffer data field 0 register 18	RSCAN0TMDF018	<RSCAN0_base> + 1128_H
RSCAN0	Transmit buffer data field 1 register 18	RSCAN0TMDF118	<RSCAN0_base> + $112C_H$
RSCAN0	Transmit buffer ID register 19	RSCAN0TMID19	<RSCAN0_base> + 1130_H
RSCAN0	Transmit buffer pointer register 19	RSCAN0TMPTR19	<RSCAN0_base> + 1134_H
RSCAN0	Transmit buffer data field 0 register 19	RSCAN0TMDF019	<RSCAN0_base> + 1138_H

Table 22.13 Registers (15/19)

Module	Register	Symbol	Address
RSCAN0	Transmit buffer data field 1 register 19	RSCAN0TMDF119	<RSCAN0_base> + $113C_H$
RSCAN0	Transmit buffer ID register 20	RSCAN0TMID20	<RSCAN0_base> + 1140_H
RSCAN0	Transmit buffer pointer register 20	RSCAN0TMPTR20	<RSCAN0_base> + 1144_H
RSCAN0	Transmit buffer data field 0 register 20	RSCAN0TMDF020	<RSCAN0_base> + 1148_H
RSCAN0	Transmit buffer data field 1 register 20	RSCAN0TMDF120	<RSCAN0_base> + $114C_H$
RSCAN0	Transmit buffer ID register 21	RSCAN0TMID21	<RSCAN0_base> + 1150_H
RSCAN0	Transmit buffer pointer register 21	RSCAN0TMPTR21	<RSCAN0_base> + 1154_H
RSCAN0	Transmit buffer data field 0 register 21	RSCAN0TMDF021	<RSCAN0_base> + 1158_H
RSCAN0	Transmit buffer data field 1 register 21	RSCAN0TMDF121	<RSCAN0_base> + $115C_H$
RSCAN0	Transmit buffer ID register 22	RSCAN0TMID22	<RSCAN0_base> + 1160_H
RSCAN0	Transmit buffer pointer register 22	RSCAN0TMPTR22	<RSCAN0_base> + 1164_H
RSCAN0	Transmit buffer data field 0 register 22	RSCAN0TMDF022	<RSCAN0_base> + 1168_H
RSCAN0	Transmit buffer data field 1 register 22	RSCAN0TMDF122	<RSCAN0_base> + $116C_H$
RSCAN0	Transmit buffer ID register 23	RSCAN0TMID23	<RSCAN0_base> + 1170_H
RSCAN0	Transmit buffer pointer register 23	RSCAN0TMPTR23	<RSCAN0_base> + 1174_H
RSCAN0	Transmit buffer data field 0 register 23	RSCAN0TMDF023	<RSCAN0_base> + 1178_H
RSCAN0	Transmit buffer data field 1 register 23	RSCAN0TMDF123	<RSCAN0_base> + $117C_H$
RSCAN0	Transmit buffer ID register 24	RSCAN0TMID24	<RSCAN0_base> + 1180_H
RSCAN0	Transmit buffer pointer register 24	RSCAN0TMPTR24	<RSCAN0_base> + 1184_H

Table 22.13 Registers (16/19)

Module	Register	Symbol	Address
RSCAN0	Transmit buffer data field 1 register 30	RSCAN0TMDF130	<RSCAN0_base> + $11EC_H$
RSCAN0	Transmit buffer ID register 31	RSCAN0TMID31	<RSCAN0_base> + $11F0_H$
RSCAN0	Transmit buffer pointer register 31	RSCAN0TMPTR31	<RSCAN0_base> + $11F4_H$
RSCAN0	Transmit buffer data field 0 register 31	RSCAN0TMDF031	<RSCAN0_base> + $11F8_H$
RSCAN0	Transmit buffer data field 1 register 31	RSCAN0TMDF131	<RSCAN0_base> + $11FC_H$
RSCAN0	Transmit buffer ID register 32	RSCAN0TMID32	<RSCAN0_base> + 1200_H
RSCAN0	Transmit buffer pointer register 32	RSCAN0TMPTR32	<RSCAN0_base> + 1204_H
RSCAN0	Transmit buffer data field 0 register 32	RSCAN0TMDF032	<RSCAN0_base> + 1208_H
RSCAN0	Transmit buffer data field 1 register 32	RSCAN0TMDF132	<RSCAN0_base> + $120C_H$
RSCAN0	Transmit buffer ID register 33	RSCAN0TMID33	<RSCAN0_base> + 1210_H
RSCAN0	Transmit buffer pointer register 33	RSCAN0TMPTR33	<RSCAN0_base> + 1214_H
RSCAN0	Transmit buffer data field 0 register 33	RSCAN0TMDF033	<RSCAN0_base> + 1218_H
RSCAN0	Transmit buffer data field 1 register 33	RSCAN0TMDF133	<RSCAN0_base> + $121C_H$
RSCAN0	Transmit buffer ID register 34	RSCAN0TMID34	<RSCAN0_base> + 1220_H
RSCAN0	Transmit buffer pointer register 34	RSCAN0TMPTR34	<RSCAN0_base> + 1224_H
RSCAN0	Transmit buffer data field 0 register 34	RSCAN0TMDF034	<RSCAN0_base> + 1228_H
RSCAN0	Transmit buffer data field 1 register 34	RSCAN0TMDF134	<RSCAN0_base> + $122C_H$
RSCAN0	Transmit buffer ID register 35	RSCAN0TMID35	<RSCAN0_base> + 1230_H
RSCAN0	Transmit buffer pointer register 35	RSCAN0TMPTR35	<RSCAN0_base> + 1234_H
RSCAN0	Transmit buffer data field 0 register 35	RSCAN0TMDF035	<RSCAN0_base> + 1238_H
RSCAN0	Transmit buffer data field 1 register 35	RSCAN0TMDF135	<RSCAN0_base> + $123C_H$
RSCAN0	Transmit buffer ID register 36	RSCAN0TMID36	<RSCAN0_base> + 1240_H
RSCAN0	Transmit buffer pointer register 36	RSCAN0TMPTR36	<RSCAN0_base> + 1244_H
RSCAN0	Transmit buffer data field 0 register 36	RSCAN0TMDF036	<RSCAN0_base> + 1248_H
RSCAN0	Transmit buffer data field 1 register 36	RSCAN0TMDF136	<RSCAN0_base> + $124C_H$
RSCAN0	Transmit buffer ID register 37	RSCAN0TMID37	<RSCAN0_base> + 1250_H
RSCAN0	Transmit buffer pointer register 37	RSCAN0TMPTR37	<RSCAN0_base> + 1254_H
RSCAN0	Transmit buffer data field 0 register 37	RSCAN0TMDF037	<RSCAN0_base> + 1258_H
RSCAN0	Transmit buffer data field 1 register 37	RSCAN0TMDF137	<RSCAN0_base> + $125C_H$
RSCAN0	Transmit buffer ID register 38	RSCAN0TMID38	<RSCAN0_base> + 1260_H
RSCAN0	Transmit buffer pointer register 38	RSCAN0TMPTR38	<RSCAN0_base> + 1264_H
RSCAN0	Transmit buffer data field 0 register 38	RSCAN0TMDF038	<RSCAN0_base> + 1268_H
RSCAN0	Transmit buffer data field 1 register 38	RSCAN0TMDF138	<RSCAN0_base> + $126C_H$
RSCAN0	Transmit buffer ID register 39	RSCAN0TMID39	<RSCAN0_base> + 1270_H
RSCAN0	Transmit buffer pointer register 39	RSCAN0TMPTR39	<RSCAN0_base> + 1274_H
RSCAN0	Transmit buffer data field 0 register 39	RSCAN0TMDF039	<RSCAN0_base> + 1278_H
RSCAN0	Transmit buffer data field 1 register 39	RSCAN0TMDF139	<RSCAN0_base> + $127C_H$
RSCAN0	Transmit buffer ID register 40	RSCAN0TMID40	<RSCAN0_base> + 1280_H
RSCAN0	Transmit buffer pointer register 40	RSCAN0TMPTR40	<RSCAN0_base> + 1284_H
RSCAN0	Transmit buffer data field 0 register 40	RSCAN0TMDF040	<RSCAN0_base> + 1288_H
RSCAN0	Transmit buffer data field 1 register 40	RSCAN0TMDF140	<RSCAN0_base> + $128C_H$
RSCAN0	Transmit buffer ID register 41	RSCAN0TMID41	<RSCAN0_base> + 1290_H
RSCAN0	Transmit buffer pointer register 41	RSCAN0TMPTR41	<RSCAN0_base> + 1294_H
RSCAN0	Transmit buffer data field 0 register 41	RSCAN0TMDF041	<RSCAN0_base> + 1298_H

Table 22.13 Registers (17/19)

Module	Register	Symbol	Address
RSCAN0	Transmit buffer data field 1 register 41	RSCAN0TMDF141	<RSCAN0_base> + $129C_H$
RSCAN0	Transmit buffer ID register 42	RSCAN0TMID42	<RSCAN0_base> + $12A0_H$
RSCAN0	Transmit buffer pointer register 42	RSCAN0TMPTR42	<RSCAN0_base> + $12A4_H$
RSCAN0	Transmit buffer data field 0 register 42	RSCAN0TMDF042	<RSCAN0_base> + $12A8_H$
RSCAN0	Transmit buffer data field 1 register 42	RSCAN0TMDF142	<RSCAN0_base> + $12AC_H$
RSCAN0	Transmit buffer ID register 43	RSCAN0TMID43	<RSCAN0_base> + $12B0_H$
RSCAN0	Transmit buffer pointer register 43	RSCAN0TMPTR43	<RSCAN0_base> + $12B4_H$
RSCAN0	Transmit buffer data field 0 register 43	RSCAN0TMDF043	<RSCAN0_base> + $12B8_H$
RSCAN0	Transmit buffer data field 1 register 43	RSCAN0TMDF143	<RSCAN0_base> + $12BC_H$
RSCAN0	Transmit buffer ID register 44	RSCAN0TMID44	<RSCAN0_base> + $12C0_H$
RSCAN0	Transmit buffer pointer register 44	RSCAN0TMPTR44	<RSCAN0_base> + $12C4_H$
RSCAN0	Transmit buffer data field 0 register 44	RSCAN0TMDF044	<RSCAN0_base> + $12C8_H$
RSCAN0	Transmit buffer data field 1 register 44	RSCAN0TMDF144	<RSCAN0_base> + $12CC_H$
RSCAN0	Transmit buffer ID register 45	RSCAN0TMID45	<RSCAN0_base> + $12D0_H$
RSCAN0	Transmit buffer pointer register 45	RSCAN0TMPTR45	<RSCAN0_base> + $12D4_H$
RSCAN0	Transmit buffer data field 0 register 45	RSCAN0TMDF045	<RSCAN0_base> + $12D8_H$
RSCAN0	Transmit buffer data field 1 register 45	RSCAN0TMDF145	<RSCAN0_base> + $12DC_H$
RSCAN0	Transmit buffer ID register 46	RSCAN0TMID46	<RSCAN0_base> + $12E0_H$
RSCAN0	Transmit buffer pointer register 46	RSCAN0TMPTR46	<RSCAN0_base> + $12E4_H$
RSCAN0	Transmit buffer data field 0 register 46	RSCAN0TMDF046	<RSCAN0_base> + $12E8_H$
RSCAN0	Transmit buffer data field 1 register 46	RSCAN0TMDF146	<RSCAN0_base> + $12EC_H$
RSCAN0	Transmit buffer ID register 47	RSCAN0TMID47	<RSCAN0_base> + $12F0_H$
RSCAN0	Transmit buffer pointer register 47	RSCAN0TMPTR47	<RSCAN0_base> + $12F4_H$
RSCAN0	Transmit buffer data field 0 register 47	RSCAN0TMDF047	<RSCAN0_base> + $12F8_H$
RSCAN0	Transmit buffer data field 1 register 47	RSCAN0TMDF147	<RSCAN0_base> + $12FC_H$
RSCAN0	Transmit history access register 0	RSCAN0THLACC0	<RSCAN0_base> + 1800_H
RSCAN0	Transmit history access register 1	RSCAN0THLACC1	<RSCAN0_base> + 1804_H
RSCAN0	Transmit history access register 2	RSCAN0THLACC2	<RSCAN0_base> + 1808_H
RSCAN0	RAM test page access register 0	RSCAN0RPGACC0	<RSCAN0_base> + 1900_H
RSCAN0	RAM test page access register 1	RSCAN0RPGACC1	<RSCAN0_base> + 1904_H
RSCAN0	RAM test page access register 2	RSCAN0RPGACC2	<RSCAN0_base> + 1908_H
RSCAN0	RAM test page access register 3	RSCAN0RPGACC3	<RSCAN0_base> + $190C_H$
RSCAN0	RAM test page access register 4	RSCAN0RPGACC4	<RSCAN0_base> + 1910_H
RSCAN0	RAM test page access register 5	RSCAN0RPGACC5	<RSCAN0_base> + 1914_H
RSCAN0	RAM test page access register 6	RSCAN0RPGACC6	<RSCAN0_base> + 1918_H
RSCAN0	RAM test page access register 7	RSCAN0RPGACC7	<RSCAN0_base> + $191C_H$
RSCAN0	RAM test page access register 8	RSCAN0RPGACC8	<RSCAN0_base> + 1920_H
RSCAN0	RAM test page access register 9	RSCAN0RPGACC9	<RSCAN0_base> + 1924_H
RSCAN0	RAM test page access register 10	RSCAN0RPGACC10	<RSCAN0_base> + 1928_H
RSCAN0	RAM test page access register 11	RSCAN0RPGACC11	<RSCAN0_base> + $192C_H$
RSCAN0	RAM test page access register 12	RSCAN0RPGACC12	<RSCAN0_base> + 1930_H
RSCAN0	RAM test page access register 13	RSCAN0RPGACC13	<RSCAN0_base> + 1934_H
RSCAN0	RAM test page access register 14	RSCAN0RPGACC14	<RSCAN0_base> + 1938_H
RSCAN0	RAM test page access register 15	RSCAN0RPGACC15	<RSCAN0_base> + $193C_H$

Table 22.13 Registers (18/19)

Module	Register	Symbol	Address
RSCAN0	RAM test page access register 16	RSCAN0RPGACC16	<RSCAN0_base> + 1940_H
RSCAN0	RAM test page access register 17	RSCAN0RPGACC17	<RSCAN0_base> + 1944_H
RSCAN0	RAM test page access register 18	RSCAN0RPGACC18	<RSCAN0_base> + 1948_H
RSCAN0	RAM test page access register 19	RSCAN0RPGACC19	<RSCAN0_base> + $194C_H$
RSCAN0	RAM test page access register 20	RSCAN0RPGACC20	<RSCAN0_base> + 1950_H
RSCAN0	RAM test page access register 21	RSCAN0RPGACC21	<RSCAN0_base> + 1954_H
RSCAN0	RAM test page access register 22	RSCAN0RPGACC22	<RSCAN0_base> + 1958_H
RSCAN0	RAM test page access register 23	RSCAN0RPGACC23	<RSCAN0_base> + $195C_H$
RSCAN0	RAM test page access register 24	RSCAN0RPGACC24	<RSCAN0_base> + 1960_H
RSCAN0	RAM test page access register 25	RSCAN0RPGACC25	<RSCAN0_base> + 1964_H
RSCAN0	RAM test page access register 26	RSCAN0RPGACC26	<RSCAN0_base> + 1968_H
RSCAN0	RAM test page access register 27	RSCAN0RPGACC27	<RSCAN0_base> + $196C_H$
RSCAN0	RAM test page access register 28	RSCAN0RPGACC28	<RSCAN0_base> + 1970_H
RSCAN0	RAM test page access register 29	RSCAN0RPGACC29	<RSCAN0_base> + 1974_H
RSCAN0	RAM test page access register 30	RSCAN0RPGACC30	<RSCAN0_base> + 1978_H
RSCAN0	RAM test page access register 31	RSCAN0RPGACC31	<RSCAN0_base> + $197C_H$
RSCAN0	RAM test page access register 32	RSCAN0RPGACC32	<RSCAN0_base> + 1980_H
RSCAN0	RAM test page access register 33	RSCAN0RPGACC33	<RSCAN0_base> + 1984_H
RSCAN0	RAM test page access register 34	RSCAN0RPGACC34	<RSCAN0_base> + 1988_H
RSCAN0	RAM test page access register 35	RSCAN0RPGACC35	<RSCAN0_base> + $198C_H$
RSCAN0	RAM test page access register 36	RSCAN0RPGACC36	<RSCAN0_base> + 1990_H
RSCAN0	RAM test page access register 37	RSCAN0RPGACC37	<RSCAN0_base> + 1994_H
RSCAN0	RAM test page access register 38	RSCAN0RPGACC38	<RSCAN0_base> + 1998_H
RSCAN0	RAM test page access register 39	RSCAN0RPGACC39	<RSCAN0_base> + $199C_H$
RSCAN0	RAM test page access register 40	RSCAN0RPGACC40	<RSCAN0_base> + $19A0_H$
RSCAN0	RAM test page access register 41	RSCAN0RPGACC41	<RSCAN0_base> + $19A4_H$
RSCAN0	RAM test page access register 42	RSCAN0RPGACC42	<RSCAN0_base> + $19A8_H$
RSCAN0	RAM test page access register 43	RSCAN0RPGACC43	<RSCAN0_base> + $19AC_H$
RSCAN0	RAM test page access register 44	RSCAN0RPGACC44	<RSCAN0_base> + $19B0_H$
RSCAN0	RAM test page access register 45	RSCAN0RPGACC45	<RSCAN0_base> + $19B4_H$
RSCAN0	RAM test page access register 46	RSCAN0RPGACC46	<RSCAN0_base> + $19B8_H$
RSCAN0	RAM test page access register 47	RSCAN0RPGACC47	<RSCAN0_base> + $19BC_H$
RSCAN0	RAM test page access register 48	RSCAN0RPGACC48	<RSCAN0_base> + $19C0_H$
RSCAN0	RAM test page access register 49	RSCAN0RPGACC49	<RSCAN0_base> + $19C4_H$
RSCAN0	RAM test page access register 50	RSCAN0RPGACC50	<RSCAN0_base> + $19C8_H$
RSCAN0	RAM test page access register 51	RSCAN0RPGACC51	<RSCAN0_base> + $19CC_H$

RSCAN0	RAM test page access register 57	RSCAN0RPGACC57	<RSCAN0_base> + $19E4_H$
RSCAN0	RAM test page access register 58	RSCAN0RPGACC58	<RSCAN0_base> + $19E8_H$
RSCAN0	RAM test page access register 59	RSCAN0RPGACC59	<RSCAN0_base> + $19EC_H$

Table 22.13 Registers (19/19)

Module	Register	Symbol	Address
RSCAN0	RAM test page access register 60	RSCAN0RPGACC60	<RSCAN0_base> + $19F0_H$
RSCAN0	RAM test page access register 61	RSCAN0RPGACC61	<RSCAN0_base> + $19F4_H$
RSCAN0	RAM test page access register 62	RSCAN0RPGACC62	<RSCAN0_base> + $19F8_H$
RSCAN0	RAM test page access register 63	RSCAN0RPGACC63	<RSCAN0_base> + $19FC_H$

Table 22.14 Transmit Buffer p Allocated to Each Channel

	CANm
Transmit buffer p	Transmit buffer 16 × m + 0
	Transmit buffer 16 × m + 1
	Transmit buffer 16 × m + 2
	Transmit buffer 16 × m + 3
	Transmit buffer 16 × m + 4
	Transmit buffer 16 × m + 5
	Transmit buffer 16 × m + 6
	Transmit buffer 16 × m + 7
	Transmit buffer 16 × m + 8
	Transmit buffer 16 × m + 9
	Transmit buffer 16 × m + 10
	Transmit buffer 16 × m + 11
	Transmit buffer 16 × m + 12
	Transmit buffer 16 × m + 13
	Transmit buffer 16 × m + 14
	Transmit buffer 16 × m + 15

Table 22.15 Transmit/Receive FIFO Buffer k Allocated to Each Channel

	CANm
Transmit/receive FIFO buffer k	Transmit/receive FIFO buffer 3 × m + 0
	Transmit/receive FIFO buffer 3 × m + 1
	Transmit/receive FIFO buffer 3 × m + 2

Table 22.16 Transmit Buffer p Linked to the Transmit/Receive FIFO Buffer by the Setting of Bits CFTML[3:0]

Setting of Bits CFTML[3:0]	Transmit Buffer p Linked to the Transmit/Receive FIFO Buffer
0000_B	Transmit buffer 16 × m + 0
0001_B	Transmit buffer 16 × m + 1
0010_B	Transmit buffer 16 × m + 2
0011_B	Transmit buffer 16 × m + 3
0100_B	Transmit buffer 16 × m + 4
0101_B	Transmit buffer 16 × m + 5
0110_B	Transmit buffer 16 × m + 6
0111_B	Transmit buffer 16 × m + 7
1000_B	Transmit buffer 16 × m + 8
1001_B	Transmit buffer 16 × m + 9
1010_B	Transmit buffer 16 × m + 10
1011_B	Transmit buffer 16 × m + 11
1100_B	Transmit buffer 16 × m + 12
1101_B	Transmit buffer 16 × m + 13
1110_B	Transmit buffer 16 × m + 14
1111_B	Transmit buffer 16 × m + 15

Table 22.17 Transmit Buffer p Allocated to the Transmit Queue of Each Channel

Setting of Bits TXQDC[3:0]	Transmit Buffer p Allocated to the Transmit Queue
0000_B	Setting prohibited
0001_B	Setting prohibited
0010_B	Transmit buffer 16 × m + 15 to 16 × m + 13
0011_B	Transmit buffer 16 × m + 15 to 16 × m + 12
0100_B	Transmit buffer 16 × m + 15 to 16 × m + 11
0101_B	Transmit buffer 16 × m + 15 to 16 × m + 10
0110_B	Transmit buffer 16 × m + 15 to 16 × m + 9
0111_B	Transmit buffer 16 × m + 15 to 16 × m + 8
1000_B	Transmit buffer 16 × m + 15 to 16 × m + 7
1001_B	Transmit buffer 16 × m + 15 to 16 × m + 6
1010_B	Transmit buffer 16 × m + 15 to 16 × m + 5
1011_B	Transmit buffer 16 × m + 15 to 16 × m + 4
1100_B	Transmit buffer 16 × m + 15 to 16 × m + 3
1101_B	Transmit buffer 16 × m + 15 to 16 × m + 2
1110_B	Transmit buffer 16 × m + 15 to 16 × m + 1
1111_B	Transmit buffer 16 × m + 15 to 16 × m + 0

22.3.2 RSCAN0CmCFG — Channel Configuration Register (m = 0 to 2)

Access: RSCAN0CmCFG register can be read/written in 32-bit units
RSCAN0CmCFGL, RSCAN0CmCFGH registers can be read/written in 16-bit units
RSCAN0CmCFGLL, RSCAN0CmCFGLH, RSCAN0CmCFGHL, RSCAN0CmCFGHH registers can be read/written in 8-bit units

Address: RSCAN0CmCFG: <RSCAN0_base> + 0000_H + (10_H × m)

RSCAN0CmCFGL: <RSCAN0_base> + 0000_H + (10_H × m),
RSCAN0CmCFGH: <RSCAN0_base> + 0002_H + (10_H × m)

RSCAN0CmCFGLL: <RSCAN0_base> + 0000_H + (10_H × m),
RSCAN0CmCFGLH: <RSCAN0_base> + 0001_H + (10_H × m),
RSCAN0CmCFGHL: <RSCAN0_base> + 0002_H + (10_H × m),
RSCAN0CmCFGHH: <RSCAN0_base> + 0003_H + (10_H × m)

Value after reset: $0000\ 0000_H$

15 to 10	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
9 to 0	BRP[9:0]	Prescaler Division Ratio Set When these bits are set to P (0 to 1023), the baud rate prescaler divides fCAN by P + 1.

Modify the RSCAN0CmCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode before shifting to channel communication mode or channel halt mode. For a description of the bit timing parameters and settings, see Section 22.10.1, Initial Settings.

SJW[1:0] Bits

These bits are used to specify a Tq value for the resynchronization jump width. Allowed values are 1 Tq to 4 Tq, inclusive.
Set a value less than or equal to the value of the TSEG2[2:0] bits.

TSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2).
Allowed values are 2 Tq to 8 Tq, inclusive.
Set a value smaller than the value of the TSEG1[3:0] bits.

TSEG1[3:0] Bits

These bits are used to specify a Tq value for the total length of the propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1).
Allowed values are 4 Tq to 16 Tq, inclusive.

BRP[9:0] Bits

The CANmTq clock (fCANTQm) is calculated by dividing the CAN clock (fCAN) by the baud rate prescaler, ((BRP[9:0]) + 1). One clock cycle of the CANmTq clock is 1 Time Quantum (Tq).

22.3.3 RSCAN0CmCTR — Channel Control Register (m = 0 to 2)

Access: RSCAN0CmCTR register can be read/written in 32-bit units
RSCAN0CmCTRL, RSCAN0CmCTRH registers can be read/written in 16-bit units
RSCAN0CmCTRLL, RSCAN0CmCTRLH, RSCAN0CmCTRHL, RSCAN0CmCTRHH registers can be read/written in 8-bit units

Address: RSCAN0CmCTR: <RSCAN0_base> + 0004_H + (10_H × m)

RSCAN0CmCTRL: <RSCAN0_base> + 0004_H + (10_H × m),
RSCAN0CmCTRH: <RSCAN0_base> + 0006_H + (10_H × m)

RSCAN0CmCTRLL: <RSCAN0_base> + 0004_H + (10_H × m),
RSCAN0CmCTRLH: <RSCAN0_base> + 0005_H + (10_H × m),
RSCAN0CmCTRHL: <RSCAN0_base> + 0006_H + (10_H × m),
RSCAN0CmCTRHH: <RSCAN0_base> + 0007_H + (10_H × m)

Value after reset: $0000\ 0005_H$

8	BEIE	Bus Error Interrupt Enable 0: Bus error interrupt is disabled. 1: Bus error interrupt is enabled.
7 to 4	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
3	RTBO	Forcible Return from Bus-off When this bit is set to 1, forcible return from the bus off state is made. This bit is always read as 0.
2	CSLPR	Channel Stop Mode 0: Other than channel stop mode 1: Channel stop mode
1, 0	CHMDC[1:0]	Mode Select b1 b0 0 0: Channel communication mode 0 1: Channel reset mode 1 0: Channel halt mode 1 1: Setting prohibited

CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

CTME Bit

Setting this bit to 1 enables communication test mode. Modify these bits in channel halt mode. This bit is set to 0 in channel reset mode.

ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCAN0CmERFL register.
When this bit is clear to 0, if any error is detected while the flags of bits 14 to 8 in the RSCANnCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RSCAN module.

When the BOM[1:0] bits are set to 00_B, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RSCAN module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10_B (channel halt mode) before recessive bits are detected 128 times, the RSCAN module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RSCAN module reaches the bus off state when the BOM[1:0] bits are set to 01_B, the CHMDC[1:0] bits in the RSCAN0CmCTR register (m = 0 to 2) are set to 10_B and the RSCAN module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits in the RSCAN0CmSTS register are cleared to 00_H.

When the RSCAN module reaches the bus off state when the BOM[1:0] bits are set to 10_B, the CHMDC[1:0] bits are set to 10_B and the RSCAN module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H.

When the BOM[1:0] bits are set to 11_B and the CHMDC[1:0] bits are set to 10_B while the RSCAN module is in the bus off state, the RSCAN module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H. However, if 11 consecutive recessive bits are detected 128 times and the RSCAN module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10_B, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bit at the same time as the RSCAN module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01_B or at bus off end when the BOM[1:0] bits are 10_B), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

ALIE Bit

When the ALF flag in the RSCAN0CmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BLIE Bit

When the BLF flag in the RSCAN0CmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

OLIE Bit

When the OVLF flag in the RSCAN0CmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BORIE Bit

When the BORF flag in the RSCAN0CmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BOEIE Bit

When the BOEF flag in the RSCAN0CmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EPIE Bit

When the EPF flag in the RSCAN0CmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EWIE Bit

When the EWF flag in the RSCAN0CmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BEIE Bit

When the BEF flag in the RSCAN0CmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

RTBO Bit

Setting this bit to 1 in the bus off state forcibly changes the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCAN0CmSTS register to 00_H and also clears the BOSTS flag in the RSCAN0CmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCAN0CmCTR register are 00_B (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RSCAN module transitions to the error active state. Set this bit to 1 in channel communication mode.

CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.
Clearing this bit to 0 makes the channel exit channel stop mode.
This bit should not be modified in channel communication mode or channel halt mode.

CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see Section 22.5.2, Channel Modes. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11_B. When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become 10_B.

22.3.4 RSCAN0CmSTS — Channel Status Register (m = 0 to 2)

Access: RSCAN0CmSTS register can be read only in 32-bit units
RSCAN0CmSTSL, RSCAN0CmSTSH registers can be read only in 16-bit units
RSCAN0CmSTSLL, RSCAN0CmSTSHL, RSCAN0CmSTSHH registers can be read only in 8-bit units

Address: RSCAN0CmSTS: <RSCAN0_base> + 0008_H + (10_H × m)

RSCAN0CmSTSL: <RSCAN0_base> + 0008_H + (10_H × m),
RSCAN0CmSTSH: <RSCAN0_base> + $000A_H$ + (10_H × m)

RSCAN0CmSTSLL: <RSCAN0_base> + 0008_H + (10_H × m),
RSCAN0CmSTSHL: <RSCAN0_base> + $000A_H$ + (10_H × m),
RSCAN0CmSTSHH: <RSCAN0_base> + $000B_H$ + (10_H × m)

Value after reset: $0000\ 0005_H$

Table 22.20 RSCAN0CmSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	TEC[7:0]	The transmit error counter (TEC) can be read.
23 to 16	REC[7:0]	The receive error counter (REC) can be read.
15 to 8	Reserved	These bits are read as the value after reset.
7	COMSTS	Communication Status Flag 0: Communication is not ready. 1: Communication is ready.
6	RECSTS	Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception
5	TRMSTS	Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state
4	BOSTS	Bus Off Status Flag 0: Not in bus off state 1: In bus off state
3	EPSTS	Error Passive Status Flag 0: Not in error passive state 1: In error passive state
2	CSLPSTS	Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode
1	CHLTSTS	Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode
0	CRSTSTS	Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode

TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

COMSTS Flag

This bit indicates that communication is ready.

This flag becomes 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

EPSTS Flag

This flag is set to 1 when the RSCAN module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])), It is cleared to 0 when the RSCAN module has exited the error passive state or has entered channel reset mode.

CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

22.3.5 RSCAN0CmERFL — Channel Error Flag Register (m = 0 to 2)

Access: RSCAN0CmERFL register can be read/written in 32-bit units
RSCAN0CmERFLL register can be read/written in 16-bit units
RSCANnCmERFLH register is a read-only register that can be read in 16-bit units.
RSCANnCmERFLLL, RSCANnCmERFLLH registers can be read or written in 8-bit units.
RSCANnCmERFLHL, RSCANnCmERFLHH registers are the read-only registers that can be read in 8-bit units.

Address: RSCAN0CmERFL: <RSCAN0_base> + $000C_H$ + (10_H × m)

RSCAN0CmERFLL: <RSCAN0_base> + $000C_H$ + (10_H × m),
RSCAN0CmERFLH: <RSCAN0_base> + $000E_H$ + (10_H × m)

RSCAN0CmERFLLL: <RSCAN0_base> + $000C_H$ + (10_H × m),
RSCAN0CmERFLLH: <RSCAN0_base> + $000D_H$ + (10_H × m),
RSCAN0CmERFLHL: <RSCAN0_base> + $000E_H$ + (10_H × m),
RSCAN0CmERFLHH: <RSCAN0_base> + $000F_H$ + (10_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	CRCREG[14:0]														
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 22.21 RSCAN0CmERFL Register Contents (1/2)

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
30 to 16	CRCREG[14:0]	CRC Calculation Data A CRC value calculated based on the transmit message or receive message is indicated.
15	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
14	ADERR	ACK Delimiter Error Flag 0: No ACK delimiter error is detected. 1: ACK delimiter error is detected.
13	B0ERR	Dominant Bit Error Flag 0: No dominant bit error is detected. 1: Dominant bit error is detected.
12	B1ERR	Recessive Bit Error Flag 0: No recessive bit error is detected. 1: Recessive bit error is detected.
11	CERR	CRC Error Flag 0: No CRC error is detected. 1: CRC error is detected.
10	AERR	ACK Error Flag 0: No ACK error is detected. 1: ACK error is detected.

Table 22.21 RSCAN0CmERFL Register Contents (2/2)

Bit Position	Bit Name	Function
9	FERR	Form Error Flag 0: No form error is detected. 1: Form error is detected.
8	SERR	Stuff Error Flag 0: No stuff error is detected. 1: Stuff error is detected.
7	ALF	Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected.
6	BLF	Bus Lock Flag 0: No channel bus lock is detected. 1: Channel bus lock is detected.
5	OVLF	Overload Flag 0: No overload is detected. 1: Overload is detected.
4	BORF	Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected.
3	BOEF	Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected.
2	EPF	Error Passive Flag 0: No error passive is detected. 1: Error passive is detected.
1	EWF	Error Warning Flag 0: No error warning is detected. 1: Error warning is detected.
0	BEF	Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 1 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCAN0CmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCAN0CmERFL is detected, the flag bits are only set to 1 by the error event if bits 14 to 8 were all 0 at the time when the error occurred.

CRCREG[14:0] Flag

When the CTME bit in the RSCAN0CmCTR register is set to 1 (communication test mode is enabled), the CRC value calculated based on the transmit or receive message can be read. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0.
This bit is always 0 in channel reset mode.

ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

B0ERR Flag

This flag is set to 1 when a recessive bit has been detected though a dominant bit was transmitted.

B1ERR Flag

This flag is set to 1 when a dominant bit has been detected though a recessive bit was transmitted.

CERR Flag

This flag is set to 1 when a CRC error has been detected.

AERR Flag

This flag is set to 1 when an ACK error has been detected.

FERR Flag

This flag is set to 1 when a form error has been detected.

SERR Flag

This flag is set to 1 when a stuff error has been detected.

ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCAN0CmCTR register are set to 01_B (channel reset mode).
- The RTBO bit in the RSCAN0CmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCAN0CmCTR register are set to 01_B (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCAN0CmCTR register are set to 10_B (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11_B (transition to channel halt mode upon a request from the program during bus off).

BOEF Flag

This flag is set to 1 when the bus off state is entered (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is entered when the BOM[1:0] bits in the RSCAN0CmCTR register (m = 0 to 2) set to 01_B (transition to channel halt mode at bus off entry).

EPF Flag

This flag becomes 1 when the error passive state is reached ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])).
This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCAN0CmERFL register is set to 1.

NOTE

To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

22.3.6 RSCAN0GCFG — Global Configuration Register

Access: RSCAN0GCFG register can be read/written in 32-bit units
RSCAN0GCFGL, RSCAN0GCFGH registers can be read/written in 16-bit units
RSCAN0GCFGLL, RSCAN0GCFGLH, RSCAN0GCFGHL, RSCAN0GCFGHH registers can be read/written in 8-bit units

Address: RSCAN0GCFG: <RSCAN0_base> + 0084_H

RSCAN0GCFGL: <RSCAN0_base> + 0084_H,
RSCAN0GCFGH: <RSCAN0_base> + 0086_H

RSCAN0GCFGLL: <RSCAN0_base> + 0084_H,
RSCAN0GCFGLH: <RSCAN0_base> + 0085_H,
RSCAN0GCFGHL: <RSCAN0_base> + 0086_H,
RSCAN0GCFGHH: <RSCAN0_base> + 0087_H

Value after reset: $0000\ 0000_H$

4	DCS	CAN Clock Source Select*2 0: clkc 1: clk_xincan
3	MME	Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled.
2	DRE	DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled.
1	DCE	DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled.
0	TPRI	Transmit Priority Select 0: ID priority 1: Transmit buffer number priority

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.

Note 2. For the CAN clock frequency settings, see Table 22.8, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/D1L/D1M.

Modify the RSCAN0GCFG register only in global reset mode.

ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See Section 22.7.3.1, Interval Transmission Function.

TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the bit time clock that will be the clock source of the timestamp counter.

TSSS Bit

This bit is used to select a clock source of the timestamp counter.

TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

For the CAN clock frequency settings, see Table 22.8, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/D1L/D1M.

MME Bit

Setting this bit to 1 makes the mirror function available.

DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of 00_H is stored in each data byte beyond the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCAN0GAFLP0j register to 0000_B before clearing the DCE bit in the RSCAN0GCFG register to 0.

TPRI Bit

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the transmit buffer with the smallest number of those has the highest priority.

While the transmit queue is in use, this bit should be set to 0.

22.3.7 RSCAN0GCTR — Global Control Register

Access: RSCAN0GCTR register can be read/written in 32-bit units
RSCAN0GCTRL, RSCAN0GCTRH registers can be read/written in 16-bit units
RSCAN0GCTRLL, RSCAN0GCTRLH, RSCAN0GCTRHL registers can be read/written in 8-bit units

Address: RSCAN0GCTR: <RSCAN0_base> + 0088_H

RSCAN0GCTRL: <RSCAN0_base> + 0088_H,
RSCAN0GCTRH: <RSCAN0_base> + $008A_H$

RSCAN0GCTRLL: <RSCAN0_base> + 0088_H,
RSCAN0GCTRLH: <RSCAN0_base> + 0089_H,
RSCAN0GCTRHL: <RSCAN0_base> + $008A_H$

Value after reset: $0000\ 0005_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 22.23 RSCAN0GCTR Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
16	TSRST	Timestamp Counter Reset Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0.
15 to 11	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
10	THLEIE	Transmit History Buffer Overflow Interrupt Enable 0: Transmit history buffer overflow interrupt is disabled. 1: Transmit history buffer overflow interrupt is enabled.
9	MEIE	FIFO Message Lost Interrupt Enable 0: FIFO message lost interrupt is disabled. 1: FIFO message lost interrupt is enabled.
8	DEIE	DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled.
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	GSLPR	Global Stop Mode 0: Other than global stop mode 1: Global stop mode
1, 0	GMDC[1:0]	Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited

TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCAN0GTSC register is cleared to 0000_H.

THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCAN0GERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCAN0GERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCAN0GERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

GSLPR Bit

Setting this bit to 1 places the RSCAN module into global stop mode.
Clearing this bit to 0 makes the RSCAN module leave from global stop mode.
This bit should not be modified in global operating mode or global test mode.

GMDC[1:0] Bits

These bits are used to select the mode of entire RSCAN module (global operating mode, global reset mode, or global test mode). For details, see Section 22.5.1, Global Modes. Setting the GSLPR bit to 1 when in global reset mode places the RSCAN module into global stop mode.

22.3.8 RSCAN0GSTS — Global Status Register

Access: RSCAN0GSTS register can be read only in 32-bit units
RSCAN0GSTSL register is a read-only register that can be read only in 16-bit units
RSCAN0GSTSLL register is a read-only register that can be read only in 8-bit units

Address: RSCAN0GSTS: <RSCAN0_base> + $008C_H$

RSCAN0GSTSL: <RSCAN0_base> + $008C_H$

RSCAN0GSTSLL: <RSCAN0_base> + $008C_H$

Value after reset: $0000\ 000D_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	GRAMINIT	GSLPSTS	GHLTSTS	GRSTSTS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 22.24 RSCAN0GSTS Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	GRAMINIT	CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing.
2	GSLPSTS	Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode
1	GHLTSTS	Global Test Status Flag 0: Not in global test mode 1: In global test mode
0	GRSTSTS	Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode

GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialisation is completed.

GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

GRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

22.3.9 RSCAN0GERFL — Global Error Flag Register

Access: RSCAN0GERFL register can be read/written in 32-bit units
RSCAN0GERFLL register can be read/written in 16-bit units
RSCAN0GERFLLL register can be read/written in 8-bit units

Address: RSCAN0GERFL: <RSCAN0_base> + 0090_H

RSCAN0GERFLL: <RSCAN0_base> + 0090_H

RSCAN0GERFLLL: <RSCAN0_base> + 0090_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	THLES	MES	DEF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 22.25 RSCAN0GERFL Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing these bits, write the value after reset.
13 to 8	Reserved	When read, the undefined value is returned. When writing these bits, write the value after reset.
7, 6	Reserved	When read, the value after reset is returned. When writing these bits, write the value after reset.
5	Reserved	When read, the undefined value is returned. When writing these bits, write the value after reset.
4, 3	Reserved	When read, the value after reset is returned. When writing these bits, write the value after reset.
2	THLES	Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred.
1	MES	FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred.
0	DEF	DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred.

All flags in the RSCAN0GERFL register are cleared to 0 in global reset mode.

THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCAN0THLSTSm register (m = 0 to 2) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCAN0RFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCAN0CFSTSk register (k = 0 to 8) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

NOTE

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

22.3.10 RSCAN0GTINTSTS0 — Global TX Interrupt Status Register 0

Access: RSCAN0GTINTSTS0 register can be read only in 32-bit units
RSCAN0GTINTSTS0L, RSCAN0GTINTSTS0H registers can be read only in 16-bit units
RSCAN0GTINTSTS0LL, RSCAN0GTINTSTS0LH, RSCAN0GTINTSTS0HL registers can be read only in 8-bit units

Address: RSCAN0GTINTSTS0: <RSCAN0_base> + 0460_H

RSCAN0GTINTSTS0L: <RSCAN0_base> + 0460_H,
RSCAN0GTINTSTS0H: <RSCAN0_base> + 0462_H

RSCAN0GTINTSTS0LL: <RSCAN0_base> + 0460_H,
RSCAN0GTINTSTS0LH: <RSCAN0_base> + 0461_H,
RSCAN0GTINTSTS0HL: <RSCAN0_base> + 0462_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	THIF1	CFTIF1	TQIF1	TAIF1	TSIF1	—	—	—	THIF0	CFTIF0	TQIF0	TAIF0	TSIF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R*1	R*1	R*1	R*1	R*1	R	R	R	R*1	R*1	R*1	R*1	R*1

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 22.26 RSCAN0GTINTSTS0 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 21	Reserved	These bits are read as the value after reset.
20	THIF2	Channel 2 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
19	CFTIF2	Channel 2 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
18	TQIF2	Channel 2 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
17	TAIF2	Channel 2 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
16	TSIF2	Channel 2 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
15 to 13	Reserved	These bits are read as the value after reset.
12	THIF1	Channel 1 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF1	Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF1	Channel 1 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.

Table 22.26 RSCAN0GTINTSTS0 Register Contents (2/2)

Bit Position	Bit Name	Function
9	TAIF1	Channel 1 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF1	Channel 1 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
7 to 5	Reserved	These bits are read as the value after reset.
4	THIF0	Channel 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF0	Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF0	Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF0	Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
0	TSIF0	Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCAN0TMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCAN0TMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00_B under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIE bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCAN0CmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCAN0TMSTSp register are set to 01_B (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00_B after the transmit abort is completed.

TQIFm Bits

When the TXQIE bit in the RSCAN0TXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCAN0TXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCAN0TXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCAN0CFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCAN0CFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCAN0THLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCAN0THLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCAN0THLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

22.3.11 RSCAN0GTSC — Global Timestamp Counter Register

Access: RSCAN0GTSC register is a read-only register that can be read in 32-bit units.
RSCAN0GTSCL register is a read-only register that can be read only in 16-bit units.

Address: RSCAN0GTSC: <RSCAN0_base> + 0094_H

RSCAN0GTSCL: <RSCAN0_base> + 0094_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 22.27 RSCAN0GTSC Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset.
15 to 0	TS[15:0]	Timestamp Value The timestamp counter value can be read. Counter Value: 0000_H to $FFFF_H$

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter starts and stops counting differently, depending on the count source.

- When the TSSS bit in the RSCAN0GCFG register is 0 (pclk):
  The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode.
  This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

22.3.12 RSCAN0GAFLECTR — Receive Rule Entry Control Register

Access: RSCAN0GAFLECTR register can be read or written in 32-bit units
RSCAN0GAFLECTRL register can be read/written in 16-bit units
RSCAN0GAFLECTRLL, RSCAN0GAFLECTRLH registers can be read or written in 8-bit units

Address: RSCAN0GAFLECTR: <RSCAN0_base> + 0098_H

RSCAN0GAFLECTRL: <RSCAN0_base> + 0098_H

RSCAN0GAFLECTRLL: <RSCAN0_base> + 0098_H,
RSCAN0GAFLECTRLH: <RSCAN0_base> + 0099_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 22.28 RSCAN0GAFLECTR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
8	AFLDAE	Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled.
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4 to 0	AFLPN[4:0]	Receive Rule Table Page Number Configuration A page number can be selected from a range of page 0 (00000_B) to page 11 (01011_B).

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of 00000_B to 01011_B.

22.3.13 RSCAN0GAFLCFG0 — Receive Rule Configuration Register 0

Access: RSCAN0GAFLCFG0 register can be read/written in 32-bit units
RSCAN0GAFLCFG0L, RSCAN0GAFLCFG0H registers can be read/written in 16-bit units
RSCAN0GAFLCFG0LH, RSCAN0GAFLCFG0HL, RSCAN0GAFLCFG0HH registers can be read/written in 8-bit units

Address: RSCAN0GAFLCFG0: <RSCAN0_base> + $009C_H$

RSCAN0GAFLCFG0L: <RSCAN0_base> + $009C_H$,
RSCAN0GAFLCFG0H: <RSCAN0_base> + $009E_H$

RSCAN0GAFLCFG0LH: <RSCAN0_base> + $009D_H$,
RSCAN0GAFLCFG0HL: <RSCAN0_base> + $009E_H$,
RSCAN0GAFLCFG0HH: <RSCAN0_base> + $009F_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 22.29 RSCAN0GAFLCFG0 Register Contents

Bit Position	Bit Name	Function
31 to 24	RNC0[7:0]	Number of Rules for Channel 0 Set the number of receive rules exclusively used for channel 0.
23 to 16	RNC1[7:0]	Number of Rules for Channel 1 Set the number of receive rules exclusively used for channel 1.
15 to 8	RNC2[7:0]	Number of Rules for Channel 2 Set the number of receive rules exclusively used for channel 2.
7 to 0	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Modify the RSCAN0GAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table for the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered for the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC2[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 2 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

22.3.14 RSCAN0GAFLIDj — Receive Rule ID Register (j = 0 to 15)

Access: RSCAN0GAFLIDj register can be read/written in 32-bit units
RSCAN0GAFLIDjL, RSCAN0GAFLIDjH registers can be read/written in 16-bit units
RSCAN0GAFLIDjLL, RSCAN0GAFLIDjLH, RSCAN0GAFLIDjHL, RSCAN0GAFLIDjHH registers can be read/written in 8-bit units

Address: RSCAN0GAFLIDj: <RSCAN0_base> + 0500_H + (10_H × j)

RSCAN0GAFLIDjL: <RSCAN0_base> + 0500_H + (10_H × j),
RSCAN0GAFLIDjH: <RSCAN0_base> + 0502_H + (10_H × j)

RSCAN0GAFLIDjLL: <RSCAN0_base> + 0500_H + (10_H × j),
RSCAN0GAFLIDjLH: <RSCAN0_base> + 0501_H + (10_H × j),
RSCAN0GAFLIDjHL: <RSCAN0_base> + 0502_H + (10_H × j),
RSCAN0GAFLIDjHH: <RSCAN0_base> + 0503_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAFLIDE	GAFLRTR	GAFLLB	GAFLID[28:16]

Table 22.30 RSCAN0GAFLIDj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDE	IDE Select 0: Standard ID 1: Extended ID
30	GAFLRTR	RTR Select 0: Data frame 1: Remote frame
29	GAFLLB	Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received
28 to 0	GAFLID[28:0]	ID Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0.

Modify the RSCAN0GAFLIDj register when the AFLDAE bit in the RSCAN0GAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

22.3.15 RSCAN0GAFLMj — Receive Rule Mask Register (j = 0 to 15)

Access: RSCAN0GAFLMj register can be read/written in 32-bit units
RSCAN0GAFLMjL, RSCAN0GAFLMjH registers can be read/written in 16-bit units
RSCAN0GAFLMjLL, RSCAN0GAFLMjLH, RSCAN0GAFLMjHL, RSCAN0GAFLMjHH registers can be read/written in 8-bit units

Address: RSCAN0GAFLMj: <RSCAN0_base> + 0504_H + (10_H × j)

RSCAN0GAFLMjL: <RSCAN0_base> + 0504_H + (10_H × j),
RSCAN0GAFLMjH: <RSCAN0_base> + 0506_H + (10_H × j)

RSCAN0GAFLMjLL: <RSCAN0_base> + 0504_H + (10_H × j),
RSCAN0GAFLMjLH: <RSCAN0_base> + 0505_H + (10_H × j),
RSCAN0GAFLMjHL: <RSCAN0_base> + 0506_H + (10_H × j),
RSCAN0GAFLMjHH: <RSCAN0_base> + 0507_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAFLIDEM	GAFLRTRM	—	GAFLIDM[28:16]

	GAFLIDM[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.31 RSCAN0GAFLMj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDEM	IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared.
30	GAFLRTRM	RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared
29	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
28 to 0	GAFLIDM[28:0]	ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared.

Modify the RSCAN0GAFLMj register when the AFLDAE bit in the RSCAN0GAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCAN0GAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

22.3.16 RSCAN0GAFLP0j — Receive Rule Pointer 0 Register (j = 0 to 15)

Access: RSCAN0GAFLP0j register can be read/written in 32-bit units
RSCAN0GAFLP0jL, RSCAN0GAFLP0jH registers can be read/written in 16-bit units
RSCAN0GAFLP0jLH, RSCAN0GAFLP0jHL, RSCAN0GAFLP0jHH registers can be read/written in 8-bit units

Address: RSCAN0GAFLP0j: <RSCAN0_base> + 0508_H + (10_H × j)

RSCAN0GAFLP0jL: <RSCAN0_base> + 0508_H + (10_H × j),
RSCAN0GAFLP0jH: <RSCAN0_base> + $050A_H$ + (10_H × j)

RSCAN0GAFLP0jLH: <RSCAN0_base> + 0509_H + (10_H × j),
RSCAN0GAFLP0jHL: <RSCAN0_base> + $050A_H$ + (10_H × j),
RSCAN0GAFLP0jHH: <RSCAN0_base> + $050B_H$ + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 22.32 RSCAN0GAFLP0j Register Contents

Bit Position	Bit Name	Function
31 to 28	GAFLDLC[3:0]	Receive Rule DLC b31 b30 b29 b28 0 0 0 0: DLC check is disabled. 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	GAFLPTR[11:0]	Receive Rule Label Set the 12-bit label information.
15	GAFLRMV	Receive Buffer Enable 0: No receive buffer is used. 1: A receive buffer is used.
14 to 8	GAFLRMDP[6:0]	Receive Buffer Number Select Set the receive buffer number to store receive messages.
7 to 0	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Modify the RSCAN0GAFLP0j register when the AFLDAE bit in the RSCAN0GAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000_B disables the DLC check function allowing messages with any data length to pass the DLC check.

GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCAN0RMNB register.

22.3.17 RSCAN0GAFLP1j — Receive Rule Pointer 1 Register (j = 0 to 15)

Access: RSCAN0GAFLP1j register can be read/written in 32-bit units
RSCAN0GAFLP1jL, RSCAN0GAFLP1jH registers can be read/written in 16-bit units
RSCAN0GAFLP1jLL, RSCAN0GAFLP1jLH, RSCAN0GAFLP1jHL, RSCAN0GAFLP1jHH registers can be read/written in 8-bit units

Address: RSCAN0GAFLP1j: <RSCAN0_base> + $050C_H$ + (10_H × j)

RSCAN0GAFLP1jL: <RSCAN0_base> + $050C_H$ + (10_H × j),
RSCAN0GAFLP1jH: <RSCAN0_base> + $050E_H$ + (10_H × j)

RSCAN0GAFLP1jLL: <RSCAN0_base> + $050C_H$ + (10_H × j),
RSCAN0GAFLP1jLH: <RSCAN0_base> + $050D_H$ + (10_H × j),
RSCAN0GAFLP1jHL: <RSCAN0_base> + $050E_H$ + (10_H × j),
RSCAN0GAFLP1jHH: <RSCAN0_base> + $050F_H$ + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	GAFLFDP[25:16]

Table 22.33 RSCAN0GAFLP1j Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
25 to 8	GAFLFDP[25:8]	Transmit/Receive FIFO Buffer k Select (Bit position –8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected.
7 to 0	GAFLFDP[7:0]	Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected.

Modify the RSCAN0GAFLP1j register when the AFLDAE bit in the RSCAN0GAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP [25:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers are selectable. However, when the GAFLRMV bit in the RSCAN0GAFLP0j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCAN0CFCCk register are set to 00_B (receive mode) or 10_B (gateway mode) are selectable.

22.3.18 RSCAN0RMNB — Receive Buffer Number Register

Access: RSCAN0RMNB register can be read or written in 32-bit units
RSCAN0RMNBL register can be read or written in 16-bit units
RSCAN0RMNBLL register can be read or written in 8-bit units

Address: RSCAN0RMNB: <RSCAN0_base> + $00A4_H$

RSCAN0RMNBL: <RSCAN0_base> + $00A4_H$

RSCAN0RMNBLL: <RSCAN0_base> + $00A4_H$

Value after reset: $0000\ 0000_H$

Table 22.34 RSCAN0RMNB Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
7 to 0	NRXMB[7:0]	Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 48.

Modify the RSCAN0RMNB register only in global reset mode.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RSCAN module. The maximum value is 16 × (number of channels).

Setting these bits all to 0 makes receive buffers unavailable.

22.3.19 RSCAN0RMNDy — Receive Buffer New Data Register (y = 0 to 1)

Access: RSCAN0RMNDy register can be read/written in 32-bit units
RSCAN0RMNDyL, RSCAN0RMNDyH registers can be read/written in 16-bit units
RSCAN0RMNDyLL, RSCAN0RMNDyLH, RSCAN0RMNDyHL, RSCAN0RMNDyHH registers can be read/written in 8-bit units

Address: RSCAN0RMNDy: <RSCAN0_base> + $00A8_H$ + (04_H × y)

RSCAN0RMNDyL: <RSCAN0_base> + $00A8_H$ + (04_H × y),
RSCAN0RMNDyH: <RSCAN0_base> + $00AA_H$ + (04_H × y)

RSCAN0RMNDyLL: <RSCAN0_base> + $00A8_H$ + (04_H × y),
RSCAN0RMNDyLH: <RSCAN0_base> + $00A9_H$ + (04_H × y),
RSCAN0RMNDyHL: <RSCAN0_base> + $00AA_H$ + (04_H × y),
RSCAN0RMNDyHH: <RSCAN0_base> + $00AB_H$ + (04_H × y)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 22.35 RSCAN0RMNDy Register Contents

Bit Position	Bit Name	Function
31 to 16	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.
15 to 0	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.

Write 0 to the RSCAN0RMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 47)

Each RMNS flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. It takes ten clock cycles of pclk to store a message.

These flags are cleared to 0 in global reset mode.

22.3.20 RSCAN0RMIDq — Receive Buffer ID Register (q = 0 to 47)

Access: RSCAN0RMIDq register can be read only in 32-bit units
RSCAN0RMIDqL, RSCAN0RMIDqH registers can be read only in 16-bit units
RSCAN0RMIDqLL, RSCAN0RMIDqLH, RSCAN0RMIDqHL, RSCAN0RMIDqHH registers can be read only in 8-bit units

Address: RSCAN0RMIDq: <RSCAN0_base> + 0600_H + (10_H × q)

RSCAN0RMIDqL: <RSCAN0_base> + 0600_H + (10_H × q),
RSCAN0RMIDqH: <RSCAN0_base> + 0602_H + (10_H × q)

RSCAN0RMIDqLL: <RSCAN0_base> + 0600_H + (10_H × q),
RSCAN0RMIDqLH: <RSCAN0_base> + 0601_H + (10_H × q),
RSCAN0RMIDqHL: <RSCAN0_base> + 0602_H + (10_H × q),
RSCAN0RMIDqHH: <RSCAN0_base> + 0603_H + (10_H × q)

Value after reset: $0000\ 0000_H$

Table 22.36 RSCAN0RMIDq Register Contents

Bit Position	Bit Name	Function
31	RMIDE	Receive Buffer IDE 0: Standard ID 1: Extended ID
30	RMRTR	Receive Buffer RTR 0: Data frame 1: Remote frame
29	Reserved	These bits are read as the value after reset.
28 to 0	RMID[28:0]	Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

RMRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer.

RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

22.3.21 RSCAN0RMPTRq — Receive Buffer Pointer Register (q = 0 to 47)

Access: RSCAN0RMPTRq register can be read only in 32-bit units
RSCAN0RMPTRqL, RSCAN0RMPTRqH registers can be read only in 16-bit units
RSCAN0RMPTRqLL, RSCAN0RMPTRqLH, RSCAN0RMPTRqHL, RSCAN0RMPTRqHH registers can be read only in 8-bit units

Address: RSCAN0RMPTRq: <RSCAN0_base> + 0604_H + (10_H × q)

RSCAN0RMPTRqL: <RSCAN0_base> + 0604_H + (10_H × q),
RSCAN0RMPTRqH: <RSCAN0_base> + 0606_H + (10_H × q)

RSCAN0RMPTRqLL: <RSCAN0_base> + 0604_H + (10_H × q),

Bit Position	Bit Name	Function
31 to 28	RMDLC[3:0]	Receive Buffer DLC Data b31 b30 b29 b28 0 0 0 0: No data byte 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	RMPTR[11:0]	Receive Buffer Label Data Label information of the received message.
15 to 0	RMTS[15:0]	Receive Buffer Timestamp Data Timestamp value of the received message.

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer.

RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

22.3.22 RSCAN0RMDF0q — Receive Buffer Data Field 0 Register (q = 0 to 47)

Access: RSCAN0RMDF0q register can be read only in 32-bit units
RSCAN0RMDF0qL, RSCAN0RMDF0qH registers can be read only in 16-bit units
RSCAN0RMDF0qLL, RSCAN0RMDF0qLH, RSCAN0RMDF0qHL, RSCAN0RMDF0qHH registers can be read only in 8-bit units

Address: RSCAN0RMDF0q: <RSCAN0_base> + 0608_H + (10_H × q)

RSCAN0RMDF0qL: <RSCAN0_base> + 0608_H + (10_H × q),
RSCAN0RMDF0qH: <RSCAN0_base> + $060A_H$ + (10_H × q)

Table 22.40 RSCAN0RFCCx Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
15 to 13	RFIGCV[2:0]	Receive FIFO Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.
12	RFIM	Receive FIFO Interrupt Source Select 0: An interrupt occurs when the condition set by the RFIGCV[2:0] bits is met. 1: An interrupt occurs each time a message has been received.
11	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
10 to 8	RFDC[2:0]	Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7 to 2	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
1	RFIE	Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled.

Table 22.40 RSCAN0RFCCx Register Contents (2/2)

Bit Position	Bit Name	Function
0	RFE	Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001_B (4 messages), set the RFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000_B, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCAN0RFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode. Set this bit to 1 with another instruction after the settings to all bits in the RSCANnRFCCx register have been done. This bit is cleared to 0 in global reset mode.

22.3.25 RSCAN0RFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

Access: RSCAN0RFSTSx register can be read/written in 32-bit units
RSCAN0RFSTSxL register can be read/written in 16-bit units
RSCAN0RFSTSxLL register can be read/written in 8-bit units
RSCAN0RFSTSxLH register is a read-only register that can be read in 8-bit units

Address: RSCAN0RFSTSx: <RSCAN0_base> + $00D8_H$ + (04_H × x)

RSCAN0RFSTSxL: <RSCAN0_base> + $00D8_H$ + (04_H × x)

RSCAN0RFSTSxLL: <RSCAN0_base> + $00D8_H$ + (04_H × x),
RSCAN0RFSTSxLH: <RSCAN0_base> + $00D9_H$ + (04_H × x)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFMC[7:0]								—	—	—	—	RFIF	RFMLT	RFFLL	RFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 22.41 RSCAN0RFSTSx Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
15 to 8	RFMC[7:0]	Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed.
7 to 4	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
3	RFIF	Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present.
2	RFMLT	Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost.
1	RFFLL	Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.
0	RFEMP	Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).

RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes 00_H when the RFE bit in the RSCAN0RFCCx register is set to 0.
This flag is 00_H in global reset mode.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCAN0RFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCAN0RFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCAN0RFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCAN0RFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

22.3.26 RSCAN0RFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

Access: RSCAN0RFPCTRx register can only be written in 32-bit units
RSCAN0RFPCTRxL register is a write-only register that can only be written in 16-bit units
RSCAN0RFPCTRxLL register is a write-only register that can only be written in 8-bit units

Address: RSCAN0RFPCTRx: <RSCAN0_base> + $00F8_H$ + (04_H × x)

RSCAN0RFPCTRxL: <RSCAN0_base> + $00F8_H$ + (04_H × x)

RSCAN0RFPCTRxLL: <RSCAN0_base> + $00F8_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

Table 22.42 RSCAN0RFPCTRx Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	RFPC[7:0]	Receive FIFO Pointer Control When these bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer.

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCAN0RFSTSx register is decremented by 1. Read the RSCAN0RFIDx, RSCAN0RFPTRx, RSCAN0RFDF0x, and RSCAN0RFDF1x registers to read messages in the receive FIFO buffer, and then write FF_H to the RFPC[7:0] bits.

When writing FF_H to these bits, make sure that the RFE bit in the RSCAN0RFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCAN0RFSTSx register is 0 (the receive FIFO buffer contains unread messages).

22.3.27 RSCAN0RFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

Access: RSCAN0RFIDx register can be read only in 32-bit units
RSCAN0RFIDxL, RSCAN0RFIDxH registers can be read only in 16-bit units
RSCAN0RFIDxLL, RSCAN0RFIDxLH, RSCAN0RFIDxHL, RSCAN0RFIDxHH registers can be read only in 8-bit units

Address: RSCAN0RFIDx: <RSCAN0_base> + $0E00_H$ + (10_H × x)

RSCAN0RFIDxL: <RSCAN0_base> + $0E00_H$ + (10_H × x),
RSCAN0RFIDxH: <RSCAN0_base> + $0E02_H$ + (10_H × x)

RSCAN0RFIDxLL: <RSCAN0_base> + $0E00_H$ + (10_H × x),

Table 22.43 RSCAN0RFIDx Register Contents

Bit Position	Bit Name	Function
31	RFIDE	Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	RFRTR	Receive FIFO Buffer RTR 0: Data frame 1: Remote frame
29	Reserved	These bits are read as the value after reset.
28 to 0	RFID[28:0]	Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

22.3.28 RSCAN0RFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

Access: RSCAN0RFPTRx register can be read only in 32-bit units
RSCAN0RFPTRxL, RSCAN0RFPTRxH registers can be read only in 16-bit units
RSCAN0RFPTRxLL, RSCAN0RFPTRxLH, RSCAN0RFPTRxHL, RSCAN0RFPTRxHH registers can be read only in 8-bit units

Address: RSCAN0RFPTRx: <RSCAN0_base> + $0E04_H$ + (10_H × x)

RSCAN0RFPTRxL: <RSCAN0_base> + $0E04_H$ + (10_H × x),

Table 22.47 RSCAN0CFCCk Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 24	CFITT[7:0]	Set a message transmission interval. Set Value: 00_H to FF_H
23 to 20	CFTML[3:0]	Transmit Buffer Link Configuration Set the transmit buffer number to be linked to the transmit/receive FIFO buffer.
19	CFITR	Transmit/Receive FIFO Interval Timer Resolution 0: Clock dividing pclk/2 by (ITRCP [15:0] bits) 1: Clock dividing pclk/2 by (ITRCP [15:0] bits × 10)
18	CFITSS	Transmit/Receive FIFO Interval Timer Clock Source Select 0: Interval timer clock source selected by the CFITR bit 1: Interval timer clock source is the bit time clock for the channel to which the FIFO is linked.
17, 16	CFM[1:0]	Transmit/Receive FIFO Mode Select b17 b16 0 0: Receive mode 0 1: Transmit mode 1 0: Gateway mode 1 1: Setting prohibited
15 to 13	CFIGCV[2:0]	Transmit/Receive FIFO Receive Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.

Table 22.47 RSCAN0CFCCk Register Contents (2/2)

Bit Position	Bit Name	Function
12	CFIM	Transmit/Receive FIFO Interrupt Source Select 0: • Receive mode/gateway mode When the number of received messages has met the condition set by the CFIGCV[2:0] bits, a FIFO receive interrupt request is generated. • Transmit mode/gateway mode When the buffer becomes empty upon completion of message transmission, a FIFO transmit interrupt request is generated. 1: • Receive mode/gateway mode A FIFO receive interrupt request is generated each time a message has been received. • Transmit mode/gateway mode A FIFO transmit interrupt request is generated each time a message has been transmitted.
11	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
10 to 8	CFDC[2:0]	Transmit/Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	CFTXIE	Transmit/Receive FIFO Transmit Interrupt Enable 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled.
1	CFRXIE	Transmit/Receive FIFO Receive Interrupt Enable 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled.
0	CFE	Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used.

CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]).

See **Table 22.15** and **Table 22.16**, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p.

Setting the CFDC[2:0] bits to 001_B or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the same channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCAN0GCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RSCAN0GCFG register × 10).

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the bit time clock of the channel to which the FIFO is linked is the count source of the interval timer.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00_B (receive mode) or 10_B (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001_B (4 messages), set the CFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B.

Modify these bits only in global reset mode.

CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000_B, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCAN0CFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCAN0CFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCANnCFCCk register have been set, set this bit to 1 by using other instructions.

22.3.32 RSCAN0CFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 8)

Access: RSCAN0CFSTSk register can be read/written in 32-bit units
RSCAN0CFSTSkL register can be read/written in 16-bit units
RSCAN0CFSTSkLL register can be read/written in 8-bit units
RSCAN0CFSTSkLH register is a read-only register that can be read in 8-bit units.

Address: RSCAN0CFSTSk: <RSCAN0_base> + 0178_H + (04_H × k)

RSCAN0CFSTSkL: <RSCAN0_base> + 0178_H + (04_H × k)

RSCAN0CFSTSkLL: <RSCAN0_base> + 0178_H + (04_H × k),
RSCAN0CFSTSkLH: <RSCAN0_base> + 0179_H + (04_H × k)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 22.48 RSCAN0CFSTSk Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
15 to 8	CFMC[7:0]	Transmit/Receive FIFO Message Counter The number of messages stored in the transmit/receive FIFO buffer.
7 to 5	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
4	CFTXIF	Transmit/Receive FIFO Transmit Interrupt Request Flag 0: No transmit/receive FIFO transmit interrupt request is present. 1: A transmit/receive FIFO transmit interrupt request is present.
3	CFRXIF	Transmit/Receive FIFO Receive Interrupt Request Flag 0: No transmit/receive FIFO receive interrupt request is present. 1: A transmit/receive FIFO receive interrupt request is present.
2	CFMLT	Transmit/Receive FIFO Message Lost Flag 0: No transmit/receive FIFO message is lost. 1: A transmit/receive FIFO message is lost.
1	CFFLL	Transmit/Receive FIFO Buffer Full Status Flag 0: The transmit/receive FIFO buffer is not full. 1: The transmit/receive FIFO buffer is full.
0	CFEMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty).

CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCAN0CFCCk register.

- When CFM[1:0] value is 01_B (transmit mode): Number of untransmitted messages in the buffer

- When CFM[1:0] value is 00_B (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10_B (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00_B: In global reset mode
- When CFM[1:0] value is 01_B or 10_B: In channel reset mode
- When the CFE bit in the RSCANnCFCCk register is cleared to 0.

CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01_B or 10_B, and the factor selected by the CFIM bit in the RSCAN0CFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B, and the factor selected by the CFIM bit in the RSCAN0CFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCAN0CFCCk register.

The CFFLL flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCAN0CFCCk register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01_B: A value of FF_H has been written to the RSCAN0CFPCTRk register after data was written to the RSCAN0CFIDk, RSCAN0CFPTRk, RSCAN0CFDF0k, and RSCAN0CFDF1k registers.

NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

22.3.33 RSCAN0CFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 8)

Access: RSCAN0CFPCTRk register can only be written in 32-bit units
RSCAN0CFPCTRkL register is a write-only register that can only be written in 16-bit units
RSCAN0CFPCTRkLL register is a write-only register that can only be written in 8-bit units

Address: RSCAN0CFPCTRk: <RSCAN0_base> + $01D8_H$ + (04_H × k)

RSCAN0CFPCTRkL: <RSCAN0_base> + $01D8_H$ + (04_H × k)

RSCAN0CFPCTRkLL: <RSCAN0_base> + $01D8_H$ + (04_H × k)

Value after reset: $0000\ 0000_H$

Table 22.49 RSCAN0CFPCTRk Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	CFPC[7:0]	Transmit/Receive FIFO Pointer Control • Receive mode: Writing FF_H to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. • Transmit mode: Writing FF_H to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer. • Gateway mode: Setting prohibited

CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCAN0CFCCk register is 00_B):
  Writing FF_H to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCAN0CFSTSk register is decremented by 1. Read the RSCAN0CFIDk, RSCAN0CFPTRk, RSCAN0CFDF0k, and RSCAN0CFDF1k registers to read messages from the transmit/receive FIFO buffer, and then write FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCAN0CFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCAN0CFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).
- Transmit mode (CFM[1:0] value in the RSCAN0CFCCk register is 01_B):
  Writing FF_H to the CFPC[7:0] bits stores the data written to the RSCAN0CFIDk, RSCAN0CFPTRk, RSCAN0CFDF0k, and RSCAN0CFDF1k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented by 1. Write transmit messages to the

RSCAN0CFIDk, RSCAN0CFPTRk, RSCAN0CFDF0k, and RSCAN0CFDF1k registers before writing FF_H to the CFPC[7:0] bits.
When writing FF_H to these bits, make sure that the CFE bit in the RSCAN0CFCCk register is set to 1 and the CFFLL flag in the RSCAN0CFSTSk register is 0 (the transmit/receive FIFO buffer is not full).

- Gateway mode (CFM[1:0] value in the RSCAN0CFCCk register is 10_B):
  Setting prohibited

22.3.34 RSCAN0CFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 8)

Access: RSCAN0CFIDk register can be read/written in 32-bit units
RSCAN0CFIDkL, RSCAN0CFIDkH registers can be read/written in 16-bit units
RSCAN0CFIDkLL, RSCAN0CFIDkLH, RSCAN0CFIDkHL, RSCAN0CFIDkHH registers can be read/written in 8-bit units

Address: RSCAN0CFIDk: <RSCAN0_base> + $0E80_H$ + (10_H × k)

RSCAN0CFIDkL: <RSCAN0_base> + $0E80_H$ + (10_H × k),
RSCAN0CFIDkH: <RSCAN0_base> + $0E82_H$ + (10_H × k)

RSCAN0CFIDkLL: <RSCAN0_base> + $0E80_H$ + (10_H × k),

Table 22.50 RSCAN0CFIDk Register Contents

Bit Position	Bit Name	Function
31	CFIDE	Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	CFRTR	Transmit/Receive FIFO Buffer RTR 0: Data frame 1: Remote frame
29	THLEN	Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01_B (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	CFID[28:0]	Transmit/Receive FIFO Buffer ID Data • When CFM[1:0] value is 01_B (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. • When CFM[1:0] value is 00_B (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0.

This register is writable only when the CFM[1:0] value in the RSCAN0CFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This RSCAN0CFIDk register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, these bits are used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

CFRTR Bit

This bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, and buffer type) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01_B (transmit mode).

CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

When the CFM[1:0] value is 01_B, this bit is used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

22.3.35 RSCAN0CFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 8)

Access: RSCAN0CFPTRk register can be read/written in 32-bit units
RSCAN0CFPTRkL, RSCAN0CFPTRkH registers can be read/written in 16-bit units
RSCAN0CFPTRkLL, RSCAN0CFPTRkLH, RSCAN0CFPTRkHL, RSCAN0CFPTRkHH registers can be read/written in 8-bit units

Address: RSCAN0CFPTRk: <RSCAN0_base> + $0E84_H$ + (10_H × k)

RSCAN0CFPTRkL: <RSCAN0_base> + $0E84_H$ + (10_H × k),
RSCAN0CFPTRkH: <RSCAN0_base> + $0E86_H$ + (10_H × k)

RSCAN0CFPTRkLL: <RSCAN0_base> + $0E84_H$ + (10_H × k),
RSCAN0CFPTRkLH: <RSCAN0_base> + $0E85_H$ + (10_H × k),
RSCAN0CFPTRkHL: <RSCAN0_base> + $0E86_H$ + (10_H × k),
RSCAN0CFPTRkHH: <RSCAN0_base> + $0E87_H$ + (10_H × k)

Value after reset: $0000\ 0000_H$

Table 22.51 RSCAN0CFPTRk Register Contents

Bit Position	Bit Name	Function
31 to 28	CFDLC[3:0]	Transmit/Receive FIFO Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	CFPTR[11:0]	Transmit/Receive FIFO Buffer Label Data • When CFM[1:0] value is 01_B (transmit mode): Set the label information to be stored in the transmit history buffer. Only bits CFPTR[7:0] are valid. • When CFM[1:0] value is 00_B (receive mode): The label information of the received message can be read.
15 to 0	CFTS[15:0]	Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is 00_B (receive mode). The timestamp value of the received message can be read.

This register is writable only when the CFM[1:0] value in the RSCAN0CFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer. If the data length is set to 9 bytes or more, the actual transmit data defaults to 8 bytes.

CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.

These bits are valid when the CFM[1:0] value is 00_B.

22.3.36 RSCAN0CFDF0k — Transmit/receive FIFO Buffer Access Data Field 0 Register (k = 0 to 8)

Access: RSCAN0CFDF0k register can be read/written in 32-bit units
RSCAN0CFDF0kL, RSCAN0CFDF0kH registers can be read/written in 16-bit units
RSCAN0CFDF0kLL, RSCAN0CFDF0kLH, RSCAN0CFDF0kHL, RSCAN0CFDF0kHH registers can be read/written in 8-bit units

Address: RSCAN0CFDF0k: <RSCAN0_base> + $0E88_H$ + (10_H × k)

RSCAN0CFDF0kL: <RSCAN0_base> + $0E88_H$ + (10_H × k),

Table 22.54 RSCAN0FESTS Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	These bits are read as the value after reset.
16	CF8EMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: Transmit/receive FIFO buffer k contains a message. 1: Transmit/receive FIFO buffer k contains no message. (k = 0 to 8)
15	CF7EMP	
14	CF6EMP	
13	CF5EMP	
12	CF4EMP	
11	CF3EMP	
10	CF2EMP	
9	CF1EMP	
8	CF0EMP	
7	RF7EMP	Receive FIFO Buffer Empty Status Flag 0: Receive FIFO buffer x contains an unread message. 1: Receive FIFO buffer x contains no unread message (buffer empty). (x = 0 to 7)
6	RF6EMP	
5	RF5EMP	
4	RF4EMP	
3	RF3EMP	
2	RF2EMP	
1	RF1EMP	
0	RF0EMP	

The RSCAN0FESTS register is set to $03FF\ FFFF_H$ in global reset mode.

CFkEMP Flag (k = 0 to 8)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCAN0CFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCAN0RFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

22.3.39 RSCAN0FFSTS — FIFO Full Status Register

Access: RSCAN0FFSTS register can be read only in 32-bit units
RSCAN0FFSTSL, RSCAN0FFSTSH registers can be read only in 16-bit units
RSCAN0FFSTSLL, RSCAN0FFSTSLH, RSCAN0FFSTSHL registers can be read only in 8-bit units

Address: RSCAN0FFSTS: <RSCAN0_base> + $023C_H$

RSCAN0FFSTSL: <RSCAN0_base> + $023C_H$,
RSCAN0FFSTSH: <RSCAN0_base> + $023E_H$

RSCAN0FFSTSLL: <RSCAN0_base> + $023C_H$,
RSCAN0FFSTSLH: <RSCAN0_base> + $023D_H$,
RSCAN0FFSTSHL: <RSCAN0_base> + $023E_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CF8FLL

7	RF7FLL	Receive FIFO Buffer Full Status Flag 0: Receive FIFO buffer x is not full. 1: Receive FIFO buffer x is full. (x = 0 to 7)
6	RF6FLL	
5	RF5FLL	
4	RF4FLL	
3	RF3FLL	
2	RF2FLL	
1	RF1FLL	
0	RF0FLL	

The RSCAN0FFSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkFLL Flag (k = 0 to 8)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCAN0CFSTSk register is set to 1 (the transmit/receive FIFO buffer is full). When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCAN0RFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

22.3.40 RSCAN0FMSTS — FIFO Message Lost Status Register

Access: RSCAN0FMSTS register can be read only in 32-bit units
RSCAN0FMSTSL, RSCAN0FMSTSH registers can be read only in 16-bit units
RSCAN0FMSTSLL, RSCAN0FMSTSLH, RSCAN0FMSTSHL registers can be read only in 8-bit units

Address: RSCAN0FMSTS: <RSCAN0_base> + 0240_H

RSCAN0FMSTSL: <RSCAN0_base> + 0240_H,
RSCAN0FMSTSH: <RSCAN0_base> + 0242_H

RSCAN0FMSTSLL: <RSCAN0_base> + 0240_H,
RSCAN0FMSTSLH: <RSCAN0_base> + 0241_H,
RSCAN0FMSTSHL: <RSCAN0_base> + 0242_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

8	CF0MLT	
7	RF7MLT	Receive FIFO Buffer Message Lost Status Flag 0: No receive FIFO buffer x message is lost. 1: A receive FIFO buffer x message is lost. (x = 0 to 7)
6	RF6MLT	
5	RF5MLT	
4	RF4MLT	
3	RF3MLT	
2	RF2MLT	
1	RF1MLT	
0	RF0MLT	

The RSCAN0FMSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkMLT Flag (k = 0 to 8)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCAN0CFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCAN0RFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

22.3.41 RSCAN0RFISTS — Receive FIFO Buffer Interrupt Flag Status Register

Access: RSCAN0RFISTS register can be read only in 32-bit units
RSCAN0RFISTSL register is a read-only register that can be read only in 16-bit units
RSCAN0RFISTSLL register is a read-only register that can be read only in 8-bit units

Address: RSCAN0RFISTS: <RSCAN0_base> + 0244_H

RSCAN0RFISTSL: <RSCAN0_base> + 0244_H

RSCAN0RFISTSLL: <RSCAN0_base> + 0244_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	RF7IF	RF6IF	RF5IF	RF4IF	RF3IF	RF2IF	RF1IF	RF0IF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 22.57 RSCAN0RFISTS Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	These bits are read as the value after reset.
7	RF7IF	Receive FIFO Buffer Interrupt Request Status Flag 0: No receive FIFO buffer x interrupt request is present. 1: A receive FIFO buffer x interrupt request is present. (x = 0 to 7)
6	RF6IF	
5	RF5IF	
4	RF4IF	
3	RF3IF	
2	RF2IF	
1	RF1IF	
0	RF0IF	

The RSCAN0RFISTS register is cleared to $0000\ 0000_H$ in global reset mode.

RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCAN0RFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

22.3.42 RSCAN0CFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

Access: RSCAN0CFRISTS register can be read only in 32-bit units
RSCAN0CFRISTSL register can be read only in 16-bit units
RSCAN0CFRISTSLL, RSCAN0CFRISTSLH registers can be read only in 8-bit units

Address: RSCAN0CFRISTS: <RSCAN0_base> + 0248_H

RSCAN0CFRISTSL: <RSCAN0_base> + 0248_H

RSCAN0CFRISTSLL: <RSCAN0_base> + 0248_H,
RSCAN0CFRISTSLH: <RSCAN0_base> + 0249_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 22.58 RSCAN0CFRISTS Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset.
8	CF8RXIF	Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k receive interrupt request is present. 1: A transmit/receive FIFO buffer k receive interrupt request is present. (k = 0 to 8)
7	CF7RXIF	
6	CF6RXIF	
5	CF5RXIF	
4	CF4RXIF	
3	CF3RXIF	
2	CF2RXIF	
1	CF1RXIF	
0	CF0RXIF	

The RSCAN0CFRISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkRXIF Flag (k = 0 to 8)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCAN0CFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

22.3.43 RSCAN0CFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

Access: RSCAN0CFTISTS register can be read only in 32-bit units
RSCAN0CFTISTSL register can be read only in 16-bit units
RSCAN0CFTISTSLL, RSCAN0CFTISTSLH registers can be the read-only in 8-bit units

Address: RSCAN0CFTISTS: <RSCAN0_base> + $024C_H$

RSCAN0CFTISTSL: <RSCAN0_base> + $024C_H$

RSCAN0CFTISTSLL: <RSCAN0_base> + $024C_H$,
RSCAN0CFTISTSLH: <RSCAN0_base> + $024D_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CF8TXIF	CF7TXIF	CF6TXIF	CF5TXIF	CF4TXIF	CF3TXIF	CF2TXIF	CF1TXIF	CF0TXIF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 22.59 RSCAN0CFTISTS Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset.
8	CF8TXIF	Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k transmit interrupt request is present. 1: A transmit/receive FIFO buffer k transmit interrupt request is present. (k = 0 to 8)
7	CF7TXIF	
6	CF6TXIF	
5	CF5TXIF	
4	CF4TXIF	
3	CF3TXIF	
2	CF2TXIF	
1	CF1TXIF	
0	CF0TXIF	

The RSCAN0CFTISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkTXIF Flag (k = 0 to 8)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCAN0CFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

22.3.44 RSCAN0TMCp — Transmit Buffer Control Register (p = 0 to 47)

Access: RSCAN0TMCp register can be read/written in 8-bit units

Address: RSCAN0TMCp: <RSCAN0_base> + 0250_H + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W*1	R/W*1

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

Table 22.60 RSCAN0TMCp Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	TMOM	One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled.
1	TMTAR	Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested.
0	TMTR	Transmit Request 0: Transmission is not requested. 1: Transmission is requested.

When the RSCAN0TMCp register meets any of the following conditions, set it to 00_H.

- The RSCAN0TMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCAN0CFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCAN0TMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCAN0TXQCCm (m = 0 to 2) register (p = (m × 16 + 15) to (m × 16 + 15 – the value of TXQDC[3:0] bits)).

Bits in the RSCAN0TMCp register are all cleared to 0 in channel reset mode. Modify the RSCAN0TMCp register in channel communication mode or channel halt mode.

TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCAN0TMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration-lost has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCAN0TMSTSp register is 00_B.

22.3.45 RSCAN0TMSTSp — Transmit Buffer Status Register (p = 0 to 47)

Access: RSCAN0TMSTSp register can be read/written in 8-bit units

Address: RSCAN0TMSTSp: <RSCAN0_base> + $02D0_H$ + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R

Table 22.61 RSCAN0TMSTSp Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4	TMTARM	Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present.
3	TMTRM	Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present.
2, 1	TMTRF[1:0]	Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request).
0	TMTSTS	Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress.

The RSCAN0TMSTSp register is cleared to all 0 in channel reset mode.

TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCAN0TMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCAN0TMCp register is set to 0.

TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCAN0TMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCAN0TMCp register is set to 0.

TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00_B: Transmission is in progress or no transmit request is present.

01_B: Transmission from the transmit buffer was aborted.

10_B: Transmission has been completed with the TMTAR bit in the RSCAN0TMCp register set to 0 (transmit abort is not requested).

11_B: Transmission has been completed with the TMTAR bit in the RSCAN0TMCp register set to 1 (transmit abort is requested).

Write 00_B to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00_B to this flag.

TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

22.3.46 RSCAN0TMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0, 1)

Access: RSCAN0TMTRSTSy register can be read only in 32-bit units
RSCAN0TMTRSTSyL, RSCAN0TMTRSTSyH registers can be read only in 16-bit units
RSCAN0TMTRSTSyLL, RSCAN0TMTRSTSyLH, RSCAN0TMTRSTSyHL, RSCAN0TMTRSTSyHH registers can be read only in 8-bit units

Address: RSCAN0TMTRSTSy: <RSCAN0_base> + 0350_H + (04_H × y)

RSCAN0TMTRSTSyL: <RSCAN0_base> + 0350_H + (04_H × y),
RSCAN0TMTRSTSyH: <RSCAN0_base> + 0352_H + (04_H × y)

RSCAN0TMTRSTSyLL: <RSCAN0_base> + 0350_H + (04_H × y),
RSCAN0TMTRSTSyLH: <RSCAN0_base> + 0351_H + (04_H × y),
RSCAN0TMTRSTSyHL: <RSCAN0_base> + 0352_H + (04_H × y),
RSCAN0TMTRSTSyHH: <RSCAN0_base> + 0353_H + (04_H × y)

Value after reset: $0000\ 0000_H$

Table 22.62 RSCAN0TMTRSTSy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit request is present. 1: A transmit request is present.
15 to 0	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit request is present. 1: A transmit request is present.

TMTRSTSp Flags (p = 0 to 47)

These flags indicate the status of the TMTR bit in the RSCAN0TMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 22.63 shows the bit assignment.

Bit Position	Bit Name	Function
31 to 16	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 31 to y × 32 + 16) 0: Transmit buffer interrupt is disabled 1: Transmit buffer interrupt is enabled
15 to 0	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled.

TMIEp Bits (p = 0 to 47)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCAN0TMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

Table 22.71 shows the bit assignment.

Table 22.72 RSCAN0TMIDp Register Contents

Bit Position	Bit Name	Function
31	TMIDE	Transmit Buffer IDE 0: Standard ID 1: Extended ID
30	TMRTR	Transmit Buffer RTR 0: Data frame 1: Remote frame
29	THLEN	Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	TMID[28:0]	Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.

Modify this register when the TMTRM bit in the corresponding RSCAN0TMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

THLEN Bit

With this bit set to 1, the transmit history data of the message transmitted (label information and the number and type) are stored in the transmit history buffer after transmission is completed.

TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

22.3.52 RSCAN0TMPTRp — Transmit Buffer Pointer Register (p= 0 to 47)

Access: RSCAN0TMPTRp register can be read/written in 32-bit units
RSCAN0TMPTRpH register can be read/written in 16-bit units
RSCAN0TMPTRpHL, RSCAN0TMPTRpHH registers can be read/written in 8-bit units

Address: RSCAN0TMPTRp: <RSCAN0_base> + 1004_H + (10_H × p)

RSCAN0TMPTRpH: <RSCAN0_base> + 1006_H + (10_H × p)

RSCAN0TMPTRpHL: <RSCAN0_base> + 1006_H + (10_H × p),
RSCAN0TMPTRpHH: <RSCAN0_base> + 1007_H + (10_H × p)

Value after reset: 0000 0000_H

Table 22.73 RSCAN0TMPTRp Register Contents

Bit Position	Bit Name	Function
31 to 28	TMDLC[3:0]	Transmit Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 24	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
23 to 16	TMPTR[7:0]	Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer.
15 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Modify this register when the TMTRM bit in the corresponding RSCAN0TMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCAN0TMIDp register is set to 0 (data frame). If the data length is set to 9 bytes or more, the transmit data is 8 bytes long.

When the TMRTR bit is set to 1 (remote frame), set the data length of messages to be requested.

TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

22.3.53 RSCAN0TMDF0p — Transmit Buffer Data Field 0 Register (p = 0 to 47)

Access: RSCAN0TMDF0p register can be read/written in 32-bit units
RSCAN0TMDF0pL, RSCAN0TMDF0pH registers can be read/written in 16-bit units
RSCAN0TMDF0pLL, RSCAN0TMDF0pLH, RSCAN0TMDF0pHL, RSCAN0TMDF0pHH registers can be read/written in 8-bit units

Table 22.74 RSCAN0TMDF0p Register Contents

Bit Position	Bit Name	Function
31 to 24	TMDB3[7:0]	Transmit Buffer Data Byte 3 Transmit Buffer Data Byte 2 Transmit Buffer Data Byte 1 Transmit Buffer Data Byte 0 Set the transmit buffer data.
23 to 16	TMDB2[7:0]	
15 to 8	TMDB1[7:0]	
7 to 0	TMDB0[7:0]	

Modify this register when the TMTRM bit in the corresponding RSCAN0TMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

22.3.54 RSCAN0TMDF1p — Transmit Buffer Data Field 1 Register (p = 0 to 47)

Access: RSCAN0TMDF1p register can be read/written in 32-bit units
RSCAN0TMDF1pL, RSCAN0TMDF1pH registers can be read/written in 16-bit units
RSCAN0TMDF1pLL, RSCAN0TMDF1pLH, RSCAN0TMDF1pHL, RSCAN0TMDF1pHH registers can be read/written in 8-bit units

Address: RSCAN0TMDF1p: <RSCAN0_base> + $100C_H$ + (10_H × p)

RSCAN0TMDF1pL: <RSCAN0_base> + $100C_H$ + (10_H × p),
RSCAN0TMDF1pH: <RSCAN0_base> + $100E_H$ + (10_H × p)

RSCAN0TMDF1pLL: <RSCAN0_base> + $100C_H$ + (10_H × p),
RSCAN0TMDF1pLH: <RSCAN0_base> + $100D_H$ + (10_H × p),
RSCAN0TMDF1pHL: <RSCAN0_base> + $100E_H$ + (10_H × p),
RSCAN0TMDF1pHH: <RSCAN0_base> + $100F_H$ + (10_H × p)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 22.75 RSCAN0TMDF1p Register Contents

Bit Position	Bit Name	Function
31 to 24	TMDB7[7:0]	Transmit Buffer Data Byte 7
23 to 16	TMDB6[7:0]	Transmit Buffer Data Byte 6
15 to 8	TMDB5[7:0]	Transmit Buffer Data Byte 5
7 to 0	TMDB4[7:0]	Transmit Buffer Data Byte 4 Set the transmit buffer data.

Modify this register when the TMTRM bit in the corresponding RSCAN0TMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

22.3.55 RSCAN0TXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 2)

Access: RSCAN0TXQCCm register can be read/written in 32-bit units
RSCAN0TXQCCmL register can be read/written in 16-bit units
RSCAN0TXQCCmLL, RSCAN0TXQCCmLH registers can be read/written in 8-bit units

Address: RSCAN0TXQCCm: <RSCAN0_base> + $03A0_H$ + (04_H × m)

RSCAN0TXQCCmL: <RSCAN0_base> + $03A0_H$ + (04_H × m)

RSCAN0TXQCCmLL: <RSCAN0_base> + $03A0_H$ + (04_H × m),
RSCAN0TXQCCmLH: <RSCAN0_base> + $03A1_H$ + (04_H × m)

Value after reset: $0000\ 0000_H$

Table 22.76 RSCAN0TXQCCm Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
13	TXQIM	Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted.
12	TXQIE	Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled.
11 to 8	TXQDC[3:0]	Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 15) makes the (g + 1) transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited.
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	TXQE	Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used.

TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQIE bit.

TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0). For examples of how buffer allocation is done, see **Figure 22.9**. Modify these bits only in channel reset mode.

TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010_B or more.

22.3.56 RSCAN0TXQSTSm — Transmit Queue Status Register (m = 0 to 2)

Access: RSCAN0TXQSTSm register can be read/written in 32-bit units
RSCAN0TXQSTSmL register can be read/written in 16-bit units
RSCAN0TXQSTSmLL register can be read/written in 8-bit units

Address: RSCAN0TXQSTSm: <RSCAN0_base> + $03C0_H$ + (04_H × m)

RSCAN0TXQSTSmL: <RSCAN0_base> + $03C0_H$ + (04_H × m)

RSCAN0TXQSTSmLL: <RSCAN0_base> + $03C0_H$ + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQIF	TXQFLL	TXQEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 22.77 RSCAN0TXQSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
12 to 8	Reserved	When read, an undefined value is returned. When writing these bits, write “0”.
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	TXQIF	Transmit Queue Interrupt Request Flag 0: No transmit queue interrupt request is present. 1: A transmit queue interrupt request is present.
1	TXQFLL	Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full.
0	TXQEMP	Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty).

TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCAN0TXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCAN0TXQCCm register to 0 (the transmit queue is not used).

TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCAN0TXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

22.3.57 RSCAN0TXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 2)

Access: RSCAN0TXQPCTRm registers can only be written in 32-bit units
RSCAN0TXQPCTRmL register is a write-only register that can only be written in 16-bit units
RSCAN0TXQPCTRmLL register is a write-only register that can only be written in 8-bit units

Address: RSCAN0TXQPCTRm: <RSCAN0_base> + $03E0_H$ + (04_H × m)

RSCAN0TXQPCTRmL: <RSCAN0_base> + $03E0_H$ + (04_H × m)

RSCAN0TXQPCTRmLL: <RSCAN0_base> + $03E0_H$ + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TXQPC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 22.78 RSCAN0TXQPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	TXQPC[7:0]	Transmit Queue Pointer Control Writing FF_H to these bits moves the write pointer of the transmit queue to the next queue buffer.

TXQPC[7:0] Bits

Writing FF_H to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCAN0TMIDp, RSCAN0TMPTRp, RSCAN0TMDF0p, and RSCAN0TMDF1p registers (p = 15, 31, and 47) before writing FF_H to the TXQPC[7:0] bits.

When writing FF_H to these bits, make sure that the TXQE bit in the RSCAN0TXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCAN0TXQSTSm register is 0 (he transmit queue is not full).

22.3.58 RSCAN0THLCCm — Transmit History Configuration and Control Register (m = 0 to 2)

Access: RSCAN0THLCCm register can be read/written in 32-bit units
RSCAN0THLCCmL register can be read/written in 16-bit units
RSCAN0THLCCmLL, RSCAN0THLCCmLH registers can be read/written in 8-bit units

Address: RSCAN0THLCCm: <RSCAN0_base> + 0400_H + (04_H × m)

RSCAN0THLCCmL: <RSCAN0_base> + 0400_H + (04_H × m)

RSCAN0THLCCmLL: <RSCAN0_base> + 0400_H + (04_H × m),
RSCAN0THLCCmLH: <RSCAN0_base> + 0401_H + (04_H × m)

Value after reset: $0000\ 0000_H$

R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W

Table 22.79 RSCAN0THLCCm Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
10	THLDTE	Transmit History Target Buffer Select 0: Entry from transmit/receive FIFO buffers and transmit queue 1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue
9	THLIM	Transmit History Interrupt Source Select 0: When 12 sets of data have been stored in the transmit history buffer 1: When a single set of transmit history data has been stored
8	THLIE	Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled.
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	THLE	Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used.

THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit set to 0.

THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.

This bit is cleared to 0 in cahnnel reset mode.

22.3.59 RSCAN0THLSTSm — Transmit History Status Register (m = 0 to 2)

Access: RSCAN0THLSTSm register can be read/written in 32-bit units
RSCAN0THLSTSmL register can be read/written in 16-bit units
RSCAN0THLSTSmLL register can be read/written in 8-bit units
RSCAN0THLSTSmLH register is a read-only register that can be read in 8-bit units

Address: RSCAN0THLSTSm: <RSCAN0_base> + 0420_H + (04_H × m)

RSCAN0THLSTSmL: <RSCAN0_base> + 0420_H + (04_H × m)

RSCAN0THLSTSmLL: <RSCAN0_base> + 0420_H + (04_H × m),
RSCAN0THLSTSmLH: <RSCAN0_base> + 0421_H + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	THLMC[4:0]					—	—	—	—	THLIF	THLELT	THLFLL	THLEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 22.80 RSCAN0THLSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
12 to 8	THLMC[4:0]	Transmit History Buffer Unread Data Counter These bits indicate the number of unread data sets stored in the transmit history buffer.
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	THLIF	Transmit History Interrupt Request Flag 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present.
2	THLELT	Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.
1	THLFLL	Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full.
0	THLEMP	Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).

THLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer.

These bits are cleared to 0 in cahnnel reset mode.

THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCAN0THLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCAN0THLCCm register is set to 0 (transmit history buffer is not used).

THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCAN0THLCCm register is set to 0 (transmit history buffer is not used).

NOTE

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

22.3.60 RSCAN0THLACCm — Transmit History Access Register (m = 0 to 2)

Access: RSCAN0THLACCm register can be read only in 32-bit units
RSCAN0THLACCmL register is a read-only register that can be read only in 16-bit units
RSCAN0THLACCmLL, RSCAN0THLACCmLH registers are the read-only in 8-bit units

Address: RSCAN0THLACCm: <RSCAN0_base> + 1800_H + (04_H × m)

RSCAN0THLACCmL: <RSCAN0_base> + 1800_H + (04_H × m)

RSCAN0THLACCmLL: <RSCAN0_base> + 1800_H + (04_H × m),
RSCAN0THLACCmLH: <RSCAN0_base> + 1801_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Table 22.81 RSCAN0THLACCm Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 8	TID[7:0]	Label Data The label information of stored data can be read.
7	Reserved	When read, the value after reset is returned.
6 to 3	BN[3:0]	Buffer Number Data The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read.
2 to 0	BT[2:0]	Buffer Type Data b2 b1 b0 0 0 1: Transmit buffer 0 1 0: Transmit/receive FIFO buffer 1 0 0: Transmit queue

TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

22.3.61 RSCAN0THLPCTRm — Transmit History Pointer Control Register (m = 0 to 2)

Access: RSCAN0THLPCTRm register can only be written in 32-bit units
RSCAN0THLPCTRmL register is a write-only register that can only be written in 16-bit units
RSCAN0THLPCTRmLL register is a write-only register that can only be written in 8-bit units

Address: RSCAN0THLPCTRm: <RSCAN0_base> + 0440_H + (04_H × m)

RSCAN0THLPCTRmL: <RSCAN0_base> + 0440_H + (04_H × m)

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 22.82 RSCAN0THLPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write the value after reset.
7 to 0	THLPC[7:0]	Transmit History List Pointer Control Writing FF_H to these bits moves the read pointer to the next unread data in the transmit history buffer.

THLPC[7:0] Bits

When the THLPC[7:0] bits are set to FF_H, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCAN0THLSTSm register is decremented. Write FF_H to the THLPC[7:0] bits after reading from the RSCAN0THLACCm register.

When writing FF_H to these bits, make sure that the THLE bit in the RSCAN0THLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCAN0THLSTSm register is 0.

22.3.62 RSCAN0GTSTCFG — Global Test Configuration Register

Access: RSCAN0GTSTCFG register can be read/written in 32-bit units
RSCAN0GTSTCFGL, RSCAN0GTSTCFGH registers can be read/written in 16-bit units
RSCAN0GTSTCFGLL, RSCAN0GTSTCFGHL registers can be read/written in 8-bit units

Address: RSCAN0GTSTCFG: <RSCAN0_base> + 0468_H

RSCAN0GTSTCFGL: <RSCAN0_base> + 0468_H,
RSCAN0GTSTCFGH: <RSCAN0_base> + $046A_H$

RSCAN0GTSTCFGLL: <RSCAN0_base> + 0468_H,
RSCAN0GTSTCFGHL: <RSCAN0_base> + $046A_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 22.83 RSCAN0GTSTCFG Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
22 to 16	RTMPS[6:0]	RAM Test Page Configuration Set a value within a range of page 0 (00_H) to page 29 ($1D_H$).
15 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	C2ICBCE	CAN2 Inter-channel Communication Test Enable 0: RSCAN2 inter-channel communication test is disabled 1: RSCAN2 inter-channel communication test is enabled.
1	C1ICBCE	CAN1 Inter-Channel Communication Test Enable 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled.
0	C0ICBCE	CAN0 Inter-Channel Communication Test Enable 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled.

Modify the RSCAN0GTSTCFG register only in global test mode.

RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00_H to $1D_H$, inclusive.

Do not access more than 160 bytes in the last page (RTMPS[6:0] = $1D_H$) during RAM test.

C2ICBCE Bit

Setting this bit to 1 enables the channel 2 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

22.3.63 RSCAN0GTSTCTR — Global Test Control Register

Access: RSCAN0GTSTCTR register can be read/written in 32-bit units
RSCAN0GTSTCTRL register can be read/written in 16-bit units
RSCAN0GTSTCTRLL register can be read/written in 8-bit units

Address: RSCAN0GTSTCTR: <RSCAN0_base> + $046C_H$

RSCAN0GTSTCTRL: <RSCAN0_base> + $046C_H$

RSCAN0GTSTCTRLL: <RSCAN0_base> + $046C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 22.84 RSCAN0GTSTCTR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	RTME	RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled.
1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	ICBCTME	Communication Test between Channels Enable 0: Communication test between channels disabled 1: Communication test between channels enabled

RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.

This bit is cleared to 0 in global reset mode.

1. Set the GMDC[1:0] bits in the RSCAN0GCTR register to 10_B (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0 to 2) in the RSCAN0GTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.

This bit is cleared to 0 in global reset mode.

22.3.64 RSCAN0GLOCKK — Global Lock Key Register

Access: RSCAN0GLOCKK register can be written only in 32-bit units.
RSCAN0GLOCKKL register is a write-only register that can be written only in 16-bit units.

Address: RSCAN0GLOCKK: <RSCAN0_base> + $047C_H$

RSCAN0GLOCKKL: <RSCAN0_base> + $047C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LOCK[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1

Note 1. Writing to these bits is effective only when the RSCAN module is in global test mode.

Table 22.85 RSCAN0GLOCKK Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When writing these bits, write the value after reset.
15 to 0	LOCK[15:0]	Lock Key These bits are key bits to release protection of test mode.

The RSCAN0GLOCKK register releases protection of special test bits and is write only.

For the protection release data, see Section 22.10.4.2, Procedure for Releasing the Protection.

LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCAN0GTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCAN0_base> + 0000_H to <RSCAN0_base> + $04FF_H$) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/wring to other areas does not enable the protection.

22.3.65 RSCAN0RPGACCr — RAM Test Page Access Register (r = 0 to 63)

Access: RSCAN0RPGACCr register can be read/written in 32-bit units
RSCAN0RPGACCrL, RSCAN0RPGACCrH registers can be read/written in 16-bit units
RSCAN0RPGACCrLL, RSCAN0RPGACCrLH, RSCAN0RPGACCrHL, RSCAN0RPGACCrHH registers can be read/written in 8-bit units

Address: RSCAN0RPGACCr: <RSCAN0_base> + 1900_H + (04_H × n)

RSCAN0RPGACCrL: <RSCAN0_base> + 1900_H + (04_H × n),
RSCAN0RPGACCrH: <RSCAN0_base> + 1902_H + (04_H × n)

RSCAN0RPGACCrLL: <RSCAN0_base> + 1900_H + (04_H × n),
RSCAN0RPGACCrLH: <RSCAN0_base> + 1901_H + (04_H × n),
RSCAN0RPGACCrHL: <RSCAN0_base> + 1902_H + (04_H × n),
RSCAN0RPGACCrHH: <RSCAN0_base> + 1903_H + (04_H × n)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 22.86 RSCAN0RPGACCr Register Contents

Bit Position	Bit Name	Function
31 to 0	RDTA [31:0]	RAM Data Test Access Data can be read and written in RSCAN RAM.

Modify the RSCAN0RPGACCr register in global test mode with the RTME bit in the RSCAN0GTSTCTR register set to 1 (RAM test is enabled).

The RSCAN0RPGACCr register is readable and writable when the RTME bit is set to 1.

22.4 Interrupt Sources

The RSCAN module has 11 interrupts that are grouped into global interrupts and channel interrupts.

- Global interrupts (2 sources):

  Receive FIFO interrupt

  Global error interrupt

- Channel interrupts (3 sources/channel):
  CANm transmit interrupt (m = 0 to 2)
  - CANm transmit complete interrupt
  - CANm transmit abort interrupt
  - CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode)
  - CANm transmit history interrupt
  - CANm transmit queue Interrupt

  CANm transmit/receive FIFO receive complete interrupt (in revceive mode, gateway mode)
  CANm error interrupt

When an interrupt request is generated, the corresponding interrupt request flag is set to 1 (interrupt request present). In that case, when the interrupt enable bit is set to 1 (enabling interrupts), an interrupt request is output from the RSCAN module. (Generation of interrupts also depends on the interrupt control register settings of the interrupt controller.)

Setting the interrupt request flag to 0 (no interrupt request present) or setting the interrupt enable bit to 0 (disabling interrupts) clears the current interrupt request. The current interrupt request is still output until the interrupt request flag is cleared.

Table 22.87 lists the CAN interrupt sources. **Figure 22.2** shows the CAN global interrupt block diagram. **Figure 22.3** shows the CAN channel interrupt block diagram.

Table 22.87 List of CAN Interrupt Sources (1/2)

Interrupt Source			Corresponding Interrupt Request Flag	Corresponding Interrupt Enable Bit
Global interrupts	Receive FIFO	Receive FIFO 0	RFIF in the RSCAN0RFSTS0 register	RFIE in the RSCAN0RFCC0 register
		Receive FIFO 1	RFIF in the RSCAN0RFSTS1 register	RFIE in the RSCAN0RFCC1 register
		Receive FIFO 2	RFIF in the RSCAN0RFSTS2 register	RFIE in the RSCAN0RFCC2 register
		Receive FIFO 3	RFIF in the RSCAN0RFSTS3 register	RFIE in the RSCAN0RFCC3 register
		Receive FIFO 4	RFIF in the RSCAN0RFSTS4 register	RFIE in the RSCAN0RFCC4 register
		Receive FIFO 5	RFIF in the RSCAN0RFSTS5 register	RFIE in the RSCAN0RFCC5 register
		Receive FIFO 6	RFIF in the RSCAN0RFSTS6 register	RFIE in the RSCAN0RFCC6 register
		Receive FIFO 7	RFIF in the RSCAN0RFSTS7 register	RFIE in the RSCAN0RFCC7 register
	Global error		• DEF in the RSCAN0GERFL register • MES in the RSCAN0GERFL register • THLES in the RSCAN0GERFL register	• DEIE in the RSCAN0GCTR register • MEIE in the RSCAN0GCTR register • THLEIE in the RSCAN0GCTR register

Table 22.87 List of CAN Interrupt Sources (2/2)

Interrupt Source			Corresponding Interrupt Request Flag	Corresponding Interrupt Enable Bit
Channel interrupts (m = 0 to 2)	CANm transmit	CANm transmit complete	TMTRF[1:0] in the RSCAN0TMSTSp register	TMIE in the RSCAN0TMIECy register
		CANm transmit abort	TMTRF[1:0] in the RSCAN0TMSTSp register	TAIE in the RSCAN0CmCTR register
		CANm transmit/receive FIFO transmit complete	CFTXIF in the RSCAN0CFSTSk register	CFTXIE in the RSCAN0CFCCk register
		CANm transmit queue	TXQIF in the RSCAN0TXQSTSm register	TXQIE in the RSCAN0TXQCCm register
		CANm transmit history	THLIF in the RSCAN0THLSTSm register	THLIE in the RSCAN0THLCCm register
	CANm transmit/receive FIFO receive complete		CFRXIF in the RSCAN0CFSTSk register	CFRXIE in the RSCAN0CFCCk register
	CANm error		• BEF in the RSCAN0CmERFL register • ALF in the RSCAN0CmERFL register • BLF in the RSCAN0CmERFL register • OVLF in the RSCAN0CmERFL register • BORF in the RSCAN0CmERFL register • BOEF in the RSCAN0CmERFL register • EPF in the RSCAN0CmERFL register • EWF in the RSCAN0CmERFL register	• BEIE in the RSCAN0CmCTR register • ALIE in the RSCAN0CmCTR register • BLIE in the RSCAN0CmCTR register • OLIE in the RSCAN0CmCTR register • BORIE in the RSCAN0CmCTR register • BOEIE in the RSCAN0CmCTR register • EPIE in the RSCAN0CmCTR register • EWIE in the RSCAN0CmCTR register

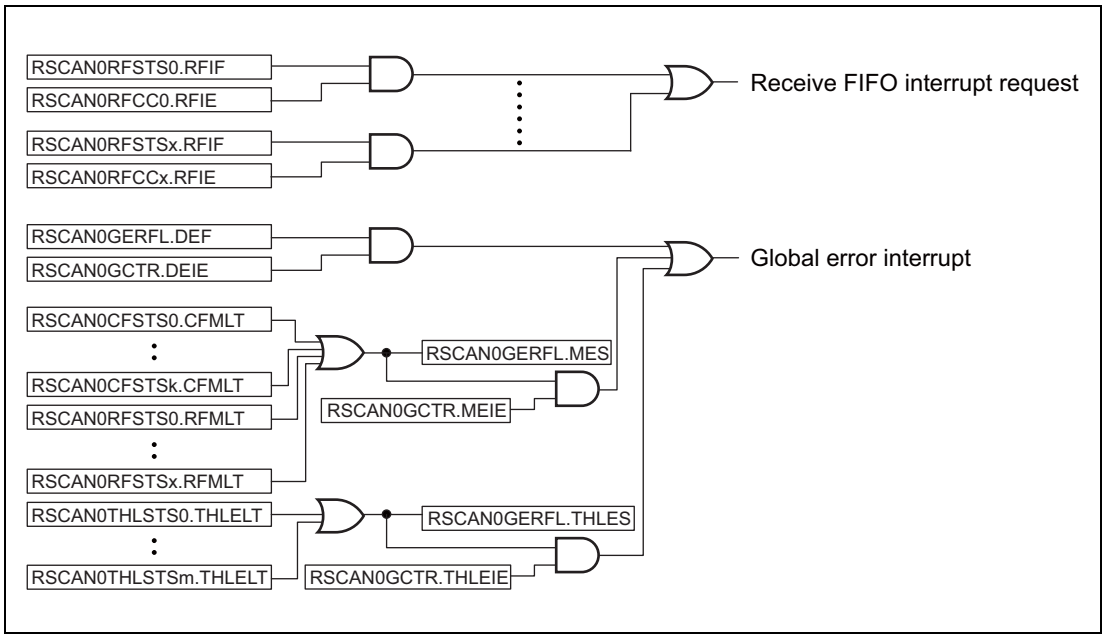

Figure 22.2 CAN Global Interrupt Block Diagram

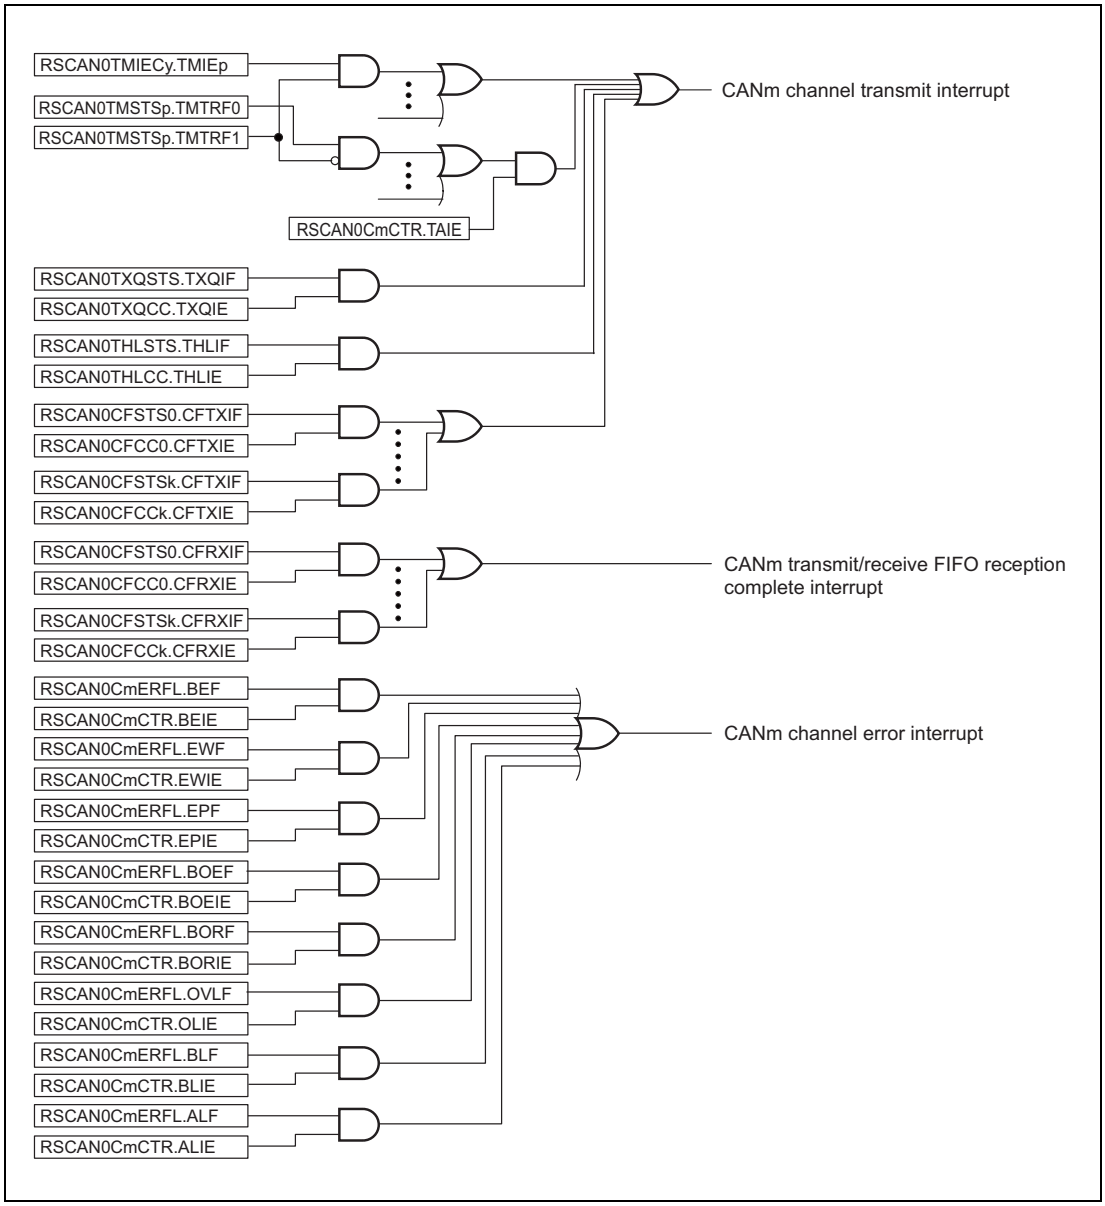

Figure 22.3 CAN Channel Interrupt Block Diagram

22.5 CAN Modes

The RSCAN module has four global modes to control the entire RSCAN module status and four channel modes to control individual channel status. Details of global modes are described in Section 22.5.1, Global Modes, and details of channel modes are described in Section 22.5.2, Channel Modes.

- Global stop mode: Stops the clocks of the entire module to achieve low power consumption.
- Global reset mode: Performs initial settings for the entire module.
- Global test mode: Performs test settings and performs the RAM test.
- Global operating mode: Makes the entire module operable.
- Channel stop mode: Stops the channel clock.
- Channel reset mode: Performs initial settings for the channels.
- Channel halt mode: Stops CAN communication and allows channel testing.
- Channel communication mode: Performs CAN communication.

22.5.1 Global Modes

Figure 22.4 shows the transitions of global modes.

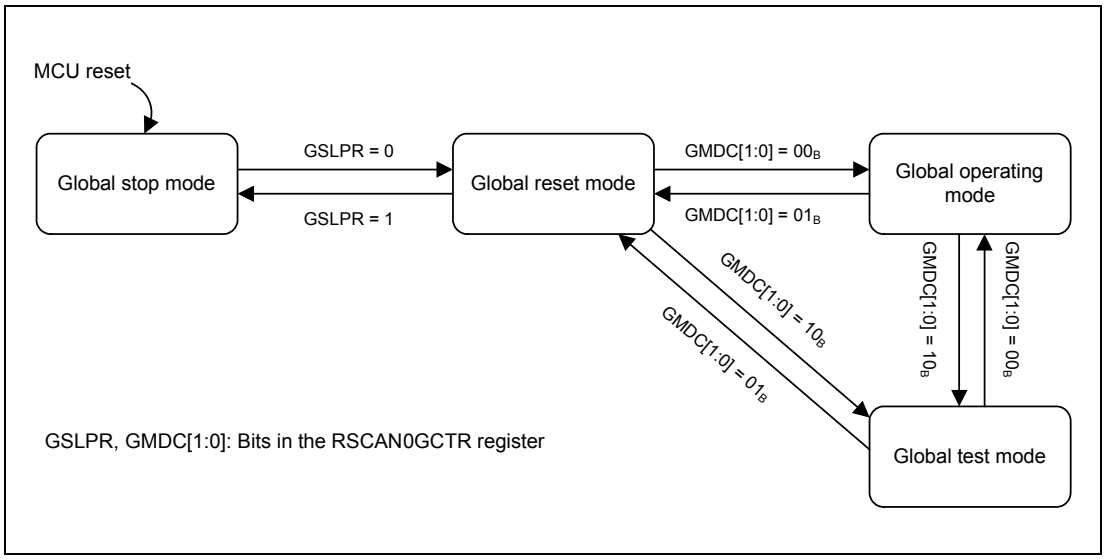

Figure 22.4 Transitions of Global Modes

In some cases, global mode transitions also force channel mode transitions. **Table 22.88** shows the channel mode transitions depending on the global mode setting dictated by the GMDC[1:0] bits and the GSLPR bit.

Table 22.88 Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)

Channel Mode before Setting	Channel Mode after Setting			
	GMDC[1:0] = 00_B GSLPR = 0 (Global Operation)	GMDC[1:0] = 10_B GSLPR = 0 (Global Test)	GMDC[1:0] = 01_B GSLPR = 0 (Global Reset)	GMDC[1:0] = 01_B GSLPR = 1 (Global Stop)
Channel communication	Channel communication	Channel halt	Channel reset	Transition prohibited
Channel halt	Channel halt	Channel halt	Channel reset	Transition prohibited
Channel reset	Channel reset	Channel reset	Channel reset	Channel stop
Channel stop	Channel stop	Channel stop	Channel stop	Channel stop

Note: GMDC[1:0], GSLPR: Bits in the RSCAN0GCTR register

Table 22.89 shows the global mode transition time.

Table 22.89 Global Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Global stop	Global reset	Three pclk cycles
Global reset	Global stop	Three pclk cycles
Global reset	Global test	Ten pclk cycles
Global reset	Global operating	Ten pclk cycles
Global test	Global reset	Two CANm bit times*1
Global test	Global operating	Three pclk cycles
Global operating	Global reset	Two CANm bit times*1
Global operating	Global test	Two CAN frames*1

Note 1. CAN frame time of the lowest communication speed of the channels in use

22.5.1.1 Global Stop Mode

In global stop mode, clocks of the CAN do not run and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained. Only the clock used by the CPU for writing to the GSLPR bit runs in this mode.

After the MCU is reset, the CAN module transitions to global stop mode. Setting the GSLPR bit in the RSCAN0GCTR register to 1 (in global stop mode) in global reset mode sets the CSLPR bit in each of the RSCAN0CmCTR register to 1 (channel stop mode). If all channels are forced to transition to channel stop mode, the CAN module transitions to global stop mode. The GSLPR bit should not be modified in global operating mode or global test mode.

22.5.1.2 Global Reset Mode

In global reset mode, RSCAN module settings are performed. When the RSCAN module transitions to global reset mode, some registers are initialized. **Table 22.92** and **Table 22.93** list the registers to be initialized.

Setting the GMDC[1:0] bits in the RSCAN0GCTR register to 01_B sets the CHMDC[1:0] bits in each of the RSCAN0CmCTR registers (m = 0 to 2) to 01_B (channel reset mode). If all channels are forced to transition to channel reset mode, the CAN module transitions to global reset mode. Channels that are already in channel reset mode or channel stop mode do not transition (because the CHMDC[1:0] bits have already been set to 01_B).

22.5.1.3 Global Test Mode

In global test mode, settings for test-related registers are performed. When the CAN module transitions to global test mode, all CAN communications are disabled.

Setting the GMDC[1:0] bits in the RSCAN0GCTR register to 10_B sets the CHMDC[1:0] bits in each of the RSCAN0CmCTR register to 10_B (channel halt mode). If all channels are forced to transition to channel halt mode, the CAN module transitions to global test mode. Channels that are in channel stop mode, channel reset mode, or channel halt mode do not transition.

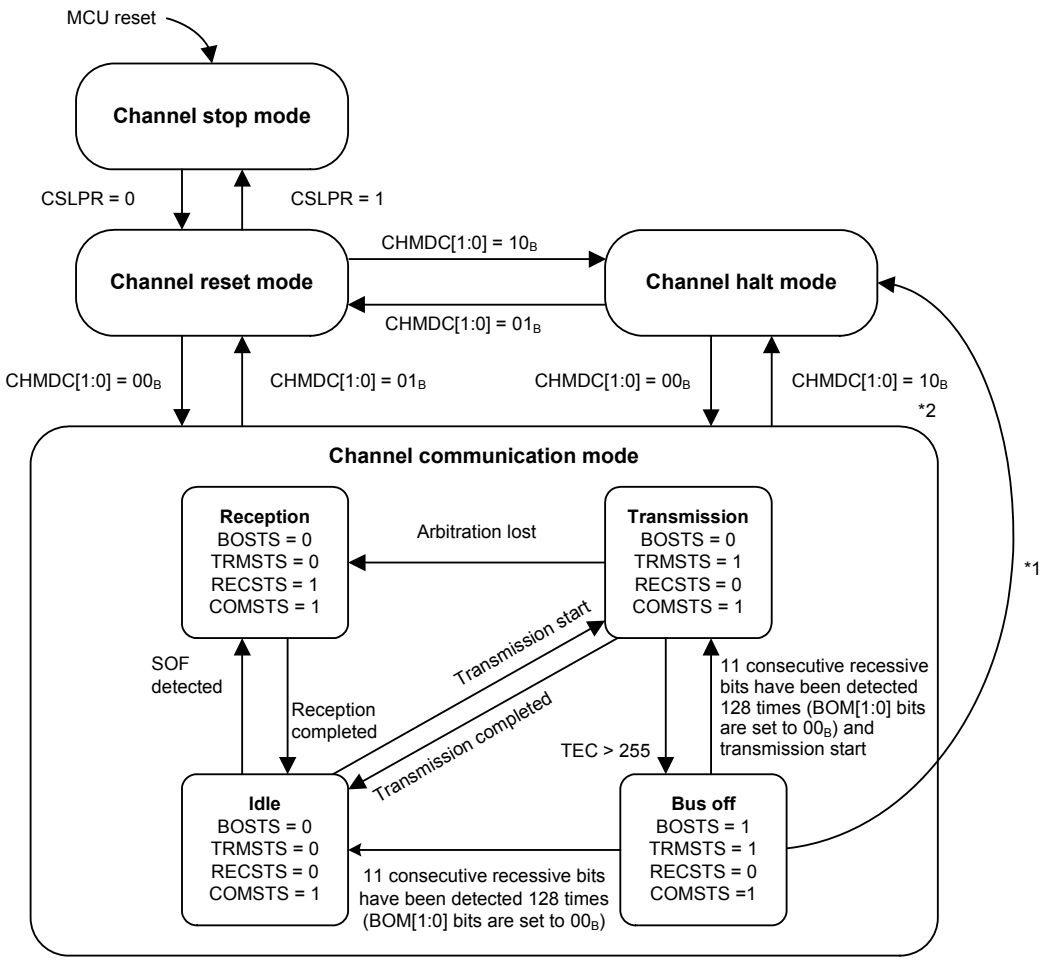
22.5.1.4 Global Operating Mode

The RSCAN module operates in global operating mode.

When the GMDC[1:0] bits in the RSCAN0GCTR register are set to 00_B, the RSCAN module transitions to global operating mode.

22.5.2 Channel Modes

Figure 22.5 shows a channel mode state transition chart. **Table 22.90** shows the channel mode transition time.



Note: CHMDC[1:0], CSLPR, BOM[1:0]: Bits in the RSCAN0CmCTR register (m = 0 to 2)
BOSTS, TRMSTS, RECSTS, COMSTS: Bits in the RSCAN0CmSTS register

Note 1. Timing of transition from bus off state to channel halt mode
- When BOM[1:0] = 01_B: Transition to channel halt mode when TEC exceeds 255
- When BOM[1:0] = 10_B: Transition to channel halt mode when 11 consecutive recessive bits have been detected 128 times
- When BOM[1:0] = 11_B: Transition to channel halt mode when the CHMDC[1:0] bits are set to 10_B

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode.

Figure 22.5 Channel Mode State Transition Chart

Table 22.90 Channel Mode Transition Time (1/2)

Mode before Transition	Mode after Transition	Maximum Transition Time
Channel stop	Channel reset	Three pclk cycles
Channel reset	Channel stop	Three pclk cycles
Channel reset	Channel halt	Three CANm bit times
Channel reset	Channel communication	Four CANm bit times
Channel halt	Channel reset	Two CANm bit times

Table 22.90 Channel Mode Transition Time (2/2)

Mode before Transition	Mode after Transition	Maximum Transition Time
Channel halt	Channel communication	Four CANm bit times
Channel communication	Channel reset	Two CANm bit times
Channel communication	Channel halt	Two CANm frames

22.5.2.1 Channel Stop Mode

In channel stop mode, clocks are not supplied to channels and therefore power consumption is reduced. Channel-related registers can be read, but writing data to them is prohibited. Register values are retained.

Each channel enters channel stop mode after the MCU is reset. Channels also transition to channel stop mode when the CSLPR bit in the RSCAN0CmCTR register (m = 0 to 2) is set to 1 (channel stop mode) in channel reset mode. The CSLPR bit should not be modified in channel communication mode and channel halt mode.

22.5.2.2 Channel Reset Mode

In channel reset mode, channel settings are performed. When a channel transitions to channel reset mode, some channel-related registers are initialized. **Table 22.92** lists the registers to be initialized.

When the CHMDC[1:0] bits in the RSCAN0CmCTR register are set to 01_B (channel reset mode) during CAN communication, communication is terminated before it is completed and the channel transitions to channel reset mode. **Table 22.91** shows the operation when the CHMDC[1:0] bits are set to 01_B (channel reset mode) during CAN communication.

22.5.2.3 Channel Halt Mode

In channel halt mode, settings for test-related registers of channels are performed. When a channel transitions to channel halt mode, CAN communication of the channel stops.

Table 22.91 shows operation when the CHMDC[1:0] bits are set to 10_B (channel halt mode) during CAN communication.

Table 22.91 Operation a Channel Transitions to Channel Reset Mode/Channel Halt Mode

Mode	During Reception	During Transmission	Bus Off State
Channel reset (CHMDC[1:0] = 01_B)	Transitions to channel reset mode before reception is completed.*1	Transitions to channel reset mode before transmission is completed.*1	Transitions to channel reset mode before bus off recovery.
Channel halt*3 (CHMDC[1:0] = 10_B)	Transitions to channel halt mode after reception is completed.*2	Transitions to channel halt mode after transmission is completed.	[When BOM[1:0] = 00_B] Transitions to channel halt mode (CHMDC[1:0] = 10_B) only after bus off recovery. [When BOM[1:0] = 01_B] Transitions to channel halt mode automatically when the condition for transition to bus off state is met. [When BOM[1:0] = 10_B] Transitions to channel halt mode automatically after bus off recovery. [When BOM[1:0] = 11_B] Transitions to channel halt mode immediately after the CHMDC[1:0] bits are set to 10_B before bus off recovery.

Note 1. To allow transition to channel reset mode after communication is completed, set the CHMDC[1:0] bits to 10_B and confirm that communication has been completed and transition to channel halt mode has been made, and then set the CHMDC[1:0] bits to 01_B.

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode. The CAN bus status can be confirmed with the BLF flag of the RSCAN0CmERFL register that becomes 1 when dominant lock is detected.

Note 3. When the transition from channel reset mode to channel halt mode is to be made, set the RSCAN0CmCFG register in channel reset mode and then shift to channel halt mode.

22.5.2.4 Channel Communication Mode

In channel communication mode, CAN communication is performed. Each channel has the following communication states during CAN communication.

- Idle: Neither reception nor transmission is in progress.
- Reception:Receiving a message sent from another node.
- Transmission:Transmitting a message.
- Bus off:Isolated from CAN communication.

When the CHMDC[1:0] bits in the RSCAN0CmCTR register are set to 00_B, the channel transitions to channel communication mode. After that, once 11 consecutive recessive bits have been detected, the COMSTS flag in the RSCAN0CmSTS register (m = 0 to 2) is set to 1 (communication is ready) and transmission and reception are enabled on the CAN network as an active node. At this time, transmission and reception of messages can be started.

22.5.2.5 Bus Off State

A channel transitions to the bus off state according to the transmit/receive error counter increment/decrement rules of the CAN specifications.

The conditions for returning from the bus off state are determined by the BOM[1:0] bits in the RSCAN0CmCTR register.

- When BOM[1:0] = 00_B:
  Bus off recovery is compliant with the CAN specifications. After 11 consecutive recessive bits have been detected 128 times, a channel returns from the bus off state to the CAN communication ready state (error active state). At that time, the TEC[7:0] and REC[7:0] bits in the RSCAN0CmSTS register are initialized to 00_H, the BORF flag in the RSCAN0CmERFL register is set to 1 (bus off recovery is detected), and a bus off recovery interrupt request is generated. When the CHMDC[1:0] bits in the RSCAN0CmCTR register are set to 10_B (channel halt mode) in the bus off state, the channel transitions to channel halt mode after bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times).
- When BOM[1:0] = 01_B:
  When a channel transitions to the bus off state, the CHMDC[1:0] bits are set to 10_B and the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, but the BORF flag is not set to 1. Also, a bus off recovery interrupt request is not generated.
- When BOM[1:0] = 10_B:
  When a channel has transitioned to the bus off state, the CHMDC[1:0] bits are set to 10_B. After bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times), the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, the BORF flag is set to 1, and a bus off recovery interrupt request is generated.
- When BOM[1:0] = 11_B:
  When the CHMDC[1:0] bits are set to 10_B in the bus off state, the channel transitions to channel

halt mode before bus off recovery is completed. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, but the BORF flag is not set to 1. Also, a bus off recovery interrupt is not generated.
However, the BORF flag becomes 1 and a bus off recovery interrupt request is generated if a CAN module transitions to error active state (by detecting 128 times of 11 consecutive recessive bits) before CHMDC[1:0] bits are set to 10_B.

If the RSCAN module causes the channel to transition to channel halt mode simultaneously with a program write to the CHMDC[1:0] bits, the program write takes precedence. An automatic transition to channel halt mode when the BOM[1:0] bits are set to 01_B or 10_B is made only when the CHMDC[1:0] bits are 00_B (channel communication mode).

Furthermore, setting the RTBO bit in the RSCAN0CmCTR register to 1 allows a forced return from the bus off state. As soon as the RTBO bit is set to 1, the state changes to the error active state. After 11 consecutive recessive bits have been detected, the CAN module becomes ready for communication. In this case, the BORF flag is not set to 1 and the TEC[7:0] and REC[7:0] bits are initialized to 00_H. Write 1 to the RTBO bit only when the BOM[1:0] value is 00_B. Writing the RTBO bit to 1 in a state other than the bus off state is ignored, and the RTBO bit is immediately set to 0.

Table 22.92 Registers Initialized in Global Reset Mode or Channel Reset Mode

Register	Bit / Flag
RSCAN0CmCTR register	CTMS[1:0], CTME, CHMDC[1:0]
RSCAN0CmSTS register	CHLTSTS, EPSTS, BOSTS, TRMSTS, RECSTS, COMSTS, REC[7:0], TEC[7:0]
RSCAN0CmERFL register	CRCREG[14:0], ADERR, B0ERR, B1ERR, CERR, AERR, FERR, SERR, ALF, BLF, OVLF, BORF, BOEF, EPF, EWF, BEF
RSCAN0CFCCk register	When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFE
RSCAN0CFSTSk register	When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFMC[7:0], CFFLL, CFEMP, CFMLT, CFRXIF, CFTXIF
RSCAN0CFTISTS register	CFkTXIF
RSCAN0TMCp register	TMOM, TMTAR, TMTR
RSCAN0TMSTSp register	TMTARM, TMTRM, TMTRF[1:0], TMTSTS
RSCAN0TMTRSTSy register	TMTRSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCAN0TMTARSTSy register	TMTARSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCAN0TMTCSTSy register	TMTCSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCAN0TMTASTSy register	TMTASTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCAN0TXQCCm register	TXQE
RSCAN0TXQSTSm register	TXQIF, TXQFLL, TXQEMP
RSCAN0THLCCm register	THLE
RSCAN0THLSTSm register	THLMC[4:0], THLIF, THLELT, THLFLL, THLEMP
RSCAN0GTINTSTS0 register	TSIFm, TAIFm, TQIFm, CFTIFm, THIFm (m = 0 to 2)

Table 22.93 Registers Initialized Only in Global Reset Mode (1/2)

Register	Bit / Flag
RSCAN0GSTS register	GHLTSTS
RSCAN0GERFL register	THLES, MES, DEF
RSCAN0GTSC register	TS[15:0]
RSCAN0RMNDy register	RMNSq

Table 22.93 Registers Initialized Only in Global Reset Mode (2/2)

Register	Bit / Flag
RSCAN0RFCCx register	RFE
RSCAN0RFSTSx register	RFMC[7:0], RFIF, RFMLT, RFFLL, RFEMP
RSCAN0CFCCk register	When transmit/receive FIFO buffer is in receive mode: CFE
RSCAN0CFSTSk register	When transmit/receive FIFO buffer is in receive mode: CFMC[7:0], CFFLL, CFEMP, CFTXIF, CFRXIF, CFMLT
RSCAN0FESTS register	CFkEMP, RFxEMP
RSCAN0FFSTS register	CFkFLL, RFxFLL
RSCAN0FMSTS register	CFkMLT, RFxMLT
RSCAN0RFISTS register	RFxIF
RSCAN0CFRISTS register	CFkRXIF
RSCAN0GTSTCFG register	RTMPS[6:0], C0ICBCE, C1ICBCE, C2ICBCE
RSCAN0GTSTCTR register	RTME, ICBCTME

22.6 Reception Function

There are two reception types.

- Reception by receive buffers:
  Zero to 48 receive buffers can be shared by all channels. Since messages stored in receive buffers are overwritten at each reception, the latest receive data can always be read.
- Reception by receive FIFO buffers and transmit/receive FIFO buffers (receive mode):
  Eight receive FIFO buffers can be shared by all channels and three dedicated transmit/receive FIFO buffers are provided for each channel. Messages of up to the number of buffer stages specified with the RFDC[2:0] and CFDC[2:0] bits can be stored in FIFO buffers and can be read sequentially from the oldest.

22.6.1 Data Processing Using the Receive Rule Table

Data processing using the receive rule table allows dispatching of selected messages to the specified buffer. Data processing includes acceptance filter processing, DLC filter processing, routing processing, label addition processing, and mirror function processing.

Up to 128 receive rules can be registered per channel and up to (64 × number of channels) total receive rules can be registered in the entire module. (Up to 192 receive rules can be registered in this module). Set receive rules for each channel. Receive rules cannot be shared with other channels. If receive rules are not set, no messages can be received. **Figure 22.6** illustrates how receive rules are registered.

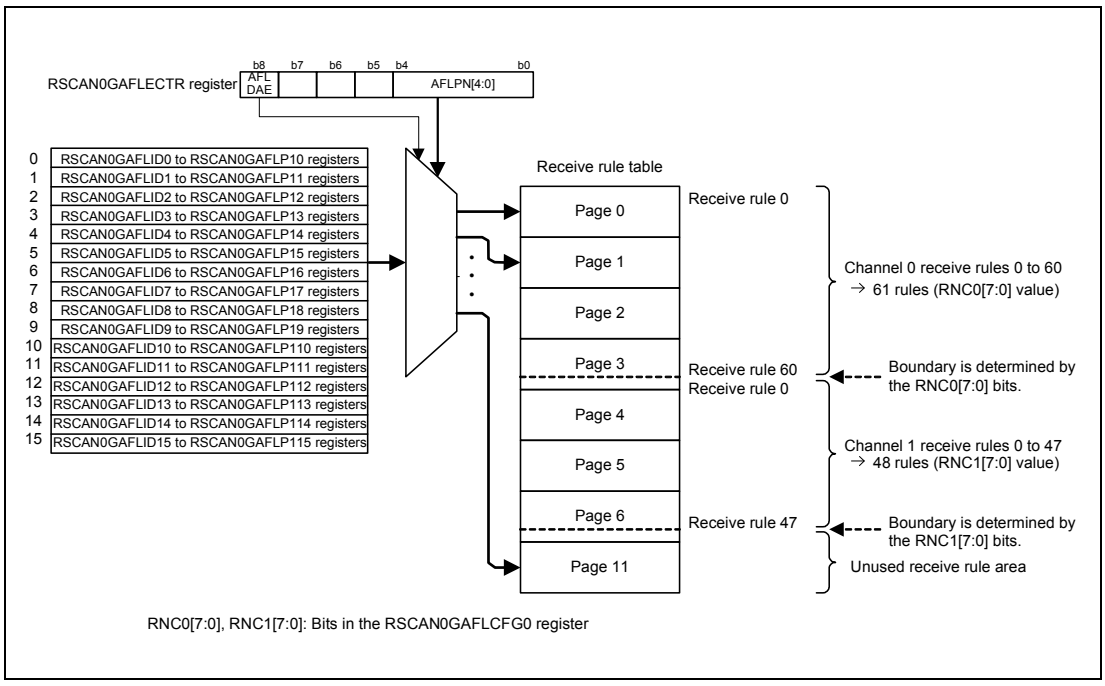


Figure 22.6 Entry of Receive Rules (for Setting Channel 0 and 1)

CAUTION

Receive rules for each channel must be set in contiguous blocks.
Channel 1 rules and channel 0 rules must be set separately.

Each receive rule consists of 16 bytes in the RSCAN0GAFLIDj, RSCAN0GAFLMj, RSCAN0GAFLP0j, and RSCAN0GAFLP1j registers (j = 0 to 15). The RSCAN0GAFLIDj register is

used to set GAFLID[28:0], GAFLIDE bit, GAFLRTR bit, and the mirror function, the RSCAN0GAFLMj register is used to set mask, the RSCAN0GAFLP0j register is used to set label information to be added, DLC value, and storage receive buffer, and the RSCAN0GAFLP1j register is used to set storage FIFO buffer. Up to 16 receive rules can be set per page.

22.6.1.1 Acceptance Filter Processing

In the acceptance filter processing, the ID data, IDE bit, and RTR bit in a received message are compared with the ID data, IDE bit, and RTR bit set in the receive rule of the corresponding channel. When all these bits match, the message passes through the acceptance filter processing. The ID data, IDE bit, and RTR bit in the received message which correspond to the bits set to 0 (bits are not compared) in the RSCAN0GAFLMj register are not compared and are regarded as matched.

Check begins with the receive rule of the minimum number for the corresponding channel. When all the bits to be compared in a received message match the bits set in the receive rule or when all the receive rules are compared without any match, filter processing stops. If there is no matching receive rule, the received message is not stored in the receive buffer or FIFO buffer.

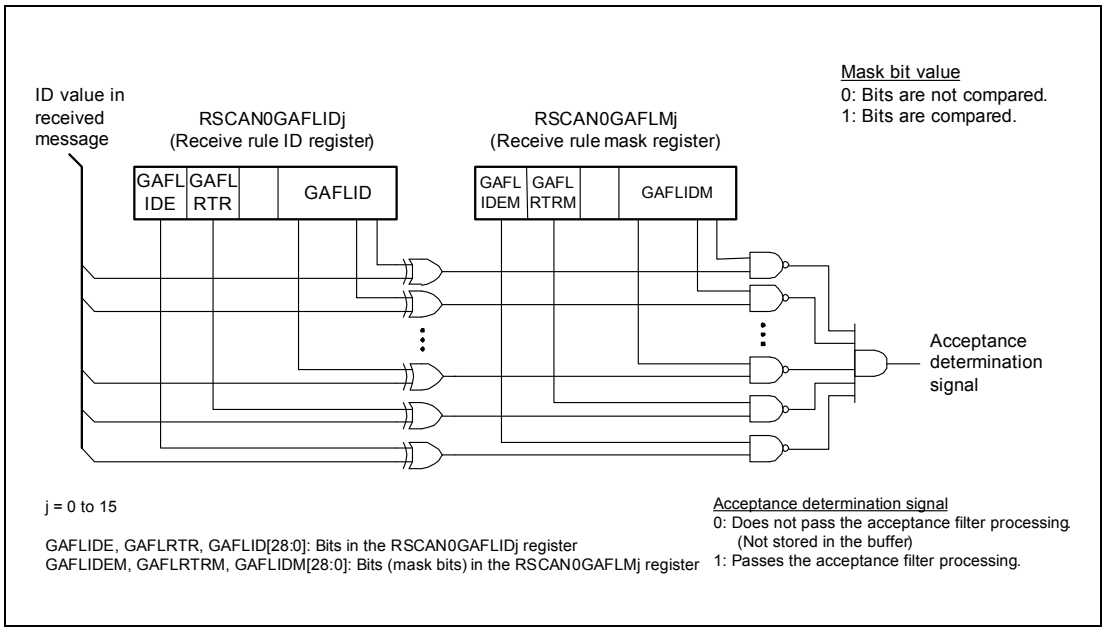

Figure 22.7 Acceptance Filter Function

22.6.1.2 DLC Filter Processing

When the DCE bit in the RSCAN0GCFG register is set to 1 (DLC check is enabled), DLC filter processing is added to messages that passed through the acceptance filter processing. When the DLC value in a message is equal to or larger than the DLC value set in the receive rule, the message passes through the DLC filter processing.

When a message has passed through the DLC filter processing with the DRE bit in the RSCAN0GCFG register set to 0 (DLC replacement is disabled), the DLC value in the received message is stored in the buffer. In this case, all the data bytes in the received message are stored in the buffer.

When a message has passed through the DLC filter processing with the DRE bit in the RSCAN0GCFG register set to 1 (DLC replacement is enabled), the DLC value in the receive rule is stored in the buffer instead of the DLC value in the received message. In this case, a value of 00_H is stored in each data byte beyond the number of bytes which is indicated by the DLC value in the receive rule.

When the DLC value in the received message is smaller than that in the receive rule, the message does not pass through the DLC filter processing. In this case, the message is not stored in the receive buffer or the FIFO buffer and the DEF flag in the RSCAN0GERFL register is set to 1 (a DLC error is present).

22.6.1.3 Routing Processing

Messages that passed through the acceptance filter processing and the DLC filter processing are stored in receive buffers, receive FIFO buffers, or transmit/receive FIFO buffers (set to receive mode or gateway mode). Message storage destination is set by the GAFLRMV and GAFLRMDP[6:0] bits in the RSCAN0GAFLP0j register (j = 0 to 15) and by the RSCAN0GAFLP1j register. Messages that passed through the acceptance filter processing and the DLC filter processing can be stored in up to eight buffers.

22.6.1.4 Label Addition Processing

It is possible to add 12-bit label information to messages that passed through the filter processing and store them in buffers. This label information is set in the GAFLPTR[11:0] bits in the RSCAN0GAFLP0j register.

22.6.1.5 Mirror Function Processing

The mirror function allows the CAN node to receive its own transmitted messages. The mirror function is made available by setting the MME bit in the RSCAN0GCFG register to 1 (mirror function is enabled).

When the mirror function is in use, receive rules for which the GAFLLB bit in the RSCAN0GAFLIDj register is set to 0 are used for data processing when receiving messages transmitted from other CAN nodes. When the CAN node is receiving its own transmitted messages, receive rules for which the GAFLLB bit is set to 1 are used for data processing.

22.6.1.6 Timestamp

The timestamp counter is a 16-bit free-running counter used for recording message receive time. The timestamp counter value is fetched at the start-of-frame (SOF) timing of a message and is then stored in a receive buffer or a FIFO buffer together with the message ID and data. Either pclk/2 or the CANm bit time clock (m = 0 to 2) may be selected as a timestamp counter clock source using the TSBTCS[2:0] and TSSS bits in the RSCAN0GCFG register. The timestamp counter count source is obtained by dividing the selected clock source by the TSP[3:0] value in the RSCAN0GCFG register.

When the CANm bit time clock is used as a clock source, the timestamp counter stops when the corresponding channel transitions to channel reset mode or channel halt mode. When the pclk/2 is used as a clock source, the timestamp function is not affected by channel mode.

The timestamp counter value is reset to 0000_H by setting the TSRST bit in the RSCAN0GCTR register to 1.

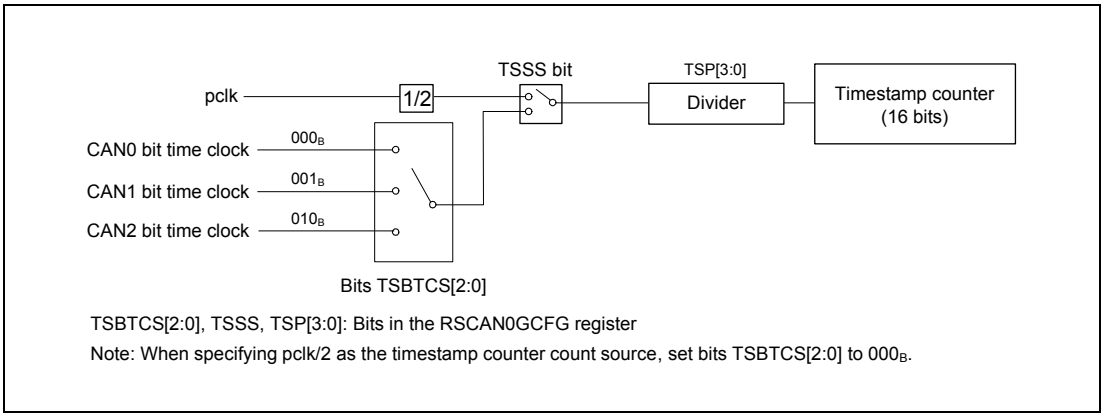

Figure 22.8 Timestamp Function Block Diagram

22.7 Transmission Functions

There are three types of transmission.

- Transmission using transmit buffers:
  Each channel has 16 buffers.
- Transmission using transmit/receive FIFO buffers (transmit mode):
  Each channel has three FIFO buffers. Up to 128 messages can be contained in a single FIFO buffer. Each FIFO buffer is used with a link to a transmit buffer. Only the message to be transmitted next in a FIFO buffer becomes the target of transmit priority determination. Messages are transmitted sequentially on a first-in, first-out basis.
- Transmission using transmit queues:
  Up to 16 transmit buffers per channel can be allocated to the transmit queues. Transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel. Transmit buffers are allocated to transmit queues in descending order of buffer number. All messages in transmit queues, which are targets of priority determination, are transmitted in the order of ID number.

Figure 22.9 shows the allocation of transmit queues and transmit/receive FIFO buffer link.

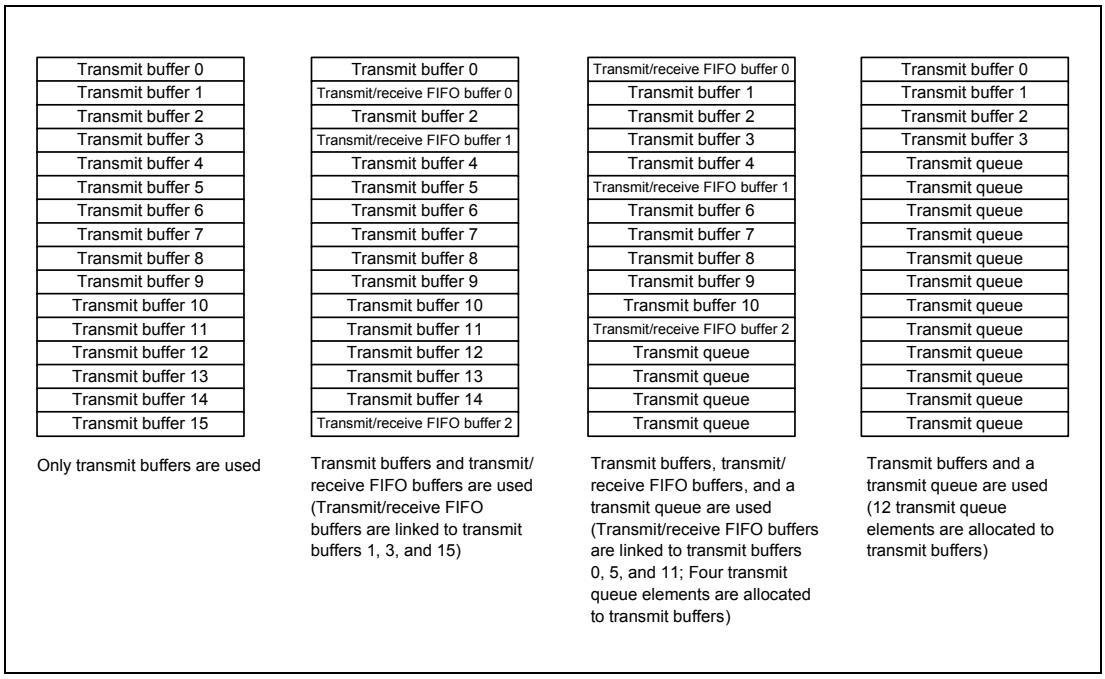

Figure 22.9 Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links

22.7.1 Transmit Priority Determination

If transmit requests are issued from multiple buffers or from the queue on the same channel, transmit priority is determined using one of the following methods.

- ID priority (TPRI bit = 0)
- Transmit buffer number priority (TPRI bit = 1)

All CAN channels use the setting of the TPRI bit in the RSCAN0GCFG register.

When the TPRI bit is set to 0, messages are transmitted according to the priority of stored message IDs. ID priority conforms to the CAN bus arbitration specification defined in the CAN specifications. All IDs of pending transmit messages are targets of priority determination, regardless of whether they are stored in transmit buffers, transmit/receive FIFO buffers (set to transmit mode or gateway mode), or the transmit queue. If even a single transmit queue is used, select ID priority. When transmit/receive FIFO buffers are used, the oldest message in a FIFO buffer becomes the target of priority determination. When a message is being transmitted from a transmit/receive FIFO buffer, the next message in the FIFO buffer becomes the target of priority determination. When a transmit queue is used, all messages in the transmit queue are targets of priority determination. If the same ID is set for two or more buffers, the buffer with the smaller buffer number takes precedence.

When the TPRI bit is set to 1, the message in the transmit buffer with the minimum buffer number among all buffers with a transmit request is transmitted first. When transmit/receive FIFO buffers are linked to transmit buffers, transmit priority is determined according to linked transmit buffer numbers.

When messages are retransmitted due to an arbitration-lost or an error, transmit priority determination is made again according to the TPRI bit.

22.7.2 Transmission Using Transmit Buffers

Setting the transmit request bit (TMTR bit in the RSCAN0TMCp register) in a transmit buffer to 1 (transmission is requested) allows transmission of data frames or remote frames.

The transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCAN0TMSTSp register (p = 0 to 47). When transmit completes successfully, the TMTRF[1:0] flag is set to 10_B (transmission has been completed (without transmit abort request)) or 11_B (transmission has been completed (with transmit abort request)).

22.7.2.1 Transmit Abort Function

With respect to transmit buffers for which the TMTRM bit in the RSCAN0TMSTSp register is set to 1 (a transmit request is present), when the TMTAR bit in the RSCAN0TMCp register is set to 1 (transmit abort is requested), the transmit request is canceled. When transmit abort is completed, the TMTRF[1:0] flag in the RSCAN0TMSTSp register is set to 01_B (transmit abort has been completed) and the transmit request is canceled (clearing the TMTRM bit to 0).

A message that is being transmitted or a message to be transmitted next according to the transmit priority determination cannot be aborted. However, when an arbitration-lost or an error occurs during transmission of a message for which the TMTAR bit is set to 1, retransmission is not performed.

22.7.2.2 One-Shot Transmission Function (Retransmission Disabling Function)

When the TMOM bit in the RSCAN0TMCp register is set to 1 (one-shot transmission is enabled), transmission is performed only once. Even if an arbitration-lost or an error occurs, retransmission is not performed.

The one-shot transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCAN0TMSTSp register. When one-shot transmission completes successfully, the TMTRF[1:0] flag is set to 10_B or 11_B. When an arbitration-lost or an error occurs, the TMTRF[1:0] flag is set to 01_B (transmit abort has been completed).

22.7.3 Transmission Using FIFO Buffers

Multiple messages can be stored in a single transmit/receive FIFO buffers, up to the number specified by the FIFO buffer depth, which is set by the CFDC[2:0] bits in the RSCAN0CFCCk register (k = 0 to 8). Messages are transmitted sequentially on a first-in, first-out basis.

Each transmit/receive FIFO buffer is linked to a transmit buffer selected by the CFTML[3:0] bits in the RSCAN0CFCCk register. When the CFE bit in the RSCAN0CFCCk register is set to 1 (transmit/receive FIFO buffers are used), transmit/receive FIFO buffers become targets of transmit priority determination. Priority of only the next transmit message is determined in the FIFO buffer.

When the CFE bit is set to 0 (no transmit/receive FIFO buffer is used), the CFEMP flag is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) at the timing below.

- The transmit/receive FIFO buffer becomes empty immediately if the message in it is not being transmitted or is not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, arbitration-lost or the transition to channel halt mode in the case that a message in it is being transmitted or to be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages cannot be stored in FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

22.7.3.1 Interval Transmission Function

A message transmission interval time can be set to space the transmission of messages from the same FIFO buffer when using a transmit/receive FIFO buffer set to transmit mode or gateway mode.

Immediately after the first message has been transmitted successfully from the FIFO buffer with the CFE bit in the RSCAN0CFCCk register set to 1, the interval timer starts counting (after EOF7 of the CAN protocol). After that, when the interval time has passed, the next message is transmitted. The interval timer stops in channel reset mode or by clearing the CFE bit to 0.

The interval time is set by the CFITT[7:0] bits in the RSCAN0CFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to 00_H.

Select an interval timer count source using the CFITR and CFITSS bits in the RSCAN0CFCCk register. When the CFITR and CFITSS bits are set to 00_B, the count source is obtained by dividing pclk/2 by the value of the ITRCP[15:0] bits. When the CFITR and CFITSS bits are set to 10_B, the count source is obtained by dividing pclk/2 by (the value of the ITRCP[15:0] bits in the RSCAN0GCFG register × 10). When the CFITR and CFITSS bits are set to $x1_B$, the CANm bit time clock is used as a count source.

The interval time is calculated by the following equations where M is the value of ITRCP[15:0] and N is the value of CFITT[7:0].

- When CFITR and CFITSS = 00_B (fPBA is the frequency of pclk):

$$\frac{1}{fPBA} \times 2 \times M \times N$$

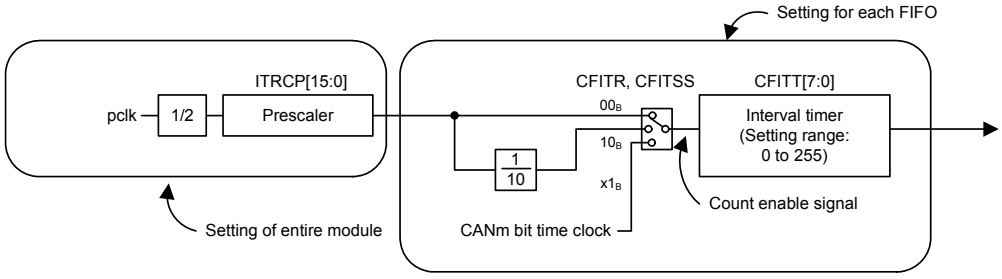
- When CFITR and CFITSS = 10_B:

$$\frac{1}{fPBA} \times 2 \times M \times 10 \times N$$

- When CFITR and CFITSS = $x1_B$ (fCANBIT is the frequency of CANm bit time clock):

$$\frac{1}{fCANBIT} \times N$$

Figure 22.10 shows the interval timer block diagram.

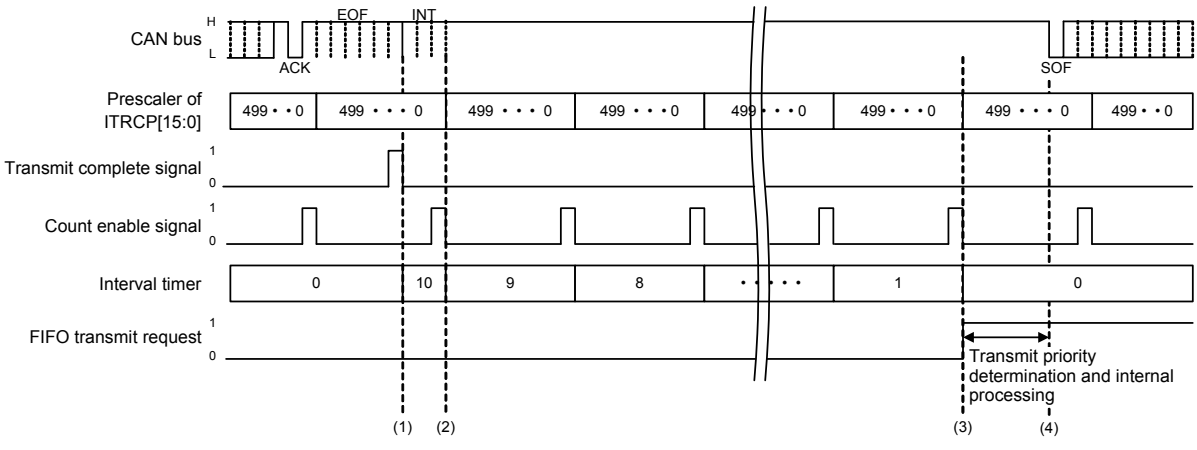


ITRCP[15:0]: Bits in the RSCAN0GCFG register
CFITR, CFITSS, CFITT[7:0] : Bits in the RSCAN0CFCCk register

Note: m = 0 to 2, k = 0 to 8

Figure 22.10 Interval Timer Block Diagram

Figure 22.11 shows the interval timer timing diagram.



Interval time (logical value) = 2/fPBA × (set ITRCP[15:0] value) × set CFITT[7:0] value

fPBA: Frequency of pclk
ITRCP[15:0]: Bits in the RSCAN0GCFG register (The set value is 500 in this figure.)
CFITT[7:0]: Bits in the RSCAN0CFCCk register (The set value is 10 in this figure.)

Figure 22.11 Interval Timer Timing Chart

(1) The interval timer starts counting upon completion of transmission. Since the prescaler is not initialized at the time of transmission completion, the first interval time contains an error of up to one count of the interval timer.

(2) The interval timer is decremented by 1 upon the next count enable signal.

(3) When the interval timer has decreased to 0, the transmit/receive FIFO buffer issues a transmit request.

(4) The transmit/receive FIFO buffer is determined for the next transmission by the priority determination, it starts transmitting data. Transmission starts usually with a delay of three CANm bit time clock cycles or less from the issue of transmit request. If multiple internal processes (such as receive filter processing, message routing, and transmit priority determination) take place in all channels, a delay of up to 582 cycles of the pclk may be generated.

22.7.4 Transmission Using Transmit Queues

Three to sixteen buffers are allocated to a transmit queue for each channel, and transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel.

All messages in a transmit queue are targets of transmit priority determination and are transmitted in the ID priority order regardless of storage sequence. If two messages having the same ID are stored in a transmit queue, these messages are not always transmitted in the order of their storage in the transmit queue.

Setting the TXQE bit in the RSCAN0TXQCCm register to 0 disables transmit queues. When the TXQE bit is set to 0, the TXQEMP flag in the RSCAN0TXQSTSm register is set to 1 (the transmit queue contains no messages (transmit queue empty) at the timing below.

- The transmit queue becomes empty immediately when no message in it is being transmitted or will be transmitted next.
- The transmit queue becomes empty after transmission completion, CAN bus error detection, arbitration-lost, or the transition to channel halt mode when a message in it is being transmitted or will be transmitted next.

When the TXQE bit is cleared to 0, all messages in transmit queues are lost and messages cannot be stored in transmit queues. Confirm that the TXQEMP flag is set to 1 before setting the TXQE bit to 1 again.

22.7.5 Transmit History Function

Information about transmission-completed messages can be stored in the transmit history buffer. Each channel has a single transmit history buffer that can contain 16 sets of transmit history data.

A message transmit source buffer type can be selected by the THLDTE bit in the RSCAN0THLCCm register. The THLEN bit in the RSCAN0CFIDk register (k = 0 to 8) determines whether transmit history data is stored for each message.

The following information on a transmitted message will be stored in the transmission history buffer after the successful completion of transmission.

Storage of the transmission history data after the successful completion of transmission may take up to 150 cycles of pclk.

- Buffer type
  001_B: Transmit buffer
  010_B: Transmit/receive FIFO buffer
  100_B: Transmit queue
- Buffer number
  Number of source transmit buffer, transmit queue, or transmit/receive FIFO buffer. This number depends on buffer types. See **Table 22.94**.

- Label data Label information of the transmit message

Table 22.94 Transmit History Data Buffer Numbers

Buffer type / Buffer No.	001_B	010_B	100_B
0000_B	Transmit buffer 16 × m + 0	Buffer numbers of the transmit buffer linked to the transmit/receive FIFO buffer by the CFTML[3:0] bits in the RSCAN0CFCCk register (k = 0 to 8)	Buffer numbers of the transmit buffer allocated to the transmit queue that performed transmission
0001_B	Transmit buffer 16 × m + 1		
0010_B	Transmit buffer 16 × m + 2		
0011_B	Transmit buffer 16 × m + 3		
0100_B	Transmit buffer 16 × m + 4		
0101_B	Transmit buffer 16 × m + 5		
0110_B	Transmit buffer 16 × m + 6		
0111_B	Transmit buffer 16 × m + 7		
1000_B	Transmit buffer 16 × m + 8		
1001_B	Transmit buffer 16 × m + 9		
1010_B	Transmit buffer 16 × m + 10		
1011_B	Transmit buffer 16 × m + 11		
1100_B	Transmit buffer 16 × m + 12		
1101_B	Transmit buffer 16 × m + 13		
1110_B	Transmit buffer 16 × m + 14		
1111_B	Transmit buffer 16 × m + 15		

Label data is used to identify each message. Unique label data can be added to each message transmitted from a transmit buffer, transmit queue, or transmit/receive FIFO buffer.

Transmit history data can be read from the RSCAN0THLACCm register. If an attempt is made to store new transmit history data while the buffer is full, the buffer overflows and the new data is discarded.

22.8 Gateway Function

When a transmit/receive FIFO buffer is set to gateway mode, receive massages can be transmitted from an arbitrary channel without CPU intervention.

When the CFM[1:0] bits in the RSCAN0CFCCk register are set to 10_B (gateway mode) and the transmit/receive FIFO buffer of a channel transmitting a message is selected in RSCAN0GAFLP1j register, messages that passed through the filter processing of the receive rule are stored in the specified transmit/receive FIFO buffer and are automatically transmitted from the buffer.

Messages stored in a transmit/receive FIFO buffer are transmitted sequentially on a first-in, first-out basis. Only the message to be transmitted next becomes the target of transmit priority determination.

Transmit/receive FIFO buffers in the gateway mode are disabled by setting the CFE bit in the RSCAN0CFCCk register to 0 and the CFEMP flag becomes 1 according to the timing below.

- The transmit/receive FIFO buffer becomes empty immediately when the message in it is not being transmitted and will not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, or arbitration-lost when the message in it is being transmitted or will be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages can no longer be stored in transmit/receive FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

22.9 Test Function

The test function is classified into communication tests and global tests.

- Communication tests: Performed for each channel.
  - Standard test mode
  - Listen-only mode
  - Self-test mode 0 (external loopback mode)
  - Self-test mode 1 (internal loopback mode)
- Global tests: Performed for the entire module
  - RAM test (read/write test)
  - Inter-channel communication test

22.9.1 Standard Test Mode

Standard test mode allows CRC test.

22.9.2 Listen-Only Mode

Listen-only mode allows reception of data frames and remote frames. Only recessive bits are transmitted on the CAN bus, and the ACK bit, overload flag, and active error flag are not transmitted.

Listen-only mode is available for detecting the communication speed.

Do not make a transmit request from any buffer or queue in listen-only mode.

Figure 22.12 shows the connection when listen-only mode is selected.

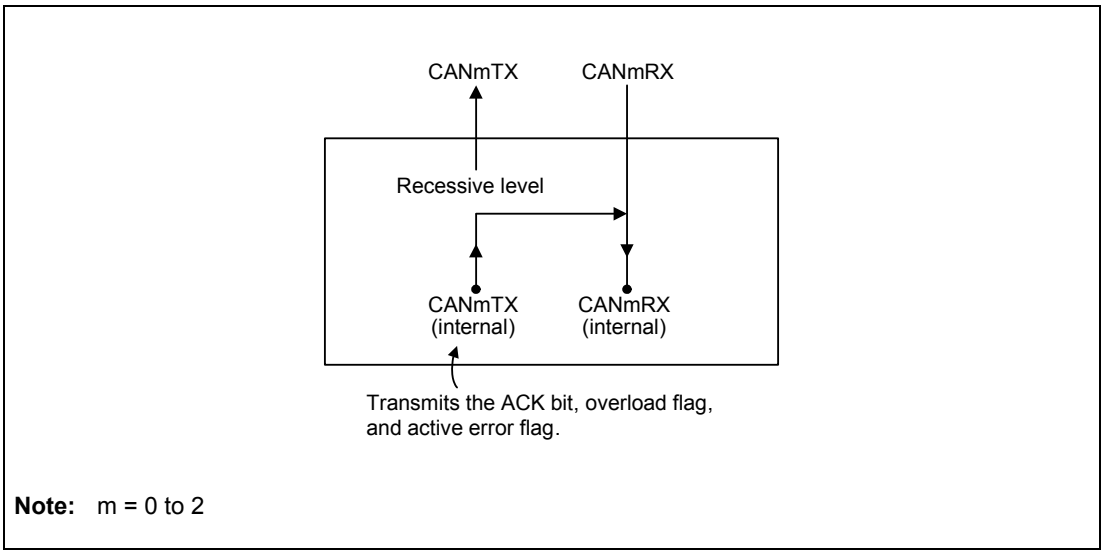


Figure 22.12 Connection when Listen-Only Mode is Selected

22.9.3 Self-Test Mode (Loopback Mode)

In self-test mode, transmitted messages are compared with the receive rule of the own channel and the messages are stored in a buffer if they have passed through the filter processing. Messages transmitted from other CAN nodes are compared only with the receive rule for which the GAFLLB bit in the RSCAN0GAFLIDj register (j = 0 to 15) is set to 0 (when a message transmitted from another CAN node is received).

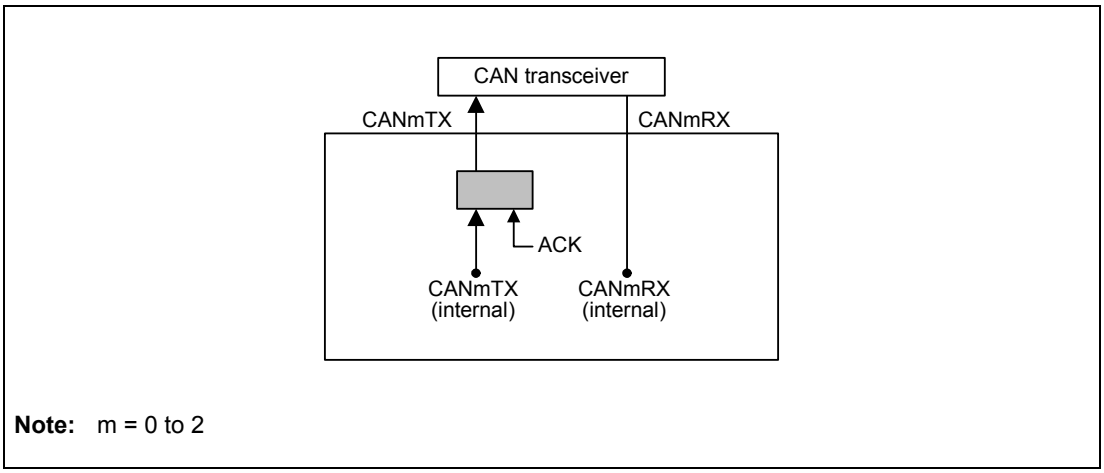
If the mirror function and self-test mode are both enabled, the self-test mode setting takes precedence.

22.9.3.1 Self-Test Mode 0 (External Loopback Mode)

Self-test mode 0 is used to perform a loopback test within a channel including the CAN transceiver.

In self-test mode 0, transmitted messages are handled as messages received through the CAN transceiver and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

Figure 22.13 shows the connection when self-test mode 0 is selected.



Note: m = 0 to 2

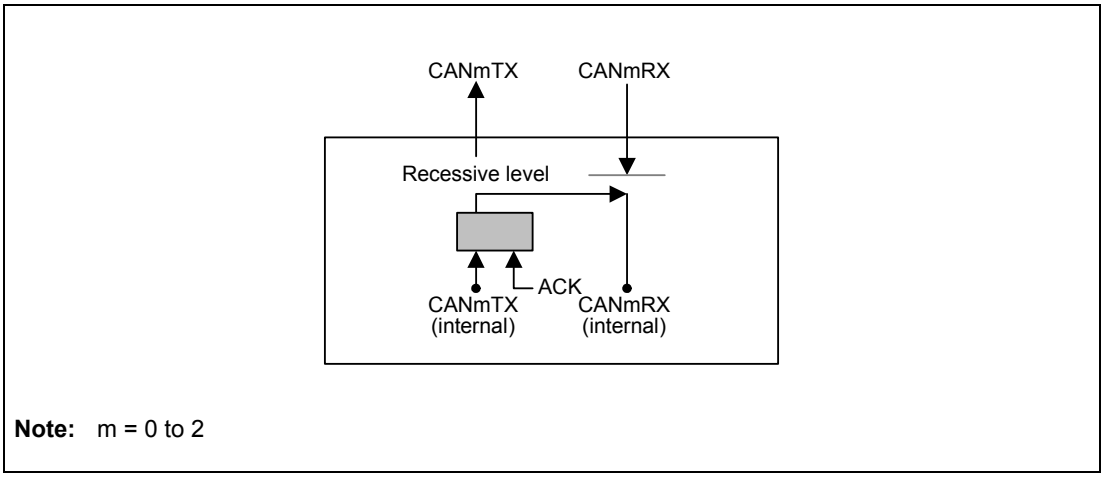
Figure 22.13 Connection when Self-Test Mode 0 is Selected

22.9.3.2 Self-Test Mode 1 (Internal Loopback Mode)

In self-test mode 1, transmitted messages are handled as received messages and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

In self-test mode 1, internal feedback from the internal CANmTX pin (m = 0 to 2) to the internal CANmRX pin is performed. The external CANmRX pin input is isolated. The external CANmTX pin outputs only recessive bits.

Figure 22.14 shows the connection when self-test mode 1 is selected.



Note: m = 0 to 2

Figure 22.14 Connection when Self-Test Mode 1 is Selected

22.9.4 RAM Test

The RAM test function allows accesses to all CAN RAM addresses.

When the RAM test function is used, the RAM is divided into pages of 256 bytes each. RAM test page is set by the RTMPS[6:0] bits in the RSCAN0GTSTCFG register. Data in the set page can be read from and written to the RSCAN0RPGACCr register (r = 0 to 63). The available total RAM size is 7584 bytes ($1DA0_H$).

Do not access more than 160 bytes in the last page (RTMPS[6:0] = $1D_H$) during RAM test.

22.9.5 Inter-Channel Communication Test

The inter-channel communication test function allows communication test by internally connecting CAN channels to each other. During this test, channels are isolated from the external CAN bus.

Before starting data transmission/reception in channel communication mode, make transmission/reception settings for each channel.

Channels not included in the test must be placed in channel halt mode.

Figure 22.15 shows the connection for inter-channel communication test.

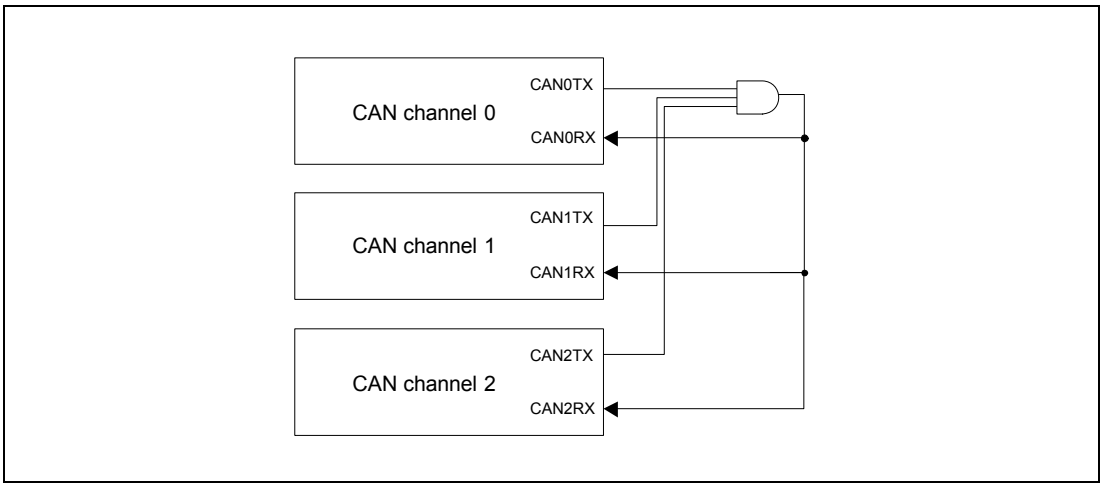


Figure 22.15 Connection for Inter-Channel Communication Test

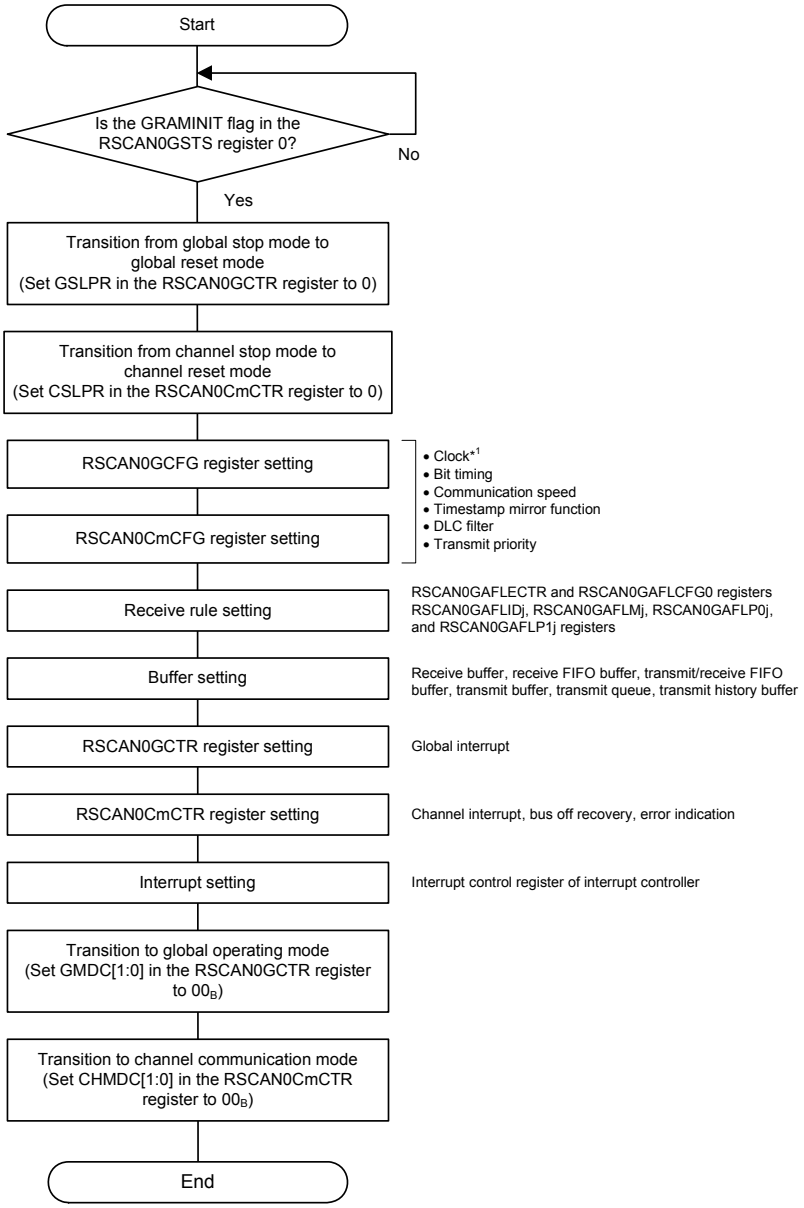
22.10 RSCAN Setting Procedure

22.10.1 Initial Settings

The RSCAN module initializes the CAN RAM after the MCU is reset. The RAM initialization time is 3794 cycles of the pclk. The GRAMINIT flag in the RSCAN0GSTS register is set to 1 (CAN RAM initialization is ongoing) during the RAM initialization and is cleared to 0 (CAN RAM initialization is finished) when the initialization is completed. Make CAN settings after the GRAMINIT flag is cleared to 0. **Figure 22.16** shows the CAN setting procedure after the MCU is reset.



Note 1. For the setting of CAN clock frequency, see the Table 22.8, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/D1L/D1M.

Note: m = 0 to 2, j = 0 to 15

Figure 22.16 CAN Setting Procedure after the MCU is Reset

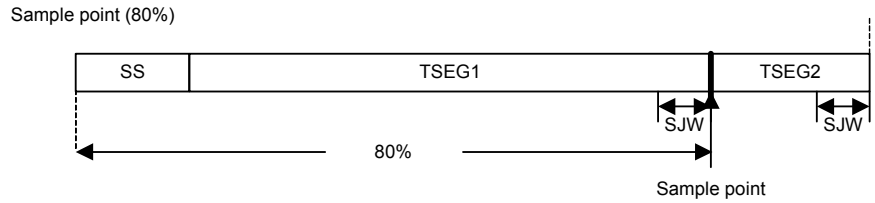
22.10.1.1 Clock Setting

Set the CAN clock (fCAN) as a clock source of the RSCAN module. Select the clk_xincan or clkc using the DCS bit in the RSCAN0GCFG register.

22.10.1.2 Bit Timing Setting

In the CAN protocol, one bit of a communication frame consists of three segments SS, TSEG1, and TSEG2, of which two segments TSEG1 and TSEG2 can be set by the RSCAN0CmCFG register for each channel. Sample point timing can be determined by setting these two segments. This timing can be adjusted in units of 1 Time Quantum (hereafter referred to as Tq). 1 Tq is equal to one CANmTq clock cycle. The CANmTq clock is obtained by selecting the clock source with the DCS bit in the RSCAN0GCFG register and selecting the clock division ratio with the BRP[9:0] bits in the RSCAN0CmCFG register.

Figure 22.17 shows the bit timing chart. **Table 22.95** shows an example of bit timing setting.



SS = 1 Tq fixed
Set TSEG1 to a range of 4 Tq to 16 Tq
Set TSEG2 to a range of 2 Tq to 8 Tq
Set SJW to a range of 1 Tq to 4 Tq
Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 25 Tq
TSEG1 > TSEG2 ≥ SJW

- SS (synchronization segment):
  The SS is a segment that performs synchronization by monitoring the edge from recessive to dominant bits in the Interframe Space.
  Interframe Space consists of Intermission, Suspend Transmission, and Bus Idle. All nodes can start transmission during Bus Idle.
- TSEG1 (Time segment 1):
  TSEG1 is a segment that absorbs physical delay on the CAN network. The physical delay on the CAN network is twice the total of the delay on the CAN bus, the delay in the input comparator, and the delay in the output driver.
- TSEG2 (Time segment 2):
  TSEG2 is a segment that compensates phase error due to an error in frequency.
- SJW (Resynchronization jump width)
  The SJW is a length to extend or reduce the time segment to compensate for an error in phase due to phase error.

Figure 22.17 Bit Timing Chart

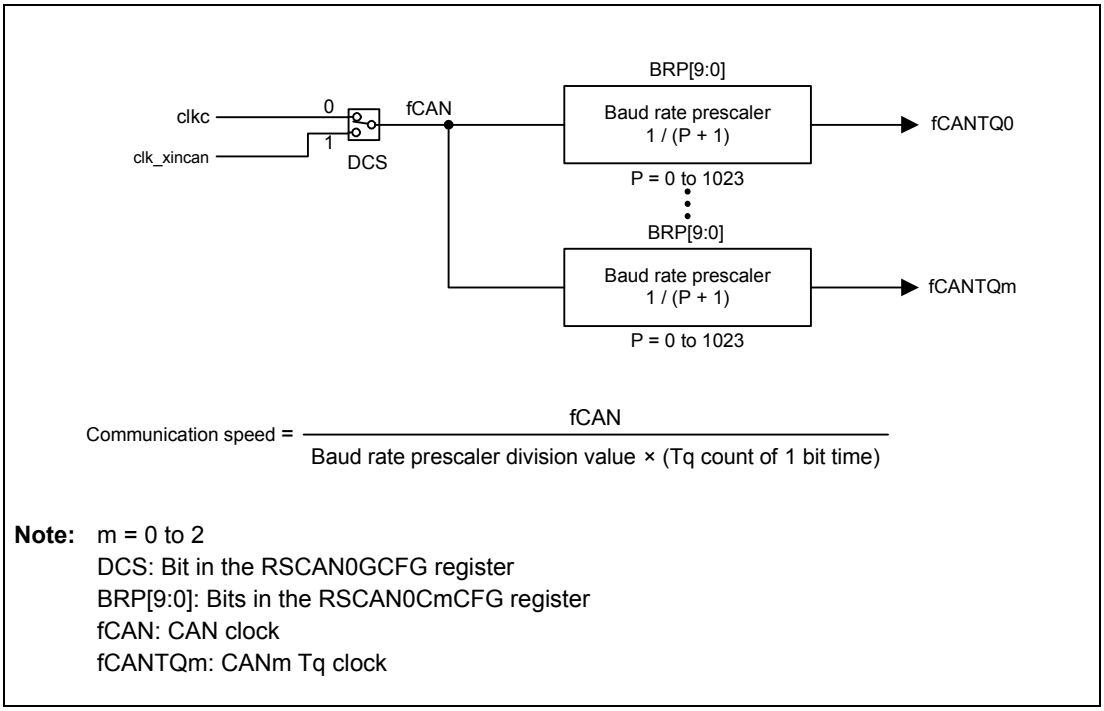
Table 22.95 Example of Bit Timing Setting

1 Bit	Set Value (Tq)				Sample Point (%) Note: See Figure 22.17.
	SS	TSEG1	TSEG2	SJW	
20 Tq	1	12	7	1	65.00
	1	13	6	1	70.00

22.10.1.3 Communication Speed Setting

Set the CAN communication speed for each channel using the fCAN, baud rate prescaler division value (BRP[9:0] bits in the RSCAN0CmCFG register), and Tq count per bit time.

Figure 22.18 shows the CAN clock control block diagram, and **Table 22.96** shows an example of the communication speed setting.



Note: m = 0 to 2
DCS: Bit in the RSCAN0GCFG register
BRP[9:0]: Bits in the RSCAN0CmCFG register
fCAN: CAN clock
fCANTQm: CANm Tq clock

Figure 22.18 CAN Clock Control Block Diagram

Table 22.96 Example of Communication Speed Setting

fCAN / Communication rate	40 MHz
1 Mbps	8 Tq (5) 20 Tq (2)
500 Kbps	8 Tq (10) 20 Tq (4)
250 Kbps	8 Tq (20) 20 Tq (8)

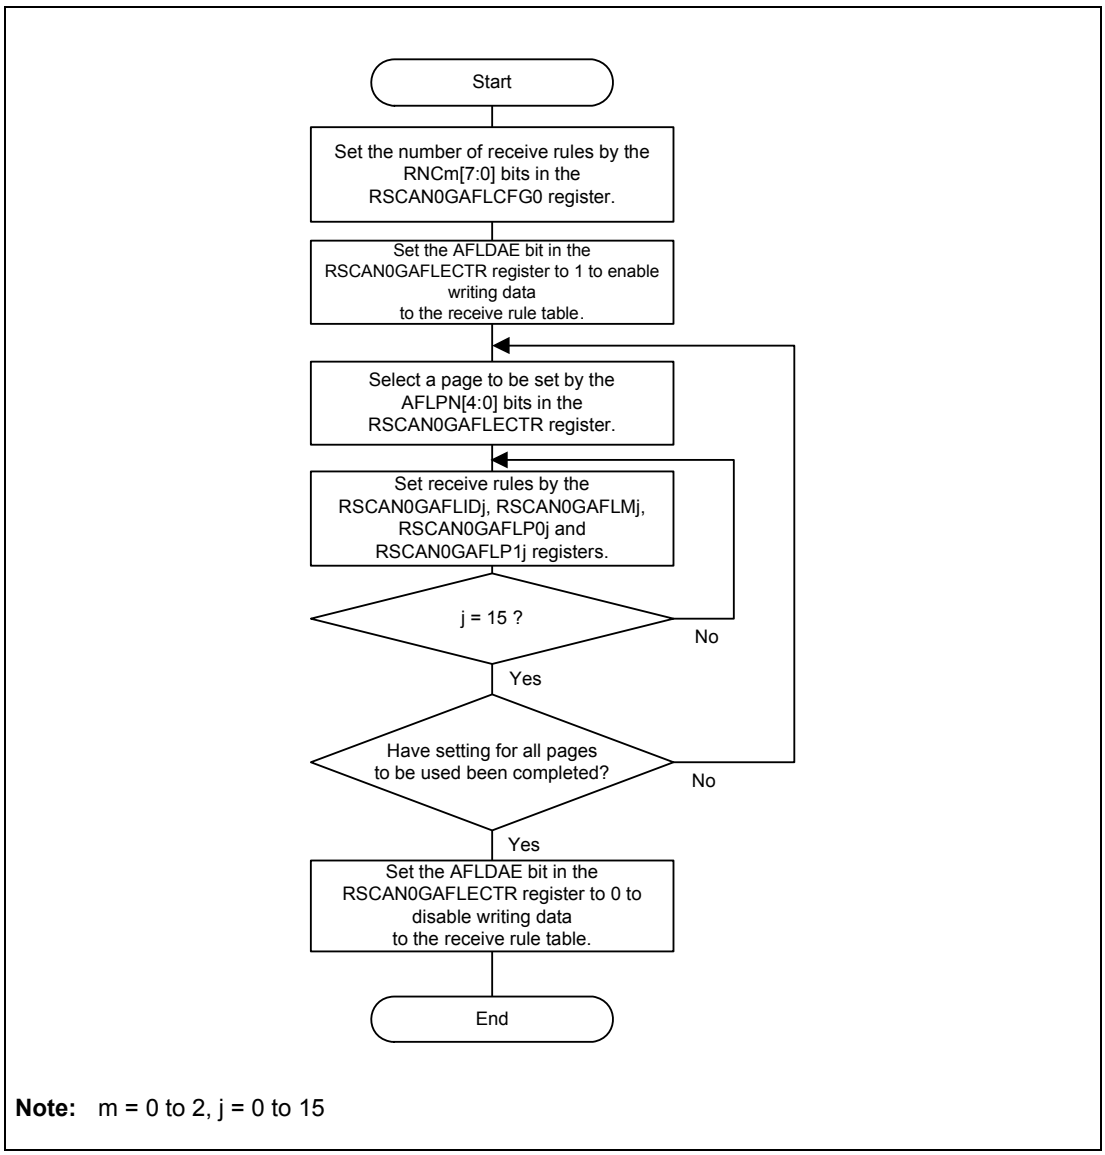
Note: Values in ( ) are baud rate prescaler division values.

22.10.1.4 Receive Rule Setting

Receive rules can be set using receive rule-related registers.

Up to 16 receive rules can be registered per page. Specify pages 0 to 11 by the AFLPN[4:0] bits in the RSCAN0GAFLECTR register. Set receive rule table write enable/disable using the AFLDAE bit.

Figure 22.19 shows the receive rule setting procedure.



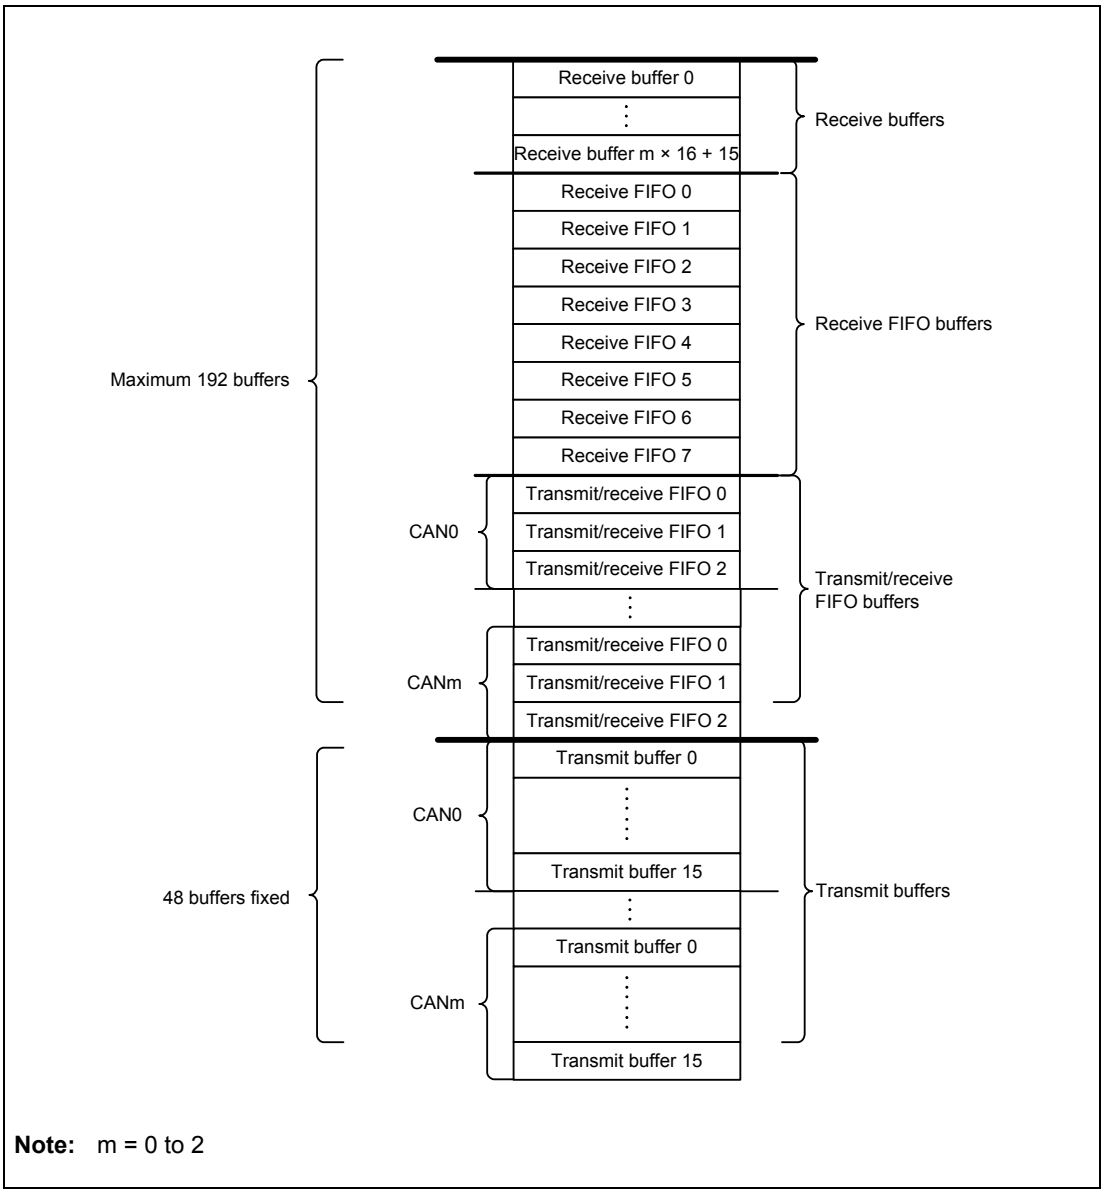
Note: m = 0 to 2, j = 0 to 15

Figure 22.19 Receive Rule Setting Procedure

22.10.1.5 Buffer Setting

Set sizes and interrupt sources of buffers. For transmit/receive FIFO buffers that are set to transmit mode, set transmit buffers to be linked.

Figure 22.20 shows the buffer configuration. **Figure 22.21** shows the buffer setting procedure.



Note: m = 0 to 2

Figure 22.20 Buffer Configuration

CAUTION

Receive buffers, receive FIFO buffers, transmit/receive FIFO buffers, and transmit buffers are located in succession.

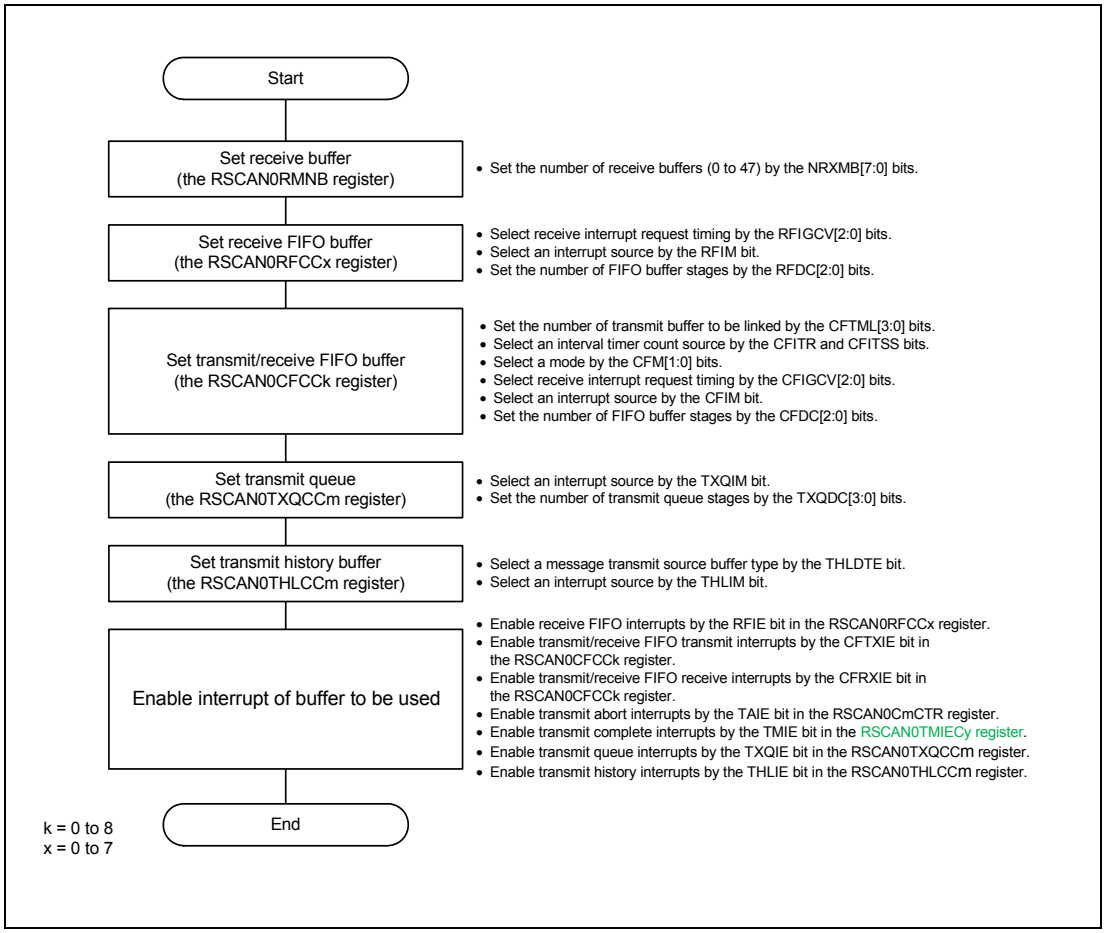


Figure 22.21 Buffer Setting Procedure

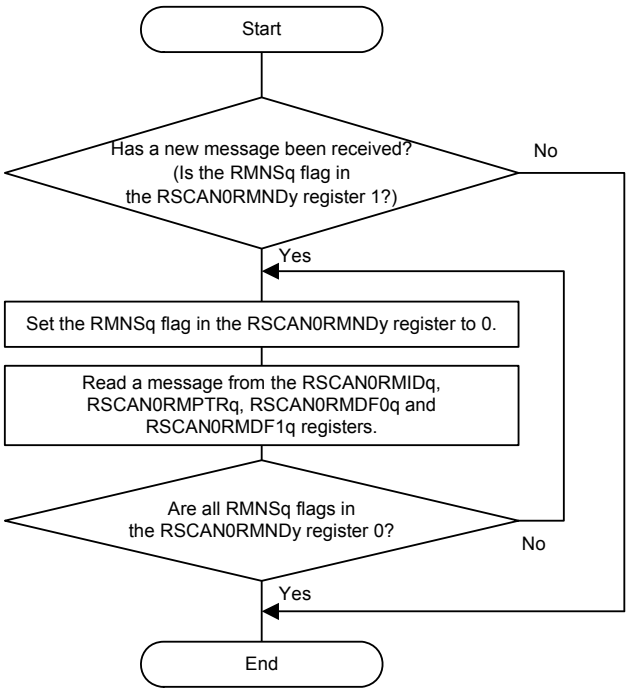
22.10.2 Reception Procedure

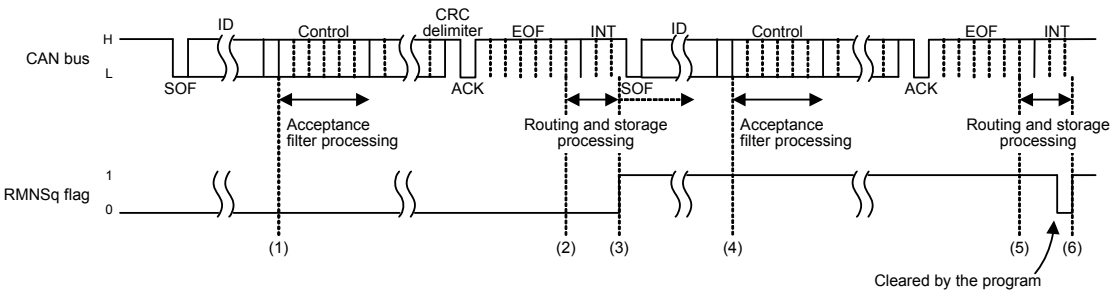
22.10.2.1 Receive Buffer Reading Procedure

When the processing to store received messages in a receive buffer starts, the RMNSq flag in the RSCAN0RMNDy register (y = 0 to 1, q = 0 to 47) is set to 1 (receive buffer q contains a new message). Messages can be read from the RSCAN0RMIDq, RSCAN0RMPTRq, RSCAN0RMDF0q, and RSCAN0RMDF1q registers. If the next message has been received before the current message is read from the receive buffer, the message is overwritten. **Figure 22.22** shows the receive buffer reading procedure.



Note: y = 0, 1, q = 0 to 47

Figure 22.22 Receive Buffer Reading Procedure



Note: y = 0, 1, q = 0 to 47
RMNSq: Flag in the RSCAN0RMNDy register

Figure 22.23 Receive Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCAN0GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing, the processing to store the message in the specified receive buffer starts.
When the message storage processing starts, the RMNSq flag in the corresponding RSCAN0RMNDy register is set to 1 (the receive buffer contains a new message). If other channels are performing filter processing or transmit priority determination processing, the routing processing and the storage processing may be delayed.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCAN0GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(6) When the corresponding RMNSq flag is cleared to 0 (the receive buffer contains no new message), this flag is set to 1 again when the message storage processing starts. Even if the RMNSq flag remains 1, a new message is overwritten to the receive buffer. The RMNSq flag should not be cleared to 0 during storage of messages.

22.10.2.2 FIFO Buffer Reading Procedure

When received messages have been stored in one or more receive FIFO buffers or a transmit/receive FIFO buffer that is set to receive mode or gateway mode, the corresponding message count display counter (RFMC[7:0] bits in the RSCAN0RFSTSx register (x = 0 to 7) or CFMC[7:0] bits in the RSCAN0CFSTSk register (k = 0 to 8)) is incremented by 1. At this time, when the RFIE bit (receive FIFO interrupt is enabled) in the RSCAN0RFCCx register or the CFRXIE bit (transmit/receive FIFO receive interrupt is enabled) in the RSCAN0CFCCk register is set to 1, an interrupt request is generated. Received messages can be read from the RSCAN0RFIDx, RSCAN0RFPTRx, RSCAN0RFDF0x, and RSCAN0RFDF1x registers for receive FIFO buffers, or from the RSCAN0CFIDk, RSCAN0CFPTRk, RSCAN0CFDF0k, and RSCAN0CFDF1k registers for transmit/receive FIFO buffers. Messages in FIFO buffers can be read sequentially on a first-in, first-out basis.

When the message count display counter value matches the FIFO buffer depth (a value set by the RFDC[2:0] bits in the RSCAN0RFCCx register or the CFDC[2:0] bits in the RSCAN0CFCCk register), the RFFLL or CFFLL flag is set to 1 (the receive FIFO buffer is full).

When all messages have been read out of the FIFO buffer, the RFEMP flag in the RSCAN0RFSTSx register or the CFEMP flag in the RSCAN0CFSTSk register is set to 1 (the receive FIFO buffer contains no unread message (buffer empty)).

If the RFE bit or the CFE bit is cleared to 0 (no receive FIFO buffer is used) with the interrupt request flag (RFIF flag in the RSCAN0RFSTSx register or CFRXIF flag in the RSCAN0CFSTSk register) set to 1 (a receive FIFO interrupt request is present), the interrupt request flag is not automatically cleared to 0. The program must clear the interrupt request flag to 0.

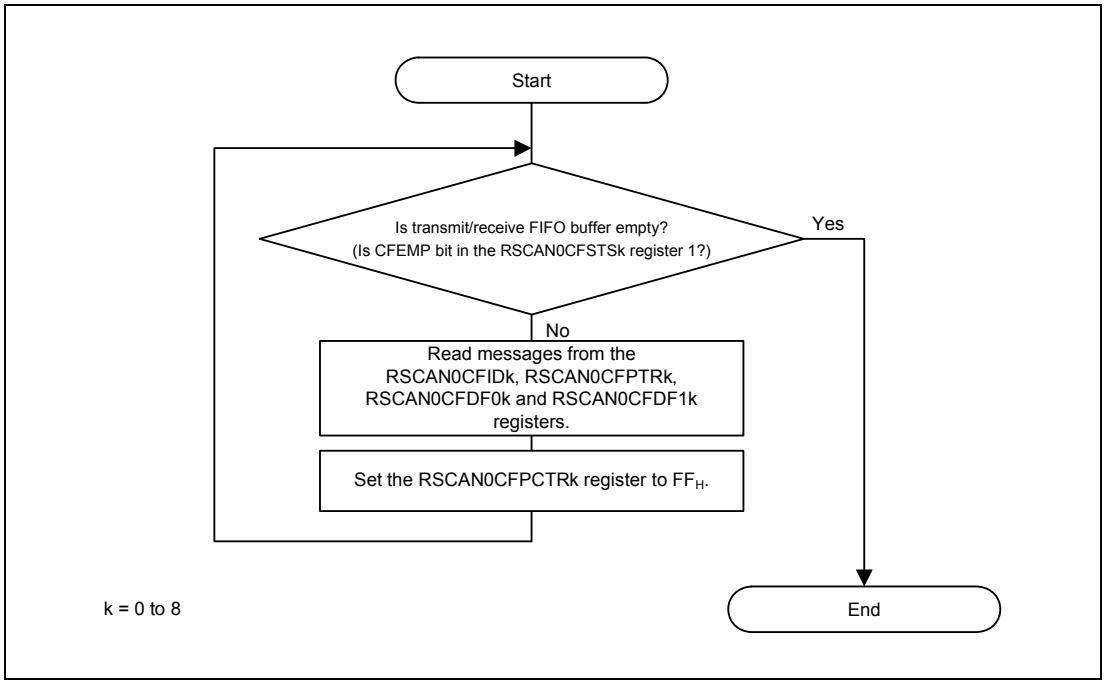


Figure 22.24 Transmit/Receive FIFO Buffer Reading Procedure

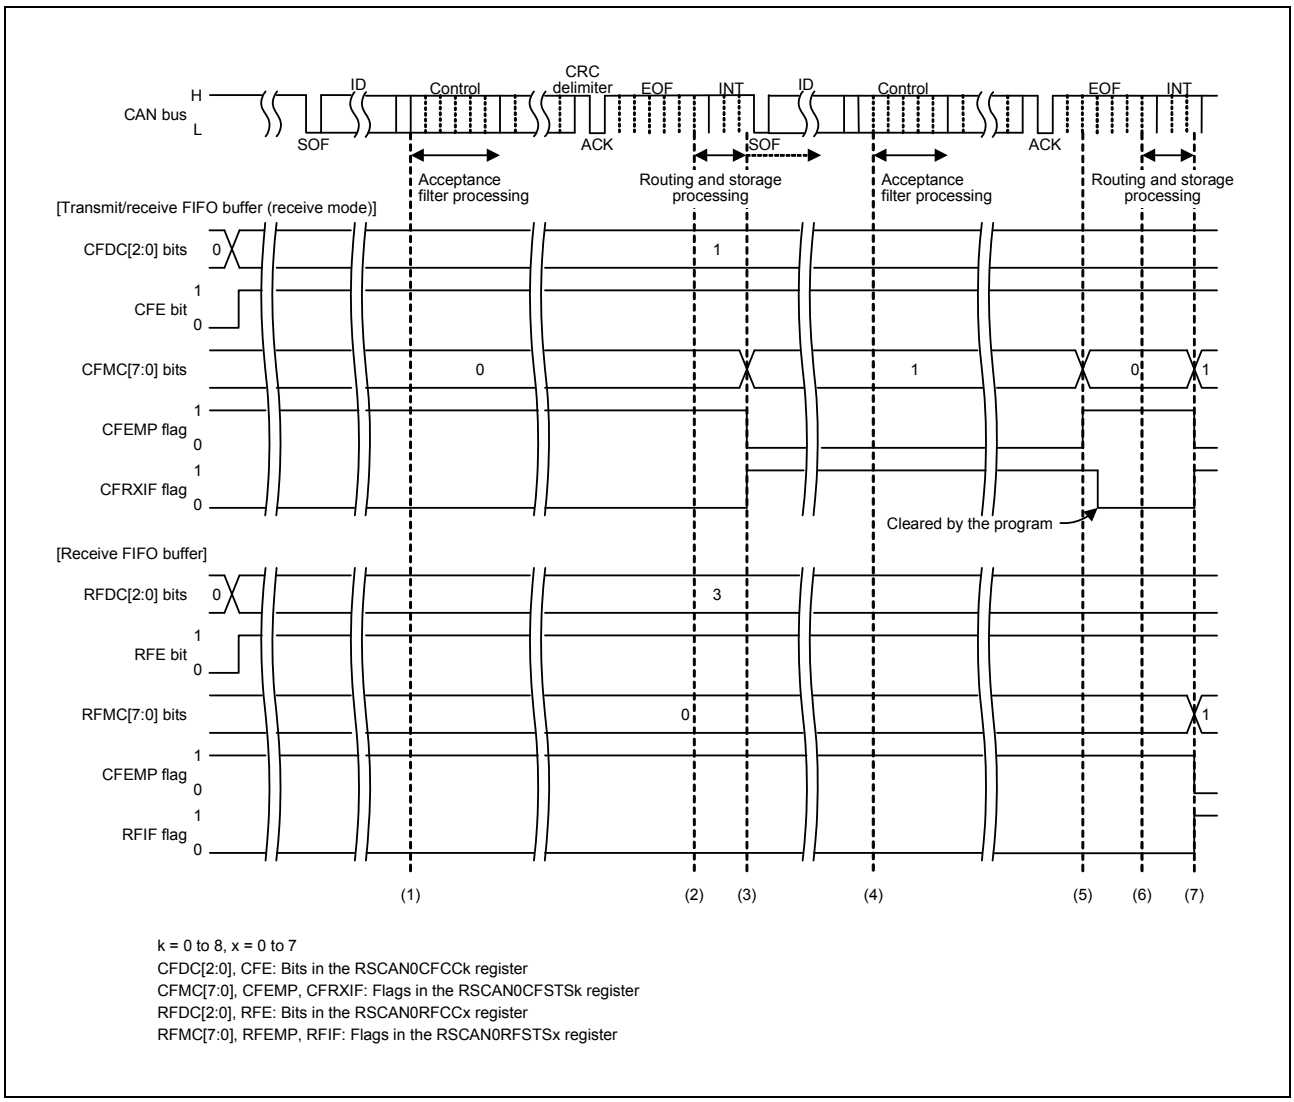

Figure 22.25 FIFO Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCAN0GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing and the CFE bit in the RSCAN0CFCCk register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCAN0CFCCk register is 001_B or more, the message is stored in the transmit/receive FIFO buffer that is set to receive mode. The CFMC[7:0] value in the RSCAN0CFSTSk register is incremented and becomes 01_H. When the CFIM bit in the RSCAN0CFCCk register is set to 1 (a FIFO receive interrupt request is generated each time a message has been received), the CFRXIF flag in the RSCAN0CFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). The CFRXIF flag can be reset to 0 by the program.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) Read received messages from the RSCAN0CFIDk, RSCAN0CFPTRk, RSCAN0CFDF0k, and RSCAN0CFDF1k registers and write FF_H to the RSCAN0CFPCTRk register. This causes the

CFMC[7:0] bits in the RSCAN0CFSTSk register to be decremented. When CFMC[7:0] becomes 00_H, the CFEMP flag in the RSCAN0CFSTSk register becomes 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

(6) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCAN0GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(7) The message is stored in the transmit/receive FIFO buffer set in receive mode when the message has passed through the DLC filter process if the CFE bit is set to 1 (transmit/receive FIFO buffers are used), and the CFDC[2:0] bits are set to 001_B or more. The CFMC[7:0] bit value is incremented by 1 to be 01_H. When the CFIM bit is set to 1 (an interrupt occurs each time a message has been received), the CFRXIF flag is set to 1 (a transmit/receive FIFO receive interrupt request is present).
The message is stored in the receive FIFO buffer if the RFE bit in the RSCAN0RFCCx register is set to 1 (receive FIFO buffers are used), and the RFDC[2:0] bits in the RSCAN0RFCCx register are set to 001_B or more. The RFMC[7:0] bits in the RSCAN0RFSTSx register are set to 01_H by being incremented by 1. When the RFIM bit in the RSCAN0RFCCx register is set to 1 (an interrupt occurs each time a message has been received), the RFIF flag in the RSCAN0RFSTSx register is set to 1 (a receive FIFO interrupt request is present).

22.10.3 Transmission Procedure

22.10.3.1 Procedure for Transmission from Transmit Buffers

Figure 22.26 shows the procedure for transmission from transmit buffers.

Figure 22.27 shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmission has been successfully completed. **Figure 22.28** shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmit abort has been completed.

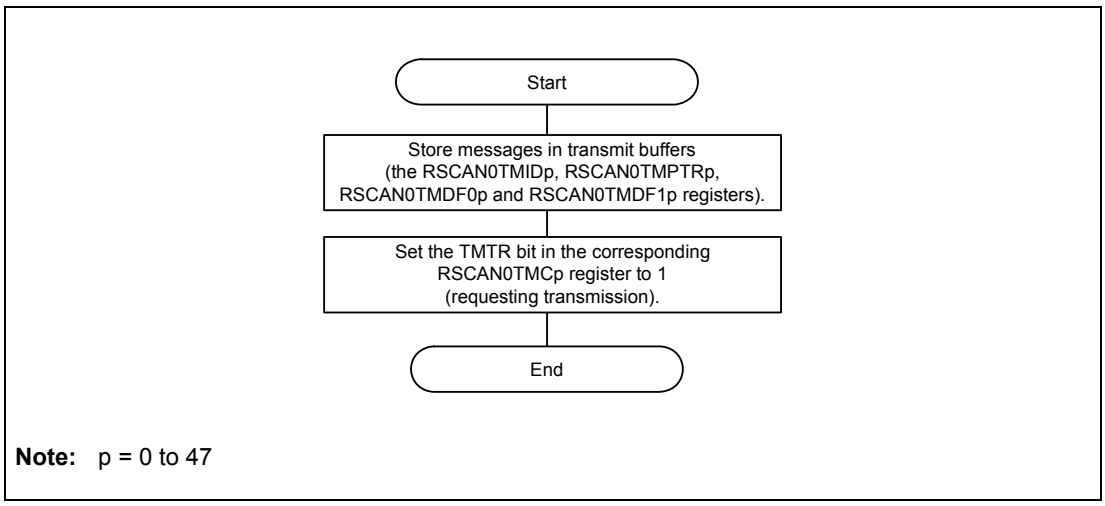

Figure 22.26 Procedure for Transmission from Transmit Buffers

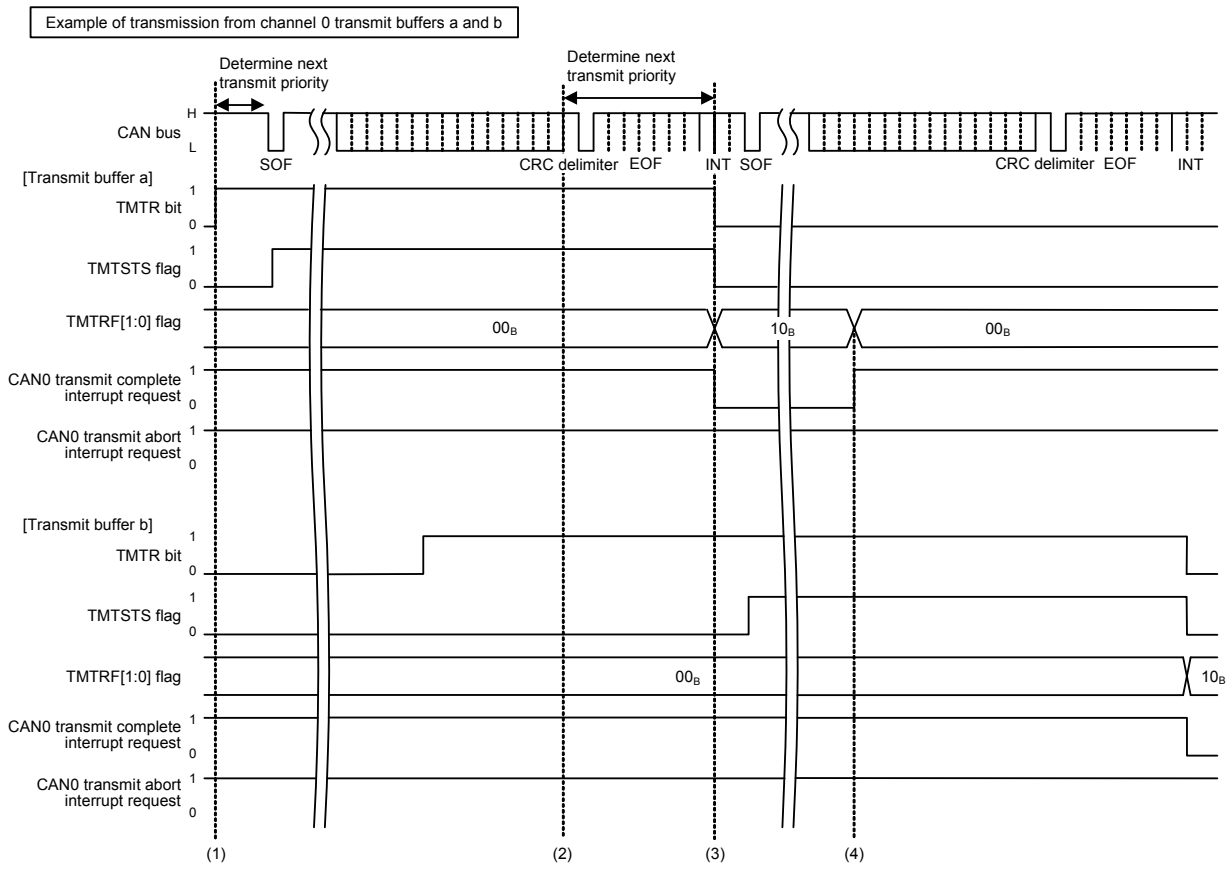


Note: a = 0 to 47, b = 0 to 47
TMTR: Bit in the RSCAN0TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCAN0TMSTSp registers

Figure 22.27 Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully)

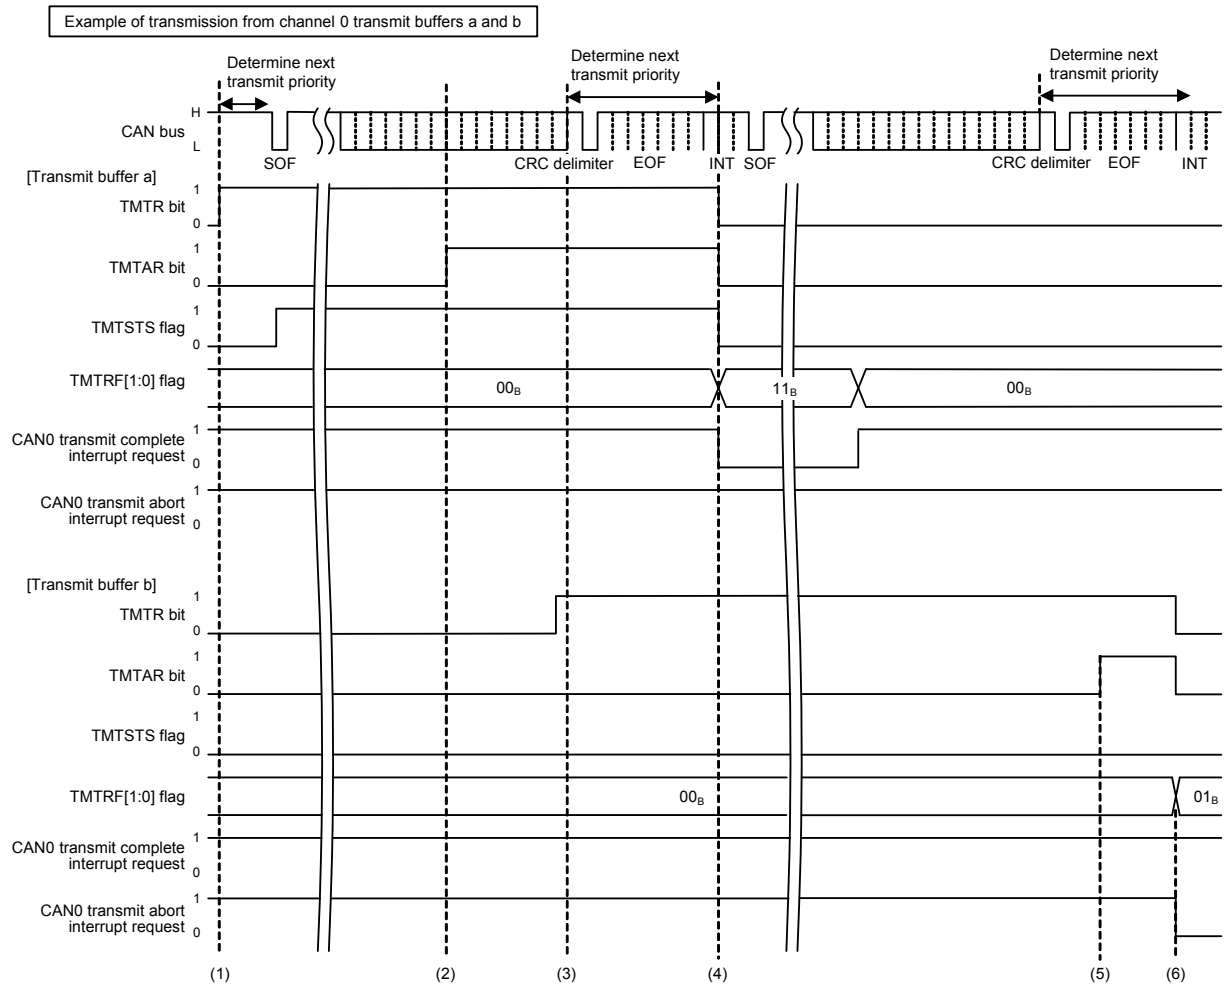
(1) When the TMTR bit in the RSCAN0TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCAN0TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

(2) When a transmit request from a buffer is present, the priority determination starts with the CRC delimiter for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the TMTRF[1:0] flag in the RSCAN0TMSTSa register is set to 10_B (transmission has been completed (without transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCAN0TMCa register are cleared to 0. When the TMIEa bit in the RSCAN0TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B (transmission is in progress or no transmit request is present).

(4) Before starting the next transmission, set the TMTRF[1:0] flag to 00_B. Write the next message to the transmit buffer, and then set the TMTR bit to 1 (transmission is requested). The TMTR bit can be set to 1 only when the TMTRF[1:0] flag value is 00_B.

If an arbitration-lost has occurred after transmission is started, the TMTSTS flag is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC delimiter to search the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.



Note: a = 0 to 47, b = 0 to 47
TMTR, TMTAR: Bits in the RSCAN0TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCAN0TMSTSp register

Figure 22.28 Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) When the TMTR bit in the RSCAN0TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCAN0TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

(2) When it is determined that the transmit buffer is used for the next transmission or transmission is in progress, message transmission is not aborted unless an error or arbitration loss occurs even if the TMTAR bit is set to 1 (transmit abort is requested).

(3) The priority determination starts with the CRC delimiter for the next transmission. In this timing chart, buffer b is not selected as the next transmit buffer. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(4) When transmission completes successfully, the TMTRF[1:0] flag in the RSCAN0TMSTSa register is set to 11_B (transmission has been completed (with transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCAN0TMCa register are cleared to 0. When the TMIEa value in the RSCAN0TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B (transmission is in progress or no transmit request is present).

(5) While another CAN node is transmitting data on the CAN bus (TMTSTS flag = 0), if the TMTAR bit is set to 1 while the corresponding channel is determining transmit priority, the TMTR bit cannot be cleared to 0.

(6) After the internal processing time has passed, the transmission is terminated and the TMTRF[1:0] flag is set to 01_B. When the transmit buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not being made, an abort request is immediately accepted and the TMTRF[1:0] flag is set to 01_B. At this time, the TMTR and TMTAR bits are cleared to 0. When transmit abort is completed with the TAIE bit in the RSCAN0CmCTR register set to 1 (transmit abort interrupt is enabled), an interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B.

If an arbitration loss has occurred after the CAN channel started transmission, the TMTSTS bit is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC delimiter to find the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

22.10.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers

Figure 22.29 shows the procedure for transmission from transmit/receive FIFO buffers.

Figure 22.30 shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmission has been successfully completed. **Figure 22.31** shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmit abort has been completed.

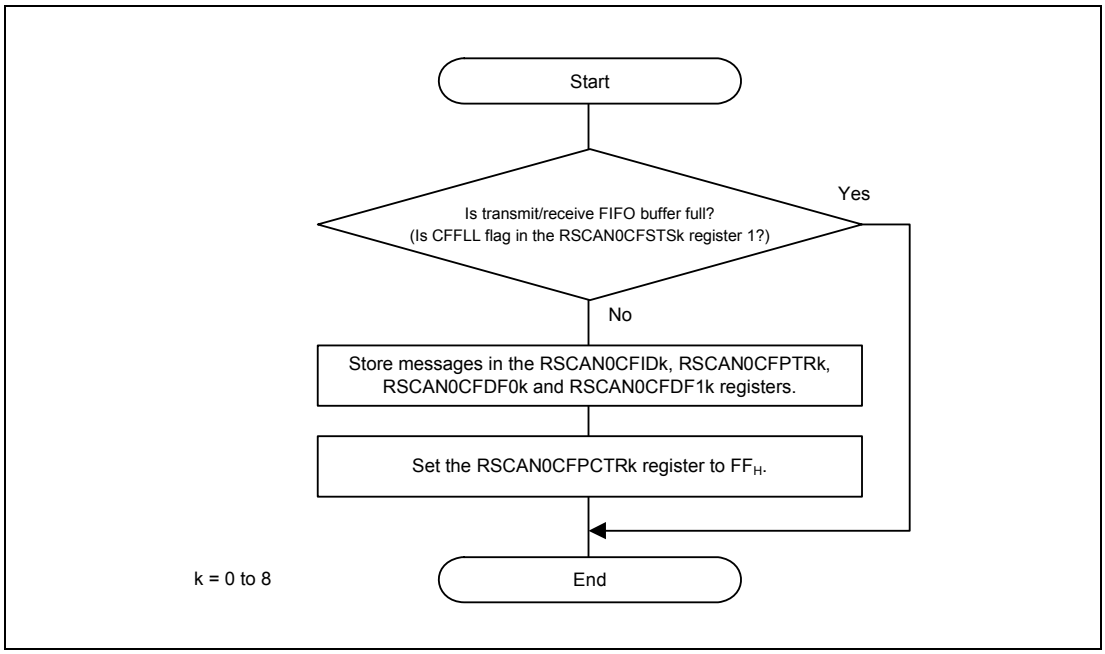


Figure 22.29 Procedure for Transmission from Transmit/Receive FIFO Buffers

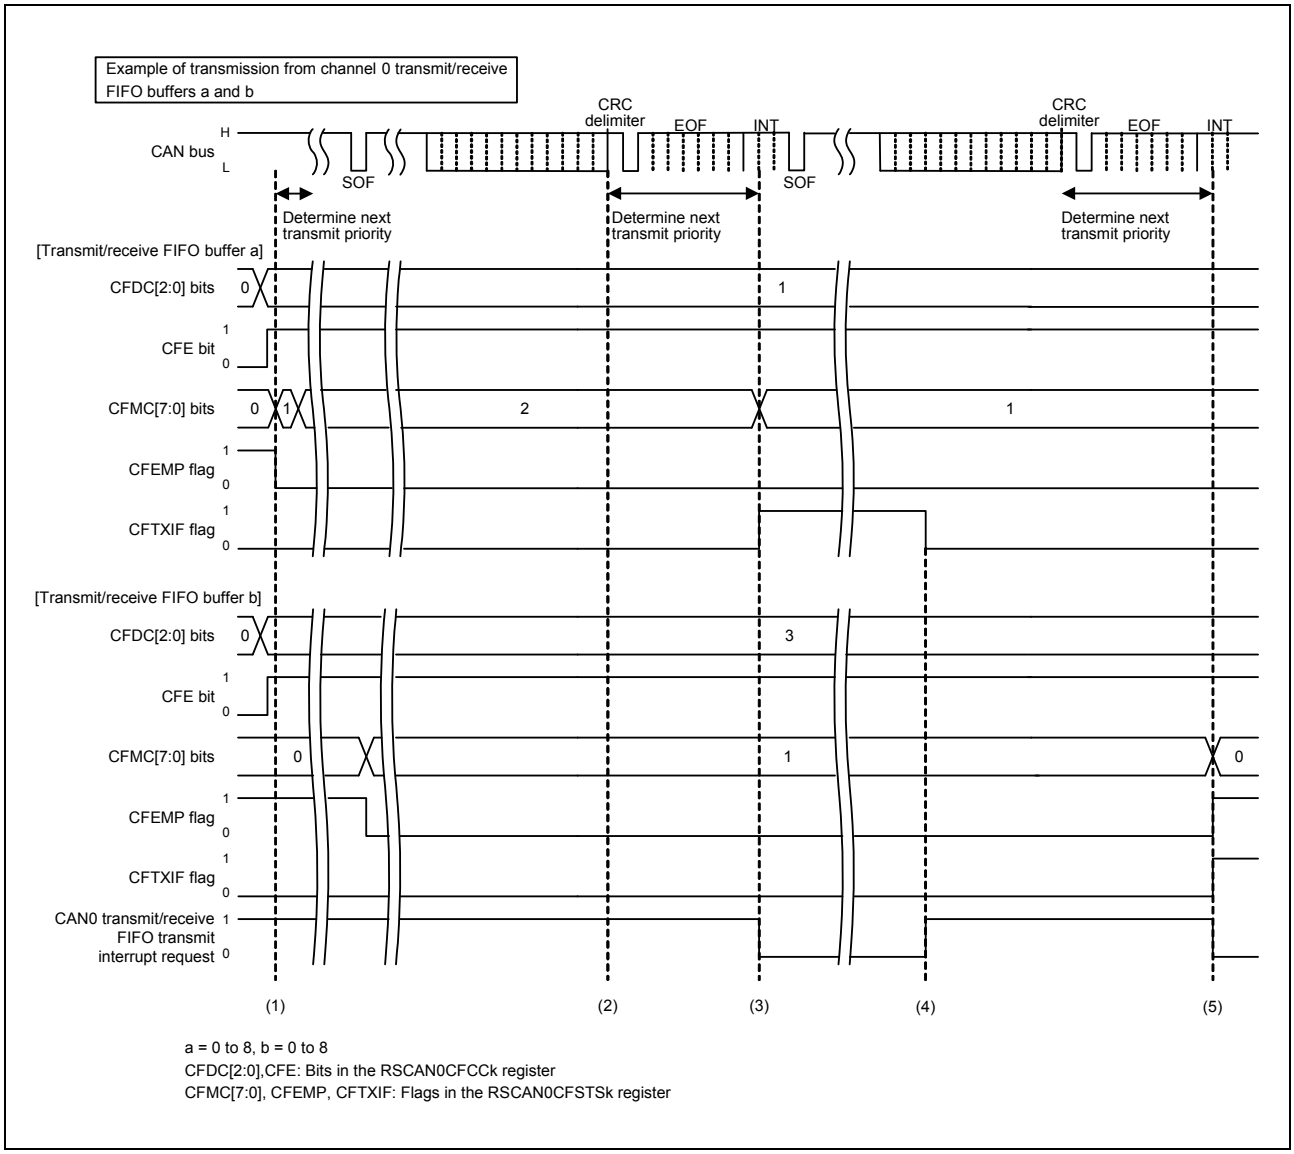

Figure 22.30 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully)

(1) While the CAN bus is idle, when the CFE bit in the RSCA0CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCAN0CFCCa register is 001_B (4 messages) or more and the CFMC[7:0] value in the RSCAN0CFSTSa register is 01_H or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When a transmit request from a buffer is present, the priority determination starts with the CRC delimiter for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the CFMC[7:0] value in the RSCAN0CFSTSa register is decremented by 1. Setting the CFIM bit in the RSCAN0CFCCa register to 1 (a FIFO transmit

interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCAN0CFSTSk register to 1 (a transmit/receive FIFO transmit interrupt request is present).

(4) The program can clear the CFTXIF flag.

(5) Message transmission from transmit/receive FIFO buffer b of channel 0 has been completed and the CFMC[7:0] value in the RSCAN0CFSTSb register is decremented by 1. The CFMC[7:0] bits are cleared to 00_H and therefore the CFEMP flag in the RSCAN0CFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

Transmission is continued until the CFEMP flag is set to 1. It is possible to continuously store transmit messages in FIFO buffers until the CFFLL flag in the RSCAN0CFSTSa and RSCAN0CFSTSb register is set to 1 (the transmit/receive FIFO buffer is full).

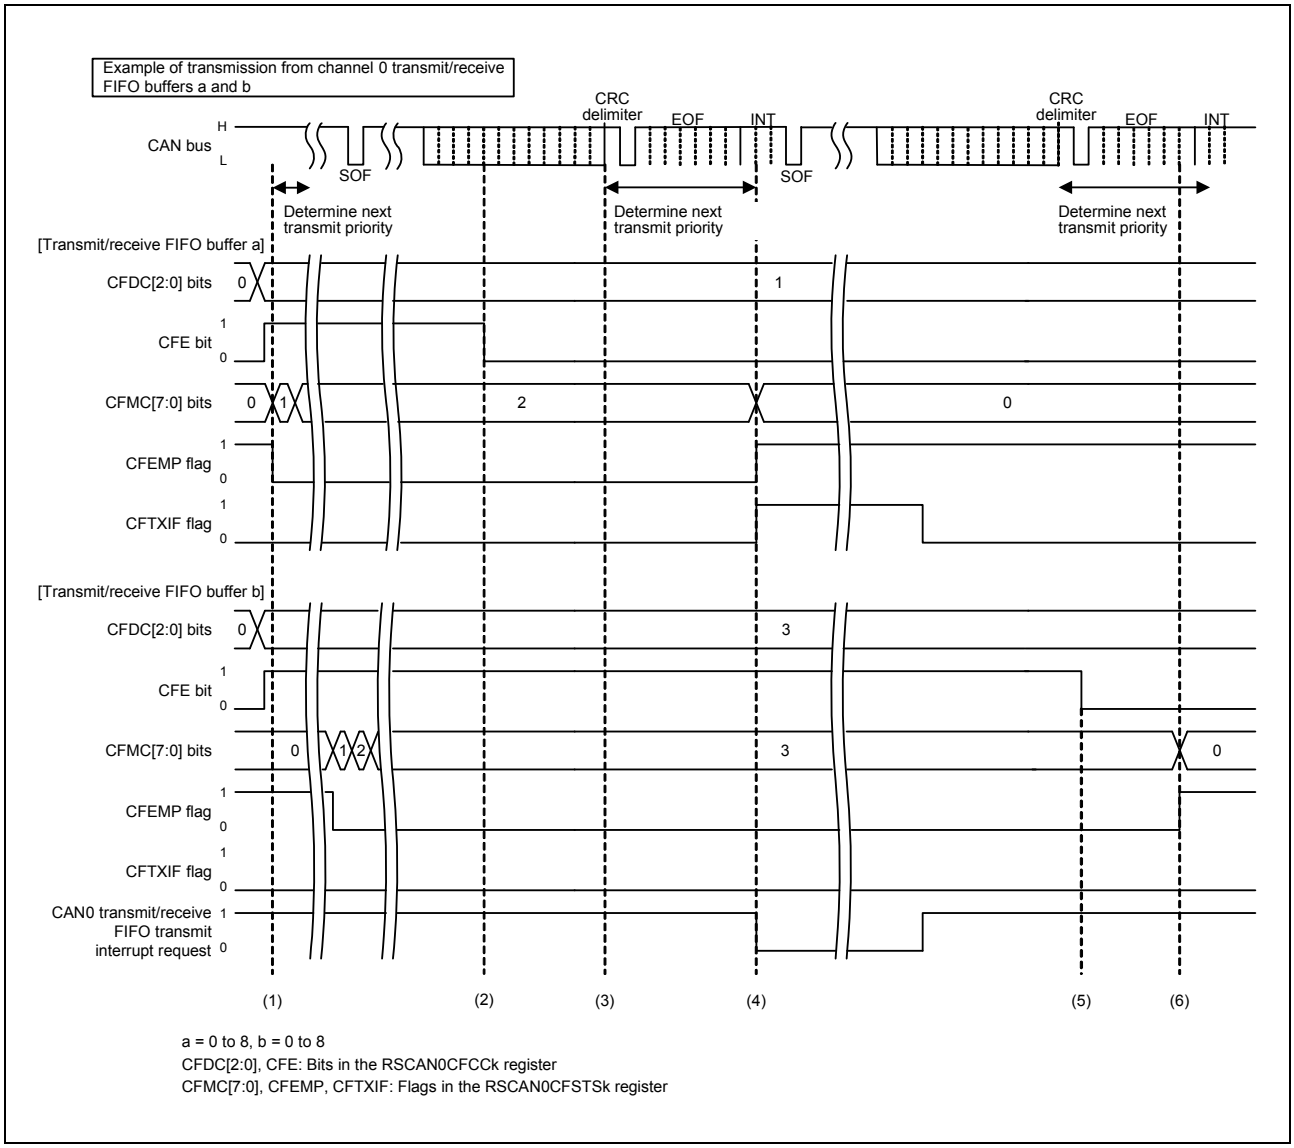

Figure 22.31 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) While the CAN bus is idle, when the CFE bit in the RSCAN0CFCCa register (a = 0 to 8) is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCAN0CFCCa register is 001_B (4 messages) or more and the CFMC[7:0] value in the RSCAN0CFSTSa register is 01_H or more, the priority determination processing starts to determine the highest-priority transmit

message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When transmission is in progress or it is determined that the transmit/receive FIFO buffer is used for the next transmission, message transmission is not aborted unless an error or arbitration loss occurs even if the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

(3) When a transmit request from a buffer is present, the priority determination starts with the CRC delimiter for the next transmission. In this figure, transmit/receive FIFO buffer b is not selected as a buffer for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(4) When transmit completes successfully, the CFMC[7:0] value is cleared to 00_H. Setting the CFIM bit to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCAN0CFSTSa register to 1 (a transmit/receive FIFO transmit interrupt request is present). The program can clear the CFTXIF flag.

(5) If another CAN node on the CAN bus is transmitting data (not from transmit/receive FIFO buffer b), transmit/receive FIFO buffers cannot be disabled immediately even if the CFE bit in the RSCAN0CFCCb register is cleared to 0 (no transmit/receive FIFO buffer is used) during transmit priority determination. (The CFEMP flag in the RSCAN0CFSTSb register is not set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) immediately.)

(6) After the internal processing time has passed, transmit/receive FIFO buffers are disabled and the CFMC[7:0] bits in the RSCAN0CFSTSb register are cleared to 00_H and the CFEMP flag is set to 1. When the transmit/receive FIFO buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not in progress, the transmit/receive FIFO buffer is immediately disabled. (The CFMC[7:0] bits are cleared to 00_H and the CFEMP flag is set to 1.)

22.10.3.3 Procedure for Transmission from the Transmit Queue

Figure 22.32 shows the procedure for transmission from the transmit queue.

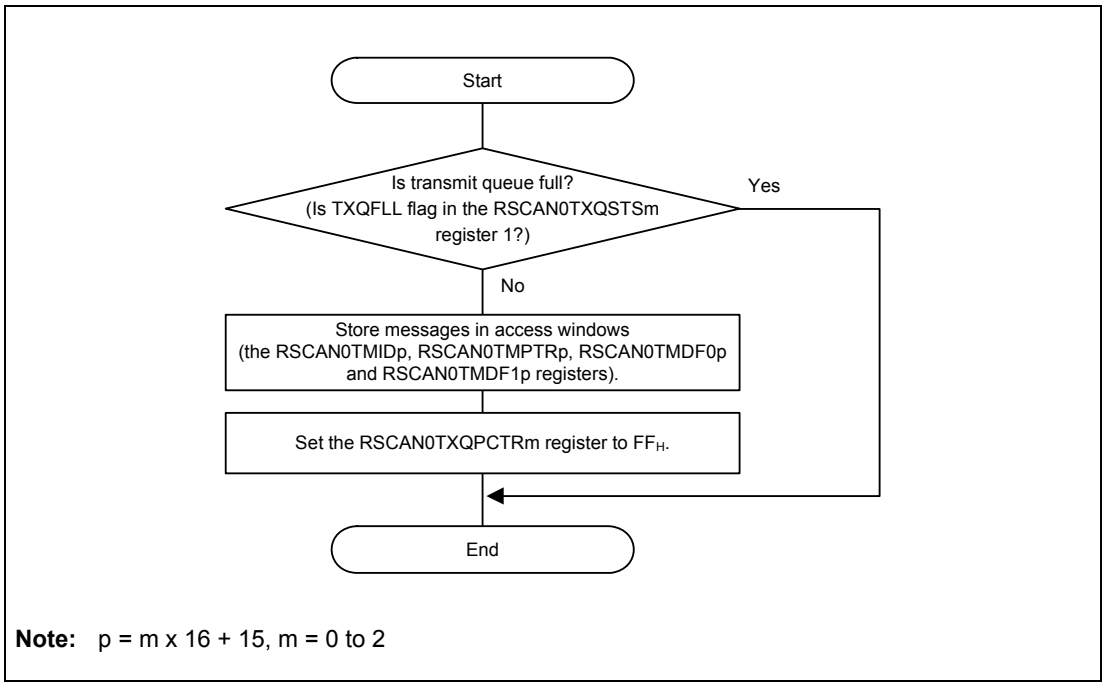

Figure 22.32 Procedure for Transmission from the Transmit Queue

22.10.3.4 Transmit History Buffer Reading Procedure

Transmit history data can be read from the RSCAN0THLACCm register. The next data can be accessed by writing FF_H to the corresponding RSCAN0THLPCTRm register (m = 0 to 2) after reading a set of data. **Figure 22.33** shows the transmit history buffer reading procedure.

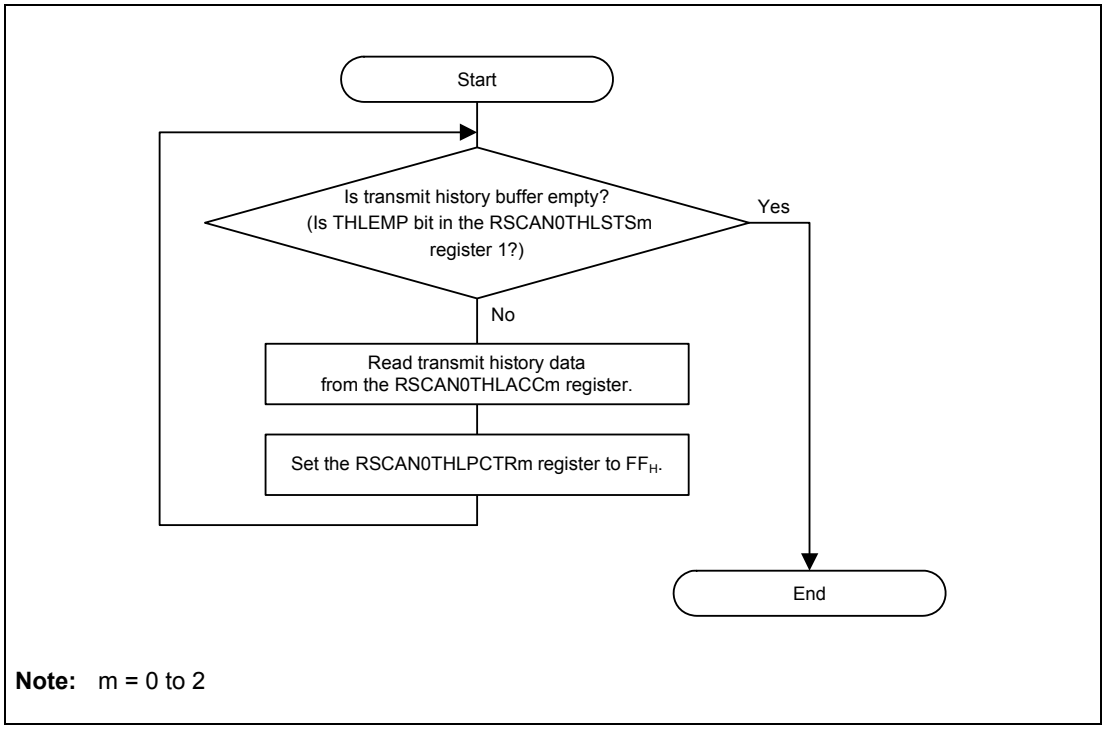

Figure 22.33 Transmit History Buffer Reading Procedure

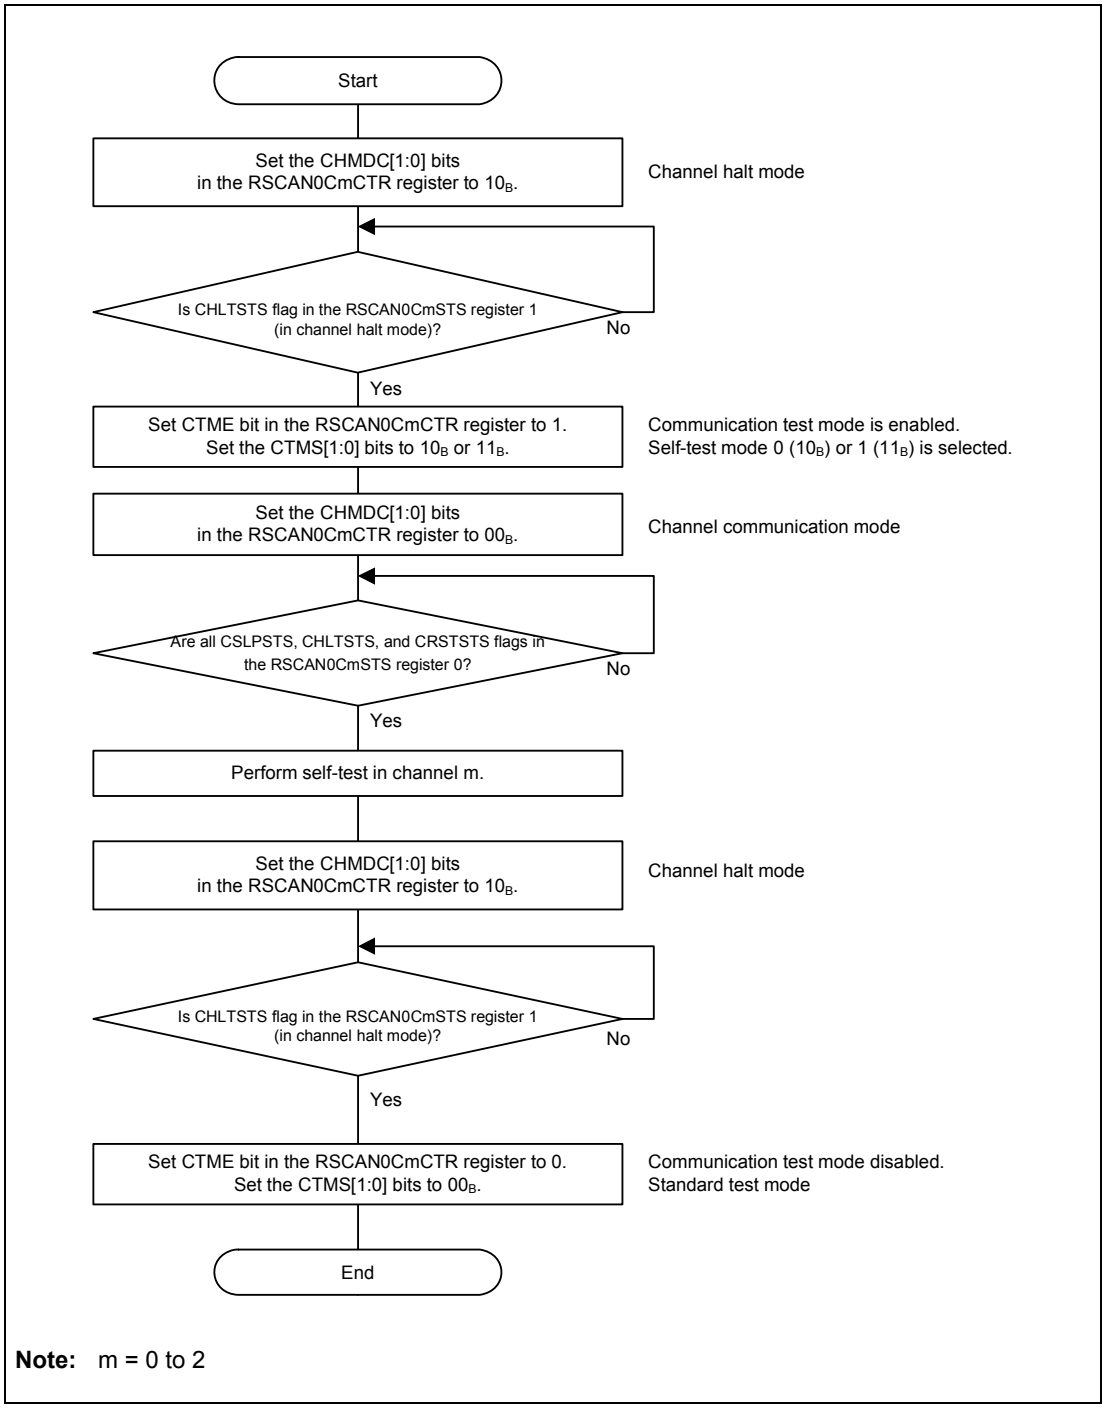
22.10.4 Test Settings

22.10.4.1 Self-Test Mode Setting Procedure

Self-test mode allows communication test on a channel basis by enabling a CAN node to receive its own transmitted messages.

Figure 22.34 shows the self-test mode setting procedure.



Note: m = 0 to 2

Figure 22.34 Self-Test Mode Setting Procedure

22.10.4.2 Procedure for Releasing the Protection

Since the global test function in **Table 22.97** is protected, write the protection release data 1 and release data 2 in succession to the LOCK[15:0] bits in the RSCAN0GLOCKK register, then set the target test bit to 1.

Table 22.97 Protection Release Data for Test Function

Test Function	Protection Release Data 1	Protection Release Data 2	Target Bit
RAM test	7575_H	$8A8A_H$	RTME bit in the RSCAN0GTSTCTR register

If an incorrect value is written to the LOCK[15:0] bits, restart from writing the protection release data 1. **Figure 22.35** shows the procedure for releasing the protection.

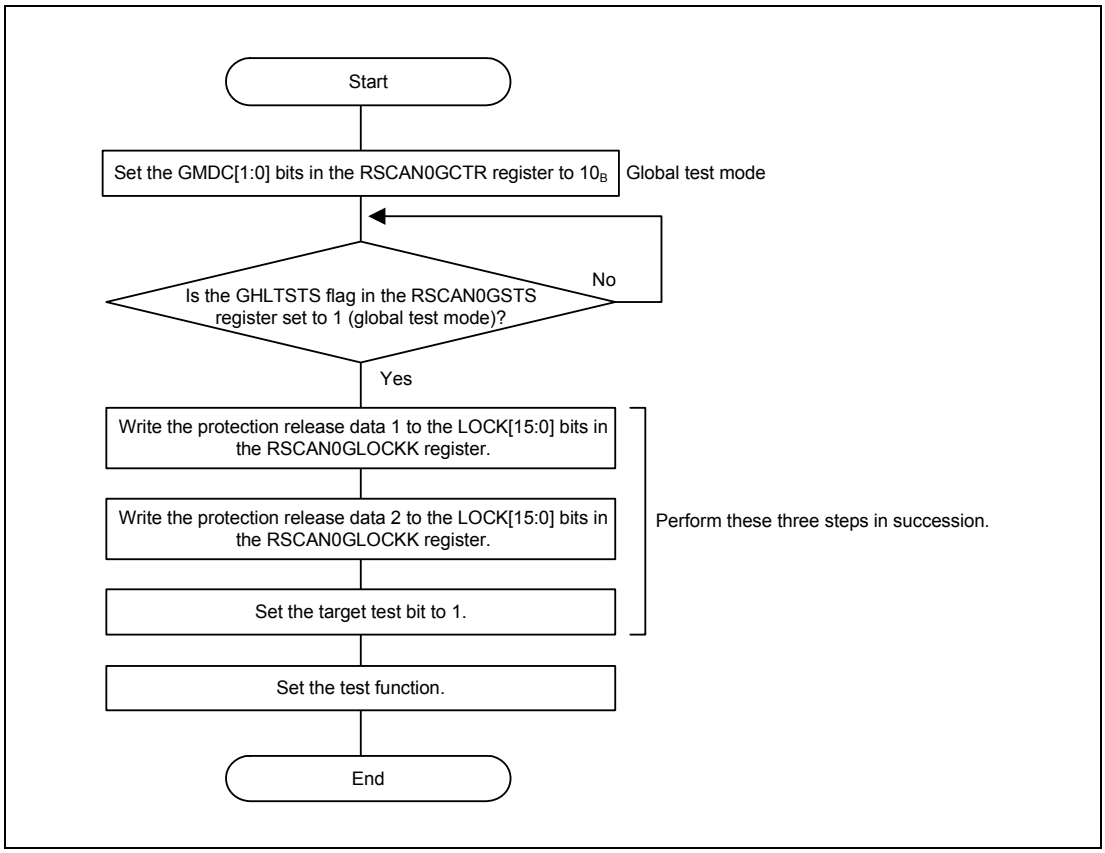


Figure 22.35 Protection Release Procedure

22.10.4.3 RAM Test Setting Procedure

RAM tests include CAN RAM read/write test. The read/write test verifies that data written to the RAM is read correctly. Before closing the RAM test, write 0000 0000_H to all pages of the CAN RAM.

Figure 22.36 shows the RAM test setting procedure.

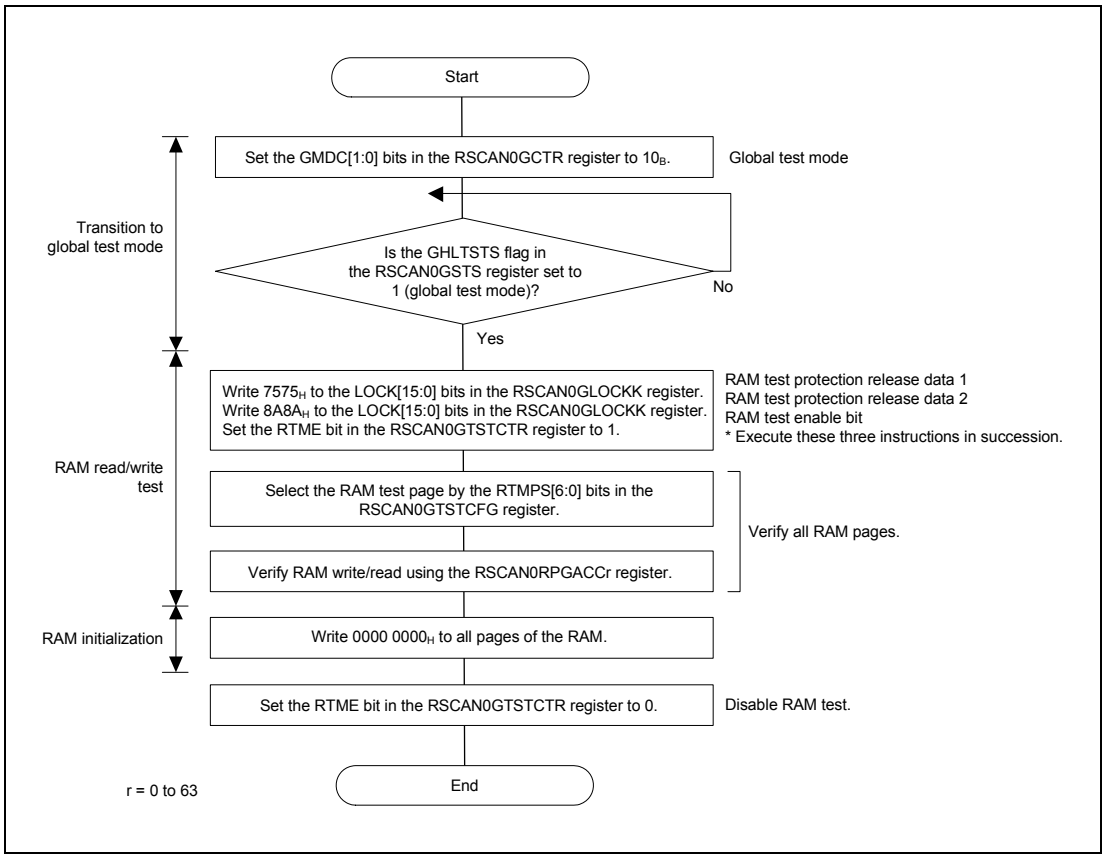

Figure 22.36 RAM Test Setting Procedure

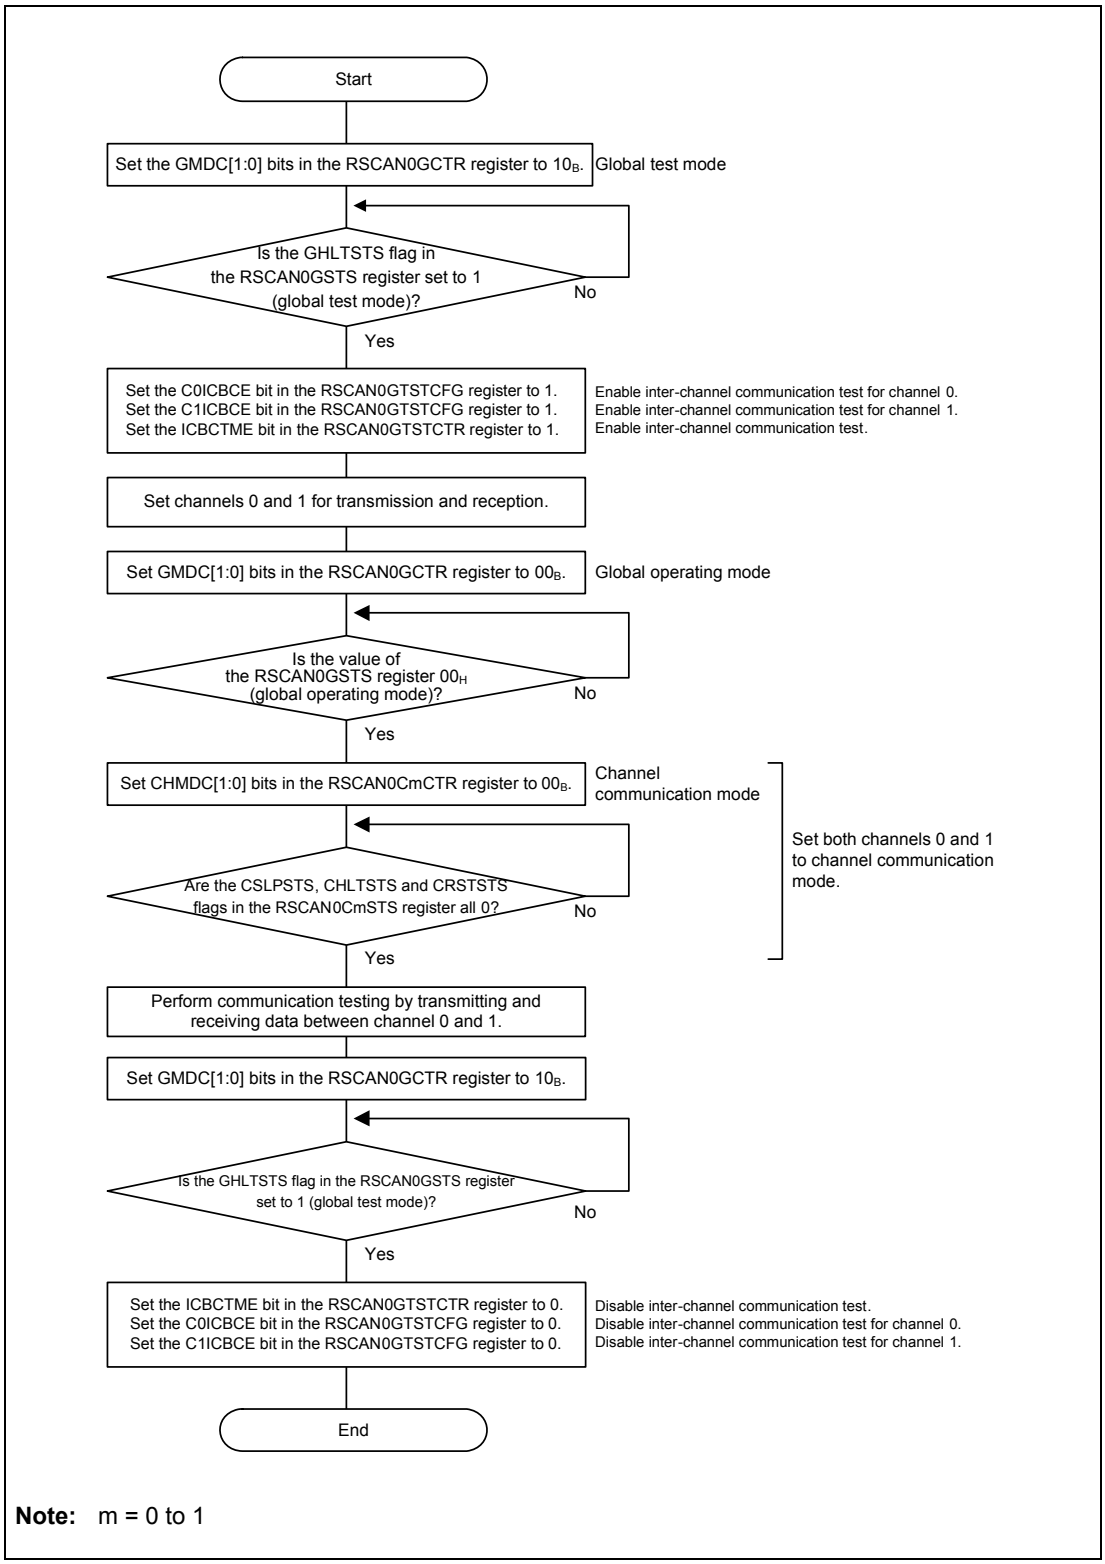
22.10.4.4 Inter-Channel Communication Test Setting Procedure

Communication testing can be performed by transmitting and receiving data between different channels.

Figure 22.37 shows the inter-channel communication test setting procedure.



Note: m = 0 to 1

Figure 22.37 Inter-Channel Communication Test Setting Procedure (Example of Communication Test between Channel 0 and Channel 1)

22.11 Detection and Correction of Errors in RSCAN RAM

22.11.1 ECC for the RSCAN0 RAM

Table 22.98 gives an outline of the ECC functions for the RSCAN0 RAM.

Table 22.98 List of the ECC Functions for the RSCAN0 RAM

Item	Outline of Functions
ECC error detection/correction	The RAM is checked for ECC errors. The following options are selectable. • 2-bit error detection and 1-bit error detection/correction • 2-bit error detection and 1-bit error detection The ECC error detection/correction can be disabled by using through mode. With the initial settings, error detection/correction is enabled.
Error notification	When an ECC 2-bit error is generated, the error is notified. • Error notification can be enabled or disabled when an ECC 2-bit error is detected. In the initial setting, 2-bit error notification is enabled.
Error status	Monitoring for the detection of two-bit ECC errors and for the detection of one-bit ECC errors is available. A register for clearing the error status is provided.
Address capture	• Only one address at which an ECC error has occurred can be captured. • A signal is generated upon detection of a 2-bit or ECC 1-bit error, and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared).

CAUTION

When ECC error detection/correction is performed, confirm initialization of the RSCAN0 RAM (RSCAN0GSTS.GRAMINIT = 0) before it is used.

NOTE

There are two ECC decoders for the RSCAN0 RAM.
One is for page 0 to 11 of RSCAN0 RAM.
The other is for page 12 to 29.
In case of testing ECC, test two decoders.

22.11.2 Interrupt Request

Table 22.99 lists the ECC interrupt request of RSCAN0 RAM.

Table 22.99 Interrupt Requests

Unit Interrupt Signal	Outline	Connected to
—	RSCAN ECC 2 bit error interrupt	Error Control Module INTECCDPERIRAM
—	RSCAN ECC 1 bit error interrupt	Error Control Module INTECCSPERIRAM

22.11.3 ECCRCAN0CTL — RSCAN0 ECC Control Register

The ECCRCAN0CTL register controls the mode of the ECC and the status for RSCAN0.

Bits 7, 5 and 4 should be set (written) while the RSCAN0 operation is stopped.

In addition, when writing to bit 7, EMCA1 and EMCA0 need to be 01_B.

Access: This register can be read/written in 16-bit units.

Address: FFC7 1000_H

Value after reset: Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA1	EMCA0	—	—	—	ECER2C	ECER1C	—	ECTHM	ECERVF	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	Undefined
R/W	R/W*1	R/W*1	R	R	R	R/W*1	R/W*1	R	R/W	R/W	R/W	R/W	R/W	R	R	R

Note 1. These bits are always read as 0.

Table 22.100 ECCRCAN0CTL Register Contents (1/2)

Bit position	Bit Name	Function
15	EMCA1	Access control bits 1 and 0 to ECC mode selection bit These bits specify whether modifying the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 01_B, writing to bit 7 is enabled.
14	EMCA0	
13 to 11	Reserved	When read, the value after reset is returned. Writing to these bits, write the value after reset.
10	ECER2C	2-bit ECC error detection flag clear bit This bit is used to clear the 2 bit error detection flag of ECER2F (bit 2). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority.
9	ECER1C	1-bit ECC error correction accumulation flag clear bit This bit is used to clear the 1 bit error detection/correction flag of ECER1F (bit 1). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority.
8	Reserved	When read, the value after reset is returned. Writing to these bits, write the value after reset.
7	ECTHM	ECC function through mode selection bit This bit is used to set enabling and disabling of ECC. Setting this bit to 1 disables ECC function. When writing to this bit, (0, 1) must be written to (EMCA1, EMCA0) at the same time. 0: Through mode is disabled (normal operation mode). 1: Through mode is enabled. (ECC function disable)
6	ECERVF	ECC error judgment enable 0: error judgement disabled 1: error judgement enabled Error judgement is only effective in normal operation mode, i.e. if ECCRCAN0CTL.ECTHM = 0. If error judgement is disabled no interrupts are asserted in case of a single or double bit error detection. However detected single bit errors are corrected. Modification of this bit is only possible, if EMCA[1:0] = 01_B. Otherwise any write to this bit is ignored.

Table 22.100 ECCRCAN0CTL Register Contents (2/2)

Bit position	Bit Name	Function
5	EC1ECP	1-bit error correction enable bit This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled. 0: When 1-bit error is detected, the error will be corrected. 1: When 1-bit error is detected, the error will not be corrected.
4	EC2EDIC	2-bit error detection interrupt control bit This bit controls whether to generate an interrupt when 2-bit error is detected. 0: When 2-bit error is detected, a INTECCDCNRAM interrupt will not be generated. 1: When 2-bit error is detected, a INTECCDCNRAM interrupt will be generated. (initial value) When ECC 2-bit detection is used, EC2EDIC must be set to 1.
3	EC1EDIC	1-bit error detection interrupt control bit This bit controls whether to generate an interrupt when 1-bit error is detected. 0: When 1-bit error is detected, a INTECCSPERIRAM interrupt will not be generated. 1: When 1-bit error is detected, a INTECCSPERIRAM interrupt will be generated. When ECC 1-bit detection is used, EC1EDIC must be set to 1.
2	ECER2F	2-bit error detection flag bit This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). When 2-bit error interrupt is enabled (EC2EDIC = 1) and this flag is set, an ECC 2-bit error interrupt (INTECCDCNRAM) is output. Write 1 to the ECER2C bit (bit 10) to clear the flag. This bit is cleared at the time of through mode enable selection (ECTHM = 1). If 2-bit error is detected again while this bit is set, an interrupt signal will not be generated. 0: 2-bit error has not occurred since this bit was cleared. 1: 2-bit error has occurred. When ECC 2-bit detection is used, EC2EDIC must be set to 1.
1	ECER1F	1-bit error detection/correction flag bit This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). Write 1 to the ECER1C bit (bit 9) to clear the flag. This bit is cleared at the time of through mode enable selection (ECTHM = 1). 0: 1-bit error has not occurred since this bit was cleared. 1: 1-bit error has occurred. When ECC 1-bit detection is used, EC1EDIC must be set to 1.
0	ECEMF	ECC error message flag This flag indicates whether an error exists in the current read data. This bit is updated whenever the RAM reads data. This bit might be set if it is read before initialization of the RAM. This bit is cleared at the time of through mode enable selection (ECTHM = 1) and when there is no 1 bit error in the decode circuit input data. 0: The currently-read RAM data does not have bit errors. 1: The currently-read RAM data have bit errors.

CAUTION

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

We recommend initializing the RAM before clearing bits 2 and 1.

22.11.4 ECCRCAN0TMC — RSCAN0 ECC Test Mode Control Register

The ECCRCAN0TMC register switches to and controls the test mode.

This register can be used when RSCAN is not accessed to RAM.

Access: This register can be read or written in 16-bit units.

Address: FFC7 1004_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ETMA1	ETMA0	—	—	—	—	—	—	ECTMCE	—	—	ECTRRS	ECREOS	ECENS	ECDCS	ECREIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W*1	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Note 1. These bits are always read as 0.

Table 22.101 ECCRCAN0TMC Register Contents (1/2)

Bit position	Bit Name	Function
15	ETMA1	Access control bits 1 and 0 to ECC test mode bit These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 10_B, writing to bit 7 is enabled.
14	ETMA0	
13 to 8	Reserved	When read, the value after reset is returned. Writing to these bits, write the value after reset.
7	ECTMCE	ECC test mode enable bit This bit specifies whether to enable access to the test registers and test control bits. When writing to this bit, (1, 0) should be written to (ETMA1, ETMA0) at the same time. 0: Access to the test mode registers and bits is disabled. 1: Access to the test mode registers and bits is enabled. Test registers: ECCRCAN0TED, ECCRCAN0TRC, ECCRCAN0SYND, ECCRCAN0HORD, ECCRCAN0ECRD, ECCRCAN0ERDB Register test control bit: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS
6, 5	Reserved	When read, the value after reset is returned. Writing to these bits, write the value after reset.
4	ECTRRS	ECC RAM read test mode selection bit Select reading destination when reading ECCRCAN0TED register and reading destination when reading ECCRCAN0ERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0:The read value of the ECCRCAN0TED register is the write value of the ECCRCAN0TED register. The read value of the ECCRCAN0ERDB register is the write value of the ECCRCAN0ERDB register. 1: The read value of the ECCRCAN0TED register can read RAM data. The read value of the ECCRCAN0ERDB register is the ECC data to be written to RAM.
3	ECREOS	ECC redundant bit output data selection bit This bit is used to identifyand select the ECC data to be stored in RAM as ECC data generated for write data or the value of the ECCRCAN0ERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Store ECC data generated for write data to RAM. 1: Store the value of ECCRCAN0ERDB register to RAM.

Table 22.101 ECCRCAN0TMC Register Contents (2/2)

Bit position	Bit Name	Function
2	ECENS	ECC encoder input selection bit This bit is used to identify the targeted data for ECC data generation as write data to RAM or the value of the ECCRCAN0TED register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate ECC data from the write data to RAM. 1: Generate ECC data from the value of the ECCRCAN0TED register.
1	ECDCS	ECC decoder input selection bit This bit is used to indetify and select the targeted data for syndrome code generation and error detection as RAM data or the value of the ECCRCAN0TED register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate syndrome code from RAM data and detect errors. 1: Generate syndrome code from the value of the ECCRCAN0TED register and detect errors.
0	ECREIS	ECC redundant bit input data selection bit This bit is used to indetify and select the targeted data for syndrome code generation and error detection as RAM data or the value of the ECCRCAN0ERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate syndrome code from ECC data stored in RAM and detect errors. 1: Generate syndrome code from the value of the ECCRCAN0ERDB register and detect errors.

22.11.5 ECCRCAN0TED — RSCAN0 ECC Encode/Decode Input/Output Replacement Test Register

In ECC test mode, this register handles test data.

The value of the register can be used to generate ECC data or syndrome code.

When ECC test mode is enabled (ECCRCAN0TMC.ECTMCE = 1), it is accesible. When ECCRCAN0TMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when RSCAN is not accessed to RAM.

Access: This register can be read/written in 32-bit units.

Address: FFC7 $100C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEDB[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.102 ECCRCAN0TED Register Contents

Bit position	Bit Name	Function
31 to 0	ECEDB[31:0]	When ECCRCAN0TMC.ECENS = 1, the value of this register is used to generate ECC data and the value this register to RAM is stored to RAM. When ECCRCAN0TMC.ECDCS = 1, the value of this register is used to generate syndrome code and the value of this register is stored in ECC decode syndrome data register (ECCRCAN0SYND). In addition, when ECCRCAN0TMC.ECTRRS = 1, RAM data [31:0], instead of written data, is read for the value of this register.

22.11.6 ECCRCAN0TRC — RSCAN0 ECC Redundant Bit Data Control Test Register

In ECC test mode, this test register, for ECC data, consists of four 8-bit registers, ECCRCAN0SYND, ECCRCAN0HORD, ECCRCAN0ECRD, and ECCRCAN0ERDB.

When ECC test mode is enabled (ECCRCAN0TMC.ECTMCE = 1), this register can be accessed. When ECCRCAN0TMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when RSCAN is not accessed to RAM.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFC7 1008_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	ECCRCAN0ECRD (See **Section 22.11.9**)								ECCRCAN0ERDB (See **Section 22.11.10**)							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

22.11.7 ECCRCAN0SYND — RSCAN0 ECC Decode Syndrome Data Register

In ECC test mode, this is a read-only register for storing generated syndrome code.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCAN0TMC.ECTMCE = 1), this register can be accessed. When ECC test mode is disabled (ECCRCAN0TMC.ECTMCE = 0), 00_H is read.

Access: This register can be read/written in 8-bit units.

Address: FFC7 $100B_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	SYND6	SYND5	SYND4	SYND3	SYND2	SYND1	SYND0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 22.103 ECCRCAN0SYND Register Contents

Bit position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	SYND[6:0]	The generated syndrome code is stored as needed.

22.11.8 ECCRCAN0HORD — RSCAN0 ECC 7-Bit Redundant Bit Data Hold Test Register

In ECC test mode, this register is used to store ECC data for read RAM data.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCAN0TMC.ECTMCE = 1), this register can be accessed. When ECC test mode is disabled (ECCRCAN0TMC.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: FFC7 $100A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	HORD6	HORD5	HORD4	HORD3	HORD2	HORD1	HORD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 22.104 ECCRCAN0HORD Register Contents

Bit position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	HORD[6:0]	ECC code for read RAM data is stored as needed. When ECCRCAN0TMC.ECTRRS = 1 and ECCRCAN0TED register is read, ECC code is stored.

22.11.9 ECCRCAN0ECRD — RSCAN0 ECC Encode Test Register

In ECC test mode, this is a read-only register for storing ECC data generated for write RAM data.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCAN0TMC.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (ECCRCAN0TMC.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: FFC7 1009_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ECRD6	ECRD5	ECRD4	ECRD3	ECRD2	ECRD1	ECRD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 22.105 ECCRCAN0ECRD Register Contents

Bit position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	ECRD[6:0]	These bits can read ECC data generated at the time of RAM data writing, and can read ECC data for the data written to the ECCRCAN0TED register when ECCRCAN0TMC.ECENS = 1.

22.11.10 ECCRCAN0ERDB — RSCAN0 ECC Redundant Bit Input/Output Replacement Buffer Register

In ECC test mode, this register handles ECC data.

The value of this register can be used as ECC data generated at the time of RAM writing or ECC data read at the time of RAM data reading.

When ECC test mode is enabled (ECCRCAN0TMC.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (ECCRCAN0TMC.ECTMCE = 0), 00_H is read.

Access: This register can be read/written in 8-bit units.

Address: FFC7 1008_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ERDB6	ERDB5	ERDB4	ERDB3	ERDB2	ERDB1	ERDB0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.106 ECCRCAN0ERDB Register Contents

Bit position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
6 to 0	ERDB[6:0]	When ECCRCAN0TMC.ECREOS = 1, these bits store the value of this register as ECC data to RAM. When ECCRCAN0TMC.ECREIS = 1, the value of this register is read as ECC data read from RAM. When ECCRCAN0TMC.ECTRRS = 1, ECC data to be stored in RAM is read instead of the write data for the read value of this register.

22.11.11 ECCRCAN0EAD0 — RSCAN0 ECC Error Address Register

ECCRCAN0EAD0 is a read-only register to hold the address at which an ECC error has occurred.

Access: This register can be read/written in 32-bit units.

Address: FFC7 1010$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEAD[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEAD[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.107 ECCRCAN0EAD0 Register Contents

Bit position	Bit Name	Function
31 to 0	ECEAD[31:0]	ECCRCAN0EAD0 is a read-only register to hold the address at which an ECC error has occurred. If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in ECCRCAN0EAD0 as the address at which the ECC error has occurred. The address is stored upon detection of the first ECC error while no error status is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored. Only one address can be held in ECCRCAN0EAD0.

22.12 Notes on the RSCAN Module

- When changing a global mode, check the GSLPSTS, GHLTSTS, and GRSTSTS flags in the RSCAN0GSTS register for transitions. When changing a channel mode, check the CSLPSTS, CHLTSTS, and CRSTSTS flags in the RSCAN0CmSTS register (m = 0 to 2) for transitions.
- The acceptance filter processing checks receive rules sequentially in ascending order from the minimum rule number. If the same ID, IDE bit, or RTR bit value is set for multiple receive rules, the minimum number of receive rule is used for the acceptance filter processing. If the message does not pass through the subsequent DLC filter processing, the data processing is terminated without returning to the acceptance filter processing and the message is not stored in the buffer.
- When linking transmit buffers to transmit/receive FIFO buffers or allocating transmit buffers to transmit queues, set the control register (RSCAN0TMCp) of the corresponding transmit buffer to 00_H. The status register (RSCAN0TMSTSp) of the corresponding transmit buffer should not be used. Flags in other status registers (registers RSCAN0TMTRSTS0 to RSCAN0TMTRSTS2, RSCAN0TMTARSTS0 to RSCAN0TMTARSTS2, RSCAN0TMTCSTS0 to RSCAN0TMTCSTS2, and RSCAN0TMTASTS0 to RSCAN0TMTASTS2), which correspond to transmit buffers linked to transmit/receive FIFO buffers or allocated to transmit queues remain unchanged. Set the enable bit in the corresponding interrupt enable register (registers RSCAN0TMIEC0 to RSCAN0TMIEC2) to 0 (transmit buffer interrupt is disabled).
- Transmit buffers that are linked to transmit/receive FIFO buffers must not be allocated to transmit queues.
- Only a single transmit/receive FIFO buffer can be linked to a transmit buffer. Do not link two or more transmit/receive FIFO buffers to transmit buffers of the same number.
- When the CANm bit time clock is selected as a timestamp counter clock source, the timestamp counter stops when the corresponding channel has transitioned to channel reset mode or channel halt mode.
- In case of an attempt to store a new received message when the receive FIFO buffer and the transmit/receive FIFO buffer are full, the new message is discarded. If you wish to store a new transmit message in the transmit/receive FIFO buffer or the transmit queue, check that the transmit/receive FIFO buffer or the transmit queue is not full.
- The values of unused receive buffers (RSCAN0RMIDq, RSCAN0RMPTRq, RSCAN0RMDF0q, and RSCAN0RMDF1q registers), receive FIFO buffer access registers (RSCAN0RFIDx, RSCAN0RFPTRx, RSCAN0RFDF0x, and RSCAN0RFDF1x registers), and transmit/receive FIFO buffer access registers (RSCAN0CFIDk, RSCAN0CFPTRk, RSCAN0CFDF0k, and RSCAN0CFDF1k registers) are undefined when the RSCAN module transitions to global operation mode or global test mode after exiting from global reset mode.

Section 23 CANFD Interface (RS-CANFD)

This section contains a generic description of the CANFD Interface (RS-CANFD).

The first part of this section describes all RH850/D1L/D1M specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RS-CANFD.

23.1 Features of RH850/D1L/D1M RS-CANFD

23.1.1 Number of Units and Channels

This microcontroller has the following number of RS-CANFD units.

Table 23.1 Number of Units for D1L Devices

	D1L1		D1L2(H)	
Product Name	R7F701401	R7F701421	R7F701402 R7F701403	R7F701422 R7F701423

The RS-CANFD has two interface modes (classical CAN mode and CAN FD mode) and uses different registers for each mode. There are two types of register names RSCANnXXX and RSCFDnCFDXXX (XXX: arbitrary) depending on interface modes. When explaining specifications common to two registers, register names are described as RSCFDn(CFD)XXX.

Table 23.5 Index

Index	Meaning
n	Throughout this section, the individual RS-CANFD units are generically indicated by the index “n” (n = 0); for example, RSCFDn(CFD)GCTR is the global control register of the RSCFDn unit.
m	Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index “m” (m = 0 to 2); for example, RSCFDn(CFD)CmSTS is the channel m status register.
j	The individual registers associated with receive rule table are generically indicated by the index “j” (j = 0 to 15); for example, RSCFDn(CFD)GAFLIDj is the receive rule ID register.
k	The individual transmit/receive FIFO buffers are generically indicated by the index “k” (k = 0 to [channel m × 3 + 2]); for example, RSCFDn(CFD)CFCCk is the transmit/receive FIFO buffer configuration/control register.
x	The individual receive FIFO buffers are generically identified by the index “x” (x = 0 to 7); for example, RSCFDn(CFD)RFSTSx is the receive FIFO buffer status register.
d	Data field registers of transmit/receive FIFO buffers and receive FIFO buffers are identified by “d” (classical CAN mode: d = 0 to 1, CAN FD mode: d = 0 to 15). For example, the transmit/receive FIFO buffer data field register is described as RSCFDn(CFD)CFDFd_k.
q	The individual receive buffers are generically indicated by the index “q” (q = 0 to [channel m × 16 + 15]); for example, RSCFDn(CFD)RMIDq is the receive buffer ID register.
p	The individual transmit buffers are generically indicated by the index “p” (p = 0 to [channel m × 16 + 15]; for example, RSCFDn(CFD)TMCp is the transmit buffer control register.
b	Data field registers of receive buffers and transmit buffers are identified by “b” (classical CAN mode: b = 0 to 1, CAN FD mode: b = 0 to 4). For example, the receive buffer data field register is described as RSCFDn(CFD)RMDFb_q.
r	The individual RAM tests for CAN are generically indicated by the index “r” (r = 0 to 63); for example, RSCFDn(CFD)RPGACCr is the RAM test page access register.
y	The registers not covered above are indicated by the index “y” (y = 0, 1); for example, RSCFDn(CFD)RMNDy is a receive buffer new data register.

23.1.2 Register Base Address

RSCFDn base addresses are listed in the following table.

RSCFDn register addresses are given as offsets from the base addresses in general.

Table 23.6 Register Base Address

Base Address Name	Base Address
<RSCFD0_base>	FFD0 0000_H

23.1.3 Clock Supply

The RSCFDn clock supply is shown in the following table.

Table 23.7 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
RSCFDn	clk_xincan	Clock Controller C_ISO_RSCANXIN
	clkc	Clock Controller C_ISO_RSCAN
	pclk	Clock Controller RSCANPCLK

The operating frequency of the RSCFDn depends on the transfer rate and the number of channels in use. **Table 23.8** shows the range of the frequency.

Table 23.8 Setting Range example of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/D1L/D1M

Condition			Range of Operating Frequency	
Nominal Bit Rate	Data Bit Rate	No. of Channels in Use	pclk	clkc, clk_xincan*1
1 Mbps	8 Mbps (5Tq setting)	3ch	pclk ≥ 80 MHz	40 MHz ≤ clk_xincan ≤ pclk/2
		2ch	pclk ≥ 80 MHz	
		1ch	pclk ≥ 80 MHz	
500 Kbps	2 Mbps (8Tq setting)	3ch	pclk ≥ 32 MHz	16 MHz ≤ clk_xincan ≤ pclk/2
		2ch	pclk ≥ 32 MHz	
		1ch	pclk ≥ 32 MHz	
1 Mbps	5 Mbps (8Tq setting)	3ch	pclk ≥ 80 MHz	40 MHz ≤ clk_xincan ≤ pclk/2
		2ch	pclk ≥ 80 MHz	
		1ch	pclk ≥ 80 MHz	

Note 1. Setting the DCS bit in the RSCFDn(CFD)GCFG register enables to select either clk_xincan or clkc. Set clocks less than or equal to pclk/2.

23.1.4 Interrupt Request

RSCFDn interrupt requests are listed in the following table.

Table 23.9 Interrupt Requests (1/2)

Unit Interrupt Signal	Outline	Connected to
RSCFD0		
INTRCANGERR	CAN global error interrupt	Interrupt Controller INTRCANGERR
INTRCANGRECC	CAN receive FIFO interrupt	Interrupt Controller INTRCANGRECC
CAN0		
INTRCANmERR (m = 0)	CAN0 error interrupt	Interrupt Controller INTRCAN0ERR
INTRCANmREC (m = 0)	CAN0 transmit/receive FIFO receive completion interrupt	Interrupt Controller INTRCAN0REC
INTRCANmTRX (m = 0)	CAN0 transmit interrupt	Interrupt Controller INTRCAN0TRX
CAN1		
INTRCANmERR (m = 1)	CAN1 error interrupt	Interrupt Controller INTRCAN1ERR
INTRCANmREC (m = 1)	CAN1 transmit/receive FIFO receive completion interrupt	Interrupt Controller INTRCAN1REC
INTRCANmTRX (m = 1)	CAN1 transmit interrupt	Interrupt Controller INTRCAN1TRX
CAN2		

Table 23.9 Interrupt Requests (2/2)

Unit Interrupt Signal	Outline	Connected to
INTRCANmERR (m = 2)	CAN2 error interrupt	Interrupt Controller INTRCAN2ERR
INTRCANmREC (m = 2)	CAN2 transmit/receive FIFO receive completion interrupt	Interrupt Controller INTRCAN2REC
INTRCANmTRX (m = 2)	CAN2 transmit interrupt	Interrupt Controller INTRCAN2TRX

NOTE

For the wake-up factors from standby mode, see Section 13.1.2.1, Wake-up factors.

23.1.5 Reset Sources

RSCFDn reset sources are listed in the following table. RSCFDn is initialized by these reset sources.

Table 23.10 Reset Sources

Unit Name	Reset Source
RSCFDn	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

23.1.6 External Input/Output Signals

External input/output signals of RSCFDn are listed below.

Table 23.11 External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
RSCFD0		
CANmRX (m = 0 to 2)	CANm receive data input	CANmRX (m = 0 to 2)
CANmTX (m = 0 to 2)	CANm transmit data output	CANmTX (m = 0 to 2)
CANmDREN (m = 0 to 2)	CANm data phase output	CANmDREN (m = 0 to 2)

23.2 Overview

23.2.1 Functional Overview

Table 23.12 shows the RS-CANFD module specifications. **Figure 23.1** shows the RS-CANFD module block diagram.

Table 23.12 RS-CANFD module Specifications (1/3)

Item	Specification
Number of channels	3
Protocol	ISO11898-1 compliant Using CAN FD frames is selectable by switching interface modes.
Communication speed	Classical CAN mode: • Maximum 1 Mbps $\text{Communication speed (CANm bit time clock)} = \frac{1}{\text{CANm bit time}}$ CANm bit time = CANmTq × Tq count per bit $\text{CANmTq} = \frac{\text{(BRP[9:0] bits in the RSCANnCmCFG register + 1)}}{\text{fCAN}}$ fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCANnGCFG register) CAN FD mode: • Nominal bit rate: max.1 Mbps, data bit rate: max. 5 Mbps $\text{Transmission rate (CANm nominal bit time clock)} = \frac{1}{\text{CANm nominal bit time}}$ $\text{Transmission rate (CANm data bit time clock)} = \frac{1}{\text{CANm data bit time}}$ CANm nominal bit time = CANmTq(N) × Tq count per nominal bit CANm data bit time = CANmTq(D) × Tq count per data bit $\text{CANmTq(N)} = \frac{\text{(NBRP[9:0] bits in the RSCFDnCFDCmNCFG register + 1)}}{\text{fCAN}}$ $\text{CANmTq(D)} = \frac{\text{(DBRP[7:0] bits in the RSCFDnCFDCmDCFG register + 1)}}{\text{fCAN}}$ fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCFDnCFDGCFG register) m = 0 to 2 Tq: Time quantum **Note:** To check calculation of sample point, see Section 23.11.1.2, Bit Timing Setting.
Buffer	240 buffers in total • Individual buffers: 48 buffers (16 buffers × 3 channels) Transmit buffer: 16 buffers per channel Transmit queue: Single queue per channel (shared with the transmit buffer; up to 16 buffers allocatable) • Shared buffers: 192 buffers for all channels Receive buffer: 48 buffers Receive FIFO buffer: 8 FIFO buffers (up to 128 buffers allocatable to each) Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocatable to each) • ECC included The 7-bit ECC value is calculated for each 32-bit transfer.

Table 23.12 RS-CANFD module Specifications (2/3)

Item	Specification
Reception function	• Receives data frames and remote frames. • Selects ID format (standard ID, extended ID, or both IDs) to be received. • Sets interrupt enable/disable for each FIFO. • Mirror function (reception of messages transmitted from the own CAN node) • Timestamp function (to record message reception time as a 16-bit timer value)
Reception filter function	• Selects receive messages according to 192 receive rules. • Sets the number of receive rules (0 to 127) for each channel. • Acceptance filter processing: Sets ID and mask for each receive rule. • DLC filter processing: Enables DLC filter check for each acceptance rule.
Receive message transfer function	• Routing function Transfers receive messages to arbitrary destinations (can be transferred to up to 8 buffers) Transfer destination: Receive buffer, receive FIFO buffer, and/or transmit/receive FIFO buffer • Label addition function Stores label information together with a message in a receive buffer and FIFO buffer.
Transmission function	• Transmits data frames and remote frames. • Selects ID format (standard ID, extended ID, or both IDs) to be transmitted. • Sets interrupt enable/disable for each transmit buffer and transmit/receive FIFO buffer. • Selects ID priority transmission or transmit buffer number priority transmission. • Transmit request can be aborted (possible to confirm with a flag) • One-shot transmission function
Interval transmission function	Transmit messages at configurable intervals (transmit mode or gateway mode of transmit/receive FIFO buffers)
Transmit queue function	Transmits all stored messages according to the ID priority.
Transmit history function	Stores the history information of transmission-completed messages Adds timestamp (recording message transmission time as a 16-bit timer value) to the history information.
Gateway function	Transmits a received message automatically.
Bus off recovery mode selection	Selects the method for returning from bus off state. • ISO11898-1 compliant • Automatic entry to channel halt mode at bus-off entry • Automatic entry to channel halt mode at bus-off end • Transition to channel halt mode by program request • Transition to the error-active state by program request (forcible return from the bus off state)
Error status monitoring	• Monitors CAN protocol errors (stuff error, form error, ACK error, CRC error, bit error, ACK delimiter error, and bus dominant lock). • Detects error status transitions (error warning, error passive, bus off entry, and bus off recovery) • Reads the error counter. • Monitors DLC errors.
Interrupt source	11 sources • Global Interrupts (2 sources) Receive FIFO interrupt Global error interrupt • Channel interrupts (3 sources/channel) CANm transmit interrupt (m = 0 to 2) – CANm transmit complete interrupt – CANm transmit abort interrupt – CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode) – CANm transmit history interrupt – CANm transmit queue interrupt CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode) CANm error interrupt
CAN stop mode	Reduces power consumption by stopping clock supply to the RS-CANFD module.

Table 23.12 RS-CANFD module Specifications (3/3)

Item	Specification
CAN clock source	Selects the clkc or the clk_xincan. As for the range of operating frequency, see **Table 23.8**.
Test function	Test function for user evaluation • Listen-only mode • Self-test mode 0 (external loopback) • Self-test mode 1 (internal loopback) • Restricted operation mode • RAM test (read/write test) • Inter-channel communication test [CRC error test enabled]

23.2.2 Interface Modes

The RS-CANFD has two interface modes.

- Classical CAN mode: Handles only classical CAN frames.
- CAN FD mode: Handles classical CAN frames and CAN FD frames.

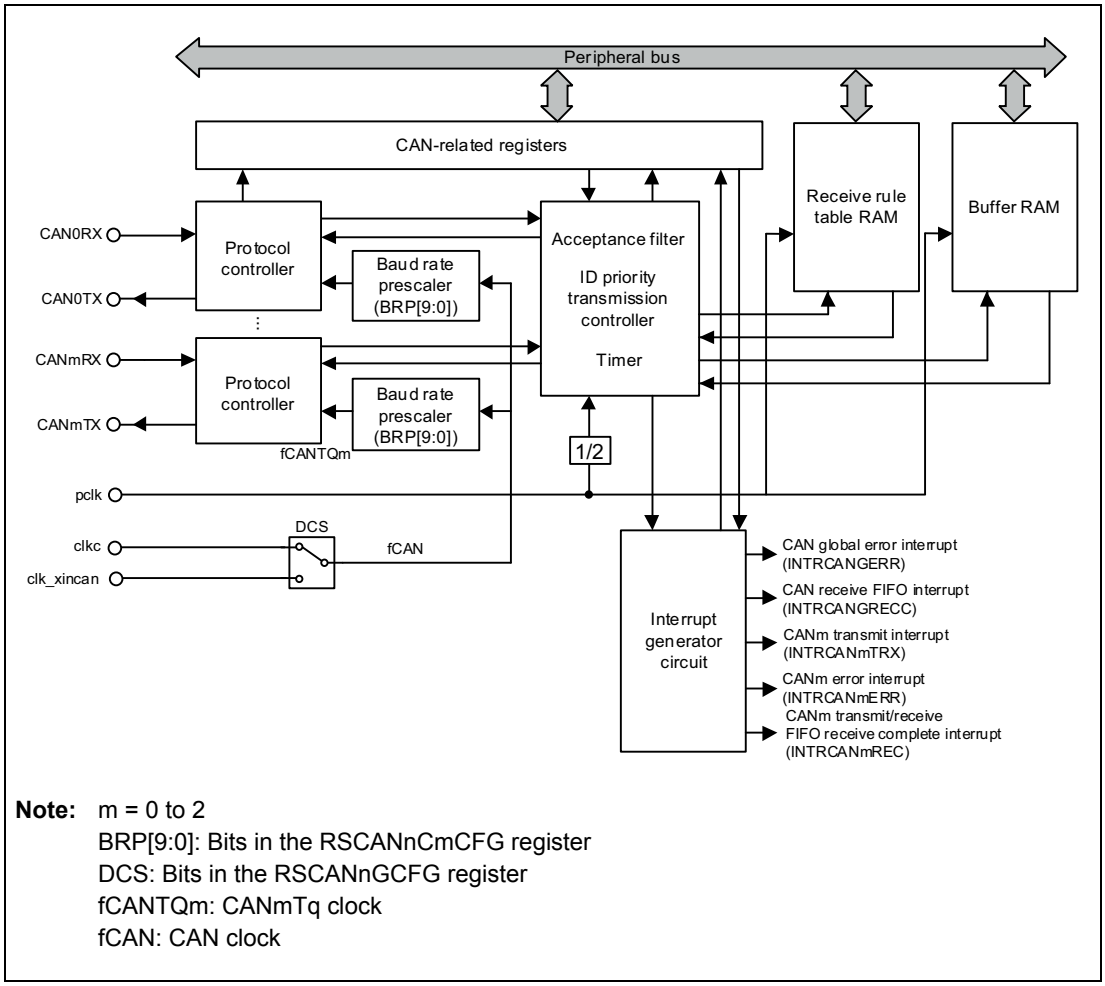
These two modes use different register maps with the same base address. Register maps change by switching interface modes.

Interface modes are switched by the RCMC bit in the RSCFDn(CFD)GRMCFG register.

23.2.3 CAN FD protocol switchover

This product supports CAN FD according to the ISO 11898-1:2015 protocol that specifies the new CRC field including stuff counters. In addition, by setting the NIE bit in the RSCFDnCFDGCRCCFG register, this product can support the CRC field that has compatibility to CAN FD protocol (ISO/CD 11898-1 (2014-08-12 version)).

23.2.4 Block Diagram



Note: m = 0 to 2
BRP[9:0]: Bits in the RSCANnCmCFG register
DCS: Bits in the RSCANnGCFG register
fCANTQm: CANmTq clock
fCAN: CAN clock

Figure 23.1 RS-CANFD module Block Diagram (Classical CAN Mode)

In CAN FD mode, different clock signals are input to the baud rate prescaler and the protocol controller respectively. See Section 23.11.1.3, Communication Speed Setting.

23.3 Registers (Classical CAN Mode)

23.3.1 List of Registers

The following tables list RS-CANFD registers to be used in classical CAN mode.

For details about <RSCFDn_base>, see Section 23.1.2, Register Base Address.

For details about registers initialized in Global reset mode or Channel reset mode, see following:

- Table 23.177, Registers Initialized in Global Reset Mode or Channel Reset Mode
- Table 23.178, Registers Initialized Only in Global Reset Mode

Table 23.13 Registers (1/2)

Module	Register	Symbol	Address
Interface mode-related registers			
RSCANn	Global interface mode select register	RSCANnGRMCFG	<RSCFDn_base> + $04FC_H$
Channel-related registers			
RSCANn	Channel m Configuration Register	RSCANnCmCFG	<RSCFDn_base> + 0000_H + (10_H × m)
RSCANn	Channel m control register	RSCANnCmCTR	<RSCFDn_base> + 0004_H + (10_H × m)
RSCANn	Channel m status register	RSCANnCmSTS	<RSCFDn_base> + 0008_H + (10_H × m)
RSCANn	Channel m error flag register	RSCANnCmERFL	<RSCFDn_base> + $000C_H$ + (10_H × m)
Global-related registers			
RSCANn	Global configuration register	RSCANnGCFG	<RSCFDn_base> + 0084_H
RSCANn	Global control register	RSCANnGCTR	<RSCFDn_base> + 0088_H
RSCANn	Global status register	RSCANnGSTS	<RSCFDn_base> + $008C_H$
RSCANn	Global error flag register	RSCANnGERFL	<RSCFDn_base> + 0090_H
RSCANn	Global timestamp counter register	RSCANnGTSC	<RSCFDn_base> + 0094_H
RSCANn	Global TX Interrupt Status Register 0	RSCANnGTINTSTS0	<RSCFDn_base> + 0460_H
Receive rule-related registers			
RSCANn	Receive Rule Entry Control Register	RSCANnGAFLECTR	<RSCFDn_base> + 0098_H
RSCANn	Receive Rule Configuration Register 0	RSCANnGAFLCFG0	<RSCFDn_base> + $009C_H$
RSCANn	Receive Rule ID Register j	RSCANnGAFLIDj	<RSCFDn_base> + 0500_H + (10_H × j)
RSCANn	Receive Rule Mask Register j	RSCANnGAFLMj	<RSCFDn_base> + 0504_H + (10_H × j)
RSCANn	Receive Rule Pointer 0 Register j	RSCANnGAFLP0_j	<RSCFDn_base> + 0508_H + (10_H × j)
RSCANn	Receive Rule Pointer 1 Register j	RSCANnGAFLP1_j	<RSCFDn_base> + $050C_H$ + (10_H × j)
Receive buffer-related registers			
RSCANn	Receive Buffer Number Register	RSCANnRMNB	<RSCFDn_base> + $00A4_H$
RSCANn	Receive Buffer New Data Register y	RSCANnRMNDy	<RSCFDn_base> + $00A8_H$ + (04_H × y)
RSCANn	Receive Buffer ID Register q	RSCANnRMIDq	<RSCFDn_base> + 0600_H + (10_H × q)
RSCANn	Receive Buffer Pointer Register q	RSCANnRMPTRq	<RSCFDn_base> + 0604_H + (10_H × q)
RSCANn	Receive Buffer Data Field 0 Register q	RSCANnRMDF0_q	<RSCFDn_base> + 0608_H + (10_H × q)
RSCANn	Receive Buffer Data Field 1 Register q	RSCANnRMDF1_q	<RSCFDn_base> + $060C_H$ + (10_H × q)
Receive FIFO buffer-related registers			
RSCANn	Receive FIFO Buffer Configuration and Control Register x	RSCANnRFCCx	<RSCFDn_base> + $00B8_H$ + (04_H × x)
RSCANn	Receive FIFO Buffer Status Register x	RSCANnRFSTSx	<RSCFDn_base> + $00D8_H$ + (04_H × x)
RSCANn	Receive FIFO Buffer Pointer Control Register x	RSCANnRFPCTRx	<RSCFDn_base> + $00F8_H$ + (04_H × x)
RSCANn	Receive FIFO Buffer Access ID Register x	RSCANnRFIDx	<RSCFDn_base> + $0E00_H$ + (10_H × x)
RSCANn	Receive FIFO Buffer Access Pointer Register x	RSCANnRFPTRx	<RSCFDn_base> + $0E04_H$ + (10_H × x)
RSCANn	Receive FIFO Buffer Access Data Field 0 Register x	RSCANnRFDF0_x	<RSCFDn_base> + $0E08_H$ + (10_H × x)
RSCANn	Receive FIFO Buffer Access Data Field 1 Register x	RSCANnRFDF1_x	<RSCFDn_base> + $0E0C_H$ + (10_H × x)

Table 23.13 Registers (2/2)

Module	Register	Symbol	Address
Transmit/Receive FIFO buffer related registers			
RSCANn	Transmit/receive FIFO Buffer Configuration and Control Register k	RSCANnCFCCk	<RSCFDn_base> + 0118_H + (04_H × k)
RSCANn	Transmit/receive FIFO Buffer Status Register k	RSCANnCFSTSk	<RSCFDn_base> + 0178_H + (04_H × k)
RSCANn	Transmit/receive FIFO Buffer Pointer Control Register k	RSCANnCFPCTRk	<RSCFDn_base> + $01D8_H$ + (04_H × k)
RSCANn	Transmit/receive FIFO Buffer Access ID Register k	RSCANnCFIDk	<RSCFDn_base> + $0E80_H$ + (10_H × k)
RSCANn	Transmit/receive FIFO Buffer Access Pointer Register k	RSCANnCFPTRk	<RSCFDn_base> + $0E84_H$ + (10_H × k)
RSCANn	Transmit/receive FIFO Buffer Access Data Field 0 Register k	RSCANnCFDF0_k	<RSCFDn_base> + $0E88_H$ + (10_H × k)
RSCANn	Transmit/receive FIFO Buffer Access Data Field 1 Register k	RSCANnCFDF1_k	<RSCFDn_base> + $0E8C_H$ + (10_H × k)
FIFO status-related registers			
RSCANn	FIFO Empty Status Register	RSCANnFESTS	<RSCFDn_base> + 0238_H
RSCANn	FIFO Full Status Register	RSCANnFFSTS	<RSCFDn_base> + $023C_H$
RSCANn	FIFO Message Lost Status Register	RSCANnFMSTS	<RSCFDn_base> + 0240_H
RSCANn	Receive FIFO Buffer Interrupt Flag Status Register	RSCANnRFISTS	<RSCFDn_base> + 0244_H
RSCANn	Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register	RSCANnCFRISTS	<RSCFDn_base> + 0248_H
RSCANn	Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register	RSCANnCFTISTS	<RSCFDn_base> + $024C_H$
Transmit buffer-related registers			
RSCANn	Transmit Buffer Control Register p	RSCANnTMCp	<RSCFDn_base> + 0250_H + (01_H × p)
RSCANn	Transmit Buffer Status Register p	RSCANnTMSTSp	<RSCFDn_base> + $02D0_H$ + (01_H × p)
RSCANn	Transmit Buffer ID Register p	RSCANnTMIDp	<RSCFDn_base> + 1000_H + (10_H × p)
RSCANn	Transmit Buffer Pointer Register p	RSCANnTMPTRp	<RSCFDn_base> + 1004_H + (10_H × p)
RSCANn	Transmit Buffer Data Field 0 Register p	RSCANnTMDF0_p	<RSCFDn_base> + 1008_H + (10_H × p)
RSCANn	Transmit Buffer Data Field 1 Register p	RSCANnTMDF1_p	<RSCFDn_base> + $100C_H$ + (10_H × p)
RSCANn	Transmit Buffer Interrupt Enable Configuration Register y	RSCANnTMIECy	<RSCFDn_base> + 0390_H + (04_H × y)
Transmit buffer status-related registers			
RSCANn	Transmit Buffer Transmit Request Status Register y	RSCANnTMTRSTSy	<RSCFDn_base> + 0350_H + (04_H × y)
RSCANn	Transmit Buffer Transmit Abort Request Status Register y	RSCANnTMTARSTSy	<RSCFDn_base> + 0360_H + (04_H × y)
RSCANn	Transmit Buffer Transmit Complete Status Register y	RSCANnTMTCSTSy	<RSCFDn_base> + 0370_H + (04_H × y)
RSCANn	Transmit Buffer Transmit Abort Status Register y	RSCANnTMTASTSy	<RSCFDn_base> + 0380_H + (04_H × y)
Transmit queue-related registers			
RSCANn	Transmit Queue Configuration and Control Register m	RSCANnTXQCCm	<RSCFDn_base> + $03A0_H$ + (04_H × m)
RSCANn	Transmit Queue Status Register m	RSCANnTXQSTSm	<RSCFDn_base> + $03C0_H$ + (04_H × m)
RSCANn	Transmit Queue Pointer Control Register m	RSCANnTXQPCTRm	<RSCFDn_base> + $03E0_H$ + (04_H × m)
Transmit history-related registers			
RSCANn	Transmit History Configuration and Control Register m	RSCANnTHLCCm	<RSCFDn_base> + 0400_H + (04_H × m)
RSCANn	Transmit History Status Register m	RSCANnTHLSTSm	<RSCFDn_base> + 0420_H + (04_H × m)
RSCANn	Transmit History Access Register m	RSCANnTHLPCTRm	<RSCFDn_base> + 0440_H + (04_H × m)
RSCANn	Transmit History Pointer Control Register m	RSCANnTHLACCm	<RSCFDn_base> + 1800_H + (04_H × m)
Test-related registers			
RSCANn	Global Test Configuration Register	RSCANnGTSTCFG	<RSCFDn_base> + 0468_H
RSCANn	Global Test Control Register	RSCANnGTSTCTR	<RSCFDn_base> + $046C_H$
RSCANn	Global Lock Key Register	RSCANnGLOCKK	<RSCFDn_base> + $047C_H$
RSCANn	RAM Test Page Access Register r	RSCANnRPGACCr	<RSCFDn_base> + 1900_H + (04_H × r)

1111_B	Transmit buffer 16 × m + 15 to 16 × m + 0

23.3.2 Details of Channel-Related Registers

23.3.2.1 RSCANnGRMCFG — Global Interface Mode Select Register

Access: RSCANnGRMCFG register can be read/written in 32-bit units
RSCANnGRMCFGL register can be read/written in 16-bit units
RSCANnGRMCFGLL register can be read/written in 8-bit units

Address: RSCANnGRMCFG: <RSCFDn_base> + $04FC_H$

RSCANnGRMCFGL: <RSCFDn_base> + $04FC_H$

RSCANnGRMCFGLL: <RSCFDn_base> + $04FC_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 23.18 RSCANnGRMCFG Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	RCMC	Interface Mode Select 0: Classical CAN mode 1: CAN FD mode

Note 1. The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Modify the RSCANnGRMCFG register only in global reset mode. Before setting other RS-CANFD registers, set this register.

RCMC Bit

Setting this bit to 0 makes classical CAN mode available. To switch CAN FD mode to classical CAN mode, set the value after reset to all registers and bits allocated to the register map of CAN FD mode and then modify the RSCANnGRMCFG register.

To switch the RS-CAN FD module from CAN FD mode to classical CAN mode, set the values after reset to all respective registers and bits allocated only to the register map in CAN FD mode, and then modify the value of RSCANnGRMCFG register.

23.3.2.2 RSCANnCmCFG — Channel Configuration Register (m = 0 to 2)

Access: RSCANnCmCFG register can be read/written in 32-bit units
RSCANnCmCFGL, RSCANnCmCFGH registers can be read/written in 16-bit units
RSCANnCmCFGLL, RSCANnCmCFGLH, RSCANnCmCFGHL, RSCANnCmCFGHH registers can be read/written in 8-bit units

Address: RSCANnCmCFG: <RSCFDn_base> + 0000_H + (10_H × m)

RSCANnCmCFGL: <RSCFDn_base> + 0000_H + (10_H × m),
RSCANnCmCFGH: <RSCFDn_base> + 0002_H + (10_H × m)

RSCANnCmCFGLL: <RSCFDn_base> + 0000_H + (10_H × m),
RSCANnCmCFGLH: <RSCFDn_base> + 0001_H + (10_H × m),
RSCANnCmCFGHL: <RSCFDn_base> + 0002_H + (10_H × m),
RSCANnCmCFGHH: <RSCFDn_base> + 0003_H + (10_H × m)

15 to 10	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
9 to 0	BRP[9:0]	Prescaler Division Ratio Set When these bits are set to P (0 to 1023), the baud rate prescaler divides fCAN by P + 1.

Modify the RSCANnCmCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode before shifting to channel communication mode or channel halt mode. For a description of the bit timing parameters and settings, see Section 23.11.1, Initial Settings.

SJW[1:0] Bits

These bits are used to specify a Tq value for the resynchronization jump width. Allowed values are 1 Tq to 4 Tq, inclusive.
Set a value less than or equal to the value of the TSEG2[2:0] bits.

TSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2).
Allowed values are 2 Tq to 8 Tq, inclusive.
Set a value smaller than the value of the TSEG1[3:0] bits.

TSEG1[3:0] Bits

These bits are used to specify a Tq value for the total length of the propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1).
Allowed values are 4 Tq to 16 Tq, inclusive.

BRP[9:0] Bits

The CANmTq clock (fCANTQm) is calculated by dividing the CAN clock (fCAN) by the baud rate prescaler, ((BRP[9:0]) + 1). One clock cycle of the CANmTq clock is 1 Time Quantum (Tq).

23.3.2.3 RSCANnCmCTR — Channel Control Register (m = 0 to 2)

Access: RSCANnCmCTR register can be read/written in 32-bit units
RSCANnCmCTRL, RSCANnCmCTRH registers can be read/written in 16-bit units
RSCANnCmCTRLL, RSCANnCmCTRLH, RSCANnCmCTRHL, RSCANnCmCTRHH registers can be read/written in 8-bit units

Address: RSCANnCmCTR: <RSCFDn_base> + 0004_H + (10_H × m)

RSCANnCmCTRL: <RSCFDn_base> + 0004_H + (10_H × m),
RSCANnCmCTRH: <RSCFDn_base> + 0006_H + (10_H × m)

RSCANnCmCTRLL: <RSCFDn_base> + 0004_H + (10_H × m),
RSCANnCmCTRLH: <RSCFDn_base> + 0005_H + (10_H × m),
RSCANnCmCTRHL: <RSCFDn_base> + 0006_H + (10_H × m),
RSCANnCmCTRHH: <RSCFDn_base> + 0007_H + (10_H × m)

Value after reset: 0000 0005_H

CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCANnCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCANnCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCANnGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is

detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

CTME Bit

Setting this bit to 1 enables communication test mode. Modify these bits in channel halt mode. This bit is set to 0 in channel reset mode.

ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCANnCmERFL register.
When this bit is clear to 0, if any error is detected while the flags of bits 14-8 in the RSCANnCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module.

When the BOM[1:0] bits are set to 00_B, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10_B (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01_B, the CHMDC[1:0] bits in the RSCANnCmCTR register (m = 0 to 2) are set to 10_B and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCANnCmSTS register are cleared to 00_H.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10_B, the CHMDC[1:0] bits are set to 10_B and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H.

When the BOM[1:0] bits are set to 11_B and the CHMDC[1:0] bits are set to 10_B while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10_B, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01B or at bus off end when the BOM[1:0] bits are 10_B), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

ALIE Bit

When the ALF flag in the RSCANnCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BLIE Bit

When the BLF flag in the RSCANnCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

OLIE Bit

When the OVLF flag in the RSCANnCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BORIE Bit

When the BORF flag in the RSCANnCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BOEIE Bit

When the BOEF flag in the RSCANnCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EPIE Bit

When the EPF flag in the RSCANnCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EWIE Bit

When the EWF flag in the RSCANnCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BEIE Bit

When the BEF flag in the RSCANnCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

RTBO Bit

Setting this bit to 1 in the bus off state forcibly changes the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCANnCmSTS register to 00_H and also clears the BOSTS flag in the RSCANnCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off

recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCANnCmCTR register are 00_B (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RSCAN module transitions to the error active state. Set this bit to 1 in channel communication mode.

CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.
Clearing this bit to 0 makes the channel exit channel stop mode.
This bit should not be modified in channel communication mode or channel halt mode.

CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see Section 23.6.2, Channel Modes. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11_B. When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become 10_B.

23.3.2.4 RSCANnCmSTS — Channel Status Register (m = 0 to 2)

Access: RSCANnCmSTS register can be read only in 32-bit units
RSCANnCmSTSL, RSCANnCmSTSH registers can be read only in 16-bit units
RSCANnCmSTSLL, RSCANnCmSTSHL, RSCANnCmSTSHH registers can be read only in 8-bit units

Address: RSCANnCmSTS: <RSCFDn_base> + 0008_H + (10_H × m)

RSCANnCmSTSL: <RSCFDn_base> + 0008_H + (10_H × m),

Table 23.21 RSCANnCmSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	TEC[7:0]	The transmit error counter (TEC) can be read.
23 to 16	REC[7:0]	The receive error counter (REC) can be read.
15 to 8	Reserved	These bits are read as the value after reset.
7	COMSTS	Communication Status Flag 0: Communication is not ready. 1: Communication is ready.
6	RECSTS	Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception
5	TRMSTS	Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state
4	BOSTS	Bus Off Status Flag 0: Not in bus off state 1: In bus off state
3	EPSTS	Error Passive Status Flag 0: Not in error passive state 1: In error passive state
2	CSLPSTS	Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode
1	CHLTSTS	Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode
0	CRSTSTS	Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode

TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

COMSTS Flag

This bit indicates that communication is ready.

This flag becomes 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])), It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

23.3.2.5 RSCANnCmERFL — Channel Error Flag Register (m = 0 to 2)

Access: RSCANnCmERFL register can be read/written in 32-bit units
RSCANnCmERFLL register can be read/written in 16-bit units
RSCANnCmERFLH register is a read-only register that can be read in 16-bit units
RSCANnCmERFLLL, RSCANnCmERFLLH registers can be read/written in 8-bit units
RSCANnCmERFLHL, RSCANnCmERFLHH registers are the read-only registers that can be read in 8-bit units

Address: RSCANnCmERFL: <RSCFDn_base> + $000C_H$ + (10_H × m)

RSCANnCmERFLL: <RSCFDn_base> + $000C_H$ + (10_H × m),
RSCANnCmERFLH: <RSCFDn_base> + $000E_H$ + (10_H × m)

RSCANnCmERFLLL: <RSCFDn_base> + $000C_H$ + (10_H × m),
RSCANnCmERFLLH: <RSCFDn_base> + $000D_H$ + (10_H × m),
RSCANnCmERFLHL: <RSCFDn_base> + $000E_H$ + (10_H × m),
RSCANnCmERFLHH: <RSCFDn_base> + $000F_H$ + (10_H × m)

Value after reset: $0000\ 0000_H$

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 23.22 RSCANnCmERFL Register Contents (1/2)

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
30 to 16	CRCREG[14:0]	CRC Calculation Data A CRC value calculated based on the transmit message or receive message is indicated.
15	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
14	ADERR	ACK Delimiter Error Flag 0: No ACK delimiter error is detected. 1: ACK delimiter error is detected.
13	B0ERR	Dominant Bit Error Flag 0: No dominant bit error is detected. 1: Dominant bit error is detected.
12	B1ERR	Recessive Bit Error Flag 0: No recessive bit error is detected. 1: Recessive bit error is detected.
11	CERR	CRC Error Flag 0: No CRC error is detected. 1: CRC error is detected.
10	AERR	ACK Error Flag 0: No ACK error is detected. 1: ACK error is detected.
9	FERR	Form Error Flag 0: No form error is detected. 1: Form error is detected.

Table 23.22 RSCANnCmERFL Register Contents (2/2)

Bit Position	Bit Name	Function
8	SERR	Stuff Error Flag 0: No stuff error is detected. 1: Stuff error is detected.
7	ALF	Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected.
6	BLF	Bus Lock Flag 0: No channel bus lock is detected. 1: Channel bus lock is detected.
5	OVLF	Overload Flag 0: No overload is detected. 1: Overload is detected.
4	BORF	Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected.
3	BOEF	Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected.
2	EPF	Error Passive Flag 0: No error passive is detected. 1: Error passive is detected.
1	EWF	Error Warning Flag 0: No error warning is detected. 1: Error warning is detected.
0	BEF	Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 1 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCANnCmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCANnCmERFL is detected, the flag bits are only set to 1 by the error event if bits 14 to 8 were all 0 at the time when the error occurred.

CRCREG[14:0] Flag

When the CTME bit in the RSCANnCmCTR register is set to 1 (communication test mode is enabled), the CRC value calculated based on the transmit or receive message can be read. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0. This bit is always 0 in channel reset mode.

ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

B0ERR Flag

This flag is set to 1 when a recessive bit has been detected though a dominant bit was transmitted.

B1ERR Flag

This flag is set to 1 when a dominant bit has been detected though a recessive bit was transmitted.

CERR Flag

This flag is set to 1 when a CRC error has been detected.

AERR Flag

This flag is set to 1 when an ACK error has been detected.

FERR Flag

This flag is set to 1 when a form error has been detected.

SERR Flag

This flag is set to 1 when a stuff error has been detected.

ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCANnCmCTR register are set to 01_B (channel reset mode).
- The RTBO bit in the RSCANnCmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCANnCmCTR register are set to 01_B (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCANnCmCTR register are set to 10_B (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11_B (transition to channel halt mode upon a request from the program during bus off).

BOEF Flag

This flag is set to 1 when the bus off state is entered (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is entered when the BOM[1:0] bits in the RSCANnCmCTR register (m = 0 to 2) set to 01_B (transition to channel halt mode at bus off entry).

EPF Flag

This flag becomes 1 when the error passive state is reached ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])).
This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCANnCmERFL register is set to 1.

NOTE

To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

23.3.3 Details of Global-Related Registers

23.3.3.1 RSCANnGCFG — Global Configuration Register

Access: RSCANnGCFG register can be read/written in 32-bit units
RSCANnGCFGL, RSCANnGCFGH registers can be read/written in 16-bit units
RSCANnGCFGLL, RSCANnGCFGLH, RSCANnGCFGHL, RSCANnGCFGHH registers can be read/written in 8-bit units

Address: RSCANnGCFG: <RSCFDn_base> + 0084_H

RSCANnGCFGL: <RSCFDn_base> + 0084_H,
RSCANnGCFGH: <RSCFDn_base> + 0086_H

RSCANnGCFGLL: <RSCFDn_base> + 0084_H,
RSCANnGCFGLH: <RSCFDn_base> + 0085_H,
RSCANnGCFGHL: <RSCFDn_base> + 0086_H,
RSCANnGCFGHH: <RSCFDn_base> + 0087_H

Value after reset: $0000\ 0000_H$

6	EEFE	ECC Error Flag Enable 0: The ECC error flag is disabled. 1: The ECC error flag is enabled.
5	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
4	DCS	CAN Clock Source Select*2 0: clkc 1: clk_xincan
3	MME	Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled.
2	DRE	DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled.
1	DCE	DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled.
0	TPRI	Transmit Priority Select 0: ID priority 1: Transmit buffer number priority

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.

Note 2. For the CAN clock frequency settings, see Table 23.8, Setting Range example of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/D1L/D1M.

Modify the RSCANnGCFG register only in global reset mode.

ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See Section 23.8.3.1, Interval Transmission Function.

TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the bit time clock that will be the clock source of the timestamp counter.

TSSS Bit

This bit is used to select a clock source of the timestamp counter.

TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

TMTSCE Bit

Setting this bit to 1 makes it possible to store the timestamp of a transmitted message in the transmit history buffer. The timestamp is stored in TMTS[15:0] bits in the RSCANnTHLACCm register.

EEFE Bit

Setting this bit to 1 sets the EEFm bit in the RSCANnGERFL register to 1 when a 2-bit ECC error is detected during the transmission priority determination. At this time, the message in which a 2-bit ECC error was detected is not transmitted.

DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

For the CAN clock frequency settings, see Table 23.8, Setting Range example of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/D1L/D1M.

MME Bit

Setting this bit to 1 makes the mirror function available.

DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of 00_H is stored in each data byte beyond the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCANnGAFLP0_j register to 0000_B before clearing the DCE bit in the RSCANnGCFG register to 0.

TPRI Bit

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the transmit buffer with the smallest number of those has the highest priority.

While the transmit queue is in use, this bit should be set to 0.

23.3.3.2 RSCANnGCTR — Global Control Register

Access: RSCANnGCTR register can be read/written in 32-bit units
RSCANnGCTRL, RSCANnGCTRH registers can be read/written in 16-bit units
RSCANnGCTRLL, RSCANnGCTRLH, RSCANnGCTRHL registers can be read/written in 8-bit units

Address: RSCANnGCTR: <RSCFDn_base> + 0088_H

RSCANnGCTRL: <RSCFDn_base> + 0088_H,
RSCANnGCTRH: <RSCFDn_base> + $008A_H$

RSCANnGCTRLL: <RSCFDn_base> + 0088_H,
RSCANnGCTRLH: <RSCFDn_base> + 0089_H,
RSCANnGCTRHL: <RSCFDn_base> + $008A_H$

Value after reset: $0000\ 0005_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 23.24 RSCANnGCTR Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
16	TSRST	Timestamp Counter Reset Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0.
15 to 11	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
10	THLEIE	Transmit History Buffer Overflow Interrupt Enable 0: Transmit history buffer overflow interrupt is disabled. 1: Transmit history buffer overflow interrupt is enabled.
9	MEIE	FIFO Message Lost Interrupt Enable 0: FIFO message lost interrupt is disabled. 1: FIFO message lost interrupt is enabled.
8	DEIE	DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled.
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	GSLPR	Global Stop Mode 0: Other than global stop mode 1: Global stop mode
1, 0	GMDC[1:0]	Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited

TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCANnGTSC register is cleared to 0000_H.

THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

GSLPR Bit

Setting this bit to 1 places the RSCAN module into global stop mode.
Clearing this bit to 0 makes the RSCAN module leave from global stop mode.
This bit should not be modified in global operating mode or global test mode.

GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see Section 23.6.1, Global Modes. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module into global stop mode.

23.3.3.3 RSCANnGSTS — Global Status Register

Access: RSCANnGSTS register can be read only in 32-bit units
RSCANnGSTSL register is a read-only register that can be read only in 16-bit units
RSCANnGSTSLL register is a read-only register that can be read only in 8-bit units

Address: RSCANnGSTS: <RSCFDn_base> + $008C_H$

RSCANnGSTSL: <RSCFDn_base> + $008C_H$

RSCANnGSTSLL: <RSCFDn_base> + $008C_H$

Value after reset: $0000\ 000D_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	GRAMINIT	GSLPSTS	GHLTSTS	GRSTSTS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 23.25 RSCANnGSTS Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	GRAMINIT	CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing.
2	GSLPSTS	Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode
1	GHLTSTS	Global Test Status Flag 0: Not in global test mode 1: In global test mode
0	GRSTSTS	Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode

GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

GRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

23.3.3.4 RSCANnGERFL — Global Error Flag Register

Access: RSCANnGERFL register can be read/written in 32-bit units
RSCANnGERFLL, RSCANnGERFLH registers can be read/written in 16-bit units
RSCANnGERFLLL, RSCANnGERFLHL registers can be read/written in 8-bit units

Address: RSCANnGERFL: <RSCFDn_base> + 0090_H

RSCANnGERFLL: <RSCFDn_base> + 0090_H,
RSCANnGERFLH: <RSCFDn_base> + 0092_H

RSCANnGERFLLL: <RSCFDn_base> + 0090_H,
RSCANnGERFLHL: <RSCFDn_base> + 0092_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	EEF2	EEF1	EEF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	THLES	MES	DEF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 23.26 RSCANnGERFL Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned. When writing these bits, write the value after reset.
18	EEF2	ECC Error Flag for Channel 2 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
17	EEF1	ECC Error Flag for Channel 1 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
16	EEF0	ECC Error Flag for Channel 0 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
15, 14	Reserved	When read, the value after reset is returned. When writing these bits, write the value after reset.
13 to 8	Reserved	When read, the undefined value is returned. When writing these bits, write the value after reset.
7, 6	Reserved	When read, the value after reset is returned. When writing these bits, write the value after reset.
5	Reserved	When read, the undefined value is returned. When writing these bits, write the value after reset.
4, 3	Reserved	When read, the value after reset is returned. When writing these bits, write the value after reset.
2	THLES	Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred.
1	MES	FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred.

Table 23.26 RSCANnGERFL Register Contents

Bit Position	Bit Name	Function
0	DEF	DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred.

All flags in the RSCANnGERFL register are cleared to 0 in global reset mode.

EEFm Flag

While the EEFE bit in the RSCANnGCFG register is 1, when a 2-bit ECC error is detected during the transmission priority determination of channel m (m = 0 to 2), the EEFm flag is set to 1, disabling message transmission. This flag can be cleared to 0 by writing 0 by the program.

THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCANnTHLSTSm register (m = 0 to 2) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCANnRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCANnCFSTSk register (k = 0 to 8) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

NOTE

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

23.3.3.5 RSCANnGTSC — Global Timestamp Counter Register

Access: RSCANnGTSC register can be read only in 32-bit units.
RSCANnGTSCL register is a read-only register that can be read only in 16-bit units.

Address: RSCANnGTSC: <RSCFDn_base> + 0094_H

RSCANnGTSCL: <RSCFDn_base> + 0094_H

Value after reset: $0000\ 0000_H$

Table 23.27 RSCANnGTSC Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset.
15 to 0	TS[15:0]	Timestamp Value The timestamp counter value can be read. Counter Value: 0000_H to $FFFF_H$

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer.

Furthermore, while the TMTSCE bit in the RSCANnGCFG register is 1, the TS[15: 0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter start timing and stop timing depend on the count source.

- When the TSSS bit in the RSCANnGCFG register is 0 (pclk):
  The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode.
  This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

23.3.3.6 RSCANnGTINTSTS0 — Global TX Interrupt Status Register 0

Access: RSCANnGTINTSTS0 register can be read only in 32-bit units
RSCANnGTINTSTS0L, RSCANnGTINTSTS0H registers can be read only in 16-bit units
RSCANnGTINTSTS0LL, RSCANnGTINTSTS0LH, RSCANnGTINTSTS0HL registers can be read only in 8-bit units

Address: RSCANnGTINTSTS0: <RSCFDn_base> + 0460_H

RSCANnGTINTSTS0L: <RSCFDn_base> + 0460_H,
RSCANnGTINTSTS0H: <RSCFDn_base> + 0462_H

RSCANnGTINTSTS0LL: <RSCFDn_base> + 0460_H,
RSCANnGTINTSTS0LH: <RSCFDn_base> + 0461_H,
RSCANnGTINTSTS0HL: <RSCFDn_base> + 0462_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 23.28 RSCANnGTINTSTS0 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 21	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
20	THIF2	Channel 2 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
19	CFTIF2	Channel 2 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
18	TQIF2	Channel 2 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
17	TAIF2	Channel 2 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
16	TSIF2	Channel 2 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
15 to 13	Reserved	These bits are read as the value after reset.
12	THIF1	Channel 1 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF1	Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF1	Channel 1 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.

Table 23.28 RSCANnGTINTSTS0 Register Contents (2/2)

Bit Position	Bit Name	Function
9	TAIF1	Channel 1 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF1	Channel 1 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
7 to 5	Reserved	These bits are read as the value after reset.
4	THIF0	Channel 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF0	Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF0	Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF0	Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
0	TSIF0	Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCANnTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCANnTMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00_B under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCANnCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCANnTMSTSp register are set to 01_B (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00_B after the transmit abort is completed.

TQIFm Bits

When the TXQIE bit in the RSCANnTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCANnTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCANnTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCANnCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCANnTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCANnTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCANnTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

23.3.4 Details of Receive Rule-related Registers

23.3.4.1 RSCANnGAFLECTR — Receive Rule Entry Control Register

Access: RSCANnGAFLECTR register can be read/written in 32-bit units
RSCANnGAFLECTRL register can be read/written in 16-bit units
RSCANnGAFLECTRLL, RSCANnGAFLECTRLH registers can be read/written in 8-bit units

Address: RSCANnGAFLECTR: <RSCFDn_base> + 0098_H

RSCANnGAFLECTRL: <RSCFDn_base> + 0098_H

RSCANnGAFLECTRLL: <RSCFDn_base> + 0098_H,
RSCANnGAFLECTRLH: <RSCFDn_base> + 0099_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 23.29 RSCANnGAFLECTR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
8	AFLDAE	Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled.
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4 to 0	AFLPN[4:0]	Receive Rule Table Page Number Configuration A page number can be selected from a range of page 0 (00000_B) to page 11 (01011_B).

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of 00000_B to 01011_B.

23.3.4.2 RSCANnGAFLCFG0 — Receive Rule Configuration Register 0

Access: RSCANnGAFLCFG0 register can be read/written in 32-bit units
RSCANnGAFLCFG0L, RSCANnGAFLCFG0H registers can be read/written in 16-bit units
RSCANnGAFLCFG0LH, RSCANnGAFLCFG0HL, RSCANnGAFLCFG0HH registers can be read/written in 8-bit units

Address: RSCANnGAFLCFG0: <RSCFDn_base> + $009C_H$

RSCANnGAFLCFG0L: <RSCFDn_base> + $009C_H$,
RSCANnGAFLCFG0H: <RSCFDn_base> + $009E_H$

RSCANnGAFLCFG0LH: <RSCFDn_base> + $009D_H$,
RSCANnGAFLCFG0HL: <RSCFDn_base> + $009E_H$,
RSCANnGAFLCFG0HH: <RSCFDn_base> + $009F_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 23.30 RSCANnGAFLCFG0 Register Contents

Bit Position	Bit Name	Function
31 to 24	RNC0[7:0]	Number of Rules for Channel 0 Set the number of receive rules exclusively used for channel 0.
23 to 16	RNC1[7:0]	Number of Rules for Channel 1 Set the number of receive rules exclusively used for channel 1.
15 to 8	RNC2[7:0]	Number of Rules for Channel 2 Set the number of receive rules exclusively used for channel 2.
7 to 0	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Modify the RSCANnGAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table for the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered for the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC2[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 2 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

23.3.4.3 RSCANnGAFLIDj — Receive Rule ID Register (j = 0 to 15)

Access: RSCANnGAFLIDj register can be read/written in 32-bit units
RSCANnGAFLIDjL, RSCANnGAFLIDjH registers can be read/written in 16-bit units
RSCANnGAFLIDjLL, RSCANnGAFLIDjLH, RSCANnGAFLIDjHL, RSCANnGAFLIDjHH registers can be read/written in 8-bit units

Address: RSCANnGAFLIDj: <RSCFDn_base> + 0500_H + (10_H × j)

RSCANnGAFLIDjL: <RSCFDn_base> + 0500_H + (10_H × j),
RSCANnGAFLIDjH: <RSCFDn_base> + 0502_H + (10_H × j)

RSCANnGAFLIDjLL: <RSCFDn_base> + 0500_H + (10_H × j),
RSCANnGAFLIDjLH: <RSCFDn_base> + 0501_H + (10_H × j),
RSCANnGAFLIDjHL: <RSCFDn_base> + 0502_H + (10_H × j),
RSCANnGAFLIDjHH: <RSCFDn_base> + 0503_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAFLIDE	GAFLRTR	GAFLLB	GAFLID[28:16]

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.31 RSCANnGAFLIDj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDE	IDE Select 0: Standard ID 1: Extended ID
30	GAFLRTR	RTR Select 0: Data frame 1: Remote frame
29	GAFLLB	Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received
28 to 0	GAFLID[28:0]	ID Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0.

Modify the RSCANnGAFLIDj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

23.3.4.4 RSCANnGAFLMj — Receive Rule Mask Register (j = 0 to 15)

Access: RSCANnGAFLMj register can be read/written in 32-bit units
RSCANnGAFLMjL, RSCANnGAFLMjH registers can be read/written in 16-bit units
RSCANnGAFLMjLL, RSCANnGAFLMjLH, RSCANnGAFLMjHL, RSCANnGAFLMjHH registers can be read/written in 8-bit units

Address: RSCANnGAFLMj: <RSCFDn_base> + 0504_H + (10_H × j)

RSCANnGAFLMjL: <RSCFDn_base> + 0504_H + (10_H × j),
RSCANnGAFLMjH: <RSCFDn_base> + 0506_H + (10_H × j)

RSCANnGAFLMjLL: <RSCFDn_base> + 0504_H + (10_H × j),
RSCANnGAFLMjLH: <RSCFDn_base> + 0505_H + (10_H × j),
RSCANnGAFLMjHL: <RSCFDn_base> + 0506_H + (10_H × j),
RSCANnGAFLMjHH: <RSCFDn_base> + 0507_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAFLIDEM	GAFLRTRM	—	GAFLIDM[28:16]												
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.32 RSCANnGAFLMj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDEM	IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared.
30	GAFLRTRM	RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared
29	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
28 to 0	GAFLIDM[28:0]	ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared.

Modify the RSCANnGAFLMj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCANnGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

23.3.4.5 RSCANnGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15)

Access: RSCANnGAFLP0_j register can be read/written in 32-bit units
RSCANnGAFLP0_jL, RSCANnGAFLP0_jH registers can be read/written in 16-bit units
RSCANnGAFLP0_jLH, RSCANnGAFLP0_jHL, RSCANnGAFLP0_jHH registers can be read/written in 8-bit units

Address: RSCANnGAFLP0_j: <RSCFDn_base> + 0508_H + (10_H × j)

RSCANnGAFLP0_jL: <RSCFDn_base> + 0508_H + (10_H × i),
RSCANnGAFLP0_jH: <RSCFDn_base> + $050A_H$ + (10_H × j)

RSCANnGAFLP0_jLH: <RSCFDn_base> + 0509_H + (10_H × j),
RSCANnGAFLP0_jHL: <RSCFDn_base> + $050A_H$ + (10_H × j),
RSCANnGAFLP0_jHH: <RSCFDn_base> + $050B_H$ + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 23.33 RSCANnGAFLP0_j Register Contents

Bit Position	Bit Name	Function
31 to 28	GAFLDLC[3:0]	Receive Rule DLC b31 b30 b29 b28 0 0 0 0: DLC check is disabled. 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	GAFLPTR[11:0]	Receive Rule Label Set the 12-bit label information.
15	GAFLRMV	Receive Buffer Enable 0: No receive buffer is used. 1: A receive buffer is used.
14 to 8	GAFLRMDP[6:0]	Receive Buffer Number Select Set the receive buffer number to store receive messages.
7 to 0	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Modify the RSCANnGAFLP0_j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000_B disables the DLC check function allowing messages with any data length to pass the DLC check.

GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCANnRMNB register.

23.3.4.6 RSCANnGAFLP1_j — Receive Rule Pointer 1 Register (j = 0 to 15)

Access: RSCANnGAFLP1_j register can be read/written in 32-bit units
RSCANnGAFLP1_jL, RSCANnGAFLP1_jH registers can be read/written in 16-bit units
RSCANnGAFLP1_jLL, RSCANnGAFLP1_jLH, RSCANnGAFLP1_jHL, RSCANnGAFLP1_jHH registers can be read/written in 8-bit units

Address: RSCANnGAFLP1_j: <RSCFDn_base> + $050C_H$ + (10_H × j)

RSCANnGAFLP1_jL: <RSCFDn_base> + $050C_H$ + (10_H × j),

Table 23.34 RSCANnGAFLP1_j Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
25 to 8	GAFLFDP[25:8]	Transmit/Receive FIFO Buffer k Select (Bit position –8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected.
7 to 0	GAFLFDP[7:0]	Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected.

Modify the RSCANnGAFLP1_j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP [25:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers are selectable. However, when the GAFLRMV bit in the RSCANnGAFLP0_j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCANnCFCCk register are set to 00_B (receive mode) or 10_B (gateway mode) are selectable.

23.3.5 Details of Receive Buffer-Related Registers

23.3.5.1 RSCANnRMNB — Receive Buffer Number Register

Access: RSCANnRMNB register can be read/written in 32-bit units
RSCANnRMNBL register can be read/written in 16-bit units
RSCANnRMNBLL register can be read/written in 8-bit units

Address: RSCANnRMNB: <RSCFDn_base> + $00A4_H$

RSCANnRMNBL: <RSCFDn_base> + $00A4_H$

RSCANnRMNBLL: <RSCFDn_base> + $00A4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 23.35 RSCANnRMNB Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
7 to 0	NRXMB[7:0]	Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 48.

Modify the RSCANnRMNB register only in global reset mode.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

Setting these bits all to 0 makes receive buffers unavailable.

23.3.5.2 RSCANnRMNDy — Receive Buffer New Data Register (y = 0, 1)

Access: RSCANnRMNDy register can be read/written in 32-bit units
RSCANnRMNDyL, RSCANnRMNDyH registers can be read/written in 16-bit units
RSCANnRMNDyLL, RSCANnRMNDyLH, RSCANnRMNDyHL, RSCANnRMNDyHH registers can be read/written in 8-bit units

Address: RSCANnRMNDy: <RSCFDn_base> + $00A8_H$ + (04_H × y)

RSCANnRMNDyL: <RSCFDn_base> + $00A8_H$ + (04_H × y),
RSCANnRMNDyH: <RSCFDn_base> + $00AA_H$ + (04_H × y)

RSCANnRMNDyLL: <RSCFDn_base> + $00A8_H$ + (04_H × y),
RSCANnRMNDyLH: <RSCFDn_base> + $00A9_H$ + (04_H × y),
RSCANnRMNDyHL: <RSCFDn_base> + $00AA_H$ + (04_H × y),
RSCANnRMNDyHH: <RSCFDn_base> + $00AB_H$ + (04_H × y)

Table 23.36 RSCANnRMNDy Register Contents

Bit Position	Bit Name	Function
31 to 16	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.
15 to 0	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.

Write 0 to the RSCANnRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 47)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. It takes ten clock cycles of pclk to store a message.

These flags are cleared to 0 in global reset mode.

23.3.5.3 RSCANnRMIDq — Receive Buffer ID Register (q = 0 to 47)

Access: RSCANnRMIDq register can be read only in 32-bit units
RSCANnRMIDqL, RSCANnRMIDqH registers can be read only in 16-bit units
RSCANnRMIDqLL, RSCANnRMIDqLH, RSCANnRMIDqHL, RSCANnRMIDqHH registers can be read only in 8-bit units

Address: RSCANnRMIDq: <RSCFDn_base> + 0600_H + (10_H × q)

RSCANnRMIDqL: <RSCFDn_base> + 0600_H + (10_H × q),
RSCANnRMIDqH: <RSCFDn_base> + 0602_H + (10_H × q)

RSCANnRMIDqLL: <RSCFDn_base> + 0600_H + (10_H × q),
RSCANnRMIDqLH: <RSCFDn_base> + 0601_H + (10_H × q),
RSCANnRMIDqHL: <RSCFDn_base> + 0602_H + (10_H × q),
RSCANnRMIDqHH: <RSCFDn_base> + 0603_H + (10_H × q)

Value after reset: $0000\ 0000_H$

Table 23.37 RSCANnRMIDq Register Contents

Bit Position	Bit Name	Function
31	RMIDE	Receive Buffer IDE 0: Standard ID 1: Extended ID
30	RMRTR	Receive Buffer RTR 0: Data frame 1: Remote frame
29	Reserved	These bits are read as the value after reset.
28 to 0	RMID[28:0]	Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

RMRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer.

RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

23.3.5.4 RSCANnRMPTRq — Receive Buffer Pointer Register (q = 0 to 47)

Access: RSCANnRMPTRq register can be read only in 32-bit units
RSCANnRMPTRqL, RSCANnRMPTRqH registers can be read only in 16-bit units
RSCANnRMPTRqLL, RSCANnRMPTRqLH, RSCANnRMPTRqHL, RSCANnRMPTRqHH registers can be read only in 8-bit units

Address: RSCANnRMPTRq: <RSCFDn_base> + 0604_H + (10_H × q)

RSCANnRMPTRqL: <RSCFDn_base> + 0604_H + (10_H × q),
RSCANnRMPTRqH: <RSCFDn_base> + 0606_H + (10_H × q)

Table 23.38 RSCANnRMPTRq Register Contents

Bit Position	Bit Name	Function
31 to 28	RMDLC[3:0]	Receive Buffer DLC Data b31 b30 b29 b28 0 0 0 0: No data byte 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	RMPTR[11:0]	Receive Buffer Label Data Label information of the received message.
15 to 0	RMTS[15:0]	Receive Buffer Timestamp Data Timestamp value of the received message.

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer.

RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

23.3.5.5 RSCANnRMDF0_q — Receive Buffer Data Field 0 Register (q = 0 to 47)

Access: RSCANnRMDF0_q register can be read only in 32-bit units
RSCANnRMDF0_qL, RSCANnRMDF0_qH registers can be read only in 16-bit units
RSCANnRMDF0_qLL, RSCANnRMDF0_qLH, RSCANnRMDF0_qHL, RSCANnRMDF0_qHH registers can be read only in 8-bit units

Address: RSCANnRMDF0_q: <RSCFDn_base> + 0608_H + (10_H × q)

RSCANnRMDF0_qL: <RSCFDn_base> + 0608_H + (10_H × q),
RSCANnRMDF0_qH: <RSCFDn_base> + $060A_H$ + (10_H × q)

Table 23.41 RSCANnRFCCx Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
15 to 13	RFIGCV[2:0]	Receive FIFO Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.
12	RFIM	Receive FIFO Interrupt Source Select 0: An interrupt occurs when the condition set by the RFIGCV[2:0] bits is met. 1: An interrupt occurs each time a message has been received.
11	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
10 to 8	RFDC[2:0]	Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7 to 2	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Table 23.41 RSCANnRFCCx Register Contents (2/2)

Bit Position	Bit Name	Function
1	RFIE	Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled.
0	RFE	Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001_B (4 messages), set the RFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000_B, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCANnRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode.

Set this bit to 1 with another instruction after the settings to all bits in the RSCANnRFCCx register have been done.

This bit is cleared to 0 in global reset mode.

23.3.6.2 RSCANnRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

Access: RSCANnRFSTSx register can be read/written in 32-bit units
RSCANnRFSTSxL register can be read/written in 16-bit units
RSCANnRFSTSxLL register can be read/written in 8-bit units
RSCANnRFSTSxLH register is a read-only register that can be read in 8-bit units

Address: RSCANnRFSTSx: <RSCFDn_base> + $00D8_H$ + (04_H × x)

RSCANnRFSTSxL: <RSCFDn_base> + $00D8_H$ + (04_H × x)

RSCANnRFSTSxLL: <RSCFDn_base> + $00D8_H$ + (04_H × x),
RSCANnRFSTSxLH: <RSCFDn_base> + $00D9_H$ + (04_H × x)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 23.42 RSCANnRFSTSx Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
15 to 8	RFMC[7:0]	Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed.
7 to 4	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
3	RFIF	Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present.
2	RFMLT	Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost.
1	RFFLL	Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.
0	RFEMP	Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).

RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes 00_H when the RFE bit in the RSCANnRFCCx register is set to 0.
This flag is 00_H in global reset mode.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCANnRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCANnRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCANnRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCANnRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

23.3.6.3 RSCANnRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

Access: RSCANnRFPCTRx register can only be written in 32-bit units
RSCANnRFPCTRxL register is a write-only register that can only be written in 16-bit units
RSCANnRFPCTRxLL register is a write-only register that can only be written in 8-bit units

Address: RSCANnRFPCTRx: <RSCFDn_base> + $00F8_H$ + (04_H × x)

RSCANnRFPCTRxL: <RSCFDn_base> + $00F8_H$ + (04_H × x)

RSCANnRFPCTRxLL: <RSCFDn_base> + $00F8_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

Table 23.43 RSCANnRFPCTRx Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	RFPC[7:0]	Receive FIFO Pointer Control When these bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer.

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCANnRFSTSx register is decremented by 1. Read the RSCANnRFIDx, RSCANnRFPTRx, RSCANnRFDF0_x, and RSCANnRFDF1_x registers to read messages in the receive FIFO buffer, and then write FF_H to the RFPC[7:0] bits.

When writing FF_H to these bits, make sure that the RFE bit in the RSCANnRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCANnRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

23.3.6.4 RSCANnRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

Access: RSCANnRFIDx register can be read only in 32-bit units
RSCANnRFIDxL, RSCANnRFIDxH registers can be read only in 16-bit units
RSCANnRFIDxLL, RSCANnRFIDxLH, RSCANnRFIDxHL, RSCANnRFIDxHH registers can be read only in 8-bit units

Address: RSCANnRFIDx: <RSCFDn_base> + $0E00_H$ + (10_H × x)

RSCANnRFIDxL: <RSCFDn_base> + $0E00_H$ + (10_H × x),
RSCANnRFIDxH: <RSCFDn_base> + $0E02_H$ + (10_H × x)

RSCANnRFIDxLL: <RSCFDn_base> + $0E00_H$ + (10_H × x),
RSCANnRFIDxLH: <RSCFDn_base> + $0E01_H$ + (10_H × x),
RSCANnRFIDxHL: <RSCFDn_base> + $0E02_H$ + (10_H × x),

Bit Position	Bit Name	Function
31	RFIDE	Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	RFRTR	Receive FIFO Buffer RTR 0: Data frame 1: Remote frame
29	Reserved	These bits are read as the value after reset.
28 to 0	RFID[28:0]	Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

23.3.6.5 RSCANnRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

Access: RSCANnRFPTRx register can be read only in 32-bit units
RSCANnRFPTRxL, RSCANnRFPTRxH registers can be read only in 16-bit units
RSCANnRFPTRxLL, RSCANnRFPTRxLH, RSCANnRFPTRxHL, RSCANnRFPTRxHH registers can be read only in 8-bit units

Address: RSCANnRFPTRx: <RSCFDn_base> + $0E04_H$ + (10_H × x)

RSCANnRFPTRxL: <RSCFDn_base> + $0E04_H$ + (10_H × x),

Table 23.48 RSCANnCFCCk Register Contents (2/2)

Bit Position	Bit Name	Function
12	CFIM	Transmit/Receive FIFO Interrupt Source Select 0: • Receive mode/gateway mode When the number of received messages has met the condition set by the CFIGCV[2:0] bits, a FIFO receive interrupt request is generated. • Transmit mode/gateway mode When the buffer becomes empty upon completion of message transmission, a FIFO transmit interrupt request is generated. 1: • Receive mode/gateway mode A FIFO receive interrupt request is generated each time a message has been received. • Transmit mode/gateway mode A FIFO transmit interrupt request is generated each time a message has been transmitted.
11	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
10 to 8	CFDC[2:0]	Transmit/Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	CFTXIE	Transmit/Receive FIFO Transmit Interrupt Enable 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled.
1	CFRXIE	Transmit/Receive FIFO Receive Interrupt Enable 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled.
0	CFE	Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used.

CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]) (see **Table 23.16**).

See **Table 23.14** and **Table 23.15**, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p.

Setting the CFDC[2:0] bits to 001_B or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the same channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCANnGCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RSCANnGCFG register × 10).

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the bit time clock of the channel to which the FIFO is linked is the count source of the interval timer.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00_B (receive mode) or 10_B (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001_B (4 messages), set the CFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B.

Modify these bits only in global reset mode.

CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000_B, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCANnCFCCk register have been set, set this bit to 1 by using another instruction.

23.3.7.2 RSCANnCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 8)

Access: RSCANnCFSTSk register can be read/written in 32-bit units
RSCANnCFSTSkL register can be read/written in 16-bit units
RSCANnCFSTSkLL register can be read/written in 8-bit units
RSCANnCFSTSkLH register is a read-only register that can be read in 8-bit units.

Address: RSCANnCFSTSk: <RSCFDn_base> + 0178_H + (04_H × k)

RSCANnCFSTSkL: <RSCFDn_base> + 0178_H + (04_H × k)

RSCANnCFSTSkLL: <RSCFDn_base> + 0178_H + (04_H × k),
RSCANnCFSTSkLH: <RSCFDn_base> + 0179_H + (04_H × k)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CFMC[7:0]								—	—	—	CFTXIF	CFRXIF	CFMLT	CFFLL	CFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 23.49 RSCANnCFSTSk Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
15 to 8	CFMC[7:0]	Transmit/Receive FIFO Message Counter The number of messages stored in the transmit/receive FIFO buffer.
7 to 5	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
4	CFTXIF	Transmit/Receive FIFO Transmit Interrupt Request Flag 0: No transmit/receive FIFO transmit interrupt request is present. 1: A transmit/receive FIFO transmit interrupt request is present.
3	CFRXIF	Transmit/Receive FIFO Receive Interrupt Request Flag 0: No transmit/receive FIFO receive interrupt request is present. 1: A transmit/receive FIFO receive interrupt request is present.
2	CFMLT	Transmit/Receive FIFO Message Lost Flag 0: No transmit/receive FIFO message is lost. 1: A transmit/receive FIFO message is lost.
1	CFFLL	Transmit/Receive FIFO Buffer Full Status Flag 0: The transmit/receive FIFO buffer is not full. 1: The transmit/receive FIFO buffer is full.
0	CFEMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty).

CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCANnCFCCk register.

- When CFM[1:0] value is 01_B (transmit mode): Number of untransmitted messages in the buffer

- When CFM[1:0] value is 00_B (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10_B (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00_B: In global reset mode
- When CFM[1:0] value is 01_B or 10_B: In channel reset mode
- When the CFE bit in the RSCANnCFCCk register is cleared to 0.

CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01_B or 10_B, and the factor selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B, and the factor selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCANnCFCCk register.

The CFFLL flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCANnCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01_B: A value of FF_H has been written to the RSCANnCFPCTRk register after data was written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers.

NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

23.3.7.3 RSCANnCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 8)

Access: RSCANnCFPCTRk register can only be written in 32-bit units
RSCANnCFPCTRkL register can only be written in 16-bit units
RSCANnCFPCTRkLL register can only be written in 8-bit units

Address: RSCANnCFPCTRk: <RSCFDn_base> + $01D8_H$ + (04_H × k)

RSCANnCFPCTRkL: <RSCFDn_base> + $01D8_H$ + (04_H × k)

RSCANnCFPCTRkLL: <RSCFDn_base> + $01D8_H$ + (04_H × k)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 23.50 RSCANnCFPCTRk Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	CFPC[7:0]	Transmit/Receive FIFO Pointer Control • Receive mode: Writing FF_H to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. • Transmit mode: Writing FF_H to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer. • Gateway mode: Setting prohibited

CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCANnCFCCk register is 00_B):
  Writing FF_H to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCANnCFSTSk register is decremented by 1. Read the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers to read messages from the transmit/receive FIFO buffer, and then write FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).
- Transmit mode (CFM[1:0] value in the RSCANnCFCCk register is 01_B):
  Writing FF_H to the CFPC[7:0] bits stores the data written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented by 1 Write transmit messages to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers

before writing FF_H to the CFPC[7:0] bits.
When writing FF_H to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 and the CFFLL flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).

- Gateway mode (CFM[1:0] value in the RSCANnCFCCk register is 10_B):
  Setting prohibited

23.3.7.4 RSCANnCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 8)

Access: RSCANnCFIDk register can be read/written in 32-bit units
RSCANnCFIDkL, RSCANnCFIDkH registers can be read/written in 16-bit units
RSCANnCFIDkLL, RSCANnCFIDkLH, RSCANnCFIDkHL, RSCANnCFIDkHH registers can be read/written in 8-bit units

Address: RSCANnCFIDk: <RSCFDn_base> + $0E80_H$ + (10_H × k)

RSCANnCFIDkL: <RSCFDn_base> + $0E80_H$ + (10_H × k),
RSCANnCFIDkH: <RSCFDn_base> + $0E82_H$ + (10_H × k)

RSCANnCFIDkLL: <RSCFDn_base> + $0E80_H$ + (10_H × k),
RSCANnCFIDkLH: <RSCFDn_base> + $0E81_H$ + (10_H × k),
RSCANnCFIDkHL: <RSCFDn_base> + $0E82_H$ + (10_H × k),
RSCANnCFIDkHH: <RSCFDn_base> + $0E83_H$ + (10_H × k)

Value after reset: $0000\ 0000_H$

Table 23.51 RSCANnCFIDk Register Contents

Bit Position	Bit Name	Function
31	CFIDE	Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	CFRTR	Transmit/Receive FIFO Buffer RTR 0: Data frame 1: Remote frame
29	THLEN	Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01_B (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	CFID[28:0]	Transmit/Receive FIFO Buffer ID Data • When CFM[1:0] value is 01_B (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. • When CFM[1:0] value is 00_B (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This RSCANnCFIDk register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, these bits are used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

CFRTR Bit

This bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, and buffer type) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01_B (transmit mode).

CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

When the CFM[1:0] value is 01_B, this bit is used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

23.3.7.5 RSCANnCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 8)

Access: RSCANnCFPTRk register can be read/written in 32-bit units
RSCANnCFPTRkL, RSCANnCFPTRkH registers can be read/written in 16-bit units
RSCANnCFPTRkLL, RSCANnCFPTRkLH, RSCANnCFPTRkHL, RSCANnCFPTRkHH registers can be read/written in 8-bit units

Address: RSCANnCFPTRk: <RSCFDn_base> + $0E84_H$ + (10_H × k)

RSCANnCFPTRkL: <RSCFDn_base> + $0E84_H$ + (10_H × k),
RSCANnCFPTRkH: <RSCFDn_base> + $0E86_H$ + (10_H × k)

RSCANnCFPTRkLL: <RSCFDn_base> + $0E84_H$ + (10_H × k),
RSCANnCFPTRkLH: <RSCFDn_base> + $0E85_H$ + (10_H × k),
RSCANnCFPTRkHL: <RSCFDn_base> + $0E86_H$ + (10_H × k),
RSCANnCFPTRkHH: <RSCFDn_base> + $0E87_H$ + (10_H × k)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 23.52 RSCANnCFPTRk Register Contents

Bit Position	Bit Name	Function
31 to 28	CFDLC[3:0]	Transmit/Receive FIFO Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	CFPTR[11:0]	Transmit/Receive FIFO Buffer Label Data • When CFM[1:0] value is 01_B (transmit mode): Set the label information to be stored in the transmit history buffer. Only bits CFPTR[7:0] are valid. • When CFM[1:0] value is 00_B (receive mode): The label information of the received message can be read.
15 to 0	CFTS[15:0]	Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is 00_B (receive mode). The timestamp value of the received message can be read.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer. If the data length is set to 1001_B or more, the actual transmit data defaults to 8 bytes.

CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.

These bits are valid when the CFM[1:0] value is 00_B.

23.3.7.6 RSCANnCFDF0_k — Transmit/receive FIFO Buffer Access Data Field 0 Register (k = 0 to 8)

Access: RSCANnCFDF0_k register can be read/written in 32-bit units
RSCANnCFDF0_kL, RSCANnCFDF0_kH registers can be read/written in 16-bit units
RSCANnCFDF0_kLL, RSCANnCFDF0_kLH, RSCANnCFDF0_kHL, RSCANnCFDF0_kHH registers can be read/written in 8-bit units

Address: RSCANnCFDF0_k: <RSCFDn_base> + $0E88_H$ + (10_H × k)

RSCANnCFDF0_kL: <RSCFDn_base> + $0E88_H$ + (10_H × k),
RSCANnCFDF0_kH: <RSCFDn_base> + $0E8A_H$ + (10_H × k)

RSCANnCFDF0_kLL: <RSCFDn_base> + $0E88_H$ + (10_H × k),
RSCANnCFDF0_kLH: <RSCFDn_base> + $0E89_H$ + (10_H × k),
RSCANnCFDF0_kHL: <RSCFDn_base> + $0E8A_H$ + (10_H × k),

Table 23.53 RSCANnCFDF0_k Register Contents

Bit Position	Bit Name	Function
31 to 24	CFDB3[7:0]	Transmit/Receive FIFO Buffer Data Byte 3
23 to 16	CFDB2[7:0]	Transmit/Receive FIFO Buffer Data Byte 2
15 to8	CFDB1[7:0]	Transmit/Receive FIFO Buffer Data Byte 1
7 to 0	CFDB0[7:0]	Transmit/Receive FIFO Buffer Data Byte 0 • When CFM[1:0] value is 01_B (transmit mode): Set the transmit/receive FIFO buffer data. • When CFM[1:0] value is 00_B (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode).

This register is readable only when the CFM[1:0] value is 00_B (receive mode). When the CFDLC[3:0] value in the RSCANnCFPTRk register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

23.3.7.7 RSCANnCFDF1_k — Transmit/receive FIFO Buffer Access Data Field 1 Register (k = 0 to 8)

Access: RSCANnCFDF1_k register can be read/written in 32-bit units
RSCANnCFDF1_kL, RSCANnCFDF1_kH registers can be read/written in 16-bit units
RSCANnCFDF1_kLL, RSCANnCFDF1_kLH, RSCANnCFDF1_kHL, RSCANnCFDF1_kHH registers can be read/written in 8-bit units

Address: RSCANnCFDF1_k: <RSCFDn_base> + $0E8C_H$ + (10_H × k)

RSCANnCFDF1_kL: <RSCFDn_base> + $0E8C_H$ + (10_H × k),
RSCANnCFDF1_kH: <RSCFDn_base> + $0E8E_H$ + (10_H × k)

RSCANnCFDF1_kLL: <RSCFDn_base> + $0E8C_H$ + (10_H × k),
RSCANnCFDF1_kLH: <RSCFDn_base> + $0E8D_H$ + (10_H × k),
RSCANnCFDF1_kHL: <RSCFDn_base> + $0E8E_H$ + (10_H × k),
RSCANnCFDF1_kHH: <RSCFDn_base> + $0E8F_H$ + (10_H × k)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.54 RSCANnCFDF1_k Register Contents

Bit Position	Bit Name	Function
31 to 24	CFDB7[7:0]	Transmit/Receive FIFO Buffer Data Byte 7
23 to 16	CFDB6[7:0]	Transmit/Receive FIFO Buffer Data Byte 6
15 to 8	CFDB5[7:0]	Transmit/Receive FIFO Buffer Data Byte 5
7 to 0	CFDB4[7:0]	Transmit/Receive FIFO Buffer Data Byte 4 • When CFM[1:0] value is 01_B (transmit mode): Set the transmit/receive FIFO buffer data. • When CFM[1:0] value is 00_B (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode).

This register is readable only when the CFM[1:0] value is 00_B (receive mode). When the CFDLC[3:0] value in the RSCANnCFPTRk register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

23.3.8 Details of FIFO Status-Related Registers

23.3.8.1 RSCANnFESTS — FIFO Empty Status Register

Access: RSCANnFESTSregisters can be read only in 32-bit units
RSCANnFESTSL, RSCANnFESTSH registers can be read only in 16-bit units
RSCANnFESTSLL, RSCANnFESTSLH, RSCANnFESTSHL registers can be read only in 8-bit units

Address: RSCANnFESTS: <RSCFDn_base> + 0238_H

RSCANnFESTSL: <RSCFDn_base> + 0238_H,
RSCANnFESTSH: <RSCFDn_base> + $023A_H$

RSCANnFESTSLL: <RSCFDn_base> + 0238_H,
RSCANnFESTSLH: <RSCFDn_base> + 0239_H,
RSCANnFESTSHL: <RSCFDn_base> + $023A_H$

Value after reset: 03FF $FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CF8EMP

Table 23.55 RSCANnFESTS Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	These bits are read as the value after reset.
16	CF8EMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: Transmit/receive FIFO buffer k contains a message. 1: Transmit/receive FIFO buffer k contains no message. (k = 0 to 8)
15	CF7EMP	
14	CF6EMP	
13	CF5EMP	
12	CF4EMP	
11	CF3EMP	
10	CF2EMP	
9	CF1EMP	
8	CF0EMP	
7	RF7EMP	Receive FIFO Buffer Empty Status Flag 0: Receive FIFO buffer x contains an unread message. 1: Receive FIFO buffer x contains no unread message (buffer empty). (x = 0 to 7)
6	RF6EMP	
5	RF5EMP	
4	RF4EMP	
3	RF3EMP	
2	RF2EMP	
1	RF1EMP	
0	RF0EMP	

The RSCANnFESTS register is set to 03FF $FFFF_H$ in global reset mode.

CFkEMP Flag (k = 0 to 8)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

23.3.8.2 RSCANnFFSTS — FIFO Full Status Register

Access: RSCANnFFSTS register can be read only in 32-bit units
RSCANnFFSTSL, RSCANnFFSTSH registers can be read only in 16-bit units
RSCANnFFSTSLL, RSCANnFFSTSLH, RSCANnFFSTSHL registers can be read only in 8-bit units

Address: RSCANnFFSTS: <RSCFDn_base> + $023C_H$

RSCANnFFSTSL: <RSCFDn_base> + $023C_H$,
RSCANnFFSTSH: <RSCFDn_base> + $023E_H$

RSCANnFFSTSLL: <RSCFDn_base> + $023C_H$,
RSCANnFFSTSLH: <RSCFDn_base> + $023D_H$,
RSCANnFFSTSHL: <RSCFDn_base> + $023E_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CF8FLL

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 23.56 RSCANnFFSTS Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	These bits are read as the value after reset.
16	CF8FLL	Transmit/Receive FIFO Buffer Full Status Flag 0: Transmit/receive buffer k is not full. 1: Transmit/receive buffer k is full. (k = 0 to 8)
15	CF7FLL	
14	CF6FLL	
13	CF5FLL	
12	CF4FLL	
11	CF3FLL	
10	CF2FLL	
9	CF1FLL	
8	CF0FLL	
7	RF7FLL	Receive FIFO Buffer Full Status Flag 0: Receive FIFO buffer x is not full. 1: Receive FIFO buffer x is full. (x = 0 to 7)
6	RF6FLL	
5	RF5FLL	
4	RF4FLL	
3	RF3FLL	
2	RF2FLL	
1	RF1FLL	
0	RF0FLL	

The RSCANnFFSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkFLL Flag (k = 0 to 8)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).

When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

23.3.8.3 RSCANnFMSTS — FIFO Message Lost Status Register

Access: RSCANnFMSTS register can be read only in 32-bit units
RSCANnFMSTSL, RSCANnFMSTSH registers can be read only in 16-bit units
RSCANnFMSTSLL, RSCANnFMSTSLH, RSCANnFMSTSHL registers can be read only in 8-bit units

Address: RSCANnFMSTS: <RSCFDn_base> + 0240_H

RSCANnFMSTSL: <RSCFDn_base> + 0240_H,
RSCANnFMSTSH: <RSCFDn_base> + 0242_H

RSCANnFMSTSLL: <RSCFDn_base> + 0240_H,
RSCANnFMSTSLH: <RSCFDn_base> + 0241_H,
RSCANnFMSTSHL: <RSCFDn_base> + 0242_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CF8MLT

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 23.57 RSCANnFMSTS Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	These bits are read as the value after reset.
16	CF8MLT	Transmit/Receive FIFO Buffer Message Lost Status Flag 0: No transmit/receive FIFO buffer k message is lost. 1: A transmit/receive FIFO buffer k message is lost. (k = 0 to 8)
15	CF7MLT	
14	CF6MLT	
13	CF5MLT	
12	CF4MLT	
11	CF3MLT	
10	CF2MLT	
9	CF1MLT	
8	CF0MLT	
7	RF7MLT	Receive FIFO Buffer Message Lost Status Flag 0: No receive FIFO buffer x message is lost. 1: A receive FIFO buffer x message is lost. (x = 0 to 7)
6	RF6MLT	
5	RF5MLT	
4	RF4MLT	
3	RF3MLT	
2	RF2MLT	
1	RF1MLT	
0	RF0MLT	

The RSCANnFMSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkMLT Flag (k = 0 to 8)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

23.3.8.4 RSCANnRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

Access: RSCANnRFISTS register can be read only in 32-bit units
RSCANnRFISTSL register is a read-only register that can be read only in 16-bit units
RSCANnRFISTSLL register is a read-only register that can be read only in 8-bit units

Address: RSCANnRFISTS: <RSCFDn_base> + 0244_H

RSCANnRFISTSL: <RSCFDn_base> + 0244_H

RSCANnRFISTSLL: <RSCFDn_base> + 0244_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	RF7IF	RF6IF	RF5IF	RF4IF	RF3IF	RF2IF	RF1IF	RF0IF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 23.58 RSCANnRFISTS Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	These bits are read as the value after reset.
7	RF7IF	Receive FIFO Buffer Interrupt Request Status Flag 0: No receive FIFO buffer x interrupt request is present. 1: A receive FIFO buffer x interrupt request is present. (x = 0 to 7)
6	RF6IF	
5	RF5IF	
4	RF4IF	
3	RF3IF	
2	RF2IF	
1	RF1IF	
0	RF0IF	

The RSCANnRFISTS register is cleared to $0000\ 0000_H$ in global reset mode.

RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

23.3.8.5 RSCANnCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

Access: RSCANnCFRISTS register can be read only in 32-bit units
RSCANnCFRISTSL register is a read-only register that can be read only in 16-bit units
RSCANnCFRISTSLL, RSCANnCFRISTSLH are the read-only registers that can be read only in 8-bit units

Address: RSCANnCFRISTS: <RSCFDn_base> + 0248_H

RSCANnCFRISTSL: <RSCFDn_base> + 0248_H

RSCANnCFRISTSLL: <RSCFDn_base> + 0248_H,
RSCANnCFRISTSLH: <RSCFDn_base> + 0249_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 23.59 RSCANnCFRISTS Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset.
8	CF8RXIF	Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k receive interrupt request is present. 1: A transmit/receive FIFO buffer k receive interrupt request is present. (k = 0 to 8)
7	CF7RXIF	
6	CF6RXIF	
5	CF5RXIF	
4	CF4RXIF	
3	CF3RXIF	
2	CF2RXIF	
1	CF1RXIF	
0	CF0RXIF	

The RSCANnCFRISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkRXIF Flag (k = 0 to 8)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

23.3.8.6 RSCANnCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

Access: RSCANnCFTISTS register can be read only in 32-bit units
RSCANnCFTISTSL register is a read-only register that can be read only in 16-bit units
RSCANnCFTISTSLL, RSCANnCFTISTSLH are the read-only registers that can be read only in 8-bit units

Address: RSCANnCFTISTS: <RSCFDn_base> + $024C_H$

RSCANnCFTISTSL: <RSCFDn_base> + $024C_H$

RSCANnCFTISTSLL: <RSCFDn_base> + $024C_H$,
RSCANnCFTISTSLH: <RSCFDn_base> + $024D_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CF8TXIF	CF7TXIF	CF6TXIF	CF5TXIF	CF4TXIF	CF3TXIF	CF2TXIF	CF1TXIF	CF0TXIF

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 23.60 RSCANnCFTISTS Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset.
8	CF8TXIF	Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k transmit interrupt request is present. 1: A transmit/receive FIFO buffer k transmit interrupt request is present. (k = 0 to 8)
7	CF7TXIF	
6	CF6TXIF	
5	CF5TXIF	
4	CF4TXIF	
3	CF3TXIF	
2	CF2TXIF	
1	CF1TXIF	
0	CF0TXIF	

The RSCANnCFTISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkTXIF Flag (k = 0 to 8)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

23.3.9 Details of Transmit Buffer-Related Registers

23.3.9.1 RSCANnTMCp — Transmit Buffer Control Register (p = 0 to 47)

Access: RSCANnTMCp register can be read/written in 8-bit units

Address: RSCANnTMCp: <RSCFDn_base> + 0250_H + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W*1	R/W*1

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

Table 23.61 RSCANnTMCp Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	TMOM	One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled.
1	TMTAR	Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested.
0	TMTR	Transmit Request 0: Transmission is not requested. 1: Transmission is requested.

When the RSCANnTMCp register meets any of the following conditions, set it to 00_H.

- The RSCANnTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCANnCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCANnTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCANnTXQCCm (m = 0 to 2) register (p = (m × 16 + 15) to (m × 16 + 15 – the value of TXQDC[3:0] bits)).

Bits in the RSCANnTMCp register are all cleared to 0 in channel reset mode. Modify the RSCANnTMCp register in channel communication mode or channel halt mode.

TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCANnTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration-lost has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCANnTMSTSp register is 00_B.

23.3.9.2 RSCANnTMSTSp — Transmit Buffer Status Register (p = 0 to 47)

Access: RSCANnTMSTSp register can be read/written in 8-bit units

Address: RSCANnTMSTSp: <RSCFDn_base> + $02D0_H$ + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R

Table 23.62 RSCANnTMSTSp Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4	TMTARM	Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present.
3	TMTRM	Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present.
2, 1	TMTRF[1:0]	Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request).
0	TMTSTS	Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress.

The RSCANnTMSTSp register is cleared to all 0 in channel reset mode.

TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCANnTMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCANnTMCp register is set to 0.

TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCANnTMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCANnTMCp register is set to 0.

TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00_B: Transmission is in progress or no transmit request is present.

01_B: Transmission from the transmit buffer was aborted.

10_B: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 0 (transmit abort is not requested).

11_B: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 1 (transmit abort is requested).

Write 00_B to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00_B to this flag.

TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

23.3.9.3 RSCANnTMIDp — Transmit Buffer ID Register (p = 0 to 47)

Access: RSCANnTMIDp register can be read/written in 32-bit units
RSCANnTMIDpL, RSCANnTMIDpH registers can be read/written in 16-bit units
RSCANnTMIDpLL, RSCANnTMIDpLH, RSCANnTMIDpHL, RSCANnTMIDpHH registers can be read/written in 8-bit units

Address: RSCANnTMIDp: <RSCFDn_base> + 1000_H + (10_H × p)

RSCANnTMIDpL: <RSCFDn_base> + 1000_H + (10_H × p),
RSCANnTMIDpH: <RSCFDn_base> + 1002_H + (10_H × p)

RSCANnTMIDpLL: <RSCFDn_base> + 1000_H + (10_H × p),
RSCANnTMIDpLH: <RSCFDn_base> + 1001_H + (10_H × p),
RSCANnTMIDpHL: <RSCFDn_base> + 1002_H + (10_H × p),
RSCANnTMIDpHH: <RSCFDn_base> + 1003_H + (10_H × p)

Value after reset: $0000\ 0000_H$

Table 23.63 RSCANnTMIDp Register Contents

Bit Position	Bit Name	Function
31	TMIDE	Transmit Buffer IDE 0: Standard ID 1: Extended ID
30	TMRTR	Transmit Buffer RTR 0: Data frame 1: Remote frame
29	THLEN	Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	TMID[28:0]	Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp (timestamp is included if the TMTSCE bit in the RSCANnGCFG register is 1)) of transmit messages is stored in the transmit history buffer after transmission is completed.

TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

23.3.9.4 RSCANnTMPTRp — Transmit Buffer Pointer Register (p = 0 to 47)

Access: RSCANnTMPTRp register can be read/written in 32-bit units
RSCANnTMPTRpH register can be read/written in 16-bit units
RSCANnTMPTRpHL, RSCANnTMPTRpHH registers can be read/written in 8-bit units

Address: RSCANnTMPTRp: <RSCFDn_base> + 1004_H + (10_H × p)

RSCANnTMPTRpH: <RSCFDn_base> + 1006_H + (10_H × p)

RSCANnTMPTRpHL: <RSCFDn_base> + 1006_H + (10_H × p),
RSCANnTMPTRpHH: <RSCFDn_base> + 1007_H + (10_H × p)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMDLC[3:0]				—	—	—	—	TMPTR[7:0]

Table 23.64 RSCANnTMPTRp Register Contents

Bit Position	Bit Name	Function
31 to 28	TMDLC[3:0]	Transmit Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 24	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
23 to 16	TMPTR[7:0]	Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer.
15 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCANnTMIDp register is set to 0 (data frame). If the data length is set to 1001_B or more, the transmit data is 8 bytes long.

When the TMRTR bit is set to 1 (remote frame), set the data length of messages to be requested.

TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

23.3.9.5 RSCANnTMDF0_p — Transmit Buffer Data Field 0 Register (p = 0 to 47)

Access: RSCANnTMDF0_p register can be read/written in 32-bit units
RSCANnTMDF0_pL, RSCANnTMDF0_pH registers can be read/written in 16-bit units
RSCANnTMDF0_pLL, RSCANnTMDF0_pLH, RSCANnTMDF0_pHL, RSCANnTMDF0_pHH registers can be read/written in 8-bit units

Address: RSCANnTMDF0_p: <RSCFDn_base> + 1008_H + (10_H × p)

RSCANnTMDF0_pL: <RSCFDn_base> + 1008_H + (10_H × p),
RSCANnTMDF0_pH: <RSCFDn_base> + $100A_H$ + (10_H × p)

RSCANnTMDF0_pLL: <RSCFDn_base> + 1008_H + (10_H × p),
RSCANnTMDF0_pLH: <RSCFDn_base> + 1009_H + (10_H × p),
RSCANnTMDF0_pHL: <RSCFDn_base> + $100A_H$ + (10_H × p),
RSCANnTMDF0_pHH: <RSCFDn_base> + $100B_H$ + (10_H × p)

Value after reset: $0000\ 0000_H$

15 to 0	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled.

TMIEp Bits (p = 0 to 47)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCANnTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

Table 23.68 shows the bit assignment.

Table 23.69 RSCANnTMTRSTSy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit request is present. 1: A transmit request is present.
15 to 0	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit request is present. 1: A transmit request is present.

TMTRSTSp Flags (p = 0 to 47)

These flags indicate the status of the TMTR bit in the RSCANnTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 23.70 shows the bit assignment.

Table 23.70 TMTRSTSp Bit Assignment

Table 23.71 RSCANnTMTARSTSy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTARSTSp	Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit abort request is present. 1: A transmit abort request is present.
15 to 0	TMTARSTSp	Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit abort request is present. 1: A transmit abort request is present.

TMTARSTSp Flags (p = 0 to 47)

These flags indicate the status of the TMTAR bit in the RSCANnTMCp register.

When the TMTAR bit is set to 1 (transmit abort is requested), the corresponding TMTARSTSp flag is set to 1.

The corresponding TMTARSTSp flag is cleared to 0 when the TMTAR bit is set to 0 (transmit abort is not requested) or in channel reset mode.

Table 23.77 RSCANnTXQCCm Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
13	TXQIM	Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted.
12	TXQIE	Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled.
11 to 8	TXQDC[3:0]	Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 15) makes the (g + 1) transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited.
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	TXQE	Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used.

TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQIE bit.

TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0) (see **Table 23.17**). For examples of how buffer allocation is done, see **Figure 23.9**. Modify these bits only in channel reset mode.

TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010_B or more.

23.3.11.2 RSCANnTXQSTSm — Transmit Queue Status Register (m = 0 to 2)

Access: RSCANnTXQSTSm register can be read/written in 32-bit units
RSCANnTXQSTSmL register can be read/written in 16-bit units
RSCANnTXQSTSmLL register can be read/written in 8-bit units

Address: RSCANnTXQSTSm: <RSCFDn_base> + $03C0_H$ + (04_H × m)

RSCANnTXQSTSmL: <RSCFDn_base> + $03C0_H$ + (04_H × m)

RSCANnTXQSTSmLL: <RSCFDn_base> + $03C0_H$ + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQIF	TXQFLL	TXQEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 23.78 RSCANnTXQSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
12 to 8	Reserved	When read, the undefined value is returned. When writing to these bits, write the value after reset.
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	TXQIF	Transmit Queue Interrupt Request Flag 0: No transmit queue interrupt request is present. 1: A transmit queue interrupt request is present.
1	TXQFLL	Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full.
0	TXQEMP	Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty).

TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCANnTXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCANnTXQCCm register to 0 (the transmit queue is not used).

TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCANnTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

23.3.11.3 RSCANnTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 2)

Access: RSCANnTXQPCTRm register can only be written in 32-bit units
RSCANnTXQPCTRmL register can only be written in 16-bit units
RSCANnTXQPCTRmLL register can only be written in 8-bit units

Address: RSCANnTXQPCTRm: <RSCFDn_base> + $03E0_H$ + (04_H × m)

RSCANnTXQPCTRmL: <RSCFDn_base> + $03E0_H$ + (04_H × m)

RSCANnTXQPCTRmLL: <RSCFDn_base> + $03E0_H$ + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TXQPC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 23.79 RSCANnTXQPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	TXQPC[7:0]	Transmit Queue Pointer Control Writing FF_H to these bits moves the write pointer of the transmit queue to the next queue buffer.

TXQPC[7:0] Bits

Writing FF_H to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCANnTMIDp, RSCANnTMPTRp, RSCANnTMDF0_p, and RSCANnTMDF1_p registers (p = 15, 31, and 47) before writing FF_H to the TXQPC[7:0] bits.

When writing FF_H to these bits, make sure that the TXQE bit in the RSCANnTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCANnTXQSTSm register is 0 (he transmit queue is not full).

23.3.12 Details of Transmission History-Related Registers

23.3.12.1 RSCANnTHLCCm — Transmit History Configuration and Control Register (m = 0 to 2)

Access: RSCANnTHLCCm register can be read/written in 32-bit units
RSCANnTHLCCmL register can be read/written in 16-bit units
RSCANnTHLCCmLL, RSCANnTHLCCmLH registers can be read/written in 8-bit units

Address: RSCANnTHLCCm: <RSCFDn_base> + 0400_H + (04_H × m)

RSCANnTHLCCmL: <RSCFDn_base> + 0400_H + (04_H × m)

RSCANnTHLCCmLL: <RSCFDn_base> + 0400_H + (04_H × m),
RSCANnTHLCCmLH: <RSCFDn_base> + 0401_H + (04_H × m)

Table 23.80 RSCANnTHLCCm Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
10	THLDTE	Transmit History Target Buffer Select 0: Entry from transmit/receive FIFO buffers and transmit queue 1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue
9	THLIM	Transmit History Interrupt Source Select 0: When 12 sets of data have been stored in the transmit history buffer 1: When a single set of transmit history data has been stored
8	THLIE	Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled.
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	THLE	Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used.

THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit set to 0.

THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.

This bit is cleared to 0 in channel reset mode.

23.3.12.2 RSCANnTHLSTSm — Transmit History Status Register (m = 0 to 2)

Access: RSCANnTHLSTSm register can be read/written in 32-bit units
RSCANnTHLSTSmL register can be read/written in 16-bit units
RSCANnTHLSTSmLL register can be read/written in 8-bit units
RSCANnTHLSTSmLH register is a read-only register that can be read in 8-bit units

Address: RSCANnTHLSTSm: <RSCFDn_base> + 0420_H + (04_H × m)

RSCANnTHLSTSmL: <RSCFDn_base> + 0420_H + (04_H × m)

RSCANnTHLSTSmLL: <RSCFDn_base> + 0420_H + (04_H × m),

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 23.81 RSCANnTHLSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
12 to 8	THLMC[4:0]	Transmit History Buffer Unread Data Counter These bits indicate the number of unread data sets stored in the transmit history buffer.
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	THLIF	Transmit History Interrupt Request Flag 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present.
2	THLELT	Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.
1	THLFLL	Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full.
0	THLEMP	Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).

THLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer.

These bits are cleared to 0 in channel reset mode.

THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCANnTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

NOTE

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

23.3.12.3 RSCANnTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 2)

Access: RSCANnTHLPCTRm register can only be written in 32-bit units
RSCANnTHLPCTRmL register can only be written in 16-bit units
RSCANnTHLPCTRmLL register can only be written in 8-bit units

Address: RSCANnTHLPCTRm: <RSCFDn_base> + 0440_H + (04_H × m)

RSCANnTHLPCTRmL: <RSCFDn_base> + 0440_H + (04_H × m)

RSCANnTHLPCTRmLL: <RSCFDn_base> + 0440_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 23.82 RSCANnTHLPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write the value after reset.
7 to 0	THLPC[7:0]	Transmit History List Pointer Control Writing FF_H to these bits moves the read pointer to the next unread data in the transmit history buffer.

THLPC[7:0] Bits

When the THLPC[7:0] bits are set to FF_H, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCANnTHLSTSm register is decremented. Write FF_H to the THLPC[7:0] bits after reading from the RSCANnTHLACCm register.

When writing FF_H to these bits, make sure that the THLE bit in the RSCANnTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCANnTHLSTSm register is 0.

23.3.12.4 RSCANnTHLACCm — Transmit History Access Register (m = 0 to 2)

Access: RSCANnTHLACCm register can be read only in 32-bit units
RSCANnTHLACCmL, RSCANnTHLACCmH registers can be read only in 16-bit units
RSCANnTHLACCmLL, RSCANnTHLACCmLH, RSCANnTHLACCmHL, RSCANnTHLACCmHH registers can be read only in 8-bit units

Address: RSCANnTHLACCm: <RSCFDn_base> + 1800_H + (04_H × m)

RSCANnTHLACCmL: <RSCFDn_base> + 1800_H + (04_H × m),
RSCANnTHLACCmH: <RSCFDn_base> + 1802_H + (04_H × m)

RSCANnTHLACCmLL: <RSCFDn_base> + 1800_H + (04_H × m),
RSCANnTHLACCmLH: <RSCFDn_base> + 1801_H + (04_H × m),
RSCANnTHLACCmHL: <RSCFDn_base> + 1802_H + (04_H × m),
RSCANnTHLACCmHH: <RSCFDn_base> + 1803_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMTS[15:0]

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 23.83 RSCANnTHLACCm Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTS[15:0]	Timestamp Data The timestamp data of stored data can be read.
15 to 8	TID[7:0]	Label Data The label information of stored data can be read.
7	Reserved	When read, the value after reset is returned.
6 to 3	BN[3:0]	Buffer Number Data The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read.
2 to 0	BT[2:0]	Buffer Type Data b2 b1 b0 0 0 1: Transmit buffer 0 1 0: Transmit/receive FIFO buffer 1 0 0: Transmit queue

TMTS[15:0] Bits

When the TMTSCE bit in the RSCANnGCFG register is 1, timestamp values in transmit history data stored in the transmit history buffer are displayed. When the TMTSCE bit is 0, these bits are always read as 0.

TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

23.3.13 Details of Test-Related Registers

23.3.13.1 RSCANnGTSTCFG — Global Test Configuration Register

Access: RSCANnGTSTCFG register can be read/written in 32-bit units
RSCANnGTSTCFGL, RSCANnGTSTCFGH registers can be read/written in 16-bit units
RSCANnGTSTCFGLL, RSCANnGTSTCFGHL registers can be read/written in 8-bit units

Address: RSCANnGTSTCFG: <RSCFDn_base> + 0468_H

RSCANnGTSTCFGL: <RSCFDn_base> + 0468_H,
RSCANnGTSTCFGH: <RSCFDn_base> + $046A_H$

RSCANnGTSTCFGLL: <RSCFDn_base> + 0468_H,
RSCANnGTSTCFGHL: <RSCFDn_base> + $046A_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	RTMPS[6:0]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 23.84 RSCANnGTSTCFG Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
22 to 16	RTMPS[6:0]	RAM Test Page Configuration Set a value within a range of page 0 (00_H) to page 29 ($1D_H$).
15 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	C2ICBCE	CAN2 Inter-channel Communication Test Enable 0: CAN2 inter-channel communication test is disabled 1: CAN2 inter-channel communication test is enabled.
1	C1ICBCE	CAN1 Inter-Channel Communication Test Enable 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled.
0	C0ICBCE	CAN0 Inter-Channel Communication Test Enable 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled.

Modify the RSCANnGTSTCFG register only in global test mode.

RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00_H to $1D_H$, inclusive.

C2ICBCE Bit

Setting this bit to 1 enables the channel 2 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

23.3.13.2 RSCANnGTSTCTR — Global Test Control Register

Access: RSCANnGTSTCTR register can be read/written in 32-bit units
RSCANnGTSTCTRL register can be read/written in 16-bit units
RSCANnGTSTCTRLL register can be read/written in 8-bit units

Address: RSCANnGTSTCTR: <RSCFDn_base> + $046C_H$

RSCANnGTSTCTRL: <RSCFDn_base> + $046C_H$

RSCANnGTSTCTRLL: <RSCFDn_base> + $046C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RTME	—	ICBCTME
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Table 23.85 RSCANnGTSTCTR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	RTME	RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled.
1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	ICBCTME	Communication Test between Channels Enable 0: Communication test between channels disabled 1: Communication test between channels enabled

RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.

This bit is cleared to 0 in global reset mode (See Figure 23.37, RAM Test Setting Procedure).

1. Set the GMDC[1:0] bits in the RSCANnGCTR register to 10_B (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0 to 2) in the RSCANnGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.

This bit is cleared to 0 in global reset mode.

23.3.13.3 RSCANnGLOCKK — Global Lock Key Register

Access: RSCANnGLOCKK register can be write only in 32-bit units.
RSCANnGLOCKKL register can be write only in 16-bit units.

Address: RSCANnGLOCKK: <RSCFDn_base> + $047C_H$

RSCANnGLOCKKL: <RSCFDn_base> + $047C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LOCK[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

Table 23.86 RSCANnGLOCKK Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When writing these bits, write the value after reset.
15 to 0	LOCK[15:0]	Lock Key These bits are key bits to release protection of test mode.

The RSCANnGLOCKK register releases protection of special test bits and is write only.

For the protection release data, see Section 23.11.4.2, Procedure for Releasing the Protection.

LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCANnGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCFDn_base> + 0000_H to <RSCFDn_base> + $04FF_H$) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

23.3.13.4 RSCANnRPGACCr — RAM Test Page Access Register (r = 0 to 63)

Access: RSCANnRPGACCr register can be read/written in 32-bit units
RSCANnRPGACCrL, RSCANnRPGACCrH registers can be read/written in 16-bit units
RSCANnRPGACCrLL, RSCANnRPGACCrLH, RSCANnRPGACCrHL, RSCANnRPGACCrHH registers can be read/written in 8-bit units

Address: RSCANnRPGACCr: <RSCFDn_base> + 1900_H + (04_H × r)

RSCANnRPGACCrL: <RSCFDn_base> + 1900_H + (04_H × r)),
RSCANnRPGACCrH: <RSCFDn_base> + 1902_H + (04_H × r))

RSCANnRPGACCrLL: <RSCFDn_base> + 1900_H + (04_H × r)),
RSCANnRPGACCrLH: <RSCFDn_base> + 1901_H + (04_H × r)),
RSCANnRPGACCrHL: <RSCFDn_base> + 1902_H + (04_H × r)),
RSCANnRPGACCrHH: <RSCFDn_base> + 1903_H + (04_H × r))

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RDTA[31:16]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RDTA[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.87 RSCANnRPGACCr Register Contents

Bit Position	Bit Name	Function
31 to 0	RDTA [31:0]	RAM Data Test Access Data can be read and written in RSCAN RAM.

Modify the RSCANnRPGACCr register in global test mode with the RTME bit in the RSCANnGTSTCTR register set to 1 (RAM test is enabled).

The RSCANnRPGACCr register is readable and writable when the RTME bit is set to 1.

23.4 Registers (CAN FD Mode)

This section describes all registers to be used when the RS-CANFD is used in CAN FD mode.

23.4.1 List of Registers

The following tables list RS-CANFD registers to be used in CAN FD mode.

For details about <RSCFDn_base>, see Section 23.1.2, Register Base Address.

For details about registers initialized in Global reset mode or Channel reset mode, see following:

- Table 23.177, Registers Initialized in Global Reset Mode or Channel Reset Mode
- Table 23.178, Registers Initialized Only in Global Reset Mode

Table 23.88 Registers (1/3)

Module	Register	Symbol	Address
Interface mode-related registers			
RSCFDn	Global interface mode select register	RSCFDnCFDGRMCFG	<RSCFDn_base> + $04FC_H$
Channel-related registers			
RSCFDn	Channel m nominal bit rate configuration register	RSCFDnCFDCmNCFG	<RSCFDn_base> + 0000_H + (10_H × m)
RSCFDn	Channel m control register	RSCFDnCFDCmCTR	<RSCFDn_base> + 0004_H + (10_H × m)
RSCFDn	Channel m status register	RSCFDnCFDCmSTS	<RSCFDn_base> + 0008_H + (10_H × m)
RSCFDn	Channel m error flag register	RSCFDnCFDCmERFL	<RSCFDn_base> + $000C_H$ + (10_H × m)
RSCFDn	Channel m data bit rate configuration register	RSCFDnCFDCmDCFG	<RSCFDn_base> + 0500_H + (20_H × m)
RSCFDn	Channel m CAN FD configuration register	RSCFDnCFDCmFDCFG	<RSCFDn_base> + 0504_H + (20_H × m)
RSCFDn	Channel m CAN FD control register	RSCFDnCFDCmFDCTR	<RSCFDn_base> + 0508_H + (20_H × m)
RSCFDn	Channel m CAN FD status register	RSCFDnCFDCmFDSTS	<RSCFDn_base> + $050C_H$ + (20_H × m)
RSCFDn	Channel m CAN FD CRC register	RSCFDnCFDCmFDCRC	<RSCFDn_base> + 0510_H + (20_H × m)
Global-related registers			
RSCFDn	Global configuration register	RSCFDnCFDGCFG	<RSCFDn_base> + 0084_H
RSCFDn	Global control register	RSCFDnCFDGCTR	<RSCFDn_base> + 0088_H
RSCFDn	Global status register	RSCFDnCFDGSTS	<RSCFDn_base> + $008C_H$
RSCFDn	Global error flag register	RSCFDnCFDGERFL	<RSCFDn_base> + 0090_H
RSCFDn	Global timestamp counter register	RSCFDnCFDGTSC	<RSCFDn_base> + 0094_H
RSCFDn	Global TX Interrupt Status Register 0	RSCFDnCFDGTINTSTS0	<RSCFDn_base> + 0460_H
RSCFDn	Glboal FD configuration register	RSCFDnCFDGFDCFG	<RSCFDn_base> + 0474_H
RSCFDn	Global CRC configuration register	RSCFDnCFDGCRCCFG	<RSCFDn_base> + 0478_H
Receive rule-related registers			
RSCFDn	Receive Rule Entry Control Register	RSCFDnCFDGAFLECTR	<RSCFDn_base> + 0098_H
RSCFDn	Receive Rule Configuration Register 0	RSCFDnCFDGAFLCFG0	<RSCFDn_base> + $009C_H$
RSCFDn	Receive Rule ID Register j	RSCFDnCFDGAFLIDj	<RSCFDn_base> + 1000_H + (10_H × j)
RSCFDn	Receive Rule Mask Register j	RSCFDnCFDGAFLMj	<RSCFDn_base> + 1004_H + (10_H × j)
RSCFDn	Receive Rule Pointer 0 Register j	RSCFDnCFDGAFLP0_j	<RSCFDn_base> + 1008_H + (10_H × j)
RSCFDn	Receive Rule Pointer 1 Register j	RSCFDnCFDGAFLP1_j	<RSCFDn_base> + $100C_H$ + (10_H × j)
Receive buffer-related registers			
RSCFDn	Receive Buffer Number Register	RSCFDnCFDRMNB	<RSCFDn_base> + $00A4_H$
RSCFDn	Receive Buffer New Data Register y	RSCFDnCFDRMNDy	<RSCFDn_base> + $00A8_H$ + (04_H × y)
RSCFDn	Receive Buffer ID Register q	RSCFDnCFDRMIDq	<RSCFDn_base> + 2000_H + (20_H × q)
RSCFDn	Receive Buffer Pointer Register q	RSCFDnCFDRMPTRq	<RSCFDn_base> + 2004_H + (20_H × q)
RSCFDn	Receive buffer CAN FD status register q	RSCFDnCFDRMFDSTSq	<RSCFDn_base> + 2008_H + (20_H × q)

Table 23.88 Registers (2/3)

Module	Register	Symbol	Address
RSCFDn	Receive Buffer Data Field b Register q	RSCFDnCFDRMDFb_q	<RSCFDn_base> + $200C_H$ + (04_H × b) + (20_H × q)
Receive FIFO buffer-related registers			
RSCFDn	Receive FIFO Buffer Configuration and Control Register x	RSCFDnCFDRFCCx	<RSCFDn_base> + $00B8_H$ + (04_H × x)
RSCFDn	Receive FIFO Buffer Status Register x	RSCFDnCFDRFSTSx	<RSCFDn_base> + $00D8_H$ + (04_H × x)
RSCFDn	Receive FIFO Buffer Pointer Control Register x	RSCFDnCFDRFPCTRx	<RSCFDn_base> + $00F8_H$ + (04_H × x)
RSCFDn	Receive FIFO Buffer Access ID Register x	RSCFDnCFDRFIDx	<RSCFDn_base> + 3000_H + (80_H × x)
RSCFDn	Receive FIFO Buffer Access Pointer Register x	RSCFDnCFDRFPTRx	<RSCFDn_base> + 3004_H + (80_H × x)
RSCFDn	Receive FIFO CAN FD status register x	RSCFDnCFDRFFDSTSx	<RSCFDn_base> + 3008_H + (80_H × x)
RSCFDn	Receive FIFO Buffer Access Data Field d Register x	RSCFDnCFDRFDFd_x	<RSCFDn_base> + $300C_H$ + (04_H × d) + (80_H × x)
Transmit/Receive FIFO buffer related registers			
RSCFDn	Transmit/receive FIFO Buffer Configuration and Control Register k	RSCFDnCFDCFCCk	<RSCFDn_base> + 0118_H + (04_H × k)
RSCFDn	Transmit/receive FIFO Buffer Status Register k	RSCFDnCFDCFSTSk	<RSCFDn_base> + 0178_H + (04_H × k)

Table 23.93 RSCFDnCFDGRMCFG Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	RCMC	Interface Mode Select 0: Classical CAN mode 1: CAN FD mode

Note 1. The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Modify the RSCFDnCFDGRMCFG register only in global reset mode. Before setting other RS-CANFD registers, set this register.

RCMC Bit

Setting this bit to 1 makes CAN-FD mode available. To switch classical CAN mode to CAN FD mode, set the value after reset to all registers and bits allocated to the register map of classical CAN mode and then modify the RSCFDnCFDGRMCFG register.

To switch the RS-CAN FD module from classical CAN mode to CAN FD mode, set the values after reset to all respective registers and bits allocated only to the register map in classical CAN mode, and then modify the value of RSCFDnCFDGRMCFG register.

23.4.3 Details of Channel-Related Registers

23.4.3.1 RSCFDnCFDCmNCFG — Channel Nominal Bit Rate Configuration Register (m = 0 to 2)

Access: RSCFDnCFDCmNCFG register can be read/written in 32-bit units
RSCFDnCFDCmNCFGL, RSCFDnCFDCmNCFGH registers can be read/written in 16-bit units
RSCFDnCFDCmNCFGLL, RSCFDnCFDCmNCFGLH, RSCFDnCFDCmNCFGHL,
RSCFDnCFDCmNCFGHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmNCFG: <RSCFDn_base> + 0000_H + (10_H × m)

RSCFDnCFDCmNCFGL: <RSCFDn_base> + 0000_H + (10_H × m),
RSCFDnCFDCmNCFGH: <RSCFDn_base> + 0002_H + (10_H × m)

Table 23.94 RSCFDnCFDCmNCFG register contents

Bit Position	Bit Name	Function
15 to 11	NSJW [4:0]	Nominal Bit Rate Resynchronization Jump Width Control b15 b14 b13 b12 b11 0 0 0 0 0: 1 Tq 0 0 0 0 1: 2 Tq 0 0 0 1 0: 3 Tq : : 1 1 1 1 0: 31 Tq 1 1 1 1 1: 32 Tq
10	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
9 to 0	NBRP [9:0]	Nominal Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 1023), the nominal bit rate prescaler divides fCAN by (P + 1).

Modify the RSCFDnCFDCmNCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. For the description and settings of bit timing parameters, see Section 23.11.1, Initial Settings.

NTSEG2[4:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate. Allowed values are 2 Tq to 32 Tq, inclusive. Set a value smaller than the value of the NTSEG1[6:0] bits.

NTSEG1[6:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of nominal bit rate as a Tq value.

A value of 4 to 128 Tq is settable.

NSJW[4:0] Bits

These bits specify the resynchronization jump width of nominal bit rate as a Tq value. A value of 1 to 32 Tq is settable. Specify a value equal to or smaller than the NTSEG2[4:0] value.

NBRP[9:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the nominal bit rate prescaler ((NBRP[9:0]) + 1) becomes CANmTq(N) clock (fCANTQ(N)m). One clock of the CANmTq(N) clock becomes one Time Quantum (Tq).

Be sure to specify the same value for both NBRP[9:0] and DBRP[7:0].
To specify a different value for the nominal bit rate and the data bit rate, change the values of the RSCFDnCFDCmNCFG.NTSEG1[6:0] and NTSEG2[4:0] bits and RSCFDnCFDCmDCFG.DTSEG1[3:0] and DTSEG2[2:0] bits, respectively.

23.4.3.2 RSCFDnCFDCmCTR — Channel Control Register (m = 0 to 2)

Access: RSCFDnCFDCmCTR register can be read/written in 32-bit units
RSCFDnCFDCmCTRL, RSCFDnCFDCmCTRH registers can be read/written in 16-bit units
RSCFDnCFDCmCTRLL, RSCFDnCFDCmCTRLH, RSCFDnCFDCmCTRHL, RSCFDnCFDCmCTRHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmCTR: <RSCFDn_base> + 0004_H + (10_H × m)

RSCFDnCFDCmCTRL: <RSCFDn_base> + 0004_H + (10_H × m),
RSCFDnCFDCmCTRH: <RSCFDn_base> + 0006_H + (10_H × m)

RSCFDnCFDCmCTRLL: <RSCFDn_base> + 0004_H + (10_H × m),
RSCFDnCFDCmCTRLH: <RSCFDn_base> + 0005_H + (10_H × m),
RSCFDnCFDCmCTRHL: <RSCFDn_base> + 0006_H + (10_H × m),

2	CSLPR	Channel Stop Mode 0: Other than channel stop mode 1: Channel stop mode
1, 0	CHMDC[1:0]	Mode Select b1 b0 0 0: Channel communication mode 0 1: Channel reset mode 1 0: Channel halt mode 1 1: Setting prohibited

ROM Bit

When the ROM bit and the CTME bit in the RSCFDnCFDCmCTR register are set to 1, restricted operation mode is enabled. Use the restricted operation mode only when the CTMS[1:0] value in the RSCFDnCFDCmCTR register is 00_B (standard test mode). Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCFDnCFDCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCFDnCFDGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

CTME Bit

Setting this bit to 1 enables communication test mode. Modify these bits in channel halt mode. This bit is set to 0 in channel reset mode.

ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCFDnCFDCmERFL register. When this bit is clear to 0, if any error is detected while the flags of bits 14-8 in the RSCFDnCFDCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module.

When the BOM[1:0] bits are set to 00_B, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10_B (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01_B, the CHMDC[1:0] bits in the RSCFDnCFDCmCTR register (m = 0 to 2) are set to 10_B and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register are cleared to 00_H.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10_B, the CHMDC[1:0] bits are set to 10_B and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H.

When the BOM[1:0] bits are set to 11_B and the CHMDC[1:0] bits are set to 10_B while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10_B, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01B or at bus off end when the BOM[1:0] bits are 10_B), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

TDCVFIE Bit

When the TDCVF flag in the RSCFDnCFDCmFDSTS register is set to 1 after the TDCVFIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

SOCOIE Bit

When the SOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the SOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

EOCOIE Bit

When the EOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the EOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

ALIE Bit

When the ALF flag in the RSCFDnCFDCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BLIE Bit

When the BLF flag in the RSCFDnCFDCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

OLIE Bit

When the OVLF flag in the RSCFDnCFDCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BORIE Bit

When the BORF flag in the RSCFDnCFDCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BOEIE Bit

When the BOEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EPIE Bit

When the EPF flag in the RSCFDnCFDCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EWIE Bit

When the EWF flag in the RSCFDnCFDCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BEIE Bit

When the BEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

RTBO Bit

Setting this bit to 1 in the bus off state forcibly changes the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register to 00_H and also clears the BOSTS flag in the RSCFDnCFDCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCFDnCFDCmCTR register are 00_B (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RSCAN module transitions to the error active state. Set this bit to 1 in channel communication mode.

CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.
Clearing this bit to 0 makes the channel exit channel stop mode.
This bit should not be modified in channel communication mode or channel halt mode.

CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see Section 23.6.2, Channel Modes. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11_B. When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become 10_B.

23.4.3.3 RSCFDnCFDCmSTS — Channel Status Register (m = 0 to 2)

Access: RSCFDnCFDCmSTS register can be read/written in 32-bit units
RSCFDnCFDCmSTSL register can be read/written in 16-bit units
RSCFDnCFDCmSTSH register is a read-only register that can be read in 16-bit units
RSCFDnCFDCmSTSLH register can be read/written in 8-bit units
RSCFDnCFDCmSTSLL, RSCFDnCFDCmSTSHL, RSCFDnCFDCmSTSHH registers are the read-only registers that can be read in 8-bit units

Address: RSCFDnCFDCmSTS: <RSCFDn_base> + 0008_H + (10_H × m)

RSCFDnCFDCmSTSL: <RSCFDn_base> + 0008_H + (10_H × m),
RSCFDnCFDCmSTSH: <RSCFDn_base> + $000A_H$ + (10_H × m)

RSCFDnCFDCmSTSLL: <RSCFDn_base> + 0008_H + (10_H × m),
RSCFDnCFDCmSTSLH: <RSCFDn_base> + 0009_H + (10_H × m),
RSCFDnCFDCmSTSHL: <RSCFDn_base> + $000A_H$ + (10_H × m),
RSCFDnCFDCmSTSHH: <RSCFDn_base> + $000B_H$ + (10_H × m)

Value after reset: $0000\ 0005_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TEC[7:0]								REC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ESIF	COMSTS	RECSTS	TRMSTS	BOSTS	EPSTS	CSLPSTS	CHLTSTS	CRSTSTS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1
R/W	R	R	R	R	R	R	R	R/W*1	R	R	R	R	R	R	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 23.96 RSCFDnCFDCmSTS Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 24	TEC[7:0]	The transmit error counter (TEC) can be read.
23 to 16	REC[7:0]	The receive error counter (REC) can be read.
15 to 9	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
8	ESIF	Error State Indication Flag 0: No CAN FD message whose ESI bit is recessive has been received. 1: At least one CAN FD message whose ESI bit is recessive has been received.
7	COMSTS	Communication Status Flag 0: Communication is not ready. 1: Communication is ready.
6	RECSTS	Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception
5	TRMSTS	Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state
4	BOSTS	Bus Off Status Flag 0: Not in bus off state 1: In bus off state
3	EPSTS	Error Passive Status Flag 0: Not in error passive state 1: In error passive state

Table 23.96 RSCFDnCFDCmSTS Register Contents (2/2)

Bit Position	Bit Name	Function
2	CSLPSTS	Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode
1	CHLTSTS	Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode
0	CRSTSTS	Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode

TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

ESIF Flag

When the recessive ESI bit is detected in a successfully received message, this flag is set to 1. In loopback mode or mirror mode, the own transmission message is regarded as a received message. To clear this flag to 0, write 0 to this bit by the program. This bit cannot be set to 1 by the program. If the flag setting (to 1) timing matches the writing 0 (by the program) timing, this flag is set to 1.

This flag is 0 in channel reset mode.

COMSTS Flag

This bit indicates that communication is ready.

This flag becomes 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])), It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

23.4.3.4 RSCFDnCFDCmERFL — Channel Error Flag Register (m = 0 to 2)

Access: RSCFDnCFDCmERFL register can be read/written in 32-bit units
RSCFDnCFDCmERFLL register can be read/written in 16-bit units
RSCFDnCFDCmERFLH register is the read-only register that can be read in 16-bit units
RSCFDnCFDCmERFLLL, RSCFDnCFDCmERFLLH registers can be read/written in 8-bit units
RSCFDnCFDCmERFLHL, RSCFDnCFDCmERFLHH registers are the read-only registers that can be read in 8-bit units

Address: RSCFDnCFDCmERFL: <RSCFDn_base> + $000C_H$ + (10_H × m)

RSCFDnCFDCmERFLL: <RSCFDn_base> + $000C_H$ + (10_H × m),
RSCFDnCFDCmERFLH: <RSCFDn_base> + $000E_H$ + (10_H × m)

RSCFDnCFDCmERFLLL: <RSCFDn_base> + $000C_H$ + (10_H × m),
RSCFDnCFDCmERFLLH: <RSCFDn_base> + $000D_H$ + (10_H × m),
RSCFDnCFDCmERFLHL: <RSCFDn_base> + $000E_H$ + (10_H × m),
RSCFDnCFDCmERFLHH: <RSCFDn_base> + $000F_H$ + (10_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	CRCREG[14:0]

R/W	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 23.97 RSCFDnCFDCmERFL Register Contents (1/2)

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
30 to 16	CRCREG[14:0]	CRC Calculation Data (CRC length:15 bits) A CRC value calculated based on the transmit message or receive message is indicated.
15	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
14	ADERR	ACK Delimiter Error Flag 0: No ACK delimiter error is detected. 1: ACK delimiter error is detected.
13	B0ERR	Dominant Bit Error Flag 0: No dominant bit error is detected. 1: Dominant bit error is detected.
12	B1ERR	Recessive Bit Error Flag 0: No recessive bit error is detected. 1: Recessive bit error is detected.
11	CERR	CRC Error Flag 0: No CRC error is detected. 1: CRC error is detected.
10	AERR	ACK Error Flag 0: No ACK error is detected. 1: ACK error is detected.
9	FERR	Form Error Flag 0: No form error is detected. 1: Form error is detected.

Table 23.97 RSCFDnCFDCmERFL Register Contents (2/2)

Bit Position	Bit Name	Function
8	SERR	Stuff Error Flag 0: No stuff error is detected. 1: Stuff error is detected.
7	ALF	Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected.
6	BLF	Bus Lock Flag 0: No channel bus lock is detected. 1: Channel bus lock is detected.
5	OVLF	Overload Flag 0: No overload is detected. 1: Overload is detected.
4	BORF	Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected.
3	BOEF	Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected.
2	EPF	Error Passive Flag 0: No error passive is detected. 1: Error passive is detected.
1	EWF	Error Warning Flag 0: No error warning is detected. 1: Error warning is detected.
0	BEF	Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 1 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCFDnCFDCmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCFDnCFDCmERFL is detected, the flag bits are only set to 1 by the error event if bits 14 to 8 were all 0 at the time when the error occurred.

CRCREG[14:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode is enabled), if transmit or receive message is a classical CAN frame (CRC length = 15 bits), this flag is updated and the CRC value calculated based on the message can be read. When a CAN FD frame is sent or received, the value of CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register is updated. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0. This bit is always 0 in channel reset mode.

ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

B0ERR Flag

This flag is set to 1 when a recessive bit has been detected though a dominant bit was transmitted.

B1ERR Flag

This flag is set to 1 when a dominant bit has been detected though a recessive bit was transmitted.

CERR Flag

This flag is set to 1 when a CRC error has been detected.

AERR Flag

This flag is set to 1 when an ACK error has been detected.

FERR Flag

This flag is set to 1 when a form error has been detected.

SERR Flag

This flag is set to 1 when a stuff error has been detected.

ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to 01_B (channel reset mode).
- The RTBO bit in the RSCFDnCFDCmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCFDnCFDCmCTR register are set to 01_B (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to 10_B (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11_B (transition to channel halt mode upon a request from the program during bus off).

BOEF Flag

This flag is set to 1 when the bus off state is entered (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is entered when the BOM[1:0] bits in the RSCFDnCFDCmCTR register (m = 0 to 2) set to 01_B (transition to channel halt mode at bus off entry).

EPF Flag

This flag becomes 1 when the error passive state is reached ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])).
This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCFDnCFDCmERFL register is set to 1.

NOTE

To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

23.4.3.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration register (m = 0 to 2)

Access: RSCFDnCFDCmDCFG register can be read/written in 32-bit units
RSCFDnCFDCmDCFGL, RSCFDnCFDCmDCFGH registers can be read/written in 16-bit units
RSCFDnCFDCmDCFGLL, RSCFDnCFDCmDCFGHL, RSCFDnCFDCmDCFGHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmDCFG: <RSCFDn_base> + 0500_H + (20_H × m)

RSCFDnCFDCmDCFGL: <RSCFDn_base> + 0500_H + (20_H × m),
RSCFDnCFDCmDCFGH: <RSCFDn_base> + 0502_H + (20_H × m)

RSCFDnCFDCmDCFGLL: <RSCFDn_base> + 0500_H + (20_H × m),
RSCFDnCFDCmDCFGHL: <RSCFDn_base> + 0502_H + (20_H × m),
RSCFDnCFDCmDCFGHH: <RSCFDn_base> + 0503_H + (20_H × m)

Value after reset: $0000\ 0000_H$

Bit Position	Bit Name	Function
19 to 16	DTSEG1 [3:0]	Data Bit Rate Time Segment 1 Control b19 b18 b17 b16 0 0 0 0: Setting prohibited 0 0 0 1: 2 Tq 0 0 1 0: 3 Tq 0 0 1 1: 4 Tq 0 1 0 0: 5 Tq 0 1 0 1: 6 Tq 0 1 1 0: 7 Tq 0 1 1 1: 8 Tq 1 0 0 0: 9 Tq 1 0 0 1: 10 Tq 1 0 1 0: 11 Tq 1 0 1 1: 12 Tq 1 1 0 0: 13 Tq 1 1 0 1: 14 Tq 1 1 1 0: 15 Tq 1 1 1 1: 16 Tq
15 to 8	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
7 to 0	DBRP [7:0]	Data Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 255), the data bit rate prescaler divides fCAN by (P + 1).

Modify the RSCFDnCFDCmDCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. When only classical CAN frames are used in CAN FD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value. For the description and settings of bit timing parameters, see Section 23.11.1, Initial Settings..

DSJW[2:0] Bits

These bits specify the resynchronization jump width of data bit rate as a Tq value. A value of 1 to 8 Tq is settable. Specify a value equal to or smaller than the DTSEG2[2:0] bits value.

DTSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate.

Allowed values are 2 Tq to 8 Tq, inclusive.

Set a value smaller than the value of the DTSEG1[3:0] bits.

DTSEG1[3:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of data bit rate as a Tq value.

A value of 2 to 16 Tq is settable.

DBRP[7:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the data bit rate prescaler ((DBRP[7:0]) + 1) becomes CANmTq(D) clock (fCANTQ(D)m). One clock of the CANmTq(D) clock becomes one Time Quantum (Tq).

Be sure to specify the same value for both NBRP[9:0] and DBRP[7:0].
To specify a different value for the nominal bit rate and the data bit rate, change the values of the

RSCFDnCFDCmNCFG.NTSEG1[6:0] and NTSEG2[4:0] bits and RSCFDnCFDCmDCFG.DTSEG1[3:0] and DTSEG2[2:0] bits, respectively.

When the TDCE bit is set to 1(Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

23.4.3.6 RSCFDnCFDCmFDCFG — Channel CAN FD Configuration Register (m = 0 to 2)

Access: RSCFDnCFDCmFDCFG register can be read/written in 32-bit units
RSCFDnCFDCmFDCFGL, RSCFDnCFDCmFDCFGH registers can be read/written in 16-bit units
RSCFDnCFDCmFDCFGLL, RSCFDnCFDCmFDCFGLH, RSCFDnCFDCmFDCFGHL, RSCFDnCFDCmFDCFGHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmFDCFG: <RSCFDn_base> + 0504_H + (20_H × m)

RSCFDnCFDCmFDCFGL: <RSCFDn_base> + 0504_H + (20_H × m),
RSCFDnCFDCmFDCFGH: <RSCFDn_base> + 0506_H + (20_H × m)

RSCFDnCFDCmFDCFGLL: <RSCFDn_base> + 0504_H + (20_H × m),
RSCFDnCFDCmFDCFGLH: <RSCFDn_base> + 0505_H + (20_H × m),
RSCFDnCFDCmFDCFGHL: <RSCFDn_base> + 0506_H + (20_H × m),
RSCFDnCFDCmFDCFGHH: <RSCFDn_base> + 0507_H + (20_H × m)

Table 23.99 RSCFDnCFDCmFDCFG Register Contents (1/2)

Bit Position	Bit Name	Function
31, 30	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
29	REFE	Reception data edge filter enable bit 0: Reception data edge filter disabled 1: Reception data edge filter enabled
28	FDOE	FD-only mode enable bit 0: FD-only mode disabled 1: FD-only mode enabled
27	TMME	Transmit Buffer Merge Mode Enable 0: Transmit buffer merge mode is disabled. 1: Transmit buffer merge mode is enabled.
26	GWBRS	Gateway BRS 0: A frame is transmitted with the BRS bit in the received frame set to 0. 1: A frame is transmitted with the BRS bit in the received frame set to 1.
25	GWFDF	Gateway FDF 0: A frame is transmitted regarding the received frame as a classical CAN frame. 1: A frame is transmitted regarding the received frame as a CAN FD frame.
24	GWEN	CAN-CAN FD Gateway Enable 0: The CAN-CAN FD gateway is disabled. 1: The CAN-CAN FD gateway is enabled.
23	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
22 to 16	TDCO[6:0]	Transmitter Delay Compensation Offset These bits are set to the transmitter delay compensation offset value.
15 to 11	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Table 23.99 RSCFDnCFDCmFDCFG Register Contents (2/2)

Bit Position	Bit Name	Function
10	ESIC	Error State Display Mode Select 0: Always displays the node error state. 1: When the node is not in the error passive state: Displays the message buffer error state. When the node is in the error passive state: Displays the node error state.
9	TDCE	Transmitter delay compensation Enable 0: Transmitter delay compensation is disabled. 1: Transmitter delay compensation is enabled.
8	TDCOC	Transmitter delay compensation Measurement Select 0: Measurement and offset 1: Only offset
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2 to 0	EOCCFG[2:0]	Error Occurrence Counting Method Select b2 b1 b0 0 0 0: All transmit messages and receive messages 0 0 1: All transmit messages 0 1 0: All receive messages 0 1 1: Setting prohibited 1 0 0: Only data phase of transmitted or received CAN FD message 1 0 1: Only data phase of transmitted CAN FD message 1 1 0: Only data phase of received CAN FD message 1 1 1: Setting prohibited

REFE bit

Setting this bit to 1 enables reception data edge filtering when the idle condition is detected, and a dominant level with less than 2 time quanta is ignored. A dominant level with more than or equal to 2 time quanta is detected as an edge. Modify this bit only in channel reset mode.

FDOE bit

Setting this bit to 1 enables FD-only mode. When data is transmitted, a CAN FD frame will be sent regardless of the settings to the CFFDF bit in the RSCFDnCFDCFFDCSTSk register or the TMFDF bit in the RSCFDnCFDTMFDCTRp register. When a Classical CAN frame is received, a form error is detected. Modify this bit only in channel reset mode.

TMME Bit

Setting this bit to 1 enables transmit buffer merge mode. Modify this bit only in channel reset mode or channel halt mode.

GWBRS Bit

When the GWEN bit is 1, the BRS bit in a CAN FD frame to be transmitted by the gateway function is set.When the GWFDF bit is set to 0, write 0 to this bit. Modify this bit only in channel reset mode.

GWFDF Bit

When the GWEN bit is 1, the FDF bit in a CAN FD frame to be transmitted by the gateway function is set. Modify this bit only in channel reset mode.

GWEN Bit

This bit is used to control the operation of the transmit/receive FIFO buffer with the CFM[1:0] bits in the RSCFDnCFDCFCCk register set to 10_B (gateway mode).

Setting this bit to 1 enables the CAN-CAN FD gateway, enabling transmission in a format different from that of frames received by the gateway function. Received frames are replaced in accordance with the settings of the GWFDF bit and the GWBRS bit. When the DLC value in the received classical CAN frame is 1001_B or more and the GWFDF bit is 1 (CAN FD frame), the DLC value is replaced with 1000_B.

While this bit is 1, do not perform routing the following frames by using the gateway function.

- CAN FD frames with a payload length of more than 8 bytes
- Remote frames

While this bit is 1, the following frame should be transmitted from the channel according to the setting of GWFDF.

- When GWFDF bit is set to 0, only classical CAN frame should be transmitted.
- When GWFDF bit is set to 1, only CAN FD frame should be transmitted.

Modify this bit only in channel reset mode.

Table 23.100 shows the settings and formats of transmit frame and receive frame while the CAN-CAN FD gateway is enabled.

Table 23.100 Operation when the CAN-CAN FD Gateway Is Enabled

Receive Frame			GWFDF Bit	Transmit Frame		
Format	BRS Bit	Received DLC Value		Format	BRS Bit	DLC Value to be Transmitted
Classical CAN	None	DLC ≤ 1000_B	0	Classical CAN	None	Not replaced
		DLC > 1000_B				
CAN FD	Arbitrary	DLC ≤ 1000_B				
Classical CAN	None	DLC ≤ 1000_B	1	CAN FD	According to GWBRS bit setting	Not replaced
		DLC > 1000_B				Replaced with 1000_B
CAN FD	Arbitrary	DLC ≤ 1000_B				Not replaced

TDCO[6:0] Bits

These bits set the SSP offset value. How to use this value depends on the TDCOC bit in the RSCFDnCFDCmFDCFG register.

These bits are based on CAN clock frequency (fCAN).

When the TDCOC bit is 0, the transmitter delay compensation result equals to the total value of the measured delay value and the TDCO[6:0] value (rounded down to the nearest integer Tq).

When the TDCOC bit is 1, the transmitter delay compensation result equals to the TDCO[6:0] value.

The SSP offset value = (set value of TDCO[6:0] bits + 1).

Modify these bits only in channel reset mode or channel halt mode.

ESIC Bit

When the ESIC bit is set to 1, if the channel is in the error active state, the ESI bit value (CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register) set in

the transmit/receive FIFO buffer or transmit buffer is transmitted as an ESI bit value of the transmit message. When the channel is in the error passive state or the ESIC bit is 0, the channel status is transmitted as an ESI bit value. Modify this bit only in channel reset mode or channel halt mode.

Table 23.101 ESI Value to Be Transmitted

ESIC Bit	Channel Status	ESI Value to be Transmitted
0	Error active	0 (error active node)
	Error passive	1 (error passive node)
1	Error active	ESI value set in the transmit/receive FIFO buffer or transmit buffer (CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register)
	Error passive	1 (error passive node)

TDCE Bit

Setting this bit to 1 enables transmitter delay compensation. Modify this bit only in channel reset mode or channel halt mode.

TDCOC Bit

When this bit is 0, the SSP position is defined by the total of the measured delay value and the SSP offset value (fixed value).

When this bit is 1, the SSP position is defined only by the SSP offset value.

Modify this bit only in channel reset mode or channel halt mode.

EOCCFG[2:0] Bits

These bits are used to select a frame format and a transmission/reception direction when the error occurrence counter counts CAN bus errors.

Modify these bits only in channel reset mode or channel halt mode.

23.4.3.7 RSCFDnCFDCmFDCTR — Channel CAN FD Control Register (m = 0 to 2)

Access: RSCFDnCFDCmFDCTR register can be read/written in 32-bit units
RSCFDnCFDCmFDCTRL register can be read/written in 16-bit units
RSCFDnCFDCmFDCTRLL register can be read/written in 8-bit units

Address: RSCFDnCFDCmFDCTR: <RSCFDn_base> + 0508_H + (20_H × m)

RSCFDnCFDCmFDCTRL: <RSCFDn_base> + 0508_H + (20_H × m)

RSCFDnCFDCmFDCTRLL: <RSCFDn_base> + 0508_H + (20_H × m)

Value after reset: $0000\ 0000_H$

Table 23.102 RSCFDnCFDCmFDCTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
1	SOCCLR	Successful Occurrence Counter Clear Setting the SOCCLR bit to 1 clears the successful occurrence counter. This bit is always read as 0.
0	EOCCLR	Error Occurrence Counter Clear Setting the EOCCLR bit to 1 clears the error occurrence counter. This bit is always read as 0.

SOCCLR Bit

Setting this bit to 1 clears the successful occurrence counter (SOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

EOCCLR Bit

Setting this bit to 1 clears the error occurrence counter (EOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

23.4.3.8 RSCFDnCFDCmFDSTS — Channel CAN FD Status Register (m = 0 to 2)

Access: RSCFDnCFDCmFDSTS register can be read/written in 32-bit units
RSCFDnCFDCmFDSTSL register can be read/written in 16-bit units
RSCFDnCFDCmFDSTSH register is the read-only register that can be read in 8-bit units
RSCFDnCFDCmFDSTSLH register can be read/written in 8-bit units.
RSCFDnCFDCmFDSTSLL, RSCFDnCFDCmFDSTSHL, RSCFDnCFDCmFDSTSHH register is the read-only register that can be read in 8-bit units.

Address: RSCFDnCFDCmFDSTS: <RSCFDn_base> + $050C_H$ + (20_H × m)

RSCFDnCFDCmFDSTSL: <RSCFDn_base> + $050C_H$ + (20_H × m),
RSCFDnCFDCmFDSTSH: <RSCFDn_base> + $050E_H$ + (20_H × m)

RSCFDnCFDCmFDSTSLL: <RSCFDn_base> + $050C_H$ + (20_H × m),
RSCFDnCFDCmFDSTSLH: <RSCFDn_base> + $050D_H$ + (20_H × m),
RSCFDnCFDCmFDSTSHL: <RSCFDn_base> + $050E_H$ + (20_H × m),
RSCFDnCFDCmFDSTSHH: <RSCFDn_base> + $050F_H$ + (20_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SOC[7:0]								EOC[7:0]

	—	—	—	—	—	—	SOCO	EOCO	TDCVF	TDCR[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R	R	R	R	R	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 23.103 RSCFDnCFDCmFDSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	SOC[7:0]	Successful Occurrence Counter The successful occurrence counter value can be read.
23 to 16	EOC[7:0]	Error Occurrence Counter The error occurrence counter value can be read.
15 to 10	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
9	SOCO	Successful Occurrence Counter Overflow Flag 0: The successful occurrence counter does not overflow. 1: The successful occurrence counter has overflowed.
8	EOCO	Error Occurrence Counter Overflow Flag 0: The error occurrence counter does not overflow. 1: The error occurrence counter has overflowed.
7	TDCVF	Transmitter Delay Compensation Violation Flag 0: No transmitter delay compensation violation is present. 1: A transmitter delay compensation violation is present.
6 to 0	TDCR[6:0]	Transmitter Delay Compensation Result Status The transmitter delay compensation result can be read.

SOC[7:0] Bits

These bits show the successful occurrence counter value. The successful occurrence counter is incremented upon completion of message reception or transmission without an error. This counter stops counting when it reaches FFH. In loopback mode, this counter is incremented twice.

These bits are cleared to 0 by writing 1 to the SOCCLR bit in the RSCFDnCFDCmCTR register. These bits are 0 in channel reset mode.

EOC[7:0] Bits

These bits show the error occurrence counter value. The error occurrence counter is incremented each time an error occurs according to the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register. This counter stops counting when it reaches FFH.

These bits are cleared to 0 by writing 1 to the EOCCLR bit in the RSCFDnCFDCmCTR register. These bits are 0 in channel reset mode.

SOCO Flag

This bit indicates that successful occurrence counter overflow has occurred.

This flag is set to 1 when message reception or transmission is completed while the SOC[7:0] value has reached FF_H. This flag is 0 in channel reset mode.

EOCO Flag

This bit indicates that error occurrence counter overflow has occurred.

This flag is set to 1 when a CAN bus error is detected under the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register when the EOC[7:0] value has reached FF_H. This flag is 0 in channel reset mode.

TDCVF Flag

This bit indicates violation of transmitter delay compensation.

The transmit data is compared with the reception CAN bus level delayed due to the transceiver's loop delay. This delay changes due to physical factors such as temperature. Because the TDCR[6:0] flags are updated for each message, temporary maximum delay cannot be confirmed.

This bit is set to 1 when the transmitter delay compensation exceeds the maximum compensation 3 CANm bit times - 2 fCAN (CANm bit time is the values of data bit rate).

This flag is 0 in channel reset mode.

TDCR[6:0] Flag

These bits indicate the transmitter delay compensation result as a multiple of CAN clock frequency (fCAN).

This result depends on the settings of the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

This flag is updated at a falling edge between the FDF bit and res bit when the TDCE bit in the RSCFDnCFDCmFDCFG register is set to 1 and also the TDCOC bit in the RSCFDnCFDCmFDCFG register is set to 0.

This flag is 0 in channel reset mode.

NOTE

To clear the flag of this register to 0, use a store instruction to write "0" to the given flag and "1" to the other flags.

23.4.3.9 RSCFDnCFDCmFDCRC — Channel CAN FD CRC Register (m = 0 to 2)

Access: RSCFDnCFDCmFDCRC register can be read only in 32-bit units
RSCFDnCFDCmFDCRCL, RSCFDnCFDCmFDCRCH registers can be read only in 16-bit units
RSCFDnCFDCmFDCRCLL, RSCFDnCFDCmFDCRCLH, RSCFDnCFDCmFDCRCHL, RSCFDnCFDCmFDCRCHH registers can be read only in 8-bit units

Address: RSCFDnCFDCmFDCRC: <RSCFDn_base> + 0510_H + (20_H × m)

RSCFDnCFDCmFDCRCL: <RSCFDn_base> + 0510_H + (20_H × m),
RSCFDnCFDCmFDCRCH: <RSCFDn_base> + 0512_H + (20_H × m)

RSCFDnCFDCmFDCRCLL: <RSCFDn_base> + 0510_H + (20_H × m),
RSCFDnCFDCmFDCRCLH: <RSCFDn_base> + 0511_H + (20_H × m),
RSCFDnCFDCmFDCRCHL: <RSCFDn_base> + 0512_H + (20_H × m),
RSCFDnCFDCmFDCRCHH: <RSCFDn_base> + 0513_H + (20_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	SCNT[3:0]				—	—	—	CRCREG[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 23.104 RSCFDnCFDCmFDCRC Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	These bits are read as the value after reset.
27 to 24	SCNT[3:0]	Stuff count bit Indicate a value of the stuff count in a CAN FD frame. Bits 25-27 indicates the Gray-coded value of the stuff bit count modulo 8 in the transsmitted/received frames. Bit 24 indicates an even parity value of bits 25-27.
23 to 21	Reserved	These bits are read as the value after reset.
20 to 0	CRCREG[20:0]	CRC Calculation Data (CRC Length:17 Bit or 21 Bit) These bits show the CRC value calculated based on the transmit message or receive message. When the CRC length is 17 bits, bits b20 to b17 are read as 0.

SCNT[3:0] flag

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode enabled), a stuff count bit value of the CAN FD frame can be read if a message transmitted/received is a CAN FD frame. When the CTME bit is 0 (communication test mode disabled), this flag is always read as 0. This flag is updated at the first bit in the CRC field of the CAN FD frame. These bits are cleared to 0 in channel reset mode.

CRCREG[20:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled), if transmit or receive message is a CAN FD frame (CRC length = 17 or 21 bits), these flags are updated and the CRC value calculated based on the message can be read. When the CRC length of the message is 17 bits, bits b20 to b17 are always read as 0. When a classical CAN frame is transmitted or received, the CRCREG[14:0] value in the RSCFDnCFDCmERFL register is updated. When the CTME bit is 0 (communication test mode disabled), these bits are always read as 0.

These bits are cleared to 0 in channel reset mode.

23.4.4 Details of Global-Related Registers

23.4.4.1 RSCFDnCFDGCFG — Global Configuration Register

Access: RSCFDnCFDGCFG register can be read/written in 32-bit units
RSCFDnCFDGCFGL, RSCFDnCFDGCFGH registers can be read/written in 16-bit units
RSCFDnCFDGCFGLL, RSCFDnCFDGCFGLH, RSCFDnCFDGCFGHL, RSCFDnCFDGCFGHH registers can be read/written in 8-bit units

7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	CMPOC	Payload Overflow Mode Select 0: No message is stored. 1: Messages are stored and payloads exceeding the buffer size are discarded.
4	DCS	CAN Clock Source Select*2 0: clkc 1: clk_xincan
3	MME	Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled.
2	DRE	DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled.
1	DCE	DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled.
0	TPRI	Transmit Priority Select 0: ID priority 1: Transmit buffer number priority

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000B.

Note 2. For the CAN clock frequency settings, see Table 23.8, Setting Range example of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/D1L/D1M.

Modify the RSCFDnCFDGCFG register only in global reset mode.

ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See Section 23.8.3.1, Interval Transmission Function.

TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the nominal bit time clock that will be the clock source of the timestamp counter. However, do not select the channel that handles the CAN FD frames.

TSSS Bit

This bit is used to select a clock source of the timestamp counter. Select pclk if there is no channel that handles only classical CAN frames.

TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

CMPOC Bit

This bit is used to select operation in case the payload length of received message exceeds the payload storage size of the storage buffer.

When this bit is 0, the received message in which the payload overflows is not stored in the buffer.

When this bit is 1, the received message in which the payload overflows is stored in the buffer, and depending on the DRE bit the received DLC value or the DLC value of the receive rule is stored in the buffer. At this time, payloads exceeding the buffer's payload storage size are discarded.

The buffer’s payload storage size is set by the following bits.

- Receive buffer: RMPLS[1:0] bits in the RSCFDnCFDRMNB register
- Receive FIFO buffer: RFPLS[2:0] bits in the RSCFDnCFDRFCCx register
- Transmit/receive FIFO buffer: CFPLS[2:0] bits in the RSCFDnCFDCFCCk register

DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

For the CAN clock frequency settings, see Table 23.8, Setting Range example of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/D1L/D1M.

MME Bit

Setting this bit to 1 makes the mirror function available.

DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of 00_H is stored in each data byte beyond the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCFDnCFDGAFLP0_j register to 0000_B before clearing the DCE bit in the RSCFDnCFDGCFG register to 0.

TPRI Bit

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the transmit buffer with the smallest number of those has the highest priority.

While the transmit queue is in use, this bit should be set to 0.

23.4.4.2 RSCFDnCFDGCTR — Global Control Register

Access: RSCFDnCFDGCTR register can be read/written in 32-bit units
RSCFDnCFDGCTRL, RSCFDnCFDGCTRH registers can be read/written in 16-bit units
RSCFDnCFDGCTRLL, RSCFDnCFDGCTRLH, RSCFDnCFDGCTRHL registers can be read/written in 8-bit units

Address: RSCFDnCFDGCTR: <RSCFDn_base> + 0088_H

RSCFDnCFDGCTRL: <RSCFDn_base> + 0088_H,
RSCFDnCFDGCTRH: <RSCFDn_base> + $008A_H$

RSCFDnCFDGCTRLL: <RSCFDn_base> + 0088_H,
RSCFDnCFDGCTRLH: <RSCFDn_base> + 0089_H,
RSCFDnCFDGCTRHL: <RSCFDn_base> + $008A_H$

Value after reset: $0000\ 0005_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 23.106 RSCFDnCFDGCTR Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
16	TSRST	Timestamp Counter Reset Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0.
15 to 12	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
11	CMPOFIE	Payload Overflow Interrupt Enable 0: A payload overflow interrupt is disabled. 1: A payload overflow interrupt is enabled.
10	THLEIE	Transmit History Buffer Overflow Interrupt Enable 0: Transmit history buffer overflow interrupt is disabled. 1: Transmit history buffer overflow interrupt is enabled.
9	MEIE	FIFO Message Lost Interrupt Enable 0: FIFO message lost interrupt is disabled. 1: FIFO message lost interrupt is enabled.
8	DEIE	DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled.
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	GSLPR	Global Stop Mode 0: Other than global stop mode 1: Global stop mode
1, 0	GMDC[1:0]	Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited

TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCFDnCFDGTSC register is cleared to 0000_H.

CMPOFIE Bit

When the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 after the CMPOFIE bit is set to 1, an interrupt request occurs. Modify this bit only in global reset mode.

THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

GSLPR Bit

Setting this bit to 1 places the RSCAN module into global stop mode.
Clearing this bit to 0 makes the RSCAN module leave from global stop mode.
This bit should not be modified in global operating mode or global test mode.

GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see Section 23.6.1, Global Modes. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module into global stop mode.

23.4.4.3 RSCFDnCFDGSTS — Global Status Register

Access: RSCFDnCFDGSTS register can be read only in 32-bit units
RSCFDnCFDGSTSL register is a read-only register that can be read only in 16-bit units
RSCFDnCFDGSTSLL register is a read-only register that can be read only in 8-bit units

Address: RSCFDnCFDGSTS: <RSCFDn_base> + $008C_H$

RSCFDnCFDGSTSL: <RSCFDn_base> + $008C_H$

RSCFDnCFDGSTSLL: <RSCFDn_base> + $008C_H$

Value after reset: $0000\ 000D_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	GRAMINIT	GSLPSTS	GHLTSTS	GRSTSTS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 23.107 RSCFDnCFDGSTS Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	GRAMINIT	CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing.
2	GSLPSTS	Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode
1	GHLTSTS	Global Test Status Flag 0: Not in global test mode 1: In global test mode
0	GRSTSTS	Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode

GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

GRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

23.4.4.4 RSCFDnCFDGERFL — Global Error Flag Register

Access: RSCFDnCFDGERFL register can be read/written in 32-bit units
RSCFDnCFDGERFLL, RSCFDnCFDGERFLH registers can be read/written in 16-bit units
RSCFDnCFDGERFLLL, RSCFDnCFDGERFLHL registers can be read/written in 8-bit units

Address: RSCFDnCFDGERFL: <RSCFDn_base> + 0090_H

RSCFDnCFDGERFLL: <RSCFDn_base> + 0090_H,
RSCFDnCFDGERFLH: <RSCFDn_base> + 0092_H

RSCFDnCFDGERFLLL: <RSCFDn_base> + 0090_H
RSCFDnCFDGERFLHL: <RSCFDn_base> + 0092_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	EEF2	EEF1	EEF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CMPOF	THLES	MES	DEF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R	R	R/W*1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 23.108 RSCFDnCFDGERFL Register Contents

Bit Position	Bit Name	Function
31 to 19, 15, 14, 7, 6, 4	Reserved	When read, the value after reset is returned. When writing these bits, write the value after reset.
18	EEF2	ECC Error Flag for Channel 2 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
17	EEF1	ECC Error Flag for Channel 1 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
16	EEF0	ECC Error Flag for Channel 0 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
13 to 8, 5	Reserved	When read, the undefined value is returned. When writing these bits, write the value after reset.
3	CMPOF	Payload Overflow Flag 0: No payload overflow has occurred. 1: A payload overflow has occurred.
2	THLES	Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred.
1	MES	FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred.
0	DEF	DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred.

All flags in the RSCFDnCFDGERFL register are cleared to 0 in global reset mode.

EEFm Flag

When a 2-bit ECC error is detected during the transmission priority determination of channel m (m = 0 to 2), the EEFm flag is set to 1, disabling message transmission. This flag can be cleared to 0 by writing 0 by the program.

CMPOF Flag

When a payload overflow occurs in any of channel m (m = 0 to 2), the CMPOF flag is set to 1. This flag can be cleared to 0 by writing 0 to this bit by the program.

THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCFDnCFDTHLSTSm register (m = 0 to 2) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCFDnCFDRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCFDnCFDCFSTSk register (k = 0 to 8) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

NOTE

To clear the flag of this register to 0, use a store instruction to write 0 to the given flag and 1 to the other flags.

23.4.4.5 RSCFDnCFDGTSC — Global Timestamp Counter Register

Access: RSCFDnCFDGTSC register is a read-only register that can be read only in 32-bit units.
RSCFDnCFDGTSCL register is a read-only register that can be read only in 16-bit units.

Address: RSCFDnCFDGTSC: <RSCFDn_base> + 0094_H

RSCFDnCFDGTSCL: <RSCFDn_base> + 0094_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 23.109 RSCFDnCFDGTSC Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset.
15 to 0	TS[15:0]	Timestamp Value The timestamp counter value can be read. Counter Value: 0000_H to $FFFF_H$

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. Furthermore, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter starts and stops counting differently, depending on the count source.

- When the TSSS bit in the RSCFDnCFDGCFG register is 0 (pclk):
  The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode.
  This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm nominal bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

23.4.4.6 RSCFDnCFDGTINTSTS0 — Global TX Interrupt Status Register 0

Access: RSCFDnCFDGTINTSTS0 register can be read only in 32-bit units
RSCFDnCFDGTINTSTS0L, RSCFDnCFDGTINTSTS0H registers can be read only in 16-bit units
RSCFDnCFDGTINTSTS0LL, RSCFDnCFDGTINTSTS0LH, RSCFDnCFDGTINTSTS0HL registers can be read only in 8-bit units

Address: RSCFDnCFDGTINTSTS0: <RSCFDn_base> + 0460_H

RSCFDnCFDGTINTSTS0L: <RSCFDn_base> + 0460_H,
RSCFDnCFDGTINTSTS0H: <RSCFDn_base> + 0462_H

RSCFDnCFDGTINTSTS0LL: <RSCFDn_base> + 0460_H,
RSCFDnCFDGTINTSTS0LH: <RSCFDn_base> + 0461_H,
RSCFDnCFDGTINTSTS0HL: <RSCFDn_base> + 0462_H

Value after reset: $0000\ 0000_H$

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 23.110 RSCFDnCFDGTINTSTS0 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 21	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
20	THIF2	Channel 2 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
19	CFTIF2	Channel 2 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
18	TQIF2	Channel 2 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
17	TAIF2	Channel 2 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
16	TSIF2	Channel 2 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
15 to 13	Reserved	These bits are read as the value after reset.
12	THIF1	Channel 1 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF1	Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF1	Channel 1 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.

Table 23.110 RSCFDnCFDGTINTSTS0 Register Contents (2/2)

Bit Position	Bit Name	Function
9	TAIF1	Channel 1 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF1	Channel 1 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
7 to 5	Reserved	These bits are read as the value after reset.
4	THIF0	Channel 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF0	Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF0	Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF0	Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
0	TSIF0	Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCFDnCFDTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00_B under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCFDnCFDCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to 01_B (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00_B after the transmit abort is completed.

TQIFm Bits

When the TXQIE bit in the RSCFDnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCFDnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCFDnCFDTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCFDnCFDCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCFDnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCFDnCFDTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

23.4.4.7 RSCFDnCFDGFDCFG — Global FD configuration register

Access: RSCFDnCFDGFDCFG register can be read/written in 32-bit unit
RSCFDnCFDGFDCFGL register can be read/written in 16-bit unit
RSCFDnCFDGFDCFGLL, RSCFDnCFDGFDCFGLH registers can be read/written in 8-bit unit

Address: RSCFDnCFDGFDCFG: <RSCFDn_base> + 0474_H

RSCFDnCFDGFDCFG L: <RSCFDn_base> + 0474_H,

Table 23.111 RSCFDnCFDGFDCFG Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
9, 8	TSCCFG[1:0]	Time-stamp capture setting bit b9 b8 0 0: Captured at a sample point in the SOF bit. 0 1: Captured when a valid frame has been transmitted/received. 1 0: Captured at a sample point of the res bit.*1 1 1: Setting prohibited.
7 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	RPED	Protocol exception event detection disabled bit 0: Protocol exception event detection enabled 1: Protocol exception event detection disabled

Note 1. When a Classical CAN frame is transmitted/received, a time-stamp value will be captured at the sample point in the SOF bit.

TSCCFG[1:0] bit

Select a point where a time-stamp value is captured. Modify this bit only in global reset mode.

RPED bit

Setting this bit to 1 disables the protocol exception event detection. When a protocol exception event is detected while this bit is set to 1, the event is regarded as a form error and an error frame will be output. Modify this bit only in global reset mode.

23.4.4.8 RSCFDnCFDGCRCCFG —Global CRC configuration register

Access: RSCFDnCFDGCRCCFG register can be read/written in 32-bit unit
RSCFDnCFDGCRCCFGL register can be read/written in 16-bit unit
RSCFDnCFDGCRCCFGLL register can be read/written in 8-bit unit

Address: RSCFDnCFDGCRCCFG: <RSCFDn_base> + 0478_H

RSCFDnCFDGCRCCFG L: <RSCFDn_base> + 0478_H

RSCFDnCFDGCRCCFG LL: <RSCFDn_base> + 0478_H

Table 23.112 RSCFDnCFDGCRCCFG Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	NIE	ISO11898-1 protocol switchover bit 0: Support CAN FD according to the ISO 11898-1 2015 protocol. 1: Support CAN FD ISO/DIS 11898-1 (August 12, 2014 version) protocol. (non-ISO 11898-1 2015 compliant)

NIE bit

Setting this bit to 1 supports CAN FD ISO/DIS 11898-1 (August 12, 2014 version). This setting is not based on the ISO 11898-1 2015 protocol. Modify this bit only in global reset mode.

This bit is cleared to 0 when the RCMC bit in the RSCFDnCFDGRMCFG register is 0 (Classical CAN mode is selected.)

23.4.5 Details of Receive Rule-related Registers

23.4.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register

Access: RSCFDnCFDGAFLECTR register can be read/written in 32-bit units
RSCFDnCFDGAFLECTRL register can be read/written in 16-bit units
RSCFDnCFDGAFLECTRLL, RSCFDnCFDGAFLECTRLH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLECTR: <RSCFDn_base> + 0098_H

RSCFDnCFDGAFLECTRL: <RSCFDn_base> + 0098_H

RSCFDnCFDGAFLECTRLL: <RSCFDn_base> + 0098_H,
RSCFDnCFDGAFLECTRLH: <RSCFDn_base> + 0099_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 23.113 RSCFDnCFDGAFLECTR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
8	AFLDAE	Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled.
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4 to 0	AFLPN[4:0]	Receive Rule Table Page Number Configuration A page number can be selected from a range of page 0 (00000_B) to page 11 (01011_B).

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of 00000_B to 01011_B.

23.4.5.2 RSCFDnCFDGAFLCFG0 — Receive Rule Configuration Register 0

Access: RSCFDnCFDGAFLCFG0 register can be read/written in 32-bit units
RSCFDnCFDGAFLCFG0L, RSCFDnCFDGAFLCFG0H registers can be read/written in 16-bit units
RSCFDnCFDGAFLCFG0LH, RSCFDnCFDGAFLCFG0HL, RSCFDnCFDGAFLCFG0HH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLCFG0: <RSCFDn_base> + $009C_H$

RSCFDnCFDGAFLCFG0L: <RSCFDn_base> + $009C_H$, RSCFDnCFDGAFLCFG0H: <RSCFDn_base> + $009E_H$

RSCFDnCFDGAFLCFG0LH: <RSCFDn_base> + $009D_H$,
RSCFDnCFDGAFLCFG0HL: <RSCFDn_base> + $009E_H$,
RSCFDnCFDGAFLCFG0HH: <RSCFDn_base> + $009F_H$

Value after reset: $0000\ 0000_H$

Table 23.114 RSCFDnCFDGAFLCFG0 Register Contents

Bit Position	Bit Name	Function
31 to 24	RNC0[7:0]	Number of Rules for Channel 0 Set the number of receive rules exclusively used for channel 0.
23 to 16	RNC1[7:0]	Number of Rules for Channel 1 Set the number of receive rules exclusively used for channel 1.
15 to 8	RNC2[7:0]	Number of Rules for Channel 2 Set the number of receive rules exclusively used for channel 2.
7 to 0	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Modify the RSCFDnCFDGAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table for the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered for the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC2[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 2 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

23.4.5.3 RSCFDnCFDGAFLIDj — Receive Rule ID Register (j = 0 to 15)

Access: RSCFDnCFDGAFLIDj register can be read/written in 32-bit units
RSCFDnCFDGAFLIDjL, RSCFDnCFDGAFLIDjH registers can be read/written in 16-bit units
RSCFDnCFDGAFLIDjLL, RSCFDnCFDGAFLIDjLH, RSCFDnCFDGAFLIDjHL, RSCFDnCFDGAFLIDjHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLIDj: <RSCFDn_base> + 1000_H + (10_H × j)

RSCFDnCFDGAFLIDjL: <RSCFDn_base> + 1000_H + (10_H × j),
RSCFDnCFDGAFLIDjH: <RSCFDn_base> + 1002_H + (10_H × j)

RSCFDnCFDGAFLIDjLL: <RSCFDn_base> + 1000_H + (10_H × j),
RSCFDnCFDGAFLIDjLH: <RSCFDn_base> + 1001_H + (10_H × j),
RSCFDnCFDGAFLIDjHL: <RSCFDn_base> + 1002_H + (10_H × j),
RSCFDnCFDGAFLIDjHH: <RSCFDn_base> + 1003_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Table 23.115 RSCFDnCFDGAFLIDj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDE	IDE Select 0: Standard ID 1: Extended ID
30	GAFLRTR	RTR Select 0: Data frame 1: Remote frame
29	GAFLLB	Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received
28 to 0	GAFLID[28:0]	ID Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0.

Modify the RSCFDnCFDGAFLIDj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

23.4.5.4 RSCFDnCFDGAFLMj — Receive Rule Mask Register (j = 0 to 15)

Access: RSCFDnCFDGAFLMj register can be read/written in 32-bit units
RSCFDnCFDGAFLMjL, RSCFDnCFDGAFLMjH registers can be read/written in 16-bit units
RSCFDnCFDGAFLMjLL, RSCFDnCFDGAFLMjLH, RSCFDnCFDGAFLMjHL, RSCFDnCFDGAFLMjHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLMj: <RSCFDn_base> + 1004_H + (10_H × j)

RSCFDnCFDGAFLMjL: <RSCFDn_base> + 1004_H + (10_H × j),
RSCFDnCFDGAFLMjH: <RSCFDn_base> + 1006_H + (10_H × j)

RSCFDnCFDGAFLMjLL: <RSCFDn_base> + 1004_H + (10_H × j),
RSCFDnCFDGAFLMjLH: <RSCFDn_base> + 1005_H + (10_H × j),
RSCFDnCFDGAFLMjHL: <RSCFDn_base> + 1006_H + (10_H × j),
RSCFDnCFDGAFLMjHH: <RSCFDn_base> + 1007_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Table 23.116 RSCFDnCFDGAFLMj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDEM	IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared.
30	GAFLRTRM	RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared
29	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
28 to 0	GAFLIDM[28:0]	ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared.

Modify the RSCFDnCFDGAFLMj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCFDnCFDGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

23.4.5.5 RSCFDnCFDGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15)

Access: RSCFDnCFDGAFLP0_j register can be read/written in 32-bit units
RSCFDnCFDGAFLP0_jL, RSCFDnCFDGAFLP0_jH registers can be read/written in 16-bit units
RSCFDnCFDGAFLP0_jLH, RSCFDnCFDGAFLP0_jHL, RSCFDnCFDGAFLP0_jHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLP0_j: <RSCFDn_base> + 1008_H + (10_H × j)

RSCFDnCFDGAFLP0_jL: <RSCFDn_base> + 1008_H + (10_H × j),
RSCFDnCFDGAFLP0_jH: <RSCFDn_base> + $100A_H$ + (10_H × j)

RSCFDnCFDGAFLP0_jLH: <RSCFDn_base> + 1009_H + (10_H × j),
RSCFDnCFDGAFLP0_jHL: <RSCFDn_base> + $100A_H$ + (10_H × j),

1	1	1	0		48 data bytes
1	1	1	1		64 data bytes

Table 23.117 RSCFDnCFDGAFLP0_j Register Contents

Bit Position	Bit Name	Function
14 to 8	GAFLRMDP[6:0]	Receive Buffer Number Select Set the receive buffer number to store receive messages.
7 to 0	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Modify the RSCFDnCFDGAFLP0_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000_B disables the DLC check function allowing messages with any data length to pass the DLC check.

GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCFDnCFDRMNB register.

23.4.5.6 RSCFDnCFDGAFLP1_j — Receive Rule Pointer 1 Register (j = 0 to 15)

Access: RSCFDnCFDGAFLP1_j register can be read/written in 32-bit units
RSCFDnCFDGAFLP1_jL, RSCFDnCFDGAFLP1_jH registers can be read/written in 16-bit units
RSCFDnCFDGAFLP1_jLL, RSCFDnCFDGAFLP1_jLH, RSCFDnCFDGAFLP1_jHL,
RSCFDnCFDGAFLP1_jHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLP1_j: <RSCFDn_base> + $100C_H$ + (10_H × j)

RSCFDnCFDGAFLP1_jL: <RSCFDn_base> + $100C_H$ + (10_H × j),

Table 23.118 RSCFDnCFDGAFLP1_j Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
25 to 8	GAFLFDP[25:8]	Transmit/Receive FIFO Buffer k Select (Bit position –8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected.
7 to 0	GAFLFDP[7:0]	Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected.

Modify the RSCFDnCFDGAFLP1_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP [25:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers are selectable. However, when the GAFLRMV bit in the RSCFDnCFDGAFLP0_j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register are set to 00_B (receive mode) or 10_B (gateway mode) are selectable.

23.4.6 Details of Receive Buffer-related Registers

23.4.6.1 RSCFDnCFDRMNB — Receive Buffer Number Register

Access: RSCFDnCFDRMNB register can be read/written in 32-bit units
RSCFDnCFDRMNBL register can be read/written in 16-bit units
RSCFDnCFDRMNBLL, RSCFDnCFDRMNBLH registers can be read/written in 8-bit units

Address: RSCFDnCFDRMNB: <RSCFDn_base> + $00A4_H$

RSCFDnCFDRMNBL: <RSCFDn_base> + $00A4_H$

RSCFDnCFDRMNBLL: <RSCFDn_base> + $00A4_H$,
RSCFDnCFDRMNBLH: <RSCFDn_base> + $00A5_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 8	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
9, 8	RMPLS[1:0]	Receive Buffer Payload Storage Size Select b9 b8 0 0: 8 bytes 0 1: 12 bytes 1 0: 16 bytes 1 1: 20 bytes
7 to 0	NRXMB[7:0]	Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 48.

Modify the RSCFDnCFDRMNB register only in global reset mode.

RMPLS[1:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive buffer.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

Setting these bits all to 0 makes receive buffers unavailable.

23.4.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register (y = 0, 1)

Access: RSCFDnCFDRMNDy register can be read/written in 32-bit units
RSCFDnCFDRMNDyL, RSCFDnCFDRMNDyH registers can be read/written in 16-bit units
RSCFDnCFDRMNDyLL, RSCFDnCFDRMNDyLH, RSCFDnCFDRMNDyHL, RSCFDnCFDRMNDyHH registers can be read/written in 8-bit units

Address: RSCFDnCFDRMNDy: <RSCFDn_base> + $00A8_H$ + (04_H × y)

RSCFDnCFDRMNDyL: <RSCFDn_base> + $00A8_H$ + (04_H × y),
RSCFDnCFDRMNDyH: <RSCFDn_base> + $00AA_H$ + (04_H × y)

Table 23.120 RSCFDnCFDRMNDy Register Contents

Bit Position	Bit Name	Function
31 to 16	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.
15 to 0	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.

Write 0 to the RSCFDnCFDRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 47)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. The message storing time depends on the storage payload size of the receive buffer. When the RMPLS[1:0] value in the RSCFDnCFDRMNB register is 00_B (8 bytes), the message storing time is 12 pclk clock cycles. When the RMPLS[1:0] value is 11_B (20 bytes), the message storing time is 18 pclk clock cycles. (2 pclk clock cycles per 4 bytes of storage payload size).

These flags are cleared to 0 in global reset mode.

23.4.6.3 RSCFDnCFDRMIDq — Receive Buffer ID Register (q = 0 to 47)

Access: RSCFDnCFDRMIDq register can be read only in 32-bit units
RSCFDnCFDRMIDqL, RSCFDnCFDRMIDqH registers can be read only in 16-bit units
RSCFDnCFDRMIDqLL, RSCFDnCFDRMIDqLH, RSCFDnCFDRMIDqHL, RSCFDnCFDRMIDqHH registers can be read only in 8-bit units

Address: RSCFDnCFDRMIDq: <RSCFDn_base> + 2000_H + (20_H × q)

RSCFDnCFDRMIDqL: <RSCFDn_base> + 2000_H + (20_H × q),
RSCFDnCFDRMIDqH: <RSCFDn_base> + 2002_H + (20_H × q)

RSCFDnCFDRMIDqLL: <RSCFDn_base> + 2000_H + (20_H × q),
RSCFDnCFDRMIDqLH: <RSCFDn_base> + 2001_H + (20_H × q),
RSCFDnCFDRMIDqHL: <RSCFDn_base> + 2002_H + (20_H × q),

Table 23.121 RSCFDnCFDRMIDq Register Contents

Bit Position	Bit Name	Function
31	RMIDE	Receive Buffer IDE 0: Standard ID 1: Extended ID
30	RMRTR	Receive Buffer RTR/RRS • When the received message is a classical CAN frame 0: Data frame 1: Remote frame • When the received message is a CAN FD frame The RRS bit value of the received message can be read.
29	Reserved	These bits are read as the value after reset.
28 to 0	RMID[28:0]	Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

RMRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

23.4.6.4 RSCFDnCFDRMPTRq — Receive Buffer Pointer Register (q = 0 to 47)

Access: RSCFDnCFDRMPTRq register can be read only in 32-bit units
RSCFDnCFDRMPTRqL, RSCFDnCFDRMPTRqH registers can be read only in 16-bit units
RSCFDnCFDRMPTRqLL, RSCFDnCFDRMPTRqLH, RSCFDnCFDRMPTRqHL, RSCFDnCFDRMPTRqHH registers can be read only in 8-bit units

Address: RSCFDnCFDRMPTRq: <RSCFDn_base> + 2004_H + (20_H × q)

RSCFDnCFDRMPTRqL: <RSCFDn_base> + 2004_H + (20_H × q),
RSCFDnCFDRMPTRqH: <RSCFDn_base> + 2006_H + (20_H × q)

RSCFDnCFDRMPTRqLL: <RSCFDn_base> + 2004_H + (20_H × q),

1	1	1	0		48 data bytes
1	1	1	1		64 data bytes

27 to 16	RMPTR[11:0]	Receive Buffer Label Data Label information of the received message.
15 to 0	RMTS[15:0]	Receive Buffer Timestamp Data Timestamp value of the received message.

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer. The number of bytes of the payload to be stored in the receive buffer is determined by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register.

RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

23.4.6.5 RSCFDnCFDRMFDSTSq — Receive Buffer CAN FD Status Register (q = 0 to 47)

Access: RSCFDnCFDRMFDSTSq register can be read only in 32-bit units
RSCFDnCFDRMFDSTSqL register can be read only in 16-bit units
RSCFDnCFDRMFDSTSqLL register can be read only in 8-bit units

Address: RSCFDnCFDRMFDSTSq: <RSCFDn_base> + 2008_H + (20_H × q)

RSCFDnCFDRMFDSTSqL: <RSCFDn_base> + 2008_H + (20_H × q)

RSCFDnCFDRMFDSTSqLL: <RSCFDn_base> + 2008_H + (20_H × q)

Initial value: 0000 0000_H

Table 23.123 RSCFDnCFDRMFDSTSq Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	These bits are read as the value after reset.
2	RMFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	RMBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	RMESI	ESI 0: Error active node 1: Error passive node

RMFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive buffer.

RMBRS Bit

When the RMFDF bit is 1, this bit indicates the BRS bit value of the message stored in the receive buffer. When the RMFDF bit is 0, this bit is always read as 0.

RMESI Bit

When the RMFDF bit is 1, this bit indicates the ESI bit value of the message stored in the receive buffer. When the RMFDF bit is 0, this bit is always read as 0.

23.4.6.6 RSCFDnCFDRMDFb_q — Receive Buffer Data Field b Register (b = 0 to 4, q = 0 to 47)

Access: RSCFDnCFDRMDFb_q register can be read only in 32-bit units
RSCFDnCFDRMDFb_qL, RSCFDnCFDRMDFb_qH registers can be read only in 16-bit units
RSCFDnCFDRMDFb_qLL, RSCFDnCFDRMDFb_qLH, RSCFDnCFDRMDFb_qHL, RSCFDnCFDRMDFb_qHH registers can be read only in 8-bit units

Address: RSCFDnCFDRMDFb_q: <RSCFDn_base> + $200C_H$ + (04_H × b) + (20_H × q)

RSCFDnCFDRMDFb_qL: <RSCFDn_base> + $200C_H$ + (04_H × b) + (20_H × q),
RSCFDnCFDRMDFb_qH: <RSCFDn_base> + $200E_H$ + (04_H × b) + (20_H × q)

RSCFDnCFDRMDFb_qLL: <RSCFDn_base> + $200C_H$ + (04_H × b) + (20_H × q),
RSCFDnCFDRMDFb_qLH: <RSCFDn_base> + $200D_H$ + (04_H × b) + (20_H × q),
RSCFDnCFDRMDFb_qHL: <RSCFDn_base> + $200E_H$ + (04_H × b) + (20_H × q),
RSCFDnCFDRMDFb_qHH: <RSCFDn_base> + $200F_H$ + (04_H × b) + (20_H × q)

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RMDB4 × b + 3 [7:0]								RMDB4 × b + 2 [7:0]

Table 23.124 RSCFDnCFDRMDFb_q Register Contents

Bit Position	Bit Name	Function
31 to 24	RMDB4 × b + 3 [7:0]	Receive Buffer Data Byte 4 × b + 3 Receive Buffer Data Byte 4 × b + 2 Receive Buffer Data Byte 4 × b + 1 Receive Buffer Data Byte 4 × b + 0 Data for a message stored in the receive buffer can be read.
23 to 16	RMDB4 × b + 2 [7:0]	
15 to 8	RMDB4 × b + 1 [7:0]	
7 to 0	RMDB4 × b + 0 [7:0]	

When the RMDLC[3:0] value in the RSCFDnCFDRMPTRq register is smaller than the payload storage size of the receive buffer, data bytes for which no data is set are read as 00_H.

Specify the payload storage size of the receive buffer by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register. Do not read or write the RSCFDnCFDRMDFb_q register corresponding to an area larger than the specified size.

23.4.7 Details of Receive FIFO Buffer-related Registers

23.4.7.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

Access: RSCFDnCFDRFCCx register can be read/written in 32-bit units
RSCFDnCFDRFCCxL register can be read/written in 16-bit units
RSCFDnCFDRFCCxLL, RSCFDnCFDRFCCxLH registers can be read/written in 8-bit units

Address: RSCFDnCFDRFCCx: <RSCFDn_base> + $00B8_H$ + (04_H × x)

RSCFDnCFDRFCCxL: <RSCFDn_base> + $00B8_H$ + (04_H × x)

RSCFDnCFDRFCCxLL: <RSCFDn_base> + $00B8_H$ + (04_H × x),

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
15 to 13	RFIGCV[2:0]	Receive FIFO Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.
12	RFIM	Receive FIFO Interrupt Source Select 0: An interrupt occurs when the condition set by the RFIGCV[2:0] bits is met. 1: An interrupt occurs each time a message has been received.
11	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
10 to 8	RFDC[2:0]	Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Table 23.125 RSCFDnCFDRFCCx Register Contents (2/2)

Bit Position	Bit Name	Function
6 to 4	RFPLS[2:0]	Receive FIFO Buffer Payload Storage Size Select b6 b5 b4 0 0 0: 8 bytes 0 0 1: 12 bytes 0 1 0: 16 bytes 0 1 1: 20 bytes 1 0 0: 24 bytes 1 0 1: 32 bytes 1 1 0: 48 bytes 1 1 1: 64 bytes
3 to 2	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
1	RFIE	Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled.
0	RFE	Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001_B (4 messages), set the RFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000_B, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive FIFO buffer. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCFDnCFDRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode. Set this bit to 1 with another instruction after the settings to all bits in the RSCFDnCFDRFCCx register have been done. This bit is cleared to 0 in global reset mode.

23.4.7.2 RSCFDnCFDRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

Access: RSCFDnCFDRFSTSx register can be read/written in 32-bit units
RSCFDnCFDRFSTSxL register can be read/written in 16-bit units
RSCFDnCFDRFSTSxLL register can be read/written in 8-bit units
RSCFDnCFDRFSTSxLH register is the read-only register that can be read in 8-bit units.

Address: RSCFDnCFDRFSTSx: <RSCFDn_base> + $00D8_H$ + (04_H × x)

RSCFDnCFDRFSTSxL: <RSCFDn_base> + $00D8_H$ + (04_H × x)

RSCFDnCFDRFSTSxLL: <RSCFDn_base> + $00D8_H$ + (04_H × x),
RSCFDnCFDRFSTSxLH: <RSCFDn_base> + $00D9_H$ + (04_H × x)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFMC[7:0]								—	—	—	—	RFIF	RFMLT	RFFLL	RFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 23.126 RSCFDnCFDRFSTSx Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
15 to 8	RFMC[7:0]	Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed.
7 to 4	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
3	RFIF	Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present.
2	RFMLT	Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost.
1	RFFLL	Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.
0	RFEMP	Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).

RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes 00_H when the RFE bit in the RSCFDnCFDRFCCx register is set to 0.

This flag is 00_H in global reset mode.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCFDnCFDRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCFDnCFDRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCFDnCFDRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCFDnCFDRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

23.4.7.3 RSCFDnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

Access: RSCFDnCFDRFPCTRx register can only be written in 32-bit units
RSCFDnCFDRFPCTRxL register can only be written in 16-bit units
RSCFDnCFDRFPCTRxLL register can only be written in 8-bit units

Address: RSCFDnCFDRFPCTRx: <RSCFDn_base> + $00F8_H$ + (04_H × x)

RSCFDnCFDRFPCTRxL: <RSCFDn_base> + $00F8_H$ + (04_H × x)

RSCFDnCFDRFPCTRxLL: <RSCFDn_base> + $00F8_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 23.127 RSCFDnCFDRFPCTRx Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	RFPC[7:0]	Receive FIFO Pointer Control When these bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer.

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCFDnCFDRFSTSx register is decremented by 1. Read the RSCFDnCFDRFIDx, RSCFDnCFDRFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDnCFDRFDFd_x registers to read messages in the receive FIFO buffer, and then write FF_H to the RFPC[7:0] bits.

When writing FF_H to these bits, make sure that the RFE bit in the RSCFDnCFDRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCFDnCFDRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

23.4.7.4 RSCFDnCFDRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

Access: RSCFDnCFDRFIDx register can be read only in 32-bit units
RSCFDnCFDRFIDxL, RSCFDnCFDRFIDxH registers can be read only in 16-bit units
RSCFDnCFDRFIDxLL, RSCFDnCFDRFIDxLH, RSCFDnCFDRFIDxHL, RSCFDnCFDRFIDxHH registers can be read only in 8-bit units

Address: RSCFDnCFDRFIDx: <RSCFDn_base> + 3000_H + (80_H × x)

RSCFDnCFDRFIDxL: <RSCFDn_base> + 3000_H + (80_H × x),
RSCFDnCFDRFIDxH: <RSCFDn_base> + 3002_H + (80_H × x)

RSCFDnCFDRFIDxLL: <RSCFDn_base> + 3000_H + (80_H × x),

29	Reserved	These bits are read as the value after reset.
28 to 0	RFID[28:0]	Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer.

When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

23.4.7.5 RSCFDnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

Access: RSCFDnCFDRFPTRx register can be read only in 32-bit units
RSCFDnCFDRFPTRxL, RSCFDnCFDRFPTRxH registers can be read only in 16-bit units
RSCFDnCFDRFPTRxLL, RSCFDnCFDRFPTRxLH, RSCFDnCFDRFPTRxHL, RSCFDnCFDRFPTRxHH registers can be read only in 8-bit units

Address: RSCFDnCFDRFPTRx: <RSCFDn_base> + 3004_H + (80_H × x)

15 to 0	RFTS[15:0]	Receive FIFO Buffer Timestamp Data Timestamp value of the received message can be read.

RFDLC[3:0] Bits

These bits contain the data length of the message stored in the receive FIFO buffer.

RFPTR[11:0] Bits

These bits contain the label information of the message stored in the receive FIFO buffer.

RFTS[15:0] Bits

These bits contain the timestamp value of the message stored in the receive FIFO buffer.

23.4.7.6 RSCFDnCFDRFFDSTSx — Receive FIFO CAN FD Status Register (x = 0 to 7)

Access: RSCFDnCFDRFFDSTSx register can be read only in 32-bit units
RSCFDnCFDRFFDSTSxL register can be read only in 16-bit units
RSCFDnCFDRFFDSTSxLL register can be read only in 8-bit units

Address: RSCFDnCFDRFFDSTSx: <RSCFDn_base> + 3008_H + (80_H × x)

Table 23.130 RSCFDnCFDRFFDSTSx Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	These bits are read as the value after reset.
2	RFFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	RFBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	RFESI	ESI 0: Error active node 1: Error passive node

RFFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive FIFO buffer.

RFBRS Bit

When the RFFDF bit is 1, this bit indicates the BRS bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is 0, this bit is always read as 0.

RFESI Bit

When the RFFDF bit is 1, this bit indicates the ESI bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is 0, this bit is always read as 0.

23.4.7.7 RSCFDnCFDRFDFd_x — Receive FIFO Buffer Access Data Field d Register (d = 0 to 15, x = 0 to 7)

Access: RSCFDnCFDRFDFd_x registers can be read only in 32-bit units
RSCFDnCFDRFDFd_xL, RSCFDnCFDRFDFd_xH registers can be read only in 16-bit units
RSCFDnCFDRFDFd_xLL, RSCFDnCFDRFDFd_xLH, RSCFDnCFDRFDFd_xHL, RSCFDnCFDRFDFd_xHH registers can be read only in 8-bit units

Address: RSCFDnCFDRFDFd_x: <RSCFDn_base> + $300C_H$ + (04_H × d) + (80_H × x)

RSCFDnCFDRFDFd_xL: <RSCFDn_base> + $300C_H$ + (04_H × d) + (80_H × x),

3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	CFTXIE	Transmit/Receive FIFO Transmit Interrupt Enable 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled.
1	CFRXIE	Transmit/Receive FIFO Receive Interrupt Enable 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled.
0	CFE	Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used.

CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]) (see **Table 23.91**).

See **Table 23.89** and **Table 23.90**, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p.

Setting the CFDC[2:0] bits to 001_B or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the same channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register × 10).

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the nominal bit time clock of the channel to which the FIFO is linked is the count source of the interval timer. Use this count source only for the channel does not handle the CAN FD frames.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00_B (receive mode) or 10_B (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001_B (4 messages), set the CFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B.

Modify these bits only in global reset mode.

CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000_B, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCFDnCFDCFCCk register have been set, set this bit to 1 by using another instruction.

23.4.8.2 RSCFDnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 8)

Access: RSCFDnCFDCFSTSk register can be read/written in 32-bit units
RSCFDnCFDCFSTSkL register can be read/written in 16-bit units
RSCFDnCFDCFSTSkLL register can be read/written in 8-bit units
RSCFDnCFDCFSTSkLH register is the read-only register that can be read in 8-bit units

Address: RSCFDnCFDCFSTSk: <RSCFDn_base> + 0178_H + (04_H × k)

RSCFDnCFDCFSTSkL: <RSCFDn_base> + 0178_H + (04_H × k)

RSCFDnCFDCFSTSkLL: <RSCFDn_base> + 0178_H + (04_H × k),
RSCFDnCFDCFSTSkLH: <RSCFDn_base> + 0179_H + (04_H × k)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CFMC[7:0]								—	—	—	CFTXIF	CFRXIF	CFMLT	CFFLL	CFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 23.133 RSCFDnCFDCFSTSk Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
15 to 8	CFMC[7:0]	Transmit/Receive FIFO Message Counter The number of messages stored in the transmit/receive FIFO buffer.
7 to 5	Reserved	These bits are read as the value after reset. When writing to these bits, write the value after reset.
4	CFTXIF	Transmit/Receive FIFO Transmit Interrupt Request Flag 0: No transmit/receive FIFO transmit interrupt request is present. 1: A transmit/receive FIFO transmit interrupt request is present.
3	CFRXIF	Transmit/Receive FIFO Receive Interrupt Request Flag 0: No transmit/receive FIFO receive interrupt request is present. 1: A transmit/receive FIFO receive interrupt request is present.
2	CFMLT	Transmit/Receive FIFO Message Lost Flag 0: No transmit/receive FIFO message is lost. 1: A transmit/receive FIFO message is lost.
1	CFFLL	Transmit/Receive FIFO Buffer Full Status Flag 0: The transmit/receive FIFO buffer is not full. 1: The transmit/receive FIFO buffer is full.
0	CFEMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty).

CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCFDnCFDCFCCk register.

- When CFM[1:0] value is 01_B (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is 00_B (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10_B (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00_B: In global reset mode
- When CFM[1:0] value is 01_B or 10_B: In channel reset mode
- When the CFE bit in the RSCFDnCFDCFCCk register is cleared to 0.

CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01_B or 10_B, and the factor selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B, and the factor selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCFDnCFDCFCCk register.

The CFFLL flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCFDnCFDCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01_B: A value of FF_H has been written to the RSCFDnCFDCFPCTRk register after data was written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers.

NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

23.4.8.3 RSCFDnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 8)

Access: RSCFDnCFDCFPCTRk register can only be written in 32-bit units
RSCFDnCFDCFPCTRkL register is a write-only register that can only be written in 16-bit units
RSCFDnCFDCFPCTRkLL register is a write-only register that can only be written in 8-bit units

Address: RSCFDnCFDCFPCTRk: <RSCFDn_base> + $01D8_H$ + (04_H × k)

RSCFDnCFDCFPCTRkL: <RSCFDn_base> + $01D8_H$ + (04_H × k)

RSCFDnCFDCFPCTRkLL: <RSCFDn_base> + $01D8_H$ + (04_H × k)

Value after reset: $0000\ 0000_H$

Table 23.134 RSCFDnCFDCFPCTRk Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	CFPC[7:0]	Transmit/Receive FIFO Pointer Control • Receive mode: Writing FF_H to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. • Transmit mode: Writing FF_H to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer. • Gateway mode: Setting prohibited

CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 00B):
  Writing FFH to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCFDnCFDCFSTSk register is decremented by 1. Read the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers to read messages from the transmit/receive FIFO buffer, and then write FFH to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).

- Transmit mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 01B):
  Writing FFH to the CFPC[7:0] bits stores the data written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented by 1. Write transmit messages to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers before writing FFH to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 and the CFFLL flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).
- Gateway mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 10_B):
  Setting prohibited

23.4.8.4 RSCFDnCFDCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 8)

Access: RSCFDnCFDCFIDk register can be read/written in 32-bit units
RSCFDnCFDCFIDkL, RSCFDnCFDCFIDkH registers can be read/written in 16-bit units
RSCFDnCFDCFIDkLL, RSCFDnCFDCFIDkLH, RSCFDnCFDCFIDkHL, RSCFDnCFDCFIDkHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCFIDk: <RSCFDn_base> + 3400_H + (80_H × k)

RSCFDnCFDCFIDkL: <RSCFDn_base> + 3400_H + (80_H × k),
RSCFDnCFDCFIDkH: <RSCFDn_base> + 3402_H + (80_H × k)

RSCFDnCFDCFIDkLL: <RSCFDn_base> + 3400_H + (80_H × k),
RSCFDnCFDCFIDkLH: <RSCFDn_base> + 3401_H + (80_H × k),
RSCFDnCFDCFIDkHL: <RSCFDn_base> + 3402_H + (80_H × k),

Table 23.135 RSCFDnCFDCFIDk Register Contents

Bit Position	Bit Name	Function
31	CFIDE	Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	CFRTR	Transmit/Receive FIFO Buffer RTR/RRS • When the CFM[1:0] value is 01_B (transmit mode) – When the transmit message is a classical CAN frame 0: Data frame 1: Remote frame – When the transmit message is a CAN FD frame Write 0 to this bit. • When the CFM[1:0] value is 00_B (receive mode) – When the received message is a classical CAN frame 0: Data frame 1: Remote frame – When the received message is a CAN FD frame The RRS bit value of the received message can be read.
29	THLEN	Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01_B (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	CFID[28:0]	Transmit/Receive FIFO Buffer ID Data • When CFM[1:0] value is 01_B (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. • When CFM[1:0] value is 00_B (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0.

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This RSCFDnCFDCFIDk register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, these bits are used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

CFRTR Bit

If the received message is a classical CAN frame, this bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. If the received message is a CAN FD frame, this bit indicates the RRS bit value of the received message.

When the CFM[1:0] value is 01_B, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 1 (CAN FD frame), set this bit to 0.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01_B (transmit mode).

CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

When the CFM[1:0] value is 01_B, this bit is used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

23.4.8.5 RSCFDnCFDCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 8)

Access: RSCFDnCFDCFPTRk register can be read/written in 32-bit units
RSCFDnCFDCFPTRkL, RSCFDnCFDCFPTRkH registers can be read/written in 16-bit units
RSCFDnCFDCFPTRkLL, RSCFDnCFDCFPTRkLH, RSCFDnCFDCFPTRkHL, RSCFDnCFDCFPTRkHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCFPTRk: <RSCFDn_base> + 3404_H + (80_H × k)

RSCFDnCFDCFPTRkL: <RSCFDn_base> + 3404_H + (80_H × k),
RSCFDnCFDCFPTRkH: <RSCFDn_base> + 3406_H + (80_H × k)

RSCFDnCFDCFPTRkLL: <RSCFDn_base> + 3404_H + (80_H × k),
RSCFDnCFDCFPTRkLH: <RSCFDn_base> + 3405_H + (80_H × k),
RSCFDnCFDCFPTRkHL: <RSCFDn_base> + 3406_H + (80_H × k),

		1	1	1	1		64 data bytes

Table 23.136 RSCFDnCFDCFPTRk Register Contents

Bit Position	Bit Name	Function
27 to 16	CFPTR[11:0]	Transmit/Receive FIFO Buffer Label Data • When CFM[1:0] value is 01_B (transmit mode): Set the label information to be stored in the transmit history buffer. Only bits CFPTR[7:0] are valid. • When CFM[1:0] value is 00_B (receive mode): The label information of the received message can be read.
15 to 0	CFTS[15:0]	Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is 00_B (receive mode). The timestamp value of the received message can be read.

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

When the CFM[1:0] value is 01_B, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFDLC[3:0] bits are set to 1001_B or more while the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 0 (CAN frame), 8-byte data is transmitted actually. When the CFFDF bit is 1 (CAN FD frame), the settable value range varies depending on the settings of the TMME bit in the RSCFDnCFDCmFDCFG register and the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

- When TMME bit = 0 (transmit buffer merge mode disabled):
  A value of 0000_B to 1111_B is settable. If the specified data length exceeds the payload storage size specified by the CFPLS[2:0] bits, excessive payloads are padded by CCH.
- When TMME bit = 1 (transmit buffer merge mode enabled):
  Set the data length within the payload storage size specified by the CFPLS[2:0] bits.

CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.

These bits are valid when the CFM[1:0] value is 00_B.

23.4.8.6 RSCFDnCFDCFFDCSTSk — Transmit/Receive FIFO CAN FD Configuration/Status Register (k = 0 to 8)

Access: RSCFDnCFDCFFDCSTSk register can be read/written in 32-bit units
RSCFDnCFDCFFDCSTSkL register can be read/written in 16-bit units
RSCFDnCFDCFFDCSTSkLL register can be read/written in 8-bit units

Address: RSCFDnCFDCFFDCSTSk: <RSCFDn_base> + 3408_H + (80_H × k)

RSCFDnCFDCFFDCSTSkL: <RSCFDn_base> + 3408_H + (80_H × k)

RSCFDnCFDCFFDCSTSkLL: <RSCFDn_base> + 3408_H + (80_H × k)

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 23.137 RSCFDnCFDCFFDCSTSk Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	These bits are read as the value after reset The write value should be the value after reset.
2	CFFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	CFBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	CFESI	ESI 0: Error active node 1: Error passive node

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). Do not read or write this register when the CFM[1:0] value is 10_B (gateway mode).

CFFDF Bit

When the CFM[1:0] value is 00_B, this bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the transmit/receive FIFO buffer. When the CFM[1:0] value is 01_B, this bit is used to set the FD format of the message to be transmitted from the transmit/receive FIFO buffer.

CFBRS Bit

When the CFM[1:0] value is 00_B, if the CFFDF bit is 1, this bit indicates the BRS bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is 0, this bit is always read as 0.

When the CFM[1:0] value is 01_B, if the CFFDF bit is 1, this bit is used to set the BRS bit value of the message to be transmitted from the transmit/receive FIFO buffer. If the CFFDF bit is 0, write 0 to this bit.

CFESI Bit

When the CFM[1:0] value is 00B, if the CFFDF bit is 1, this bit indicates the ESI bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is 0, this bit is always read as 0.

When the CFM[1:0] value is 01B, if the CFFDF bit is 1, this bit is used to set the ESI bit value of the message to be transmitted from the transmit/receive FIFO buffer. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the CFFDF bit is 0, write 0 to this bit.

23.4.8.7 RSCFDnCFDCFDFd_k — Transmit/receive FIFO Buffer Access Data Field d Register (d = 0 to 15, k = 0 to 8)

Access: RSCFDnCFDCFDFd_k register can be read/written in 32-bit units
RSCFDnCFDCFDFd_kL, RSCFDnCFDCFDFd_kH registers can be read/written in 16-bit units
RSCFDnCFDCFDFd_kLL, RSCFDnCFDCFDFd_kLH, RSCFDnCFDCFDFd_kHL, RSCFDnCFDCFDFd_kHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCFDFd_k: <RSCFDn_base> + $340C_H$ + (04_H × d) + (80_H × k)

RSCFDnCFDCFDFd_kL: <RSCFDn_base> + $340C_H$ + (04_H × d) + (80_H × k),
RSCFDnCFDCFDFd_kH: <RSCFDn_base> + $340E_H$ + (04_H × d) + (80_H × k)

RSCFDnCFDCFDFd_kLL: <RSCFDn_base> + $340C_H$ + (04_H × d) + (80_H × k),
RSCFDnCFDCFDFd_kLH: <RSCFDn_base> + $340D_H$ + (04_H × d) + (80_H × k),
RSCFDnCFDCFDFd_kHL: <RSCFDn_base> + $340E_H$ + (04_H × d) + (80_H × k),
RSCFDnCFDCFDFd_kHH: <RSCFDn_base> + $340F_H$ + (04_H × d) + (80_H × k)

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 23.138 RSCFDnCFDCFDFd_k Register Contents

Bit Position	Bit Name	Function
31 to 24	CFDB4 × d + 3 [7:0]	Transmit/Receive FIFO Buffer Data Byte 4 × d + 3 Transmit/Receive FIFO Buffer Data Byte 4 × d + 2 Transmit/Receive FIFO Buffer Data Byte 4 × d + 1 Transmit/Receive FIFO Buffer Data Byte 4 × d + 0 • When CFM[1:0] value is 01B (transmit mode): Set the transmit/receive FIFO buffer data. • When CFM[1:0] value is 00B (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.
23 to 16	CFDB4 × d + 2 [7:0]	
15 to 8	CFDB4 × d + 1 [7:0]	
7 to 0	CFDB4 × d + 0 [7:0]	

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode).

This register is readable only when the CFM[1:0] value is 00_B (receive mode). When the CFDLC[3:0] value in the RSCFDnCFDCFPTRk register is smaller than the payload storage size of the transmit/receive FIFO buffer, data bytes for which no data is set are read as 00_H.

Specify the payload storage size of the transmit/receive FIFO buffer by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register. Do not read or write the RSCFDnCFDCFDFd_k register corresponding to an area larger than the specified size.

This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

23.4.9 Details of FIFO Status-related Registers

23.4.9.1 RSCFDnCFDFESTS — FIFO Empty Status Register

Access: RSCFDnCFDFESTSregisters can be read only in 32-bit units
RSCFDnCFDFESTSL, RSCFDnCFDFESTSH registers can be read only in 16-bit units
RSCFDnCFDFESTSLL, RSCFDnCFDFESTSLH, RSCFDnCFDFESTSHL registers can be read only in 8-bit units

Address: RSCFDnCFDFESTS: <RSCFDn_base> + 0238_H

RSCFDnCFDFESTSL: <RSCFDn_base> + 0238_H,
RSCFDnCFDFESTSH: <RSCFDn_base> + $023A_H$

RSCFDnCFDFESTSLL: <RSCFDn_base> + 0238_H,
RSCFDnCFDFESTSLH: <RSCFDn_base> + 0239_H,
RSCFDnCFDFESTSHL: <RSCFDn_base> + $023A_H$

Value after reset: 03FF $FFFF_H$

Table 23.139 RSCFDnCFDFESTS Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	These bits are read as the value after reset.
16	CF8EMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: Transmit/receive FIFO buffer k contains a message. 1: Transmit/receive FIFO buffer k contains no message. (k = 0 to 8)
15	CF7EMP	
14	CF6EMP	
13	CF5EMP	
12	CF4EMP	
11	CF3EMP	
10	CF2EMP	
9	CF1EMP	
8	CF0EMP	
7	RF7EMP	Receive FIFO Buffer Empty Status Flag 0: Receive FIFO buffer x contains an unread message. 1: Receive FIFO buffer x contains no unread message (buffer empty). (x = 0 to 7)
6	RF6EMP	
5	RF5EMP	
4	RF4EMP	
3	RF3EMP	
2	RF2EMP	
1	RF1EMP	
0	RF0EMP	

The RSCFDnCFDFESTS register is set to 03FF $FFFF_H$ in global reset mode.

CFkEMP Flag (k = 0 to 8)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

23.4.9.2 RSCFDnCFDFFSTS — FIFO Full Status Register

Access: RSCFDnCFDFFSTS register can be read only in 32-bit units
RSCFDnCFDFFSTSL, RSCFDnCFDFFSTSH registers can be read only in 16-bit units
RSCFDnCFDFFSTSLL, RSCFDnCFDFFSTSLH, RSCFDnCFDFFSTSHL registers can be read only in 8-bit units

Address: RSCFDnCFDFFSTS: <RSCFDn_base> + $023C_H$

RSCFDnCFDFFSTSL: <RSCFDn_base> + $023C_H$,
RSCFDnCFDFFSTSH: <RSCFDn_base> + $023E_H$

RSCFDnCFDFFSTSLL: <RSCFDn_base> + $023C_H$,
RSCFDnCFDFFSTSLH: <RSCFDn_base> + $023D_H$,
RSCFDnCFDFFSTSHL: <RSCFDn_base> + $023E_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

9	CF1FLL	
8	CF0FLL	
7	RF7FLL	Receive FIFO Buffer Full Status Flag 0: Receive FIFO buffer x is not full. 1: Receive FIFO buffer x is full. (x = 0 to 7)
6	RF6FLL	
5	RF5FLL	
4	RF4FLL	
3	RF3FLL	
2	RF2FLL	
1	RF1FLL	
0	RF0FLL	

The RSCFDnCFDFFSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkFLL Flag (k = 0 to 8)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).
When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

23.4.9.3 RSCFDnCFDFMSTS — FIFO Message Lost Status Register

Access: RSCFDnCFDFMSTS register can be read only in 32-bit units
RSCFDnCFDFMSTSL, RSCFDnCFDFMSTSH registers can be read only in 16-bit units
RSCFDnCFDFMSTSLL, RSCFDnCFDFMSTSLH, RSCFDnCFDFMSTSHL registers can be read only in 8-bit units

Address: RSCFDnCFDFMSTS: <RSCFDn_base> + 0240_H

RSCFDnCFDFMSTSL: <RSCFDn_base> + 0240_H,
RSCFDnCFDFMSTSH: <RSCFDn_base> + 0242_H

RSCFDnCFDFMSTSLL: <RSCFDn_base> + 0240_H,
RSCFDnCFDFMSTSLH: <RSCFDn_base> + 0241_H,
RSCFDnCFDFMSTSHL: <RSCFDn_base> + 0242_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CF8MLT

5	RF5MLT	
4	RF4MLT	
3	RF3MLT	
2	RF2MLT	
1	RF1MLT	
0	RF0MLT	

The RSCFDnCFDFMSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkMLT Flag (k = 0 to 8)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

23.4.9.4 RSCFDnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

Access: RSCFDnCFDRFISTS register can be read only in 32-bit units
RSCFDnCFDRFISTSL register is a read-only register that can be read only in 16-bit units
RSCFDnCFDRFISTSLL register is a read-only register that can be read only in 8-bit units

Address: RSCFDnCFDRFISTS: <RSCFDn_base> + 0244_H

RSCFDnCFDRFISTSL: <RSCFDn_base> + 0244_H

RSCFDnCFDRFISTSLL: <RSCFDn_base> + 0244_H

Value after reset: $0000\ 0000_H$

Table 23.142 RSCFDnCFDRFISTS Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	These bits are read as the value after reset.
7	RF7IF	Receive FIFO Buffer Interrupt Request Status Flag 0: No receive FIFO buffer x interrupt request is present. 1: A receive FIFO buffer x interrupt request is present. (x = 0 to 7)
6	RF6IF	
5	RF5IF	
4	RF4IF	
3	RF3IF	
2	RF2IF	
1	RF1IF	
0	RF0IF	

The RSCFDnCFDRFISTS register is cleared to $0000\ 0000_H$ in global reset mode.

RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

23.4.9.5 RSCFDnCFDCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

Access: RSCFDnCFDCFRISTS register can be read only in 32-bit units
RSCFDnCFDCFRISTSL register is a read-only register that can be read only in 16-bit units
RSCFDnCFDCFRISTSLL, RSCFDnCFDCFRISTSLH registers are the read-only registers that can be read only in 8-bit units

Address: RSCFDnCFDCFRISTS: <RSCFDn_base> + 0248_H

RSCFDnCFDCFRISTSL: <RSCFDn_base> + 0248_H

RSCFDnCFDCFRISTSLL: <RSCFDn_base> + 0248_H,
RSCFDnCFDCFRISTSLH: <RSCFDn_base> + 0249_H

Value after reset: $0000\ 0000_H$

Table 23.143 RSCFDnCFDCFRISTS Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset.
8	CF8RXIF	Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k receive interrupt request is present. 1: A transmit/receive FIFO buffer k receive interrupt request is present. (k = 0 to 8)
7	CF7RXIF	
6	CF6RXIF	
5	CF5RXIF	
4	CF4RXIF	
3	CF3RXIF	
2	CF2RXIF	
1	CF1RXIF	
0	CF0RXIF	

The RSCFDnCFDCFRISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkRXIF Flag (k = 0 to 8)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

23.4.9.6 RSCFDnCFDCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

Access: RSCFDnCFDCFTISTS register can be read only in 32-bit units
RSCFDnCFDCFTISTSL register is a read-only register that can be read only in 16-bit units
RSCFDnCFDCFTISTSLL, RSCFDnCFDCFTISTSLH registers are the read-only registers that can be read only in 8-bit units

Address: RSCFDnCFDCFTISTS: <RSCFDn_base> + $024C_H$

RSCFDnCFDCFTISTSL: <RSCFDn_base> + $024C_H$

RSCFDnCFDCFTISTSLL: <RSCFDn_base> + $024C_H$,
RSCFDnCFDCFTISTSLH: <RSCFDn_base> + $024D_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 23.144 RSCFDnCFDCFTISTS Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset.
8	CF8TXIF	Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k transmit interrupt request is present. 1: A transmit/receive FIFO buffer k transmit interrupt request is present. (k = 0 to 8)
7	CF7TXIF	
6	CF6TXIF	
5	CF5TXIF	
4	CF4TXIF	
3	CF3TXIF	
2	CF2TXIF	
1	CF1TXIF	
0	CF0TXIF	

The RSCFDnCFDCFTISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkTXIF Flag (k = 0 to 8)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

23.4.10 Details of Transmit Buffer-related Registers

23.4.10.1 RSCFDnCFDTMCp — Transmit Buffer Control Register (p = 0 to 47)

Access: RSCFDnCFDTMCp register can be read/written in 8-bit units

Address: RSCFDnCFDTMCp: <RSCFDn_base> + 0250_H + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W*1	R/W*1

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

Table 23.145 RSCFDnCFDTMCp Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	TMOM	One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled.
1	TMTAR	Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested.
0	TMTR	Transmit Request 0: Transmission is not requested. 1: Transmission is requested.

When the RSCFDnCFDTMCp register meets any of the following conditions, set it to 00_H.

- The RSCFDnCFDTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCFDnCFDCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCFDnCFDTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm (m = 0 to 2) register (p = (m × 16 + 15) to (m × 16 + 15 – the value of TXQDC[3:0] bits)).
- RSCFDnCFDTMCp register (p = (m × 16) + 1, (m × 16) + 2, (m × 16) + 4, or (m × 16) + 5) corresponding to the transmit buffer allocated as a payload storage area when the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode) Bits in the RSCFDnCFDTMCp register are all cleared to 0 in channel reset mode. Modify the RSCFDnCFDTMCp register in channel communication mode or channel halt mode.

TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCFDnCFDTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration-lost has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCFDnCFDTMSTSp register is 00_B.

23.4.10.2 RSCFDnCFDTMSTSp — Transmit Buffer Status Register (p = 0 to 47)

Access: RSCFDnCFDTMSTSp register can be read/written in 8-bit units

Address: RSCFDnCFDTMSTSp: <RSCFDn_base> + $02D0_H$ + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R

Table 23.146 RSCFDnCFDTMSTSp Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4	TMTARM	Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present.
3	TMTRM	Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present.
2, 1	TMTRF[1:0]	Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request).
0	TMTSTS	Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress.

The RSCFDnCFDTMSTSp register is cleared to all 0 in channel reset mode.

TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 0.

TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCFDnCFDTMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCFDnCFDTMCp register is set to 0.

TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00_B: Transmission is in progress or no transmit request is present.

01_B: Transmission from the transmit buffer was aborted.

10_B: Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 0 (transmit abort is not requested).

11_B: Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 1 (transmit abort is requested).

Write 00_B to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00_B to this flag.

TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

23.4.10.3 RSCFDnCFDTMIDp — Transmit Buffer ID Register (p = 0 to 47)

Access: RSCFDnCFDTMIDp register can be read/written in 32-bit units
RSCFDnCFDTMIDpL, RSCFDnCFDTMIDpH registers can be read/written in 16-bit units
RSCFDnCFDTMIDpLL, RSCFDnCFDTMIDpLH, RSCFDnCFDTMIDpHL, RSCFDnCFDTMIDpHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTMIDp: <RSCFDn_base> + 4000_H + (20_H × p)

RSCFDnCFDTMIDpL: <RSCFDn_base> + 4000_H + (20_H × p),
RSCFDnCFDTMIDpH: <RSCFDn_base> + 4002_H + (20_H × p)

RSCFDnCFDTMIDpLL: <RSCFDn_base> + 4000_H + (20_H × p),
RSCFDnCFDTMIDpLH: <RSCFDn_base> + 4001_H + (20_H × p),
RSCFDnCFDTMIDpHL: <RSCFDn_base> + 4002_H + (20_H × p),
RSCFDnCFDTMIDpHH: <RSCFDn_base> + 4003_H + (20_H × p)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 23.147 RSCFDnCFDTMIDp Register Contents

Bit Position	Bit Name	Function
31	TMIDE	Transmit Buffer IDE 0: Standard ID 1: Extended ID
30	TMRTR	Transmit Buffer RTR/RRS • When the transmit message is a classical CAN frame 0: Data frame 1: Remote frame • When the transmit message is a CAN FD frame Write 0 to this bit.
29	THLEN	Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	TMID[28:0]	Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

Set this bit to 0 when the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 1 (CAN FD frame).

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

23.4.10.4 RSCFDnCFDTMPTRp — Transmit Buffer Pointer Register (p = 0 to 47)

Access: RSCFDnCFDTMPTRp register can be read/written in 32-bit units
RSCFDnCFDTMPTRpH register can be read/written in 16-bit units
RSCFDnCFDTMPTRpHL, RSCFDnCFDTMPTRpHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTMPTRp: <RSCFDn_base> + 4004_H + (20_H × p)

RSCFDnCFDTMPTRpH: <RSCFDn_base> + 4006_H + (20_H × p)

RSCFDnCFDTMPTRpHL: <RSCFDn_base> + 4006_H + (20_H × p),
RSCFDnCFDTMPTRpHH: <RSCFDn_base> + 4007_H + (20_H × p)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMDLC[3:0]				—	—	—	—	TMPTR[7:0]

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 23.148 RSCFDnCFDTMPTRp Register Contents

Bit Position	Bit Name	Function
31 to 28	TMDLC[3:0]	Transmit Buffer DLC Data
27 to 24	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
23 to 16	TMPTR[7:0]	Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer.
15 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

b31	b30	b29	b28	Classical CAN Frame	CAN FD Frame
0	0	0	0	0 data bytes	
0	0	0	1	1 data byte	
0	0	1	0	2 data bytes	
0	0	1	1	3 data bytes	
0	1	0	0	4 data bytes	
0	1	0	1	5 data bytes	
0	1	1	0	6 data bytes	
0	1	1	1	7 data bytes	
1	0	0	0	8 data bytes	
1	0	0	1	8 data bytes	12 data bytes
1	0	1	0		16 data bytes
1	0	1	1		20 data bytes
1	1	0	0		24 data bytes
1	1	0	1		32 data bytes
1	1	1	0		48 data bytes
1	1	1	1		64 data bytes

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not

write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCFDnCFDTMIDp register is set to 0 (data frame).

When the TMDLC[3:0] bits are set to 1001B or more while the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 0 (classical CAN frame), 8-byte data is transmitted actually. When the TMFDF bit is 1 (CAN FD frame), the settable value range varies depending on the setting of the TMME bit in the RSCFDnCFDCmFDCFG register.

- When the TMME bit = 0 (transmit buffer merge mode disabled):
  A value of 0000_B to 1111_B is settable. If a value larger than 1100_B is set, payloads exceeding 20 bytes are padded by CCH.
- When the TMME bit = 1 (transmit buffer merge mode enabled):
  When the corresponding transmit buffer number p = (m × 16) + 0 or (m × 16) + 3, a value of 0000_B to 1111_B is settable. In other cases, set a value of 0000_B to 1011_B (20 data bytes).

When the TMRTR bit is 1 (remote frame), set the data length of a message to be requested.

TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

23.4.10.5 RSCFDnCFDTMFDCTRp — Transmit Buffer CAN FD Configuration Register (p = 0 to 47)

Access: RSCFDnCFDTMFDCTRp register can be read/written in 32-bit units
RSCFDnCFDTMFDCTRpL register can be read/written in 16-bit units
RSCFDnCFDTMFDCTRpLL register can be read/written in 8-bit units

Address: RSCFDnCFDTMFDCTRp: <RSCFDn_base> + 4008_H + (20_H × p)

RSCFDnCFDTMFDCTRpL: <RSCFDn_base> + 4008_H + (20_H × p)

RSCFDnCFDTMFDCTRpLL: <RSCFDn_base> + 4008_H + (20_H × p)

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 23.149 RSCFDnCFDTMFDCTRp Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	TMFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	TMBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	TMESI	ESI 0: Error active node 1: Error passive node

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is 0 (transmission not requested). When this register is linked to the transmit/receive FIFO buffer, do not write data to this register. When this register is allocated to the transmit queue, write data only to transmit buffer p (p = m × 16 + 15) of the corresponding channel.

TMFDF Bit

This bit is used to set the FD format of the message to be transmitted from the transmit buffer.

TMBRS Bit

When this bit is set to 1 while the TMFDF bit is 1, the data area of a transmit message is transmitted at the data bit rate. When the TMFDF bit is 0, write 0 to this bit.

TMESI Bit

This bit is used to set the ESI bit value of the message to be transmitted from the transmit buffer when the TMFDF bit is 1. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG

register is 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the TMFDF bit is 0, write 0 to this bit.

23.4.10.6 RSCFDnCFDTMDFb_p — Transmit Buffer Data Field b Register (b = 0 to 4, p = 0 to 47)

Access: RSCFDnCFDTMDFb_p register can be read/written in 32-bit units
RSCFDnCFDTMDFb_pL, RSCFDnCFDTMDFb_pH registers can be read/written in 16-bit units
RSCFDnCFDTMDFb_pLL, RSCFDnCFDTMDFb_pLH, RSCFDnCFDTMDFb_pHL, RSCFDnCFDTMDFb_pHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTMDFb_p: <RSCFDn_base> + $400C_H$ + (04_H × b) + (20_H × p)

RSCFDnCFDTMDFb_pL: <RSCFDn_base> + $400C_H$ + (04_H × b) + (20_H × p),
RSCFDnCFDTMDFb_pH: <RSCFDn_base> + $400E_H$ + (04_H × b) + (20_H × p)

RSCFDnCFDTMDFb_pLL: <RSCFDn_base> + $400C_H$ + (04_H × b) + (20_H × p),
RSCFDnCFDTMDFb_pLH: <RSCFDn_base> + $400D_H$ + (04_H × b) + (20_H × p),
RSCFDnCFDTMDFb_pHL: <RSCFDn_base> + $400E_H$ + (04_H × b) + (20_H × p),
RSCFDnCFDTMDFb_pHH: <RSCFDn_base> + $400F_H$ + (04_H × b) + (20_H × p)

Initial value: $0000\ 0000_H$

Bit Position	Bit Name	Function
31 to 24	TMDB4 × b + 3 [7:0]	Transmit Buffer Data Byte 4 × b + 3 Transmit Buffer Data Byte 4 × b + 2 Transmit Buffer Data Byte 4 × b + 1 Transmit Buffer Data Byte 4 × b + 0 Set the transmit buffer data.
23 to 16	TMDB4 × b + 2 [7:0]	
15 to 8	TMDB4 × b + 1 [7:0]	
7 to 0	TMDB4 × b + 0 [7:0]	

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

23.4.10.7 RSCFDnCFDTMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0, 1)

Access: RSCFDnCFDTMIECy register can be read/written in 32-bit units
RSCFDnCFDTMIECyL, RSCFDnCFDTMIECyH registers can be read/written in 16-bit units
RSCFDnCFDTMIECyLL, RSCFDnCFDTMIECyLH, RSCFDnCFDTMIECyHL, RSCFDnCFDTMIECyHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTMIECy: <RSCFDn_base> + 0390_H + (04_H × y)

RSCFDnCFDTMIECyL: <RSCFDn_base> + 0390_H + (04_H × y),
RSCFDnCFDTMIECyH: <RSCFDn_base> + 0392_H + (04_H × y)

RSCFDnCFDTMIECyLL: <RSCFDn_base> + 0390_H + (04_H × y),
RSCFDnCFDTMIECyLH: <RSCFDn_base> + 0391_H + (04_H × y),
RSCFDnCFDTMIECyHL: <RSCFDn_base> + 0392_H + (04_H × y),
RSCFDnCFDTMIECyHH: <RSCFDn_base> + 0393_H + (04_H × y)

Value after reset: $0000\ 0000_H$

Table 23.151 RSCFDnCFDTMIECy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 31 to y × 32 + 16) 0: Transmit buffer interrupt is disabled 1: Transmit buffer interrupt is enabled
15 to 0	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled.

TMIEp Bits (p = 0 to 47)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCFDnCFDTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode enable), set the bit corresponding to the transmit buffer allocated as a payload storage area to 0.

Table 23.152 shows the bit assignment.

Table 23.153 RSCFDnCFDTMTRSTSy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit request is present. 1: A transmit request is present.
15 to 0	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit request is present. 1: A transmit request is present.

TMTRSTSp Flags (p = 0 to 47)

These flags indicate the status of the TMTR bit in the RSCFDnCFDTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 23.154 shows the bit assignment.

Table 23.161 RSCFDnCFDTXQCCm Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
13	TXQIM	Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted.
12	TXQIE	Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled.
11 to 8	TXQDC[3:0]	Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 15) makes the (g + 1) transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited. For transmit buffer merge mode, set g to 2 to 9.
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	TXQE	Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used.

TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQIE bit.

TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues.

Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0). (See **Table 23.92**.) For examples of how buffer allocation is done, see Figure 23.9.

When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode), transmit buffers (m × 16 + 5) to (m × 16 + 0) are merged and cannot be allocated to the transmit queue. Therefore, do not set TXQDC[3:0] bits to 10 to 15.

Modify these bits only in channel reset mode.

TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010_B or more.

23.4.12.2 RSCFDnCFDTXQSTSm — Transmit Queue Status Register (m = 0 to 2)

Access: RSCFDnCFDTXQSTSm register can be read/written in 32-bit units
RSCFDnCFDTXQSTSmL register can be read/written in 16-bit units
RSCFDnCFDTXQSTSmLL register can be read/written in 8-bit units

Address: RSCFDnCFDTXQSTSm: <RSCFDn_base> + $03C0_H$ + (04_H × m)

RSCFDnCFDTXQSTSmL: <RSCFDn_base> + $03C0_H$ + (04_H × m)

RSCFDnCFDTXQSTSmLL: <RSCFDn_base> + $03C0_H$ + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQIF	TXQFLL	TXQEMP

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 23.162 RSCFDnCFDTXQSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
12 to 8	Reserved	When read, the undefined value is returned. When writing to these bits, write the value after reset.
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	TXQIF	Transmit Queue Interrupt Request Flag 0: No transmit queue interrupt request is present. 1: A transmit queue interrupt request is present.
1	TXQFLL	Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full.
0	TXQEMP	Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty).

TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCFDnCFDTXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCFDnCFDTXQCCm register to 0 (the transmit queue is not used).

TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

23.4.12.3 RSCFDnCFDTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 2)

Access: RSCFDnCFDTXQPCTRm registers can only be written in 32-bit units
RSCFDnCFDTXQPCTRmL register is a write-only register that can only be written in 16-bit units
RSCFDnCFDTXQPCTRmLL register is a write-only register that can only be written in 8-bit units

Address: RSCFDnCFDTXQPCTRm: <RSCFDn_base> + $03E0_H$ + (04_H × m)

RSCFDnCFDTXQPCTRmL: <RSCFDn_base> + $03E0_H$ + (04_H × m)

RSCFDnCFDTXQPCTRmLL: <RSCFDn_base> + $03E0_H$ + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 23.163 RSCFDnCFDTXQPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	TXQPC[7:0]	Transmit Queue Pointer Control Writing FF_H to these bits moves the write pointer of the transmit queue to the next queue buffer.

TXQPC[7:0] Bits

Writing FF_H to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, RSCFDnCFDTMFDCTRp, and RSCFDnCFDTMDFb_p registers (p = 15, 31, and 47) before writing FF_H to the TXQPC[7:0] bits.

When writing FF_H to these bits, make sure that the TXQE bit in the RSCFDnCFDTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCFDnCFDTXQSTSm register is 0 (he transmit queue is not full).

23.4.13 Details of Transmission History-related Registers

23.4.13.1 RSCFDnCFDTHLCCm — Transmit History Configuration and Control Register (m = 0 to 2)

Access: RSCFDnCFDTHLCCm register can be read/written in 32-bit units
RSCFDnCFDTHLCCmL register can be read/written in 16-bit units
RSCFDnCFDTHLCCmLL, RSCFDnCFDTHLCCmLH registers can be read/written in 8-bit units

Address: RSCFDnCFDTHLCCm: <RSCFDn_base> + 0400_H + (04_H × m)

RSCFDnCFDTHLCCmL: <RSCFDn_base> + 0400_H + (04_H × m)

RSCFDnCFDTHLCCmLL: <RSCFDn_base> + 0400_H + (04_H × m),
RSCFDnCFDTHLCCmLH: <RSCFDn_base> + 0401_H + (04_H × m)

Table 23.164 RSCFDnCFDTHLCCm Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
10	THLDTE	Transmit History Target Buffer Select 0: Entry from transmit/receive FIFO buffers and transmit queue 1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue
9	THLIM	Transmit History Interrupt Source Select 0: When 12 sets of data have been stored in the transmit history buffer 1: When a single set of transmit history data has been stored
8	THLIE	Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled.
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	THLE	Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used.

THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit set to 0.

THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.

This bit is cleared to 0 in channel reset mode.

23.4.13.2 RSCFDnCFDTHLSTSm — Transmit History Status Register (m = 0 to 2)

Access: RSCFDnCFDTHLSTSm register can be read/written in 32-bit units
RSCFDnCFDTHLSTSmL register can be read/written in 16-bit units
RSCFDnCFDTHLSTSmLL register can be read/written in 8-bit units
RSCFDnCFDTHLSTSmLH register is a read-only register that can be read in 8-bit units

Address: RSCFDnCFDTHLSTSm: <RSCFDn_base> + 0420_H + (04_H × m)

RSCFDnCFDTHLSTSmL: <RSCFDn_base> + 0420_H + (04_H × m)

RSCFDnCFDTHLSTSmLL: <RSCFDn_base> + 0420_H + (04_H × m),
RSCFDnCFDTHLSTSmLH: <RSCFDn_base> + 0421_H + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	THLMC[4:0]					—	—	—	—	THLIF	THLELT	THLFLL	THLEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 23.165 RSCFDnCFDTHLSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
12 to 8	THLMC[4:0]	Transmit History Buffer Unread Data Counter These bits indicate the number of unread data sets stored in the transmit history buffer.
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	THLIF	Transmit History Interrupt Request Flag 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present.
2	THLELT	Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.
1	THLFLL	Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full.
0	THLEMP	Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).

THLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer. These bits are cleared to 0 in channel reset mode.

THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCFDnCFDTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

NOTE

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

23.4.13.3 RSCFDnCFDTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 2)

Access: RSCFDnCFDTHLPCTRm register can only be written in 32-bit units
RSCFDnCFDTHLPCTRmL register is a write-only register that can only be written in 16-bit units
RSCFDnCFDTHLPCTRmLL register is a write-only register that can only be written in 8-bit units

Address: RSCFDnCFDTHLPCTRm: <RSCFDn_base> + 0440_H + (04_H × m)

RSCFDnCFDTHLPCTRmL: <RSCFDn_base> + 0440_H + (04_H × m)

RSCFDnCFDTHLPCTRmLL: <RSCFDn_base> + 0440_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 23.166 RSCFDnCFDTHLPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write the value after reset.
7 to 0	THLPC[7:0]	Transmit History List Pointer Control Writing FF_H to these bits moves the read pointer to the next unread data in the transmit history buffer.

THLPC[7:0] Bits

When the THLPC[7:0] bits are set to FF_H, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCFDnCFDTHLSTSm register is decremented by 1. Write FF_H to the THLPC[7:0] bits after reading from the RSCFDnCFDTHLACCm register.

When writing FF_H to these bits, make sure that the THLE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCFDnCFDTHLSTSm register is 0.

23.4.13.4 RSCFDnCFDTHLACCm — Transmit History Access Register (m = 0 to 2)

Access: RSCFDnCFDTHLACCm register can be read only in 32-bit units
RSCFDnCFDTHLACCmL, RSCFDnCFDTHLACCmH registers can be read only in 16-bit units
RSCFDnCFDTHLACCmLL, RSCFDnCFDTHLACCmLH, RSCFDnCFDTHLACCmHL,
RSCFDnCFDTHLACCmHH registers can be read only in 8-bit units

Address: RSCFDnCFDTHLACCm: <RSCFDn_base> + 6000_H + (04_H × m)

RSCFDnCFDTHLACCmL: <RSCFDn_base> + 6000_H + (04_H × m),
RSCFDnCFDTHLACCmH: <RSCFDn_base> + 6002_H + (04_H × m)

RSCFDnCFDTHLACCmLL: <RSCFDn_base> + 6000_H + (04_H × m),
RSCFDnCFDTHLACCmLH: <RSCFDn_base> + 6001_H + (04_H × m),
RSCFDnCFDTHLACCmHL: <RSCFDn_base> + 6002_H + (04_H × m),

Table 23.167 RSCFDnCFDTHLACCm Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTS[15:0]	Timestamp Data The timestamp data of stored data can be read.
15 to 8	TID[7:0]	Label Data The label information of stored data can be read.
7	Reserved	When read, the value after reset is returned.
6 to 3	BN[3:0]	Buffer Number Data The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read.
2 to 0	BT[2:0]	Buffer Type Data b2 b1 b0 0 0 1: Transmit buffer 0 1 0: Transmit/receive FIFO buffer 1 0 0: Transmit queue

TMTS[15:0] Bits

Timestamp values in transmit history data stored in the transmit history buffer are displayed.

TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

23.4.14 Details of Test-related Registers

23.4.14.1 RSCFDnCFDGTSTCFG — Global Test Configuration Register

Access: RSCFDnCFDGTSTCFG register can be read/written in 32-bit units
RSCFDnCFDGTSTCFGL, RSCFDnCFDGTSTCFGH registers can be read/written in 16-bit units
RSCFDnCFDGTSTCFGLL, RSCFDnCFDGTSTCFGHL registers can be read/written in 8-bit units

Address: RSCFDnCFDGTSTCFG: <RSCFDn_base> + 0468_H

RSCFDnCFDGTSTCFGL: <RSCFDn_base> + 0468_H,
RSCFDnCFDGTSTCFGH: <RSCFDn_base> + $046A_H$

RSCFDnCFDGTSTCFGLL: <RSCFDn_base> + 0468_H,
RSCFDnCFDGTSTCFGHL: <RSCFDn_base> + $046A_H$

Value after reset: $0000\ 0000_H$

Table 23.168 RSCFDnCFDGTSTCFG Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
22 to 16	RTMPS[6:0]	RAM Test Page Configuration Set a value within a range of page 0 (00_H) to page 41 (29_H).
15 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	C2ICBCE	CAN2 Inter-channel Communication Test Enable 0: CAN2 inter-channel communication test is disabled 1: CAN2 inter-channel communication test is enabled.
1	C1ICBCE	CAN1 Inter-Channel Communication Test Enable 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled.
0	C0ICBCE	CAN0 Inter-Channel Communication Test Enable 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled.

Modify the RSCFDnCFDGTSTCFG register only in global test mode.

RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00_H to 29_H, inclusive.

In CAN FD mode, do not access more than 160 bytes in the last page (RTMPS[6:0] = 29_H) during RAM test.

C2ICBCE Bit

Setting this bit to 1 enables the channel 2 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

23.4.14.2 RSCFDnCFDGTSTCTR — Global Test Control Register

Access: RSCFDnCFDGTSTCTR register can be read/written in 32-bit units
RSCFDnCFDGTSTCTRL register can be read/written in 16-bit units
RSCFDnCFDGTSTCTRLL register can be read/written in 8-bit units

Address: RSCFDnCFDGTSTCTR: <RSCFDn_base> + $046C_H$

RSCFDnCFDGTSTCTRL: <RSCFDn_base> + $046C_H$

RSCFDnCFDGTSTCTRLL: <RSCFDn_base> + $046C_H$

Table 23.169 RSCFDnCFDGTSTCTR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	RTME	RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled.
1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	ICBCTME	Communication Test between Channels Enable 0: Communication test between channels disabled 1: Communication test between channels enabled

RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.

This bit is cleared to 0 in global reset mode (See Figure 23.37, RAM Test Setting Procedure).

1. Set the GMDC[1:0] bits in the RSCFDnCFDGCTR register to 10B (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0 to 2) in the RSCFDnCFDGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.

This bit is cleread to 0 in global reset mode.

23.4.14.3 RSCFDnCFDGLOCKK — Global Lock Key Register

Access: RSCFDnCFDGLOCKK register is a write-only register that can be write only in 32-bit units.
RSCFDnCFDGLOCKKL register is a write-only register that can be write only in 16-bit units.

Address: RSCFDnCFDGLOCKK: <RSCFDn_base> + $047C_H$

RSCFDnCFDGLOCKKL: <RSCFDn_base> + $047C_H$

Value after reset: $0000\ 0000_H$

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

Table 23.170 RSCFDnCFDGLOCKK Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When writing these bits, write the value after reset.
15 to 0	LOCK[15:0]	Lock Key These bits are key bits to release protection of test mode.

The RSCFDnCFDGLOCKK register releases protection of special test bits and is write only.

For the protection release data, see Section 23.11.4.2, Procedure for Releasing the Protection.

LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCFDnCFDGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCFDn_base> + 0000_H to <RSCFDn_base> + $05FF_H$) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

23.4.14.4 RSCFDnCFDRPGACCr — RAM Test Page Access Register (r = 0 to 63)

Access: RSCFDnCFDRPGACCr register can be read/written in 32-bit units
RSCFDnCFDRPGACCrL, RSCFDnCFDRPGACCrH registers can be read/written in 16-bit units
RSCFDnCFDRPGACCrLL, RSCFDnCFDRPGACCrLH, RSCFDnCFDRPGACCrHL,
RSCFDnCFDRPGACCrHH registers can be read/written in 8-bit units

Address: RSCFDnCFDRPGACCr: <RSCFDn_base> + 6400_H + (04_H × r)

RSCFDnCFDRPGACCrL: <RSCFDn_base> + 6400_H + (04_H × r)),
RSCFDnCFDRPGACCrH: <RSCFDn_base> + 6402_H + (04_H × r))

RSCFDnCFDRPGACCrLL: <RSCFDn_base> + 6400_H + (04_H × r)),
RSCFDnCFDRPGACCrLH: <RSCFDn_base> + 6401_H + (04_H × r)),
RSCFDnCFDRPGACCrHL: <RSCFDn_base> + 6402_H + (04_H × r)),
RSCFDnCFDRPGACCrHH: <RSCFDn_base> + 6403_H + (04_H × r))

Value after reset: $0000\ 0000_H$

Table 23.171 RSCFDnCFDRPGACCr Register Contents

Bit Position	Bit Name	Function
31 to 0	RDTA [31:0]	RAM Data Test Access Data can be read and written in RSCAN RAM.

Modify the RSCFDnCFDRPGACCr register in global test mode with the RTME bit in the RSCFDnCFDGTSTCTR register set to 1 (RAM test is enabled).

The RSCFDnCFDRPGACCr register is readable and writable when the RTME bit is set to 1.

23.5 Interrupt Sources

The RS-CANFD module has 11 interrupts that are grouped into global interrupts and channel interrupts.

- Global interrupts (2 sources):
  Receive FIFO interrupt
  Global error interrupt
- Channel interrupts (3 sources/channel):
  CANm transmit interrupt (m = 0 to 2)
  - CANm transmit complete interrupt
  - CANm transmit abort interrupt
  - CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode)
  - CANm transmit history interrupt
  - CANm transmit queue Interrupt

  CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode)
  CANm error interrupt

When an interrupt request is generated, the corresponding interrupt request flag is set to 1 (interrupt request present). In that case, when the interrupt enable bit is set to 1 (enabling interrupts), an interrupt request is output from the RS-CANFD module. (Generation of interrupts also depends on the interrupt control register settings of the interrupt controller.)

Setting the interrupt request flag to 0 (no interrupt request present) or setting the interrupt enable bit to 0 (disabling interrupts) clears the current interrupt request. The current interrupt request is still output until the interrupt request flag is cleared.

Table 23.172 lists the CAN interrupt sources. **Figure 23.2** shows the CAN global interrupt block diagram.

Table 23.172 List of CAN Interrupt Sources (1/2)

	Interrupt Source		Corresponding Interrupt Request Flag	Corresponding Interrupt Enable Bit
Global interrupts	Receive FIFO	Receive FIFO 0	RFIF in the RSCFDn(CFD)RFSTS0 register	RFIE in the RSCFDn(CFD)RFCC0 register
		Receive FIFO 1	RFIF in the RSCFDn(CFD)RFSTS1 register	RFIE in the RSCFDn(CFD)RFCC1 register
		Receive FIFO 2	RFIF in the RSCFDn(CFD)RFSTS2 register	RFIE in the RSCFDn(CFD)RFCC2 register
		Receive FIFO 3	RFIF in the RSCFDn(CFD)RFSTS3 register	RFIE in the RSCFDn(CFD)RFCC3 register
		Receive FIFO 4	RFIF in the RSCFDn(CFD)RFSTS4 register	RFIE in the RSCFDn(CFD)RFCC4 register
		Receive FIFO 5	RFIF in the RSCFDn(CFD)RFSTS5 register	RFIE in the RSCFDn(CFD)RFCC5 register
		Receive FIFO 6	RFIF in the RSCFDn(CFD)RFSTS6 register	RFIE in the RSCFDn(CFD)RFCC6 register
		Receive FIFO 7	RFIF in the RSCFDn(CFD)RFSTS7 register	RFIE in the RSCFDn(CFD)RFCC7 register

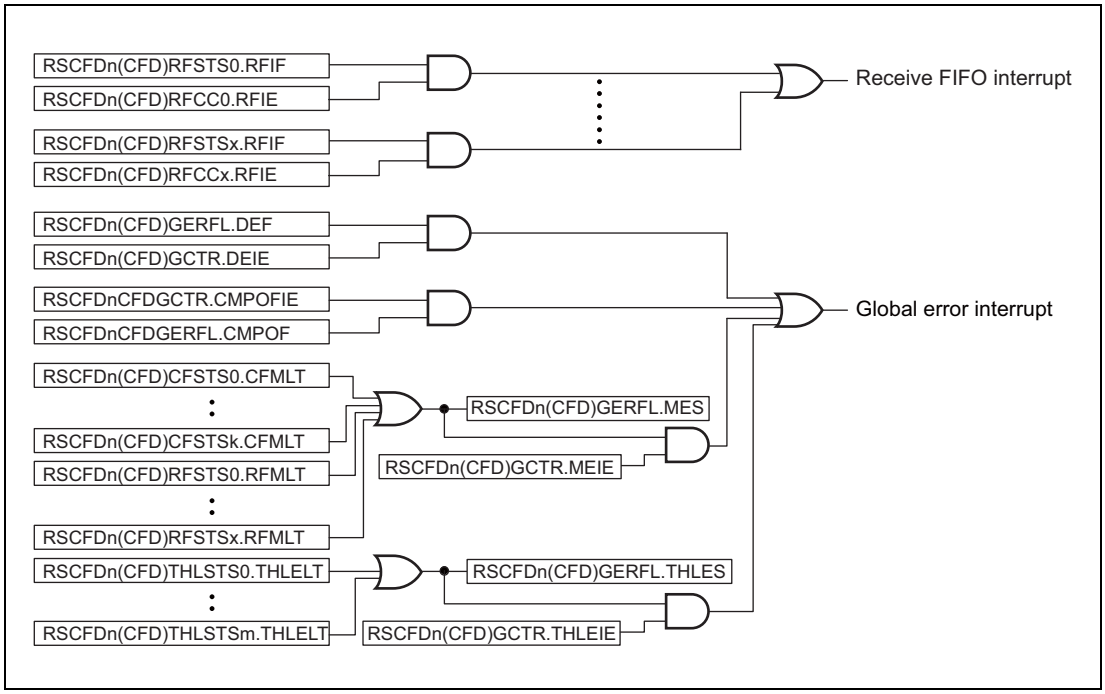

Figure 23.2 CAN Global Interrupt Block Diagram

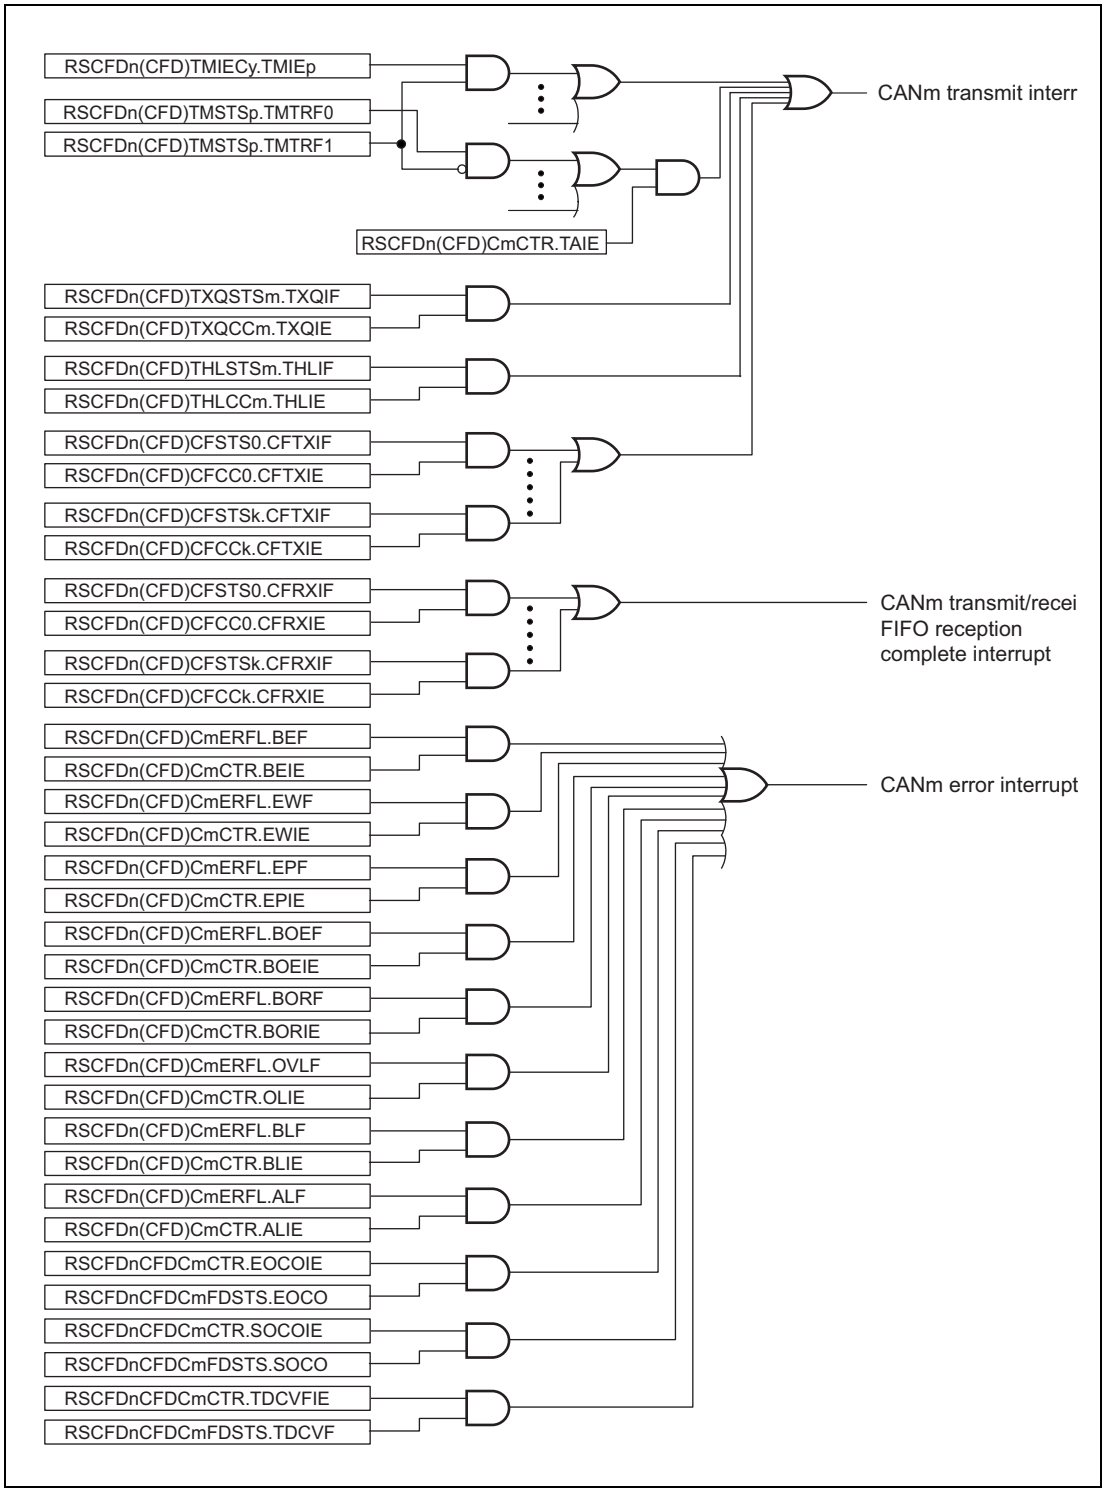

Figure 23.3 CAN Channel Interrupt Block Diagram

23.6 CAN Modes

The RS-CANFD module has four global modes to control the entire RS-CANFD module status and four channel modes to control individual channel status. Details of global modes are described in Section 23.6.1, Global Modes, and details of channel modes are described in **Section 23.6.2, Channel Modes**.

- Global stop mode: Stops the clocks of the entire module to achieve low power consumption.
- Global reset mode: Performs initial settings for the entire module.
- Global test mode: Performs test settings and performs the RAM test.
- Global operating mode: Makes the entire module operable.
- Channel stop mode: Stops the channel clock.
- Channel reset mode: Performs initial settings for the channels.
- Channel halt mode: Stops CAN communication and allows channel testing.
- Channel communication mode: Performs CAN communication.

23.6.1 Global Modes

Figure 23.4 shows the transitions of global modes.

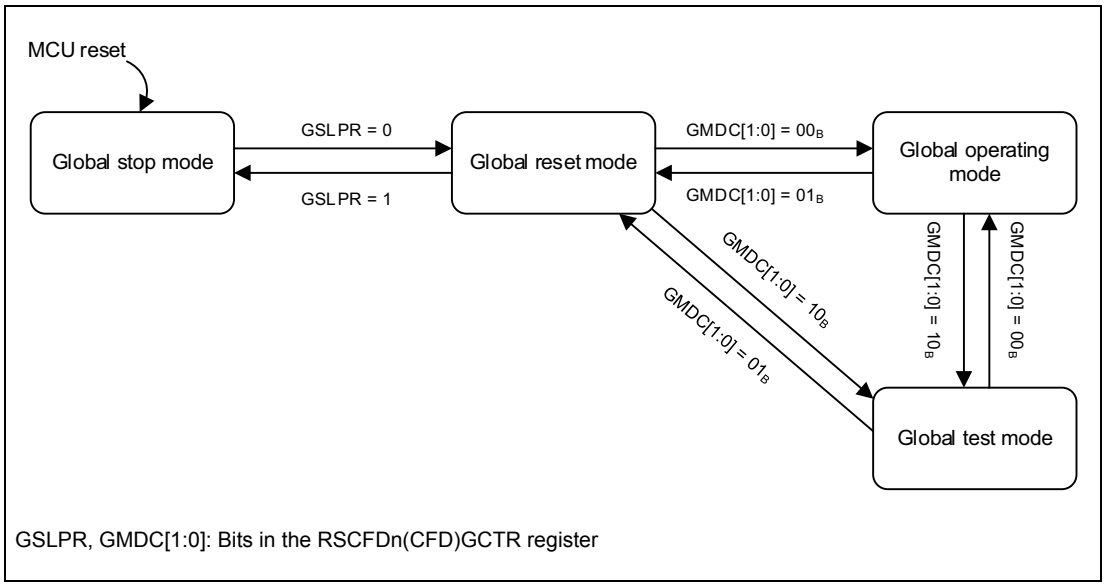

Figure 23.4 Transitions of Global Modes

In some cases, global mode transitions also force channel mode transitions. **Table 23.173** shows the channel mode transitions depending on the global mode setting dictated by the GMDC[1:0] bits and the GSLPR bit.

Table 23.173 Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)

Channel Mode before Setting	Channel Mode after Setting			
	GMDC[1:0] = 00_B GSLPR = 0 (Global Operation)	GMDC[1:0] = 10_B GSLPR = 0 (Global Test)	GMDC[1:0] = 01_B GSLPR = 0 (Global Reset)	GMDC[1:0] = 01_B GSLPR = 1 (Global Stop)
Channel communication	Channel communication	Channel halt	Channel reset	Transition prohibited
Channel halt	Channel halt	Channel halt	Channel reset	Transition prohibited
Channel reset	Channel reset	Channel reset	Channel reset	Channel stop
Channel stop	Channel stop	Channel stop	Channel stop	Channel stop

Note: GMDC[1:0], GSLPR: Bits in the RSCFDn(CFD)GCTR register

Table 23.174 shows the global mode transition time.

Table 23.174 Global Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Global stop	Global reset	Three pclk cycles
Global reset	Global stop	Three pclk cycles
Global reset	Global test	Ten pclk cycles
Global reset	Global operating	Ten pclk cycles
Global test	Global reset	Two CAN bit times*1,*2
Global test	Global operating	Three pclk cycles
Global operating	Global reset	Two CAN bit times*1,*2
Global operating	Global test	Two CAN frames*1

Note 1. CAN frame time and CAN bit time of the lowest communication speed of the channels in use

Note 2. In CAN FD mode, this time value is the CAN bit time of the nominal bit rate.

23.6.1.1 Global Stop Mode

In global stop mode, clocks of the CAN do not run and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained. Only the clock used by the CPU for writing to the GSLPR bit runs in this mode.

After the MCU is reset, the CAN module transitions to global stop mode. Setting the GSLPR bit in the RSCFDn(CFD)GCTR register to 1 (in global stop mode) in global reset mode sets the CSLPR bit in each of the RSCFDn(CFD)CmCTR register to 1 (channel stop mode). Afterwards, if all channels are forced to transition to channel stop mode, the CAN module transitions to global stop mode. The GSLPR bit should not be modified in global operating mode or global test mode.

23.6.1.2 Global Reset Mode

In global reset mode, RS-CANFD module settings are performed. When the RS-CANFD module transitions to global reset mode, some registers are initialized. For registers to be initialized, see Table 23.177, Registers Initialized in Global Reset Mode or Channel Reset Mode and Table 23.178, Registers Initialized Only in Global Reset Mode.

Setting the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register to 01_B sets the CHMDC[1:0] bits in each of the RSCFDn(CFD)CmCTR registers (m = 0 to 2) to 01_B (channel reset mode). If all channels are forced to transition to channel reset mode, the CAN module transitions to global reset mode.

Channels that are already in channel reset mode or channel stop mode do not transition (because the CHMDC[1:0] bits have already been set to 01_B).

23.6.1.3 Global Test Mode

In global test mode, settings for test-related registers are performed. When the CAN module transitions to global test mode, all CAN communications are disabled.

Setting the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register to 10_B sets the CHMDC[1:0] bits in each of the RSCFDn(CFD)CmCTR register to 10_B (channel halt mode). If all channels are forced to transition to channel halt mode, the CAN module transitions to global test mode. Channels that are in channel stop mode, channel reset mode, or channel halt mode do not transition.

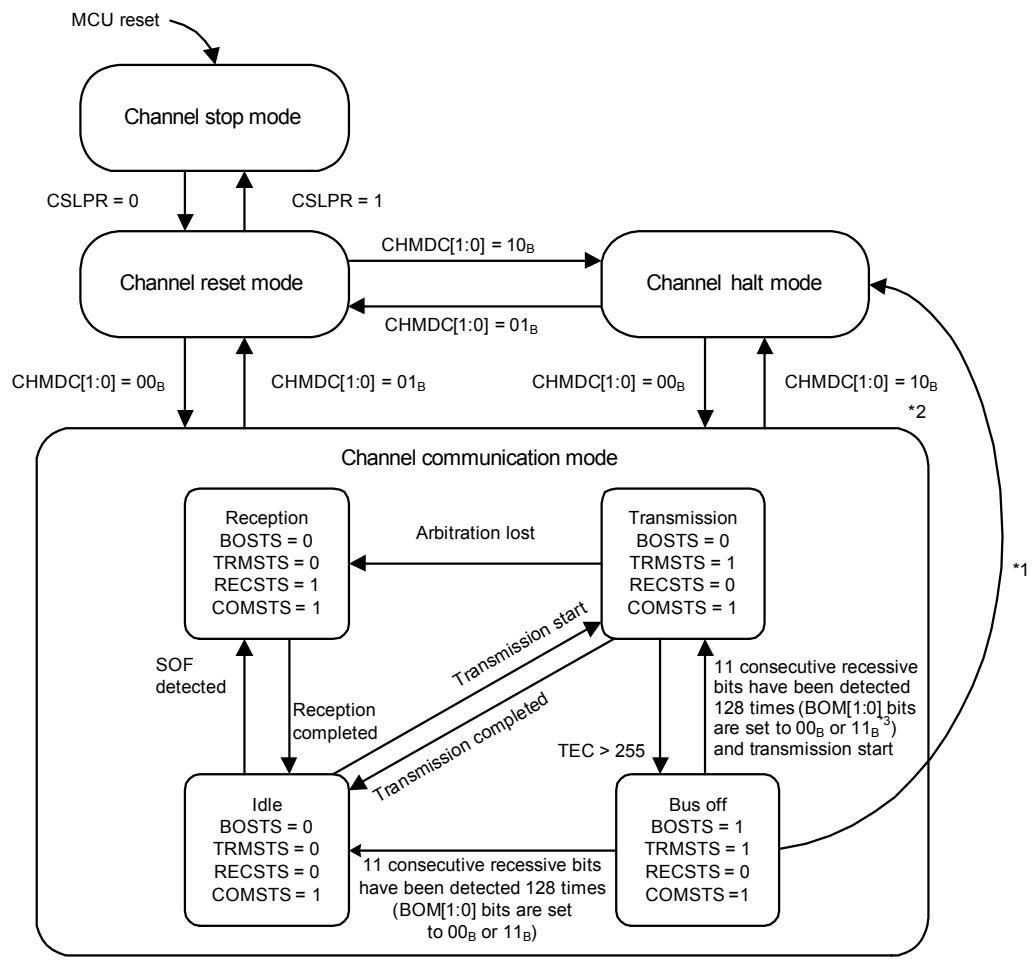
23.6.1.4 Global Operating Mode

The RS-CANFD module operates in global operating mode.

When the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register are set to 00_B, the RS-CANFD module transitions to global operating mode.

23.6.2 Channel Modes

Figure 23.5 shows a channel mode state transition chart. **Table 23.175** shows the channel mode transition time.



Note: CHMDC[1:0], CSLPR, BOM[1:0]: Bits in the RSCFDn(CFD)CmCTR register (m = 0 to 2)
BOSTS, TRMSTS, RECSTS, COMSTS: Bits in the RSCFDn(CFD)CmSTS register

Note 1. Timing of transition from bus off state to channel halt mode
- When BOM[1:0] = 01_B: Transition to channel halt mode when TEC exceeds 255
- When BOM[1:0] = 10_B: Transition to channel halt mode when 11 consecutive recessive bits have been detected 128 times
- When BOM[1:0] = 11_B: Transition to channel halt mode when the CHMDC[1:0] bits are set to 10_B

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode.

Note 3. When 11 consecutive recessive bits are detected 128 times before the CHMDC[1:0] bits are set to 10_B.

Figure 23.5 Channel Mode State Transition Chart

Table 23.175 Channel Mode Transition Time (1/2)

Mode before Transition	Mode after Transition	Maximum Transition Time
Channel stop	Channel reset	Three pclk cycles
Channel reset	Channel stop	Three pclk cycles
Channel reset	Channel halt	Three CANm bit times*1
Channel reset	Channel communication	Four CANm bit times*1
Channel halt	Channel reset	Two CANm bit times*1

Table 23.175 Channel Mode Transition Time (2/2)

Mode before Transition	Mode after Transition	Maximum Transition Time
Channel halt	Channel communication	Four CANm bit times*1
Channel communication	Channel reset	Two CANm bit times*1
Channel communication	Channel halt	Two CANm frames

Note 1. In CAN FD mode, this time value is the CANm bit time of the nominal bit rate.

23.6.2.1 Channel Stop Mode

In channel stop mode, clocks are not supplied to channels and therefore power consumption is reduced. Channel-related registers can be read, but writing data to them is prohibited. Register values are retained.

Each channel enters channel stop mode after the MCU is reset. Channels also transition to channel stop mode when the CSLPR bit in the RSCFDn(CFD)CmCTR register (m = 0 to 2) is set to 1 (channel stop mode) in channel reset mode. The CSLPR bit should not be modified in channel communication mode and channel halt mode.

23.6.2.2 Channel Reset Mode

In channel reset mode, channel settings are performed. When a channel transitions to channel reset mode, some channel-related registers are initialized. For registers to be initialized, see **Table 23.177, Registers Initialized in Global Reset Mode or Channel Reset Mode**.

When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 01_B (channel reset mode) during CAN communication, communication is terminated before it is completed and the channel transitions to channel reset mode. **Table 23.176** shows the operation when the CHMDC[1:0] bits are set to 01_B (channel reset mode) during CAN communication.

23.6.2.3 Channel Halt Mode

In channel halt mode, settings for test-related registers of channels are performed. When a channel transitions to channel halt mode, CAN communication of the channel stops.

Table 23.176 shows operation when the CHMDC[1:0] bits are set to 10_B (channel halt mode) during CAN communication.

Table 23.176 Operation a Channel Transitions to Channel Reset Mode/Channel Halt Mode

Mode	During Reception	During Transmission	Bus Off State
Channel reset (CHMDC[1:0] = 01_B)	Transitions to channel reset mode before reception is completed.*1	Transitions to channel reset mode before transmission is completed.*1	Transitions to channel reset mode before bus off recovery.
Channel halt*3 (CHMDC[1:0] = 10_B)	Transitions to channel halt mode after reception is completed.*2	Transitions to channel halt mode after transmission is completed.	[When BOM[1:0] = 00_B] Transitions to channel halt mode (CHMDC[1:0] = 10_B) only after bus off recovery. [When BOM[1:0] = 01_B] Transitions to channel halt mode automatically when the condition for transition to bus off state is met. [When BOM[1:0] = 10_B] Transitions to channel halt mode automatically after bus off recovery. [When BOM[1:0] = 11_B] Transitions to channel halt mode immediately after the CHMDC[1:0] bits are set to 10_B before bus off recovery.

Note 1. To allow transition to channel reset mode after communication is completed, set the CHMDC[1:0] bits to 10_B and confirm that communication has been completed and transition to channel halt mode has been made, and then set the CHMDC[1:0] bits to 01_B.

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode. The CAN bus status can be confirmed with the BLF flag of the RSCFDn(CFD)CmERFL register that becomes 1 when dominant lock is detected.

Note 3. In classical CAN mode, when the transition from channel reset mode to channel halt mode is to be made, set the RSCANnCmCFG register in channel reset mode and then shift to channel halt mode. In CAN FD mode, set the RSCFDnCFDCmNCFG register and the RSCFDnCFDCmDCFG register, and then make a transition.

23.6.2.4 Channel Communication Mode

In channel communication mode, CAN communication is performed. Each channel has the following communication states during CAN communication.

- Idle: Neither reception nor transmission is in progress.
- Reception:Receiving a message sent from another node.
- Transmission:Transmitting a message.
- Bus off:Isolated from CAN communication.

When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 00_B, the channel transitions to channel communication mode. After that, once 11 consecutive recessive bits have been detected, the COMSTS flag in the RSCFDn(CFD)CmSTS register (m = 0 to 2) is set to 1 (communication is ready) and transmission and reception are enabled on the CAN network as an active node. At this time, transmission and reception of messages can be started.

23.6.2.5 Bus Off State

A channel transitions to the bus off state according to the transmit/receive error counter increment/decrement rules of the CAN specifications.

The conditions for returning from the bus off state are determined by the BOM[1:0] bits in the RSCFDn(CFD)CmCTR register.

- When BOM[1:0] = 00_B:
  Bus off recovery is compliant with the CAN specifications. After 11 consecutive recessive bits have been detected 128 times, a channel returns from the bus off state to the CAN communication ready state (error active state). At that time, the TEC[7:0] and REC[7:0] bits in the RSCFDn(CFD)CmSTS register are initialized to 00_H, the BORF flag in the RSCFDn(CFD)CmERFL register is set to 1 (bus off recovery is detected), and a bus off recovery interrupt request is generated. When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 10_B (channel halt mode) in the bus off state, the channel transitions to channel halt mode after bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times).
- When BOM[1:0] = 01_B:
  When a channel transitions to the bus off state, the CHMDC[1:0] bits are set to 10_B and the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H. The BORF flag is not set to 1, and bus off recovery interrupt request is not generated.
- When BOM[1:0] = 10_B:
  When a channel has transitioned to the bus off state, the CHMDC[1:0] bits are set to 10_B. After bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times),

the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, the BORF flag is set to 1, and a bus off recovery interrupt request is generated.

- When BOM[1:0] = 11_B:
  When the CHMDC[1:0] bits are set to 10_B in the bus off state, the channel transitions to channel halt mode before bus off recovery is completed. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, but the BORF flag is not set to 1. Also, a bus off recovery interrupt is not generated.
  However, the BORF flag becomes 1 and a bus off recovery interrupt request is generated if a CAN module transitions to error active state (by detecting 128 times of 11 consecutive recessive bits) before CHMDC[1:0] bits are set to 10_B.

If the RS-CANFD module causes the channel to transition to channel halt mode simultaneously with a program write to the CHMDC[1:0] bits, the program write takes precedence. An automatic transition to channel halt mode when the BOM[1:0] bits are set to 01_B or 10_B is made only when the CHMDC[1:0] bits are 00_B (channel communication mode).

Furthermore, setting the RTBO bit in the RSCFDn(CFD)CmCTR register to 1 allows a forced return from the bus off state. As soon as the RTBO bit is set to 1, the state changes to the error active state. After 11 consecutive recessive bits have been detected, the CAN module becomes ready for communication. In this case, the BORF flag is not set to 1 and the TEC[7:0] and REC[7:0] bits are initialized to 00_H. Write 1 to the RTBO bit only when the BOM[1:0] value is 00_B. Writing the RTBO bit to 1 in a state other than the bus off state is ignored, and the RTBO bit is immediately set to 0.

23.6.3 Initializing Registers by Transition to CAN Mode

Table 23.177 lists bits and flags to be initialized by a transition to channel reset mode. These bits and flags are also initialized by a transition to global reset mode. Furthermore, **Table 23.178** lists bits and flags to be initialized only by a transition to global reset mode.

Table 23.177 Registers Initialized in Global Reset Mode or Channel Reset Mode (1/2)

Register	Bit / Flag
RSCFDn(CFD)CmCTR register	(ROM), CRCT, CTMS[1:0], CTME, CHMDC[1:0]
RSCFDn(CFD)CmSTS register	CHLTSTS, EPSTS, BOSTS, TRMSTS, RECSTS, COMSTS, (ESIF), REC[7:0], TEC[7:0]

RSCFDnCFDCmFDSTS register	SOC[7:0], EOC[7:0], SOCO, EOCO, TDCVF, TDCR[6:0]
RSCFDnCFDCmFDCRC register	CRCREG[20:0], SCNT[3:0]
RSCFDn(CFD)CFCCk register	When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFE
RSCFDn(CFD)CFSTSk register	When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFMC[7:0], CFFLL, CFEMP, CFMLT, CFRXIF, CFTXIF
RSCFDn(CFD)CFTISTS register	CFkTXIF
RSCFDn(CFD)TMCp register	TMOM, TMTAR, TMTR
RSCFDn(CFD)TMSTSp register	TMTARM, TMTRM, TMTRF[1:0], TMTSTS
RSCFDn(CFD)TMTRSTSy register	TMTRSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCFDn(CFD)TMTARSTSy register	TMTARSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCFDn(CFD)TMTCSTSy register	TMTCSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCFDn(CFD)TMTASTSy register	TMTASTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCFDn(CFD)TXQCCm register	TXQE

Table 23.177 Registers Initialized in Global Reset Mode or Channel Reset Mode (2/2)

Register	Bit / Flag
RSCFDn(CFD)TXQSTSm register	TXQIF, TXQFLL, TXQEMP
RSCFDn(CFD)THLCCm register	THLE
RSCFDn(CFD)THLSTSm register	THLMC[4:0], THLIF, THLELT, THLFLL, THLEMP
RSCFDn(CFD)GTINTSTS0 register	TSIFm, TAIFm, TQIFm, CFTIFm, THIFm (m = 0 to 2)

Note: Bits and flags in parentheses exist only in registers in CAN FD mode.

Table 23.178 Registers Initialized Only in Global Reset Mode

Register	Bit / Flag
RSCFDn(CFD)GSTS register	GHLTSTS
RSCFDn(CFD)GERFL register	EEF0, EEF1, EEF2, EEF3, EEF4, EEF5, (CMPOF), THLES, MES, DEF
RSCFDn(CFD)GTSC register	TS[15:0]
RSCFDn(CFD)RMNDy register	RMNSq
RSCFDn(CFD)RFCCx register	RFE
RSCFDn(CFD)RFSTSx register	RFMC[7:0], RFIF, RFMLT, RFFLL, RFEMP
RSCFDn(CFD)CFCCk register	When transmit/receive FIFO buffer is in receive mode: CFE
RSCFDn(CFD)CFSTSk register	When transmit/receive FIFO buffer is in receive mode: CFMC[7:0], CFFLL, CFEMP, CFTXIF, CFRXIF, CFMLT
RSCFDn(CFD)FESTS register	CFkEMP, RFxEMP
RSCFDn(CFD)FFSTS register	CFkFLL, RFxFLL
RSCFDn(CFD)FMSTS register	CFkMLT, RFxMLT
RSCFDn(CFD)RFISTS register	RFxIF
RSCFDn(CFD)CFRISTS register	CFkRXIF
RSCFDn(CFD)GTSTCFG register	RTMPS[6:0], C0ICBCE, C1ICBCE, C2ICBCE
RSCFDn(CFD)GTSTCTR register	RTME, ICBCTME

Note: Bits and flags in parentheses exist only in registers in CAN FD mode.

23.7 Reception Function

There are two reception types.

- Reception by receive buffers:
  Zero to 48 receive buffers can be shared by all channels. Since messages stored in receive buffers are overwritten at each reception, the latest receive data can always be read.
- Reception by receive FIFO buffers and transmit/receive FIFO buffers (receive mode):
  Eight receive FIFO buffers can be shared by all channels and three dedicated transmit/receive FIFO buffers are provided for each channel. Messages of up to the number of buffer stages specified with the RFDC[2:0] and CFDC[2:0] bits can be stored in FIFO buffers and can be read sequentially from the oldest.

23.7.1 Data Processing Using the Receive Rule Table

Data processing using the receive rule table allows dispatching of selected messages to the specified buffer. Data processing includes acceptance filter processing, DLC filter processing, routing processing, label addition processing, and mirror function processing.

Up to 128 receive rules can be registered per channel and up to (64 × number of channels) total receive rules can be registered in the entire module. (Up to 192 receive rules can be registered in this module

that has three channels.) Set receive rules for each channel. Receive rules cannot be shared with other channels. If receive rules are not set, no messages can be received. **Figure 23.6** illustrates how receive rules are registered.

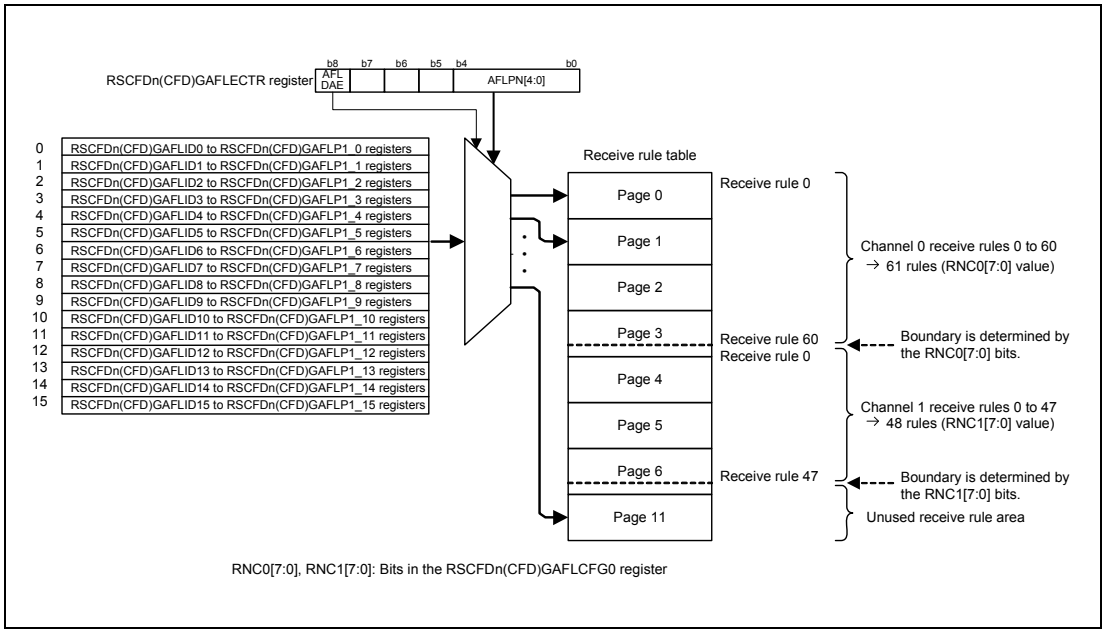

Figure 23.6 Entry of Receive Rules (for Setting Channel 0 and 1)

CAUTION

Receive rules for each channel must be set in contiguous blocks.
Channel 1 rules and channel 0 rules must be set separately.

Each receive rule consists of 16 bytes in the RSCFDn(CFD)GAFLIDj, RSCFDn(CFD)GAFLMj, RSCFDn(CFD)GAFLP0_j, and RSCFDn(CFD)GAFLP1_j registers (j = 0 to 15). The RSCFDn(CFD)GAFLIDj register is used to set GAFLID[28:0], GAFLIDE bit, GAFLRTR bit, and the mirror function, the RSCFDn(CFD)GAFLMj register is used to set mask, the RSCFDn(CFD)GAFLP0_j register is used to set label information to be added, DLC value, and storage receive buffer, and the RSCFDn(CFD)GAFLP1_j register is used to set storage FIFO buffer. Up to 16 receive rules can be set per page.

23.7.1.1 Acceptance Filter Processing

In the acceptance filter processing, the ID data, IDE bit, and RTR bit in a received message are compared with the ID data, IDE bit, and RTR bit set in the receive rule of the corresponding channel. When all these bits match, the message passes through the acceptance filter processing. The ID data, IDE bit, and RTR bit in the received message which correspond to the bits set to 0 (bits are not compared) in the RSCFDn(CFD)GAFLMj register are not compared and are regarded as matched.

Check begins with the receive rule of the minimum number for the corresponding channel. When all the bits to be compared in a received message match the bits set in the receive rule or when all the receive rules are compared without any match, filter processing stops. If there is no matching receive rule, the received message is not stored in the receive buffer or FIFO buffer.

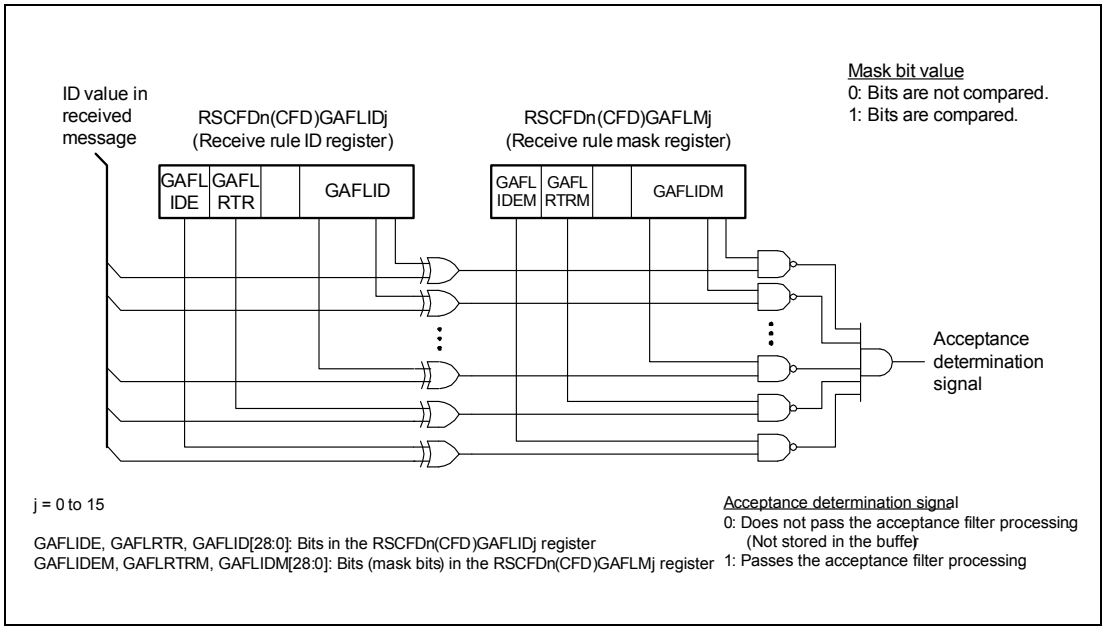

Figure 23.7 Acceptance Filter Function

23.7.1.2 DLC Filter Processing

When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), DLC filter processing is added to messages that passed through the acceptance filter processing. When the DLC value in a message is equal to or larger than the DLC value set in the receive rule, the message passes through the DLC filter processing.

When a message has passed through the DLC filter processing with the DRE bit in the RSCFDn(CFD)GCFG register set to 0 (DLC replacement is disabled), the DLC value in the received message is stored in the buffer. In this case, all the data bytes in the received message are stored in the buffer.

When a message has passed through the DLC filter processing with the DRE bit in the RSCFDn(CFD)GCFG register set to 1 (DLC replacement is enabled), the DLC value in the receive rule is stored in the buffer instead of the DLC value in the received message. In this case, a value of 00_H is stored in each data byte beyond the number of bytes which is indicated by the DLC value in the receive rule.

When the DLC value in the received message is smaller than that in the receive rule, the message does not pass through the DLC filter processing. In this case, the message is not stored in the receive buffer or the FIFO buffer and the DEF flag in the RSCFDn(CFD)GERFL register is set to 1 (a DLC error is present).

23.7.1.3 Routing Processing

Messages that passed through the acceptance filter processing and the DLC filter processing are stored in receive buffers, receive FIFO buffers, or transmit/receive FIFO buffers (set to receive mode or gateway mode). Message storage destination is set by the GAFLRMV and GAFLRMDP[6:0] bits in the RSCFDn(CFD)GAFLP0_j register (j = 0 to 15) and by the RSCFDn(CFD)GAFLP1_j register. Messages that passed through the acceptance filter processing and the DLC filter processing can be stored in up to eight buffers.

In CAN FD mode, if the payload length of the received message exceeds the payload storage size of the storage buffer, the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 (payload overflow) and

the processing is handled according to the CMPOC bit in the RSCFDnCFDGCFG register. When the CMPOC bit is 0, the received message which exceeds the payload storage size is not stored in the buffer. When the CMPOC bit is 1, the received message is stored in the buffer with payloads exceeding the storage size being discarded, and depending on the DRE bit in the RSCFDnCFDGCFG register the received DLC value or the DLC value of the receive rule is stored in the buffer.

23.7.1.4 Label Addition Processing

It is possible to add 12-bit label information to messages that passed through the filter processing and store them in buffers. This label information is set in the GAFLPTR[11:0] bits in the RSCFDn(CFD)GAFLP0_j register.

23.7.1.5 Mirror Function Processing

The mirror function allows the CAN node to receive its own transmitted messages. The mirror function is made available by setting the MME bit in the RSCFDn(CFD)GCFG register to 1 (mirror function is enabled).

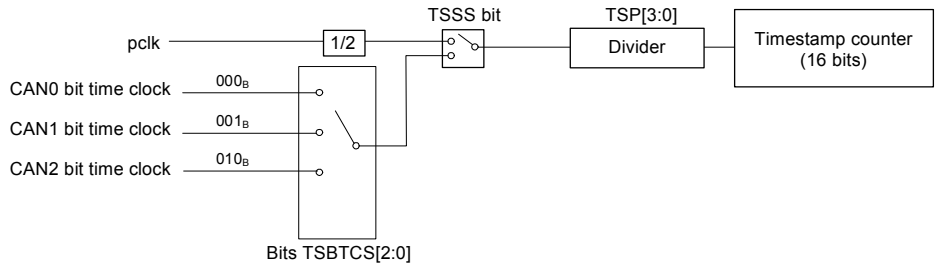
When the mirror function is in use, receive rules for which the GAFLLB bit in the RSCFDn(CFD)GAFLIDj register is set to 0 are used for data processing when receiving messages transmitted from other CAN nodes. When the CAN node is receiving its own transmitted messages, receive rules for which the GAFLLB bit is set to 1 are used for data processing.

23.7.1.6 Timestamp

The timestamp counter is a 16-bit free-running counter used for recording message receive time and transmission time. In classical CAN mode, the timestamp counter value is fetched at the start-of-frame (SOF) timing of a message. In CAN FD mode, the timestamp counter value is fetched at the timing set with the TSCCFG[1:0] bits in the RSCFDnCFDGFDCFG register. Then, the value is stored in a receive buffer or a FIFO buffer together with the message ID and data during data reception. The clock source of the timestamp counter is selected by the TSBTCS[2:0] and TSSS bits in the RSCFDn(CFD)GCFG register. In classical CAN mode, either pclk/2 or the CANm bit time clock (m = 0 to 2). In CAN FD mode, the clock source is selectable from pclk/2 or nominal CANm bit time clock. However, do not select the nominal CANm bit time clock of channels that handle CAN FD frames. The timestamp counter count source is obtained by dividing the selected clock source by the TSP[3:0] value in the RSCFDn(CFD)GCFG register.

When the CANm bit time clock or nominal CANm bit time clock is used as a clock source, the timestamp counter stops when the corresponding channel transitions to channel reset mode or channel halt mode. When the pclk/2 is used as a clock source, the timestamp function is not affected by channel mode.

The timestamp counter value is reset to 0000_H by setting the TSRST bit in the RSCFDn(CFD)GCTR register to 1.



TSBTCS[2:0], TSSS, TSP[3:0]: Bits in the RSCFDn(CFD)GCFG register

Note: When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.

Figure 23.8 Timestamp Function Block Diagram

23.8 Transmission Functions

There are three types of transmission. In classical CAN mode, transmittable payload length is 8 bytes in every transmission type. In CAN FD mode, transmittable payload length varies with transmission types.

- Transmission using transmit buffers:
  Each channel has 16 buffers. Transmittable payload length in CAN FD mode is 20 bytes. However, when transmit buffer merge mode is used, four buffers out of 16 buffers are allocated as a payload-only storage area and two buffers are able to transmit payloads with a length of more than 20 bytes.
- Transmission using transmit/receive FIFO buffers (transmit mode):
  Each channel has three FIFO buffers. Up to 128 messages can be contained in a single FIFO buffer. Transmittable payload length in CAN FD mode is 64 bytes. Each FIFO buffer is used with a link to a transmit buffer. Only the message to be transmitted next in a FIFO buffer becomes the target of transmit priority determination. Messages are transmitted sequentially on a first-in, first-out basis.
- Transmission using transmit queues:
  Up to 16 transmit buffers per channel can be allocated to the transmit queues. Transmittable payload length in CAN FD mode is 20 bytes. Transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel. Transmit buffers are allocated to transmit queues in descending order of buffer number. All messages in transmit queues, which are targets of priority determination, are transmitted in the order of ID number.

Figure 23.9 shows the allocation of transmit queues and transmit/receive FIFO buffer link.

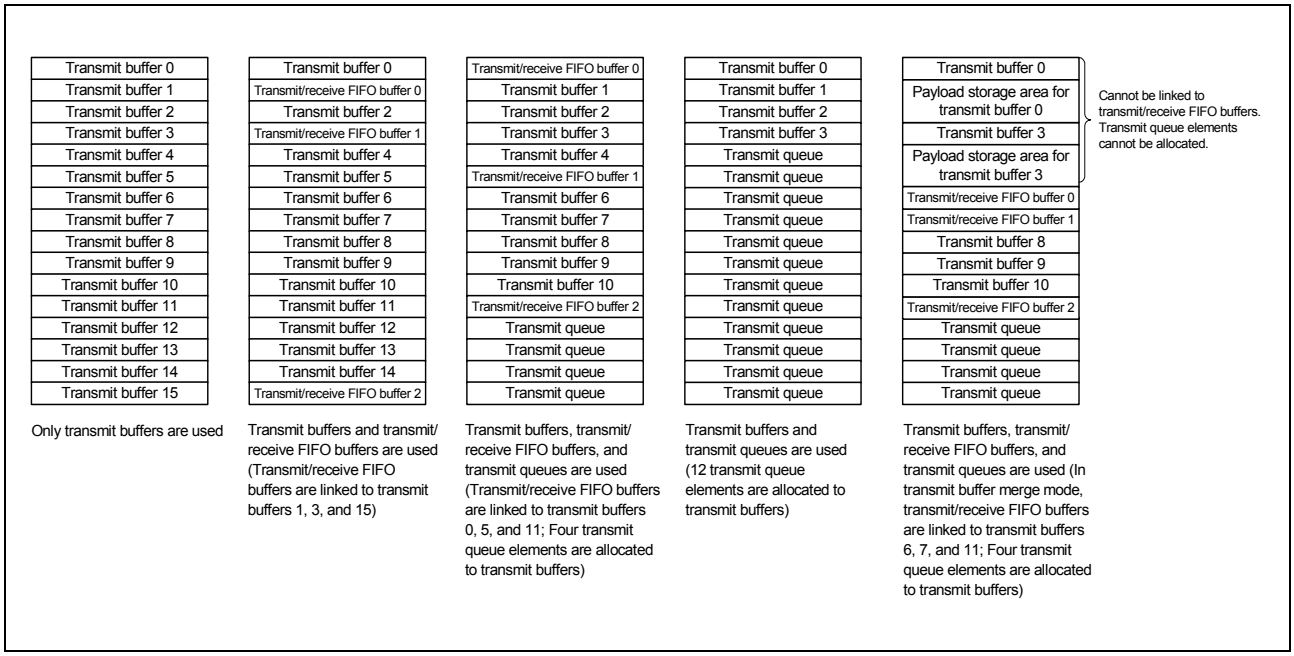


Figure 23.9 Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links

23.8.1 Transmit Priority Determination

If transmit requests are issued from multiple buffers or from the queue on the same channel, transmit priority is determined using one of the following methods.

- ID priority (TPRI bit = 0)
- Transmit buffer number priority (TPRI bit = 1)

All CAN channels use the setting of the TPRI bit in the RSCFDn(CFD)GCFG register.

When the TPRI bit is set to 0, messages are transmitted according to the priority of stored message IDs. ID priority conforms to the CAN bus arbitration specification defined in the CAN specifications. All IDs of pending transmit messages are targets of priority determination, regardless of whether they are stored in transmit buffers, transmit/receive FIFO buffers (set to transmit mode or gateway mode), or the transmit queue. If even a single transmit queue is used, select ID priority. When transmit/receive FIFO buffers are used, the oldest message in a FIFO buffer becomes the target of priority determination. When a message is being transmitted from a transmit/receive FIFO buffer, the next message in the FIFO buffer becomes the target of priority determination. When a transmit queue is used, all messages in the transmit queue are targets of priority determination. If the same ID is set for two or more buffers, the buffer with the smaller buffer number takes precedence.

When the TPRI bit is set to 1, the message in the transmit buffer with the minimum buffer number among all buffers with a transmit request is transmitted first. When transmit/receive FIFO buffers are linked to transmit buffers, transmit priority is determined according to linked transmit buffer numbers.

When messages are retransmitted due to an arbitration-lost or an error, transmit priority determination is made again according to the TPRI bit. When a 2-bit ECC error is detected in the priority determination processing, no message is transmitted (only when the EEFE bit in the RSCANnGCFG register is 1 in classical CAN mode).

23.8.2 Transmission Using Transmit Buffers

Setting the transmit request bit (TMTR bit in the RSCFDn(CFD)TMCp register) in a transmit buffer to 1 (transmission is requested) allows transmission of data frames or remote frames.

The transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCFDn(CFD)TMSTSp register (p = 0 to 47). When transmit completes successfully, the TMTRF[1:0] flag is set to 10_B (transmission has been completed (without transmit abort request)) or 11_B (transmission has been completed (with transmit abort request)).

23.8.2.1 Transmit Abort Function

With respect to transmit buffers for which the TMTRM bit in the RSCFDn(CFD)TMSTSp register is set to 1 (a transmit request is present), when the TMTAR bit in the RSCFDn(CFD)TMCp register is set to 1 (transmit abort is requested), the transmit request is canceled. When transmit abort is completed, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSp register is set to 01_B (transmit abort has been completed) and the transmit request is canceled (clearing the TMTRM bit to 0).

A message that is being transmitted or a message to be transmitted next according to the transmit priority determination cannot be aborted. However, when an arbitration-lost or an error occurs during transmission of a message for which the TMTAR bit is set to 1, retransmission is not performed.

23.8.2.2 One-Shot Transmission Function (Retransmission Disabling Function)

When the TMOM bit in the RSCFDn(CFD)TMCp register is set to 1 (one-shot transmission is enabled), transmission is performed only once. Even if an arbitration-lost or an error occurs, retransmission is not performed.

The one-shot transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCFDn(CFD)TMSTSp register. When one-shot transmission completes successfully, the TMTRF[1:0] flag is set to 10_B or 11_B. When an arbitration-lost or an error occurs, the TMTRF[1:0] flag is set to 01_B (transmit abort has been completed).

23.8.2.3 Transmit Buffer Merge Mode (Only in CAN FD Mode)

Transmit buffers can transmit messages with a payload length of 20 bytes, but can transmit messages with a payload length of up to 64 bytes by merging three transmit buffers in transmit buffer merge mode.

Setting the TMME bit to 1 in the RSCFDnCFDCmFDCFG register enables transmit buffer merge mode. In this mode, six buffers per channel become a merge area and two sets of transmit buffers (16 × m) + 0 to (16 × m) + 2 and transmit buffers (16 × m) + 3 to (16 × m) + 5 are merged. A transmission request is made by the first transmit buffer, and subsequent two buffers are used as a payload storage area. Do not set the transmission request bit (TMTR bit in the RSCFDnCFDTMCp register) and the transmission abort request bit (TMTAR bit in the RSCFDnCFDTMCp register) to 1 for transmit buffers except for the first buffer.

While transmit buffer merge mode is enabled, do not link the transmit/receive FIFO buffer to six merged buffers or allocate it to the transmit queue.

23.8.3 Transmission Using FIFO Buffers

Multiple messages can be stored in a single transmit/receive FIFO buffers, up to the number specified by the FIFO buffer depth, which is set by the CFDC[2:0] bits in the RSCFDn(CFD)CFCCk register (k = 0 to 8). Messages are transmitted sequentially on a first-in, first-out basis.

Each transmit/receive FIFO buffer is linked to a transmit buffer selected by the CFTML[3:0] bits in the RSCFDn(CFD)CFCCk register. When the CFE bit in the RSCFDn(CFD)CFCCk register is set to 1 (transmit/receive FIFO buffers are used), transmit/receive FIFO buffers become targets of transmit priority determination. Priority of only the next transmit message is determined in the FIFO buffer.

When the CFE bit is set to 0 (no transmit/receive FIFO buffer is used), the CFEMP flag is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) at the timing below.

- The transmit/receive FIFO buffer becomes empty immediately if the message in it is not being transmitted or is not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, arbitration-lost or the transition to channel halt mode in the case that a message in it is being transmitted or to be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages cannot be stored in FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

23.8.3.1 Interval Transmission Function

A message transmission interval time can be set to space the transmission of messages from the same FIFO buffer when using a transmit/receive FIFO buffer set to transmit mode or gateway mode.

Immediately after the first message has been transmitted successfully from the FIFO buffer with the CFE bit in the RSCFDn(CFD)CFCCk register set to 1, the interval timer starts counting (after EOF7 of the CAN protocol). After that, when the interval time has passed, the next message is transmitted. The interval timer stops in channel reset mode or by clearing the CFE bit to 0.

The interval time is set by the CFITT[7:0] bits in the RSCFDn(CFD)CFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to 00_H.

Select an interval timer count source using the CFITR and CFITSS bits in the RSCFDn(CFD)CFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to 00_H. When the CFITR and CFITSS bits are set to 00_B, the count source is obtained by dividing pclk/2 by the value of the ITRCP[15:0] bits. When the CFITR and CFITSS bits are set to 10_B, the count source is obtained by dividing pclk/2 by (the value of the ITRCP[15:0] bits in the RSCFDn(CFD)GCFG register × 10). When the CFITR and CFITSS bits are set to $x1_B$, the CANm bit time clock becomes a count source in classical CAN mode and the nominal CANm bit time clock becomes a count source in CAN FD mode. (Use this count source only for the channel does not handle the CAN FD frames in CAN FD mode.)

The interval time is calculated by the following equations where M is the value of ITRCP[15:0] and N is the value of CFITT[7:0].

- When CFITR and CFITSS = 00_B:

$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times N$$

- When CFITR and CFITSS = 10_B:

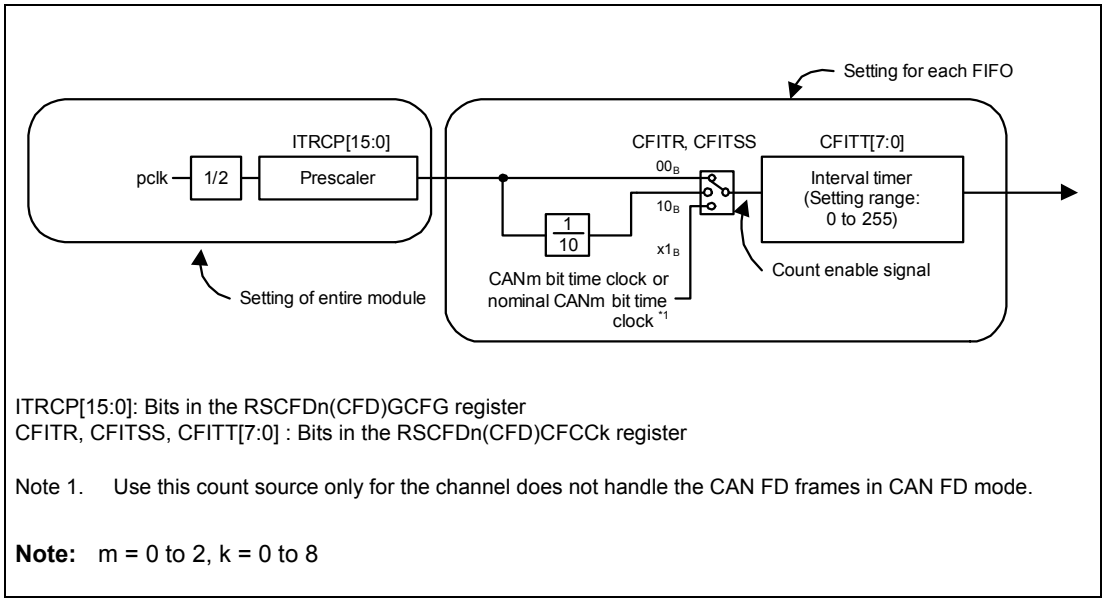
$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times 10 \times N$$

- When CFITR and CFITSS = $x1_B$:

$$\text{Classical CAN mode: } \frac{1}{\text{CANm bit time clock frequency}} \times N$$

$$\text{CAN FD mode: } \frac{1}{\text{Nominal CANm bit time clock frequency}} \times N$$

Figure 23.10 shows the interval timer block diagram.



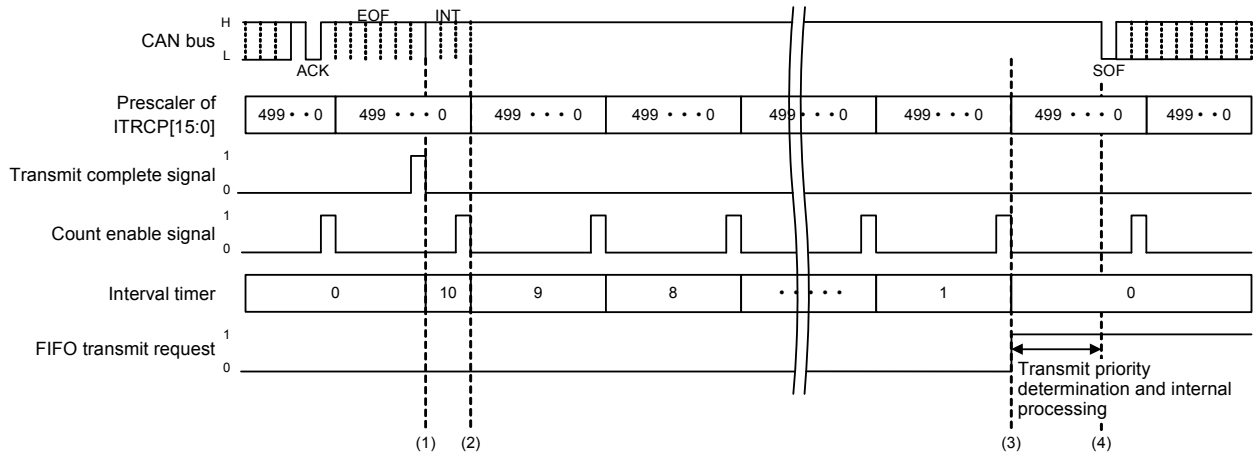
ITRCP[15:0]: Bits in the RSCFDn(CFD)GCFG register
CFITR, CFITSS, CFITT[7:0] : Bits in the RSCFDn(CFD)CFCCk register

Note 1. Use this count source only for the channel does not handle the CAN FD frames in CAN FD mode.

Note: m = 0 to 2, k = 0 to 8

Figure 23.10 Interval Timer Block Diagram

Figure 23.11 shows the interval timer timing diagram.



Interval time (logical value) = 2/fPBA × (set ITRCP[15:0] value) × set CFITT[7:0] value

- fPBA: Frequency of pclk
- ITRCP[15:0]: Bits in the RSCFDn(CFD)GCFG register (The set value is 500 in this figure.)
- CFITT[7:0]: Bits in the RSCFDn(CFD)CFCCk register (The set value is 10 in this figure.)

Figure 23.11 Interval Timer Timing Chart

(1) The interval timer starts counting upon completion of transmission. Since the prescaler is not initialized at the time of transmission completion, the first interval time contains an error of up to one count of the interval timer.

(2) The interval timer is decremented by 1 upon the next count enable signal.

(3) When the interval timer has decreased to 0, the transmit/receive FIFO buffer issues a transmit request.

(4) The transmit/receive FIFO buffer is determined for the next transmission by the priority determination, it starts transmitting data. Transmission starts usually with a delay of three CANm bit time clock cycles or less from the issue of transmit request. If multiple internal processes (such as receive filter processing, message routing, and transmit priority determination) take place in all channels, a delay of up to 774 cycles of the pclk may be generated.

23.8.4 Transmission Using Transmit Queues

Three to sixteen buffers (up to 10 buffers in transmit buffer merge mode) are allocated to a transmit queue for each channel, and transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel.

All messages in a transmit queue are targets of transmit priority determination and are transmitted in the ID priority order regardless of storage sequence. If two messages having the same ID are stored in a transmit queue, these messages are not always transmitted in the order of their storage in the transmit queue.

Setting the TXQE bit in the RSCFDn(CFD)TXQCCm register to 0 disables transmit queues. When the TXQE bit is set to 0, the TXQEMP flag in the RSCFDn(CFD)TXQSTSm register is set to 1 (the transmit queue contains no messages (transmit queue empty)) at the timing below.

- The transmit queue becomes empty immediately when no message in it is being transmitted or will be transmitted next.

- The transmit queue becomes empty after transmission completion, CAN bus error detection, arbitration-lost, or the transition to channel halt mode when a message in it is being transmitted or will be transmitted next.

When the TXQE bit is cleared to 0, all messages in transmit queues are lost and messages cannot be stored in transmit queues. Confirm that the TXQEMP flag is set to 1 before setting the TXQE bit to 1 again.

23.8.5 Transmit Data Padding (Only in CAN FD Mode)

When the payload length indicated by the set DLC value in a transmit message exceeds the payload storage area size of a buffer to be used for transmission, excessive payloads are padded by CC_H.

This processing is performed in the following cases when the transmit buffer merge mode is disabled (TMME bit in the RSCFDnCFDCmFDCFG register is 0).

- Transmit/receive FIFO set to transmission or gateway mode:
  When the payload length of the transmit DLC exceeds the transmit/receive FIFO payload storage area size set by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register
- Transmit buffer (including transmit queue):
  When the payload length of the transmit DLC exceeds 20 bytes

When the transmit buffer merge mode is enabled, no transmit data is padded in any transmission using a transmit buffer, transmit/receive FIFO buffer, or transmit queue. At this time, do not set a payload length more than the payload storage size of the buffer for transmitting as the DLC value in the transmit message.

23.8.6 Transmit History Function

Information about transmission-completed messages can be stored in the transmit history buffer. Each channel has a single transmit history buffer that can contain 16 sets of transmit history data.

A message transmit source buffer type can be selected by the THLDTE bit in the RSCFDn(CFD)THLCCm register. The THLEN bit in the RSCFDn(CFD)CFIDk register (k = 0 to 8) determines whether transmit history data is stored for each message.

In classical CAN mode, the TMTSCE bit in the RSCANnGCFG register can be used to set whether to include a timestamp value in the transmit history data. In CAN FD mode, a timestamp value is always included.

The following information on a transmitted message will be stored in the transmit history buffer after the successful completion of transmission.

Storage of the transmit history data after the successful completion of transmission may take up to 134 cycles of pclk in classical CAN mode or 386 cycles of pclk in CAN FD mode.

- Buffer type — 001_B: Transmit buffer
010_B: Transmit/receive FIFO buffer
100_B: Transmit queue
- Buffer number — Number of source transmit buffer, transmit queue, or transmit/receive FIFO buffer. This number depends on buffer types. See **Table 23.179**.
- Label data — Label information of the transmit message
- Timestamp — Timestamp value of the transmit message

(When the TMTSCE bit is 1 in classical CAN mode)

Table 23.179 Transmit History Data Buffer Numbers

Buffer type / Buffer No.	001_B	010_B	100_B
0000_B	Transmit buffer 16 × m + 0	Buffer numbers of the transmit buffer linked to the transmit/receive FIFO buffer by the CFTML[3:0] bits in the RSCFDn(CFD)CFCCk register (k = 0 to 8)	Buffer numbers of the transmit buffer allocated to the transmit queue that performed transmission
0001_B	Transmit buffer 16 × m + 1		
0010_B	Transmit buffer 16 × m + 2		
0011_B	Transmit buffer 16 × m + 3		
0100_B	Transmit buffer 16 × m + 4		
0101_B	Transmit buffer 16 × m + 5		
0110_B	Transmit buffer 16 × m + 6		
0111_B	Transmit buffer 16 × m + 7		
1000_B	Transmit buffer 16 × m + 8		
1001_B	Transmit buffer 16 × m + 9		
1010_B	Transmit buffer 16 × m + 10		
1011_B	Transmit buffer 16 × m + 11		
1100_B	Transmit buffer 16 × m + 12		
1101_B	Transmit buffer 16 × m + 13		
1110_B	Transmit buffer 16 × m + 14		
1111_B	Transmit buffer 16 × m + 15		

Label data is used to identify each message. Unique label data can be added to each message transmitted from a transmit buffer, transmit queue, or transmit/receive FIFO buffer.

The timestamp value is fetched from the timestamp counter at the SOF (start of frame) timing of the message. For details about the timestamp counter, see Section 23.7.1.6, Timestamp.

Transmit history data can be read from the RSCFDn(CFD)THLACCm register. If an attempt is made to store new transmit history data while the buffer is full, the buffer overflows and the new data is discarded.

23.9 Gateway Function

When a transmit/receive FIFO buffer is set to gateway mode, receive messages can be transmitted from an arbitrary channel without CPU intervention.

When the CFM[1:0] bits in the RSCFDn(CFD)CFCCk register are set to 10_B (gateway mode) and the transmit/receive FIFO buffer of a channel transmitting a message is selected in RSCAN0GAFLP1j register, messages that pass through filter processing according to the receive rule are stored in the specified transmit/receive FIFO buffer and are automatically transmitted from the buffer.

Messages stored in a transmit/receive FIFO buffer are transmitted sequentially on a first-in, first-out basis. Only the message to be transmitted next becomes the target of transmit priority determination.

Transmit/receive FIFO buffers in the gateway mode are disabled by setting the CFE bit in the RSCFDn(CFD)CFCCk register to 0 and the CFEMP flag becomes 1 according to the timing below.

- The transmit/receive FIFO buffer becomes empty immediately when the message in it is not being transmitted and will not to be transmitted next.

- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, or arbitration-lost when the message in it is being transmitted or will be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages can no longer be stored in transmit/receive FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

23.9.1 CAN-CAN FD Gateway (Only in CAN FD Mode)

When the gateway function is used in CAN FD mode, a frame to be transmitted can be replaced with a classical CAN frame or a CAN FD frame.

Setting the GWEN bit in the RSCFDnCFDCmFDCFG register to 1 enables the CAN-CAN FD gateway. The FDF and BRS bits in the transmit frame can be selected by the GWFDF and GWBRS bits in the RSCFDnCFDCmFDCFG register. When the DLC value of the received CAN frame is 1001_B or more and the GWFDF bit is 1 (CAN FD frame), the DLC value is replaced with 1000_B.

When the CAN-CAN FD gateway is enabled, do not perform routing for the following frames.

- CAN FD frames with a payload length of more than 8 bytes
- Remote frames

When the CAN-CAN FD gateway is enabled, the following frame should be transmitted in the channel by setting of GWFDF.

- When GWFDF bit is set to 0, only classical CAN frame should be transmitted.
- When GWFDF bit is set to 1, only CAN FD frame should be transmitted.

23.10 Test Function

The test function is classified into communication tests and global tests.

- Communication tests: Performed for each channel.
  - Standard test mode
  - Listen-only mode
  - Self-test mode 0 (external loopback mode)
  - Self-test mode 1 (internal loopback mode)
  - Restricted operation mode (only in CAN FD mode)
- Global tests: Performed for the entire module
  - RAM test (read/write test)
  - Inter-channel communication test [CRC error test enabled]

23.10.1 Standard Test Mode

CRC tests are enabled in standard test mode. The CRC value calculated by the RS-CANFD module based on the transmit message or receive message is stored in the register. This CRC value is stored in the CRCREG[14:0] bits in the RSCFDn(CFD)CmERFL register when the message is a classical CAN frame (CRC length = 15 bits) or in the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register when the message is a CAN FD frame (CRC length = 17 or 21 bits). Use the inter-channel communication test function for CRC error tests. For details, see Section 23.10.6.1, CRC Error Test.

23.10.2 Listen-Only Mode

Listen-only mode allows reception of data frames and remote frames. Only recessive bits are transmitted on the CAN bus, and the ACK bit, overload flag, and active error flag are not transmitted.

Listen-only mode is available for detecting the communication speed.

Do not make a transmit request from any buffer or queue in listen-only mode.

Figure 23.12 shows the connection when listen-only mode is selected.

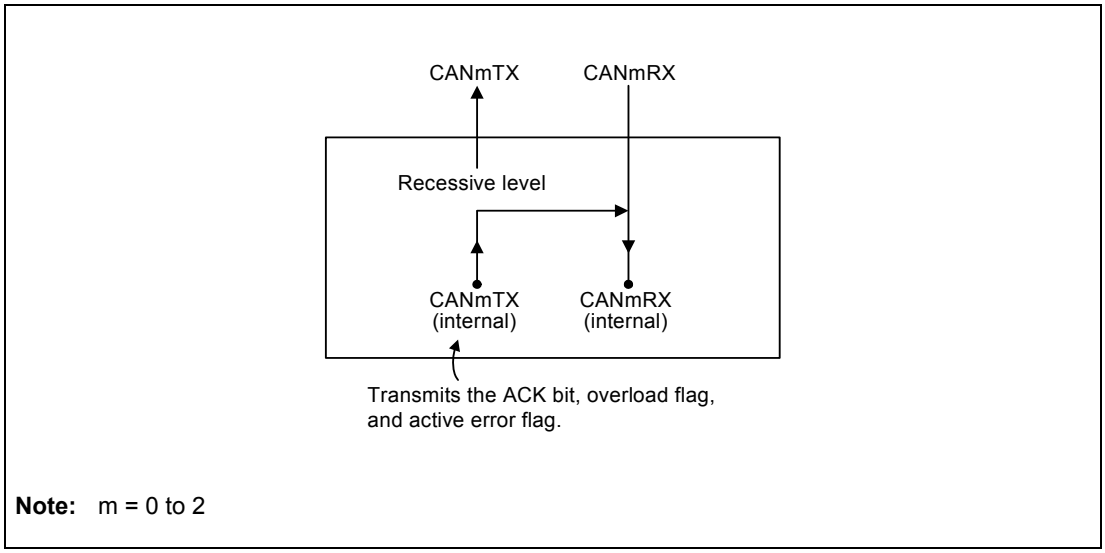


Figure 23.12 Connection when Listen-Only Mode is Selected

23.10.3 Self-Test Mode (Loopback Mode)

In self-test mode, transmitted messages are compared with the receive rule of the own channel and the messages are stored in a buffer if they have passed through the filter processing. Messages transmitted from other CAN nodes are compared only with the receive rule for which the GAFLLB bit in the RSCFDn(CFD)GAFLIDj register (j = 0 to 15) is set to 0 (when a message transmitted from another CAN node is received).

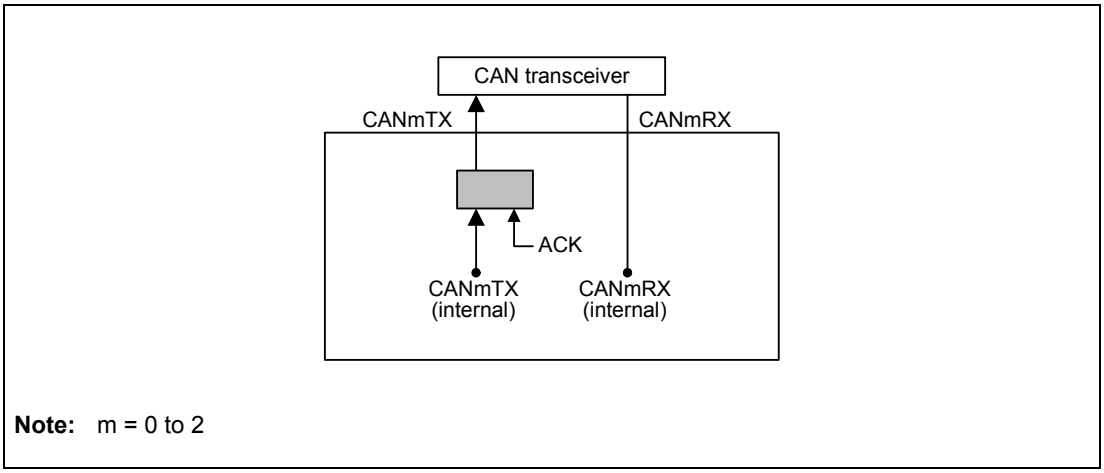
If the mirror function and self-test mode are both enabled, the self-test mode setting takes precedence.

23.10.3.1 Self-Test Mode 0 (External Loopback Mode)

Self-test mode 0 is used to perform a loopback test within a channel including the CAN transceiver.

In self-test mode 0, transmitted messages are handled as messages received through the CAN transceiver and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

Figure 23.13 shows the connection when self-test mode 0 is selected.



Note: m = 0 to 2

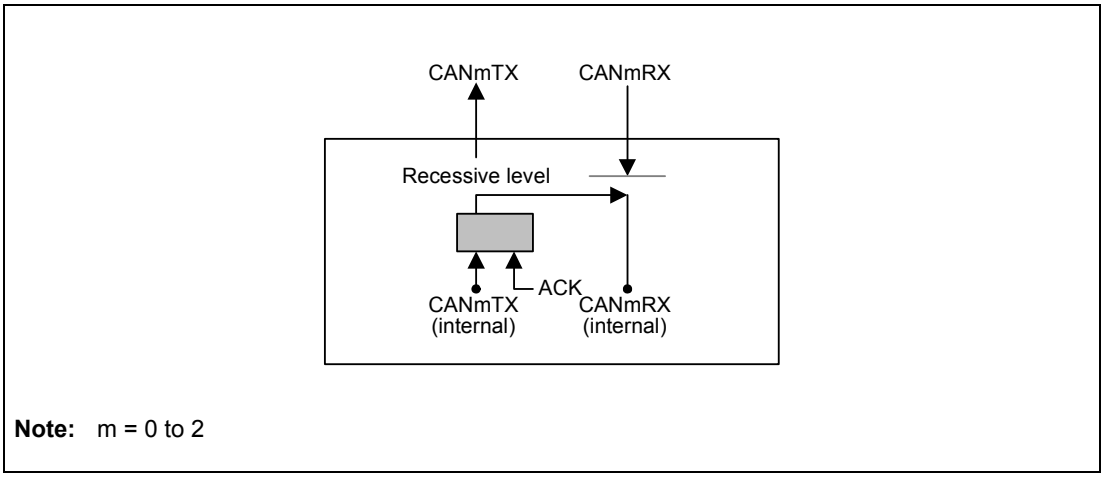
Figure 23.13 Connection when Self-Test Mode 0 is Selected

23.10.3.2 Self-Test Mode 1 (Internal Loopback Mode)

In self-test mode 1, transmitted messages are handled as received messages and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

In self-test mode 1, internal feedback from the internal CANmTX pin (m = 0 to 2) to the internal CANmRX pin is performed. The external CANmRX pin input is isolated. The external CANmTX pin outputs only recessive bits.

Figure 23.14 shows the connection when self-test mode 1 is selected.



Note: m = 0 to 2

Figure 23.14 Connection when Self-Test Mode 1 is Selected

23.10.4 Restricted Operation Mode (Only in CAN FD Mode)

In restricted operation mode, an ACK bit is generated when a valid data frame and a remote frame have been received, but these frames are not transmitted even if an error frame or an overload frame transmit condition is detected. When a condition is detected, operation is suspended until the bus idle state comes for resynchronization with the CAN communication. The receive error counter (REC) and the transmit error counter (TEC) do not change due to an error.

A desired transmission request can be made for transmission without restrictions.

23.10.5 RAM Test

The RAM test function allows accesses to all CAN RAM addresses.

When the RAM test function is used, the RAM is divided into pages of 256 bytes each. RAM test page is set by the RTMPS[6:0] bits in the RSCFDn(CFD)GTSTCFG register. Data in the set page can be read from and written to the RSCFDn(CFD)RPGACCr register (r = 0 to 63). The available total RAM size is 7680 bytes ($1E00_H$)*1 in classical CAN mode or 10656 bytes ($29A0_H$) in CAN FD mode.

In CAN FD mode, do not access more than 160 bytes in the last page (RTMPS[6:0] = 29_H) during RAM test.

Note 1. In classical CAN mode, 7584 bytes ($1DA0_H$) are used. To shorten the test time, the test of 96 bytes in the last page can be omitted.

23.10.6 Inter-Channel Communication Test

The inter-channel communication test function allows communication test by internally connecting CAN channels to each other. During this test, channels are isolated from the external CAN bus.

Before starting data transmission/reception in channel communication mode, make transmission/reception settings for each channel.

Channels not included in the test must be placed in channel halt mode. Set the channel(s) not participating in test to Channel halt mode.

Figure 23.15 shows the connection for inter-channel communication test.

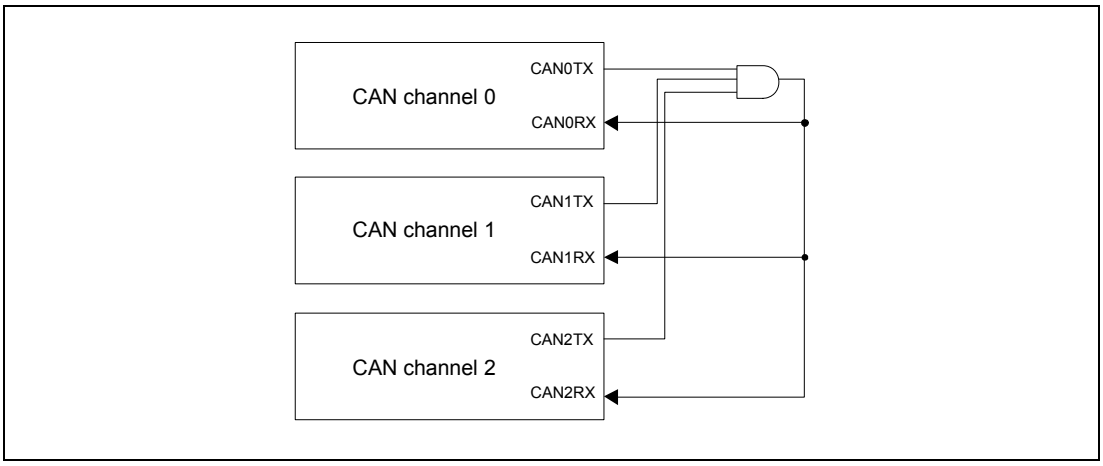


Figure 23.15 Connection for Inter-Channel Communication Test

23.10.6.1 CRC Error Test

A CRC error test is enabled during an inter-channel communication test. The following shows an example of channel 0 CRC error test procedure during a communication test between channel 0 and channel 1.

Preconditions

- Inter-channel communication test is enabled.
- Channel 0 and channel 1 are in standard test mode.

Procedure

1. Make a setting to send a message from the transmit buffer p of channel 1.
2. Set the CRCT bit in the RSCFDn(CFD)C0CTR register to 1 (to enable inversion of the first bit in the received ID field).
3. Set the TMTR bit in the RSCFDn(CFD)TMCp register to 1 (to issue a transmission request to the transmit buffer p of channel 1).
4. Wait for occurrence of a CAN0 error interrupt due to a channel bus error.
5. Read the CRCREG[14:0] bits in the RSCFDn(CFD)CmERFL register or the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register of channel 0 and channel 1, and confirm that the CRC values are different on the transmission and the reception side.
6. Confirm that the CERR bit in RSCFDm(CFD)C0ERFL is 1 (CRC error detected).

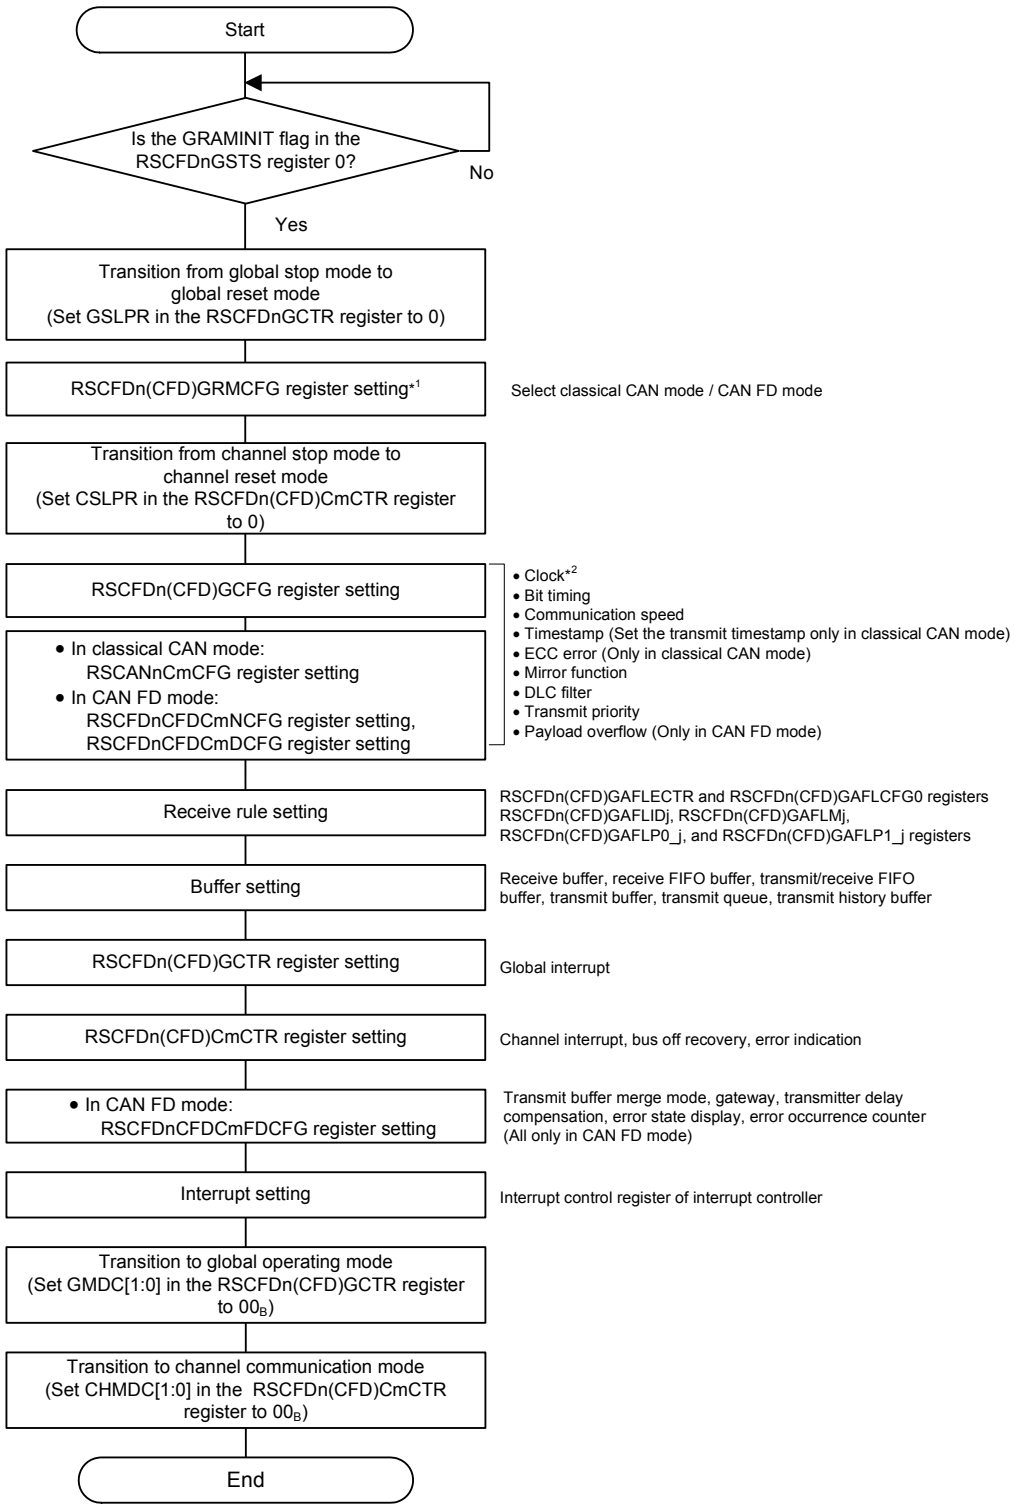
The CRC error test function generates an incorrect CRC value by inverting the first bit in the received ID field. Therefore, note that not a CRC error but a stuff error (continuous 6-bit data of the same level) is detected when a message in which ID's upper 5-bit value is 10000B or ID's upper 6-bit value is 011111B is received.

The CRC generation circuit of the RS-CANFD module is contained in the protocol controller of each channel. Another CRC calculation test is not necessary during transmission because the same circuit is used for both transmission and reception.

23.11 RS-CANFD Setting Procedure

23.11.1 Initial Settings

The RS-CANFD module initializes the CAN RAM after the MCU is reset. The RAM initialization time is 1897 cycles of the pclk. The GRAMINIT flag in the RSCFDn(CFD)GSTS register is set to 1 (CAN RAM initialization is ongoing) during the RAM initialization and is cleared to 0 (CAN RAM initialization is finished) when the initialization is completed. Make CAN settings after the GRAMINIT flag is cleared to 0. **Figure 23.16** shows the CAN setting procedure after the MCU is reset.



Note 1. The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Note 2. For the setting of CAN clock frequency, see Table 23.8, Setting Range example of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/D1L/D1M.

Note: m = 0 to 2, j = 0 to 15

Figure 23.16 CAN Setting Procedure after the MCU is Reset

23.11.1.1 Clock Setting

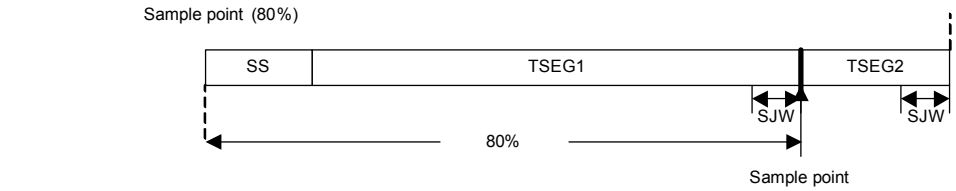
Set the CAN clock (fCAN) as a clock source of the RS-CANFD module. Select the clk_xincan or clkc using the DCS bit in the RSCFDn(CFD)GCFG register.

23.11.1.2 Bit Timing Setting

In the CAN protocol, one bit of a communication frame consists of three segments SS, TSEG1, and TSEG2, of which two segments TSEG1 and TSEG2 can be set by the corresponding register for each channel. In classical CAN mode, set these two segments in the RSCANnCmCFG register. Two bit rates (nominal bit rate and data bit rate) are provided for CAN FD mode. Set the nominal bit rate in the RSCFDnCFDCmNCFG register and set the data bit rate in the RSCFDnCFDCmDCFG register. Sample point timing can be determined by setting these two segments. This timing can be adjusted in units of 1 Time Quantum (hereafter referred to as Tq). A single Tq is the cycle of clock obtained by dividing the clock selected by the DCS bit in the RSCFDn(CFD)GCFG register. Set a division ratio by the BRP[9:0] bits in the RSCANnCmCFG register in classical CAN mode (CANmTq clock), and by the NBRP[9:0] bits in the RSCFDnCFDCmNCFG register and the DBRP[7:0] bits in the RSCFDnCFDCmDCFG register in CAN FD mode (CANmTq(N) clock and CANmTq(D) clock).
Be sure to specify the same value for both NBRP[9:0] and DBRP[7:0].
To specify a different value for the nominal bit rate and the data bit rate, change the values of the RSCFDnCFDCmNCFG.NTSEG1[6:0] and NTSEG2[4:0] bits and RSCFDnCFDCmDCFG.DTSEG1[3:0] and DTSEG2[2:0] bits, respectively.

When the TDCE bit is set to 1(Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

Figure 23.17 shows the bit timing chart. **Table 23.180** shows an example of bit timing setting.



Classical CAN mode:
SS = 1 Tq fixed
Set TSEG1 to a range of 4 Tq to 16 Tq
Set TSEG2 to a range of 2 Tq to 8 Tq
Set SJW to a range of 1 Tq to 4 Tq
Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 25 Tq
TSEG1 > TSEG2 ≥ SJW

CAN FD mode:
<Nominal bit rate>
SS = 1 Tq fixed
Set TSEG1 to a range of 4 Tq to 128 Tq
Set TSEG2 to a range of 2 Tq to 32 Tq
Set SJW to a range of 1 Tq to 32 Tq
Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 161 Tq
TSEG1 > TSEG2 ≥ SJW

<Data bit rate>
SS = 1 Tq fixed
Set TSEG1 to a range of 2 Tq to 16 Tq
Set TSEG2 to a range of 2 Tq to 8 Tq
Set SJW to a range of 1 Tq to 8 Tq
Set SS + TSEG1 + TSEG2 to a range of 5 Tq to 25 Tq
TSEG1 ≥ TSEG2 ≥ SJW
Set SJW to 1 Tq when TSEG1 = 2 Tq and TSEG2 = 2 Tq

- SS (synchronization segment):
  The SS is a segment that performs synchronization by monitoring the edge from recessive to dominant bits in the Interframe Space.
  Interframe Space consists of Intermission, Suspend Transmission, and Bus Idle. All nodes can start transmission during Bus Idle.
- TSEG1 (Time segment 1):
  TSEG1 is a segment that absorbs physical delay on the CAN network. The physical delay on the CAN network is twice the total of the delay on the CAN bus, the delay in the input comparator, and the delay in the output driver.
- TSEG2 (Time segment 2):
  TSEG2 is a segment that compensates phase error due to an error in frequency.
- SJW (Resynchronization jump width)
  The SJW is a length to extend or reduce the time segment to compensate for an error in phase due to phase error.

Figure 23.17 Bit Timing Chart

Table 23.180 Example of Bit Timing Setting

1 Bit	Set Value (Tq)				Sample Point (%) Note: See Figure 23.17.
	SS	TSEG1	TSEG2	SJW	
5 Tq*1	1	2	2	1	60.00
8 Tq	1	4	3	1	62.50
	1	5	2	1	75.00
10 Tq	1	6	3	1	70.00
	1	7	2	1	80.00
16 Tq	1	10	5	1	68.75
	1	11	4	1	75.00
20 Tq	1	12	7	1	65.00
	1	13	6	1	70.00
50 Tq*1	1	39	10	4	80.00

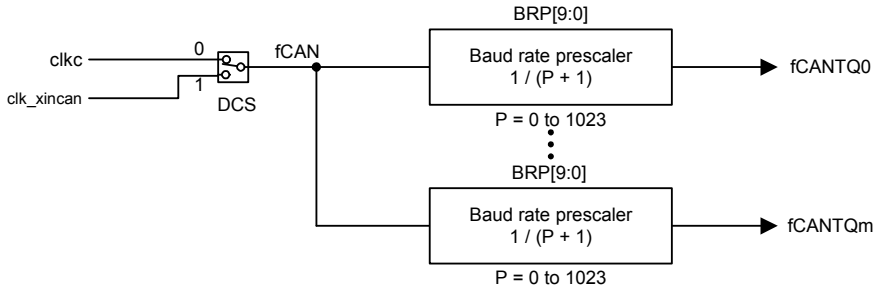
Note 1. Only in CAN FD mode

23.11.1.3 Communication Speed Setting

Set the CAN communication speed for each channel using the fCAN, baud rate prescaler division value, and Tq count per bit time. For CAN FD mode, set two types of transmission rate (arbitration phase and data phase) for each channel.

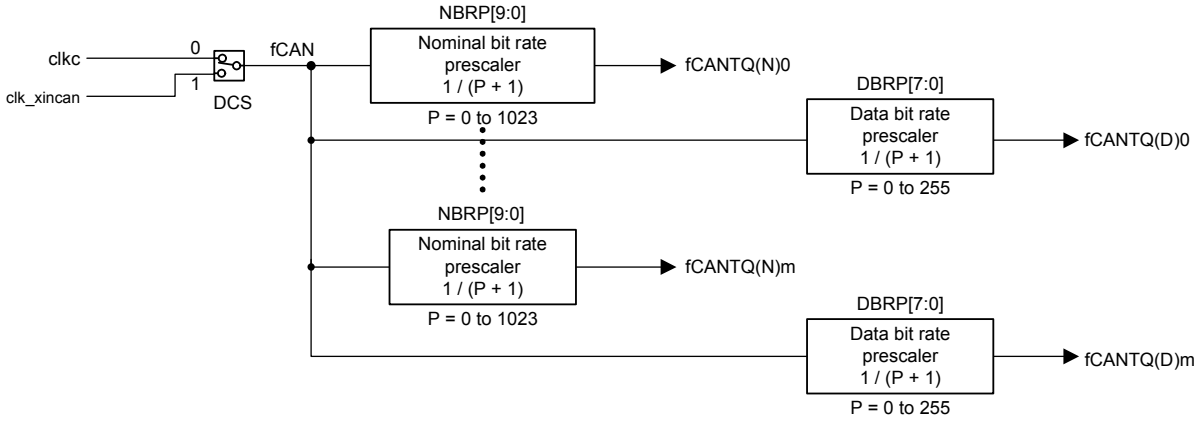
Figure 23.18 shows the CAN clock control block diagram, and **Table 23.181** shows an example of the communication speed setting.

- Classical CAN mode



$$\text{Communication speed} = \frac{\text{fCAN}}{\text{Baud rate prescaler division value} \times (\text{Tq count of 1 bit time})}$$

- CAN FD mode



$$\text{Nominal bit rate} = \frac{\text{fCAN}}{\text{Nominal bit rate prescaler division value} \times (\text{Tq count of 1 nominal bit time})}$$

$$\text{Data bit rate} = \frac{\text{fCAN}}{\text{Data bit rate prescaler division value} \times (\text{Tq count of 1 data bit time})}$$

Note: m = 0 to 2

Note: Values in ( ) are baud rate prescaler division values.

Table 23.182 Example of Transmission Rate Setting (Nominal Bit Rate and Data Bit Rate in CAN FD Mode)

fCAN / Communiation rate	40 MHz	20 MHz
Nominal bit rate 1 Mbps Data bit rate 5 Mbps	Nominal bit rate 40 Tq (1) Data bit rate 8 Tq (1)	None
Nominal bit rate 500 kbps Data bit rate 2 Mbps	Nominal bit rate 80 Tq (1) Data bit rate 20 Tq (1)	Nominal bit rate 40 Tq (1) Data bit rate 10 Tq (1)

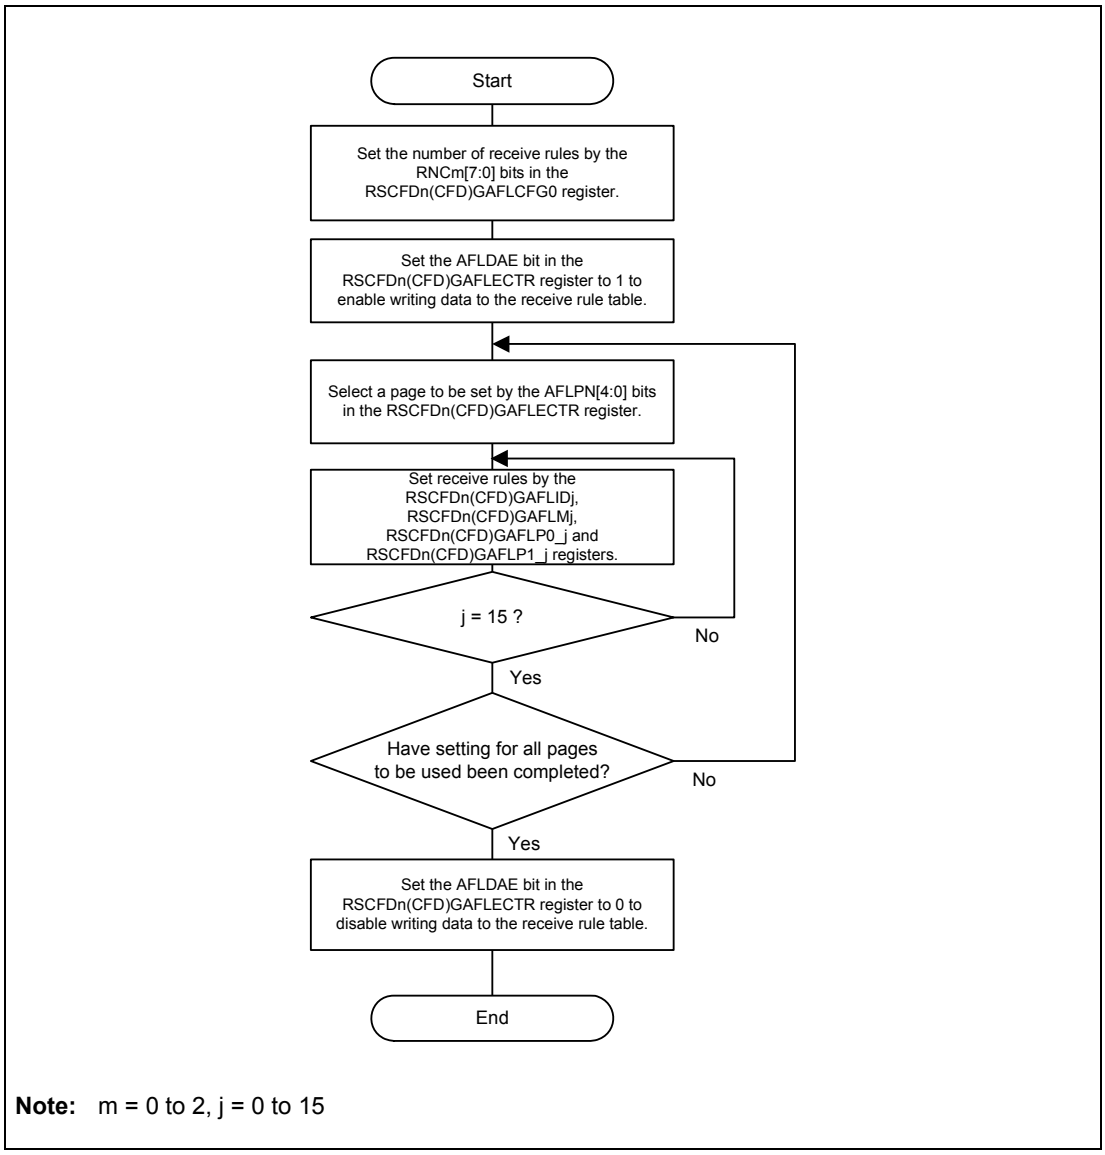
Note: Values in ( ) are nominal bit rate prescaler / data bit rate prescaler division values.

23.11.1.4 Receive Rule Setting

Receive rules can be set using receive rule-related registers.

Up to 16 receive rules can be registered per page. Specify pages 0 to 11 (for 3-channel unit) by the AFLPN[4:0] bits in the RSCFDn(CFD)GAFLECTR register. Set receive rule table write enable/disable using the AFLDAE bit.

Figure 23.19 shows the receive rule setting procedure.



Note: m = 0 to 2, j = 0 to 15

Figure 23.19 Receive Rule Setting Procedure

23.11.1.5 Buffer Setting

Set the number of buffers to be used (number of messages to be stored) and interrupt sources. Also set the payload storage size for CAN FD mode. For transmit/receive FIFO buffers that are set to transmit mode, set transmit buffers to be linked.

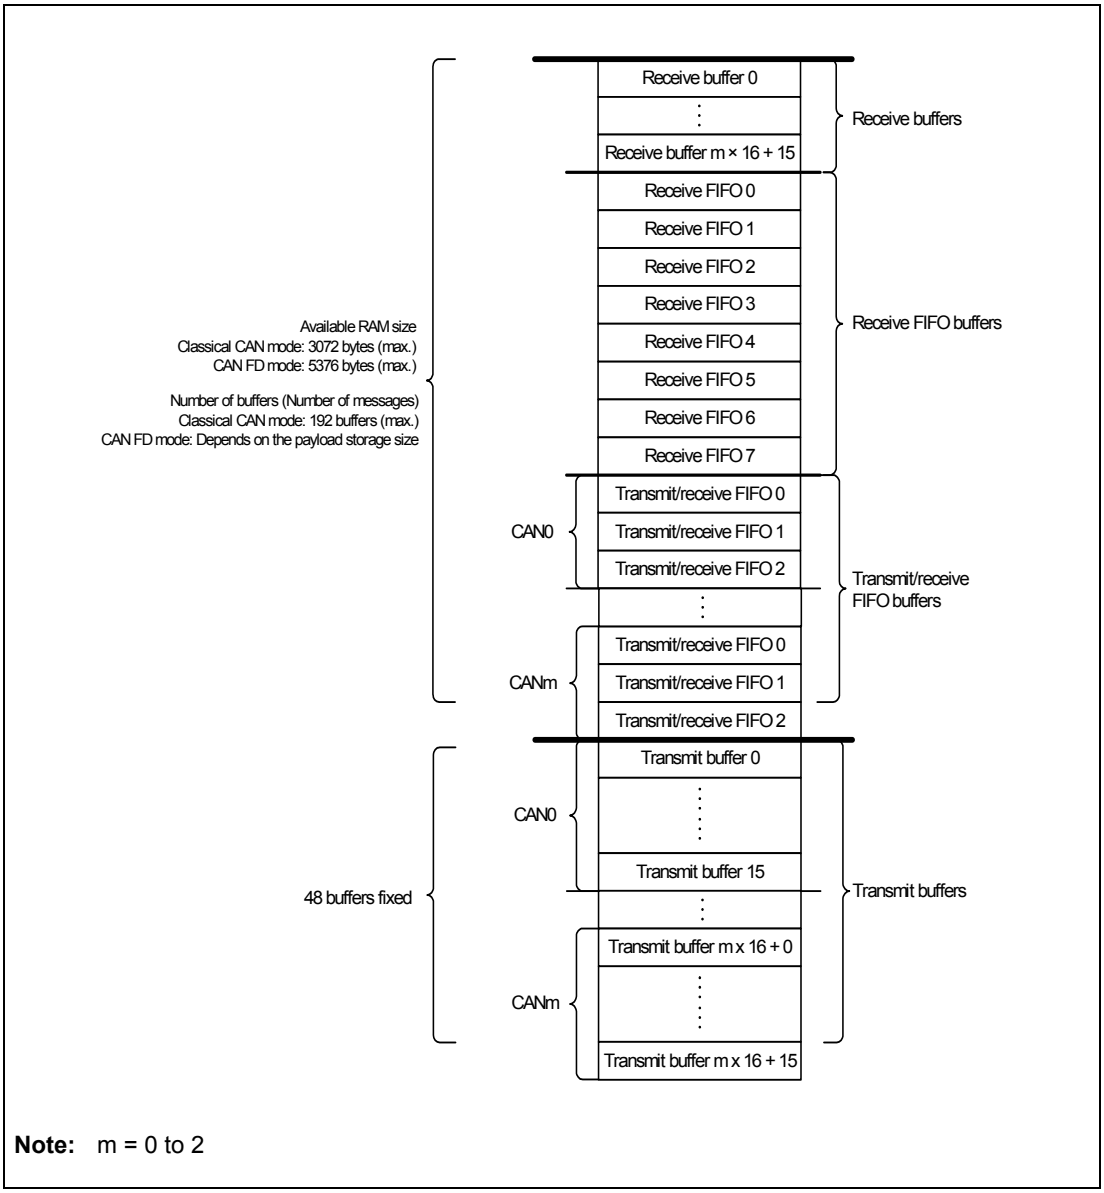
In classical CAN mode, up to 3072 bytes of the RAM can be used in receive buffers and FIFO buffers. Up to 192 buffers are available, and 16 bytes are used per buffer. Configure the buffers so that the following conditions are met.

Number of receive buffers + total number of depth of receive FIFO buffers x +
total number of depth of transmit/receive FIFO buffers k ≤ 192 buffers

In CAN FD mode, up to 5376 bytes of the RAM can be used in receive buffers and FIFO buffers. Configure the number of buffers so that the following conditions are met.

Number of receive buffers × (12 + payload storage size) + total of (number of depth × (12 + payload storage size)) of receive FIFO buffers x + total of (number of depth × (12 + payload storage size)) of transmit/receive FIFO buffers k ≤ 5376 bytes

Figure 23.20 shows the buffer configuration. **Figure 23.21** shows the buffer setting procedure.

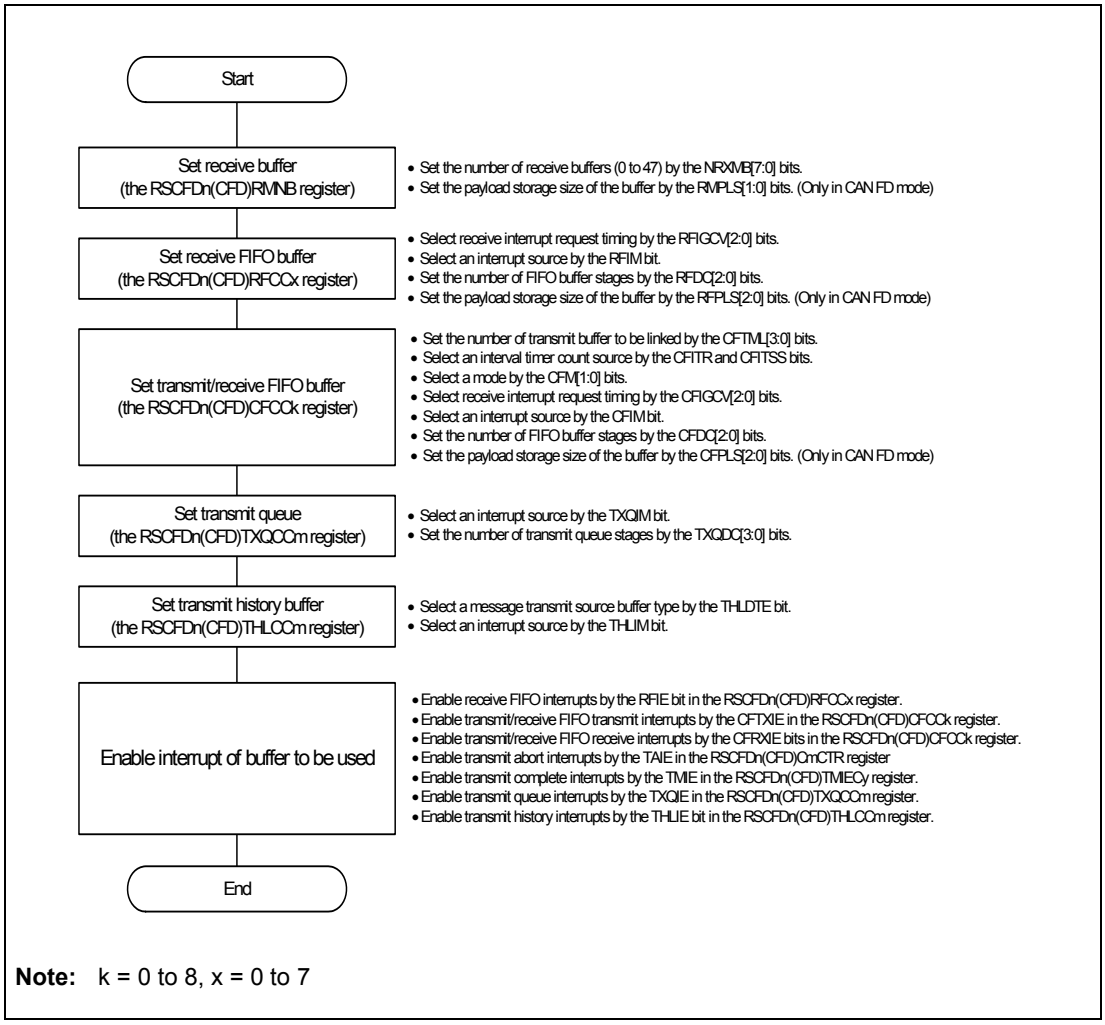


Note: m = 0 to 2

Figure 23.20 Buffer Configuration

CAUTION

Receive buffers, receive FIFO buffers, transmit/receive FIFO buffers, and transmit buffers are located in succession.



Note: k = 0 to 8, x = 0 to 7

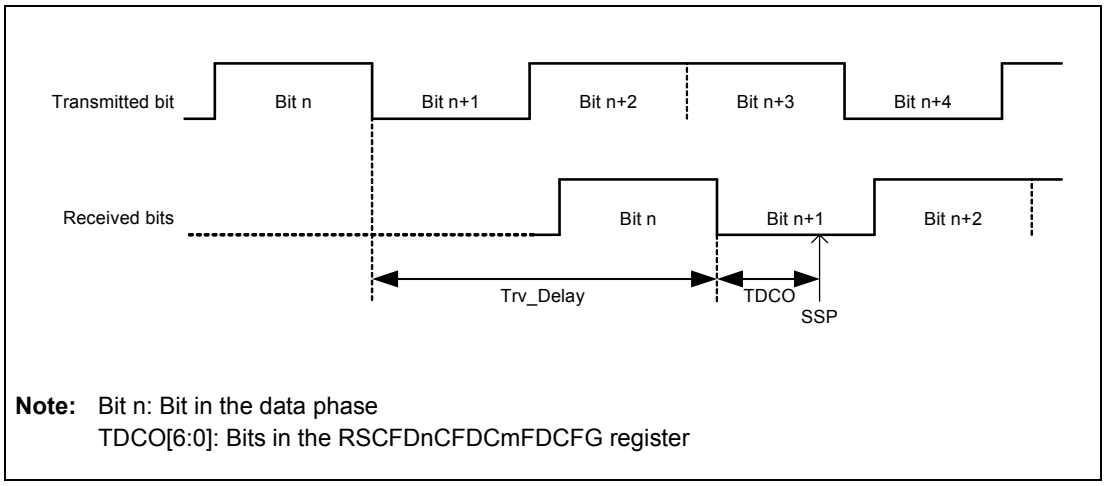
Figure 23.21 Buffer Setting Procedure

23.11.1.6 Transceiver delay compensation (Only in CAN FD Mode)

A high baud rate is used in CAN FD mode. Transmitter delay compensation is provided as a function to accept propagation delay in this case.

To use this function, set the TDCE bit in the RSCFDnCFDCmFDCFG register to 1. Also set the secondary sample point (SSP) timing used in the data phase by the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

When the TDCOC bit is 0, the SSP timing equals the total value of the delay measured by the RS-CANFD module and the TDCO[6:0] value. (This value is rounded off to the nearest integer of Tq.) Usually, the TDCO[6:0] value must be equal to SS + TSEG1, the sample point timing.



Note: Bit n: Bit in the data phase
TDCO[6:0]: Bits in the RSCFDnCFDCmFDCFG register

Figure 23.22 SSP timing

When the TDCOC bit is 1, the SSP timing is determined only by the TDCO[6:0] value. (When the DBRP[7:0] value in the RSCFDnCFDCmDCFG register is larger than 0, the TDCO[6:0] value is also rounded off to the nearest integer of Tq.)

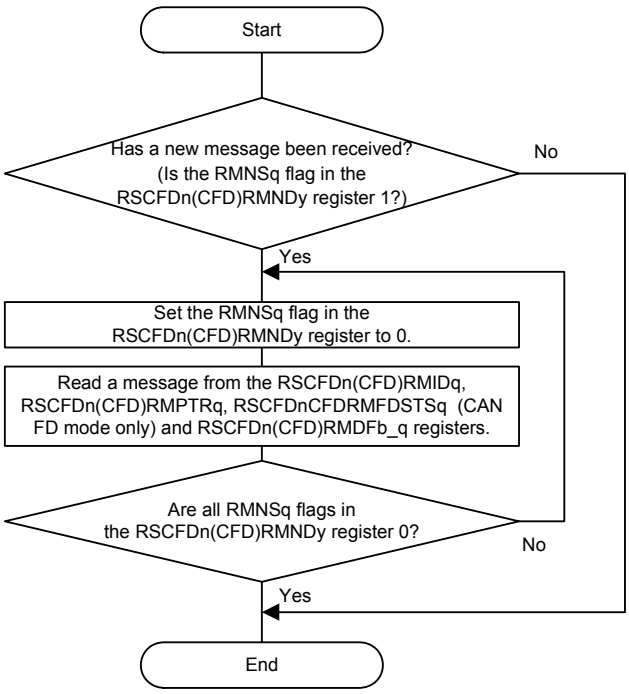
The RS-CANFD module compensates a delay up to (3 CANm bit time - 2 fCAN). (CANm bit time is data bit rate values.)

When the TDCE bit is set to 1(Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

23.11.2 Reception Procedure

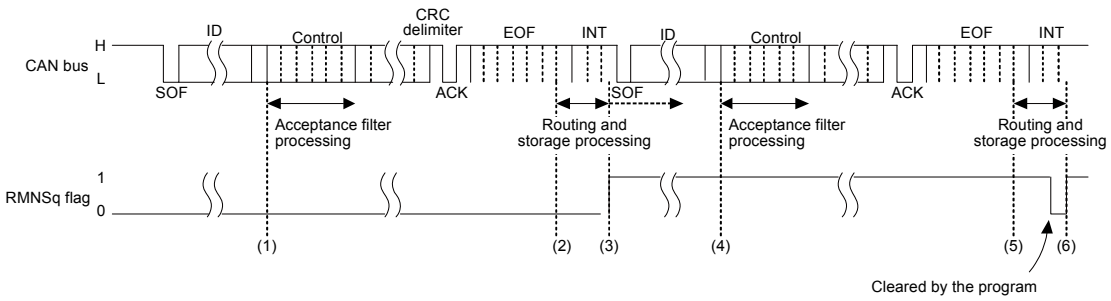
23.11.2.1 Receive Buffer Reading Procedure

When the processing to store received messages in a receive buffer starts, the RMNSq flag in the RSCFDn(CFD)RMNDy register (y = 0, 1, q = 0 to 47) is set to 1 (receive buffer q contains a new message). Messages can be read from registers RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq (only in CAN FD mode), and RSCFDn(CFD)RMDFb_q (b = 0 or 1 in classical CAN mode, b = 0 to 4 in CAN FD mode). If the next message is received before reading the message out of buffer, the message will be overwritten. **Figure 23.23** shows the receive buffer reading procedure. This procedure ensures the consistency of messages read from registers RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q.



Note: y = 0, 1, q = 0 to 47, b = 0 or 1 (classical CAN mode), 0 to 4 (CAN FD mode)

Figure 23.23 Receive Buffer Reading Procedure



Note: y = 0, 1, q = 0 to 47
RMNSq: Flag in the RSCFDn(CFD)RMNDy register

Figure 23.24 Receive Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing, the processing to store the message in the specified receive buffer starts.
When the message storage processing starts, the RMNSq flag in the corresponding

RSCFDn(CFD)RMNDy register is set to 1 (the receive buffer contains a new message). If other channels are performing filter processing or transmit priority determination processing, the routing processing and the storage processing may be delayed.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(6) When the corresponding RMNSq flag is cleared to 0 (the receive buffer contains no new message), this flag is set to 1 again when the message storage processing starts. Even if the RMNSq flag remains 1, a new message is overwritten to the receive buffer. The RMNSq flag should not be cleared to 0 during storage of messages.

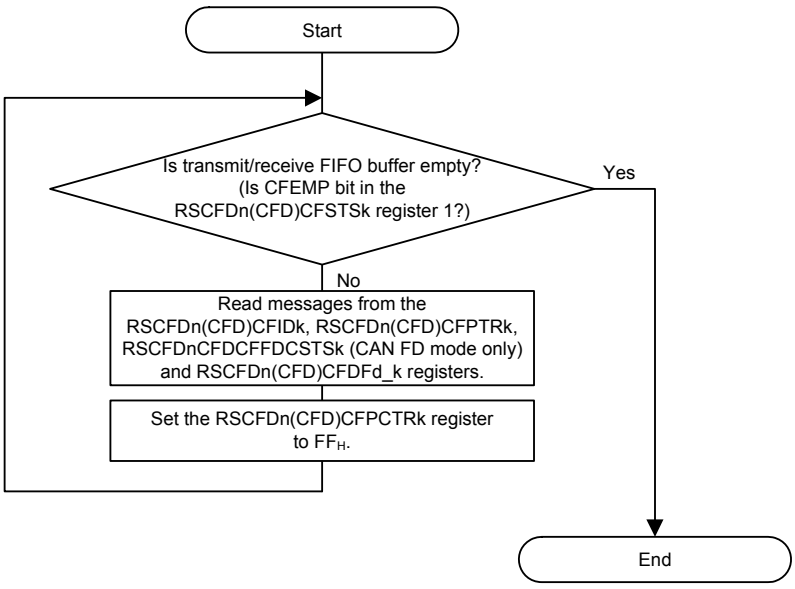
23.11.2.2 FIFO Buffer Reading Procedure

When received messages have been stored in one or more receive FIFO buffers or a transmit/receive FIFO buffer that is set to receive mode or gateway mode, the corresponding message count display counter (RFMC[7:0] bits in the RSCFDn(CFD)RFSTSx register (x = 0 to 7) or CFMC[7:0] bits in the RSCFDn(CFD)CFSTSk register (k = 0 to 8)) is incremented by 1. At this time, when the RFIE bit (receive FIFO interrupt is enabled) in the RSCFDn(CFD)RFCCx register or the CFRXIE bit (transmit/receive FIFO receive interrupt is enabled) in the RSCFDn(CFD)CFCCk register is set to 1, an interrupt request is generated. Received messages can be read from the RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx (only in CAN FD mode), and RSCFDn(CFD)RFDFd_x (d = 0 or 1 in classical CAN mode, d = 0 to 15 in CAN FD mode) registers for receive FIFO buffers, or from the RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk (only in CAN FD mode), and RSCFDn(CFD)CFDFd_k registers for transmit/receive FIFO buffers. Messages in FIFO buffers can be read sequentially on a first-in, first-out basis.

When the message count display counter value matches the FIFO buffer depth (a value set by the RFDC[2:0] bits in the RSCFDn(CFD)RFCCx register or the CFDC[2:0] bits in the RSCFDn(CFD)CFCCk register), the RFFLL or CFFLL flag is set to 1 (the receive FIFO buffer is full).

When all messages have been read out of the FIFO buffer, the RFEMP flag in the RSCFDn(CFD)RFSTSx register or the CFEMP flag in the RSCFDn(CFD)CFSTSk register is set to 1 (the receive FIFO buffer contains no unread message (buffer empty)).

If the RFE bit or the CFE bit is cleared to 0 (no receive FIFO buffer is used) with the interrupt request flag (RFIF flag in the RSCFDn(CFD)RFSTSx register or CFRXIF flag in the RSCFDn(CFD)CFSTSk register) set to 1 (a receive FIFO interrupt request is present), the interrupt request flag is not automatically cleared to 0. The program must clear the interrupt request flag to 0.



Note: k = 0 to 8, d = 0 or 1 (classical CAN mode), 0 to 15 (CAN FD mode)

Figure 23.25 Transmit/Receive FIFO Buffer Reading Procedure

When reading a message in CAN FD mode, do not read the RSCFDnCFDRFDFd_x or RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

Table 23.183 Payload Storage Area of Receive FIFO Buffer

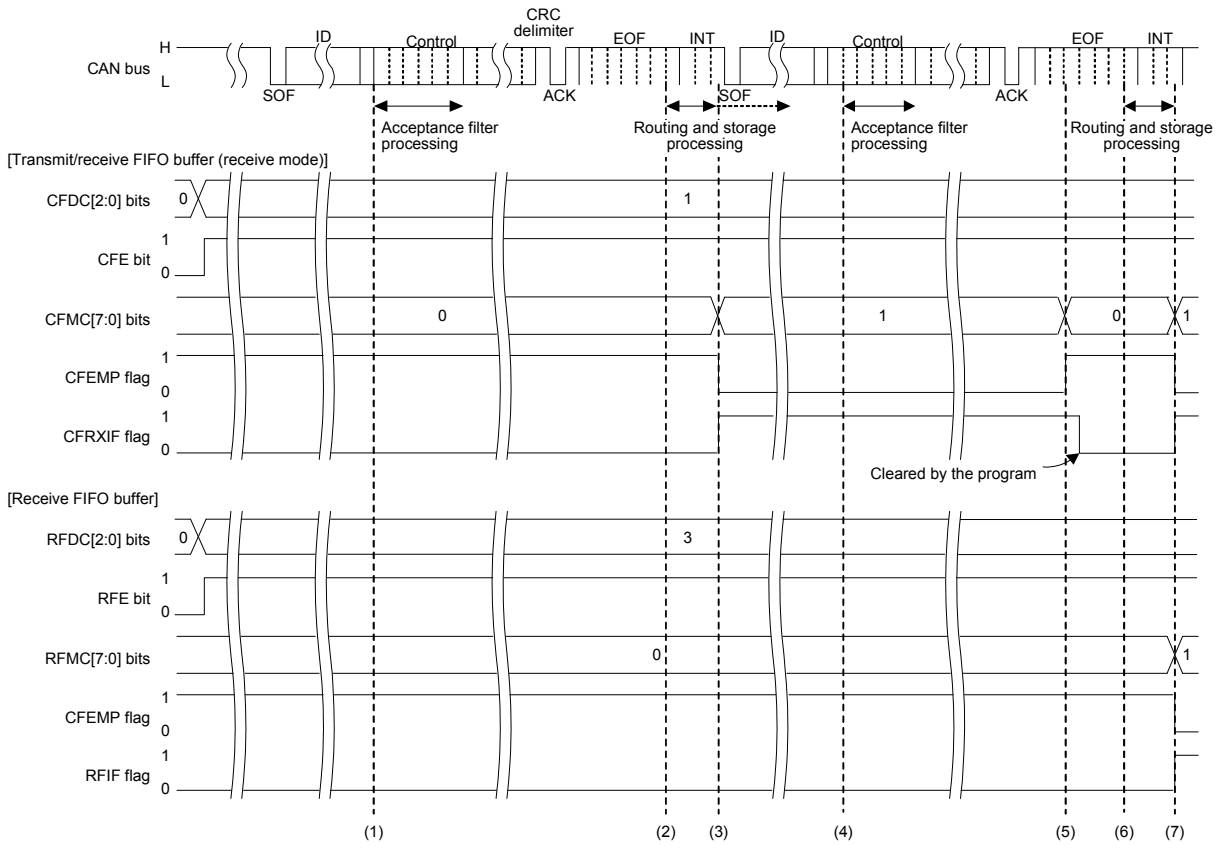
Set RFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF1_x
001_B	12 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF2_x
010_B	16 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF3_x
011_B	20 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF4_x
100_B	24 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF5_x
101_B	32 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF7_x
110_B	48 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF11_x
111_B	64 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF15_x

Table 23.184 Payload Storage Area of Transmit/Receive FIFO Buffer (1/2)

Set CFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k
001_B	12 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k
010_B	16 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k
011_B	20 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k
100_B	24 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k

Table 23.184 Payload Storage Area of Transmit/Receive FIFO Buffer (2/2)

Set CFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
101_B	32 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k
110_B	48 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k
111_B	64 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k



CFDC[2:0], CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFRXIF: Flags in the RSCFDn(CFD)CFSTSk register
RFDC[2:0], RFE: Bits in the RSCFDn(CFD)RFCCx register
RFMC[7:0], RFEMP, RFIF: Flags in the RSCFDn(CFD)RFSTSx register

Note: k = 0 to 8, x = 0 to 7

Figure 23.26 FIFO Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing and the CFE bit in the RSCFDn(CFD)CFCCk register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCk register is 001_B or more, the message is stored in the transmit/receive FIFO buffer that is set to receive mode. The CFMC[7:0] value in the

RSCFDn(CFD)CFSTSk register is incremented and becomes 01_H. When the CFIM bit in the RSCFDn(CFD)CFCCk register is set to 1 (a FIFO receive interrupt request is generated each time a message has been received), the CFRXIF flag in the RSCFDn(CFD)CFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). The CFRXIF flag can be reset to 0 by the program.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) Read received messages from the RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, and RSCFDn(CFD)CFDFd_k registers and write FF_H to the RSCFDn(CFD)CFPCTRk register. This causes the CFMC[7:0] bits in the RSCFDn(CFD)CFSTSk register to be decremented. When CFMC[7:0] becomes 00_H, the CFEMP flag in the RSCFDn(CFD)CFSTSk register becomes 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

(6) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

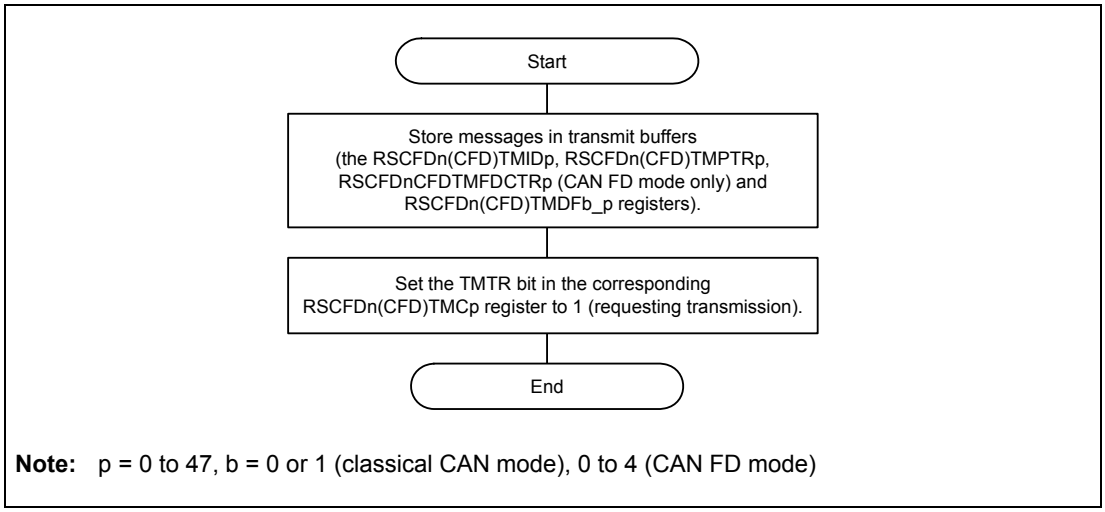
(7) The message is stored in the transmit/receive FIFO buffer set in receive mode when the message has passed through the DLC filter process if the CFE bit is set to 1 (transmit/receive FIFO buffers are used), and the CFDC[2:0] bits are set to 001_B or more. The CFMC[7:0] bit value is incremented by 1 to be 01_H. When the CFIM bit is set to 1 (an interrupt occurs each time a message has been received), the CFRXIF flag is set to 1 (a transmit/receive FIFO receive interrupt request is present).
The message is stored in the receive FIFO buffer if the RFE bit in the RSCFDn(CFD)RFCCx register is set to 1 (receive FIFO buffers are used), and the RFDC[2:0] bits in the RSCFDn(CFD)RFCCx register are set to 001_B or more. The RFMC[7:0] bits in the RSCFDn(CFD)RFSTSx register are set to 01_H by being incremented by 1. When the RFIM bit in the RSCFDn(CFD)RFCCx register is set to 1 (an interrupt occurs each time a message has been received), the RFIF flag in the RSCFDn(CFD)RFSTSx register is set to 1 (a receive FIFO interrupt request is present).

23.11.3 Transmission Procedure

23.11.3.1 Procedure for Transmission from Transmit Buffers

Figure 23.27 shows the procedure for transmission from transmit buffers.

Figure 23.28 shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmission has been successfully completed. **Figure 23.29** shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmit abort has been completed.



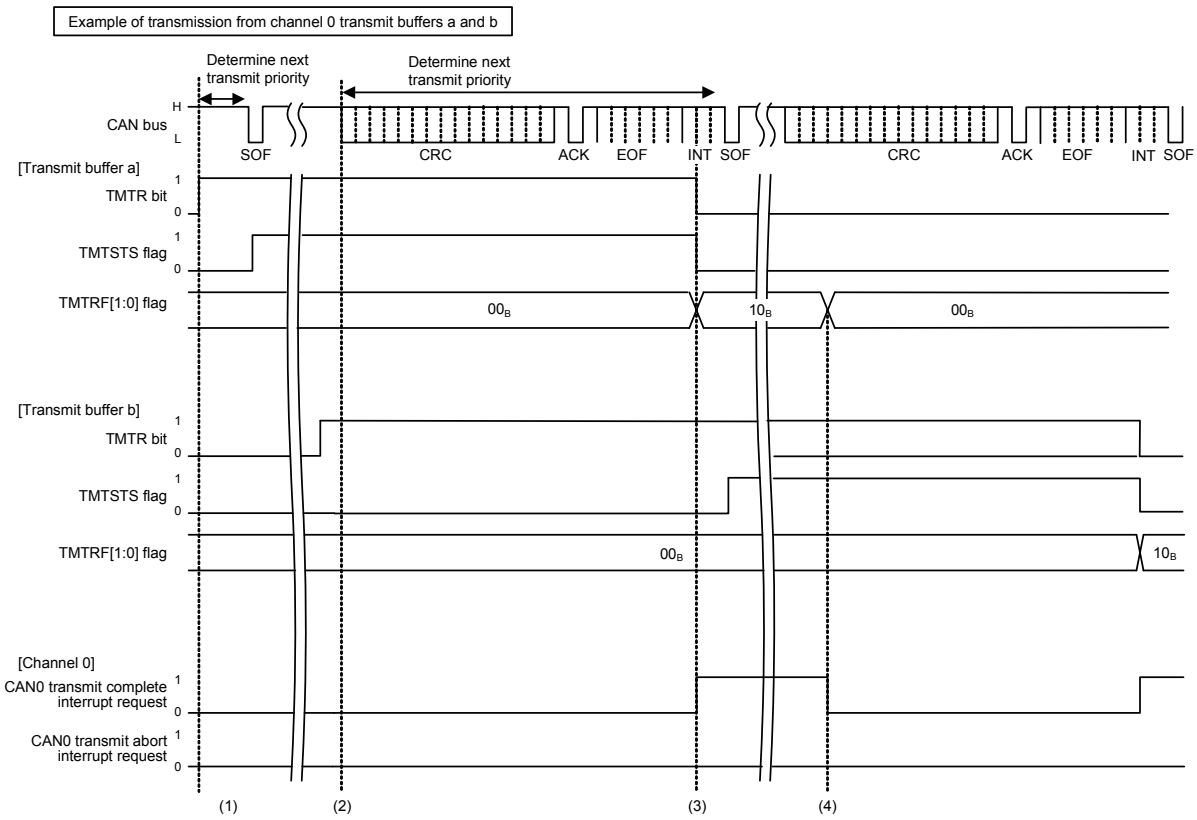
Note: p = 0 to 47, b = 0 or 1 (classical CAN mode), 0 to 4 (CAN FD mode)

Figure 23.27 Procedure for Transmission from Transmit Buffers

In CAN FD mode and transmit buffer merge mode, messages with a payload size of more than 20 bytes can be transmitted from transmit buffers (16 × m) + 0 and transmit buffers (16 × m) + 3. At this time, transmit buffers (16 × m) + 1 to (16 × m) + 2 and transmit buffers (16 × m) + 4 to (16 × m) + 5 are allocated as a payload storage area. Registers RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, and RSCFDnCFDTMFDCTRp corresponding to these buffers can be used as data field registers that can store 4-byte data bytes (payload) like the RSCFDnCFDTMDFb_p register. **Table 23.185** shows message storage registers when transmitting a message with a payload size of more than 20 bytes from transmit buffer 0.

Table 23.185 Message Storage Registers in Transmit Buffer Merge Mode (Example of Transmit Buffer 0)

Transmit Buffer	Offset from Base Address	Symbol	Register Function in Transmit Buffer Merge Mode
Transmit buffer 0	4000_H	RSCFDnCFDTMID0	Transmit buffer 0 ID data, transmit history data store enable bit, RTR bit,and IDE bit
	4004_H	RSCFDnCFDTMPTR0	Transmit buffer 0 label data and DLC data
	4008_H	RSCFDnCFDTMFDCTR0	Transmit buffer 0 ESI bit, BRS bit, and FDF bit
	$400C_H$ to $401C_H$	RSCFDnCFDTMDF0_0 to RSCFDnCFDTMDF4_0	Transmit buffer 0 data bytes 0, 1, 2, and 3 to transmit buffer 0 data bytes 16, 17, 18, and 19
Transmit buffer 1	4020_H	RSCFDnCFDTMID1	Transmit buffer 0 data bytes 20, 21, 22, and 23
	4024_H	RSCFDnCFDTMPTR1	Transmit buffer 0 data bytes 24, 25, 26, and 27
	4028_H	RSCFDnCFDTMFDCTR1	Transmit buffer 0 data bytes 28, 29, 30, and 31
	$402C_H$ to $403C_H$	RSCFDnCFDTMDF0_1 to RSCFDnCFDTMDF4_1	Transmit buffer 0 data bytes 32, 33, 34, and 35 to transmit buffer 0 data bytes 48, 49, 50, and 51
Transmit buffer 2	4040_H	RSCFDnCFDTMID2	Transmit buffer 0 data bytes 52, 53, 54, and 55
	4044_H	RSCFDnCFDTMPTR2	Transmit buffer 0 data bytes 56, 57, 58, and 59
	4048_H	RSCFDnCFDTMFDCTR2	Transmit buffer 0 data bytes 60, 61, 62, and 63
	$404C_H$ to $405C_H$	RSCFDnCFDTMDF0_2 to RSCFDnCFDTMDF4_2	Not used



Note: a = 0 to 15, b = 0 to 15
TMTR: Bit in the RSCFDn(CFD)TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCFDn(CFD)TMSTSp registers

Figure 23.28 Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully)

(1) When the TMTR bit in the RSCFDn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCFDn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

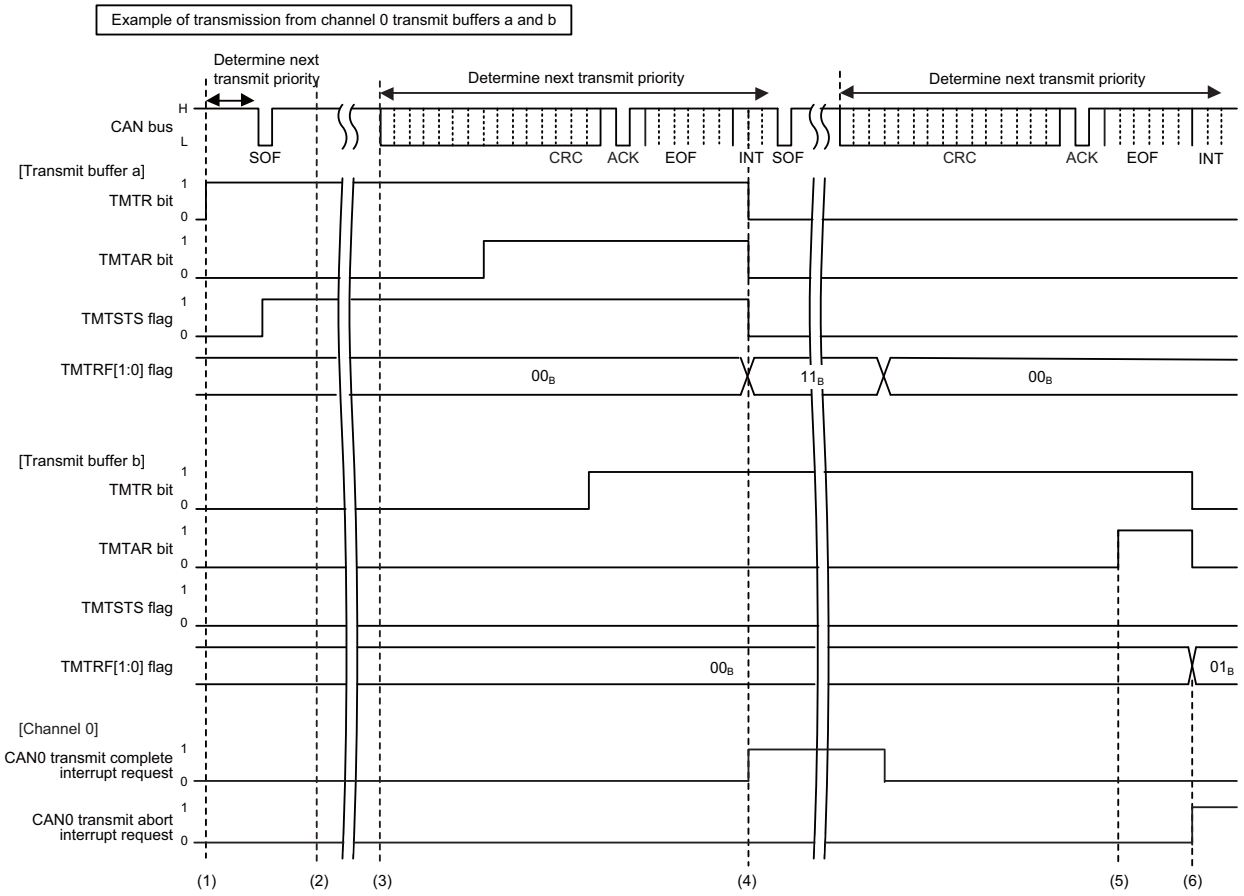
(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSa register is set to 10_B (transmission has been completed (without transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCFDn(CFD)TMCa register are cleared to 0. When the TMIEa bit in the RSCFDn(CFD)TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B (transmission is in progress or no transmit request is present).

(4) Before starting the next transmission, set the TMTRF[1:0] flag to 00_B. Write the next message to the transmit buffer, and then set the TMTR bit to 1 (transmission is requested). The TMTR bit can be set to 1 only when the TMTRF[1:0] flag value is 00_B.

If an arbitration-lost has occurred after transmission is started, the TMTSTS flag is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to search the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

When a 2-bit ECC error is detected during the priority determination processing, no data is transmitted (In classical CAN mode, only when the EEFE bit in the RSCANnGCFG register is 1).



Note: a = 0 to 15, b = 0 to 15
TMTR, TMTAR: Bits in the RSCFDn(CFD)TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCFDn(CFD)TMSTSp register

Figure 23.29 Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) When the TMTR bit in the RSCFDn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCFDn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

(2) When it is determined that the transmit buffer is used for the next transmission or transmission is in progress, message transmission is not aborted unless an error or arbitration loss occurs even if the TMTAR bit is set to 1 (transmit abort is requested).

(3) The priority determination starts at the first bit of the CRC field for the next transmission. In this timing chart, buffer b is not selected as the next transmit buffer. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(4) When transmission completes successfully, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSa register is set to 11_B (transmission has been completed (with transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCFDn(CFD)TMCa register are cleared to 0. When the TMIEa value in the RSCFDn(CFD)TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B (transmission is in progress or no transmit request is present).

(5) While another CAN node is transmitting data on the CAN bus (TMTSTS flag = 0), if the TMTAR bit is set to 1 while the corresponding channel is determining transmit priority, the TMTR bit cannot be cleared to 0.

(6) After the internal processing time has passed, the transmission is terminated and the TMTRF[1:0] flag is set to 01_B. When the transmit buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not being made, an abort request is immediately accepted and the TMTRF[1:0] flag is set to 01_B. At this time, the TMTR and TMTAR bits are cleared to 0. When transmit abort is completed with the TAIE bit in the RSCFDn(CFD)CmCTR register set to 1 (transmit abort interrupt is enabled), an interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B.

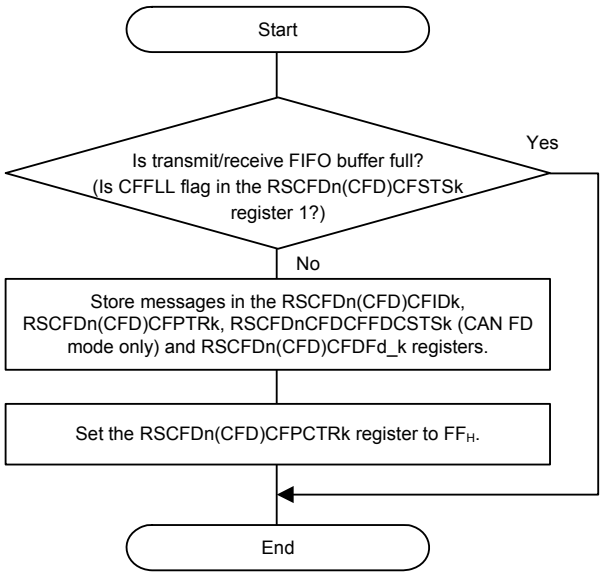
If an arbitration loss has occurred after the CAN channel started transmission, the TMTSTS bit is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to find the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

When a 2-bit ECC error is detected during the priority determination processing, no data is transmitted (In classical CAN mode, only when the EEFE bit in the RSCANnGCFG register is 1).

23.11.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers

Figure 23.30 shows the procedure for transmission from transmit/receive FIFO buffers.

Figure 23.31 shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmission has been successfully completed. **Figure 23.32** shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmit abort has been completed.



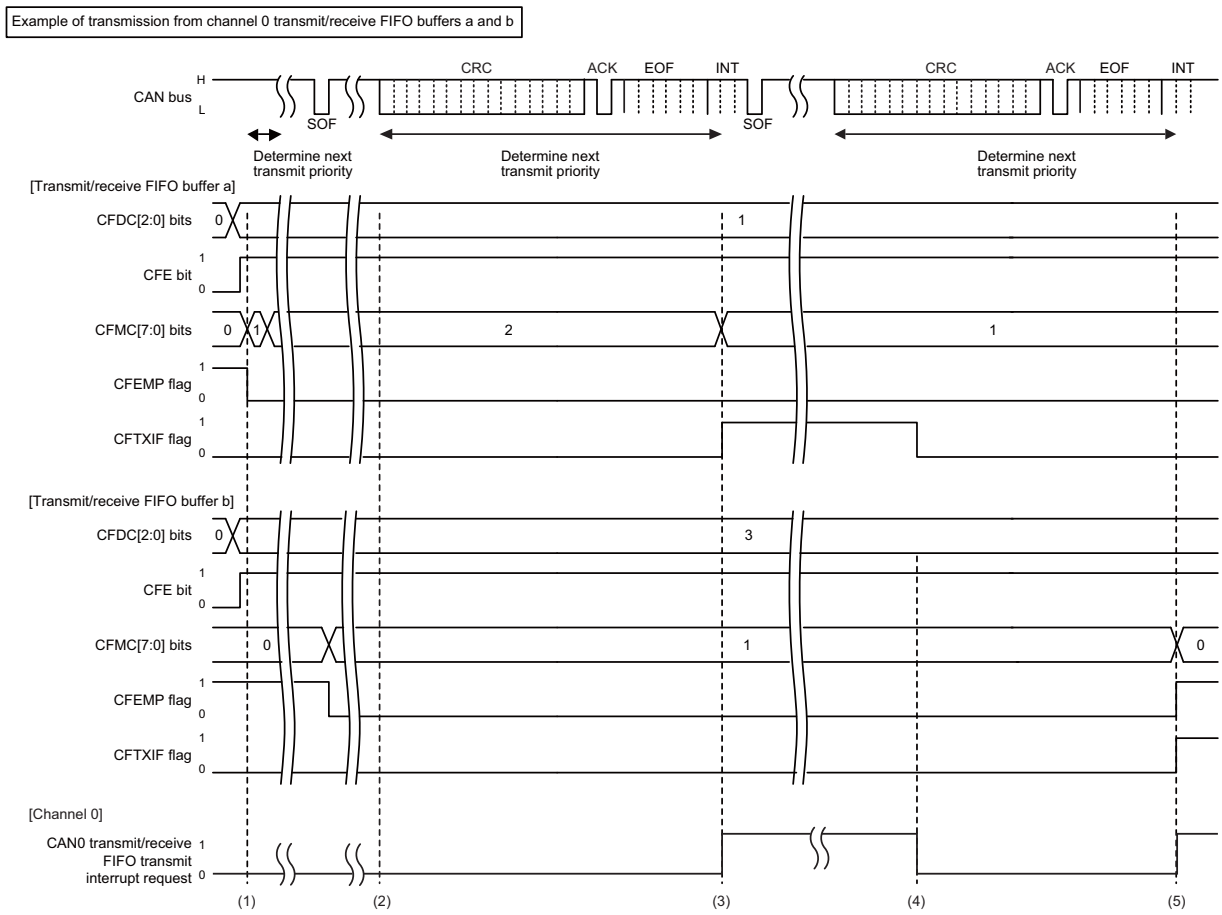
Note: k = 0 to 8, d = 0 or 1 (classical CAN mode), 0 to 15 (CAN FD mode)

Figure 23.30 Procedure for Transmission from Transmit/Receive FIFO Buffers

When storing a message, do not write a value to the RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

Table 23.186 Payload Storage Area of Transmit/Receive FIFO Buffer

Set CFPLS[2: 0] Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k
001_B	12 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k
010_B	16 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k
011_B	20 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k
100_B	24 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k
101_B	32 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k
110_B	48 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k
111_B	64 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k



Note: a = 0 to 2, b = 0 to 2
CFDC[2:0],CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFTXIF: Flags in the RSCFDn(CFD)CFSTSk register

Figure 23.31 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully)

(1) While the CAN bus is idle, when the CFE bit in the RSCFDn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCa register is 001_B (4 messages) or more and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is 01_H or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

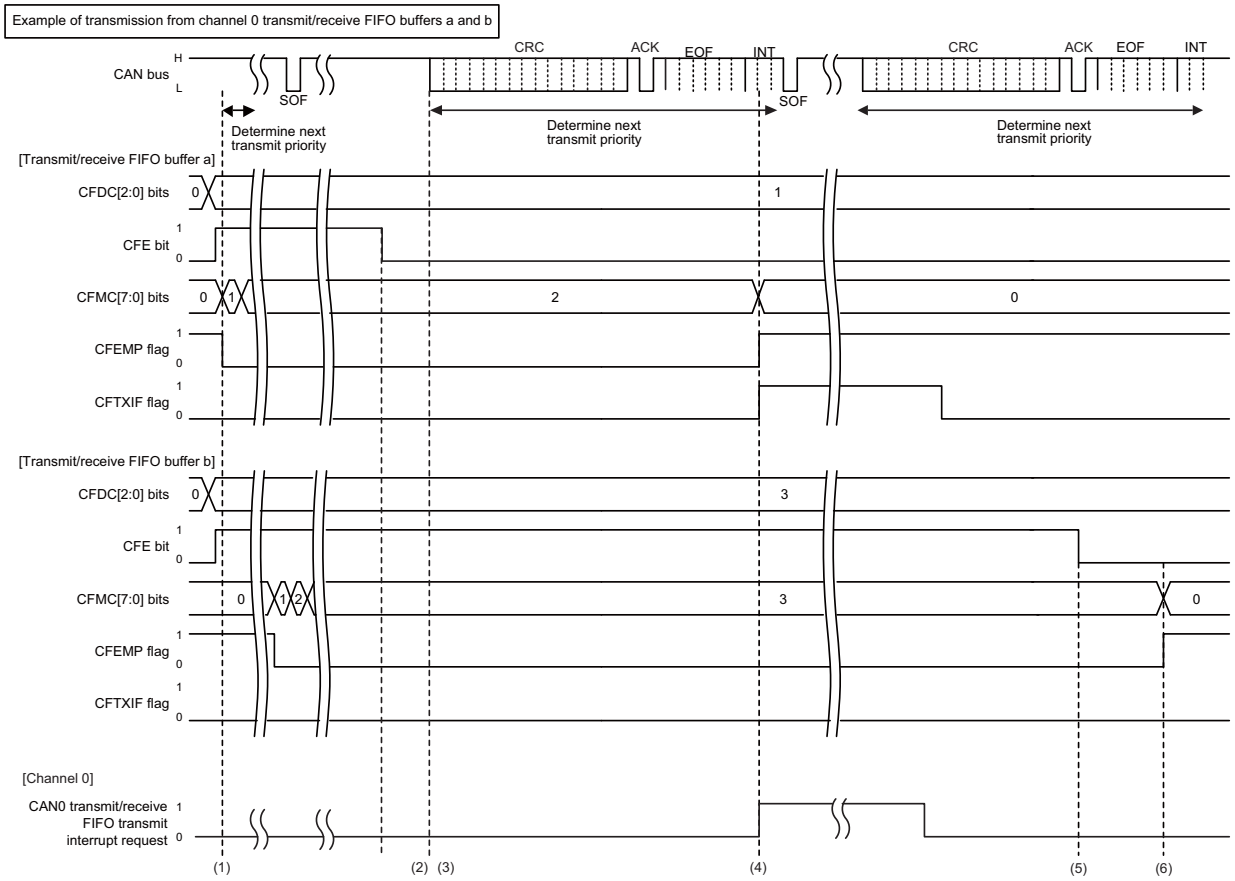
(3) When transmission completes successfully, the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is decremented by 1. Setting the CFIM bit in the RSCFDn(CFD)CFCCa register to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the

CFTXIF flag in the RSCFDn(CFD)CFSTSk register to 1 (a transmit/receive FIFO transmit interrupt request is present).

(4) The program can clear the CFTXIF flag.

(5) Message transmission from transmit/receive FIFO buffer b of channel 0 has been completed and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSb register is decremented by 1. The CFMC[7:0] bits are cleared to 00_H and therefore the CFEMP flag in the RSCFDn(CFD)CFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

Transmission is continued until the CFEMP flag is set to 1. It is possible to continuously store transmit messages in FIFO buffers until the CFFLL flag in the RSCFDn(CFD)CFSTSa and RSCFDn(CFD)CFSTSb register is set to 1 (the transmit/receive FIFO buffer is full).



Note: a = 0 to 2, b = 0 to 2
CFDC[2:0], CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFTXIF: Flags in the RSCFDn(CFD)CFSTSk register

Figure 23.32 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) While the CAN bus is idle, when the CFE bit in the RSCFDn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCa register is 001_B (4 messages) or more and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is 01_H or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined,

transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When transmission is in progress or it is determined that the transmit/receive FIFO buffer is used for the next transmission, message transmission is not aborted unless an error or arbitration loss occurs even if the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

(3) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. In this figure, transmit/receive FIFO buffer b is not selected as a buffer for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(4) When transmit completes successfully, the CFMC[7:0] value is cleared to 00_H. Setting the CFIM bit to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCFDn(CFD)CFSTSa register to 1 (a transmit/receive FIFO transmit interrupt request is present). The program can clear the CFTXIF flag.

(5) If another CAN node on the CAN bus is transmitting data (not from transmit/receive FIFO buffer b), transmit/receive FIFO buffers cannot be disabled immediately even if the CFE bit in the RSCFDn(CFD)CFCCb register is cleared to 0 (no transmit/receive FIFO buffer is used) during transmit priority determination. (The CFEMP flag in the RSCFDn(CFD)CFSTSb register is not set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) immediately.)

(6) After the internal processing time has passed, transmit/receive FIFO buffers are disabled and the CFMC[7:0] bits in the RSCFDn(CFD)CFSTSb register are cleared to 00_H and the CFEMP flag is set to 1. When the transmit/receive FIFO buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not in progress, the transmit/receive FIFO buffer is immediately disabled. (The CFMC[7:0] bits are cleared to 00_H and the CFEMP flag is set to 1.)

23.11.3.3 Procedure for Transmission from the Transmit Queue

Figure 23.33 shows the procedure for transmission from the transmit queue.

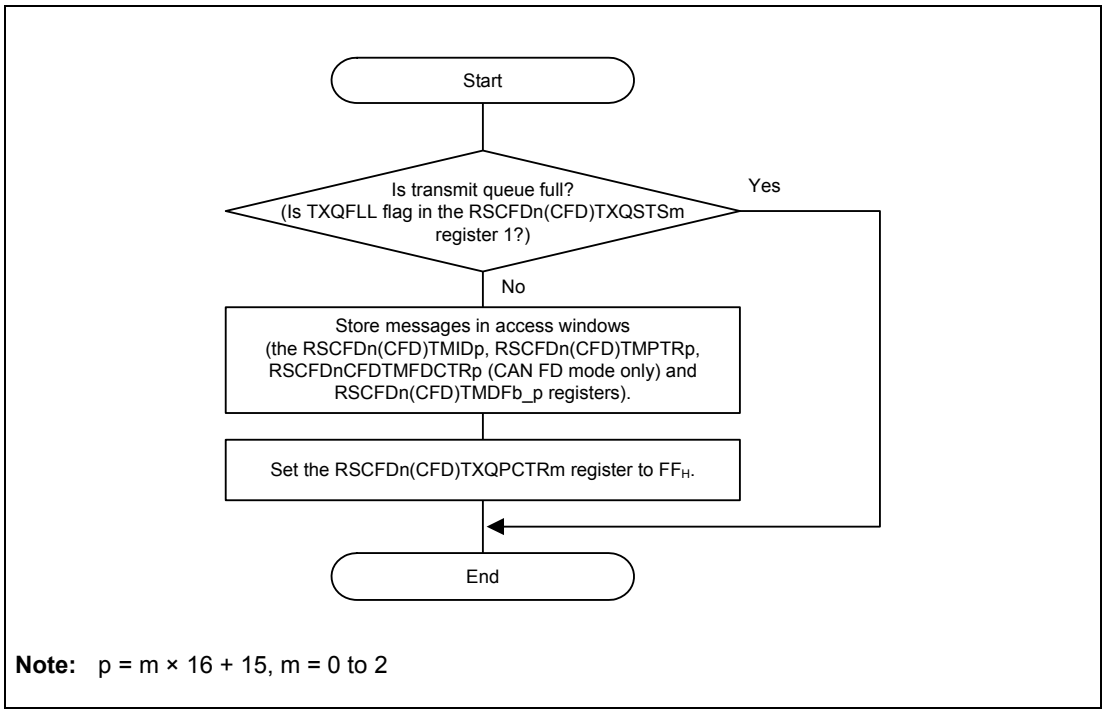


Figure 23.33 Procedure for Transmission from the Transmit Queue

23.11.3.4 Transmit History Buffer Reading Procedure

Transmit history data can be read from the RSCFDn(CFD)THLACCm register. The next data can be accessed by writing FF_H to the corresponding RSCFDn(CFD)THLPCTRm register (m = 0 to 2) after reading a set of data. **Figure 23.34** shows the transmit history buffer reading procedure.

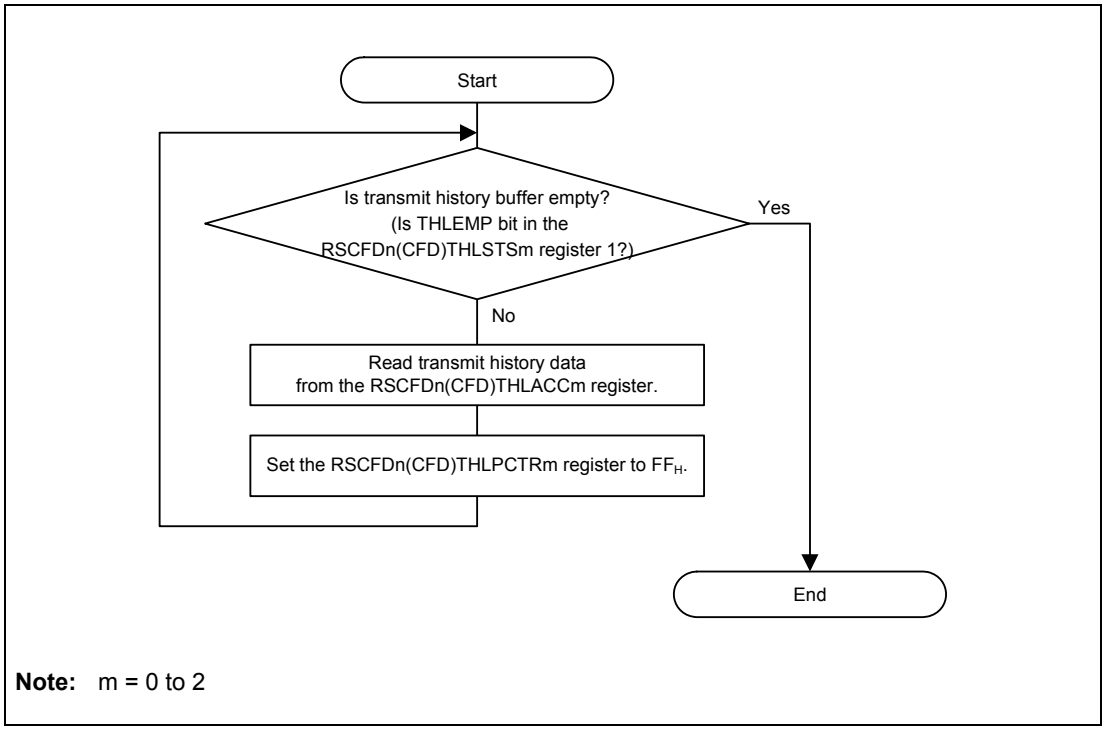

Figure 23.34 Transmit History Buffer Reading Procedure

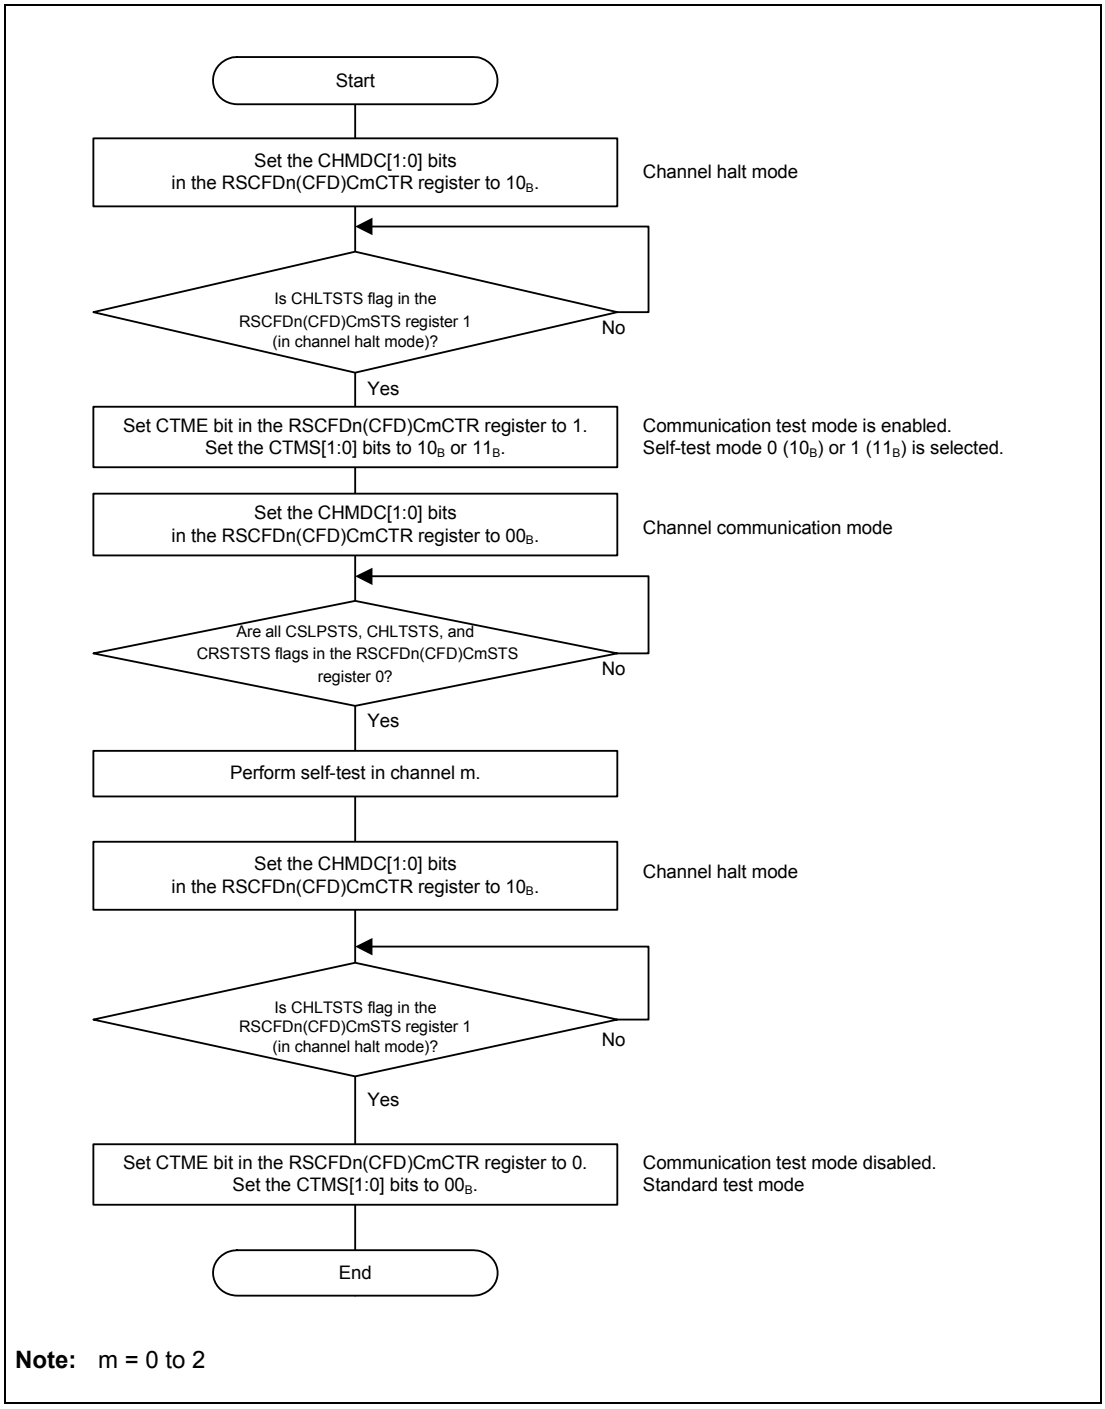
23.11.4 Test Settings

23.11.4.1 Self-Test Mode Setting Procedure

Self-test mode allows communication test on a channel basis by enabling a CAN node to receive its own transmitted messages.

Figure 23.35 shows the self-test mode setting procedure.



Note: m = 0 to 2

Figure 23.35 Self-Test Mode Setting Procedure

23.11.4.2 Procedure for Releasing the Protection

Since the global test function in **Table 23.187** is protected, write the protection release data 1 and release data 2 in succession to the LOCK[15:0] bits in the RSCFDn(CFD)GLOCKK register, then set the target test bit to 1.

Table 23.187 Protection Release Data for Test Function

Test Function	Protection Release Data 1	Protection Release Data 2	Target Bit
RAM test	7575_H	$8A8A_H$	RTME bit in the RSCFDn(CFD)GTSTCTR register

If an incorrect value is written to the LOCK[15:0] bits, restart from writing the protection release data 1. **Figure 23.36** shows the procedure for releasing the protection.

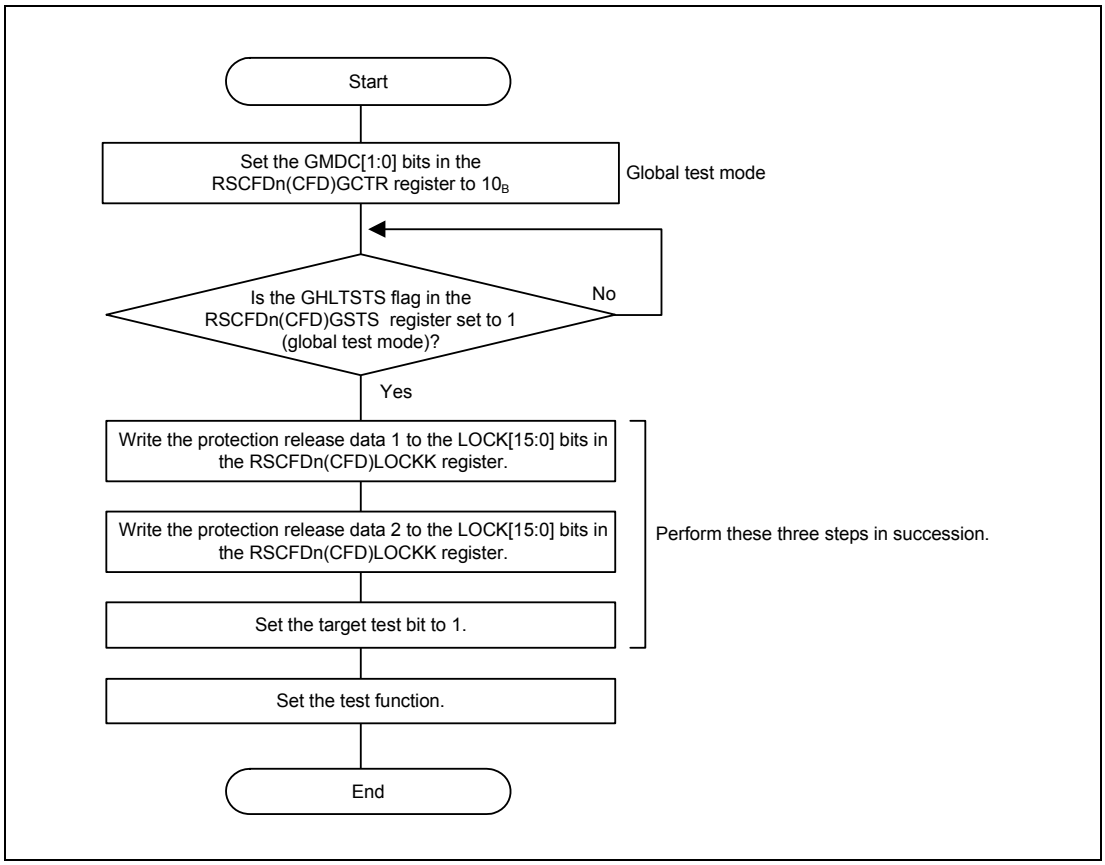


Figure 23.36 Protection Release Procedure

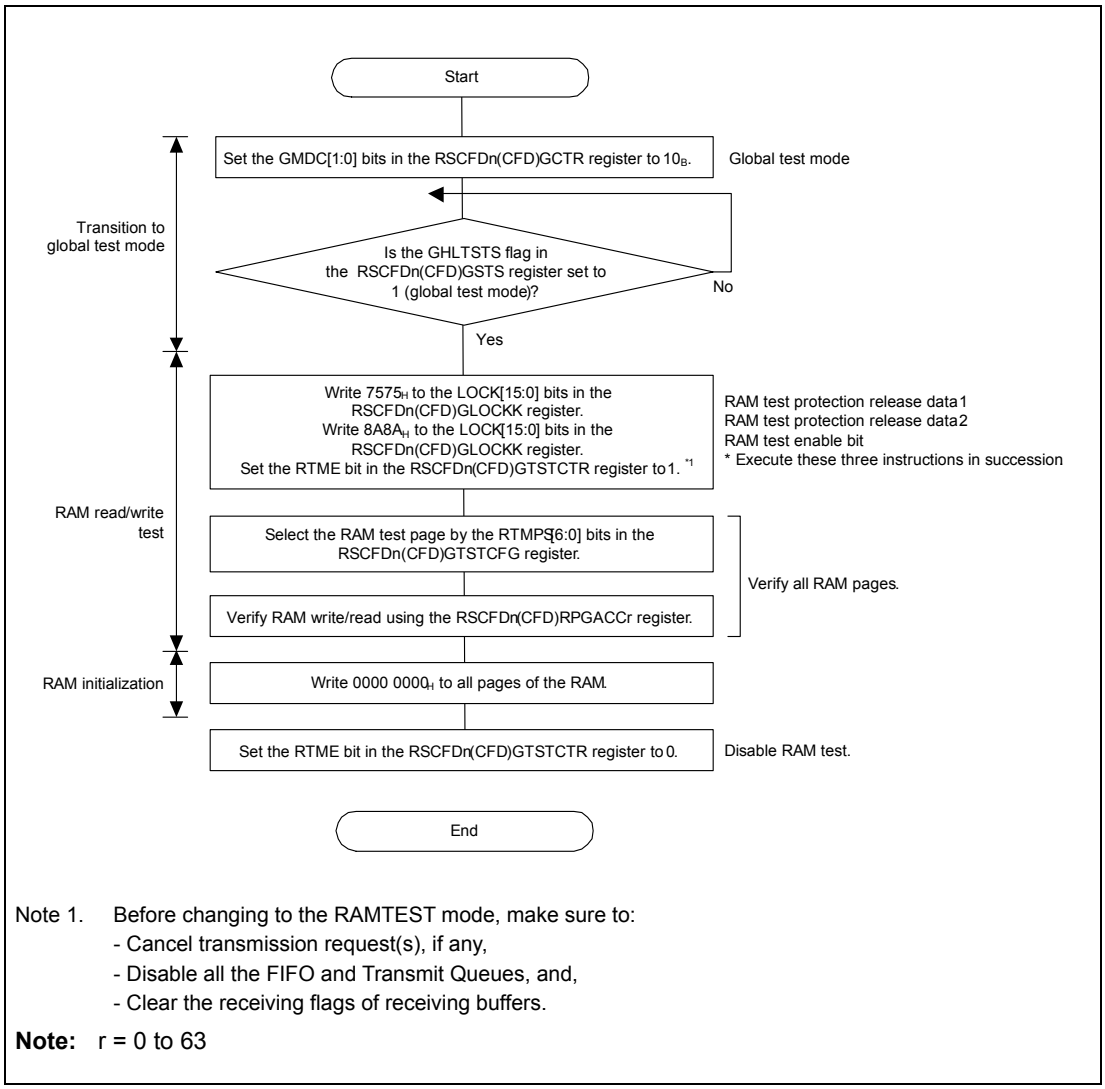
23.11.4.3 RAM Test Setting Procedure

RAM tests include CAN RAM read/write test. The read/write test verifies that data written to the RAM is read correctly. Before closing the RAM test, write 0000 0000_H to all pages of the CAN RAM.

Figure 23.37 shows the RAM test setting procedure.



Note 1. Before changing to the RAMTEST mode, make sure to:
- Cancel transmission request(s), if any,
- Disable all the FIFO and Transmit Queues, and,
- Clear the receiving flags of receiving buffers.

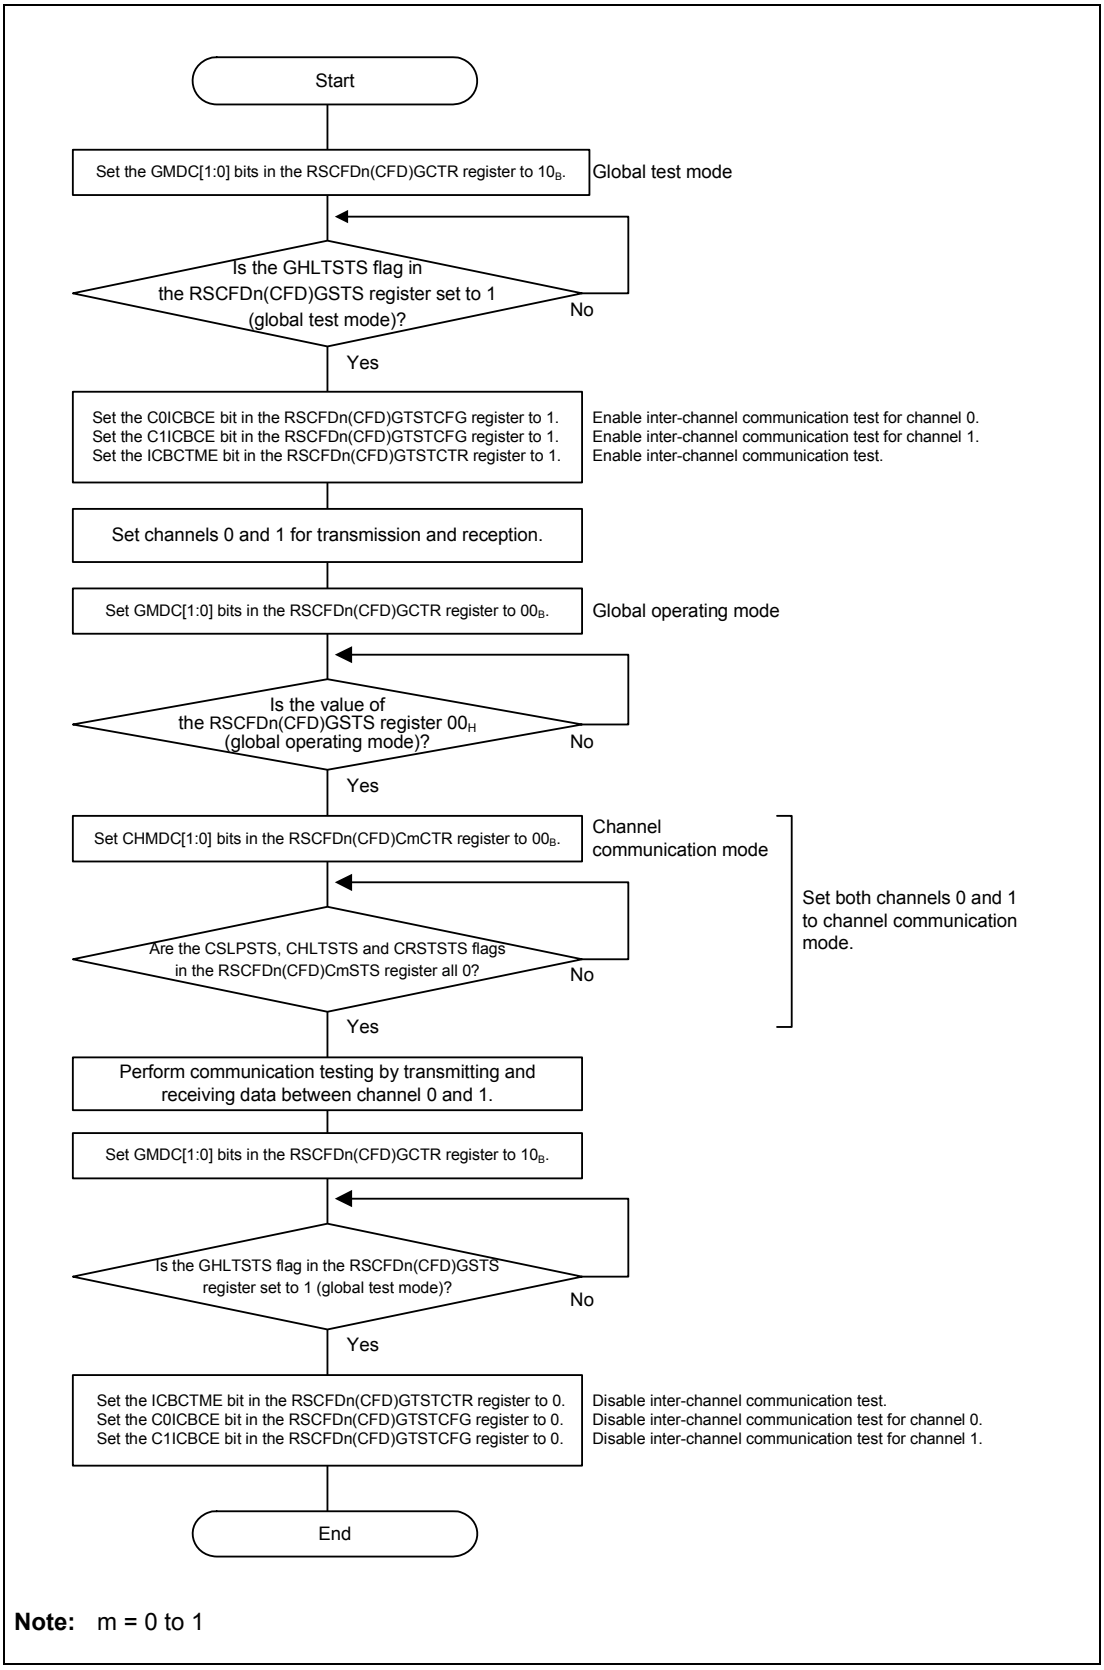
Note: r = 0 to 63

Figure 23.37 RAM Test Setting Procedure

23.11.4.4 Inter-Channel Communication Test Setting Procedure

Communication testing can be performed by transmitting and receiving data between different channels.

Figure 23.38 shows the inter-channel communication test setting procedure.



Note: m = 0 to 1

Figure 23.38 Inter-Channel Communication Test Setting Procedure (Example of Communication Test between Channel 0 and Channel 1)

23.12 Detection and Correction of Errors in RS-CANFD RAM

This section shows RS-CANFD RAM in CAN-FD mode. For RS-CANFD RAM in Classical CAN mode, see Section 22.11, Detection and Correction of Errors in RSCAN RAM.

23.12.1 ECC for the RSCFDn RAM

Table 23.188 gives an outline of the ECC functions for the RSCFDn RAM.

Table 23.188 List of the ECC Functions for the RSCFDn RAM

Item	Outline of Functions
ECC error detection/correction	The RAM is checked for ECC errors. The following options are selectable. • 2-bit error detection and 1-bit error detection/correction • 2-bit error detection and 1-bit error detection The ECC error detection/correction can be disabled by using through mode. With the initial settings, error detection/correction is enabled.
Error notification	When an ECC 2-bit error is generated, the error is notified. • Error notification can be enabled or disabled when an ECC 2-bit error is detected. In the initial setting, 2-bit error notification is enabled. However, when the interrupt is masked by the FEINTFMSK register, interrupt processing is not performed.
Error status	Monitoring for the detection of 2-bit ECC errors and for the detection of 1-bit ECC errors is available. A register for clearing the error status is provided.
Address capture	• Only one address at which an ECC error has occurred can be captured. • A signal is generated upon detection of a 2-bit or 1-bit ECC error, and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared).

CAUTION

When ECC error detection/correction is performed, confirm initialization of the RSCFDn RAM (RSCFDnGSTS.GRAMINIT = 0) before it is used.

23.12.2 Register Base Address

ECCRCFDn base addresses are listed in the following table.

ECCRCFD register addresses are given as offsets from the base addresses in general.

Table 23.189 Register Base Address

Base Address Name	Base Address
<ECCRCFD0_base>	FFC7 1800_H
<ECCRCFD1_base>	FFC7 $1C00_H$

23.12.3 Interrupt Request

Table 23.190 lists the ECC interrupt request of RSCFDn RAM.

Table 23.190 Interrupt Requests

Unit Interrupt Signal	Outline	Connected to
—	RSCFD ECC 2-bit error interrupt	Error Control Module INTECCDPERIRAM
—	RSCFD ECC 1-bit error interrupt	Error Control Module INTECCSPERIRAM

23.12.4 ECCRCFDnCTL — RSCFDn ECC Control Register

The ECCRCFDnCTL register controls the mode of the ECC and the status for RSCFDn.

Bits 7, 5 and 4 should be set (written) while the RSCFDn operation is stopped.

In addition, when writing to bit 7, EMCA1 and EMCA0 need to be 01_B.

Access: This register can be read/written in 16-bit units.

Address: <ECCRCFDn_base> + 0000_H

Value after reset: Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA1	EMCA0	—	—	—	ECER2C	ECER1C	—	ECTHM	ECERVF	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	Undefined
R/W	R/W*1	R/W*1	R	R	R	R/W*1	R/W*1	R	R/W	R/W	R/W	R/W	R/W	R	R	R

Note 1. These bits are always read as 0.

Table 23.191 ECCRCFDnCTL Register Contents (1/2)

Bit position	Bit Name	Function
15	EMCA1	Access control bits 1 and 0 to ECC mode selection bit These bits specify whether modifying the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 01_B, writing to bit 7 is enabled.
14	EMCA0	
13 to 11	Reserved	When read, the value after reset is returned. Writing to these bits, write the value after reset.
10	ECER2C	2-bit ECC error detection flag clear bit This bit is used to clear the 2 bit error detection flag of ECER2F (bit 2). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority.
9	ECER1C	1-bit ECC error correction accumulation flag clear bit This bit is used to clear the 1 bit error detection/correction flag of ECER1F (bit 1). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority.
8	Reserved	When read, the value after reset is returned. Writing to these bits, write the value after reset.
7	ECTHM	ECC function through mode selection bit This bit is used to set enabling and disabling of ECC. Setting this bit to 1 disables ECC function. When writing to this bit, (0, 1) must be written to (EMCA1, EMCA0) at the same time. 0: Through mode is disabled (normal operation mode). 1: Through mode is enabled. (ECC function disable)
6	ECERVF	ECC error judgment enable 0: error judgement disabled 1: error judgement enabled Error judgement is only effective in normal operation mode, i.e. if ECCRCFDnCTL.ECTHM = 0. If error judgement is disabled no interrupts are asserted in case of a single or double bit error detection. However detected single bit errors are corrected. Modification of this bit is only possible, if EMCA[1:0] = 01_B. Otherwise any write to this bit is ignored.

Table 23.191 ECCRCFDnCTL Register Contents (2/2)

Bit position	Bit Name	Function
5	EC1ECP	1-bit error correction enable bit This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled. 0: When 1-bit error is detected, the error will be corrected. 1: When 1-bit error is detected, the error will not be corrected.
4	EC2EDIC	2-bit error detection interrupt control bit This bit controls whether to generate an interrupt when 2-bit error is detected. 0: When 2-bit error is detected, a INTECCDCNRAM interrupt will not be generated. 1: When 2-bit error is detected, a INTECCDCNRAM interrupt will be generated. (initial value)
3	EC1EDIC	1-bit error detection interrupt control bit This bit controls whether to generate an interrupt when 1-bit error is detected. 0: When 1-bit error is detected, a INTECCSPERIRAM interrupt will not be generated. 1: When 1-bit error is detected, a INTECCSPERIRAM interrupt will be generated.
2	ECER2F	2-bit error detection flag bit This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). When 2-bit error interrupt is enabled (EC2EDIC = 1) and this flag is set, an ECC 2-bit error interrupt (INTECCDCNRAM) is output. Write 1 to the ECER2C bit (bit 10) to clear the flag. This bit is cleared at the time of through mode enable selection (ECTHM = 1). If 2-bit error is detected again while this bit is set, an interrupt signal will not be generated. 0: 2-bit error has not occurred since this bit was cleared. 1: 2-bit error has occurred.
1	ECER1F	1-bit error detection/correction flag bit This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). Write 1 to the ECER1C bit (bit 9) to clear the flag. This bit is cleared at the time of through mode enable selection (ECTHM = 1). 0: 1-bit error has not occurred since this bit was cleared. 1: 1-bit error has occurred.
0	ECEMF	ECC error message flag This flag indicates whether an error exists in the current read data. This bit is updated whenever the RAM reads data. This bit might be set if it is read before initialization of the RAM. This bit is cleared at the time of through mode enable selection (ECTHM = 1) and when there is no 1 bit error in the decode circuit input data. 0: The currently-read RAM data does not have bit errors. 1: The currently-read RAM data have bit errors.

CAUTION

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

We recommend initializing the RAM before clearing bits 2 and 1.

23.12.5 ECCRCFDnTMC — RSCFDn ECC Test Mode Control Register

The ECCRCFDnTMC register switches to and controls the test mode.

This register can be used when RSCFD is not accessed to RAM.

Access: This register can be read or written in 16-bit units.

Address: <ECCRCFDn_base> + 0004_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ETMA1	ETMA0	—	—	—	—	—	—	ECTMCE	—	—	ECTRRS	ECREOS	ECENS	ECDCS	ECREIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W*1	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Note 1. These bits are always read as 0.

Table 23.192 ECCRCFDnTMC Register Contents (1/2)

Bit position	Bit Name	Function
15	ETMA1	Access control bits 1 and 0 to ECC test mode bit These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 10_B, writing to bit 7 is enabled.
14	ETMA0	
13 to 8	Reserved	When read, the value after reset is returned. Writing to these bits, write the value after reset.
7	ECTMCE	ECC test mode enable bit This bit specifies whether to enable access to the test registers and test control bits. When writing to this bit, (1, 0) should be written to (ETMA1, ETMA0) at the same time. 0: Access to the test mode registers and bits is disabled. 1: Access to the test mode registers and bits is enabled. Test registers: ECCRCFDnTED, ECCRCFDnTRC, ECCRCFDnSYND, ECCRCFDnHORD, ECCRCFDnECRD, ECCRCFDnERDB Register test control bit: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS
6, 5	Reserved	When read, the value after reset is returned. Writing to these bits, write the value after reset.
4	ECTRRS	ECC RAM read test mode selection bit Select reading destination when reading ECCRCFDnTED register and reading destination when reading ECCRCFDnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0:The read value of the ECCRCFDnTED register is the write value of the ECCRCFDnTED register. The read value of the ECCRCFDnERDB register is the write value of the ECCRCFDnERDB register. 1: The read value of the ECCRCFDnTED register can read RAM data. The read value of the ECCRCFDnERDB register is the ECC data to be written to RAM.
3	ECREOS	ECC redundant bit output data selection bit This bit is used to identifyand select the ECC data to be stored in RAM as ECC data generated for write data or the value of the ECCRCFDnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Store ECC data generated for write data to RAM. 1: Store the value of ECCRCFDnERDB register to RAM.

Table 23.192 ECCRCFDnTMC Register Contents (2/2)

Bit position	Bit Name	Function
2	ECENS	ECC encoder input selection bit This bit is used to identify the targeted data for ECC data generation as write data to RAM or the value of the ECCRCFDnTED register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate ECC data from the write data to RAM. 1: Generate ECC data from the value of the ECCRCFDnTED register.
1	ECDCS	ECC decoder input selection bit This bit is used to indetify and select the targeted data for syndrome code generation and error detection as RAM data or the value of the ECCRCFDnTED register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate syndrome code from RAM data and detect errors. 1: Generate syndrome code from the value of the ECCRCFDnTED register and detect errors.
0	ECREIS	ECC redundant bit input data selection bit This bit is used to indetify and select the targeted data for syndrome code generation and error detection as RAM data or the value of the ECCRCFDnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate syndrome code from ECC data stored in RAM and detect errors. 1: Generate syndrome code from the value of the ECCRCFDnERDB register and detect errors.

23.12.6 ECCRCFDnTED — RSCFDn ECC Encode/Decode Input/Output Replacement Test Register

In ECC test mode, this register handles test data.

The value of the register can be used to generate ECC data or syndrome code.

When ECC test mode is enabled (ECCRCFDnTMC.ECTMCE = 1), it is accesible. When ECCRCFDnTMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when RSCFD is not accessed to RAM.

Access: This register can be read/written in 32-bit units.

Address: <ECCRCFDn_base> + $000C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEDB[31:16]

Table 23.193 ECCRCFDnTED Register Contents

Bit position	Bit Name	Function
31 to 0	ECEDB[31:0]	When ECCRCFDnTMC.ECENS = 1, the value of this register is used to generate ECC data and the value this register to RAM is stored to RAM. When ECCRCFDnTMC.ECDCS = 1, the value of this register is used to generate syndrome code and the value of this register is stored in ECC decode syndrome data register (ECCRCFDnSYND). In addition, when ECCRCFDnTMC.ECTRRS = 1, RAM data [31:0], instead of written data, is read for the value of this register.

23.12.7 ECCRCFDnTRC — RSCFDn ECC Redundant Bit Data Control Test Register

In ECC test mode, this test register, for ECC data, consists of four 8-bit registers, ECCRCFDnSYND, ECCRCFDnHORD, ECCRCFDnECRD, and ECCRCFDnERDB.

When ECC test mode is enabled (ECCRCFDnTMC.ECTMCE = 1), this register can be accessed. When ECCRCFDnTMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when RSCFD is not accessed to RAM.

Access: This register can be read/written in 32-bit units.

Address: <ECCRCFDn_base> + 0008_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

23.12.8 ECCRCFDnSYND — RSCFDn ECC Decode Syndrome Data Register

In ECC test mode, this is a read-only register for storing generated syndrome code.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCFDnTMC.ECTMCE = 1), this register can be accessed.
When ECC test mode is disabled (ECCRCFDnTMC.ECTMCE = 0), 00_H is read.

Access: This is a read-only register that can be read in 8-bit units.

Address: <ECCRCFDn_base> + $000B_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	SYND6	SYND5	SYND4	SYND3	SYND2	SYND1	SYND0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 23.194 ECCRCFDnSYND Register Contents

Bit position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	SYND[6:0]	The generated syndrome code is stored as needed.

23.12.9 ECCRCFDnHORD — RSCFDn ECC 7-Bit Redundant Bit Data Hold Test Register

In ECC test mode, this register is used to store ECC data for read RAM data.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCFDnTMC.ECTMCE = 1), this register can be accessed.
When ECC test mode is disabled (ECCRCFDnTMC.ECTMCE = 0), 00_H is read.

Access: This is a read-only register that can be read in 8-bit units.

Address: <ECCRCFDn_base> + $000A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	HORD6	HORD5	HORD4	HORD3	HORD2	HORD1	HORD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 23.195 ECCRCFDnHORD Register Contents

Bit position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	HORD[6:0]	ECC code for read RAM data is stored as needed. When ECCRCFDnTMC.ECTRRS = 1 and ECCRCFDnTED register is read, ECC code is stored.

23.12.10 ECCRCFDnECRD — RSCFDn ECC Encode Test Register

In ECC test mode, this is a read-only register for storing ECC data generated for write RAM data.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCFDnTMC.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (ECCRCFDnTMC.ECTMCE = 0), 00_H is read.

Access: This is a read-only register that can be read in 8-bit units.

Address: <ECCRCFDn_base> + 0009_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ECRD6	ECRD5	ECRD4	ECRD3	ECRD2	ECRD1	ECRD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 23.196 ECCRCFDnECRD Register Contents

Bit position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	ECRD[6:0]	These bits can read ECC data generated at the time of RAM data writing, and can read ECC data for the data written to the ECCRCFDnTED register when ECCRCFDnTMC.ECENS = 1.

23.12.11 ECCRCFDnERDB — RSCFDn ECC Redundant Bit Input/Output Replacement Buffer Register

In ECC test mode, this register handles ECC data.

The value of this register can be used as ECC data generated at the time of RAM writing or ECC data read at the time of RAM data reading.

When ECC test mode is enabled (ECCRCFDnTMC.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (ECCRCFDnTMC.ECTMCE = 0), 00_H is read.

Access: This register can be read/written in 8-bit units.

Address: <ECCRCFDn_base> + 0008_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ERDB6	ERDB5	ERDB4	ERDB3	ERDB2	ERDB1	ERDB0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.197 ECCRCFDnERDB Register Contents

Bit position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
6 to 0	ERDB[6:0]	When ECCRCFDnTMC.ECREOS = 1, these bits store the value of this register as ECC data to RAM. When ECCRCFDnTMC.ECREIS = 1, the value of this register is read as ECC data read from RAM. When ECCRCFDnTMC.ECTRRS = 1, ECC data to be stored in RAM is read instead of the write data for the read value of this register.

23.12.12 ECCRCFDnEAD0 — RSCFDn ECC Error Address Register

ECCRCFDnEAD0 is a read-only register to hold the address at which an ECC error has occurred.

Access: This register can be read/written in 32-bit units.

Address: <ECCRCFDn_base> + 0010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEAD[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEAD[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.198 ECCRCFDnEAD0 Register Contents

Bit position	Bit Name	Function
31 to 0	ECEAD[31:0]	ECCRCFDnEAD0 is a read-only register to hold the address at which an ECC error has occurred. If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in ECCRCFDnEAD0 as the address at which the ECC error has occurred. The address is stored upon detection of the first ECC error while no error status is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored. Only one address can be held in ECCRCFDnEAD0.

23.13 Notes on the RS-CANFD Module

- When changing interface mode without resetting the RS-CANFD, write the value after reset to all registers and bits that are not allocated to the register map after change and then modify the RSCFDnCFDGRMCFG register.
- When changing a global mode, check the GSLPSTS, GHLTSTS, and GRSTSTS flags in the RSCFDn(CFD)GSTS register for transitions. When changing a channel mode, check the CSLPSTS, CHLTSTS, and CRSTSTS flags in the RSCFDn(CFD)CmSTS register (m = 0 to 2) for transitions.
- When only classical CAN frames are used in CAN FD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value.
- The acceptance filter processing checks receive rules sequentially in ascending order from the minimum rule number. If the same ID, IDE bit, or RTR bit value is set for multiple receive rules, the minimum number of receive rule is used for the acceptance filter processing. If the message does not pass through the subsequent DLC filter processing, the data processing is terminated without returning to the acceptance filter processing and the message is not stored in the buffer.
- When linking transmit buffers to transmit/receive FIFO buffers or allocating transmit buffers to transmit queues, set the control register (RSCFDn(CFD)TMCp) of the corresponding transmit buffer to 00_H. The status register (RSCFDn(CFD)TMSTSp) of the corresponding transmit buffer should not be used. Flags in other status registers (registers RSCFDn(CFD)TMTRSTS0 to RSCFDn(CFD)TMTRSTS1, RSCFDn(CFD)TMTARSTS0 to RSCFDn(CFD)TMTARSTS1, RSCFDn(CFD)TMTCSTS0 to RSCFDn(CFD)TMTCSTS1, and RSCFDn(CFD)TMTASTS0 to RSCFDn(CFD)TMTASTS1), which correspond to transmit buffers linked to transmit/receive FIFO buffers or allocated to transmit queues remain unchanged. Set the enable bit in the corresponding interrupt enable register (registers RSCFDn(CFD)TMIEC0 to RSCFDn(CFD)TMIEC1) to 0 (transmit buffer interrupt is disabled).
- When using transmit buffer merge mode (in CAN FD mode), write 00H to the control register (RSCFDn(CFD)TMCp) of the transmit buffer corresponding to the transmit buffer allocated as a payload storage area. Set the enable bit of corresponding interrupt enable registers (RSCFDn(CFD)TMIEC0 to RSCFDn(CFD)TMIEC1) to 0 (to disable interrupts).
- Transmit buffers that are linked to transmit/receive FIFO buffers must not be allocated to transmit queues. Do not allocate a transmit buffer allocated as a payload storage area in transmit buffer merge mode (in CAN FD mode) to the transmit queue either.
- Only a single transmit/receive FIFO buffer can be linked to a transmit buffer. Do not link two or more transmit/receive FIFO buffers to transmit buffers of the same number.
- When the CANm bit time clock is selected as a timestamp counter clock source, the timestamp counter stops when the corresponding channel has transitioned to channel reset mode or channel halt mode.
- In case of an attempt to store a new received message when the receive FIFO buffer and the transmit/receive FIFO buffer are full, the new message is discarded. If you wish to store a new transmit message in the transmit/receive FIFO buffer or the transmit queue, check that the transmit/receive FIFO buffer or the transmit queue is not full.
- In the case of registers that access the RAM, the value after reset shown in **Section 23.3, Registers (Classical CAN Mode)** and Section 23.4, Registers (CAN FD Mode) indicate the values cleared by initialization of the CAN RAM. Values before clear are undefined. The

following registers apply.

- Receive rule (RSCFDn(CFD)GAFLIDj, RSCFDn(CFD)GAFLMj, RSCFDn(CFD)GAFLP0_j, RSCFDn(CFD)GAFLP1_j registers)
- Receive buffers (RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, RSCFDn(CFD)RMDFb_q registers)
- Receive FIFO buffer access registers (RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDn(CFD)RFDFd_x registers)
- Transmit/receive FIFO buffer access registers (RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDn(CFD)CFDFd_k registers)
- Transmit buffers (RSCFDn(CFD)TMIDp, RSCFDn(CFD)TMPTRp, RSCFDnCFDTMFDCTRp, and RSCFDn(CFD)TMDFb_p registers)
- Transmission history access register (RSCFDn(CFD)THLACCm registers)
- RAM test page access register (RSCFDn(CFD)RPGACCr registers)

- The values of unused receive buffers (RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q registers), receive FIFO buffer access registers (RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDn(CFD)RFDFd_x registers) and transmit/receive FIFO buffer access registers (RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDn(CFD)CFDFd_k registers) are undefined when the RS-CANFD module transitions to global operation mode or global test mode after exiting from global reset mode.

Section 24 Ethernet AVB MAC (ETNB)

This section contains a generic description of the Ethernet AVB MAC (ETNB).

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.
The subsequent sections describe the features that apply to all implementations.

24.1 Overview of RH850/D1L/D1M Ethernet AVB MAC (ETNB)

24.1.1 Units

This microcontroller has the following number of units of the Ethernet AVB MAC (ETNB).

Table 24.1 Units

Ethernet AVB MAC (ETNB)	D1L1	D1L2(H)	D1M1(H) D1M1-V2 D1M1A	D1M2(H)
Units	0	0	1	1
Names	–	–	ETNB0	ETNB0

Units index n

Throughout this section, the individual units of an Ethernet AVB MAC are identified by the index "n" (n = 0).

24.1.2 Register addresses

All Ethernet AVB MACs register addresses are given as address offsets from the individual base addresses <ETNBn_base>.
The <ETNBn_base> addresses of each ETNBn are listed in the following table:

Table 24.2 Register base addresses <ETNBn_base>

ETNBn unit	<ETNBn_base> address
ETNB0	FFDE 0000_H

24.1.3 Clock supply

All Ethernet AVB MACs provide three clock inputs.

Table 24.3 Clock supply

ETNBn unit	ETNBn clock	Connected to
ETNB0	PBUS clock	Clock Controller ETNBPCLK
	Cross-connect clock	Clock Controller ETNBXCCLK
	AVB clock	Clock Controller CLKFIX
	External clock	Clock Controller CLKFIX

24.1.4 Interrupts

The Ethernet AVB MACs can generate the following interrupt requests:

Table 24.4 ETNBn interrupt requests

ETNBn signals	Function	Connected to
ETNB0:		
pif_intr_line_0_n	Interrupt request line 0	Interrupt Controller INTETNB0LINE0
pif_intr_line_1_n	Interrupt request line 1	Interrupt Controller INTETNB0LINE1
pif_intr_line_2_n	Interrupt request line 2	Interrupt Controller INTETNB0LINE2
pif_intr_line_3_n	Interrupt request line 3	Interrupt Controller INTETNB0LINE3

24.1.5 Reset sources

The Ethernet AVB MACs and their registers are initialized by the following reset signal:

Table 24.5 Reset sources

ETNBn unit	Reset signal
ETNB0	• Reset Controller SYSRES • Reset Controller ETNB0RES • reset upon wake-up from DEEPSTOP mode

CAUTION

By default the ETNB0RES reset is active.
Thus before accessing this module this reset must be released via the MRSTC register of the Reset Controller. Refer to Section 9, Reset Controller for details.

24.1.6 I/O signals

The following table shows the I/O signals of the Ethernet AVB MAC.

Table 24.6 ETNBn I/O signals

ETNBn signals	Function	Connected to
ETNB0		
AVB_MDIO	Management information transmit/receive data	Port ETNB0MDIO
AVB_MDC	Management information transfer clock signal	Port ETNB0MDC
AVB_TXD[3:0]	Transmit data signal	Port ETNB0TXD[3:0]
AVB_TX_EN	Transmit data enable signal	Port ETNB0TXEN
AVB_TX_ER*1	Transmit error signal	Port ETNB0TXER
AVB_COL*1	Collision detection signal	Port ETNB0COL
AVB_CRS*1	Carrier detection signal	Port ETNB0CRS
AVB_TX_CLK	Transmit clock signal	Port ETNB0TXCLK
AVB_RX_CLK	Receive clock signal	Port ETNB0RXCLK
AVB_RXD[3:0]	Receive data signal	Port ETNB0RXD[3:0]
AVB_RX_DV	Receive data enable signal	Port ETNB0RXDV
AVB_RX_ER*1	Reception error signal	Port ETNB0RXER

Note 1. The Ethernet AVB MAC (ETNB) supports the MII-Lite interface.
When MII-Lite interface is used the signals AVB_TX_ER(out), AVB_RX_ER(in), AVB_COL(in) and AVB_CRS(in) are not used. The unused input signals are tied to low by internal circuit. Port pins with this unused ETNB functions can be used for other port mode or alternative mode functions.
Example: Port pin P42_15 (ETNB0RXER) can be used in port mode as GPIO input or output pin.

24.1.7 Bus master ID

The Ethernet AVB MAC Unit bus master interface is connected to the cross-connect system. The master interface has the following master ID:

ETNB0: MSTID6

24.2 Overview

The EthernetAVB is an on-chip Ethernet controller (E-MAC) that conforms to the definition of the MAC (Media Access Control) layer for Ethernet in the IEEE 802.3 standard.

When connected with a physical-layer LSI chip (PHY-LSI) that complies with the standard, the E-MAC is able to transmit and receive Ethernet (IEEE 802.3) frames. The E-MAC has a single MAC layer interface.

The EthernetAVB has a dedicated direct memory access controller (AVB-DMAC) for transferring transmitted Ethernet frames to and received Ethernet frames from respective storage areas in the URAM at high speed.

The AVB-DMAC is compliant with the following three standards formulated for IEEE 802.1BA: the IEEE 802.1AS timing and synchronization protocol, the IEEE 802.1Qav real-time transfer, and the IEEE 802.1Qat stream reservation protocol.

In this section, URAM refers to the CPU local RAM (LRAM), video RAM (VRAM) or external SDRAM.
For details about the memory access options refer to Section 14.2.3, Cross-connect details.

24.2.1 Specifications (Functions)

Table 24.7 lists the specifications of the EthernetAVB module.

Table 24.7 Specifications (Functions)

Item	Description
Protocol	Flow control conforming with the IEEE 802.3x standard
Data transmission and reception	Transmission and reception of Ethernet (IEEE 802.3) frames
Transfer speed	Supports transfer at 10 and 100 Mbps
Mode	• Full-duplex mode • Half-duplex mode
Interface	Supports the IEEE 802.3 standard MII (Media Independent Interface)
Summary of the EthernetAVB function	An intelligent frame separation DMAC (AVB-DMAC) conforming with the following standards stipulated for IEEE 802.1BA: • IEEE 802.1AS (time synchronization protocol) • IEEE 802.1Qav (real-time transfer) • IEEE 1722 (AVTP presentation timestamp) IEEE 802.1Qat is supported by software. • Descriptor management system • Identification and sorting of frame data, and extraction and gathering of valid data • Controllable interrupt frequency (reducing the load on the CPU)
Magic Packet™	Detection of Magic Packets™*1

Note 1. Magic Packet™ is a trademark of Advanced Micro Devices, Inc.

24.2.2 Block Diagram

Figure 24.1 is a block diagram of the EthernetAVB.

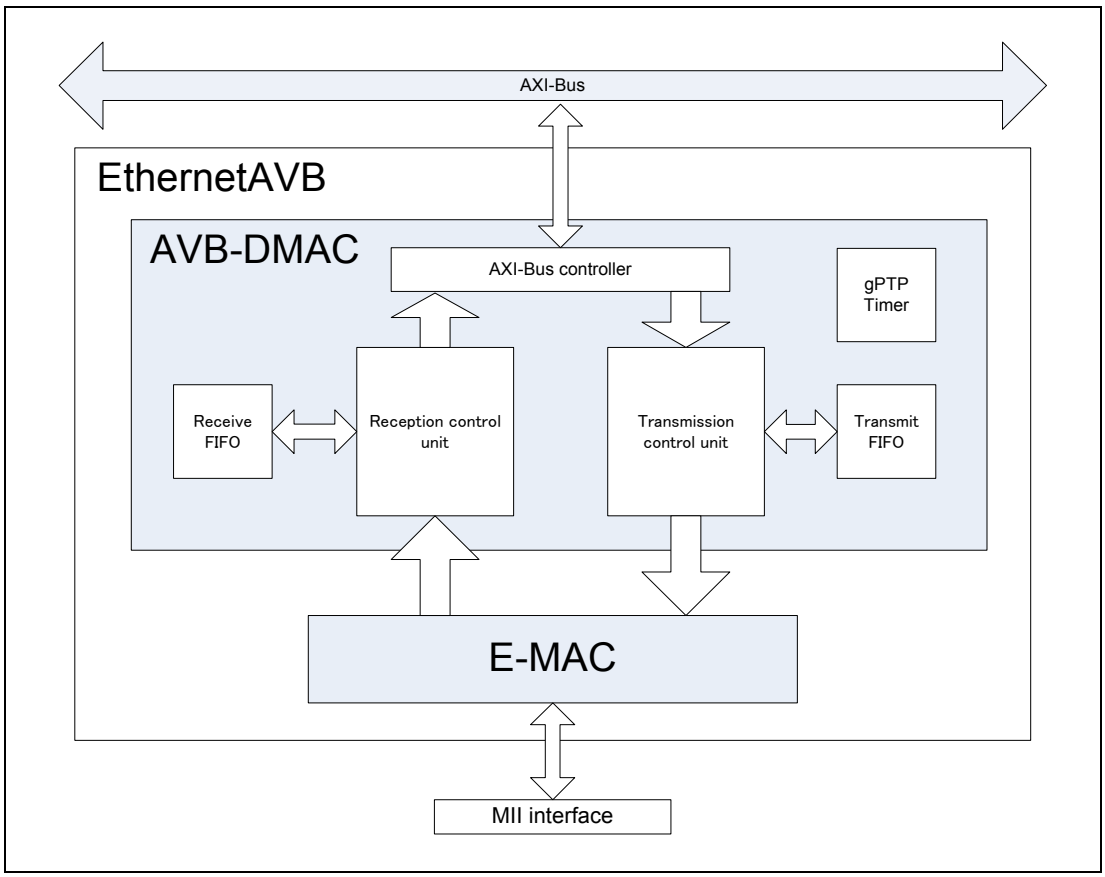

Figure 24.1 Block Diagram of EthernetAVB

24.3 Register Descriptions

Table 24.8 and **Table 24.9** lists the EthernetAVB related registers and their configurations.

Table 24.8 Configuration of AVB-DMAC-related Registers (1/2)

Module Name	Register Name	Symbol	Value after Reset	Address	Access size
ETNBn	AVB-DMAC mode register	CCC	H'0000 0000	<ETNBn_base> + 000_H	32
ETNBn	Descriptor base address table register	DBAT	H'0000 0000	<ETNBn_base> + 004_H	32
ETNBn	Descriptor base address load request register	DLR	H'003F FFFF	<ETNBn_base> + 008_H	32
ETNBn	AVB-DMAC status register	CSR	H'0000 0001	<ETNBn_base> + $00C_H$	32
ETNBn	Current descriptor address register q (q = 0 to 21)	CDARq	H'0000 0000	<ETNBn_base> + 010_H+q*4	32
ETNBn	Error Status Register	ESR	H'0000 0000	<ETNBn_base> + 088_H	32
ETNBn	Receive configuration register	RCR	H'1800 0000	<ETNBn_base> + 090_H	32
ETNBn	Receive queue configuration register i (i = 0 to 4)	RQCi	H'0000 0000	<ETNBn_base> + 094_H+i*4	32
ETNBn	Receive padding configuration register	RPC	H'0000 0100	<ETNBn_base> + $0B0_H$	32
ETNBn	Unread frame counter warning level register	UFCW	H'0000 0000	<ETNBn_base> + $0BC_H$	32
ETNBn	Unread frame counter stop level register	UFCS	H'0000 0000	<ETNBn_base> + $0C0_H$	32
ETNBn	Unread frame counter register i (i = 0 to 4)	UFCVi	H'0000 0000	<ETNBn_base> + $0C4_H$+i*4	32
ETNBn	Unread frame counter decrement register i (i = 0 to 4)	UFCDi	H'0000 0000	<ETNBn_base> + $0E0_H$+i*4	32
ETNBn	Separation filter offset register	SFO	H'0000 0000	<ETNBn_base> + $0FC_H$	32
ETNBn	Separation filter pattern register i (i = 0 to 31)	SFPi	H'0000 0000	<ETNBn_base> + 100_H+i*4	32
ETNBn	Separation filter mask register i (i = 0, 1)	SFMi	H'0000 0000	<ETNBn_base> + $1C0_H$+i*4	32
ETNBn	Transmit configuration register	TGC	H'0022 2200	<ETNBn_base> + 300_H	32
ETNBn	Transmit configuration control register	TCCR	H'0000 0000	<ETNBn_base> + 304_H	32
ETNBn	Transmit status register	TSR	H'0000 0000	<ETNBn_base> + 308_H	32
ETNBn	Time stamp FIFO access register 0	TFA0	H'0000 0000	<ETNBn_base> + 310_H	32
ETNBn	Time stamp FIFO access register 1	TFA1	H'0000 0000	<ETNBn_base> + 314_H	32
ETNBn	Time stamp FIFO access register 2	TFA2	H'0000 0000	<ETNBn_base> + 318_H	32

ETNBn	Too-long frame receive counter register	TLFRCR	H'0000 0000	<ETNBn_base> + 758_H	32
ETNBn	Residual-bit frame receive counter register	RFCR	H'0000 0000	<ETNBn_base> + 760_H	32
ETNBn	Multicast address frame receive counter register	MAFCR	H'0000 0000	<ETNBn_base> + 778_H	32

NOTE

In the header files the names of the above registers are defined in the following format:

<ModuleName> + <Symbol>.

<ModuleName> and <Symbol> are defined in the above tables.

24.3.1 AVB-DMAC Mode Register (CCC)

The CCC register specifies the operating mode of the AVB-DMAC.

Access: This register can be read/written in 8/16/32-bit units.

Address: <ETNBn_base> + 000_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

FCE (Flow Control Enable) Bit

This bit enables the flow control support of MAC.

When flow control is enabled, the MAC gets informed about the Rx-FIFO level (Rx-FIFO fill level reached RCR.RFCL[12:0]).

LBME (Loopback Mode Enable) Bit

This bit enables loopback mode.

In loopback mode, the transmission lines are internally connected to the reception lines. When loopback mode is to be used, the Ethernet transmission clock must be supplied to the MII interface. A received clock signal is not required. Writing to this bit is only possible when the current operating mode is configuration mode.

CAUTION

Data for transmission are still output normally. To eliminate effects on external modules, pin control should be applied to block the output of data. For pin control, see section 2, Pins.

BOC (First Byte Specification) Bit

Specifies the allocation of the first byte from a received Ethernet frame to the URAM.

This configuration setting does not affect the format and filter parameters of the descriptor in the URAM.

Writing to this bit is only possible when the current operating mode is configuration mode.

Figure 24.2 to **Figure 24.4** show how data from frames received via the Ethernet connection are stored in the URAM.

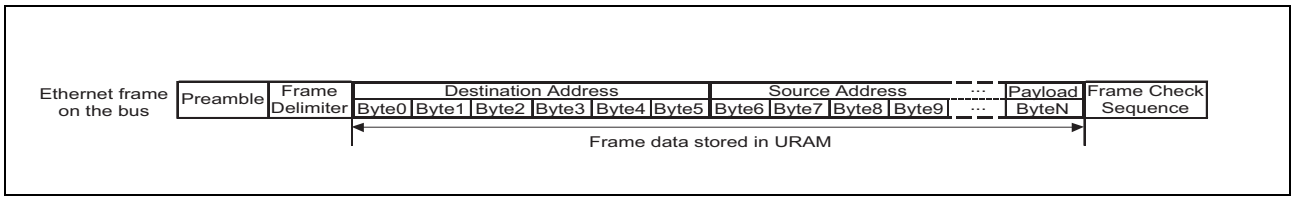

Figure 24.2 Data for Reception in an Ethernet Frame

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

DPTR+8	Byte8								Byte9								Byte10								Byte11							

Figure 24.4 When CCC.BOC = 1

CSEL[1:0] (gPTP Clock Select) Bits

These bits select the clock source for the gPTP timer.

Writing to these bits is only possible when the current operating mode is configuration mode.

DTSR (Data Transmission Suspend Request) Bit

This bit can suspend access to the URAM.

The access is suspended on completion of the transfer of the frame currently being transferred.

This function disables access to the URAM without affecting normal operation of the AVB-DMAC. Use this bit when exclusive control over the contents of the URAM is necessary, for example, in checking its integrity.

Note that the transmission and reception queues are not processed while access is suspended.

Change neither the AVB-DMAC settings nor the mode while access is suspended.

OPC[1:0] (Operating Mode Configuration) Bits

These bits specify the operating mode.

For the operating modes, see Section 24.4.1.1, Operating Modes.

Writing to this bit is possible in any of the operating modes, but should not be done after the application system has issued a Power Off request.

24.3.2 Descriptor Base Address Table Register (DBAT)

The DBAT register is used to set the base address of the descriptor table.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 004_H

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.11 DBAT register contents

Bit Position	Bit Name	Function
b31 to b0	TA[31:0]	Descriptor Base Table Address Base address of the descriptor table in the URAM

CAUTION

The setting of this bit must be a multiple of four (i.e. b0 and b1 must be set to 0).

TA[31:0] (Descriptor Base Table Address) Bits

These bits specify the base address of the descriptor table in the URAM.

For the structure of this table, see Section 24.4.3, Descriptors.

Writing to this bit is only possible when the current operating mode is configuration mode.

24.3.3 Descriptor Base Address Load Request Register (DLR)

The DLR register is used to issue a request to load the values from the current descriptor address register q (CDARq) for each queue to the descriptor base address table register (DBAT).

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 008_H

Initial value: $003F\ FFFF_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b4	LBA4	Base Address Load Request (Rx0: Best Effort) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.

Table 24.12 DLR register contents (3/3)

Bit Position	Bit Name	Function
b3	LBA3	Base Address Load Request (Tx3: Stream Class A) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
b2	LBA2	Base Address Load Request (Tx2: Stream Class B) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
b1	LBA1	Base Address Load Request (Tx1: Network Control) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
b0	LBA0	Base Address Load Request (Tx0: Best Effort) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.

LBAq (Base Address Load Request) Bits

Each bit is used to issue requests to load base addresses and to indicate that a base address is currently being loaded.

Setting a bit to 1 issues a request for loading the descriptor base address for the queue q.

If transfer is currently in progress, loading is executed on completion of transfer for the current frame.

Completion of loading leads to automatic setting of the corresponding bit to 0.

For the transmission queues, base address load requests are executed even while fetching is in progress (the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is 1). Therefore, be sure to check that fetching is not in progress before issuing a request.

Writing to a bit of this register is only possible when the current operating mode is configuration mode.

Only 1 can be written to this bit.

24.3.4 AVB-DMAC Status Register (CSR)

The CSR register is used to indicate the operating mode in which the AVB-DMAC is running and the individual communications states.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + $00C_H$

Initial value: $0000\ 0001_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b16	TPO0	Transmit Process Status 0 (Best Effort) 0: Normal operation 1: Transmission is in progress.
b15 to b9	—	Reserved These bits are read as 0. The write value should be 0.
b8	DTS	Data Transmission Suspended Status 0: Normal operation 1: Transmission is suspended.
b7 to b4	—	Reserved These bits are read as 0. The write value should be 0.
b3 to b0	OPS[3:0]	Operating Mode Status B'0001: Reset mode B'0010: Configuration mode B'0100: Operation mode B'1000: Standby mode Other settings are reserved.

RPO (Receive Process Status) Bit

This bit indicates whether a reception queue contains an unread received frame.

This bit being set to 1 indicates that a received frame is yet to be stored in the URAM.

- [Clearing conditions]
  The current operating mode is not operation mode.
  Received frames in the reception FIFO all being stored in the URAM.
- [Setting condition]
  A received frame being stored in the reception FIFO (but not yet in the URAM)

TPO3 (Transmit Process Status 3) Bit

This bit indicates whether a class A stream is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data.

- [Clearing conditions]
  The current operating mode is not operation mode.
  Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (TCCR.TSRQ3) is 0)
- [Setting condition]
  Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ3))

TPO2 (Transmit Process Status 2) Bit

This bit indicates whether a class B stream is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data.

- [Clearing conditions]
  The current operating mode is not operation mode.
  Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (TCCR.TSRQ2) is 0)
- [Setting condition]
  Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ2))

TPO1 (Transmit Process Status 1) Bit

This bit indicates whether a network control is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data.

- [Clearing conditions]
  The current operating mode is not operation mode.
  Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (TCCR.TSRQ1) is 0)
- [Setting condition]
  Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ1))

TPO0 (Transmit Process Status 0) Bit

This bit indicates whether a best effort is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data.

- [Clearing conditions]
  The current operating mode is not operation mode.
  Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (TCCR.TSRQ0) is 0)
- [Setting condition]
  Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ0))

DTS (Data Transmission Suspend Status) Bit

This bit indicates whether access to the URAM is enabled.

- [Clearing condition]
  The data transmission suspend request bit in the AVB-DMAC mode register (CCC.DTSR) being 0.
- [Setting condition]
  Access to the URAM not proceeding while the data transmission suspend request bit (CCC.DTSR) in the AVB-DMAC mode register (CCC) is 1 (if the URAM is being accessed, this bit is set to 1 on completion of access).

OPS[3:0] (Operating Mode Status) Bits

These bits indicate the current operating mode.

For the operating modes, see Section 24.4.1.1, Operating Modes.

24.3.5 Current Descriptor Address Register q (CDARq) (q = 0 to 21)

The CDARq register indicates the current descriptor address.

Access: This register is read-only in 32-bit units.

Address: CDAR0: <ETNBn_base> + 010_H; CDAR1: <ETNBn_base> + 014_H; CDAR2: <ETNBn_base> + 018_H
CDAR3: <ETNBn_base> + $01C_H$; CDAR4: <ETNBn_base> + 020_H; CDAR5: <ETNBn_base> + 024_H
CDAR6: <ETNBn_base> + 028_H; CDAR7: <ETNBn_base> + $02C_H$; CDAR8: <ETNBn_base> + 030_H
CDAR9: <ETNBn_base> + 034_H; CDAR10: <ETNBn_base> + 038_H; CDAR11: <ETNBn_base> + $03C_H$
CDAR12: <ETNBn_base> + 040_H; CDAR13: <ETNBn_base> + 044_H; CDAR14: <ETNBn_base> + 048_H
CDAR15: <ETNBn_base> + $04C_H$; CDAR16: <ETNBn_base> + 050_H; CDAR17: <ETNBn_base> + 054_H
CDAR18: <ETNBn_base> + 058_H; CDAR19: <ETNBn_base> + $05C_H$; CDAR20: <ETNBn_base> + 060_H
CDAR21: <ETNBn_base> + 064_H

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.14 CDARq (q = 0 to 21) register contents

Bit Position	Bit Name	Function
b31 to b0	CDA[31:0]	Current Descriptor Address The address of the current descriptors for the transmission queues

CDA[31:0] (Current Descriptor Address) Bits

CDAR0 to CDAR3 indicate the addresses of the current descriptors for the corresponding transmission queues while CDAR4 to CDAR21 indicate the addresses of the current descriptors for the corresponding reception queues.

If the operating mode is changed to operation mode, the contents of the register for the queue to be used are set in the descriptor base address table register (DBAT).

Also, when the descriptor base address load request register (DLR) issues a load request, the contents of the corresponding register are set in the descriptor base address table register (DBAT).

Conditions for updating:

These bits are set to 0 when the operating mode is not operation mode.

This register is updated in response to processing of the descriptor for a queue.

24.3.6 Error Status Register (ESR)

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 088_H

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	EIL	ET[3:0]				—	—	—	EQN[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 24.15 ESR register contents

Bit Position	Bit Name	Function
b31 to b13	—	Reserved These bits are read as 0. The write value should be 0.
b12	EIL	Error Information Lost 0: No loss of error information 1: Lost of error information detected
b11 to b8	ET[3:0]	Error Type B'0000: Read descriptor from URAM B'0001: Write descriptor to URAM B'0010: Interpret read descriptor B'0011: Tx-Buffer is corrupted B'0100: Read data from URAM B'0101: Write data or timestamp to URAM B'0110: Reading from Rx-FIFO B'0111: Rx-FIFO is corrupted B'1000: Frame size error during reception detected B'1001: Frame size error during transmission detected B'1010: Tx-Buffer overflow
b7 to b5	—	Reserved These bits are read as 0. The write value should be 0.
b4 to b0	EQN[4:0]	Error Queue Number

EIL Error Information Lost Bit

This bit indicates that error information detected by ETNB is lost because the previous reported error has not been processed by CPU.

[Changing condition]

This bit is set to 0 when leaving OPERATION mode.

This bit is set to 0 when CPU writes 0b to EIS.QEF.

This bit is set to 1 when the set condition of EIS.QEF is fulfilled while EIS.QEF is 1.

ET[3:0] Error Type Bits

These bits indicate details about the transfer stage which was handled when ETNB has detected an error.

When the fault is related to the read descriptor (ESR.ET[3:0] = B'0000 or B'0010), CPU needs to correct the faulty descriptor before the related queue can continue processing. Because the queue halts at the faulty descriptor CDARq.CDA[31:0] (with q = ESR.EQN[4:0]) is identifying the faulty descriptor directly.

When the fault is related to descriptor writing (ESR.ET[3:0] = B'0001), CPU needs recognise the not-updated or incorrectly updated descriptor in queue ESR.EQN[4:0]. The write problem is not influencing how ETNB processes the descriptor chain.

When the fault is related to the Tx-Buffer (ESR.ET[3:0] = B'0011) CPU needs to clean-up the Tx-Buffer to correct the buffer control structures.

All other errors are transient in nature and may be corrected by continuation of HW or SW operation; so there is no strong demand on CPU interaction.

The CPU should only evaluate these bits when EIS.QEF is 1.

[Changing condition]

These bits are updated when the set condition of EIS.QEF is fulfilled and EIS.QEF is 0.

EQN[4:0] Error Queue Number Bits

These bits indicate the queue number which was handled when ETNB has detected an error.

A fault reported for ESR.EQN[4:0] = 0 to 3 is related to transmit queue t = 0 to 3.
From ESR.EQN[4:0] = 4 the fault is related to receive queue r = ESR.EQN[4:0] - 4.

The CPU should only evaluate these bits when EIS.QEF is 1.

The CPU should not evaluate these bits when ESR.ET[3:0] is B'0011 or B'0111.

[Changing condition]

These bits are updated when the set condition of EIS.QEF is fulfilled and EIS.QEF is 0.

24.3.7 Receive Configuration Register (RCR)

The RCR register is used to make settings related to reception for the AVB-DMAC.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 090_H

Initial value: $1800\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	—	—	—	—	—	—	—	—	—	—	ETS2	ETS0	ESF[1:0]		ENCF	EFFS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 24.16 RCR register contents

Bit Position	Bit Name	Function
b31 to b29	—	Reserved These bits are read as 0. The write value should be 0.
b28 to b16	RFCL[12:0]	Receive FIFO Caution Level Recommended value: H'1800
b15 to b6	—	Reserved These bits are read as 0. The write value should be 0.
b5	ETS2	Time Stamp Enable (Stream) 0: Time stamping is disabled. 1: Time stamping is enabled. Recommended value: 0
b4	ETS0	Time Stamp Enable (Best Effort) 0: Time stamping is disabled. 1: Time stamping is enabled. Recommended value: 0
b3, b2	ESF[1:0]	Stream Filtering Select Settings for reception queues 2 to 17 B'00: Filtering is disabled. Frames are processed in queue 0 (best effort). B'01: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames from the stream are processed in queue 0 (best effort). B'10: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames are discarded. B'11: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames from a stream are processed in queue 0 (best effort). Recommended value: 10 or 11
b1	ENCF	Network Control Filtering Enable Setting for reception queue 1 (network control) 0: Network control is disabled. 1: Network control is enabled.
b0	EFFS	Error Frame Enable 0: Error frames are disabled. 1: Error frames are enabled. Recommended value: 0

RFCL[12:0] (Receive FIFO Caution Level) Bits

These bits set the caution level for the reception FIFO and are used to maintain the priority order of the storage of received data and the fetching of data for transmission.

If the reception FIFO contains less data than this level, processing of both transmission and reception queues becomes pending.

If the reception FIFO contains more data than this level, only data in the reception queue are transferred, and processing of the transmission queue becomes pending.

Writing to this bit is only possible when the current operating mode is configuration mode.

CAUTION

- **The setting of this bit must be a multiple of four (i.e. set RFCL[1:0] = B'00).**
- **In the case of this LSI chip, set these bits to H'1800.**

ETS2 (Time Stamp Enable (Stream)) Bit

Enables the inclusion of time-stamp information in reception queues 2 to 17.

Writing to this bit is only possible when the current operating mode is configuration mode.

ETS0 (Time Stamp Enable (Best Effort)) Bit

Enables the inclusion of time-stamp information in reception queue 0.

Writing to this bit is only possible when the current operating mode is configuration mode.

ESF[1:0] (Stream Filtering Select) Bits

These bits select separation filtering for reception queues 2 to 17.

The queue-dependent separation filter can be used in combination with the identification of AVB stream frames.

When the value is B'00, filtering is disabled and frames from streams are processed in reception queue 0 (best effort).

When the value is B'01, the separation filter is enabled for both AVB stream frames and non-AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort).

When the value is B'10, the separation filter is enabled for AVB stream frames; frames from non-matching streams are discarded.

When the value is B'11, the separation filter is enabled for AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort).

For separation filtering, see **24.4.4.1** (1) Separation Filtering.

Writing to this bit is only possible when the current operating mode is configuration mode.

ENCF (Enable Network Control Filtering) Bit

Enables the AVB network control frame for reception queue 1.

When reception queue 1 is disabled, a received frame is stored in reception queue 0 (best effort).

Writing to this bit is only possible when the current operating mode is configuration mode.

EFFS (Enable Error Frame) Bit

Enables or disables the reception of frames that have been classified as error frames by the E-MAC.

Received error frames are stored in reception queue 0 (best effort).

An indicator of error detection by the E-MAC during reception is stored in the descriptor (DESCR.MS).

Writing to this bit is only possible when the current operating mode is configuration mode.

24.3.8 Receive Queue Configuration Register i (RQCi) (i = 0 to 4)

The RQC0 register is used to set up reception queues 0 to 3.

The RQC1 register is used to set up reception queues 4 to 7.

The RQC2 register is used to set up reception queues 8 to 11.

The RQC3 register is used to set up reception queues 12 to 15.

The RQC4 register is used to set up reception queues 16 to 17.

Access: This register can be read/written in 8/16/32-bit units.

Address: RQC0: <ETNBn_base> + 094_H RQC1: <ETNBn_base> + 098_H RQC2: <ETNBn_base> + $09C_H$
RQC3: <ETNBn_base> + $0A0_H$ RQC4: <ETNBn_base> + $0A4_H$

Initial value: $0000\ 0000_H$

Table 24.17 RQCi register contents (1/2)

Bit Position	Bit Name	Function
b31, b30	—	Reserved These bits are read as 0. The write value should be 0.
b29, b28	UFCC3[1:0]	Unread Frame Counter Configuration (Receive Queue 3+i*4) These bits set the unread frame counter used in reception queue 3+4*i.
b27, b26	—	Reserved These bits are read as 0. The write value should be 0.
b25, b24	RSM3[1:0]	Receive Synchronous Mode (Receive Queue 3+i*4) B'00: Mode with write-back Other than B'00: Setting prohibited
b23, b22	—	Reserved These bits are read as 0. The write value should be 0.
b21, b20	UFCC2[1:0]	Unread Frame Counter Configuration (Receive Queue 2+i*4) These bits set the unread frame counter used in reception queue 2+4*i.
b19, b18	—	Reserved These bits are read as 0. The write value should be 0.
b17, b16	RSM2[1:0]	Receive Synchronous Mode (Receive Queue 2+i*4) B'00: Mode with write-back Other than B'00: Setting prohibited
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13, b12	UFCC1[1:0]	Unread Frame Counter Configuration (Receive Queue 1+i*4) These bits set the unread frame counter used in reception queue 1+4*i.
b11, b10	—	Reserved These bits are read as 0. The write value should be 0.

Table 24.17 RQCi register contents (2/2)

Bit Position	Bit Name	Function
b9, b8	RSM1[1:0]	Receive Synchronous Mode (Receive Queue 1+i*4) B'00: Mode with write-back Other than B'00: Setting prohibited
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5, b4	UFCC0[1:0]	Unread Frame Counter Configuration (Receive Queue 0+i*4) These bits set the unread frame counter used in reception queue 0+4*i.
b3, b2	—	Reserved These bits are read as 0. The write value should be 0.
b1, b0	RSM0[1:0]	Receive Synchronous Mode (Receive Queue 0+i*4) B'00: Mode with write-back Other than B'00: Setting prohibited

UFCCr[1:0] (r = 0 to 17) Unread Frame Counter Configuration Bits

These bits set the unread frame counter for reception queue r.

With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter warning level configuration register (UFCW) and the unread frame counter stop level configuration register (UFCS) to set the warning level and stop level of the unread frame counter.

Set the pattern number (0 to 3) set in the unread frame counter warning level configuration register (UFCW) and unread frame counter stop level configuration register (UFCS) in this bit.

When the value is B'00, the stop function is disabled.

Writing to the bits is only possible when the current operating mode is configuration mode.

RSMr[1:0] (r = 0 to 17) Receive Synchronous Mode Bits

These bits set receive synchronous mode.

Set B'00 in this bit.

For receive synchronous mode, see **Section 24.4.4.3** (3) Mode with Write-Back.

Writing to the bits is only possible when the current operating mode is configuration mode.

24.3.9 Receive Padding Configuration Register (RPC)

The RPC register is used to set padding for received frames.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + $0B0_H$

Initial value: 0000 0100_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	DCNT[7:0]

R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 24.18 RPC register contents

Bit Position	Bit Name	Function
b31 to b24	—	Reserved These bits are read as 0. The write value should be 0.
b23 to b16	DCNT[7:0]	Stored Data Counter These bits specify the amount of data to be stored with the descriptor. The setting is in words. I.e. 1 in the counter indicates 1 word (4 bytes).
b15 to b11	—	Reserved These bits are read as 0. The write value should be 0.
b10 to b8	PCNT[2:0]	Stored Padding Counter These bits indicate the amount of padding to be stored in data areas for descriptors. The setting is in words. I.e. 1 in the counter indicates 1 word (4 bytes).
b7 to b0	—	Reserved These bits are read as 0. The write value should be 0.

CAUTION

Padding can be used to extend frame lengths, but frame lengths should not exceed 4 Kbytes.

DCNT[7:0] Stored Data Counter Bits

These bits specify the amount of the frame data (1 to 255) to be stored following the padding. Counting by one indicates one word (4 bytes). For example, when these bits are set to 47, the amount of data is 47 words (= 188 bytes).

When these bits are 0, all received data have been stored following the initial padding.

Writing to the bits is only possible when the current operating mode is configuration mode.

For details on padding, see **Section 24.4.4.3** (c) Padding.

PCNT[2:0] Stored Padding Counter Bits

These bits specify the amount of padding to be appended to the URAM. Counting by one indicates one word (4 bytes). For example, when these bits are set to 1, the amount of padding is one word (= 4 bytes).

Writing to the bits is only possible when the current operating mode is configuration mode.

For details on padding, see **Section 24.4.4.3** (c) Padding.

24.3.10 Unread Frame Counter Warning Level Configuration Register (UFCW)

The UFCW register sets the warning levels for the number of unread frames. Four levels are available and the RQC0 to RQC4 receive queue configuration registers (RQC0 to RQC4.UFFC0 to UFFC3) refer to the selected levels.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + $0BC_H$

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	WL3[5:0]						—	—	WL2[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	WL1[5:0]						—	—	WL0[5:0]

Table 24.19 UFCW register contents

Bit Position	Bit Name	Function
b31, b30	—	Reserved These bits are read as 0. The write value should be 0.
b29 to b24	WL3[5:0]	Warning Level 3 Unread frame count warning level 3
b23, b22	—	Reserved These bits are read as 0. The write value should be 0.
b21 to b16	WL2[5:0]	Warning Level 2 Unread frame count warning level 2
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13 to b8	WL1[5:0]	Warning Level 1 Unread frame count warning level 1
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	WL0[5:0]	Warning Level 0 Unread frame count warning level 0

WL0 to WL3[5:0] Warning Level 0 to 3 Bits

These bits set the warning levels for unread frames.

One of the four warning levels from 0 to 3 can be set for each reception queue. When these bits are set to 0, the stop function is disabled. The level to be used is specified by the receive queue configuration register i (RQCi) (i = 0 to 4).

Writing to the bits is only possible when the current operating mode is configuration mode.

24.3.11 Unread Frame Counter Stop Level Configuration Register (UFCS)

The UFCS register sets the stop levels for unread frames.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + $0C0_H$

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b31, b30	—	Reserved These bits are read as 0. The write value should be 0.
b29 to b24	SL3[5:0]	Stop Level 3 Unread frame count stop level 3
b23, b22	—	Reserved These bits are read as 0. The write value should be 0.
b21 to b16	SL2[5:0]	Stop Level 2 Unread frame count stop level 2
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13 to b8	SL1[5:0]	Stop Level 1 Unread frame count stop level 1
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	SL0[5:0]	Stop Level 0 Unread frame count stop level 0 The write value should be 0.

SL0 to SL3[5:0] Stop Level 0 to 3 Bits

These bits set the stop levels for unread frames.

One of the four stop levels from 0 to 3 can be set for each reception queue. When these bits are set to 0, the stop function is disabled. The level to be used is specified by the receive queue configuration register i (RQCi) (i = 0 to 4).

Writing to the bits is only possible when the current operating mode is configuration mode.

24.3.12 Unread Frame Counter Register i (UFCVi) (i = 0 to 4)

The UFCV0 register indicates the number of unread frames in reception queues 0 to 3.

The UFCV1 register indicates the number of unread frames in reception queues 4 to 7.

The UFCV2 register indicates the number of unread frames in reception queues 8 to 11.

The UFCV3 register indicates the number of unread frames in reception queues 12 to 15.

The UFCV4 register indicates the number of unread frames in reception queues 16 and 17.

Access: This register can be read in 32-bit units.

Address: UFCV0: <ETNBn_base> + $0C4_H$ UFCV1: <ETNBn_base> + $0C8_H$ UFCV2: <ETNBn_base> + $0CC_H$ UFCV3: <ETNBn_base> + $0D0_H$
UFCV4: <ETNBn_base> + $0D4_H$

Initial value: $0000\ 0000_H$

Table 24.21 UFCVi register contents

Bit Position	Bit Name	Function
b31, b30	—	Reserved These bits are read as 0. The write value should be 0.
b29 to b24	CV3[5:0]	Unread Frame Count 3+4*i Number of unread frames in reception queue 3+4*i
b23, b22	—	Reserved These bits are read as 0. The write value should be 0.
b21 to b16	CV2[5:0]	Unread Frame Count 2+4*i Number of unread frames in reception queue 2+4*i
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13 to b8	CV1[5:0]	Unread Frame Count 1+4*i Number of unread frames in reception queue 1+4*i
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	CV0[5:0]	Unread Frame Count 0+4*i Number of unread frames in reception queue 0+4*i

CVr[5:0] Unread Frame Count r (r = 0 to 17) Bits

These bits indicate the number of unread frames in reception queue r.

The number of unread frames is decremented by the value that is written to the unread frame counter decrement register i (UFCDi).

For a description of how to use unread frames, refer to Section 24.4.4.4, Unread Frame Counters.

Conditions for updating:

The bits are set to 0 when the operating mode is not operation mode and when the descriptor base address load request register (DLR) issues a base address load request.

The number is incremented when data received in reception queue r are stored normally. The maximum increment is H’3F. If the value exceeds H’3F, incrementation will not proceed.)

The number is decremented by the value written to the unread frame counter decrement register i (UFCDi).

24.3.13 Unread Frame Counter Decrement Register i (UFCDi) (i = 0 to 4)

The UFCD0 register is used to decrement unread counters in reception queues 0 to 3.

The UFCD1 register is used to decrement unread counters in reception queues 4 to 7.

The UFCD2 register is used to decrement unread counters in reception queues 8 to 11.

The UFCD3 register is used to decrement unread counters in reception queues 12 to 15.

The UFCD4 register is used to decrement unread counters in reception queues 16 and 17.

Access: This register can be read/written in 8/16/32-bit units.

Address: UFCD0: <ETNBn_base> + $0E0_H$ UFCD1: <ETNBn_base> + $0E4_H$ UFCD2: <ETNBn_base> + $0E8_H$
UFCD3: <ETNBn_base> + $0EC_H$ UFCD4: <ETNBn_base> + $0F0_H$

Initial value: $0000\ 0000_H$

Table 24.22 UFCDi register contents

Bit Position	Bit Name	Function
b31, b30	—	Reserved These bits are read as 0. The write value should be 0.
b29 to b24	DV3[5:0]	Unread Frame Decrement Value 3+4*i Unread frame decrement value for reception queue 3+4*i
b23, b22	—	Reserved These bits are read as 0. The write value should be 0.
b21 to b16	DV2[5:0]	Unread Frame Decrement Value 2+4*i Unread frame decrement value for reception queue 2+4*i
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13 to b8	DV1[5:0]	Unread Frame Decrement Value 1+4*i Unread frame decrement value for reception queue 1+4*i
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	DV0[5:0]	Unread Frame Decrement Value 0+4*i Unread frame decrement value for reception queue 0+4*i

DVr[5:0] Unread Frame Decrement Value r (r = 0 to 17) Bits

These bits set the decrement value for unread frames in reception queue r. The value of an unread frame counter register i (UFCVi) (i = 0 to 4) is decremented by the value set in the corresponding bits of this register.

Write H'3F to these bits to reset the unread counters in reception queue r.

These bits are always read as 0.

24.3.14 Separation Filter Offset Register (SFO)

The SFO register sets an offset into frames for use by the separation filter.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + $0FC_H$

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.23 SFO register contents

Bit Position	Bit Name	Function
b31 to b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	FBP[5:0]	First Byte Position Position in Ethernet frames of the first byte of the bytes to be used by the separation filter

FBP[5:0] First Byte Position Bits

These bits set the position in Ethernet frames of the first byte of the bytes to be used by the separation filter.

When these bits are 0, the separation filter starts from the start of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see Figure 24.2, Data for Reception in an Ethernet Frame, in Section 24.3.1, AVB-DMAC Mode Register (CCC).

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see **Section 24.4.4.1** (1) Separation Filtering.

CAUTION

Received frames having fewer bytes than the setting of these bits + 8 bytes are judged to be non-matching by the separation filter. In this case, the data will either be sorted into a reception queue or discarded in accord with the setting of the separation filtering select bits in the receive configuration register (RCR.ESF[1:0]).

24.3.15 Separation Filter Pattern Register i (SFPi)

Pairs of SFPi registers set the pattern for the separation filters to be used by the corresponding reception queues 2 to 17.

Access: This register can be read/written in 32-bit units.

Address: SFP0: <ETNBn_base> + 100_H; SFP1: <ETNBn_base> + 104_H; SFP2: <ETNBn_base> + 108_H
SFP3: <ETNBn_base> + $10C_H$; SFP4: <ETNBn_base> + 110_H; SFP5: <ETNBn_base> + 114_H
SFP6: <ETNBn_base> + 118_H; SFP7: <ETNBn_base> + $11C_H$; SFP8: <ETNBn_base> + 120_H
SFP9: <ETNBn_base> + 124_H; SFP10: <ETNBn_base> + 128_H; SFP11: <ETNBn_base> + $12C_H$
SFP12: <ETNBn_base> + 130_H; SFP13: <ETNBn_base> + 134_H; SFP14: <ETNBn_base> + 138_H
SFP15: <ETNBn_base> + $13C_H$; SFP16: <ETNBn_base> + 140_H; SFP17: <ETNBn_base> + 144_H
SFP18: <ETNBn_base> + 148_H; SFP19: <ETNBn_base> + $14C_H$; SFP20: <ETNBn_base> + 150_H
SFP21: <ETNBn_base> + 154_H; SFP22: <ETNBn_base> + 158_H; SFP23: <ETNBn_base> + $15C_H$
SFP24: <ETNBn_base> + 160_H; SFP25: <ETNBn_base> + 164_H; SFP26: <ETNBn_base> + 168_H
SFP27: <ETNBn_base> + $16C_H$; SFP28: <ETNBn_base> + 170_H; SFP29: <ETNBn_base> + 174_H;
SFP30: <ETNBn_base> + 178_H; SFP31: <ETNBn_base> + $17C_H$

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.24 SFPi register contents

Bit Position	Bit Name	Function
b31 to b0	FP[31:0]	Separation Filter Pattern These bits set the pattern of the separation filter. The 64-bit filter pattern is set for each queue.

FP[63:0] Separation Filter Pattern Bits

These bits set the pattern for a separation filter to be used with reception queues 2 to 17 (for streams 0 to 15).

Each queue shares a 64-bit setting; reception queue 2 (for stream 0) uses SFP0 and SFP1, reception queue 17 (for stream 15) uses SFP30 and SFP31, and so on.

The separation filter passes a frame when, after masking by the mask value set in the separation filter mask register (SFMi), data from received frames match the value defined in these bits.

SFPi.FP[7:0] (where i is an even number) are used for the byte of Ethernet frame data specified by the separation filter offset register, while SFPi.FP[63:56] (where i is the corresponding odd number) are used for the byte at the address specified by the separation filter offset register (SFO) + 7.

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see **Section 24.4.4.1** (1) Separation Filtering.

24.3.16 Separation Filter Mask Register i (SFMi) (i = 0 or 1)

A pair of SFMi registers sets the mask value for the separation filter used by the corresponding reception queue 2 to 17.

Access: This register can be read/written in 32-bit units.

Address: SFM0: <ETNBn_base> + $1C0_H$ SFM1: <ETNBn_base> + $1C4_H$

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.25 SFMi register contents

Bit Position	Bit Name	Function
b31 to b0	CFM[31:0]	Separation Filter Mask These bits set the mask value for the separation filter.

CFM[63:0] Separation Filter Mask Bits

These bits set the mask value for the separation filter for use with the corresponding reception queue 2 to 17 (stream 0 to 15).

SFM0.CFM[7:0] are used for bytes of Ethernet frame data specified by the separation filter offset register, while SFM1.CFM[63:56] are used for the separation filter offset register (SFO) + 7.

Frame data at the positions of mask bits that are set to 0 are masked; that is, they do not affect pattern-matching by the separation filter.

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see **Section 24.4.4.1** (1) Separation Filtering.

24.3.17 Transmit Configuration Register (TGC)

The TGC register is used to make settings related to transmission for the AVB-DMAC.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 300_H

Initial value: 0022 2200_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.26 TGC register contents (1/2)

Bit Position	Bit Name	Function
b31 to b22	—	Reserved These bits are read as 0. The write value should be 0.
b21, b20	TBD3[1:0]	Transmit FIFO Size (Stream Class A) Number of frames to be fetched from transmission queue 3 (for stream class A) **CAUTION** Write 2 to these bits.
b19, b18	—	Reserved These bits are read as 0. The write value should be 0.
b17, b16	TBD2[1:0]	Transmit FIFO Size (Stream Class B) Number of frames to be fetched from transmission queue 2 (for stream class B) **CAUTION** Write 2 to these bits.
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13, b12	TBD1[1:0]	Transmit FIFO Size (Network Control) Number of frames to be fetched from transmission queue 1 (for network control) **CAUTION** Write 2 to these bits.
b11, b10	—	Reserved These bits are read as 0. The write value should be 0.
b9, b8	TBD0[1:0]	Transmit FIFO Size (Best Effort) Number of frames to be fetched from transmission queue 0 (for best effort) **CAUTION** Write 2 to these bits.

Table 24.26 TGC register contents (2/2)

Bit Position	Bit Name	Function
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5, b4	TQP[1:0]	Transmit Queue Priority 00: Non-AVB mode 01: AVB mode 1 10: Setting prohibited 11: AVB mode 2
b3	TSM3	Transmit Synchronous Mode (Stream Class A) 0: With write-back 1: Setting prohibited
b2	TSM2	Transmit Synchronous Mode (Stream Class B) 0: With write-back 1: Setting prohibited
b1	TSM1	Transmit Synchronous Mode (Network Control) 0: With write-back 1: Setting prohibited
b0	TSM0	Transmit Synchronous Mode (Best Effort) 0: With write-back 1: Setting prohibited

TBD0 to TBD3[1:0] Transmit FIFO Size (Stream Class A/ Stream Class B/Network Control/Best Effort) Bits

These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queues.

Writing to these bits is only possible when the current operating mode is configuration mode.

Set these bits to 2.

TQP[1:0] Transmit Queue Priority Bits

These bits set the priority of the transmission queues.

B’00: Non-AVB mode: Q3→Q2→Q1→Q0

B’01: AVB mode 1: Q3 (CBS)→Q2 (CBS)→Q1→Q0

B’10: Setting prohibited

B’11: AVB mode 2: Q1→Q3 (CBS)→Q2 (CBS)→Q0

For the credit-based shaping (CBS) algorithm, see Section 24.4.6, CBS (Credit-Based Shaping).

The CBS algorithm is not applied in non-AVB mode (i.e. when the value is B’00).

Writing to the bits is only possible when the current operating mode is configuration mode.

TSM0 to TSM3 Transmit Synchronous Bits

Set these bits to 0.

24.3.18 Transmit Configuration Control Register (TCCR)

The TCCR register controls transmission by the AVB-DMAC and is used to make related settings.

Access: This register can be read/written in 8/16/32-bit units.

Address: <ETNBn_base> + 304_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.27 TCCR register contents

Bit Position	Bit Name	Function
b31 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	TFR	Time Stamp FIFO Release 0: (Not operating) 1: Releases the oldest entry in the time-stamp FIFO.
b8	TFEN	Time Stamp FIFO Enable 0: Recording of transmission time stamps in the time-stamp FIFO is disabled. 1: Recording of transmission time stamps in the time-stamp FIFO is enabled.
b7 to b4	—	Reserved These bits are read as 0. The write value should be 0.
b3	TSRQ3	Transmit Start Request (Queue 3 (Stream Class A)) 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Fetching of data for transmission is pending.
b2	TSRQ2	Transmit Start Request (Queue 2 (Stream Class B)) 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Fetching of data for transmission is pending.
b1	TSRQ1	Transmit Start Request (Queue 1 (Network Control)) 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Fetching of data for transmission is pending.
b0	TSRQ0	Transmit Start Request (Queue 0 (Best Effort)) 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Fetching of data for transmission is pending.

TFR Time Stamp FIFO Release Bit

This bit releases the oldest entry in the time-stamp FIFO.

For a description of how to use the time-stamp FIFO, see Section 24.4.5.4, Time Stamping in Transmission.

TFEN Time Stamp FIFO Enable Bit

This bit enables storage in the time-stamp FIFO.

When it is set, time-stamp information is stored for descriptors with DESCR.TSR set to 1 (for DESCR.TSR, see **Section 24.4.5.2** (2) Configuration of Transmission Frame Data Descriptors.

When 0 is set in this bit, no entries are made in the time-stamp FIFO.

For a description of how to use the time-stamp FIFO, see section 16.3.5.4, Time Stamping in Transmission.

TSRQt Transmit Start Request (Queue t) (t = 0 to 3) Bit

This bit issues a request to start transmission for transmission queue t.

When read, this bit being set to 1 indicates that transmission queue t has a frame that has not yet been fetched to the transmission FIFO.

Frame transmission by the E-MAC is processed independently from fetching to the transmission FIFO. The timing of transmission from a queue depends on the priority order of transmission.

For the scheduling of transmission queues, see Section 24.4.5.1, Transmission Modes.

Writing to this bit is only possible when the current operating mode is configuration mode.

Only 1 can be written to the bit. Writing 0 to the bit has no effect.

Conditions for updating:

The bit is set to 0 when the operating mode is not operation mode, when a descriptor of type FEMPTY or LEMPTY (no usable data) is processed, when an EOS descriptor is processed, and when a descriptor with defective data is processed.

24.3.19 Transmit Status Register (TSR)

The TSR register indicates the state of transmission by the AVB-DMAC.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 308_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.28 TSR register contents

Bit Position	Bit Name	Function
b31 to b11	—	Reserved These bits are read as 0. The write value should be 0.
b10 to b8	TFFL[2:0]	Time Stamp FIFO Count Number of time-stamp FIFOs
b7 to b4	—	Reserved These bits are read as 0. The write value should be 0.
b3, b2	CCS1[1:0]	CBS Counter Status 1 (Class A) B'00: The current credit value is within the limit. B'01: The current credit value is less than or equal to the lower limit. B'10: The current credit value is greater than or equal to the upper limit. B'11: (Reserved)
b1, b0	CCS0[1:0]	CBS Counter Status 0 (Class B) B'00: The current credit value is within the limit. B'01: The current credit value is less than or equal to the lower limit. B'10: The current credit value is greater than or equal to the upper limit. B'11: (Reserved)

TFFL[3:0] Time Stamp FIFO Count Bits

These bits indicate the number of time stamps in the time-stamp FIFO.

The values 0 and 2 indicate that the time-stamp FIFO is empty and full, respectively (values 3 to 7 are reserved).

Conditions for updating:

The bits are set to 0 when the operating mode is not operation mode and when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) = 0.

When the time stamp FIFO enable bit (TCCR.TFEN) is 1 and these bits are not 2, the value of these bits is incremented after a frame with DESCR.TSR set has been transmitted by the E-MAC (for DESCR.TSR, see **Section 24.4.5.2** (2) Configuration of Transmission Frame Data Descriptors.

The value of these bits is decremented if it is not 0 when 1 is written to the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR).

CCS0 and CCS1[1:0] CBS Counter Status 0 and 1 Bits

These bits indicate the CBS (credit-based shaping) state of stream data transmission queues 0 and 1. If the calculated credit value is outside the range specified by CBS upper limit register c (CULc) and CBS lower limit register c (CLLc), it falls outside the range for CBS.

Conditions for updating:

The bits are set to B’00 when the operating mode is not operation mode.

The bits are set to B’01 if the credit value calculated by the CBS is lower than the value in CBS lower limit register c (CLLc).

The bits are set to B’10 if the credit value calculated by the CBS is higher than the value in CBS upper limit register c (CULc).

24.3.20 Time Stamp FIFO Access Register 0 (TFA0)

TFA0 indicates the seconds portion of the time stamp value.

Access: This register is read-only in 32-bit units.

Address: <ETNBn_base> + 310_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TSV[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 24.29 TFA0 register contents

Bit Position	Bit Name	Function
b31 to b0	TSV[31:0]	Time Stamp Value Time stamp value

TSV[79:0] Time Stamp Value Bits

These 80 bits consist of TFA0.TSV[31:0], TFA1.TSV[63:32], and TFA2.TSV[79:64], which together indicate the oldest time stamp value stored in the time-stamp FIFO.

Once the time-stamp FIFO is full, no further time-stamp values are stored.

Conditions for updating:

The bits are set to H'0000 0000 when the operating mode is not operation mode.

The register is updated whenever a value is stored in the time-stamp FIFO (when the time-stamp FIFO count bit in the transmit status register (TSR.TFFL[2:0]) changes from 0 to 1).

The register is updated when the oldest entry is released (when the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR) is set to 1).

24.3.21 Time Stamp FIFO Access Register 1 (TFA1)

The TFA1 register indicates the nanoseconds portion of the time-stamp value.

Access: This register is read-only in 32-bit units.

Address: <ETNBn_base> + 314_H

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.30 TFA1 register contents

Bit Position	Bit Name	Function
b31 to b0	TSV[63:32]	Time Stamp Value Time-stamp value

TSV[63:32] Time Stamp Value Bits

For details, see Section 24.3.20, Time Stamp FIFO Access Register 0 (TFA0).

24.3.22 Time Stamp FIFO Access Register 2 (TFA2)

The TFA2 register indicates the time-stamp tag and part of the time-stamp value.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 318_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.31 TFA2 register contents

Bit Position	Bit Name	Function
b31 to b26	—	Reserved These bits are read as 0.
b25 to b16	TST[9:0]	Time Stamp Tag Time-stamp tag
b15 to b0	TSV[79:64]	Time Stamp Value Time-stamp value

TST[9:0] Time Stamp Tag Bits

These bits indicate the contents of the DESCR.TAG bit within the descriptor for frame transmission. These values are used to check the correlation between frames within the transmission queue and the time-stamp values (accessible through time stamp FIFO access register i (TFAi)) which can be placed in the FIFO.

For the tagging of frames in transmission, Section 24.4.5.4, Time Stamping in Transmission.

Conditions for updating:

The bits are set to H’000 when the operating mode is not operation mode.

Updated when a value is stored in the time-stamp FIFO (when the value of the time stamp FIFO count bit in the transmit status register (TSR.TFFL[2:0]) changes from 0 to 1).

Updated when the oldest entry has been released (1 is set in the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR)).

TSV[79:64] Time Stamp Value Bits

For details, see Section 24.3.20, Time Stamp FIFO Access Register 0 (TFA0).

24.3.23 CBS Increment Value Register c (CIVRc) (c = 0 or 1)

The CIVR0 register sets the increment in the CBS algorithm for transmission queue 2 (for stream class B).

The CIVR1 register sets the increment in the CBS algorithm for transmission queue 3 (for stream class A).

Access: This register can be read/written in 32-bit units.

Address: CIVR0: <ETNBn_base> + 320_H CIVR1: <ETNBn_base> + 324_H

Initial value: $0000\ 0001_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 24.32 CIVRc register contents

Bit Position	Bit Name	Function
b31 to b0	CIV[31:0]	CBS Increment Value CBS increment value (1 to H'FFFF)

CIV[31:0] CBS Increment Value Bits

These bits set the increment for the CBS algorithm.

Set a value in the range from H'0000 0001 to H'0000 FFFF.

The value to be written to these bits depends on the Ethernet bit rate and fCHI (peripheral bus clock). For details, see Section 24.4.6, CBS (Credit-Based Shaping).

24.3.24 CBS Decrement Value Register c (CDVRc) (c = 0 or 1)

The CDVR0 register sets the decrement in the CBS algorithm for transmission queue 2 (for stream class B).

The CDVR1 register sets the decrement in the CBS algorithm for transmission queue 3 (for stream class A).

Access: This register can be read/written in 32-bit units.

Address: CDVR0: <ETNBn_base> + 328_H CDVR1: <ETNBn_base> + $32C_H$

Initial value: FFFF $FFFF_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.33 CDVR0 and CDVR1 register contents

Bit Position	Bit Name	Function
b31 to b0	CDV[31:0]	CBS Decrement Value Setting value: -1 to -65536 (H'FFFF FFFF to H'FFFF 0000)

CDV[31:0] CBS Decrement Value Bits

These bits set the decrement for the CBS algorithm.

Set a negative value from -1 to -65536 (H'FFFF FFFF to H'FFFF 0000).

The value to be written to these bits depends on the Ethernet bit rate and fCHI (peripheral bus clock). For details, see Section 24.4.6, CBS (Credit-Based Shaping).

24.3.25 CBS Upper Limit Register c (CULc) (c = 0 or 1)

The CUL0 register sets the upper limit for credit values calculated by using the CSB algorithm for transmission queue 2 (for stream class B).

The CUL1 register sets the upper limit for credit values calculated by using the CSB algorithm for transmission queue 3 (for stream class A).

Access: This register can be read/written in 32-bit units.

Address: CUL0: <ETNBn_base> + 330_H CUL1: <ETNBn_base> + 334_H

Initial value: 7FFF FFFF$_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.34 CUL0 and CUL1 register contents

Bit Position	Bit Name	Function
b31 to b0	ULV[31:0]	CBS Upper Limit Upper limit on CBS values

ULV[31:0] CBS Upper Limit Bits

These bits set the upper limit for credit values calculated by using the CBS algorithm.

The setting is a limiting value for error detection and does not normally affect operation of the algorithm.

Write a positive value to these bits.

For details, see Section 24.4.6, CBS (Credit-Based Shaping).

24.3.26 CBS Lower Limit Register c (CLLc) (c = 0 or 1)

The CUL0 register sets the lower limit for credit values calculated by using the CSB algorithm for transmission queue 2 (for stream class B).

The CUL1 register sets the lower limit for credit values calculated by using the CSB algorithm for transmission queue 3 (for stream class A).

Access: This register can be read/written in 32-bit units.

Address: CLL0: <ETNBn_base> + 338_H CLL1: <ETNBn_base> + $33C_H$

Initial value: $8000\ 0001_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.35 CLLc register contents

Bit Position	Bit Name	Function
b31 to b0	LLV[31:0]	CBS Lower Limit Lower limit on CBS values

LLV[31:0] CBS Lower Limit Bits

These bits set the lower limit for credit values calculated by using the CBS algorithm.

The setting is a limiting value for error detection and does not normally affect operation of the algorithm.

Write a negative value to these bits.

For details, see Section 24.4.6, CBS (Credit-Based Shaping).

24.3.27 Descriptor Interrupt Control Register (DIC)

The DIC register is used to control descriptor interrupts 1 to 15.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 350_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b0	—	Reserved This bit is read as 0. The write value should be 0.

RPE1 to RPE15 Descriptor Interrupt Enable Bits 1 to 15

When an interrupt source flag is set (a bit from among the DPF1 to DPF15 bits in the descriptor interrupt status register (DIS) = 1) while the interrupt is enabled, the interrupt is issued.

24.3.28 Descriptor Interrupt Status Register (DIS)

The DIS register indicates the state of descriptor interrupts.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 354_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b0	—	Reserved This bit is read as 0. The write value should be 0.

DPF1 to DPF15 Descriptor Interrupt Status Bits

When DESCR.DIE is 1 to 15, the corresponding bit indicates completion of the processing of a descriptor within the reception or transmission queue.

When DESCR.DIE is 0, the descriptor interrupt is not generated.

Only 0 can be written to these bits.

[Conditions for Changing]

A bit is set to 0 when the operating mode is not operation mode.

A bit is set to 1 when a descriptor with DESCR.DIE set to the corresponding number from 1 to 15 is processed.

24.3.29 Error Interrupt Control Register (EIC)

The EIC register controls the AVB-DMAC-related error interrupts.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 358_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b1	MTEE	MAC Transmission Error interrupt Enable 0: Disabled 1: Enabled
b0	MREE	MAC Reception Error interrupt Enable 0: Disabled 1: Enabled

TFFE Time Stamp FIFO Full-Error Interrupt Enable Bits

When the time stamp FIFO is full (TFFF in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

CULE1 CBS Upper Limit Error Interrupt Enable Bit (Class A)

When the Class A CBS reaches its upper limit (CULF1 in the error interrupt status register (EIS) = 1), the interrupt is issued.

CULE0 CBS Upper Limit Error Interrupt Enable Bit (Class B)

When the Class B CBS reaches its upper limit (CULF0 in the error interrupt status register (EIS) = 1), the interrupt is issued.

CLLE1 CBS Lower Limit Error Interrupt Enable Bit (Class A)

When the Class A CBS reaches its lower limit (CLLF1 in the error interrupt status register (EIS) = 1), the interrupt is issued.

CLLE0 CBS Lower Limit Error Interrupt Enable Bit (Class B)

When the Class B CBS reaches its lower limit (CLLF0 in the error interrupt status register (EIS) = 1), the interrupt is issued.

SEE Separation Error interrupt Enable Bit

While this bit is 1 an interrupt will be generated when EIS.SEF is 1.

QEE Queue Error interrupt Enable Bit

While this bit is 1 an interrupt will be generated when EIS.QEF is 1.

MTEE MAC Transmission Error interrupt Enable Bit

While this bit is 1 an interrupt will be generated when EIS.MTEF is 1.

MREE MAC Reception Error interrupt Enable Bit

While this bit is 1 an interrupt will be generated when EIS.MREF is 1.

24.3.30 Error Interrupt Status Register (EIS)

The EIS register indicates the states of AVB-DMAC-related error interrupts.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + $35C_H$

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	QFS

Table 24.39 EIS register contents

Bit Position	Bit Name	Function
b31 to b17	—	Reserved These bits are read as 0. The write value should be 0.
b16	QFS	Queue Full Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b15 to b9	—	Reserved These bits are read as 0. The write value should be 0.
b8	TFFF	Time Stamp FIFO Full Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b7	CULF1	CBS Upper Limit Error Interrupt Status (Class A) 0: The interrupt is not pending. 1: The interrupt is pending.
b6	CULF0	CBS Upper Limit Error Interrupt Status (Class B) 0: The interrupt is not pending. 1: The interrupt is pending.
b5	CLLF1	CBS Lower Limit Error Interrupt Status (Class A) 0: The interrupt is not pending. 1: The interrupt is pending.
b4	CLLF0	CBS Lower Limit Error Interrupt Status (Class B) 0: The interrupt is not pending. 1: The interrupt is pending.
b3	SEF	Separation Error Flag 0: The interrupt is not pending. 1: The interrupt is pending.
b2	QEF	Queue Error Flag 0: The interrupt is not pending. 1: The interrupt is pending.
b1	MTEF	MAC Transmission Error Flag 0: The interrupt is not pending. 1: The interrupt is pending.
b0	MREF	MAC Reception Error Flag 0: The interrupt is not pending. 1: The interrupt is pending.

QFS Queue Full Error Status Bit

With the interrupts enabled, this bit indicates that a queue is full (the receive queue r full interrupt status bit (QFFr) or the receive FIFO full interrupt status bit (RFFF) in receive interrupt status register 2 (RIS2) = 1).

[Conditions for Changing]

If the receive queue r full interrupt status bit (RIS2.QFFr) and the receive queue r full interrupt enable bit in the receive interrupt control register 2 (RIC2.QFEr) are updated, this bit is also updated.

If the receive FIFO full interrupt status bit (RIS2.RFFF) and the receive FIFO full interrupt enable bit (RIC2.RFFE) are updated, this bit is also updated.

TFFF Time Stamp FIFO Full-Error Interrupt Status Bit

This bit indicates that a new transmission time stamp has been discarded due to the time-stamp FIFO being full (i.e. has reached the overflow state).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.
The bit is set to 1 when a frame with DESCR.TSR set is transmitted while the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is set to 1 and the time stamp FIFO count bit in the transmit status register (TSR.TFFL[2:0]) is set to 2.

CULF1 CBS Upper Limit Error Interrupt Status Bit (Class A)

This bit indicates that CBS counter 1 has exceeded the set upper limit (CUL1.ULV[31:0] in the CBS upper limit register c (CULc)).

Only 0 can be written to the bit.

[Conditions for Changing]

This bit is set to 0 when the operating mode is not operation mode.

This bit is set to 1 when the value of the CBS counter status 1 (Class A) bits in the transmit status register (TSR.CCS1[1:0]) change from B’00 (indicating a value within the range between the limits) to B’10 (indicating a value over the upper limit).

CULF0 CBS Upper Limit Error Interrupt Status Bit (Class B)

This bit indicates that CBS counter 0 has exceeded the set upper limit (CUL0.ULV[31:0] in the CBS upper limit register c (CULc)).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the value of the CBS counter status 0 (Class B) bit in the transmit status register changes from B’00 (indicating a value within the range between the limits) to B’10 (indicating a value over the upper limit).

CLLF1 CBS Lower Limit Error Interrupt Status Bit (Class A)

This bit indicates that CBS counter 1 has fallen below the set lower limit (CLL1.LLV[31:0] in CBS lower limit register c (CLLc)).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the value of the CBS counter status 1 (Class A) bit in the transmit status register (TSR.CCS1[1:0]) changes from B'00 (indicating a value within the range between the limits) to B'01 (indicating a value less than the lower limit).

CLLF0 CBS Lower Limit Error Interrupt Status Bit (Class B)

This bit indicates that CBS counter 0 has fallen below the set lower limit (CLL0.LLV[31:0] in the CBS lower limit register c (CLLc)).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the value of the CBS counter status 0 (Class B) bit in the transmit status register (TSR.CCS0[1:0]) changes from B'00 (indicating a value within the range between the limits) to B'01 (indicating a value less than the lower limit).

SEF Separation Error Flag

This bit indicates that a received frame was discarded because it has not matched any configured separation filter for AVB stream data frames.

The CPU can only write 0 to this bit.

[Changing condition]

This bit is set to 0b when leaving OPERATION mode.

This bit is set to 1 when a valid AVB stream data frame was received by MAC but discarded because RCR.ESF[1:0] is B'10 and no separation filter has matched.

QEF Queue Error Flag

This bit indicates that an error has been detected while processing reception or transmit queue.

Detail about the detected error is indicated by ESR.

The CPU can only write 0 to this bit.

[Changing condition]

This bit is set to 0 when leaving OPERATION mode.

This bit is set to 1 when an error condition is detected.

MTEF MAC Transmission Error Flag

This bit indicates that the MAC has detected a fault during transmission.

For detail the MAC registers have to be checked.

The CPU can only write 0 to this bit.

[Changing condition]

This bit is set to 0 when leaving OPERATION mode.

This bit is set to 1 when MAC detects an error during frame transmission.

MREF MAC Reception Error Flag

This bit indicates that the MAC has detected a fault during reception.

For detail the MAC registers have to be checked.

NOTE

When the storage of faulty received frames (RCR.EFFS) is enabled, the MAC error code (DESCR.MSC) is stored in the descriptor. By evaluating this information CPU can identify corrupted frames in URAM.

The CPU can only write 0 to this bit.

[Changing condition]

This bit is set to 0 when leaving OPERATION mode.

This bit is set to 1 when MAC detects an error during frame reception.

24.3.31 Receive Interrupt Control Register 0 (RIC0)

The RIC0 register controls the AVB-DMAC receive interrupts.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 360_H

Initial value: 0000 0000_H

FRE0 to FRE17 Receive Frame Interrupt Enable Bits 0 to 17

When an interrupt source flag is set (a bit from among the receive interrupt status bits in the receive interrupt status register (RIS0.FRF0 to 17) = 1) while the interrupt is enabled, the interrupt is issued.

24.3.32 Receive Interrupt Status Register 0 (RIS0)

The RIS0 register indicates the states of the AVB-DMAC receive interrupts.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 364_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b0	FRF0	Receive Frame Interrupt Status 0 (Best Effort) 0: The interrupt is not pending. 1: The interrupt is pending.

FRF0 to FRF17 Receive Frame Interrupt Status Bits 0 to 17

Each bit indicates that a corresponding frame has been stored normally in reception queues 0 to 17 and that data are ready for CPU processing.

Only 0 can be written to the bit.

[Conditions for Changing]

A bit is set to 0 when the operating mode is not operation mode.

A bit is set to 0 when a value is written to the unread frame counter decrement register i (UFCDi) (i = 0 to 4), and this decrements the value of unread frame counter register i (UFCVi) (i = 0 to 4) to 0.

When a frame is stored normally in a reception queue, the corresponding bit is set to 1.

24.3.33 Receive Interrupt Control Register 1 (RIC1)

The RIC1 register controls the AVB-DMAC receive interrupts.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 368_H

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.42 RIC1 register contents

Bit Position	Bit Name	Function
b31	RFWE	Receive FIFO Warning Interrupt Enable 0: Disabled 1: Enabled
b30 to b0	—	Reserved These bits are read as 0. The write value should be 0.

RFWE Receive FIFO Warning Interrupt Enable Bit

If the reception FIFO reaches the caution level (the value set in the receive FIFO caution level bits in the receive configuration register (RCR.RFCL[12:0]) with the corresponding interrupt enabled, the interrupt is issued.

24.3.34 Receive Interrupt Status Register 1 (RIS1)

The RIS1 register indicates the states of the AVB-DMAC receive interrupts.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + $36C_H$

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.43 RIS1 register contents

Bit Position	Bit Name	Function
b31	RFWF	Receive FIFO Warning Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b30 to b0	—	Reserved These bits are read as 0. The write value should be 0.

RFWF Receive FIFO Warning Interrupt Status Bit

This bit indicates that the reception FIFO has reached the set caution level (the value set in the receive FIFO caution level bits in the receive configuration register (RCR.RFCL[12:0])).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the reception FIFO reaches the set caution level (the value set in the receive FIFO caution level bits in the receive configuration register (RCR.RFCL[12:0])).

24.3.35 Receive Interrupt Control Register 2 (RIC2)

The RIC2 register controls the AVB-DMAC receive interrupts.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 370_H

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.45 RIS2 register contents (1/2)

Bit Position	Bit Name	Function
b31	RFFF	Receive FIFO Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending
b30 to b18	—	Reserved These bits are read as 0. The write value should be 0.
b17	QFF17	Receive Queue 17 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b16	QFF16	Receive Queue 16 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b15	QFF15	Receive Queue 15 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b14	QFF14	Receive Queue 14 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b13	QFF13	Receive Queue 13 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b12	QFF12	Receive Queue 12 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b11	QFF11	Receive Queue 11 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b10	QFF10	Receive Queue 10 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b9	QFF9	Receive Queue 9 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.

Table 24.45 RIS2 register contents (2/2)

Bit Position	Bit Name	Function
b8	QFF8	Receive Queue 8 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b7	QFF7	Receive Queue 7 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b6	QFF6	Receive Queue 6 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b5	QFF5	Receive Queue 5 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b4	QFF4	Receive Queue 4 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b3	QFF3	Receive Queue 3 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b2	QFF2	Receive Queue 2 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b1	QFF1	Receive Queue 7 (Network Control) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b0	QFF0	Receive Queue 0 (Best Effort) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.

RFFF Receive FIFO Full Interrupt Status Bit

This bit indicates that a frame was received but storing it was not possible due to the reception FIFO being full.

When receiving a frame is not possible, the frame will be discarded.

Other information regarding discarded frames is not retained. Even if the frame is not discarded, this bit may also be set to 1 if the E-MAC determines that the frame is an error frame

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the reception FIFO cannot hold received data.

QFF0 to 17 Receive 0 to 17 Full Interrupt Status Bits

When a received frame is dropped due to non-availability of empty descriptor, RIS2.QFFr is correctly set to 1.

Additionally, when UFCVi.CVr reached the configured stop level (UFCS.SLj), the queue full flag (RIS2.QFFr) is set to 1 even before any further received frame is dropped.

CAUTION

If no FEMPTY descriptors or no empty space for descriptors remains in the queue during storing of a divided frame (see Section 24.4.4.3 (b) Storing Frame Data as

Divided Frames, Storing a frame as a divided frame), an error frame is stored in the queue. Such error frames are treated as descriptor sequence errors.

[Conditions for Changing]

A bit is set to 0 when the operating mode is not operation mode.

A bit is set to 1 when reception queue r has no space available for storage.

A bit is set to 1 when the unread frame counter (unread frame counter register i (UFCVi) (i = 0 to 4)) reaches the set level for stopping.

24.3.37 Transmit Interrupt Control Register (TIC)

The TIC register controls the AVB-DMAC transmit interrupts.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 378_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.46 TIC register contents

Bit Position	Bit Name	Function
b31 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	TFWE	Time Stamp FIFO Warning Interrupt Enable 0: Disabled 1: Enabled
b8	TFUE	Time Stamp FIFO Update Interrupt Enable 0: Disabled 1: Enabled
b7 to b0	—	Reserved These bits are read as 0. The write value should be 0.

TFWE Time Stamp FIFO Warning Interrupt Enable Bit

When the time-stamp FIFO reaches the warning level while the interrupt is enabled, the interrupt is issued.

TFUE Time Stamp FIFO Update Interrupt Enable Bit

When the time-stamp FIFO is updated while the interrupt is enabled, the interrupt is issued.

24.3.38 Transmit Interrupt Status Register (TIS)

The TIS register indicates the states of the AVB-DMAC transmit interrupts.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + $37C_H$

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Table 24.47 TIS register contents

Bit Position	Bit Name	Function
b31 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	TFWF	Time Stamp FIFO Warning Interrupt Status 0: The interrupt is not pending. 1: The time-stamp FIFO has reached the warning level.
b8	TFUF	Time Stamp FIFO Update Interrupt Status 0: The interrupt is not pending. 1: The time-stamp FIFO has been updated.
b7 to b0	—	Reserved These bits are read as 0. The write value should be 0.

TFWF Time Stamp FIFO Warning Interrupt Status Bit

This bit indicates that the transmission time-stamp FIFO has reached the warning level.

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode and when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is 0.

The bit is set to 1 after a frame including DESCR.TSR set has been transmitted and one entry has already been stored in the time-stamp FIFO.

TFUF Time Stamp FIFO Update Interrupt Status Bit

This bit indicates that the transmission time-stamp FIFO has been updated.

Only 0 can be written to the bit.

[Conditions for Changing]

This bit is set to 0 when the operating mode is not operation mode.

This bit is set to 0 when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is 0.

This bit is set to 0 when 1 is written to the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR).

This bit is set to 1 when the time stamp FIFO enable bit (TCCR.TFEN) is 1 after a frame including DESCR.TSR set has been transmitted.

24.3.39 Interrupt Summary Status Register (ISS)

The ISS register gives a summary of the states of AVB-DMAC-related interrupts.

Access: This register can be read in 32-bit units.

Address: <ETNBn_base> + 380_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.48 ISS register contents (1/2)

Bit Position	Bit Name	Function
b31	DPS15	Descriptor Interrupt 15 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b30	DPS14	Descriptor Interrupt 14 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b29	DPS13	Descriptor Interrupt 13 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b28	DPS12	Descriptor Interrupt 12 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b27	DPS11	Descriptor Interrupt 11 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b26	DPS10	Descriptor Interrupt 10 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b25	DPS9	Descriptor Interrupt 9 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b24	DPS8	Descriptor Interrupt 8 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b23	DPS7	Descriptor Interrupt 7 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b22	DPS6	Descriptor Interrupt 6 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b21	DPS5	Descriptor Interrupt 5 Summary 0: The interrupt is not pending. 1: The interrupt is pending.

Table 24.48 ISS register contents (2/2)

Bit Position	Bit Name	Function
b20	DPS4	Descriptor Interrupt 4 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b19	DPS3	Descriptor Interrupt 3 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b18	DPS2	Descriptor Interrupt 2 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b17	DPS1	Descriptor Interrupt 1 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b16 to b14	—	Reserved These bits are read as 0. The write value should be 0.
b13	CGIS	gPTP Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b12	RFWS	Receive FIFO Warning Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b11 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	TFWS	Time Stamp FIFO Warning Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b8	TFUS	Time Stamp FIFO Update Interrupt 0: The interrupt is not pending. 1: The interrupt is pending.
b7	MS	E-MAC Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b6	ES	Error Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b5 to b0	—	Reserved These bits are read as 0. The write value should be 0.

DPS1 to DPS15 Descriptor Interrupt 1 to 15 Summary Bits

These bits are set to 1 when the given descriptor interrupt enable bit (DIC.DPE1 to DPE15) and descriptor interrupt status flag (DIS.DPF1 to DPF15) are both 1.

CGIS gPTP Interrupt Summary Bit

This bit is set to 1 when either interrupt-related bit in the two gPTP-related interrupt registers (GIC and GIS) is 1.

RFWS Receive FIFO Warning Interrupt Summary Bit

This bit is set to 1 when the receive FIFO warning interrupt enable bit (RIC1.RFWE) and receive FIFO warning interrupt status flag (RIS1.RFWF) are both 1.

TFWS Time Stamp FIFO Warning Interrupt Summary Bit

This bit is set to 1 when the time stamp FIFO warning interrupt enable bit (TIC.TFWE) and time stamp FIFO warning interrupt status flag (TIS.TFWF) are both 1.

TFUS Time Stamp FIFO Update Interrupt Summary Bit

This bit is set to 1 when the time stamp FIFO update interrupt enable bit (TIC.TFUE) and time stamp FIFO update interrupt status flag (TIS.TFUF) are both 1.

MS E-MAC Interrupt Summary Bit

This bit is set to 1 when an E-MAC interrupt is issued.

ES Error Interrupt Summary Bit

This bit is set to 1 when any of the valid flags in the error interrupt status register (EIS) is 1 or the queue full error interrupt status bit (EIS.QFS) in the error interrupt status register (EIS) is 1.

24.3.40 gPTP Configuration Control Register (GCCR)

The GCCR register is used to set and control the gPTP (generalized precision time protocol).

Access: This register can be read/written in 8/16/32-bit units.

Address: <ETNBn_base> + 390_H

Initial value: 0000 $003C_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.49 GCCR register contents

Bit Position	Bit Name	Function
b31 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9, b8	TCSS[1:0]	Timer Capture Source Select 00: gPTP timer value 01: Adjusted gPTP timer value 10: AVTP presentation time 11: Setting prohibited
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5	LMTT	Maximum Transit Time Configuration Request 0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.
b4	LPTC	Presentation Time Compare Value Configuration Request 0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.
b3	LTI	Timer Increment Value Configuration Request 0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.
b2	LTO	Timer Offset Value Configuration Request 0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.
b1, b0	TCR[1:0]	Timer Control Request 00: Timer control is not requested. 01: gPTP/AVPT presentation time reset 10: Setting prohibited 11: Captures the value set in the TCSS[1:0] bit.

TCSS[1:0] Timer Capture Source Select Bits

These bits select the source used for updating the captured timer register (gPTP timer capture register (GCTi.CTV[31:0])).

These bits should still be controlled when timer control is not being requested (GCCR.TCR[1:0] = 0).

LMTT Maximum Transit Time Configuration Request Bit

This bit issues requests for configuring the gPTP maximum transit time configuration register (GMTT).

Only 1 can be written to the bit.

[Conditions for Changing]

This bit is set to 1 when the operating mode is not operation mode.

This bit is set to 0 when the value of the gPTP maximum transit time configuration register (GMTT) is loaded.

LPTC Presentation Time Compare Value Configuration Request Bit

This bit issues requests for configuring the gPTP presentation time comparison register (GPTC).

Only 1 can be written to the bit.

[Conditions for Changing]

The bit is set to 1 when the operating mode is not operation mode.

The bit is set to 0 when the value of the gPTP presentation time comparison register (GPTC) is loaded.

LTI Timer Increment Value Configuration Request Bit

This bit issues requests for configuring the gPTP timer increment configuration register (GTI).

Only 1 can be written to the bit.

[Conditions for Changing]

The bit is set to 1 when the operating mode is not operation mode.

The bit is set to 0 when the value of the gPTP timer increment configuration register (GTI) is loaded.

LTO Timer Offset Value Configuration Request Bit

This bit issues requests for configuring gPTP timer offset configuration register i (GTOi).

Only 1 can be written to the bit.

[Conditions for Changing]

The bit is set to 1 when the operating mode is not operation mode.

The bit is set to 0 when the value of gPTP timer offset configuration register i (GTOi) is loaded.

TCR[1:0] Timer Control Request Bits

These bits issue requests for controlling the gPTP timer.

Writing to the bits is only possible when the current operating mode is operation mode.

Do not write to the bit when the gPTP timer clock select bit in the AVB-DMAC mode register is B’00.

[Conditions for Changing]

These bits are set to B’00 when the operating mode is not operation mode.

These bits are set to B'00 when the completion of the requested processing.

24.3.41 gPTP Maximum Transit Time Configuration Register (GMTT)

The GMTT register sets the maximum time for transitions of the gPTP timer.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 394_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.50 GMTT register contents

Bit Position	Bit Name	Function
b31 to b0	MTTV[31:0]	Maximum Transit Time The maximum transition time for addition to the presentation time

MTTV[31:0] Maximum Transit Time Bits

These bits set the maximum transition time for use in calculating AVTP presentation times.

Write the desired setting to the bits, then issue the configuration request by setting the maximum transit time configuration request bit in the gPTP configuration control register (GCCR.LMTT) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the maximum transit time configuration request bit (GCCR.LMTT) is 1.

24.3.42 gPTP Presentation Time Comparison Register (GPTC)

The GPTC register sets a value for comparison with presentation times in the gPTP timer.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 398_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.51 GPTC register contents

Bit Position	Bit Name	Function
b31 to b0	PTCV[31:0]	Presentation Time Comparison Value Value for comparison with the gPTP presentation times

PTCV[31:0] Presentation Time Comparison Value Bits

These bits set a value for comparison with AVTP timer values to which a maximum transit time is not appended.

Write the desired setting to the bits, then issue the configuration request by setting the presentation time comparison value configuration request bit in the gPTP configuration control register (GCCR.LPTC) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the presentation time comparison value configuration request bit (GCCR.LPTC) is 1.

24.3.43 gPTP Timer Increment Configuration Register (GTI)

The GTI register sets the increment for the gPTP timer.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + $39C_H$

Initial value: 0000 0001_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.52 GTI register contents

Bit Position	Bit Name	Function
b31 to b28	—	Reserved These bits are read as 0. The write value should be 0.
b27 to b0	TIV[27:0]	gPTP Timer Increment Value Increment for the gPTP timer

TIV[27:0] Bits (gPTP Timer Increment Value)

When the gPTP clock select bits in the AVB-DMAC mode register (CCC.CSEL[1:0]) are selecting a clock signal, these bits set the value by which the timer is incremented each time a cycle of that clock signal elapses.

Write the desired setting to the bits, then issue the configuration request by setting the timer increment value configuration request bit in the gPTP configuration control register (GCCR.LTI) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the timer increment value configuration request bit (GCCR.LTI) is 1.

Do not write 0 to the bits.

24.3.44 gPTP Timer Offset Configuration Register i (GTOi) (i = 0 to 2)

The GTOi register sets an offset value for the gPTP timer.

The offset value is added to the combination of bits 0 to 31 in GTO0, 32 to 63 in GTO1, and 64 to 79 in GTO2, which together make up the gPTP timer.

Access: This register can be read/written in 32-bit units.

Address: GTO0: <ETNBn_base> + $3A0_H$ GTO1: <ETNBn_base> + $3A4_H$ GTO2: <ETNBn_base> + $3A8_H$

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.53 GTOi register contents

Bit Position	Bit Name	Function
b31 to b0	TOV[31:0]	Timer Offset Value Offset value for the gPTP timer

TOV[79:0] Timer Offset Value Bits

This is an 80-bit value consisting of the settings in GTO0.TOV[31:0], GTO1.TOV[63:32], and GTO2.TOV[79:64], and is used to set an offset for adding to the value of the gPTP timer.

Write the desired setting to the bits, then issue the configuration request by setting the timer offset value configuration request bit in the gPTP configuration control register (GCCR.LTO) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the timer offset value configuration request bit (GCCR.LTO) is 1.

Write H'0000 to GTO2.TOV[95:80].

Set a value in the range from 0 to 10^9-1 (H'0000 0000 to H'3B9A C9FF) in GTO0.TOV[31:0].

24.3.45 gPTP Interrupt Control Register (GIC)

The GCI register is used to control gPTP-related interrupts.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + $3AC_H$

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b1, b0	—	Reserved These bits are read as 0. The write value should be 0.

PTME Presentation Time Match Interrupt Enable Bit

When this bit is 1, setting of the presentation time match interrupt flag in the gPTP interrupt status register (GIS.PTMF) to 1 leads to generation of that interrupt.

24.3.46 gPTP Interrupt Status Register (GIS)

The GIC register indicates the state of the gPTP-related interrupt.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + $3B0_H$

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit Position	Bit Name	Function
b31 to b3	—	Reserved These bits are read as 0. The write value should be 0.
b2	PTMF	Presentation Time Match Interrupt Flag 0: The interrupt is not pending. 1: The interrupt is pending.
b1, b0	—	Reserved These bits are read as 0. The write value should be 0.

PTMF Presentation Time Match Interrupt Flag Bit

This bit indicates that the value of the AVTP timer exceeds the value of the gPTP presentation time comparison register (GPTC).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the AVTP timer value is greater than or equal to the value of the gPTP presentation time comparison register (GPTC).

24.3.47 gPTP Timer Capture Register i (GCTi) (i = 0 to 2)

The GCTi registers form an 80-bit register that captures the gPTP timer value.

Access: This register can be read in 32-bit units.

Address: GCT0: <ETNBn_base> + $3B8_H$ GCT1: <ETNBn_base> + $3BC_H$ GCT2: <ETNBn_base> + $3C0_H$

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.56 GCTi register contents

Bit Position	Bit Name	Function
b31 to b0	CTV[31:0]	gPTP Timer Capture Value Captured timer value

CTV[79:0] gPTP Timer Capture Value Bits

These 80 bits consist of GCT0.CTV[31:0], GCT1.CTV[63:32 and GCT2.CTV[79:64], which together indicate captured timer values.

When B’00 (value of the gPTP timer) or B'01 (adjusted gPTP timer value) is selected by the timer capture source select bits in the gPTP configuration control register, the corresponding 80-bit values are stored in these bits.

When B’10 (AVTP presentation time) is selected by the timer capture source select bit, the corresponding 32-bit values are stored in these bits.

Actual writing of the timer value specified by the timer capture source select bits (GCCR.TCSS[1:0]) proceeds when B’11 (timer capture request) is written to the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]).

Do not read the value while the value of the timer control request bits (GCCR.TCR[1:0]) is B’11, because this indicates that storage is still in progress.

24.3.48 E-MAC Mode Register (ECMR)

ECMR is used to specify the operating mode of the E-MAC. The settings in this register are normally made in the initialization process following a reset.

The operating mode settings must not be changed while transmission or reception is enabled (i.e. while the RE or TE bit in this register is 1).

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 500_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit Position	Bit Name	Function
b31 to b27	—	Reserved These bits are read as 0. The write value should be 0.
b26	TRCCM	Counter Clear Mode 0: Writing to a counter register leads to the register being cleared to 0. 1: Reading from a counter register leads to the register being cleared to 0.
b25, b24	—	Reserved These bits are read as 0. The write value should be 0.
b23	RCSC	Checksum Calculation 0: Checksums are not automatically calculated. 1: Checksums are automatically calculated.
b22	—	Reserved This bit is read as 0. The write value should be 0.
b21	DPAD	Data Padding 0: Padding to make up 60 bytes is inserted in data for transmission when fewer than 60 bytes are to be transmitted. 1: Padding is not inserted in data for transmission when fewer than 60 bytes are to be transmitted and the data are transmitted without being changed.
b20	RZPF	PAUSE Frame Reception with Time = 0 0: Reception of PAUSE frames with the TIME parameter value 0 is disabled. 1: Reception of PAUSE frames with the TIME parameter value 0 is enabled.
b19	ZPF	PAUSE Frame Usage with TIME = 0 Enable/Lost Carrier Error Detection Enable • PAUSE frame usage with TIME = 0 enable (in full-duplex mode) 0: Control in response to and for the sending of PAUSE frames with the TIME parameter value 0 is disabled. 1: Control in response to and for the sending of PAUSE frames with the TIME parameter value is 0 is enabled. • Lost carrier error detection enable (in half-duplex mode) 0: Checking for lost carrier errors proceeds during frame transmission. 1: Checking for lost carrier errors does not proceed during frame transmission

Table 24.57 ECMR register contents (2/2)

Bit Position	Bit Name	Function
b18	PFR	PAUSE Frame Receive Mode 0: PAUSE frames are not transferred to the AVB-DMAC. 1: PAUSE frames are transferred to the AVB-DMAC.
b17	RXF	Operating Mode for Flow Control in Reception 0: Detection of PAUSE frames is disabled. 1: Flow control for the receiving port is enabled.
b16	TXF	Operating Mode for Flow Control in Transmission 0: Flow control for the transmitting port is disabled (PAUSE frames are not automatically transmitted). 1: Flow control for the transmitting port is enabled (PAUSE frames are automatically transmitted as required).
b15 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	MPDE	Magic Packet™ Detection Enable 0: Magic Packet™ detection is not enabled. 1: Magic Packet™ detection is enabled.
b8, b7	—	Reserved These bits are read as 0. The write value should be 0.
b6	RE	Reception Enable 0: Reception is disabled. 1: Reception is enabled.
b5	TE	Transmission Enable 0: Transmission is disabled. 1: Transmission is enabled.
b4 to b2	—	Reserved These bits are read as 0. The write value should be 0.
b1	DM	Mode selection 0: Half-duplex mode 1: Full-duplex mode
b0	PRM	Promiscuous Mode 0: Normal operation 1: Promiscuous mode operation

TRCCM Counter Clear Mode Bit

This bit sets the method for clearing the counter register. Refer to the descriptions of the counter registers.

RCSC Checksum Calculation Bit

Setting this bit to 1 enables automatic calculation of checksums for data in received frames.

Only the data field of an Ethernet frame is in the scope of checksum calculation. Specifically, the checksum is calculated from the data field, which follows the length/type field and is followed by the CRC field. Calculation only involves 16-bit addition; it does not involve bit inversion.

DPAD Data Padding Control Bit

This bit specifies padding or non-padding of data when less than 60 bytes are to be transmitted.

When this bit is set to 1, data are transmitted without padding; when it is set to 0, data are padded to make up 60-byte units for transmission.

RZPF (PAUSE Frame Reception with Time = 0) Bit

When the RZPF bit is set to 0, received PAUSE frames with the Timer value 0 are discarded.

When the RZPF bit is set to 1, release from the transmission wait state follows reception of a PAUSE frame with the Timer value 0.

ZPF (PAUSE Frame Usage with TIME = 0 Enable/Lost Carrier Error Detection Enable) Bit

PAUSE frame usage with TIME = 0 enable (In full-duplex mode)

When the ZPF bit is set to 0, the next frame to be transmitted is not transmitted until the time specified by the Timer value has elapsed.

When the ZPF bit is set to 1, if the amount of data in the reception FIFO becomes less than the setting of the receive FIFO critical level bits (RCR.RFCL[12:0]) before the time specified by the Timer value elapses, a PAUSE frame with a Timer value of 0 is automatically transmitted. If the interface is in the transmission wait state, it is released from that state on receiving a PAUSE frame with a Timer value of 0.

- Lost carrier error detection enable (in half-duplex mode)
  In half-duplex operation, this bit enables or disables lost carrier error detection.
- Lost carrier error detection enable (in half-duplex mode)
  signal (AVB_TX_EN) (active high) to detection of the carrier detection signal (AVB_CRS) being 1 is 63 BP* or less.
  If the time from activation of the transmit data enable signal (AVB_TX_EN) (active high) to detection of the carrier detection signal (AVB_CRS) being 1 is greater than 63 BP*, or if the timing of the carrier detection signal (AVB_CRS) is undefined, this bit should not be cleared to 0 (enabling error detection).

NOTE

BP: Bit period. 1 BP = 10 ns (100 Mbps), 1 BP = 100 ns (10 Mbps)

PFR PAUSE Frame Receive Mode Bit

This bit specifies whether PAUSE frames are transferred to the AVB-DMAC.

RXF (Operating Mode for Flow Control in Reception) Bit

When the RXF bit is set to 1 and a PAUSE frame is received, a next frame to be transmitted is not transmitted until the time indicated by the Timer value in the PAUSE frame has elapsed. However, the transmission of a current frame is continued. The number of received PAUSE frames is also counted. For details, see Section 24.3.56, PAUSE Frame Receive Counter (PFRCR).

Setting this bit to 0 disables PAUSE frame detection.

TXF (Operating Mode for Flow Control in Transmission) Bit

The TXF bit enables or disables flow control in transmission by the port.

Setting this bit to 0 disables PAUSE frame detection.

MPDE Magic Packet™ Detection Enable Bit

The MPDE bit enables or disables Magic Packet™ detection by hardware to allow activation via the Ethernet connection.

RE Reception Enable Bit

If this bit is switched from reception being enabled (RE = 1) to reception being disabled (RE = 0) while a frame is being received, reception will continue until reception of that frame is completed.

TE Transmission Enable Bit

If this bit is switched from transmission being enabled (TE = 1) to transmission being disabled (TE = 0) while a frame is being transmitted, transmission will continue until transmission of that frame is completed.

DM Duplex Mode Bit

This bit selects full- or half-duplex operation.

PRM Promiscuous Mode Bit

Setting the PRM bit enables all Ethernet frames to be received. All Ethernet frames means all receivable frames, irrespective of differences or enabled/disabled status (destination address, broadcast address, multicast bit, etc.).

24.3.49 Receive Frame Length Register (RFLR)

The RFLR register specifies the maximum length (in bytes) of frames that can be received by this LSI. Settings in this register must not be changed while reception is enabled (while the RE bit in the E-MAC mode register (EMCR) is 1).

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 508_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

RFL[17:0] Receive Frame Length Bits

Frame data described here refers to all fields from the destination address up to the CRC data. Frame contents from the destination address up to the data are actually transferred to memory. CRC data are not included in the transfer. When more data than the specified number of bytes are received, the portion of data that exceeds the specified value is discarded.

24.3.50 E-MAC Status Register (ECSR)

The ECSR register indicates the state of the E-MAC. The CPU can be notified of the state. For bits associated with interrupts, the interrupt can be enabled or disabled by the corresponding bit in the E-MAC Interrupt Permission Register (ECSIPR) described in **Section 24.3.51**.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 510_H

Initial value: B'0000 0000 0000 0000 0000 0000 0000 00xx

b0	ICD	Illegal Carrier Detection 0: PHY-LSI has not detected an illegal carrier on the line. 1: PHY-LSI has detected an illegal carrier on the line.

MPD Magic Packet™ Detection Bit

This bit indicates that a Magic Packet™ has been detected on the line.

Writing 1 to this bit clears it to 0.

ICD Illegal Carrier Detection Bit

This bit indicates that the PHY-LSI has detected an illegal carrier on the line. If a change in the signal input from the PHY-LSI occurs in a period shorter than the software recognition period, the correct information may not be obtained. Refer to the timing specification for the PHY-LSI used.

Writing 1 to this bit clears it to 0.

24.3.51 E-MAC Interrupt Permission Register (ECSIPR)

The ECSIPR register enables or disables the states indicated by the ECSR register as interrupt sources. Each effective bit disables or enables interrupts corresponding to the bits in ECSR.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 518_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b0	ICDIP	False Carrier Detect Interrupt Enable 0: Interrupts on setting of the ICD bit is disabled. 1: Interrupt on setting of the ICD bit is enabled.

MPDIP Magic Packet™ Detect Interrupt Enable Bit

Setting this bit to 1 selects interrupt generation on setting of the Magic Packet™ detection bit (ECSR.MPD) in the E-MAC status register to 1.

ICDIP Illegal Carrier Detect Interrupt Enable Bit

Setting this bit to 1 selects interrupt generation on setting of the illegal carrier detection bit (ECSR.ICD) in the E-MAC status register to 1.

24.3.52 PHY Interface Register (PIR)

The PIR register provides a means of access to the PHY-LSI internal registers via the MII.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 520_H

Initial value: B'0000 0000 0000 0000 0000 0000 0000 x000

Table 24.61 PIR register contents

Bit Position	Bit Name	Function
b31 to b4	—	Reserved These bits are read as 0. The write value should be 0.
b3	MDI	MII Management Data-In Indicates the level of the AVB_MDIO pin.
b2	MDO	MII Management Data-Out Holds data for output from the AVB_MDIO pin.
b1	MMD	MII Management Mode 0: Read direction is specified. 1: Write direction is specified.
b0	MDC	MII Management Data Clock The value set in this bit is output from the AVB_MDC pin, which supplies the management data clock for the MII.

MDI MII Management Data-In Bit

This bit indicates the level of the AVB_MDIO pin.

MDO MII Management Data-Out Bit

This bit holds data for output from the AVB_MDIO pin.

The AVB_MDIO pin outputs data when the MMD bit is set to 1 (to specify writing as the direction). Data are not output while the MMD bit is set to 0 (to specify reading as the direction).

MMD MII Management Mode Bit

This bit specifies the direction for data through MDIO (reading or writing).

MDC MII Management Data Clock Bit

Values set in this bit are output on the AVB_MDC pin to supply the MII with the management data clock. For the method of access to the MII registers, see Section 24.4.13, Connection to PHY-LSI.

24.3.53 Auto PAUSE Frame Time Parameter Register (APFTP)

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 554_H

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.62 APFTP register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to b0	APFTP[15:0]	Auto Pause Frame Time Parameter H'0000: — H'0001: 1 × 512 bit-period H'0002: 2 × 512 bit-period :: H'FFFF: 65535 × 512 bit-period **NOTE** A bit-period changes relative to the transfer speed as follows. • 100Mbps: 1 bit-period = 10 ns • 10Mbps: 1 bit-period = 100 ns **CAUTION** If ECMR.TXF set to 1, APFTP[15:0] should not be set to 0000_H.

APFTP[15:0] Auto Pause Frame Time Parameter

This bits configure the Timer value for the transmit of Auto Pause Frame.

The APFTP[15:0] register is used to set the value for the TIME parameter of automatically generated PAUSE

frames. When a PAUSE frame is automatically transmitted, the value set in this register is used as its TIME parameter.

Setting value is same as MP[15:0] bit of MPR register.

24.3.54 Manual PAUSE Frame Register (MPR)

The MPR register is used to set the value for the TIME parameter of manually generated PAUSE frames. When a PAUSE frame is manually transmitted, the value set in this register is used as its TIME parameter.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 558_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 24.63 MPR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to b0	MP[15:0]	Manual PAUSE These bits set the TIME parameter value of a manual PAUSE frame. Note H'0000: — H'0001: 1 × 512 bit-period H'0002: 2 × 512 bit-period :: H'FFFF: 65535 × 512 bit-period **NOTE** A bit-period changes relative to the transfer speed as follows. • 100Mbps: 1 bit-period = 10 ns • 10Mbps: 1 bit-period = 100 ns

MP[15:0] Manual PAUSE Bits

These bits set the value of the TIME parameter in manually generated PAUSE frames.

The unit for the setting is 512 bit periods.

24.3.55 PAUSE Frame Transmit Counter (PFTCR)

The PFTCR register is a counter that indicates the number of times PAUSE frames have been transmitted.

Access: This register is read-only in 32-bit units.

Address: <ETNBn_base> + $55C_H$

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 24.64 PFTCR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0.
b15 to b0	PFTXC[15:0]	PAUSE Frame Transmit Counter Counter for counting the number of transmitted PAUSE frames

PFTXC[15:0] PAUSE Frame Transmit Counter Bits

These bits indicate the total number of PAUSE frames that have been transmitted (both manually and automatically).

The bits are cleared to 0 when they are read.

If counting up and clearing of the counter coincide, clearing the counter takes priority.

24.3.56 PAUSE Frame Receive Counter (PFRCR)

The RFRCR register is a counter that indicates the number of times PAUSE frames have been received.

Access: This register is read-only in 32-bit units.

Address: <ETNBn_base> + 560_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	PFRXC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 24.65 RFRCR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0.
b15 to b0	PFRXC[15:0]	PAUSE Frame Receive Counter Counter for counting the number of received PAUSE frames

PFRXC[15:0] PAUSE Frame Receive Counter Bits

These bits indicate the number of PAUSE frames that have been received when flow control in reception is enabled (the RXF bit in ECMR = 1).

The bits are cleared to 0 when they are read.

If counting up and clearing the counter coincide, clearing the counter takes priority.

24.3.57 EthernetAVB Mode Register (GECMR)

The GECMR register specifies the operating mode for the EthernetAVB.

The setting in the ECMR1 register must not be changed while transmission or reception is enabled.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + $5B0_H$

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

The default value of the SPEED bit must not be changed to 1.

Table 24.66 ECMR1 register contents

Bit Position	Bit Name	Function
b31 to b1	—	Reserved These bits are read as 0. The write value should be 0.
b0	SPEED	Transfer Speed Setting 0: Transfer is at 100 Mbps. 1: Prohibited

SPEED Transfer Speed Setting Bit

This bit sets the transfer rate.

24.3.58 E-MAC Address High Register (MAHR)

The MAHR register specifies the 32 higher-order bits of the 48-bit E-MAC address. The settings in this register are normally made in the initialization process after a reset.

The settings in this register must not be changed while transmission or reception is enabled.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + $5C0_H$

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MA[47:32]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 24.67 MAHR register contents

Bit Position	Bit Name	Function
b31 to b0	MA[47:16]	E-MAC Address Bits 47 to 16 These bits are used to set the 32 higher-order bits of the E-MAC address.

MA[47:16] E-MAC Address Bits 47 to 16

These bits are used to set the 32 higher-order bits of the E-MAC address.

For example, if the E-MAC address is 01-23-45-67-89-AB (hexadecimal), set H'0123 4567 in the MAHR register.

24.3.59 E-MAC Address Low Register (MALR)

The MALR register specifies the 16 lower-order bits of the 48-bit E-MAC address. The settings in this register are normally made in the initialization process after a reset.

The settings in this register must not be changed while transmission or reception is enabled.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + $5C8_H$

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 24.68 MALR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to b0	MA[15:0]	E-MAC Address Bits 15 to 0 These bits are used to set the 16 lower-order bits of the E-MAC address.

MA[15:0] E-MAC Address Bits 15 to 0

These bits are used to set the 16 lower-order bits of the E-MAC address.

For example, if the E-MAC address is 01-23-45-67-89-AB (hexadecimal), set H'89AB in the MALR register.

24.3.60 Transmit Retry Over Counter Register (TROCR)

The TROCR register is a counter that indicates the number of frames the module was unable to transmit in 16 attempts at transmission including the first attempt and retries. When 16 attempts to transmit a frame fail, this register is incremented by 1. Counting up stops when the value in this register reaches H'0000 FFFF.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 700_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 24.69 TROCR register contents

Bit Position	Bit Name	Function
b31 to 16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to 0	TROC[15:0]	Transmit Retry Over Counter These bits indicate the number of frames the module was unable to transmit in 16 attempts at transmission, including the first attempt and retries.

TROC[15:0] Transmit Retry Over Counter Bits

These bits indicate the number of frames the module was unable to transmit in 16 attempts at transmission, including the first attempt and retries.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register (ECMR) is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

24.3.61 Lost Carrier Counter Register (LCCR)

The LCCR register is a counter that indicates the number of times the carrier was lost during data transmission. Counting up stops when the value in this register reaches H'0000 FFFF.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 710_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit Position	Bit Name	Function
b31 to 16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to 0	LCC[15:0]	Lost Carrier Counter These bits indicate the number of times the carrier was lost during data transmission.

LCC[15:0] Lost Carrier Counter Bits

These bits indicate the number of times the carrier was lost during data transmission.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register (ECMR) is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

24.3.62 CRC Error Frame Receive Counter Register (CEFCR)

The CEFCR register is a counter that indicates the number of times frames with CRC errors were received. Counting up stops when the value in this register reaches H'0000 FFFF.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 740_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

b31 to b16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to b0	CEFC[15:0]	CRC Error Frame Counter These bits indicate the number of CRC error frames received.

CEFC[15:0] CRC Error Frame Counter Bits

These bits indicate the number of received frames having CRC errors.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

24.3.63 Frame Receive Error Counter Register (FRECR)

The FRECR register is a counter that indicates the number of frames for which receive errors were generated by input on the AVB_RX_ER pin from the PHY-LSI. Counting up stops when the value in this register reaches H'0000 FFFF.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 748_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit Position	Bit Name	Function
b31 to 16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to 0	FREC[15:0]	Frame Receive Error Counter These bits indicate the number of errors during frame reception.

FREC[15:0] Frame Receive Error Counter Bits

These bits indicate the number of errors during frame reception.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

24.3.64 Too-Short Frame Receive Counter Register (TSFRCR)

The TSFRCR register is a counter that indicates the number of received frames that were fewer than 64 bytes in length. Counting stops when the value in this register reaches H'0000 FFFF.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 750_H

Initial value: $0000\ 0000_H$

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 24.73 TSFRCR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to b0	TSFRC[15:0]	Too-Short Frame Receive Counter These bits indicate the number of frames received with a length of less than 64 bytes.

TSFRCR[15:0] Too-Short Frame Receive Counter Bits

These bits indicate the number of received frames that were fewer than 64 bytes in length.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

24.3.65 Too-Long Frame Receive Counter Register (TLFRCR)

The TLFRCR register is a counter that indicates the number of received frames that were longer than the value specified in the receive frame length register (RFLR). Counting up stops when the value in the TLFRCR register reaches H'0000 FFFF.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 758_H

Initial value: 0000 0000_H

Table 24.74 TLFRCR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to b0	TLFC[15:0]	Too-Long Frame Receive Counter These bits indicate the number of frames received with a length exceeding the value in RFLR.

TLFRCR[15:0] Too-Long Frame Receive Counter Bits

These bits indicate the number of received frames that were longer than the value in RFLR.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

24.3.66 Residual-Bit Frame Receive Counter Register (RFCR)

The RFCR register is a counter that indicates the number of received frames containing “residual bits” (trailing bits not making up an 8-bit unit). Counting up stops when the value in this register reaches H’0000 FFFF.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 760_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b15 to b0	RFC[15:0]	Residual-Bit Frame Receive Counter These bits indicate the number of received frames containing residual bits.

RFC[15:0] Residual-Bit Frame Receive Counter Bits

These bits indicate the number of received frames containing residual bits.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

24.3.67 Multicast Address Frame Receive Counter Register (MAFCR)

The MAFCR register is a counter that indicates the number of received frames for which a multicast address was specified. Counting up stops when the value in this register reaches H'0000 FFFF.

Access: This register can be read/written in 32-bit units.

Address: <ETNBn_base> + 778_H

Initial value: 0000 0000_H

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 24.76 MAFCR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to b0	MAFC[15:0]	Multicast Address Frame Counter These bits indicate the number of multicast frames that have been received.

MAFC[15:0] Multicast Address Frame Counter Bits

These bits indicate the number of multicast frames that have been received.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

24.4 Operation

The EthernetAVB consists of the following functional units:

- DMA transfer controller (AVB-DMAC): Handles DMA transfer between the data storage areas for reception and transmission in the URAM and the reception and transmission FIFO buffers
- MAC controller (E-MAC): Handles transfer between the reception and transmission FIFO buffers and the MII

Using its direct memory access (DMA) function, the AVB-DMAC handles DMA transfer of frame data between the destinations for storing Ethernet frame data for transmission and reception in the URAM and the FIFO buffers for reception and transmission. Data cannot be directly read from or written to the FIFO buffers.

To handle DMA transfer, the AVB-DMAC requires information that includes the addresses for storage of data for transmission and received data. These data are referred to as descriptors. The AVB-DMAC reads data for transmission from the storage area for data to be transmitted according to the information in descriptors and writes received data to the storage area for received data accompanied by information in descriptors. The descriptors are placed in the URAM. Arranging multiple descriptors in descriptor lists allows the continuous reception or transmission of multiple Ethernet frames.

The E-MAC supports a MII, which provides an interface format for the externally connected PHY-LSI. The E-MAC constructs Ethernet frames from data written to the transmission FIFO and transmits these frames to the MII. It also performs CRC checking of Ethernet frames received from the MII and writes the frames to the reception FIFO.

24.4.1 AVB-DMAC Operating Modes

Figure 24.5 illustrates the operating modes of the AVB-DMAC.

Transitions of AVB-DMAC operating mode are under the control of the items listed below.

- CPU operating mode (hardware reset and power-down mode)
- Configuration of the operating mode configuration bits (CCC.OPC[1:0]) in the AVB-DMAC mode register

The current operating mode can be confirmed by reading the operating mode status bits in the AVB-DMAC status register (CSR.OPS[3:0]).

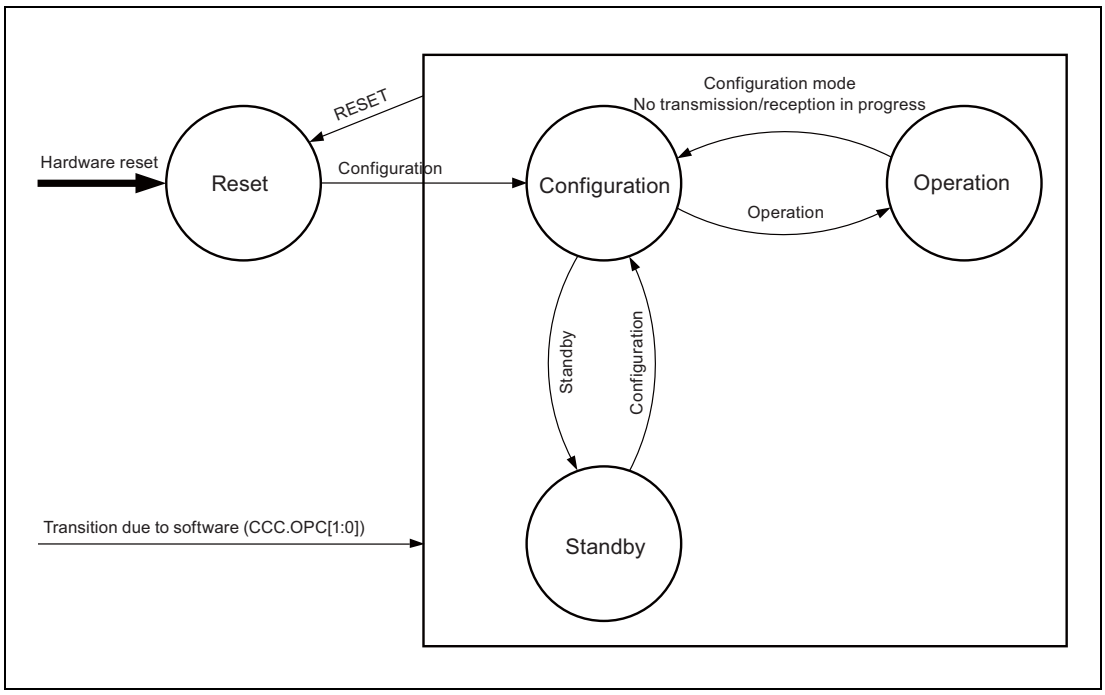

Figure 24.5 Operating Mode of AVB-DMAC

24.4.1.1 Operating Modes

(1) Reset mode

After a hardware reset, the AVB-DMAC enters reset mode.
In reset mode, only the AVB-DMAC operating mode control function is controllable and other functions are all stopped. This mode is designed for reduced power when the Ethernet function is not necessary.

(2) Configuration mode

In configuration mode, various settings for the AVB-DMAC can be made.
The operation of most functions is stopped and all status registers are initialized to their reset values.
The E-MAC functions in this mode.

(3) Operation mode

In operation mode, all functions of the AVB-DMAC can operate.
Ethernet communications can only proceed in this mode.

(4) Standby mode

In standby mode, the E-MAC can only be used to control the operating mode and to decode Magic Packets. Other functions cannot be used.

24.4.1.2 How to Set the Operating Mode

Set the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC[1:0]) to select the operating mode. Furthermore, the current operating mode can be checked by reading the operating mode status bits in the AVB-DMAC status register (CSR.OPS[3:0]).

Transitions other than from operation mode to configuration mode are made after the value is written to the operating mode configuration bits (CCC.OPC[1:0]) (**Figure 24.6**).

For transitions from operation mode to configuration mode, follow the procedure in **Figure 24.7** because any transmission and reception in progress will be executed before the transition to configuration mode.

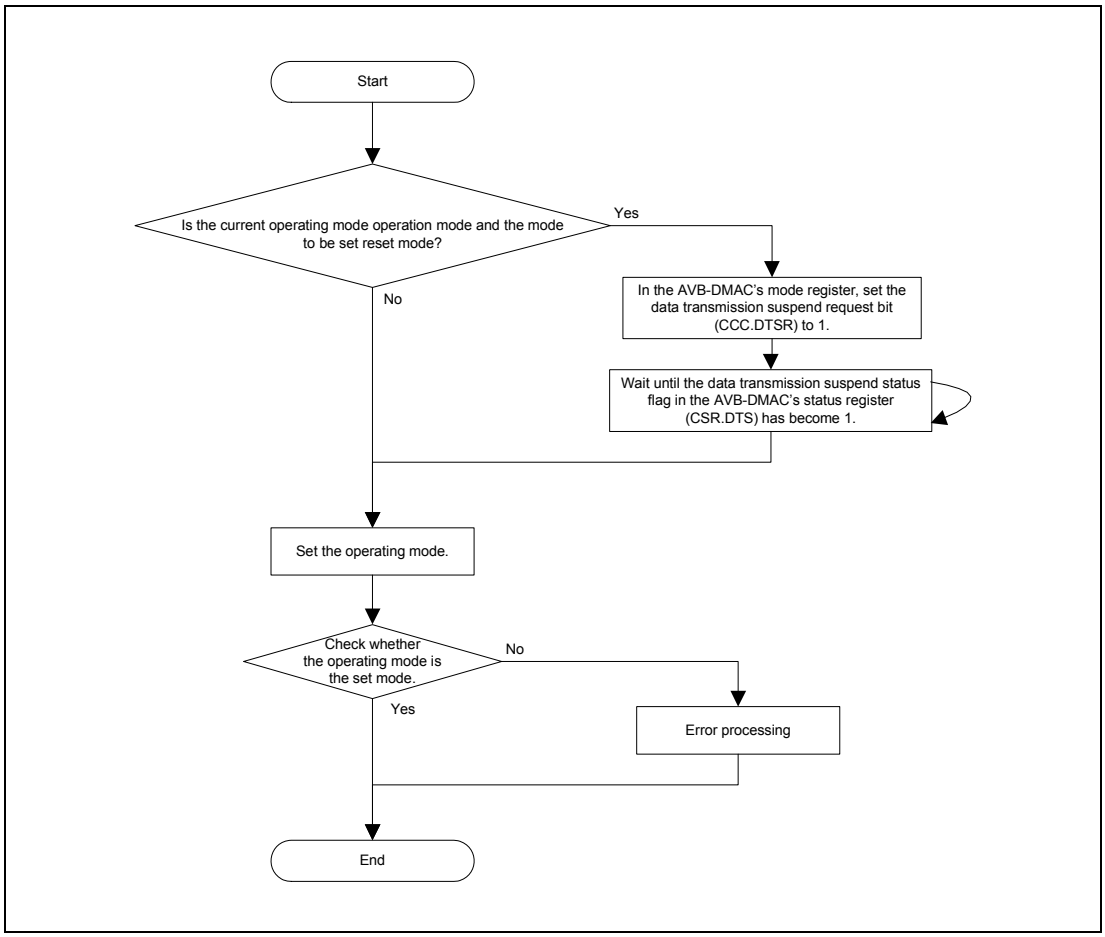

Figure 24.6 Flow for Transitions of Operating Mode (Other than from Operation Mode to Configuration Mode)

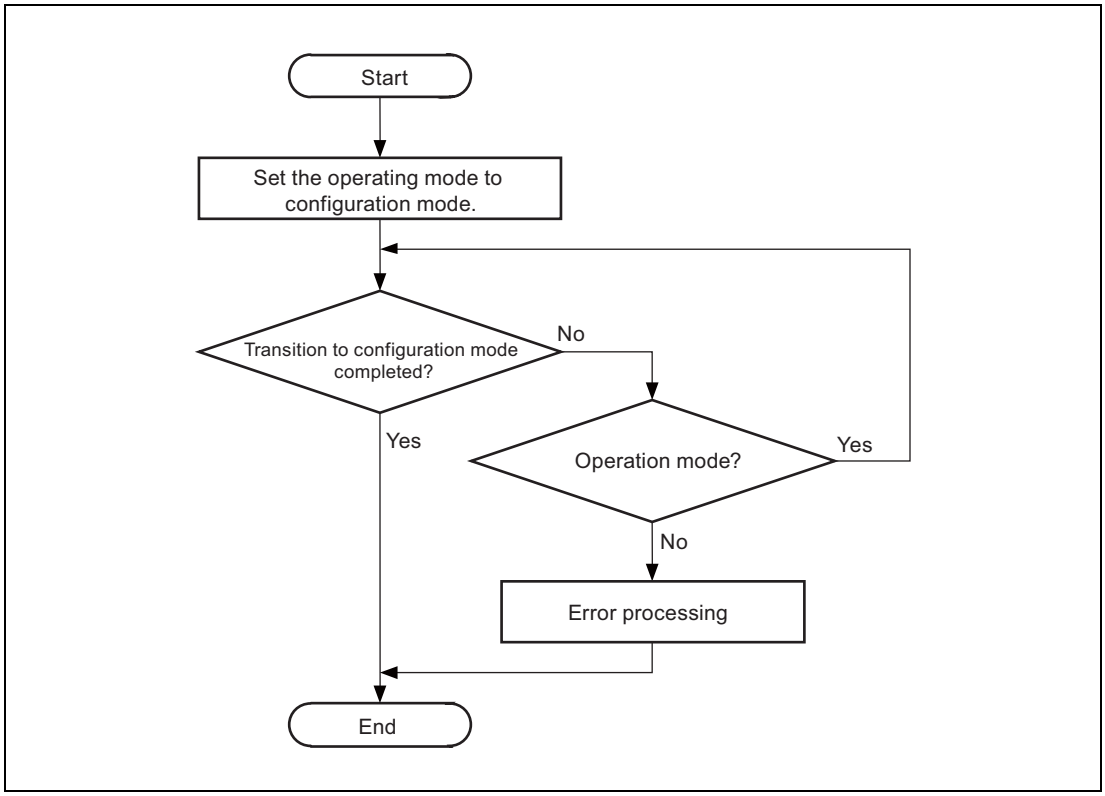

Figure 24.7 Flow for Transitions of Operating Mode (from Operation Mode to Configuration Mode)

In the transition from operation mode to configuration mode, the AVB-DMAC executes the following operations before the transition is completed. Read the operating mode status bits in the AVB-DMAC status register (CSR.OPS[3:0]) to check that the transition to configuration mode has been completed.

- If the transfer of a frame between the reception FIFO and URAM is in progress, this is completed (other received frames remaining in the FIFO and any frames that are subsequently received by the E-MAC are discarded).
- If the transfer of a frame is in progress between the transmission FIFO and URAM, this is completed
  (frames for transmission remaining in the URAM will not be transmitted).
- All frames for transmission in the transmission FIFO are transferred to the E-MAC.

Notes:

When the operating mode shifts to configuration mode, all status registers are cleared.

We recommend following the procedure below in the case of this transition.

1. Disable reception.
2. Since reception actually stopping after being disabled requires time, wait for an interval equivalent to that for reception of a maximum length packet.
3. Stop the software task that is generating data for transmission.
4. Wait until the receive process status bit (CSR.RPO) and the transmit process status bits (CSR.TPO0 to 3) in the AVB-DMAC status register are set to 0.
5. Capture all of the required status information.
6. Set the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC[1:0]) to initiate the transition to configuration mode.

24.4.1.3 Operating Mode Transitions Due to Hardware

The following hardware factors can also initiate transitions of the AVB-DMAC operating mode.

(1) Hardware reset

Resetting of the LSI chip leads to resetting of the entire EthernetAVB module. The operating mode shifts to reset mode.

(2) Transition during power-off

This transition is triggered by hardware during the power-off sequence under software control.

The AVB-DMAC completes the bus master access in progress (in the worst case, a 128-byte burst), and then shifts to reset mode. At this time, the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC[1:0]) are set to B’00.

24.4.2 Common Control for Transmission and Reception

24.4.2.1 Initialization Procedure

Figure 24.8 shows the overall initialization procedure in outline.

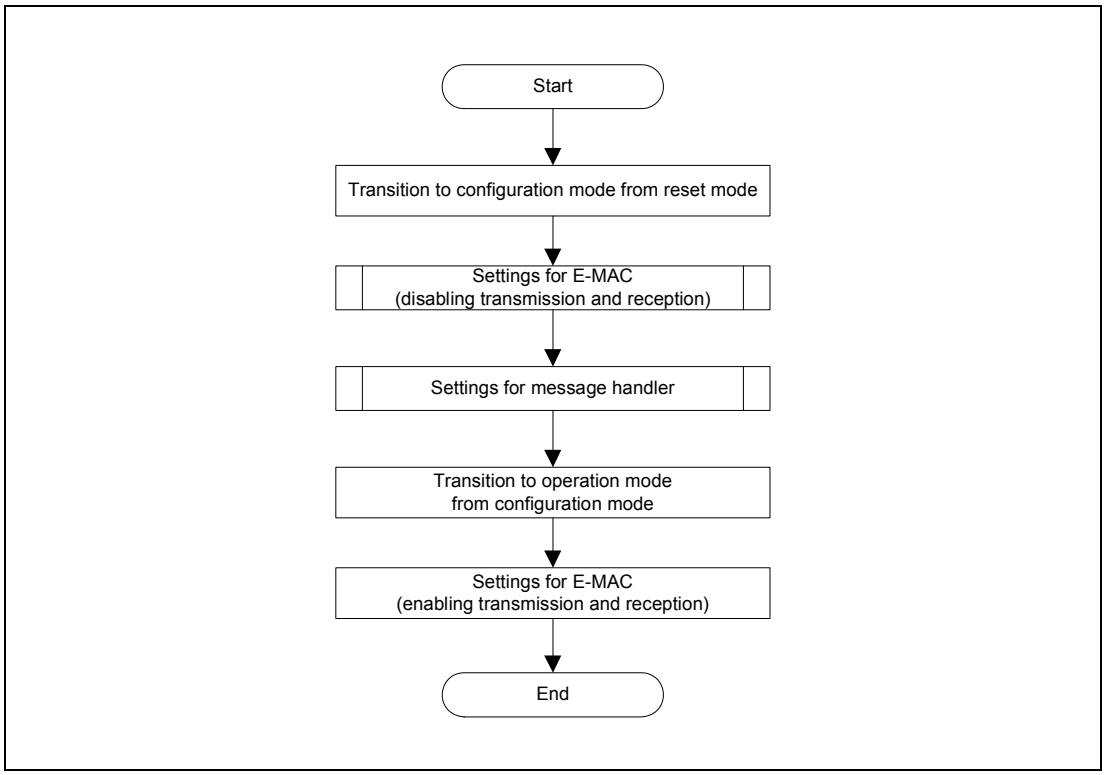

Figure 24.8 Outline of the Initialization Procedure

(1) Initializing the Receiver Section

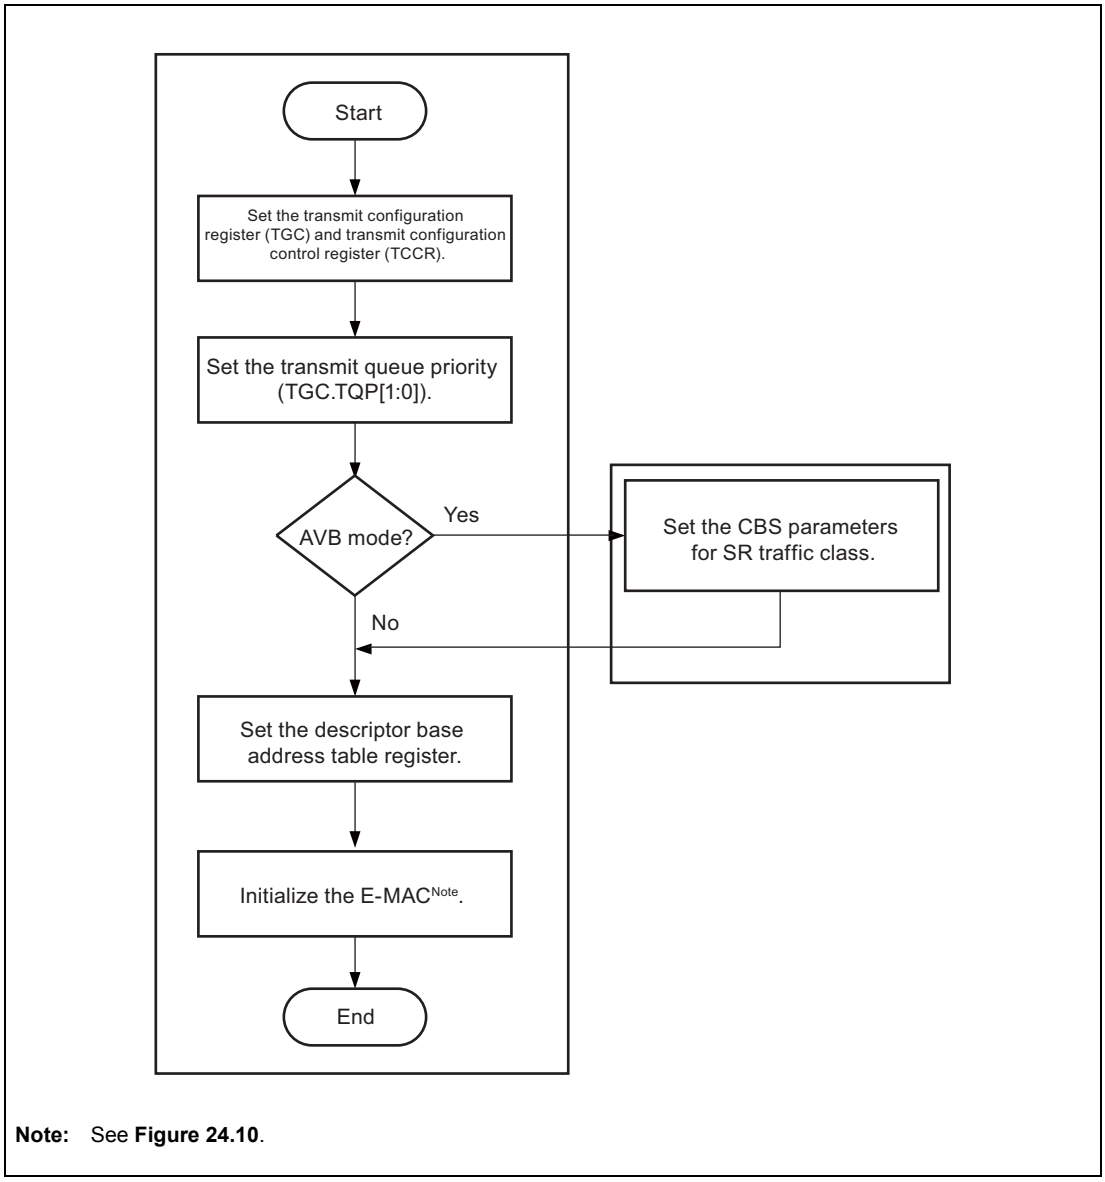
Before starting reception, follow the procedure below.

Keep the operating mode to configuration mode, and do not enable reception until the settings for the AVB-DMAC are completed.

- Set the operating mode to configuration mode.
- Set AVB filtering for network control frames and AVB stream frames to suit the specifications of the product the chip will be used in.
- Create a descriptor chain for each queue to be used.
- Set the base address for the descriptor table in the descriptor base address table register (DBAT).
- Specify the maximum frame length with the receive frame length upper limit register (RFLR).
- Specify whether padding is to be used with the receive padding configuration register (RPC).
- Set the unread frame counter for each queue with unread frame counter registers 0 to 4.

(2) Initializing the Transmitter Section

Figure 24.9 illustrates initialization of the transmitter section.



Note: See **Figure 24.10**.

Figure 24.9 Procedure for Initializing the Transmitter Section

(3) Initializing the E-MAC Section

Figure 24.10 illustrates initialization of the E-MAC section.

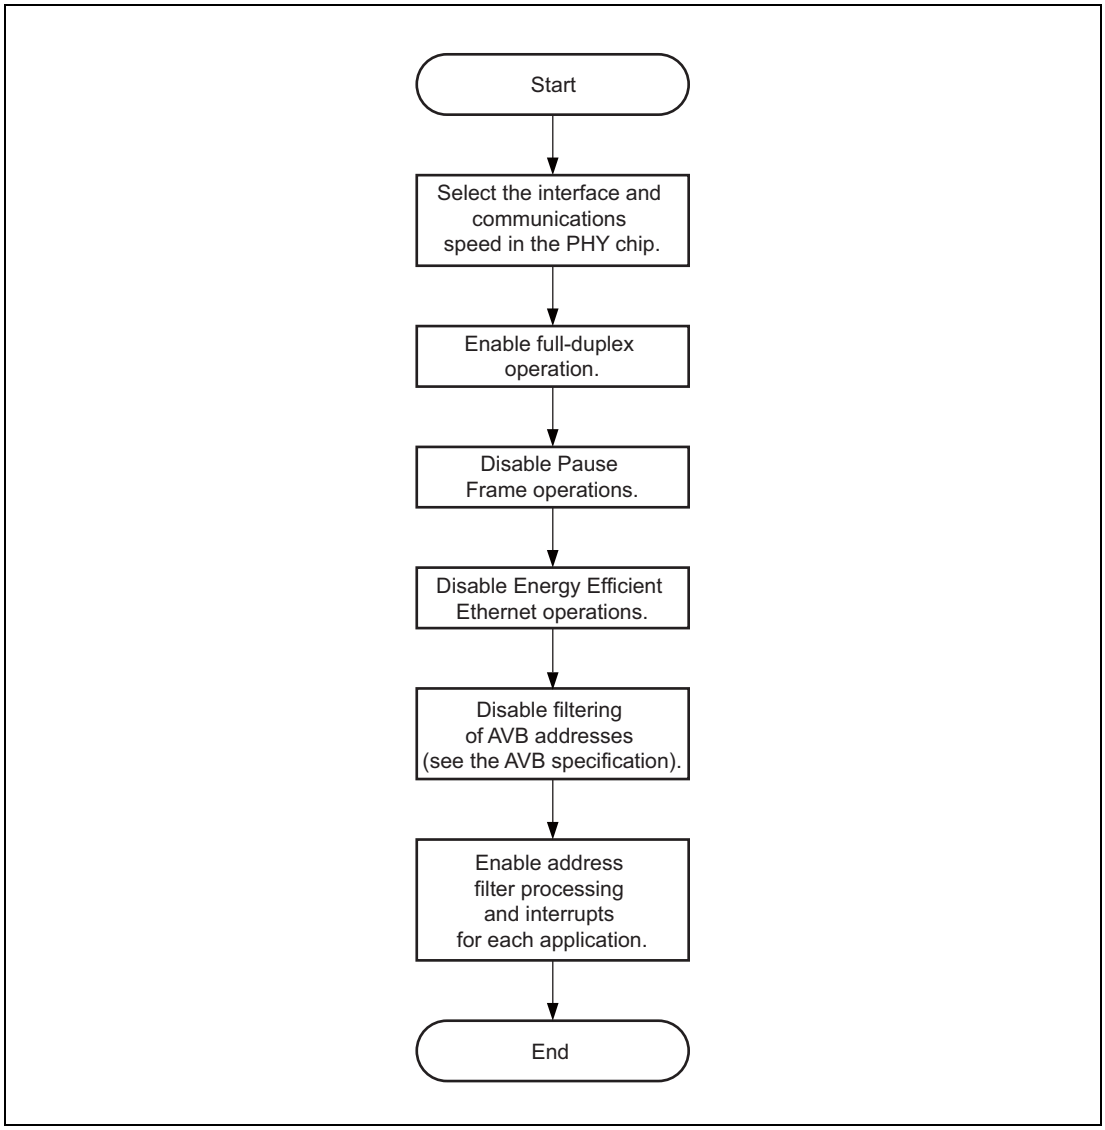


Figure 24.10 Procedure for Initializing the E-MAC Section

(4) Initialization of the Application Unit

Figure 24.11 illustrates initialization of the application unit.

For a description of how to set up the descriptors and the CBS traffic shaping parameters, see Section 24.4.3, Descriptors, and Section 24.4.6, CBS (Credit-Based Shaping).

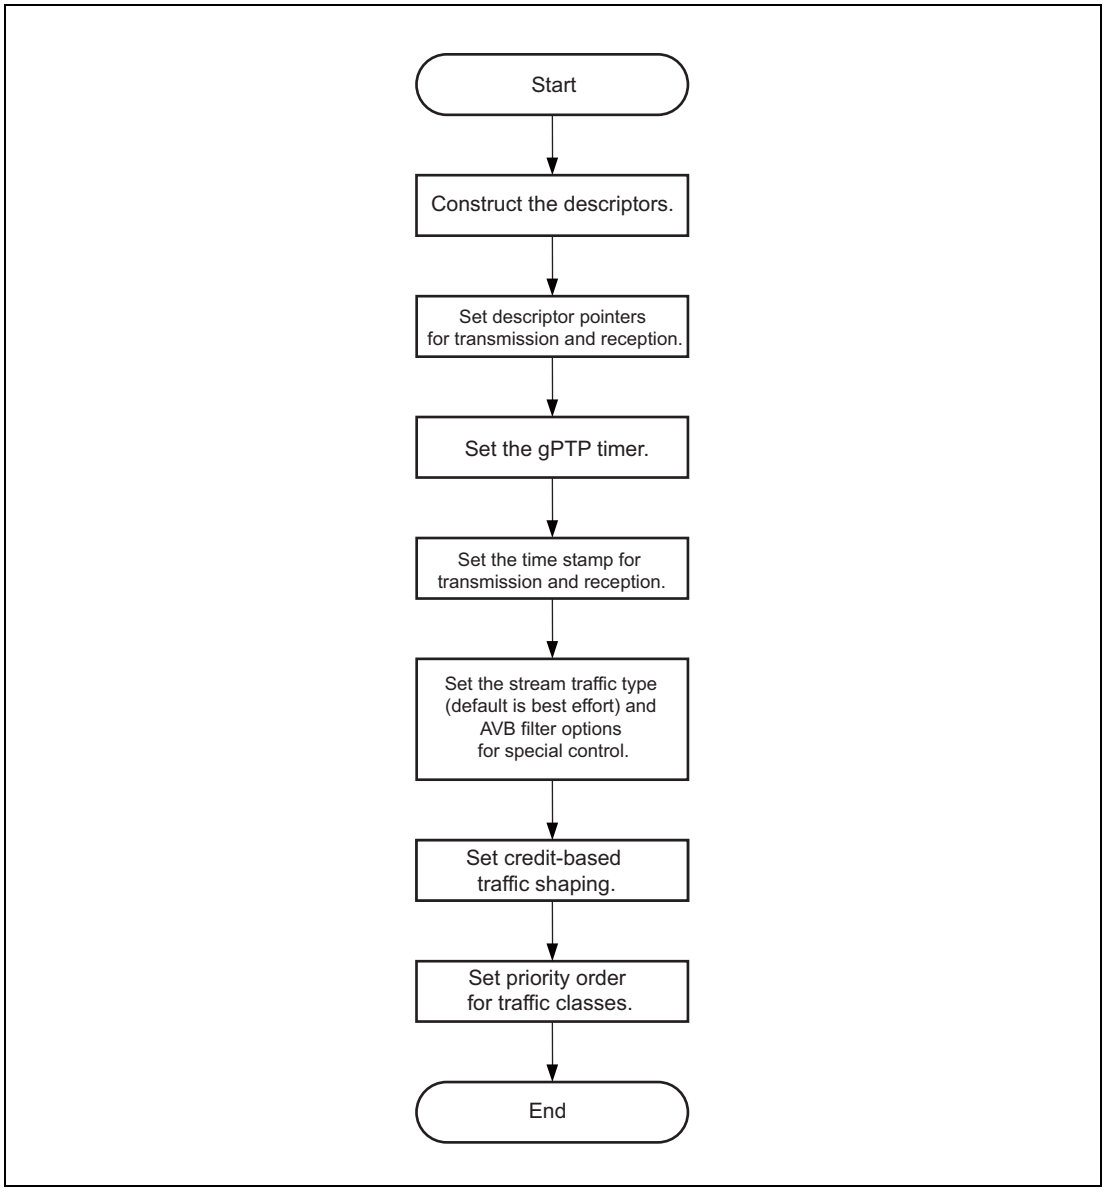

Figure 24.11 Initializing the Sections for Use by the Application

24.4.2.2 Scheduling Reception and Transmission

The AVB-DMAC normally has independent buses for transmission and reception. Furthermore, the four processes of fetching, storing, transmission and reception are basically independent of one another. Fetching and storing, however, share the same bus master so cannot be executed simultaneously. Access to the bus master is controlled by the scheduler.

Figure 24.12 is a schematic view of AVB-DMAC operations in transmission and reception.

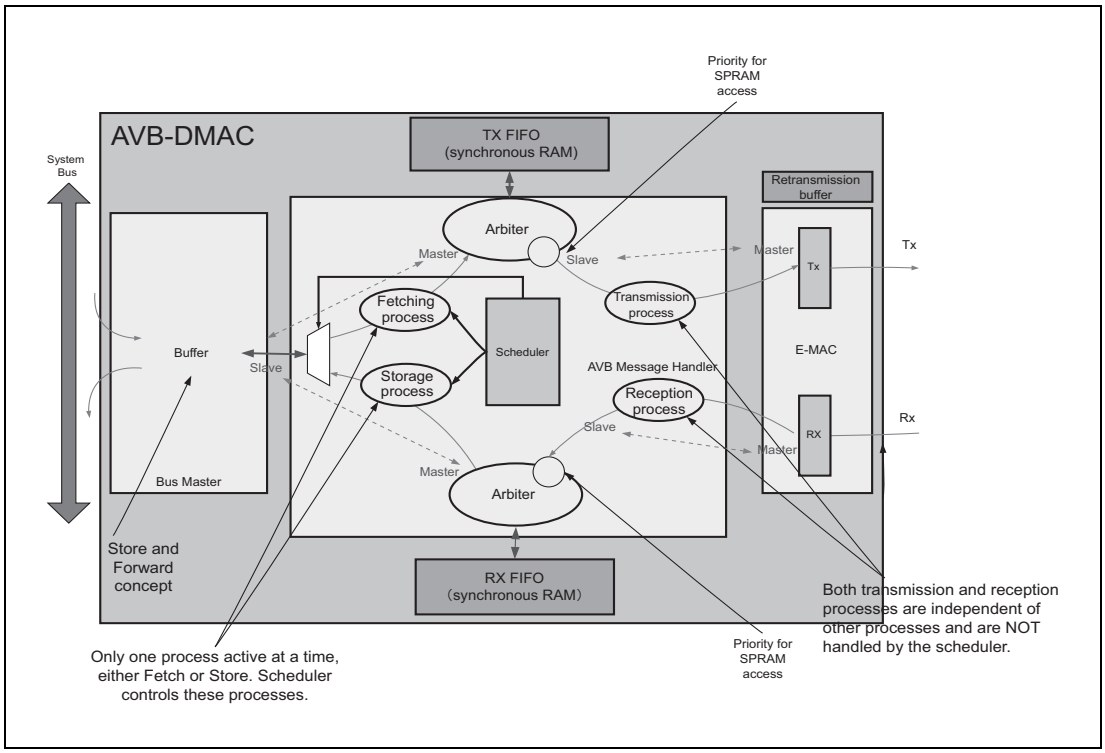

Figure 24.12 Schematic View of AVB-DMAC Operations in Transmission and Reception

Storing and fetching are alternately performed. When the number of frames held by the reception FIFO reaches the warning level, storing takes precedence over fetching.

(1) Relationship between Transmission Queue Numbers and Traffic Classes

In fetching, the relationships between the transmission queues and traffic classes are fixed, so the priority specified by the transmit queue priority bits in the transmit configuration register (TGC.TQP[1:0]) has no effect.

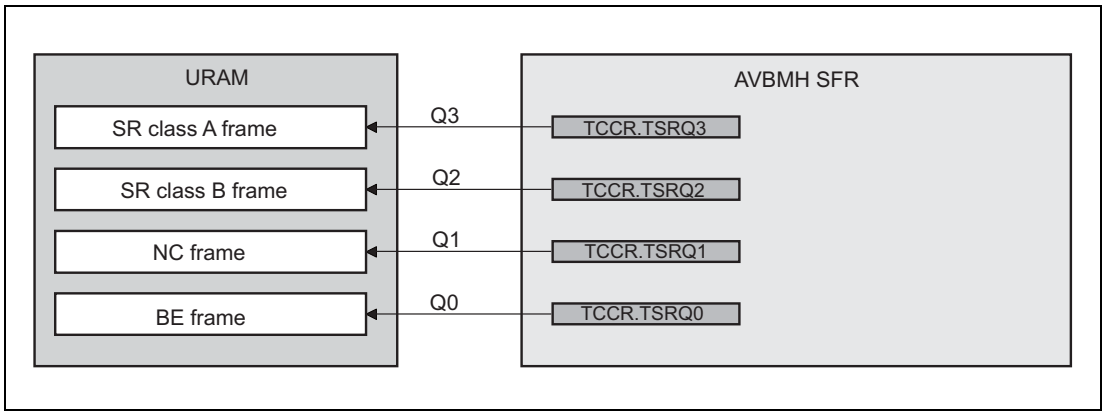

Figure 24.13 Class Associations of Queues for the Scheduler

In fetching, the credit values for stream classes A and B are not taken into account. Behavior depends on the setting of the transfer FIFO size configuration bits in the transfer configuration registers (TGC.TBDt) and on the frame size that can be fetched to the transmission FIFO.

When the transmit queue priority bits in the transmit configuration register (TGC.TQP[1:0]) are B’00 or B'01, the priority order is Q3 → Q 2 → Q1 → Q0.

When the transmit queue priority bits in the transmit configuration register (TGC.TQP[1:0]) are B’11, the priority order is Q1 → Q3 → Q2 → Q0.

24.4.2.3 Checking Integrity

The AVB-DMAC is capable of detecting and identifying errors produced in the processing of Ethernet frames and in the transfer of frame data for transmission and reception.

(1) Concept of Integrity Checking in Reception

The aim of integrity checking in reception is preventing the storage of error frames in the URAM.

If an error frame is stored, information to identify the frame as an error frame is appended to the data from the frame in the URAM.

CAUTION

If a special descriptor chain is to be used for separation of received headers from the associated data, an error that breaks the sequence may lead to storage space for synchronization running out. In such cases, software interaction or re-synchronization via the EOS descriptor is required.

(2) Concept of Integrity Checking in Transmission

The purpose of integrity checking in transmission is to prevent the transmission of broken frames.

Since transmission of a frame by the E-MAC can neither be stopped nor disabled once it has started, this check involves intensive monitoring for problems that can arise during fetching.

(3) Items for Monitoring in Both Reception and Transmission

(a) Errors in access to the URAM for reading of descriptors

The same descriptor may be processed again because the current descriptor address (CDARq.CDA[31:0]) was not changed.

If this problem occurs in a divided frame, the sequence may be broken.

In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.
- The frame will be lost from the transmission FIFO.

Errors in access to read descriptors from the URAM are detected from the response signal of the AXI-Bus.

(b) Illegal configuration of a descriptor by an application

The same descriptor may be processed again because the current descriptor address (CDARq.CDA[31:0]) was not changed.

If this problem occurs in a divided frame, the sequence may be broken.

In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.
- The frame will be lost from the transmission FIFO.

(c) Errors in access to the URAM for writing of descriptors

As in the case where no error occurs, the current descriptor address (CDARq.CDA[31:0]) and the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) are updated.

As DESCR.DT was not updated, hardware and software synchronization may have been destroyed.

Errors in access to write descriptors to the URAM are detected from the response signal of the AXI-Bus.

(4) Items for Monitoring in Reception

(a) Errors in access to the URAM for writing of data or time stamps

- As in the case where no error occurs, the current descriptor address (CDARq.CDA[31:0]) is updated.
- DESCR.EI is set to indicate incorrect contents.
- This problem occurring in a divided frame may break the descriptor sequence, making the queue unusable.

Errors in access to write data or descriptors to the URAM are detected from the response signal of the AXI-Bus.

(b) Errors in Access for Reading from the Reception FIFO

- As in the case where no error occurs, the current descriptor address (CDARq.CDA[31:0]) is updated.
- DESCR.EI is set to indicate incorrect contents.
- This problem occurring in a divided frame may break the descriptor sequence, making the queue unusable.
- Errors of this type are detected by the ECC checker for the reception FIFO.

(c) Damaged Data in the Reception FIFO

- Received frames are all invalidated.
- All frames stored as received frames are discarded. At this time, the number of frames and queue information cannot be captured.

If damaged data in the reception FIFO is an error due to the reception FIFO, this is detected by the AVB-DMAC.

(5) Items for Monitoring in Transmission

(a) Errors in Access for Reading Data from the URAM

- Data that have already been fetched are discarded from the transmission FIFO.
- When an error of this type occurs during processing of an FSINGLE or FEND descriptor:
  As in the case where no error occurs, the current descriptor address (CDARq.CDA[31:0]) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated.
  Fetching resumes after the error frame.
- When an error of this type occurs during processing of an FSTART or FMID descriptor:
  - The current descriptor address (CDARq.CDA[31:0]) is not updated.
  - The transmit start bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.

Errors in access to read data from the URAM are detected from the response signal of the AXI-Bus.

(b) Overflow of the Transmission FIFO

- As in the case where no error occurs, the current descriptor address (CDARq.CDA[31:0]) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated.
  Fetching resumes after the error frame.
- The frame will be discarded from the FIFO.

(c) Errors in Access for Reading of the Transmission FIFO

The AVB-DMAC is incapable of detecting an error in reading of the transmission FIFO, resulting in the transmission of a broken frame.

Errors of this type are detected by the ECC checker for the transmission FIFO.

(d) Frame size error during transmission

- As in the case where no error occurs, the current descriptor address (CDARq.CDA[31:0]) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated.
  Fetching resumes after the error frame.

A transmit frame size error is detected when the size setting in one or more (in the case of a divided frame) descriptors for frame transmission is 1966 or more bytes. Such frames are cut out and transmitted.

(e) Damaged Data in the Transmission FIFO

- Fetching is not affected by damaged data.
- Since damaged data from the FIFO is only detected during frame transmission, an error frame may be transmitted.

If damaged data in the transmission FIFO is an error due to the transmission FIFO, this is detected by the AVB-DMAC.

24.4.3 Descriptors

24.4.3.1 Data Representation in URAM

The AVB-DMAC transfers data for transmission and received data to and from the application software via the URAM.

The memory in the URAM for use by the AVB-DMAC is configured with control structures referred to as descriptors and associated areas to which the frame data are allocated. Dividing the memory into a control area and data area allows the flexible allocation of frame data to the URAM. This enables sharing of the areas to which frame data are allocated and the use of non-contiguous areas. Frame data can be copied without using the CPU. Arbitration that ensures hardware and software access to the memory area is also available without using the AVB-DMAC.

Figure 24.14 shows an example of the memory maps for descriptors and the descriptor data area in the URAM.

A descriptor consists of its type (DESCR.DT), which controls the descriptor functions, a descriptor pointer (DESCR.DPTR) indicating the start address for storage of the frame data in the descriptor area, and the data size field (DESCR.DS), indicating the amount of frame data. Post-processing interrupt generation can be set up for each descriptor. Enabling and disabling of the interrupt is controlled by the descriptor interrupt enable bits (DESCR.DIE).

The descriptor may also hold information related to content. This information does not affect general descriptor functions. It provides information other than the frame data proper, such as on the state of reception.

For details, see Section 24.4.4.2, Setting Up Reception Descriptors, and **Section 24.4.5.2, Setting Up Transmission Descriptors**.

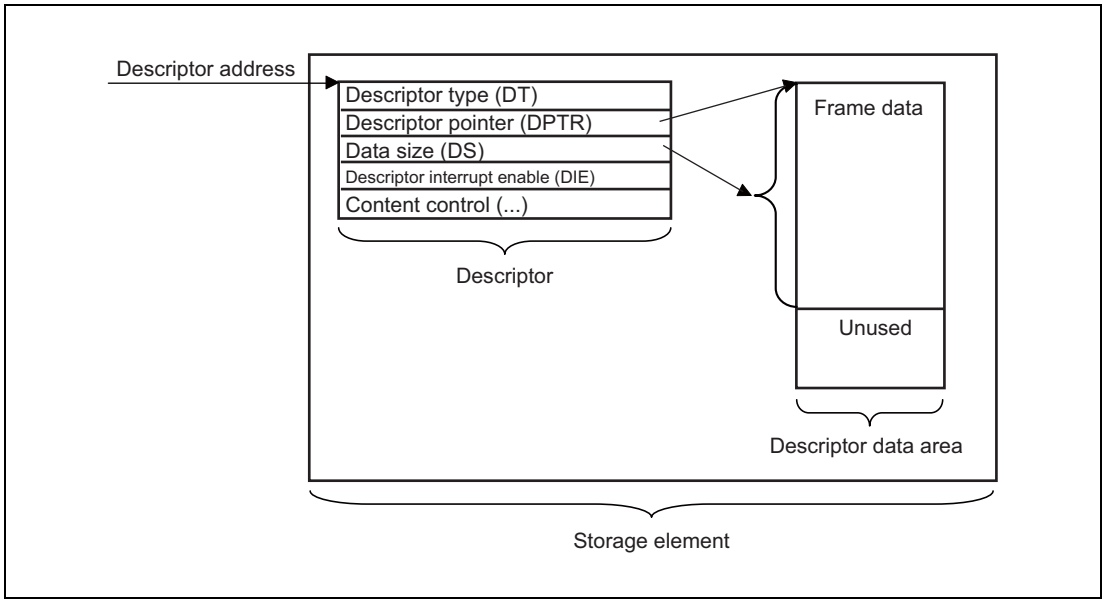

Figure 24.14 Example of URAM Memory Map

The descriptor must be aligned with a 32-bit boundary in the URAM.

Descriptors are generally configured of 64 bits, but are configured of 160 bits when reception and storage of gPTP time stamps is enabled.

The frame data must also be aligned with a 32-bit boundary in the URAM.

The amount of data in the frame is defined by the data size bits (DESCR.DS). In reception, these bits indicate the upper limit on the size of frames to be received. If the data size is not aligned with a 32-bit boundary, the bytes to the next 32-bit boundary in the data area will be an unused area.

24.4.3.2 Using Descriptor Chains in Queues

Transmission and reception descriptors in the URAM are grouped into queues. Each queue handles frames so that they are transmitted in order of priority and received separately. A queue is capable of controlling one or more frames. Accordingly, multiple descriptors can be assigned to one queue. A combination of multiple descriptors is referred to as a descriptor chain.

For a descriptor chain, the three general descriptor types listed below are defined. For details on these descriptor types, see Section 24.4.3.6, Descriptor Type.

- Descriptors that define frame data
- Descriptors that control the descriptor chain itself (e.g. LINK, EOS).
- Descriptors that arbitrate access by hardware or software

Figure 24.15 shows the two basic topologies for descriptor chains. In the simplified examples in the figure, all descriptors allocated to the chain are stored in the array.

- For a linear descriptor chain, the last descriptor in the array is a control descriptor indicating the end of the descriptors (e.g. EEMPTY).
- For a cyclic descriptor chain, the last descriptor in the array is a control descriptor that returns to the first descriptor in the array (e.g. LINK).

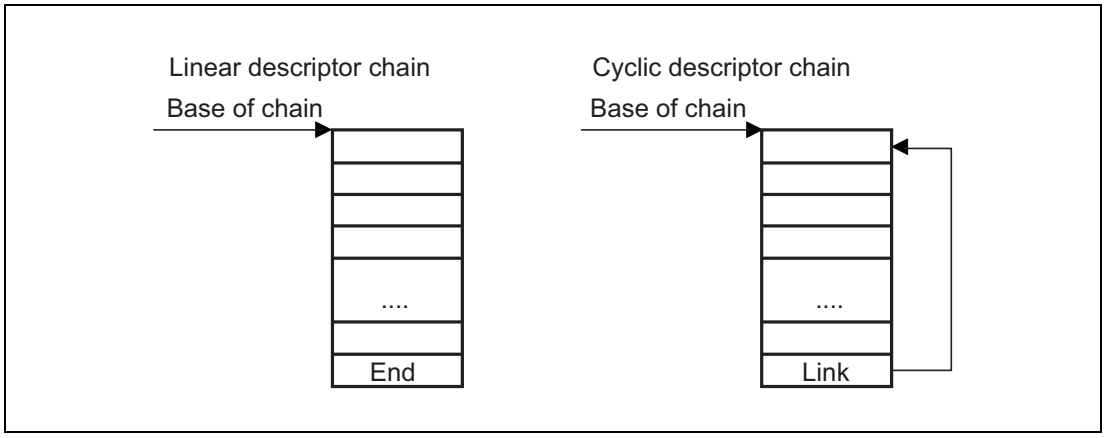

Figure 24.15 Outline of the Basic Descriptor Chains

The relationship between queues and descriptor chains is defined by the base addresses of chains. A queue is connected to one descriptor chain over one round of processing. There is also a method of switching to a different chain while in operation mode.

There are no restrictions on the number of link descriptors and their locations within the chain. The last descriptor of a designed chain determines the topology.

Which chain structure is to be used or which topology is suitable depends on the application. A description of how to design descriptor chains to suit various applications is given in **Section 24.4.4.2**. Procedure for Setting Reception Descriptors, and Section 24.4.5.2, Setting Up Transmission Descriptors.

24.4.3.3 Descriptor Base Address Table

The base address table in the URAM contains the address of the first descriptor of all chains to be handled by the respective queues.

Entries 0 to 3 are used to access transmission queues 0 to 3. Subsequent entries are used to access reception queues. Entry 4 thus corresponds to reception queue 0.

The configuration of entries in the base address table is the same as the configuration of link descriptors. We recommend using the descriptor type (DESCR.DT) LINKFIX. Processing of this link descriptor does not change it, so it does not require updating. The first descriptor of a chain performs hardware and software synchronization. If the application requires hardware and software synchronization for the base addresses, use the descriptor type (DESCR.DT) LINK.

The CPU is only capable of using LINKFIX and LINK as descriptor types (DESCR.DT) of descriptors in the base address table.

Set the location of the base address table in the URAM in the descriptor base address table register (DBAT).

Figure 24.16 shows an example of a base address table for controlling four transmission and three reception queues. The boxes to the right of the table represent descriptor chains with the desired topologies.

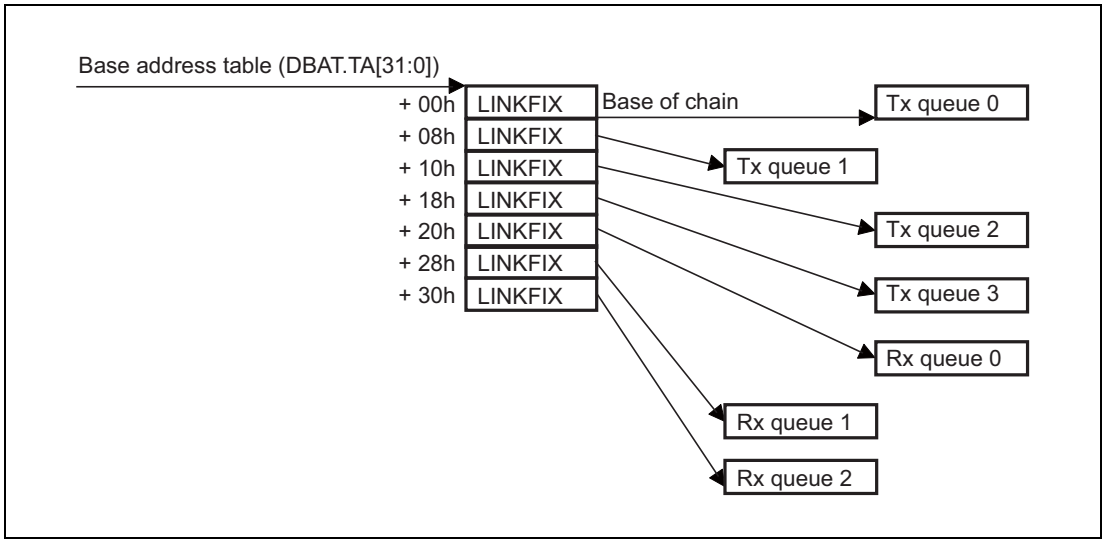

Figure 24.16 Example of a Base Address Table for Reception and Transmission Queues

CAUTION

The size of the descriptors in the base address table is always eight bytes even if the queue itself includes extended descriptors.

24.4.3.4 Descriptor Chain Processing

The descriptor that is currently processed or will be processed when the related queue gets active is the current descriptor. The current descriptor address for use by a queue q can be checked in the current descriptor address register q (CDARq).

Current descriptors are stored in registers or in descriptors as described below in the given situations.

- In the descriptor base address table registers for all q queues (DBAT) (DBAT.TA[31:0]+8*q) when the operating mode shifts to operation mode.
- In the descriptor base address table register (DBAT) (DBAT.TA[31:0]+8*q) when a base address load request is issued for a queue q by setting the corresponding bit (DLR.LBAq) in the descriptor base address load request register (DLR).
- In DESCR.DPTR for a link descriptor (LINK, LINKFIX) to be processed.

After a descriptor has been processed, the current descriptor for the same queue is incremented by the size of the descriptors being handled by the queue (8 bytes for normal descriptors and 20 bytes for extended descriptors). The AVB-DMAC updates the descriptor type and informs the CPU that the descriptor has been processed.

24.4.3.5 Descriptor Interrupts

A descriptor is able to issue a descriptor interrupt on completion of its processing. The setting of the descriptor interrupt enable bits (DESCR.DIE) in each descriptor selects disabling or generation of the descriptor interrupt.

The descriptor interrupt is a common resource that is shared between reception and transmission queues. Software control of the descriptor interrupt provides a flexible method of application-specific flag processing.

Figure 24.17 illustrates the way in which the AVB-DMAC generates descriptor interrupts (or sets bits in the descriptor interrupt status register (DIS.DPFi)). Processing of a descriptor with the value i in the descriptor interrupt enable bits (DESCR.DIE) leads to the corresponding bit in the descriptor interrupt status register (DIS.DPFi) being set.

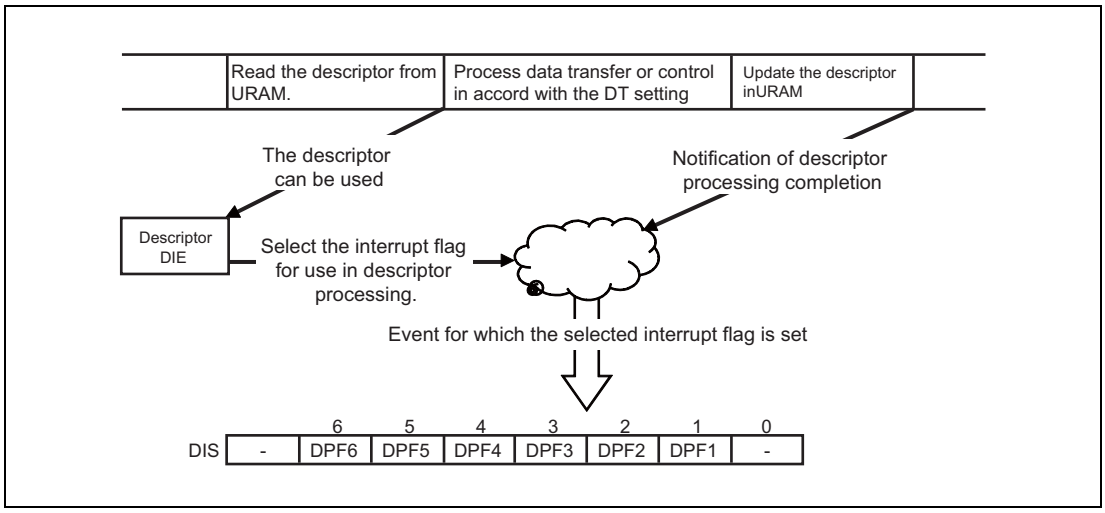

Figure 24.17 Method of Descriptor Interrupt Generation

24.4.3.6 Descriptor Type

The descriptor types (indicated by the DESCR.DT bits) supported by the AVB-DMAC fall into the following three categories.

- Definitions of frame data
- Control of descriptor chains
- Hardware and software arbitration

Table 24.77 is a summary of the descriptor types available for the AVB-DMAC. Entries under “Name” are the names of the descriptor types and the values under “DT” are the corresponding values to be set in the descriptor type field (DESCR.DT). A given descriptor may be handled differently according to whether it is in a transmission or reception queue, so the transmission and reception columns list the scopes of control and processing of the descriptor types.

The abbreviations defined below are used in the transmission and reception columns.

Definition of SW:

- The descriptor is processed by software.
- Software has access to and may modify the descriptor and descriptor data area.
- This descriptor cannot be changed by hardware (AVB-DMAC).

Definition of HW:

- The descriptor is processed by hardware (AVB-DMAC).
- Software must modify neither the descriptor nor the descriptor data area.
- Hardware (AVB-DMAC) processes this descriptor and subsequently changes the descriptor type.

Invalid:

This descriptor type is not used in transfer in the given direction (transmission or reception).

Do not write this value to the descriptor type (DESCR.DT) field for transfer in the given direction.

Hardware does not process these descriptor types in the cases listed as invalid. The current descriptor address (CDARq.CDA[31:0]) will not be changed when processing of a queue for the given direction arrives at a descriptor with this type setting.

Table 24.77 Summary of Descriptor Types

Name	DT	Description	Reception	Transmission
Frame data				
FSTART	5	Frame Start The descriptor points to valid data for a frame. The frame starts with the given data and continues with that indicated by the next descriptor.	SW	HW
FMID	4	Frame Middle The descriptor points to valid data for a frame. The frame started with a previous descriptor and continues to the data indicated by the next descriptor.	SW	HW
FEND	6	Frame End The descriptor points to valid data for a frame. The frame continues from the previous descriptor and ends with the data indicated by in this descriptor.	SW	HW
FSINGLE	7	Frame Single The descriptor points to valid data for a complete frame.	SW	HW
Chain control				
LINK	8	Link Defines the next descriptor in the chain.	HW	HW
LINKFIX	9	Fixed Link Defines the next descriptor in the chain.	SW	SW
EOS	10	End Of Set Defines the next descriptor in the chain.	HW	HW
HW/SW arbitration				
FEMPTY	12	Frame Empty A descriptor related to frame data but not containing valid data for a frame	HW	SW
FEMPTY_IS	13	Frame Empty Incremental Start A descriptor related to frame data but not containing valid data for a frame DESCR.DPTR sets the base address of an "incremental data area" in the URAM.	HW	Invalid
FEMPTY_IC	14	Frame Empty Incremental Continue A descriptor related to frame data but not containing valid data for a frame Data is stored to the incremental data area in the URAM.	HW	Invalid
FEMPTY_ND	15	Frame Empty No Data storage A descriptor related to frame data but not containing valid data for a frame The descriptor is processed in the same way as FEMPTY but data are not stored in the URAM.	HW	Invalid
LEMPTY	2	Link Empty A link descriptor for processing by the AVB-DMAC	SW	SW
EEMPTY	3	EOS Empty An EOS descriptor for processing by the AVB-DMAC	SW	SW
DT0	0	Reserved	Invalid	Invalid
DT1	1	Reserved	Invalid	Invalid
DT11	11	Reserved	Invalid	Invalid

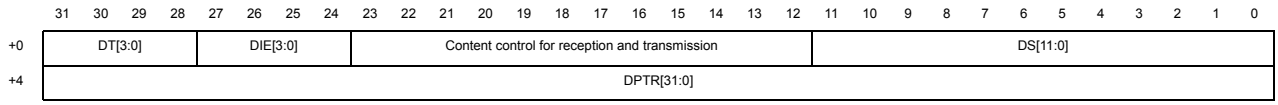
(1) Layout of General Descriptors in the URAM

The AVB-DMAC updates processed descriptors in the URAM. The field to be changed in a descriptor being updated depends upon whether the direction is transmission or reception and the queue mode. Other fields will not be changed. There are no restrictions on the values set in unused descriptor fields (indicated by "—" in the figure).

(2) Frame Data Descriptors

The allocation of bits in the frame data descriptors (FSTART, FMID, FEND, and FSINGLE) is shown below.

- Normal descriptor (usable in both reception and transmission)



- Extended descriptor (usable only in reception)

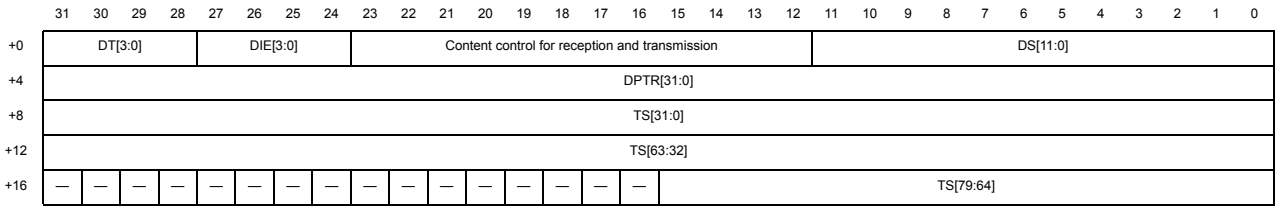


Table 24.78 Contents of Frame Data Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 5: FSTART 4: FMID 6: FEND 7: FSINGLE For details, see Section 24.4.4.2, Setting Up Reception Descriptors, and Section 24.4.5.2, Setting Up Transmission Descriptors.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see Section 24.4.4.2, Setting Up Reception Descriptors, and Section 24.4.5.2, Setting Up Transmission Descriptors.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.
TS[79:0]	Time Stamp Time stamp of the received frame (only available in extended descriptors)

CAUTION

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

Some bits in extended descriptors are reserved (the DESCR.TS[79:64] bits in an

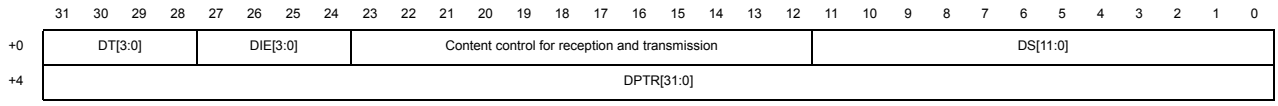
extended descriptor are set to H'0000 after the time stamp is stored).

(3) Hardware/Software Arbitration Descriptors (Only for Reception)

The allocation of bits in the descriptors for hardware/software arbitration (FEMPTY, FEMPTY_IS, FEMPTY_IC, and FEMPTY_ND) is shown below.

The allocation of bits in the arbitration descriptors for use in reception is the same as in frame data descriptors.

- Normal descriptor



- Extended descriptor (usable only in reception)

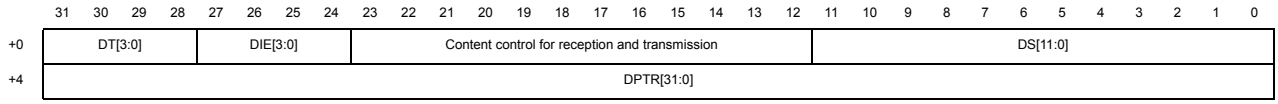


Table 24.79 Contents of Hardware/Software Arbitration Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 12: FEMPTY 13: FEMPTY_IS 14: FEMPTY_IC 15: FEMPTY_ND For details, see Table 24.77, Summary of Descriptor Types.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see Section 24.4.4.2, Setting Up Reception Descriptors, and Section 24.4.5.2, Setting Up Transmission Descriptors.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.

CAUTIONS

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

When the descriptor is an extended descriptor, it has a 12-byte unused area.

In an FEMPTY descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), data size (DS), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_IS descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_IC descriptor, the descriptor type (DT) and descriptor interrupt enable (DIE) are used.

In an FEMPTY_ND descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and data size (DS) are used.

(4) Link Descriptors

The allocation of bits in the link descriptors (LINK and LINKFIX) is shown below.

- Normal descriptor

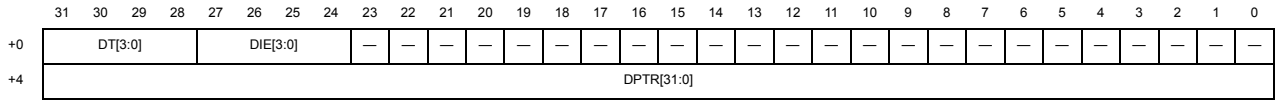

Table 24.80 Contents of Link Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 8: LINK 9: LINKFIX For details, see Table 24.77, Summary of Descriptor Types.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see Section 24.4.4.2, Setting Up Reception Descriptors, and Section 24.4.5.2, Setting Up Transmission Descriptors.
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.

CAUTION

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

(5) Other Descriptors

The allocation of bits in the other descriptors (EOS, FEMPTY (only for transmission), LEMPTY, and EEMPTY) is shown below.

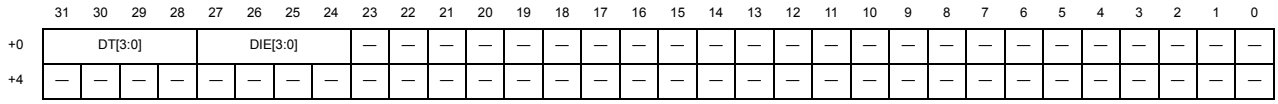

Table 24.81 Contents of Other Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 10: EOS 12: FEMPTY (only for transmission) 2: LEMPTY 3: EEMPTY For details, see Table 24.77, Summary of Descriptor Types.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).

(6) How to Use Frame Data Descriptors

The descriptor data area size field (DESCR.DS) can specify up to 2048 bytes of Ethernet frame data per data area. Settings higher than 2048 (bytes) cannot be made.

In general, Ethernet frames are not of uniform length. The AVB-DMAC is capable of dividing frame data into multiple descriptors in order to minimize the memory capacity for frame data. This function allows processing of frames that are longer than the limit for descriptor data areas. Division can also be applied to frames on the basis of their data structures.

To handle both frames divided up into multiple data areas and descriptors for complete single frames, four types (DESCR.DT) FSTART, FEND, FMID, and FSINGLE are defined.

Figure 24.18 shows the mapping of frame data by frame data descriptors. The descriptor data areas are allocated to the URAM. For frames that require division into four or more data areas, additional FMID descriptors can be added as required.

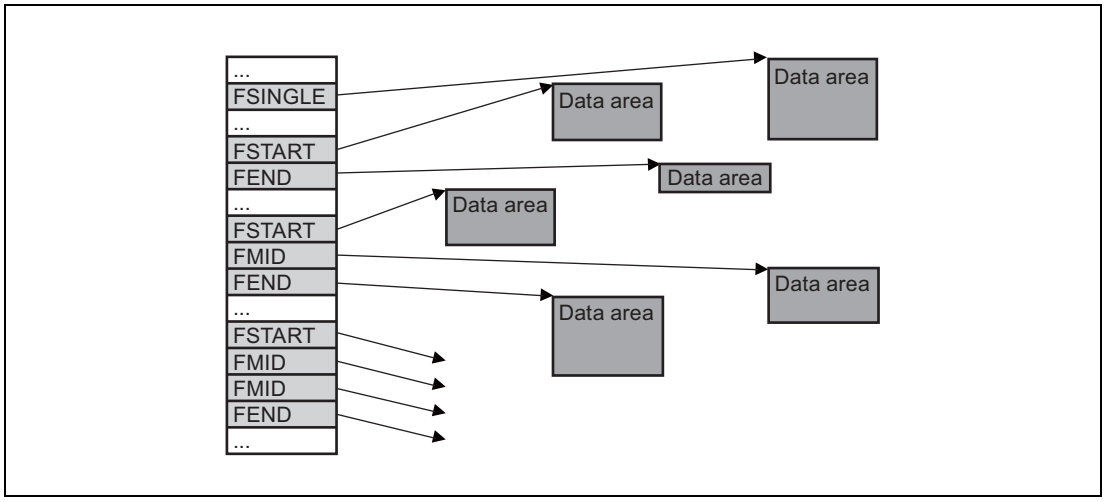

Figure 24.18 Mapping of Frame Data

For reception, set the descriptor data areas to the maximum size (i.e. give DESCR.DS its maximum value). The AVB-DMAC will store received frame data in the given area. If a received frame has more data than the maximum size, the AVB-DMAC will divide the data up.

For transmission, set the frame data size to the actual data size. The AVB-DMAC modifies the descriptor type (DESCR.DT) to FEMPTY after processing the relevant descriptor. The data size (DESCR.DS) and descriptor pointer (DESCR.PTR) fields retain their settings.

A descriptor data area including unused space produces an empty space between data areas. In reception, an "incremental data area" can be used to prevent empty spaces. For incremental data areas, see **Section 24.4.4.3** (2) Incremental Data Areas.

As well as reducing the memory capacity taken up by the descriptor area in the URAM, division into frames can be used to identify different sections of data (e.g. for separating a header and data).

(7) How to Use Chain Control Descriptors

(a) Link Descriptors

The link descriptors can be used to set up cyclic descriptor chains (for details, see **Section 24.4.3.2, Using Descriptor Chains in Queues**)

After a LINK descriptor is processed, its descriptor type (DESCR.DT) is changed to LEMPTY. The descriptor pointer (DESCR.PTR) retains its setting.

After processing of a LINKFIX descriptor, the descriptor type (DESCR.DT) is not updated. Software can change the descriptor type (DESCR.DT), descriptor interrupt enable (DESCR.DIE), and descriptor pointer (DESCR.DPTR). However, DESCR.DT should not be modified by software. Take care to check the current descriptor address register (CDARq.CDA[31:0]) before changing the descriptor pointer (DESCR.DPTR).

(b) EOS Descriptor

Use the EOS descriptor to divide a descriptor chain into various segments. The queue can continue even after an EOS descriptor.

In transmission, the response to an EOS descriptor is clearing of the transmit start request bit in the transmit configuration control register (TCCR.TSRQq) to 0.

In reception, the response is generation of a receive queue full interrupt (RIS2.QFFr), although if the frame currently being received is being divided for storage (received data such as those where some storage is in FMID- or FEND-type frames), the data are not completely stored.

(8) How to Use Hardware and Software Arbitration Descriptors

In hardware processing of descriptors, the empty descriptor types (FEMPTY, LEMPTY, and EEMPTY) are used to distinguish various descriptors. For software, they can be used to initiate checking for empty spaces, etc.

(a) FEMPTY, FEMPTY_IS, FEMPTY_IC, and FEMPTY_ND

These descriptor types (DESCR.DT) are used for descriptors that do not contain effective data. Of these, only FEMPTY is used in transmission.

(b) LEMPTY

This descriptor type (DESCR.DT) is assigned to LINK descriptors after they have been processed.

The descriptor pointer (DESCR.DPTR) of an LEMPTY descriptor still points to the linked descriptor.

(c) EEMPTY

This descriptor type (DESCR.DT) is assigned to EOS descriptors after they have been processed.

The descriptor pointer (DESCR.DPTR) of an EEMPTY descriptor is not used.

(9) Synchronization between Descriptor Access by Hardware and Software

The allocation of descriptor types (DESCR.DT) to the URAM can be used to set up the primary synchronization between hardware and software. This makes it possible to minimize access by the AVB-DMAC to the SFR via the CPU, leading to higher performance.

Basic concepts of synchronization:

- Each descriptor type in the set is exclusively for processing by hardware or software, depending on the direction of transfer (see Table 24.77, Summary of Descriptor Types).
- Software must not change a descriptor assigned to hardware processing (the hardware does not change descriptors assigned to software processing).

In the case of software processing, the software must process the information in the descriptor and the corresponding frame data before changing the descriptor type. If a descriptor type for hardware is set in DESCR.DT, the software should not change any part of the descriptor or of the corresponding frame data.

24.4.3.7 Tips for Optimizing Performance in Handling Descriptors

The following items are recommended as ways to ensure the optimal use of data structures in the URAM.

They are not requirements, but using a different approach may increase the load on the system bus within the LSI chip.

- Register descriptors with 64-bit alignment (this does not apply to extended descriptors).
- While in operation mode, use LINKFIX instead of LINK whenever a descriptor need not be changed. Hardware modifies the descriptor type (DESCR.DT) fields of LINK descriptors.
- Restrict frame data to a maximum size of 128 bytes.
- Design the descriptor chains in ways that minimize parallelism of processing.
  This helps in dividing the chains into segments allocated to different cache pages, and in arranging the different segments exclusively for access by software or hardware.
- Minimize the number of divided frames. This can reduce the overhead of descriptor handling.

24.4.4 Control in Reception

The point of the AVB-DMAC is to transfer data between the E-MAC and URAM without intervention by the CPU.

Create descriptors that define the amounts of frame data to be stored and the locations. After the E-MAC receives a frame, it stores the received frame data and the conditions of reception as the MAC state. If the descriptor is extended, the time stamp is also stored. For a description of how to set up descriptors for use in reception, see Section 24.4.4.2, Setting Up Reception Descriptors.

The AVB-DMAC filters received frames to separate them into various classifications (separation filtering). More specifically, this is done to separate received frames into the various reception queues and to set the priorities of different classes of received frames. For more on separation filtering, see **Section 24.4.4.1** (1) Separation Filtering.

Figure 24.19 shows the reception data bus and the selection of queues for use in reception.

Each frame received from the E-MAC is stored in the reception FIFO; in parallel with this, the frame is analyzed to identify its type and the target queue number. After the E-MAC completes reception, the target queue number is generated and stored in the reception FIFO. Appending of a reception flag depends on the storage of one frame among the reception queues in the URAM, and the unread frame counter (UFC) is also associated with frame storage.

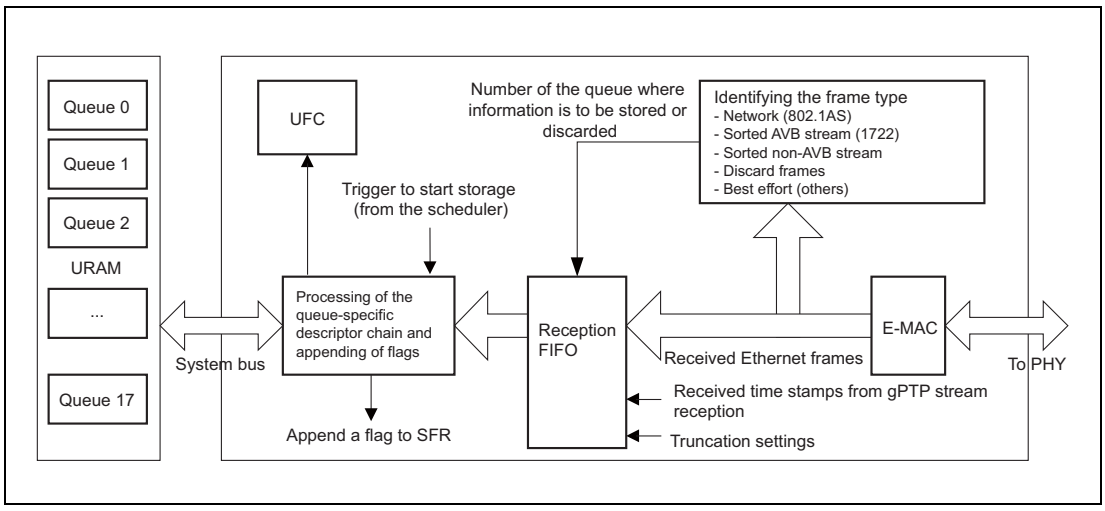

Figure 24.19 Mechanism of General Reception Queue Selection

24.4.4.1 Reception Queues

The AVB-DMAC applies its separation filtering mechanism to select the reception queue for storing a received frame. The AVB-DMAC stores all received frames in the URAM.

There are two conditions for the AVB-DMAC to discard a received frame.

- Detection of an error during reception by the E-MAC
  - Whether error frames are discarded or stored in reception queue 0 (best effort) depends on the setting of the error frame enable bit in the receive configuration register (RCR.EFFS). If error frames are to be stored (RCR.EFFS = 1), they are always stored in queue 0 (best effort). In this case, characteristics specific to the queue (e.g. truncation) will vary. If the storage of time stamps for reception queue 0 (best effort) is enabled (the time stamp enable bit in the receive configuration register RCR.ETS0 = 1), time stamps are stored even for error frames.
  - The separation filter is unable to determine where the frame data should be stored.
- Frame fails the separation filter
  - It depends on RCR.ESF[1:0] if such frame is discarded or stored in receive queue 0 (best effort).

The flowchart in **Figure 24.20** shows how the AVB-DMAC selects the reception queue in accord with the frame type, including judgment by the separation filter. Selection of the queue starts when the E-MAC completes frame reception. The result is storage of the frame in the proper queue or the frame being discarded.

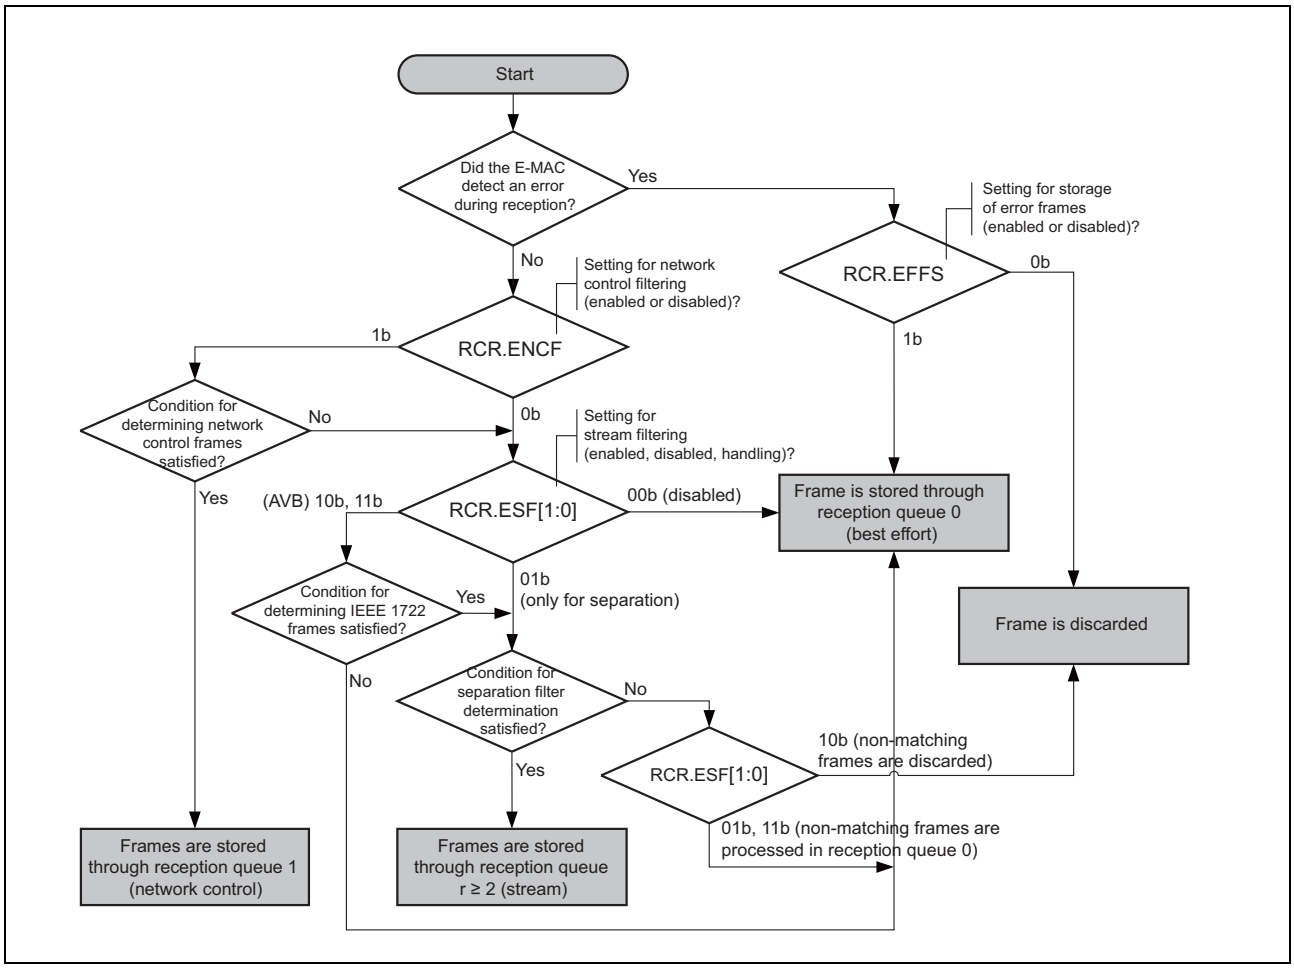

Figure 24.20 Mechanism of Reception Queue Selection

Notes on the meanings of entries in the flowchart

- "Condition for determining network control frames"
  The Ethernet destination address (DA) is 01:80:C2:00:00:0E.
  The Ethernet type (ET) is 88:F7.
- "Condition for determining IEEE 1722 frames"
  The Ethernet destination address (DA) is within the range from 91:E0:F0:00:00:00 to 91:E0:F0:00:FE:FF.
  The VLAN tagged TPID (tag protocol identifier) field (VL) is 81:00.
  The Ethernet type (ET) is 22:F0.
- "Condition for separation filter determination"
  See **Section 24.4.4.1** (1) Separation Filtering.

Figure 24.21 shows the allocation of bits related to the network and stream types in Ethernet frames. The preambles of Ethernet frames are not taken into account.

Data bytes	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
Network type	DA1	DA2	DA3	DA4	DA5	DA6	SA1	SA2	SA3	SA4	SA5	SA6	ET1	ET2	...	...	...	...	...	...
Stream type	DA1	DA2	DA3	DA4	DA5	DA6	SA1	SA2	SA3	SA4	SA5	SA6	VL1	VL2	-	-	ET1	ET2	...	...

Figure 24.21 Data Bytes of Ethernet Frames Used in Classification

(1) Separation Filtering

Separation filtering involves the checking of up to 64 bits (eight successive bytes) in received Ethernet frames. The setting for the first byte (i.e. the setting of the separation filter offset configuration register (SFO.FBP[5:0])), selects the part of frames to be used in separation filtering. There is also a common filter mask (set in the separation filter mask configuration register (SFMi.CFM[31:0])) that can be freely set to reduce the number of bytes used in separation filtering or to mask particular bits.

Examples

To use one byte in separation, set separation filter mask configuration register 0 (SFM0.CFM[31:0]) to H'0000 00FF and separation filter mask configuration register 1 (SFM1.CFM[31:0]) to H'0000 0000.

To use seven bytes in separation, set separation filter mask configuration register 0 (SFM0.CFM[31:0]) to H'FFFF FFFF and separation filter mask configuration register 1 (SFM1.CFM[31:0]) to H'00FF FFFF.

CAUTION

If bits at some positions are set to 0b in the separation mask, in order to match with the pattern, the bits at the corresponding positions of the pattern must also be set to 0b. Only those bits in which the separation filter pattern configuration register (SFPi.FPs) setting is equal to the separation filter mask configuration register (SFMi.CFM[31:0]) are sorted by matching with received data.

Figure 24.22 shows separation filtering. The selected data from a received frame (Rx_Frame[63:0]) are masked by the common filter mask. As a result, the selected frame data can be obtained. This value is compared with all filter patterns. The separation filter circuit in the AVB-DMAC selects the filter pattern that matches the queue having the lowest index s or selects a flag to indicate that there is no matching separation pattern.

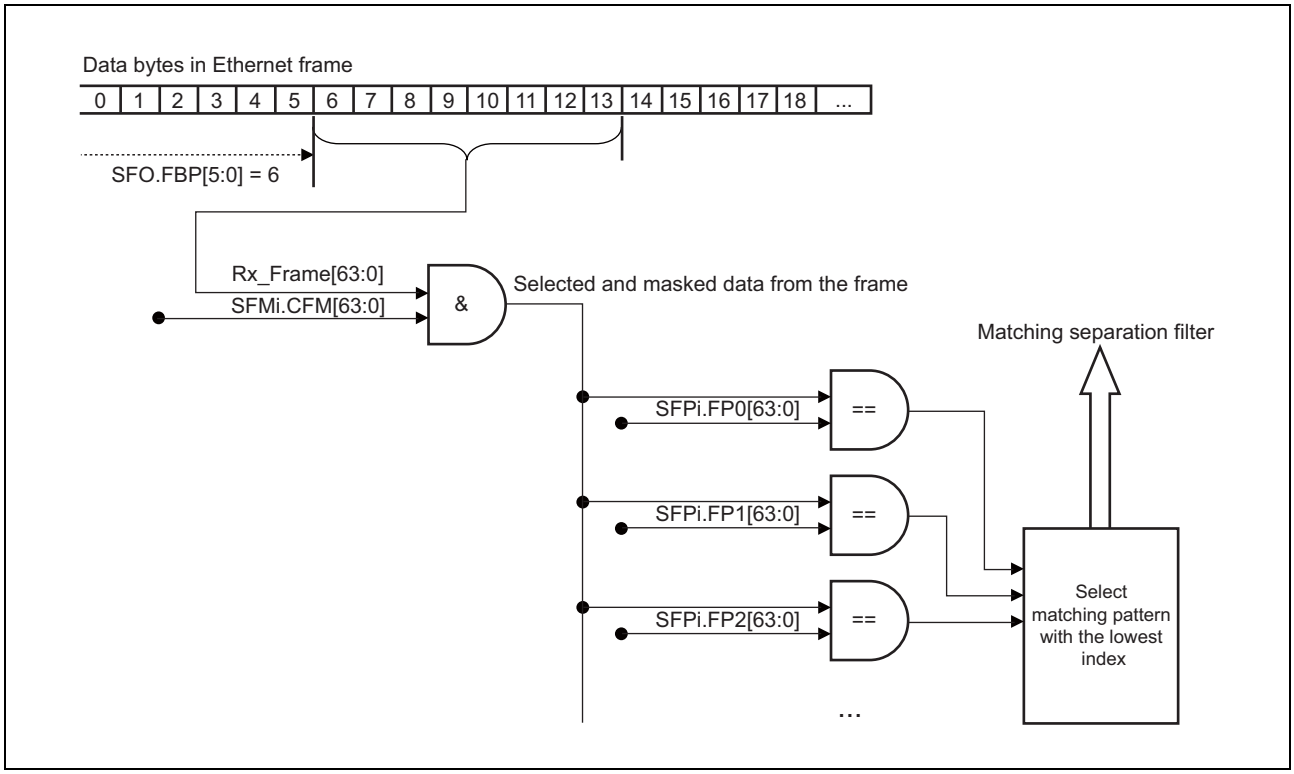

Figure 24.22 Separation Filtering

(2) Separating Streams

The AVB-DMAC applies separation filtering to sort frames received in streams. An AVB network has a concept of “Talker” and “Listener”. A Talker is an end station that generates one or more streams. A Listener is an end station that has the role of being a sink for at least one stream. The various A/V streams are identified by 8-byte stream IDs.

The number of end stations within an AVB network and their roles differ with the application.

The stream ID is a general pattern of the AVB network for identifying one stream. **Figure 24.23** shows the bit allocation of bits in IEEE1722 Ethernet frames and stream ID fields.

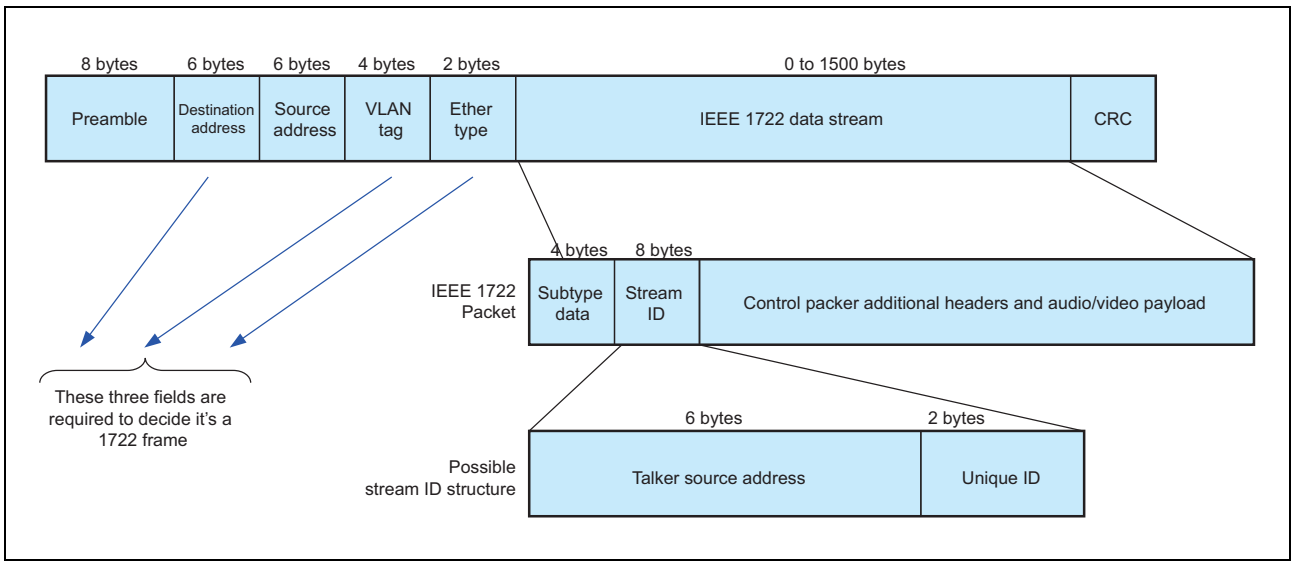

Figure 24.23 IEEE 1722 Frame Layout and Stream ID

The IEEE 1722 standard stipulates that the stream ID field starts from the 23rd byte (not counting the preamble). Accordingly, set the separation filter offset (SFO.FBP[5:0]) to 22 in operations on IEEE 1722 streams. Set the separation filter mask (SFMi) and separation filter pattern (SFPi) in accord with the specification of the product in which the chip is being used.

Example: In the example of a stream ID shown in **Figure 24.23**, the current application divides the field into the talker source address and the unique stream ID. The unique ID is used to differentiate between multiple streams from the same talker. Based on this, there are two settings for separation filter masking:

- To divide various streams into individual queues, set SFM0.CFM[31:0] to H’FFFF FFFF and SFM1.CFM[31:0] to H’FFFF FFFF.
- To divide streams from various talkers into individual queues, set SFM0.CFM[31:0] to H’FFFF FFFF and SFM1.CFM[31:0] to H’0000 FFFF. This excludes the unique ID from the filter condition.

24.4.4.2 Setting Up Reception Descriptors

For reception, the descriptor mechanism is essentially as described in Section 24.4.3, Descriptors.

This section describes memory operations that are especially required in handling reception queues.

(1) Reception Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 24.82 shows the descriptor types used in reception.

Table 24.82 Descriptor Types in Reception

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	Condition for data not being stored in a reception queue: The RIS2.QFFr bit indicates that queue r is full and the received frame is not stored. Descriptor processing proceeds again in response to further reception.	Not changed
Frame Middle (FMID)	Same as FSTART	Not changed
Frame End (FEND)	Same as FSTART	Not changed
Frame Single (FSINGLE)	Same as FSTART	Not changed
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	A stop point defined by software has been reached. A frame of this type within a divided frame (writing of FMID or FEND) stops the frame being stored and the frame is lost. RIS2.QFFr indicates that the frame has been lost. If this happens at the start of a frame (writing of FSTART or FSINGLE), storing of frames starts from the next descriptor. In either case, processing shifts to the next descriptor in the chain.	EEMPTY
Frame Empty (FEMPTY)	The descriptor can be used to store received data. Up to DESCR.DS bytes are stored in the descriptor data area. For details, see **Section 24.4.4.3** (1) Storing Frame Data in the Descriptor Data Area.	FSTART, FMID, FEND, or FSINGLE
Frame Empty Incremental Start (FEMPTY_IS)	The descriptor can be used to store received data. All data for the frame are stored in the descriptor's data area. DESCR.DPTR indicates the base address of the incremental data area. For details, see **Section 24.4.4.3** (2) Incremental Data Areas.	FEND or FSINGLE
Frame Empty Incremental Continue (FEMPTY_IC)	The descriptor can be used to store received data. The remaining bytes of frame data are stored in the descriptor's data area. DESCR.DPTR is undefined, but is written back at the start position within the incremental data area after processing. For details, see **Section 24.4.4.3** (2) Incremental Data Areas.	FEND or FSINGLE
Frame Empty No Data storage (FEMPTY_ND)	The descriptor can be used to store received data. Up to DESCR.DS bytes are captured from the reception FIFO but not stored. After processing, DESCR.DS is written back as 0. For details, see **Section 24.4.4.3** (2) Incremental Data Areas	FSTART, FMID, FEND or FSINGLE
Link Empty (LEMPTY)	Same as FSTART	Not changed
EOS Empty (EEMPTY)	Same as FSTART	Not changed

(2) Configuration of Reception Frame Data Descriptors

Figure 24.24shows the configuration of descriptors for use with reception queues. The reception-specific fields are the same whether the descriptor is normal or extended. The reception-specific fields (DESCR.MSC, DESCR.PS, DESCR.EI, and DESCR.TR) are described in **Table 24.83**.

For the other fields and the descriptor types, see Section 24.4.3.6, Descriptor Type.

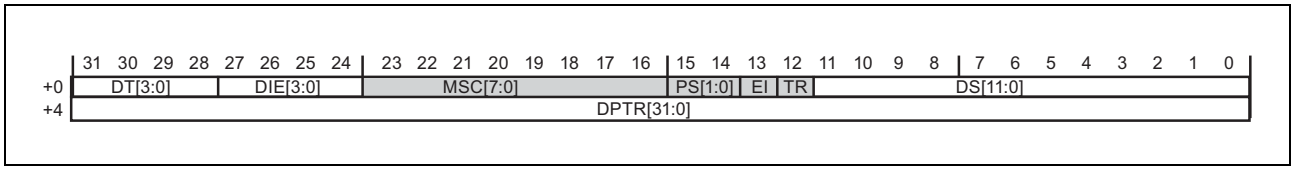

Figure 24.24 Configuration of Descriptor for a Received Frame

Table 24.83 Configuration of a Received Descriptor

Bit Name	Function
MSC	MAC Status Code These bits indicate errors in reception detected by the E-MAC. In the case of a divided frame, these bits are set to the same value within all descriptors for the frame data. Details of the bits are as follows. MSC[7]: Received frame has a multicast address. MSC[6]: Carrier expansion error MSC[5]: Carrier expansion loss MSC[4]: Received frame has residual bits. MSC[3]: Received frame is too long. MSC[2]: Received frame is too short MSC[1]: Error in frame reception MSC[0]: Received frame has a CRC error.
PS	Padding Selection These bits specify whether frame data are to be padded when stored in the incremental data area. Insertion of padding data is in accord with the settings in the RPC register. B'00: Padding is not to be inserted. B'01: Padding data may be inserted. This depends on the RPC settings. Other settings are not effective.
EI	Error Indication This bit indicates the detection of an error in frame data while a frame was being stored. The bit is set to 1 for a descriptor in which an error has been detected. If the descriptor is for a divided frame, storage of the frame is aborted. "0": No error "1": Error is detected
TR	Truncation Indication This bit indicates whether frame data received from the E-MAC have been truncated before being stored. These bits are set to the same value within all frame data descriptors for a divided frame. 0b: Data have not been truncated. 1b: Data have been truncated.

CAUTION

The RCR.EFFS bit specifies whether or not frames with errors detected by the E-MAC are to be stored in the URAM. When the storing of error frames is disabled, error codes are not written to DESCR.MSC.

24.4.4.3 Reception Processing

After initialization, the AVB-DMAC is able to select the proper reception queue and store received frames in the data area in the URAM as indicated by the descriptor. The AVB-DMAC continues to store received data in the URAM as long as space is available for descriptors and data areas.

Received frames are classified and stored in the reception FIFO in accord with the algorithm described in **Section 24.4.4.1** (1) Separation Filtering. A frame will already have been sorted by separation filtering, truncated, or discarded based on reception by the MAC before being stored in the reception FIFO. The following data are stored in the reception FIFO.

- MAC status of received frames
- Length of received frames
- Time stamp of received frames
- Target reception queue
- Received frame data

If the reception FIFO contains even one frame, the scheduler executes storing in the reception queue (see Section 24.4.2.2, Scheduling Reception and Transmission).

If there is even one empty data descriptor in a queue for which reception has started, the storage of frame data starts. Received frames for a queue that is already full (there is no empty frame descriptor or the UFC stop level has been reached) are discarded from the reception FIFO. This ensures that one queue being full does not prevent the storage of data in the other queues.

(1) Storing Frame Data in the Descriptor Data Area

Frame data for storage are assumed to be in either of the two patterns described below.

- The data for an entire frame will fit in the descriptor data area.
  - In this case, the descriptor type (DESCR.DT) is FSINGLE.
- Frame data to be stored in the descriptor data area arrive in divided form.
  - In this case, FSTART is written to the descriptor type (DESCR.DT) bits of the first of the frame data to arrive and FMID and FEND are written to the type bits of descriptors for subsequent data.

The descriptor type is updated by the AVB-DMAC in the last step of descriptor processing, so software can always access the descriptor assigned to DESCR.DT.

When normal synchronization mode is used, the CPU can write FEMPTYxxx directly to the descriptor type field after processing the stored element. Do not change the descriptor or any part of the descriptor data area after FEMPTYxxx is written to DESCR.DT.

(a) Storing Frame Data for a Whole Single Frame

For a frame with an FSINGLE descriptor, all data for the frame are held at the position defined by DESCR.DPTR. DESCR.DS indicates the length of the received frame.

If DESCR.DS is bigger than the actual size of a received frame, the FEMPTY or FEMPTY_ND descriptor is stored in place of the FSINGLE descriptor after processing.

Also, the FEMPTY_IS and FEMPTY_IC descriptors, which always hold the full frame data for the reception FIFO, are stored in place of the FSINGLE descriptor after processing.

(b) Storing Frame Data as Divided Frames

Divided frames are handled in the same way as a single frame. A frame stored with divided descriptors must be recombined before use. DESCR.EI and DESCR.TS are only valid in the last descriptor of the sequence for a divided frame.

CAUTION

If the data area size setting in DESCR.DS is not a multiple of four, the number of bytes set in DESCR.DS is fetched from the reception FIFO and the remaining bytes are used as the next storage area.

After a received frame is divided into different descriptors, each storage element is handled separately, and the descriptor type is assigned by software after processing. Accordingly, an error frame (FEMPTYxxx instead of FMID or FEND) may exist while a descriptor chain is being processed. In such a case, the CPU must postpone processing of the error frame to the next trigger point.

(c) No Data are Stored

The application specification may lead to some types of received frames being unimportant (for example, when the application only requires stream data from the Ethernet frames). Storing frames in divided form makes separating out the unnecessary parts of Ethernet frames possible.

If part of a divided frame is not required, use the FEMPTY_ND descriptor for that part so that it is not stored in the URAM. Not storing the data negates the need for bandwidth on the data bus, improving the overall performance.

When an FEMPTY_ND descriptor is processed, DESCR.DS is set to 0. This brings the frame data section of the descriptor into agreement with the FEMPTY type. DESCR.DS = 0 is for the unique identification of the descriptor after writing.

(2) Incremental Data Areas

Secure space in the URAM for storing received data. Even when data are placed in the URAM area such that all descriptor data areas of a chain are contiguous, a received frame being shorter than the descriptor data area will lead to an empty space. **Figure 24.25** shows an example of settings and the memory map.

Certain applications require that data areas be contiguous (e.g. when received data are to be processed other than by hardware as the A/V codec module). When the length of received frames differs (e.g. when payloads vary between having one or two A/V packages), the use of a static pointer in the descriptor produces empty spaces in the data area. This may necessitate direct additional processing to remove the empty spaces.

Accordingly, and to reduce the CPU load imposed by copying data, the AVB-DMAC supports an "incremental data area" function.

When incremental data areas are in use, all descriptors use a common data area for storage. One descriptor (FEMPTY_IS) defines the base address of the incremental data area and the next descriptor (FEMPTY_IC) within the descriptor chain holds received data. **Figure 24.26** shows an example of settings and the memory map.

Use of an incremental data area does not reduce the memory space in the individual descriptor data areas.

The hardware and software synchronization strategy and performance are also not changed.

It is also possible to divide a frame up among various descriptors in a way that reflects its structure (e.g. one descriptor for the Ethernet header and one for the data payload).

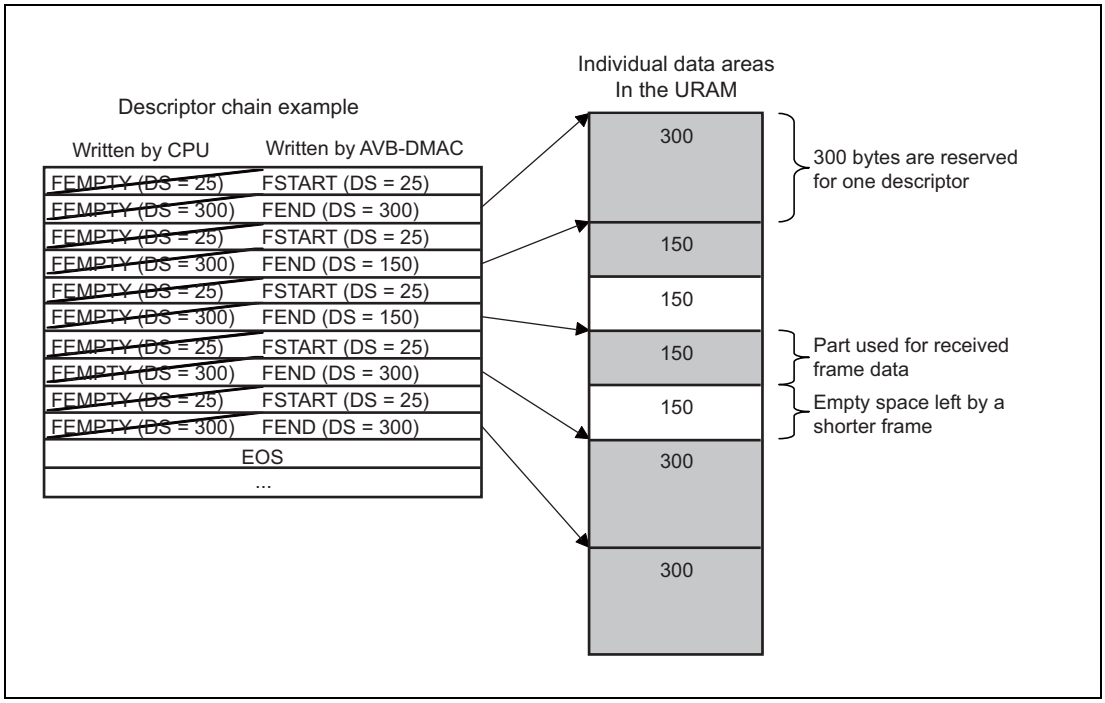

Figure 24.25 A Reception Queue Using Individual Descriptor Data Areas

Figure 24.25 and **Figure 24.26** show how control of the data storage areas by a descriptor chain varies according to whether individual or incremental data areas are in use. The chains are configured for storing received frames consisting of a 25-byte header (which is treated as one descriptor; and is outside the scope) and a 150- or 300-byte payload (whether one or two 150-byte payload packages are transmitted with one Ethernet frame depends on the data source).

In **Figure 24.25**, the EOS descriptor is added as an example of a re-synchronization point. If the frame source transmits a frame containing more than 325 bytes, the frame will be divided among three descriptors, meaning that synchronization of the header and data sequences is lost. Despite this, however, the frame is not divided across the EOS descriptor, so recovery is automatic without software interaction. The EOS is not required with the incremental descriptors because all data being processed are always stored while an incremental data area is in use.

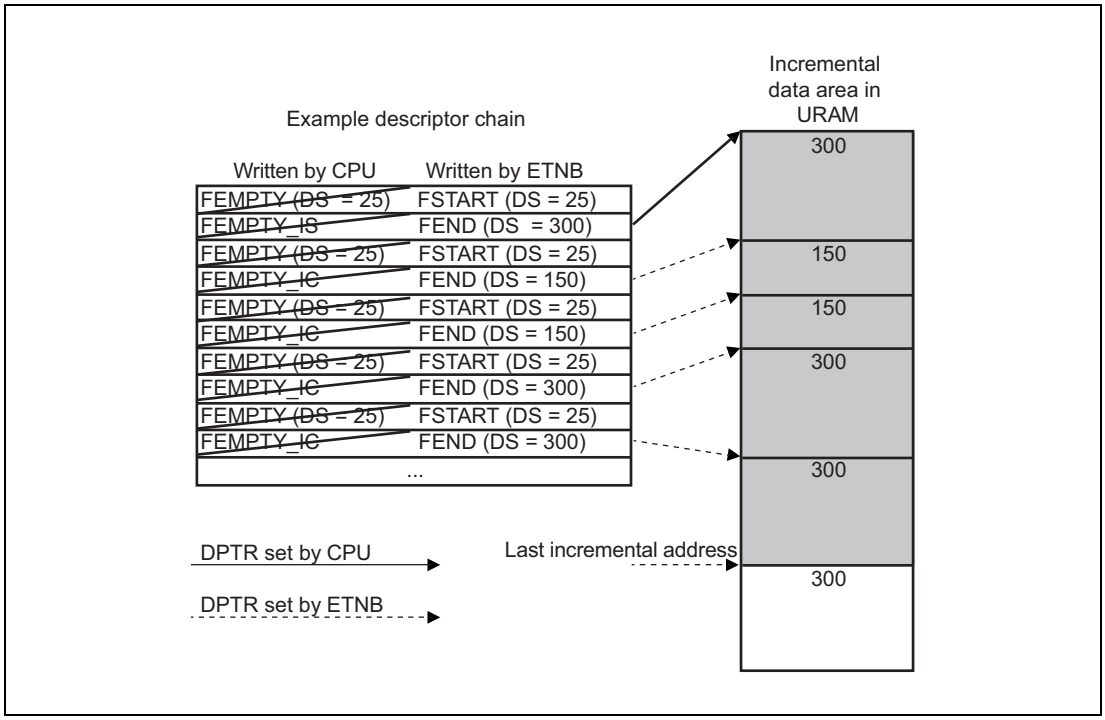

Figure 24.26 Reception Queue Using a Common Incremental Data Area

As **Figure 24.26** shows, when data are stored in an incremental data area, the descriptor pointers in the FEMPTY_IC descriptors (DESCR.DPTR) are updated. Accordingly, the resulting FEND or FSINGLE descriptor is in the same format as after writing to an FEMPTY descriptor.

Software captures received data from an incremental data area, which has no empty storage areas between frame data. The only empty space is that at the end of the incremental data area. The sizes of incremental data areas and of blocks of data for storage in incremental data areas must be multiples of four bytes. When the amount of data for storage in an incremental data area is not a multiple of four bytes, from one to three bytes of empty space will be produced. DESCR.DS can be read to check for such empty spaces.

Directly controlling the amount of received data to be stored from the incremental descriptors FEMPTY_IS and FEMPTY_IC is not possible because storage due to the DESCR.DS of other descriptors (FEMPTY and FEMPTY_ND) is also possible. All received data in the chain are always stored in an incremental descriptor.

(a) Setting Up an Incremental Data Area

A descriptor chain in the incremental data area having N descriptors (one FEMPTY_IS and N-1 FEMPTY_IC) means that a storage area for the maximum of N times the capacity must be prepared.

As **Figure 24.26** shows, DESCR.DPTR of an FEMPTY_IS descriptor indicates the base address of the incremental data area. The next FEMPTY_IS descriptor in the chain indicates the processing step where data must be stored in the incremental data area.

(b) Processing an Incremental Data Area Based on Descriptors

Since data processing by the CPU is the same regardless of how the AVB-DMAC stores the data, data stored in an incremental data area do not require any special handling.

(c) Padding

Use padding for received frame data that are not aligned correctly in the specified memory structure. Padding can be set individually for each descriptor. Accordingly, in the reception of divided frames, padding can be restricted to only those frames that require it (e.g. A/V payload data.)

Padding can also be used to optimize system performance in an incremental data area (e.g. to prevent inefficient access by aligning received data with 32-byte boundaries in the incremental data area), as well as to fulfill application-specific requirements for specified memory structures (e.g. formats required by other modules that will be processing the received data).

Padding can only be used in an incremental data area.

The value H'0000 0000 is always used in padding.

Padding is the addition of the number of words (from one to seven 32-bit words) set in the stored padding counter in the receive padding configuration register (RPC.PCNT[2:0]). This padding is repeatedly inserted in accord with the value in the stored data counter (RPC.DCNT[7:0]) (from one to 255 32-bit words). When the stored data counter (RPC.DCNT[7:0]) reaches 0, however, padding is not repeated.

The first word of padding is always inserted at the position specified by DESCR.DPTR. When divided frames are in use, a padding word can be inserted at any byte position, and padding is handled on a 32-bit basis (e.g. an incremental data area where the first descriptor is for a 42-byte header data and the second descriptor holds padded payload data).

The next figure shows a general example of how padding is inserted and an example of setting up padding. A indicates frame data A received from the E-MAC, while B indicates frame data already stored in the descriptor data area (32-bit word units).

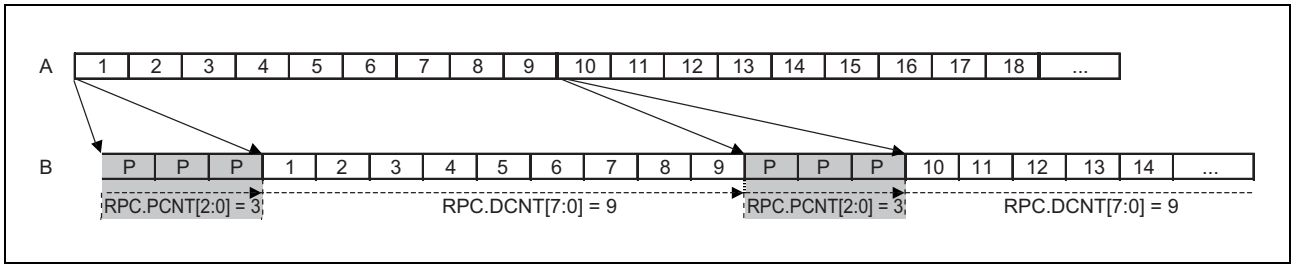

Figure 24.27 Example of a Padding Setting

Both padding and received frame data are counted in the descriptor size (DESCR.DS).

(3) Mode with Write-Back

Constructing a descriptor chain requires software (see **Figure 24.28**).

In the example in the figure, the variable SWdescr (software descriptor pointer) is a structure to identify a descriptor being processed. SWdescr must be initialized after operation mode is entered and a descriptor base address load request (DLR.LBAq) is executed (condition for starting the flow of software operations).

The frame_processing() function processes the stored data. The function can use SWdescr.DT to check whether processing of a frame is completed. How frame data are processed differs with the application, so create functions that handle processing in accord with the specification.

The processing section is common to all modes of reception. The number of frames processed in response to each trigger can be restricted. When multiple frames have to be processed in a batch, waiting for individual trigger boxes must be skipped for these frames.

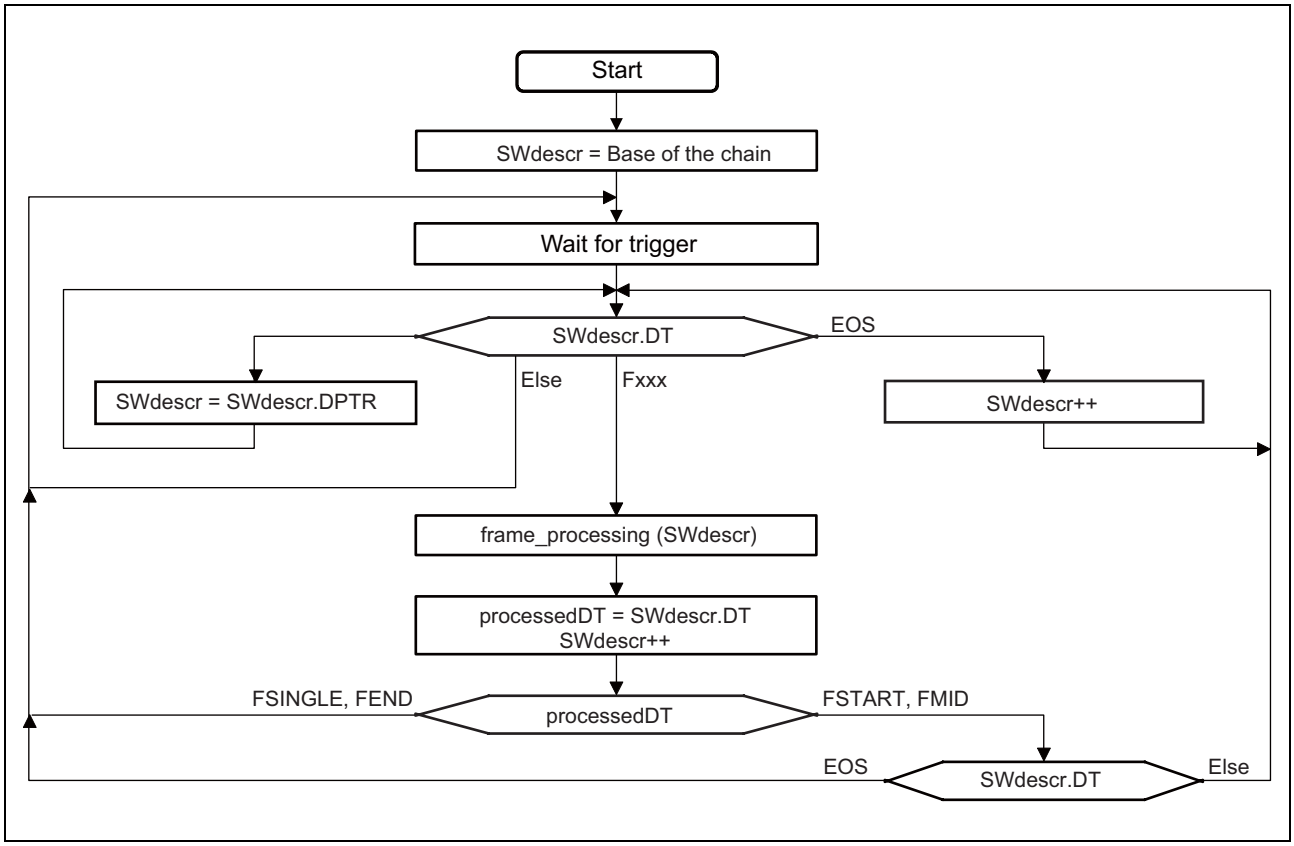

Figure 24.28 Flow of Reception Descriptor Processing (with Write-Back)

(4) Support for Reception Time Stamps

Capturing reception time stamps is essential for IEEE 802.1AS time synchronization. Other types of received frames may also require that a reception time stamp be appended; this depends on the application. The AVB-DMAC supports reception time stamps based on the gPTP timer by storing time stamps, which have been captured when Start Frame Delimiter (SFD) of a received frame is arrived, in the last frame data descriptor (FEND or FSINGLE). For the gPTP timer, see Section 24.4.7.1, gPTP Timer.

When time stamps are to be stored, use extended descriptors for the entire reception queue. Furthermore, time stamps are always stored for reception queue 1 (network control). Time stamps for reception queue 0 (best effort) and reception queue r ($r \geq 2$; for stream data) can be selected by the time stamp enable bits in the receive configuration register (RCR.ETS0 or RCR.ETS2).

24.4.4.4 Unread Frame Counters

Each reception queue has an unread frame counter (UFCVi). Use the unread frame counter configuration bits in the receive queue configuration register (RQCi.UFCCr) to select from among the four warning and stop levels for each unread frame counter. The 0 setting disables the stop and warning functions. For how to set this up, see **Figure 24.29**.

Operations of the AVB-DMAC (hardware) and CPU (software) drive an unread frame counter (UFC) in the following ways.

- The hardware indicates that it has added a new frame to the descriptor chain for the queue (this increments the counter).
- Software indicates how many frames from the descriptor chain it has processed by writing to the corresponding bits of the unread frame counter decrement register for the queue (this decrements the register by the number written).

The unread frame counter is based on the number of frames stored in the URAM and is only incremented by one even when a received frame is divided into different descriptors. Failure in storing a descriptor chain requires care because this may unread frame counter may fail in synchronization as described in **Section 24.4.4.4** (1) Unread Frame (UFC) Synchronization Failure.

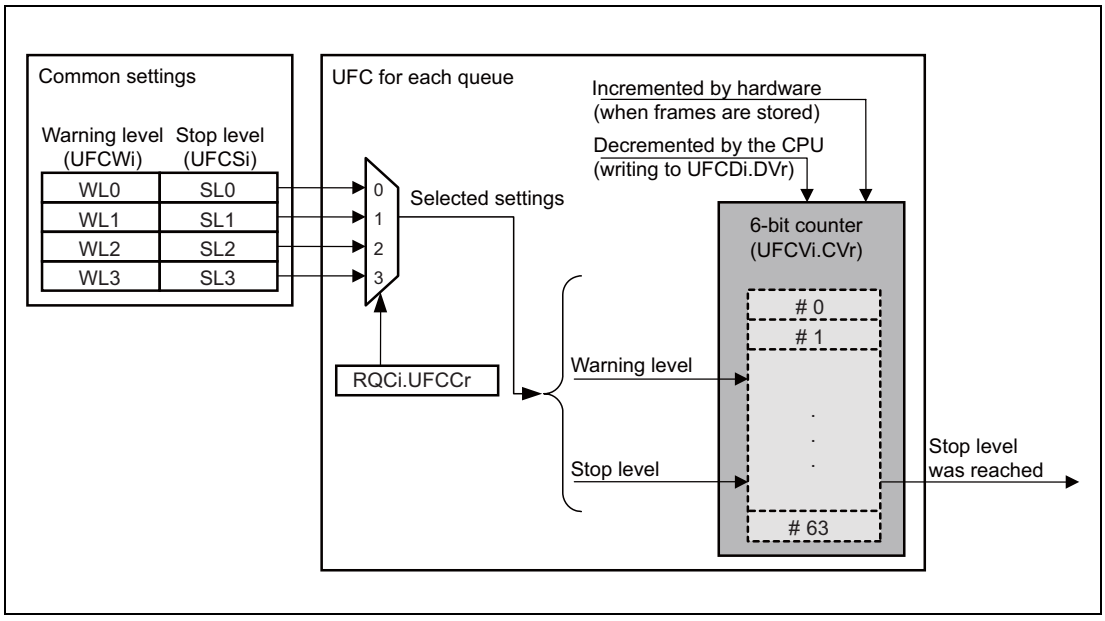

Figure 24.29 Overview of an Unread Frame Counter

Unless synchronization of hardware and software is lost, the current unread frame counter value (UFCVi.CVr) indicates the number of unread frames in the queue.

The indicator that the stop level has been reached prevents the storage of further received frames in the descriptor chain. Selecting 0 as the stop level disables this function. Otherwise, further received frames for the queue are discarded once its unread frame counter reaches the stop level. Activation of the unread frame counter stop function is indicating by setting of the receive queue full interrupt flag in the receive interrupt status register 2 (RIS2.QFFr).

Set the unread frame counter warning level configuration register (UFCW) and the unread frame counter stop level configuration register (UFCS) for each reception queue that will use the unread frame counter function while the current operating mode is configuration mode.

(1) Unread Frame (UFC) Synchronization Failure

The unread frame counters do not recognize failure to store a frame in the URAM. In other words, the AVB-DMAC increments the counter for a queue each time it captures a frame for that queue from the reception FIFO whether or not it succeeds in storing the frame normally in the descriptor chain.

In general, synchronization of hardware and software fails under the following conditions.

- An unread frame counter reaching its maximum value
  When the value of a counter in an unread frame counter register i (UFCVi) (i = 0 to 4) reaches 63, synchronization for the corresponding queue can fail.
  The CPU can only judge that a failure in synchronization has not occurred when the stop level is set to 63.
- A queue not having enough space for a descriptor or the associated data
  In this case, the corresponding receive queue full interrupt flag (RIS2.QFFr) in receive interrupt status register 2 (RIS2) is set.
  If an unread frame counter reaches its stop level while synchronization remains normal, the receive queue full interrupt flag (RIS2.QFFr) in the receive interrupt status register 2 (RIS2) is set. Software must respond to this.
- A problem occurring during access to memory

The result of a failure in synchronization is the unread frame counter indicating that the corresponding descriptor chain contains more available frames than it actually does. To retrieve the correct starting point for operations, use the descriptor base address load request (DLR.LBAq) for the given queue.

24.4.5 Transmission Control

Areas in the URAM for storing transmission descriptors must also be secured (for descriptors, see Section 24.4.3, Descriptors).

The AVB-DMAC fetches data from the URAM in accord with the procedure the descriptor describes. The descriptor also retains tag information once the frame has been fetched for transmission. The tag information is used to maintain the relationships between state information and time stamps for the software and the AVB-DMAC. The status and time stamp information for transmitted frames remains accessible after their transmission is completed.

24.4.5.1 Transmission Modes

The AVB-DMAC has two modes of transmission.

- AVB transmission mode
  This mode is selected by the priority level setting for the transmission queue in the transmit configuration register (setting of the TGC.TQP[1:0] bits) being B'01 or B'11.
- Non-AVB transmission mode
  This mode is selected by the priority level setting for the transmission queue in the transmit configuration register (setting of the TGC.TQP[1:0] bits) being B'00.

(1) AVB Transmission Mode

AVB transmission supports the control of traffic through the output port to implement various traffic classes.

(a) Support for Traffic Classes and Associated Priority

When transmission is in AVB transmission mode, streams of traffic are transmitted in accord with the part of the AVB specification called Forwarding and Queuing for Time Sensitive Streams (FQTSS; for details on this, see the IEEE 802.1Q standard).

In the AVB specification, at least one queue for a reserving stream under the Stream Reservation Protocol (SR stream) and at least one queue for a non-SR stream are present, and the queues for SR traffic are highest priority queues.

The AVB-DMAC supports four traffic classes: SR class A, SR class B, network control (NC) traffic (gPTP frames), and best effort (BE) traffic. Allocating a specific queue to network control (NC) frames ensures the control of synchronization.

The AVB-DMAC realizes compliance with the AVB standards by handling queues with the following architecture (in terms of traffic classes).

- Four transmission queues (Q3, Q2, Q1, and Q0) are available.
- Q3 and Q2 are for SR streams (one each for class A and class B).
- Q1 is for low-bandwidth network control (NC) traffic (gPTP frames)
- Q0 is for other types of traffic (MSRPDU*1, MVRPDU*2, best effort (BE), etc.)

CAUTIONS

1. **MSRPDU: Multiple Stream Registration Protocol Data Unit**
2. **MVRPDU: Multiple VLAN Registration Protocol Data Unit**

Fetching from queues proceeds in order of priority of the above traffic types. Three systems of priority are available through the setting of the transmit queue priority bits in the transmit configuration register (TGC.TQP[1:0]). In the default priority scheme, which is called AVB mode 1 (selected by TGC.TQP[1:0] = B'11), operation of the AVB-DMAC is fully in accord with the AVB specification. AVB mode 2 (transmit queue priority bits (TGC.TQP[1:0] = B'11) is an alternative priority scheme and varies from the AVB specification. Using this scheme thus requires more care. The other setting is for non-AVB-mode transmission.

Table 24.84 Default and Alternative Priority Orders in AVB Transmission Mode

Priority Schemes (AVB Mode)	Priority Order of Queues
Default	Q3 (SR class A) > Q2 (SR class B) > Q1 (NC) > Q0 (BE)
Alternative	Q1 (NC) > Q3 (SR class A) > Q2 (SR class B) > Q0 (BE)

(b) Transmission Selecting Algorithm and CBS

The algorithm the AVB-DMAC applies to select frames for transmission is in accord with the specifications under section 8.6.8, Transmission selection, of the IEEE 802.1Q standard. For AVB mode, the CBS (credit-based shaping) algorithm is applied to the class A and class B SR queues (Q3 and Q2). Use of the CBS enables correct handling of the priorities of transmission from the SR queues. For the CBS algorithm, see Section 24.4.6, CBS (Credit-Based Shaping).

When the following conditions both hold, transmission from an SR queue (Q3 or Q2) proceeds at the specified time.

- The queue contains at least one frame ready for transmission.
- The queue has available credit.
- Unless an SR queue satisfies the above conditions, a higher priority queue is not present (not ready for transmission).

A non-SR queue (Q1 or Q0) is selected if the conditions below both hold.

- The queue contains at least one frame ready for transmission.
- As well as the above condition, a higher priority queue is not present (not ready for transmission).

Figure 24.30 and **Figure 24.31** are flowcharts of selection for transmission in AVB mode 1 (default) and AVB mode 2 (alternative).

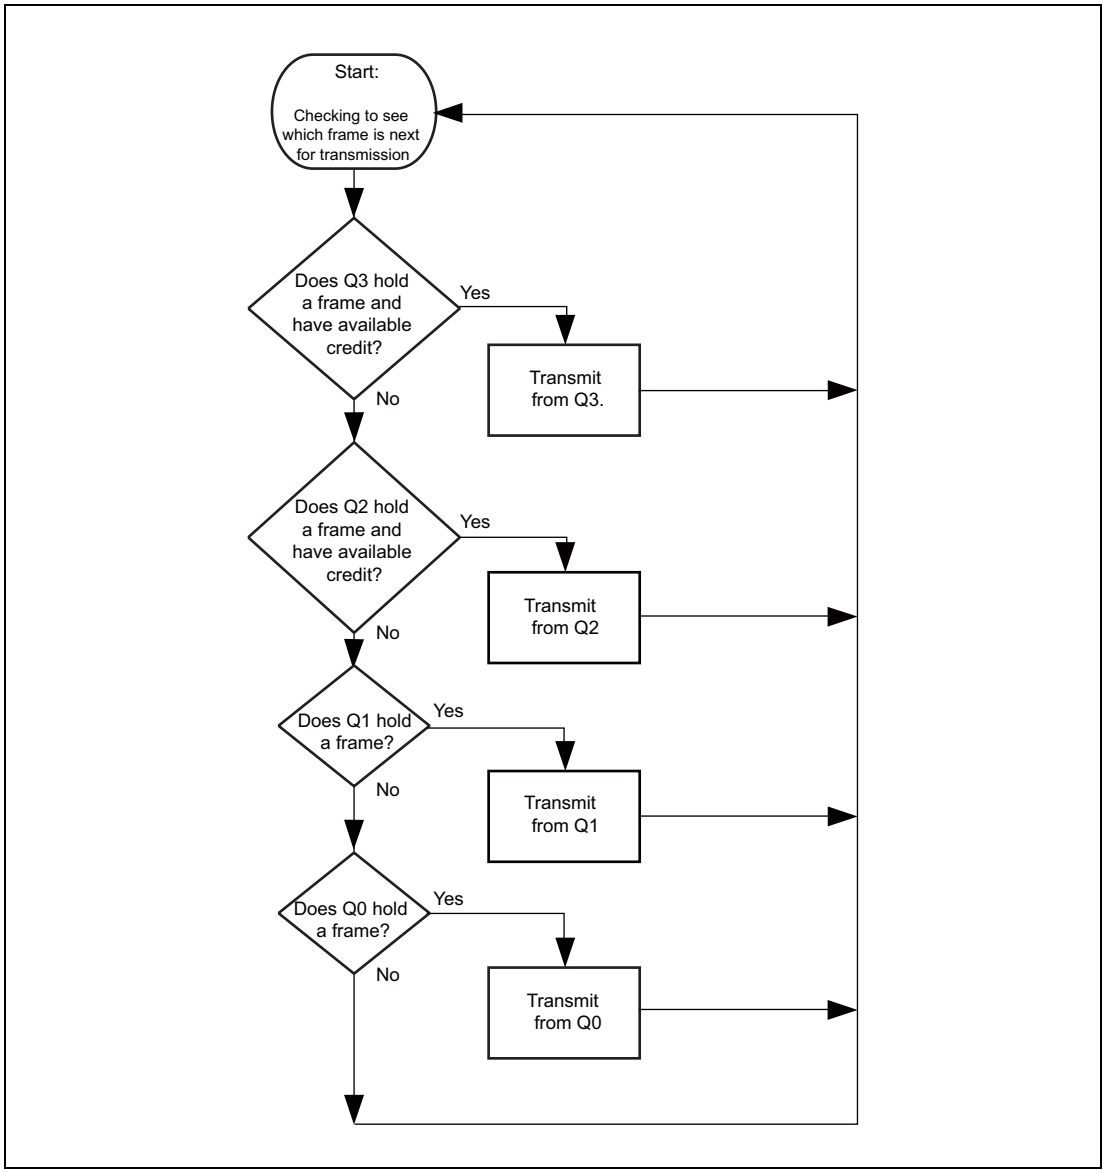

Figure 24.30 Flow of Selection for Transmission in AVB Mode 1 (Default)

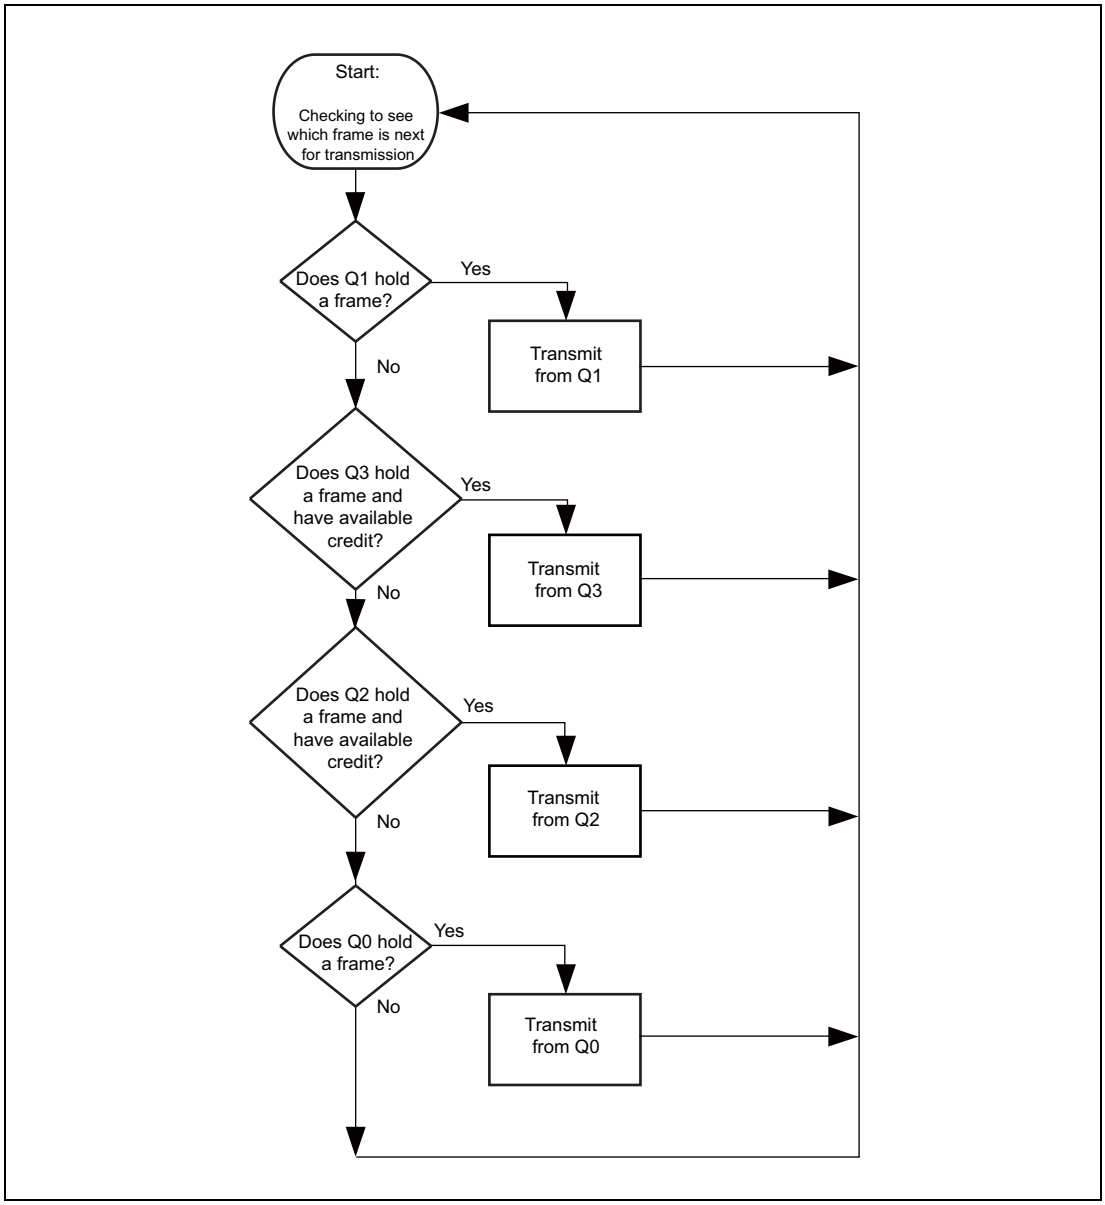

Figure 24.31 Flow of Selection for Transmission in AVB Mode 2 (Alternative)

(2) Non-AVB Transmission Mode

In non-AVB transmission mode, an absolute priority scheme is used. The SR class is not supported and the CBS algorithm is not used.

In non-AVB transmission mode (when the transmit queue priority bits in the transmit configuration register (TGC.TQP[1:0]) are B'00), data is fetched for transmission in a strict order of priority (Q3 > Q2 > Q1 > Q0).

Figure 24.32 shows the flow of selection in non-AVB transmission mode.

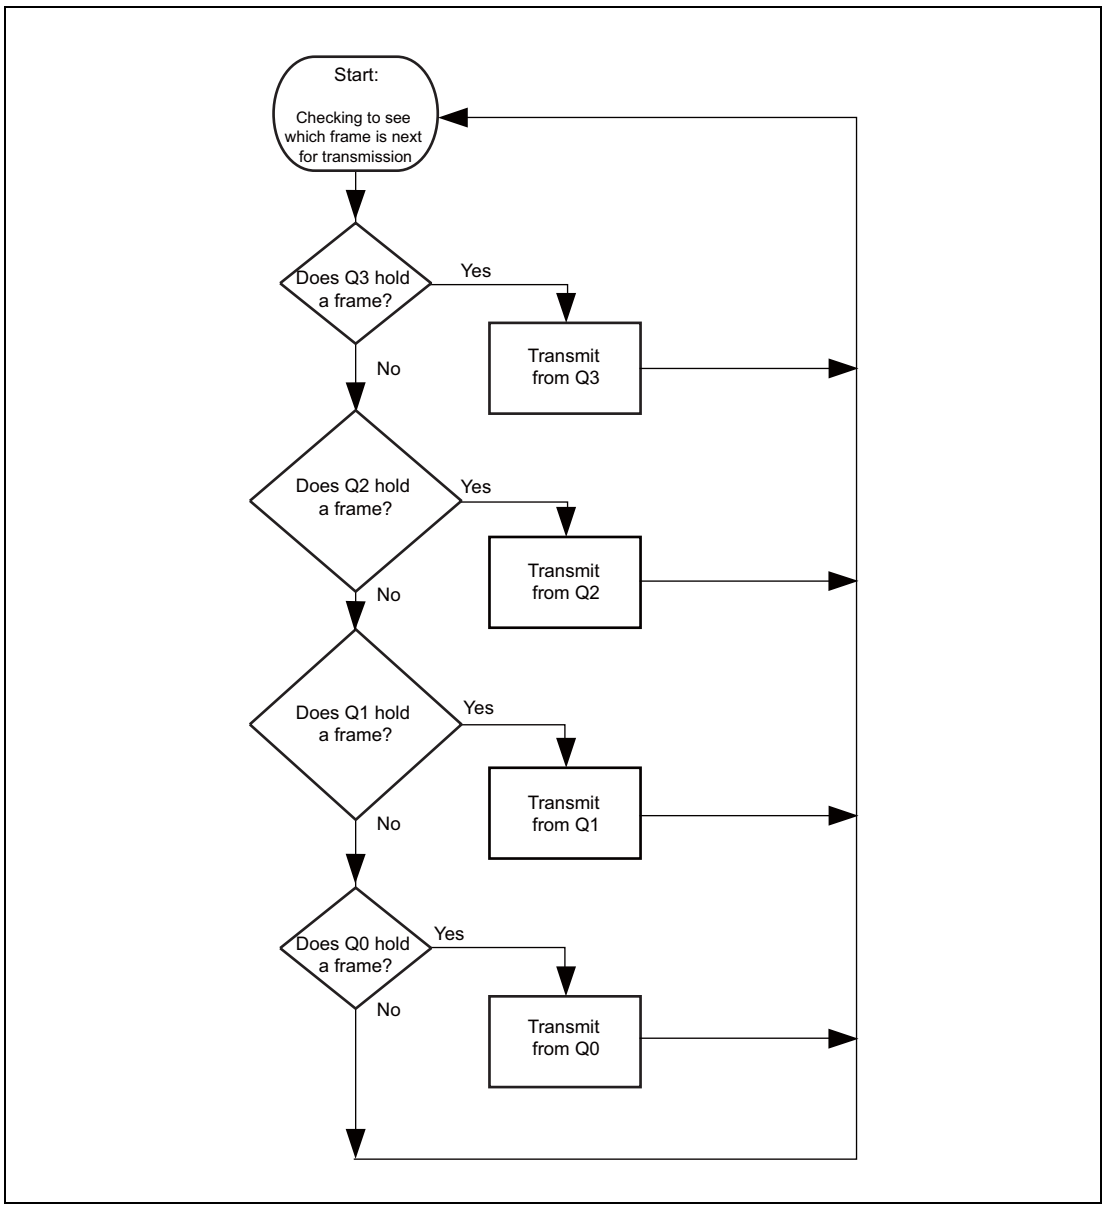

Figure 24.32 Flow of Selection for Transmission in Non-AVB Mode

(3) Setting the Size of the Transmission FIFO

The transmission FIFO is made up of 124 clusters. Each cluster can hold up to 128 bytes.

The size of the part of the transmission FIFO for use by each of the four transmission queues can be set by the corresponding transmit queue configuration q bits in the transmit control register (TGC.TBDq). The setting of TGC.TBDq is fixed to 2.

General Usage Examples:

Q0: Frames containing up to 1500 bytes → 1500/128 = 11.7 → 12 clusters

Q1: Frames containing up to 1024 bytes → 1024/128 = 8.0 → 8 clusters

Q3: Frames containing up to 1996 bytes → 1996/128 = 15.6 → 16 clusters

Q4: Frames containing up to 1996 bytes → 1996/128 = 15.6 → 16 clusters

When the depth of all transmission queues is 2, only the following number of clusters is required.

2 * (12 + 8 + 16 + 16) + 16 = 2 * 52 + 16 = 120

In the worst case (each of the transmission queues holds 1996 bytes), 2 * 64 + 16 = 144 clusters are required, so 1 must be set in TGC.TBDt for at least two transmission queues (e.g. Q0 and Q1).

24.4.5.2 Setting Up Transmission Descriptors

(1) Transmission Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 24.85 shows the descriptor types used in transmission.

Table 24.85 Descriptor Types in Transmission

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	The AVB-DMAC fetches the first of the data for the divided frame and proceeds to processing of the next descriptor.	FEMPTY
Frame Middle (FMID)	The AVB-DMAC fetches the second or subsequent data for the divided frame and proceeds to processing of the next descriptor.	FEMPTY
Frame End (FEND)	The AVB-DMAC fetches the last of the data for the divided frame. When the frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, the AVB-DMAC proceeds to processing of the next descriptor.	FEMPTY
Frame Single (FSINGLE)	The AVB-DMAC fetches the frame of data. When the frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, the AVB-DMAC proceeds to processing of the next descriptor.	FEMPTY
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	This is a transmission stop point defined by software This leads to clearing of the transmit start request bit (TCCR.TSRQt), which stops transmission. When the TCCR.TSRQt is again set to 1 (a new transmission start request is issued), processing proceeds to the next descriptor.	EEMPTY
Frame Empty (FEMPTY)	No frame data are ready for transmission This leads to clearing of the transmit start request bit (TCCR.TSRQt), which stops transmission. When the TCCR.TSRQt is again set to 1 (a new transmission start request is issued), processing starts at this descriptor.	Not changed
Link Empty (LEMPTY)	Same as FEMPTY	Not changed
EOS Empty (EEMPTY)	Same as FEMPTY	Not changed

(2) Configuration of Transmission Frame Data Descriptors

Figure 24.33 shows the configuration of descriptors for use with transmission queues. The transmission-specific fields (DESCR.TSR, and DESCR.TAG) are described in **Table 24.86**.

For the other fields and the descriptor types, see Section 24.4.3.6, Descriptor Type.

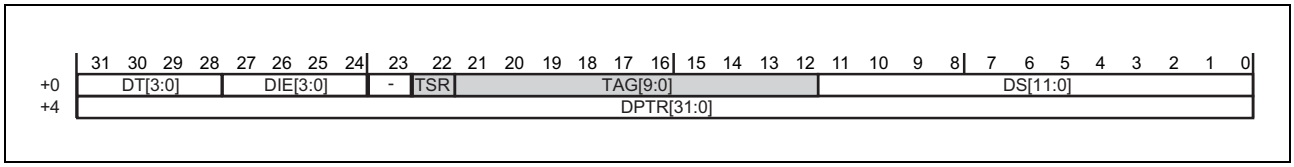

Figure 24.33 Configuration of Descriptor for a Transmitted Frame

Table 24.86 Configuration of a Transmission Descriptor

Bit Name	Function
TSR	Time Stamp Store Request This bit specifies whether the transmission time stamp is to be stored within the EthernetAVB module. 0: The time stamp status FIFO within the EthernetAVB module does not retain a transmission time stamp. 1: The time stamp status FIFO within the EthernetAVB module retains a transmission time stamp. Only control this bit while the current DESCR.DT is FEND or FSINGLE.
TAG	Frame Tag This TAG field is used to associate each frame data with a time stamp. Frame TAG is not required but is recommended. Only control this bit while the current DESCR.DT is FEND or FSINGLE.

For the time stamp FIFO function, see Section 24.4.5.4, Time Stamping in Transmission.

24.4.5.3 Transmission

(1) Transmitting Frames

Setting the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) starts the transfer of frames from the corresponding transmission queue.

The descriptor in the current descriptor address (CDARq.CDA[31:0]) for the queue t (with q = t) is read first.

If this descriptor is a descriptor for frame transmission (FSINGLE, etc.), the AVB-DMAC fetches the frame data from the data area indicated by the descriptor, writes FEMPTY back to the descriptor type (DESCR.DT) bits to indicate completion of this processing, then proceeds to processing of the next descriptor.

If the descriptor is not for transmission, processing is as dictated by the given descriptor (for these descriptors, see the descriptions in Section 24.4.3, Descriptors).

If a base address load request is issued for a descriptor chain while it is being processed (by setting 1 in the LBAq bit for transmission queue q that is currently being processed in the descriptor base address load request register, DLR), processing proceeds to the new descriptor chain. Changing the chain does not interrupt frame fetching, but note that frames that have not been fetched from the old chain remain where they are.

Figure 24.34 shows descriptor processing during transmission.

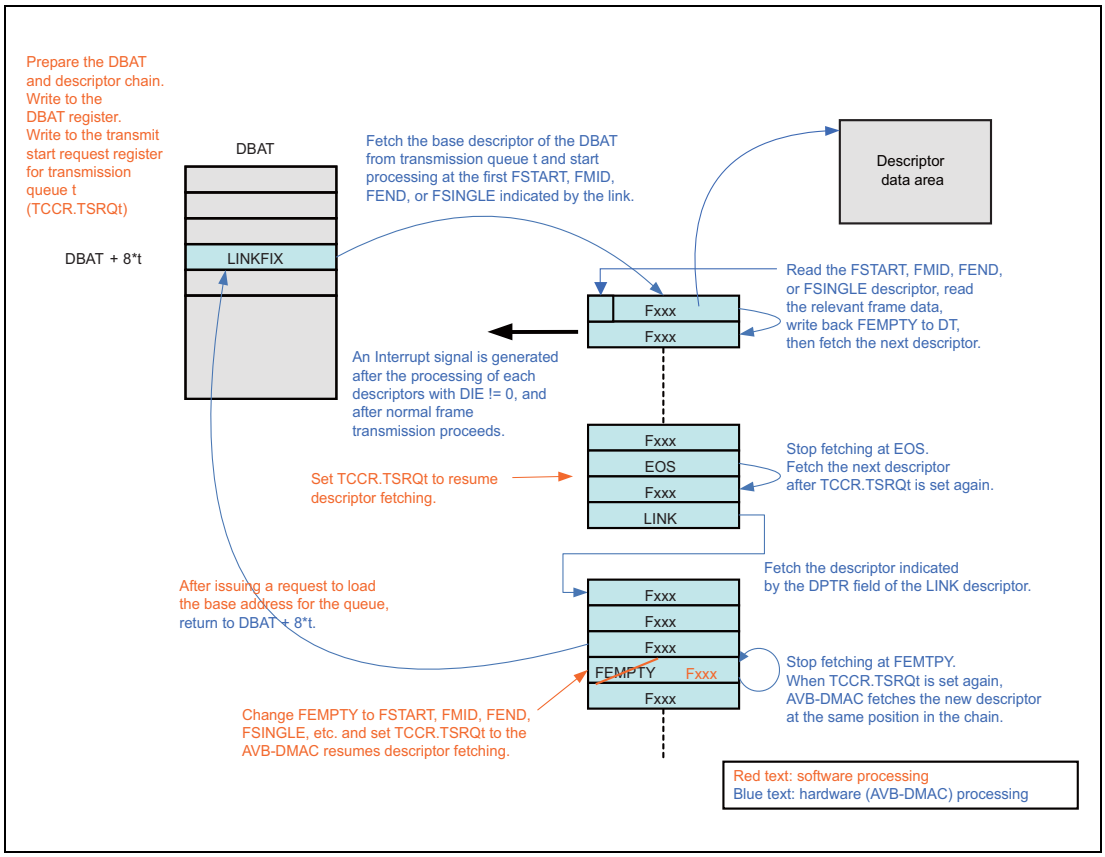

Figure 24.34 Descriptor Processing During Transmission

(2) Examples of Descriptor Usage

(a) Immediate Frame Transmission

Immediate frame transmission is a pattern in which fetching by the AVB-DMAC starts whenever software adds data to a queue. FEMPTY descriptors are used as stop points to keep the hardware and software in synchronization.

Create descriptor chains that have FEMTPY descriptors at the stop points.

Figure 24.35 shows the flow for software implementing this pattern.

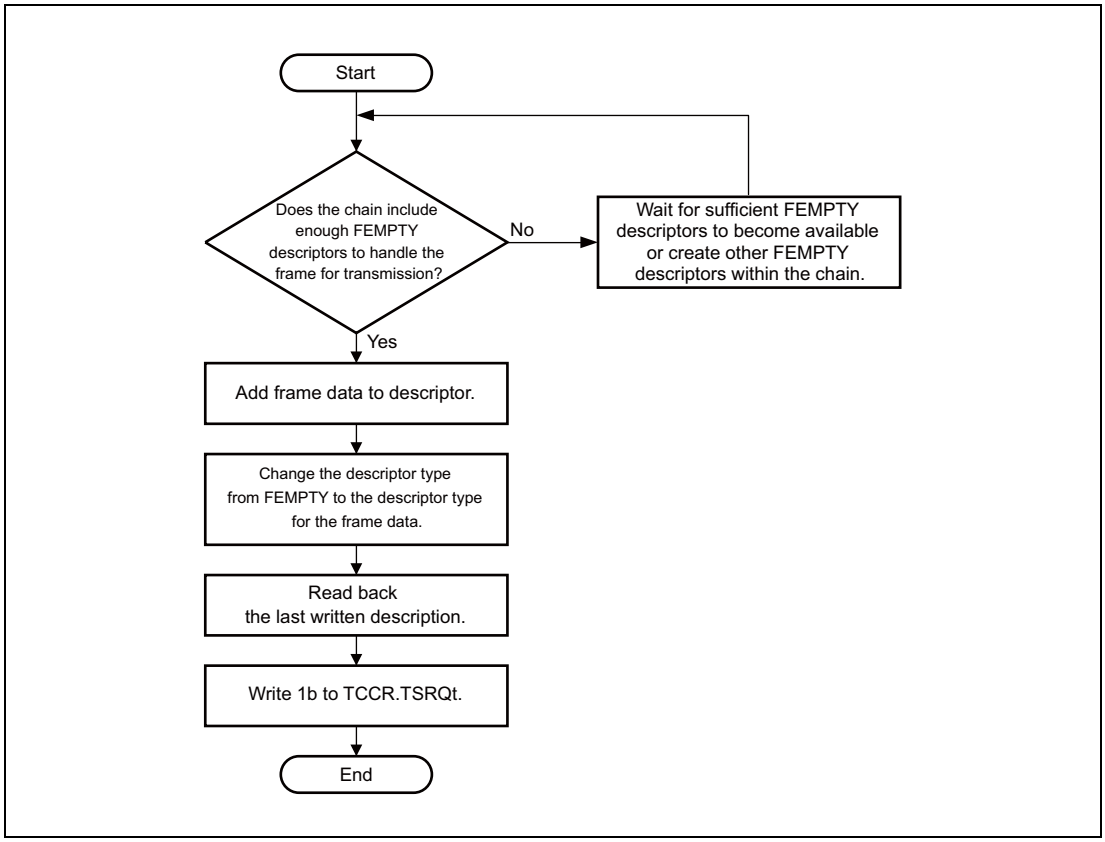

Figure 24.35 Software Flow for Immediate Frame Transmission

Figure 24.36 shows software and AVB-DMAC operations for immediate frame transmission.

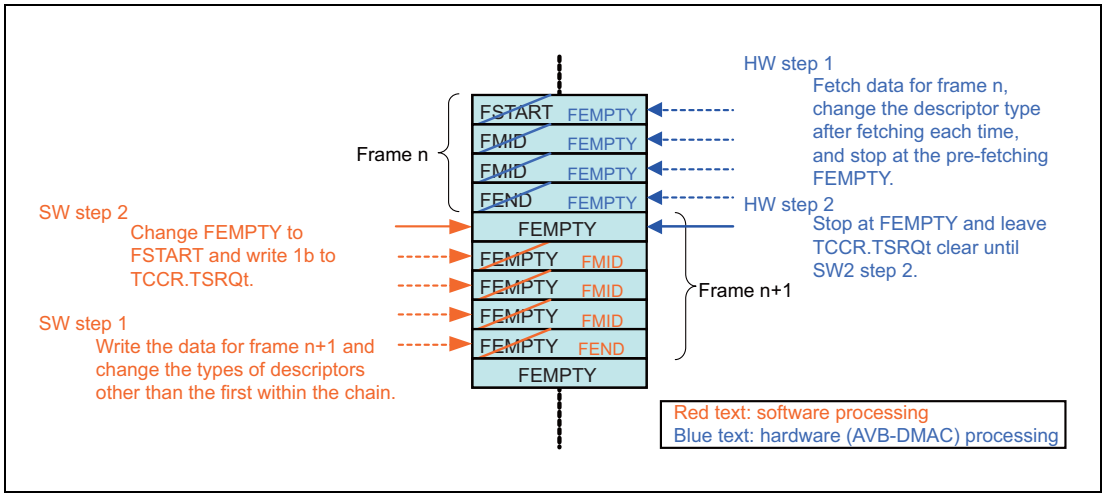

Figure 24.36 Software and AVB-DMAC Operations for Immediate Frame Transmission

(b) Frame Set Transmission with Changing of the Active Descriptor Chain

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. EOS descriptors are used for the stop points.

Start by creating a descriptor chain that has a FEMPTY descriptor as its stop point.

Figure 24.37 shows the software flow in this pattern.

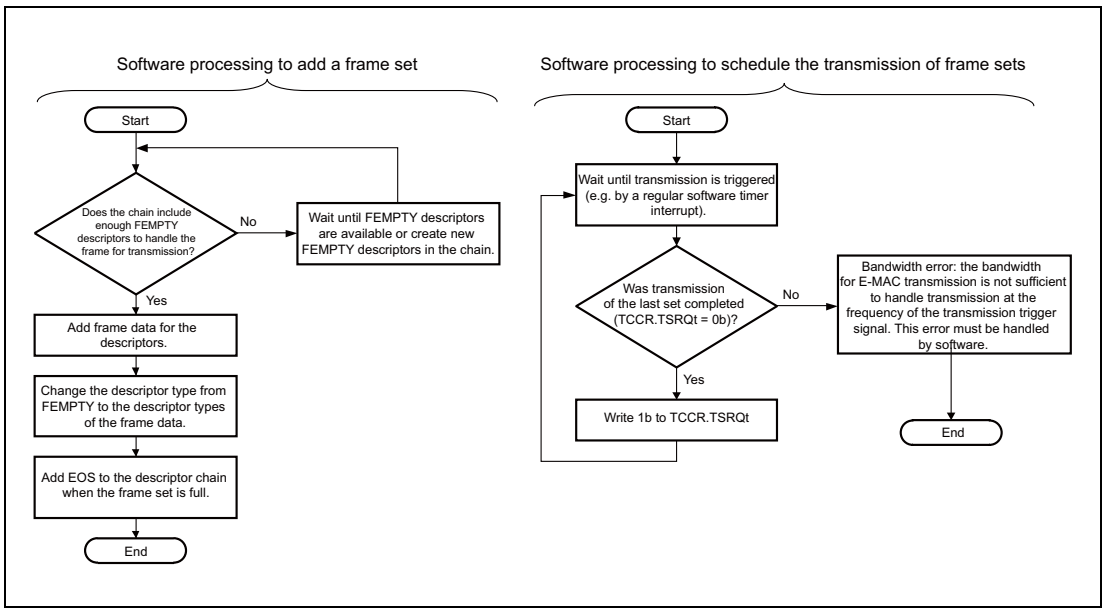

Figure 24.37 Software Flow for Frame Set Transmission with Changing of the Active Descriptor Chain

Figure 24.38 shows software and AVB-DMAC operations for frame set transmission.

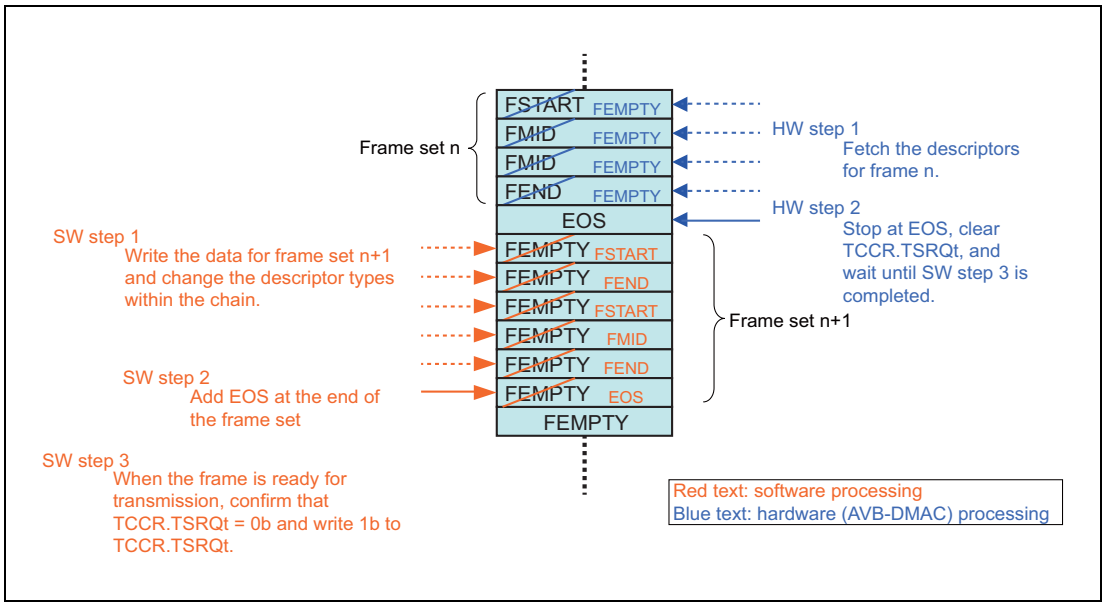

Figure 24.38 SW and AVB-DMAC Operations for Frame Set Transmission with Changing of the Active Descriptor Chain

(c) Frame Set Transmission Using a Shadow Descriptor Chain

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. Two or more descriptor chains are used. The chains are classified as active or shadow chains. EOS descriptors are used for the stop points.

Create descriptor chains that have FEMTPY descriptors at the stop points.

Figure 24.39 shows the flow for software implementing this pattern.

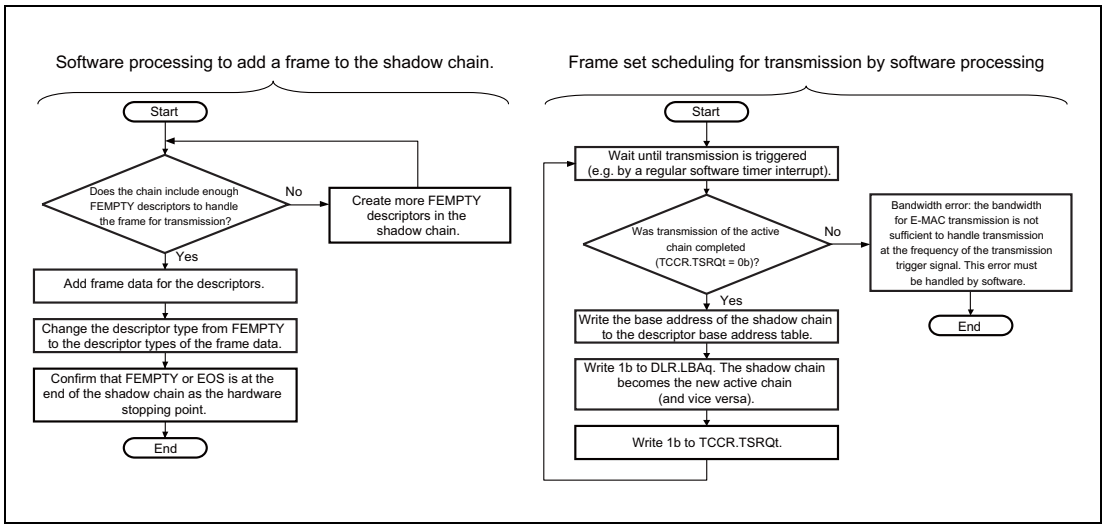

Figure 24.39 Software Flow for Frame Set Transmission Using the Shadow Descriptor Chain

Figure 24.40 shows software and AVB-DMAC operations for frame set transmission.

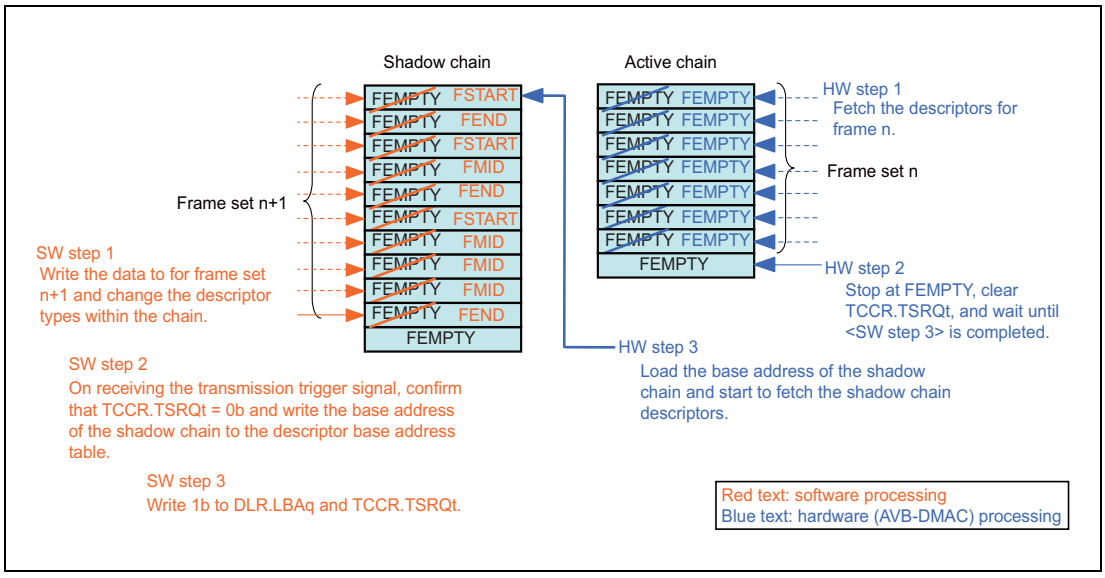

Figure 24.40 SW and AVB-DMAC Operations for Frame Set Transmission Using the Shadow Descriptor Chain

24.4.5.4 Time Stamping in Transmission

Transmission time stamps are important in satisfying the requirements for timing and synchronization of the IEEE 802.1AS standard. Reference to this information can also be useful to other applications and in testing. The AVB-DMAC supports the storage of time stamps for transmitted frames. The time-stamp values are based on the gPTP timer and are captured at the same time as sending of the Start of Frame Delimiter (SFD) for transmitted frames.

When the time stamp storage request field (DESCR.TSR) is set to 1, selecting storage of a time stamp, the tag number defined in the tag field (DESCR.TAG) of the last descriptor in a set (FEND) or of an FSINGLE descriptor for the frame being transmitted is stored with the time stamp. This eases identification and association. The time-stamp FIFO is accessible at any time.

Figure 24.41 shows the mechanism supporting transmission time stamping.

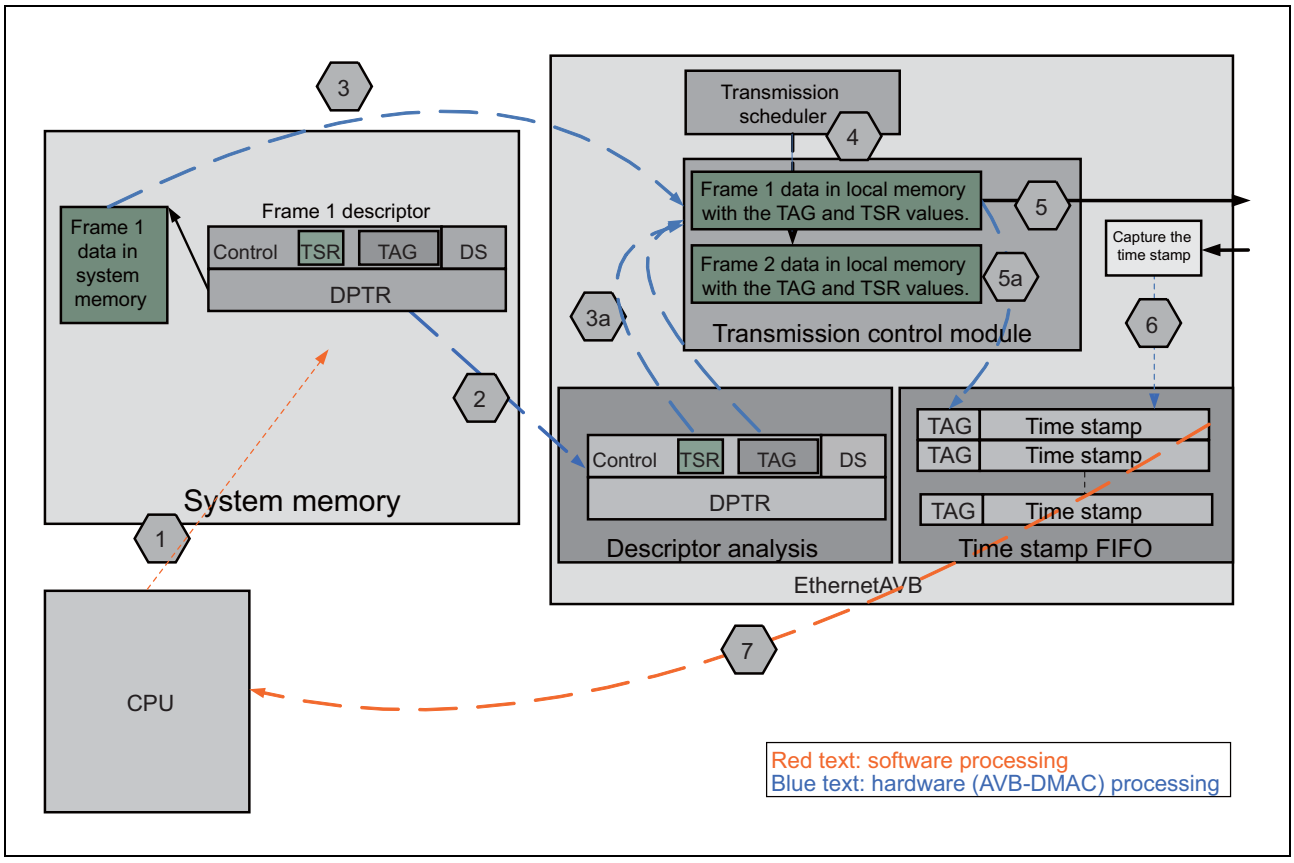

Figure 24.41 Mechanism to Support Transmission Time Stamps

The method of using this function is described below:

1. Secure space in the URAM for the frame requiring time stamping.
   Write the tag number of the frame to the frame tag field (DESCR.TAG) and set the time stamp storage request field (DESCR.TSR) to 1.
2. The AVB-DMAC fetches and analyzes the descriptor. The time stamp storage request field (DESCR.TSR) is 1, so it recognizes that transmitting this frame also requires storage of the time stamp.
3. The AVB-DMAC fetches the data for frame 1 and temporarily stores the frame in internal memory for scheduling.

   3a: The frame tag field (DESCR.TAG) and time stamp storage request field (DESCR.TSR) are stored with the fetched data.)
4. Under the control of priority settings according to credit-based shaping (CBS) or another scheme, the transmission scheduler decides it is time to transmit frame 1.
5. Transmission of frame 1 starts.

   5a: Frame 1's tag is stored in the time-stamp FIFO.
6. The gPTP time stamp is captured at the start of sending the frame delimiter (SFD) for transmission and stored with the tag in the time-stamp FIFO. On completion of the transmission, an interrupt is generated. For this to happen, the descriptor interrupt control register (DIC) must be set beforehand.
7. The entry can now be read from the time-stamp FIFO.

Use the time-stamp FIFO for the timing and synchronization of frames with IEEE 802.1AS compliance.

Time stamping can also be used with other frames, but take care not to allow the time-stamp FIFO to overflow. When the FIFO is full, further time stamps supplied to it are lost.

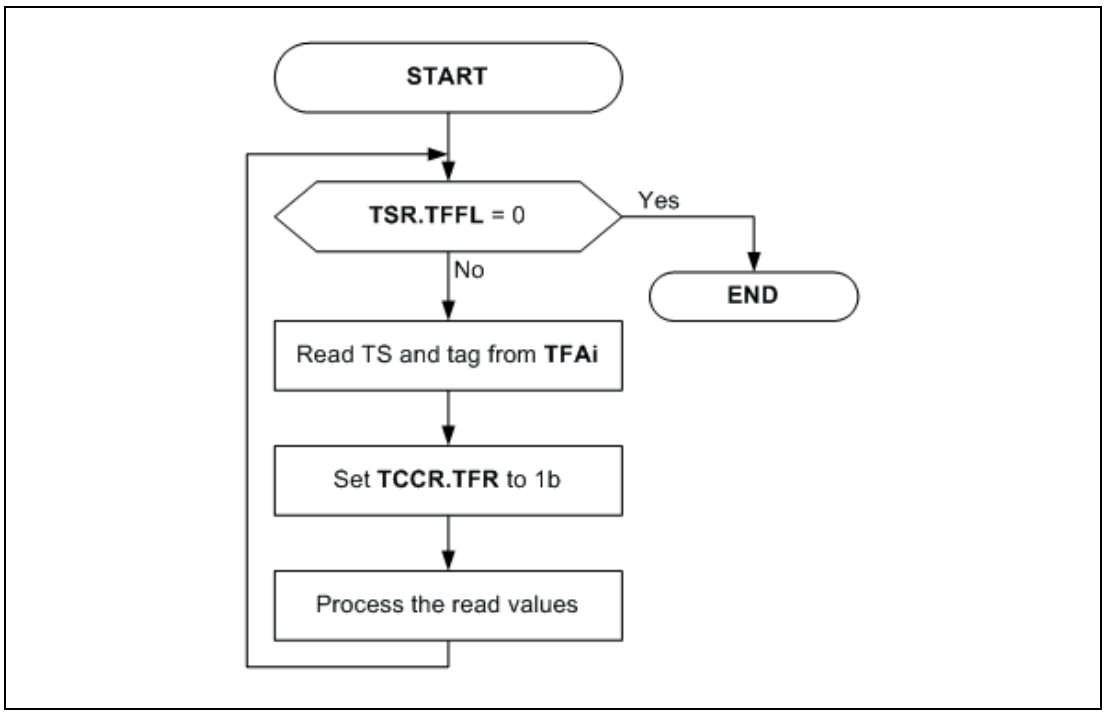

Figure 24.42 Flow of Transmission Time Stamping

(1) Ending Transmission

Figure 24.43 shows the procedure for ending transmission.

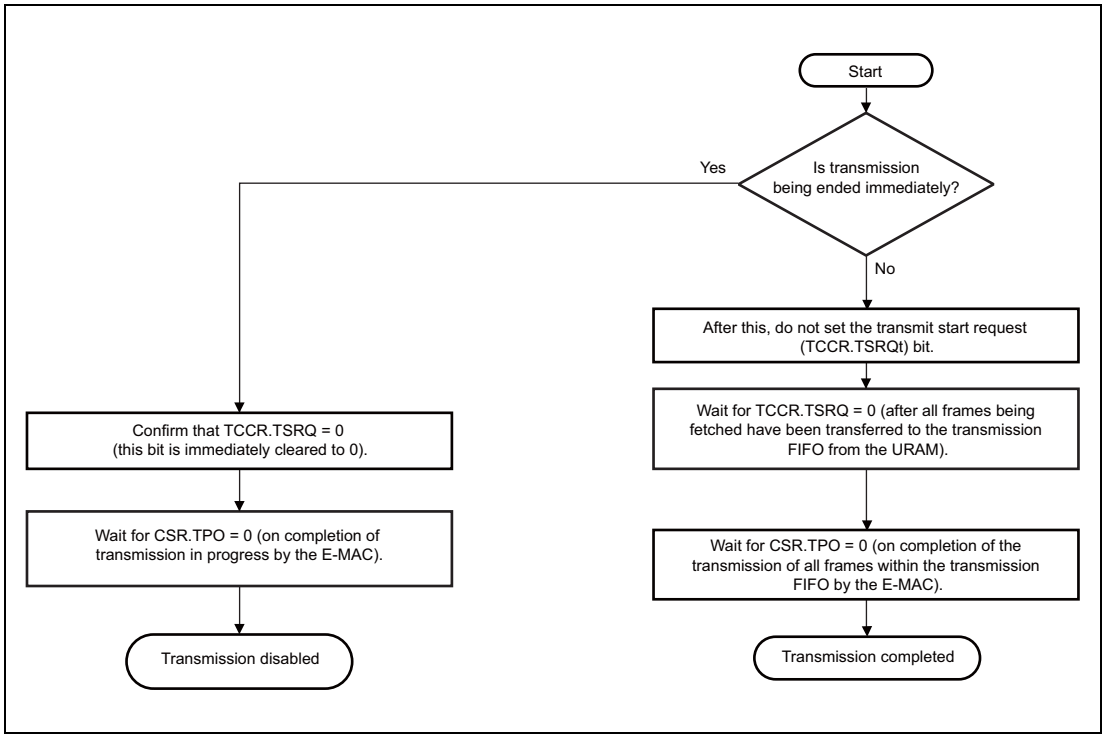

Figure 24.43 Procedures for Ending Transmission

24.4.6 CBS (Credit-Based Shaping)

In AVB transmission mode (i.e. when the transmit queue priority field in the transmit configuration register (TGC.TQP[1:0]) is B'01 or B'11), transmission queues Q3 and Q2 are respectively assigned to class A and class B stream traffic and the CBS (Credit Based Shaping) algorithm is used to select the transmission queues in order to satisfy the Forwarding and Queuing for Time Sensitive Streams (FQTSS) specification (see section 8.6.8 or section 34 in IEEE 802.1Q).

The CBS algorithm is based on the concept of transmission credit for each queue. Credit can be thought of as the degree to which a queue has the "right" to transmit at a given time. Actually, in AVB transmission mode as specified in IEEE 802.1Q, queues that are subject to the CBS algorithm are able to transmit when the following conditions are met.

- At least one frame is stored in the queue.
- The credit for the queue is 0 or a positive value.

The credit for a transmission queue is incremented while one or more frames from the queue are present in the transmission FIFO but transmission of these frames is not proceeding. This state is indicated by the transmission process status bit for queue t in the AVB-DMAC status register (CSR.TPOt). The credit is decremented while transmission of a frame from the queue is in progress. This mechanism is used to control transmission so that the transmission of frames from the queues for each of the traffic classes does not exceed the specified maximum bandwidths.

IEEE 802.1Q defines the following parameters for queues under the control of the CBS algorithm.

portTransmitRate: Maximum transmission data rate of an external port. The E-MAC determines this parameter.

bandwidthFraction: Maximum fraction of portTransmitRate that can be used for a queue.

idleSlope: Rate of change of credit for a queue when transmission of frames from the queue is not proceeding so the credit value (in bits per second) is increasing. idleSlope is also equal to the maximum fraction of the total bandwidth (portTransmitRate) that is available to the given queue under a specified condition (frames from the queue can be placed in a continuous stream. See Annex L of IEEE 802.Q.
idleSlope = bandwidthFraction * portTransmitRate

sendSlope: Rate of change of credit for a queue while transmission of a frame from the queue is in progress so the credit value is decreasing.
The value of sendSlope is defined as follows:
sendSlope = idleSlope - portTransmitRate

Furthermore, the values below are used to define individual traffic classes (or queues for the classes) under control of the algorithm. See Annex L of IEEE 802.Q.

maxFrameSize: Maximum size of frames (in bits) of the corresponding traffic class that can be transmitted from a port

maxInterferenceSize: Maximum burst size (in bits) by which delays for the corresponding traffic class can be allowed

hiCredit: Maximum credit value (positive number). Can be calculated by using the following equation: hiCredit = maxInterferenceSize * (idleSlope / portTransmitRate)

loCredit: Minimum credit value (negative number). Can be calculated by using the following equation: loCredit = maxFrameSize * (sendSlope / portTransmitRate)

Figure 24.44 shows how the CBS algorithm works and the meaning of the above parameters.

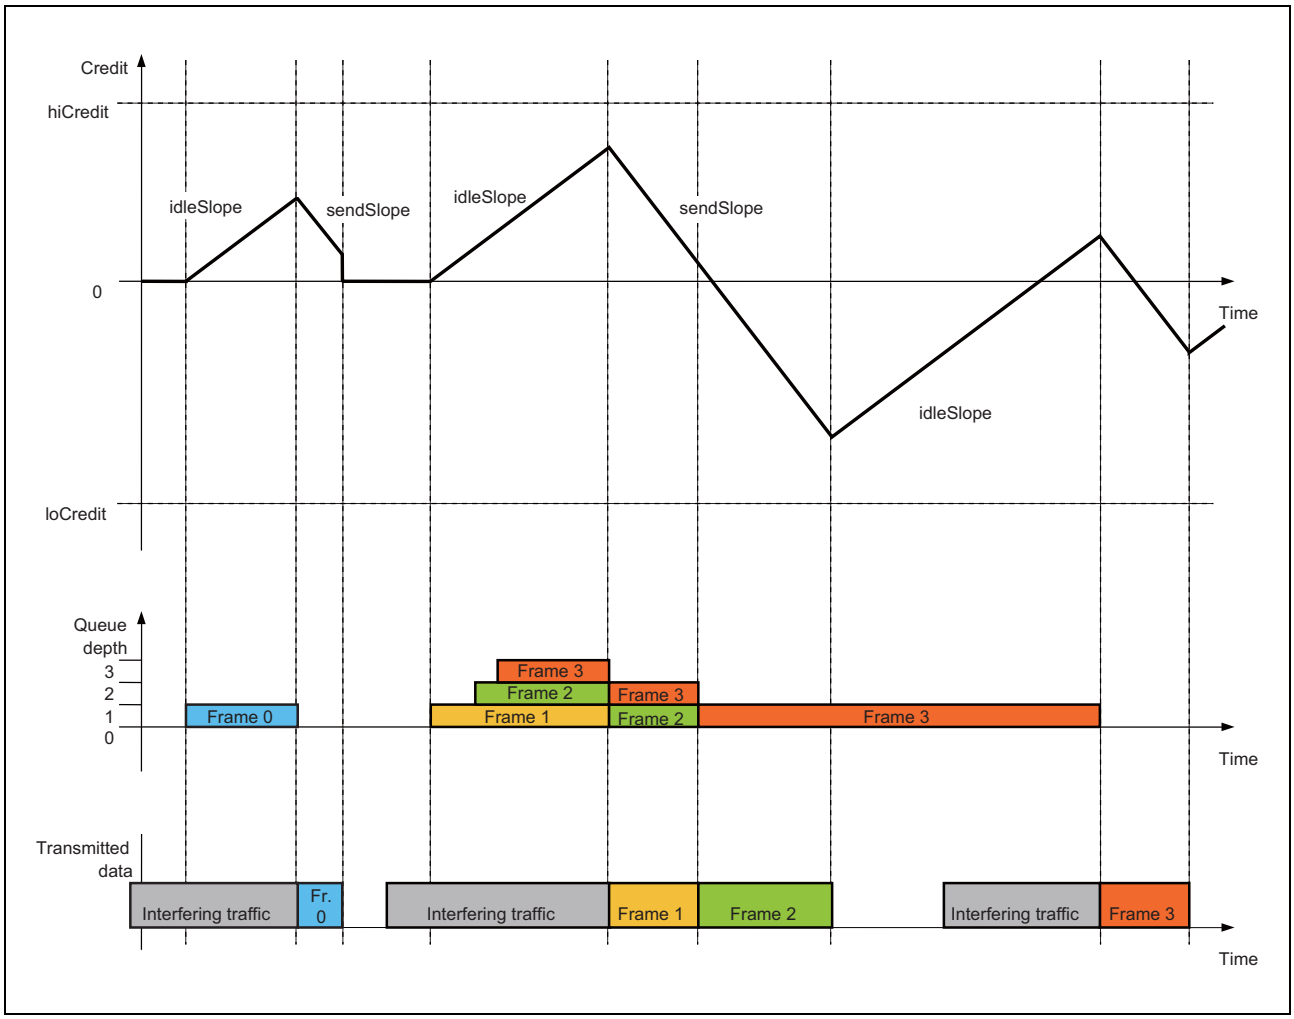

Figure 24.44 CBS (Credit-Based Shaping) Operation

Figure 24.45 shows the implementation of CBS in the AVB-DMAC.

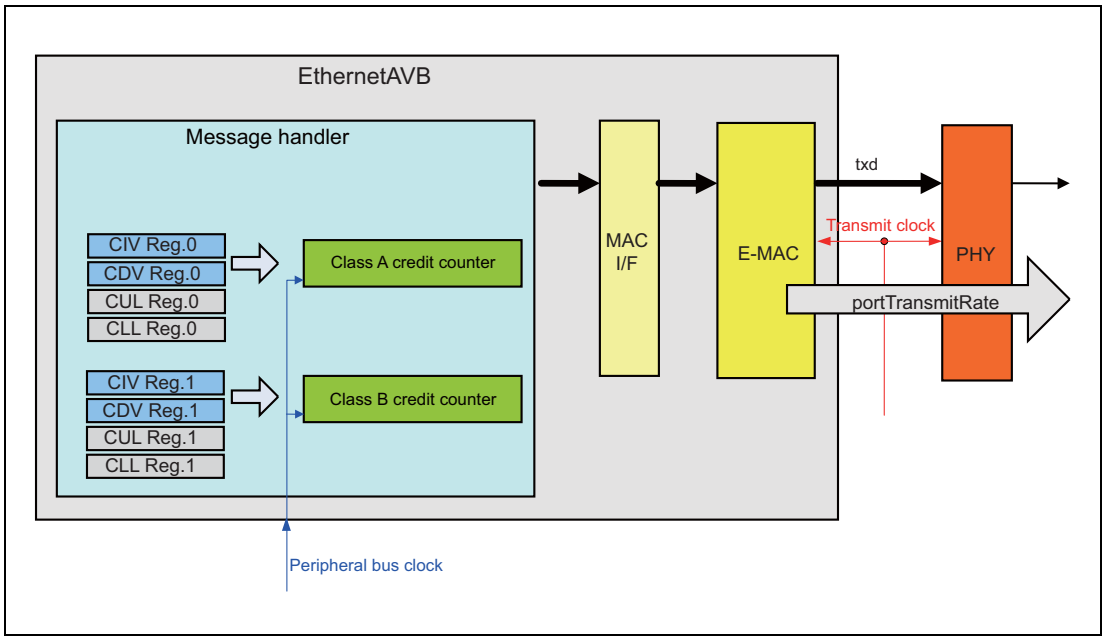

Figure 24.45 CBS (Credit-Based Shaping) Operation in the AVB-DMAC

The above implementation is based on “credit counters” for the respective traffic classes (SR class A and class B). The following parameters apply for these classes.

CBS increment value (CIV): Signed positive number
The credit is incremented by this amount every peripheral bus clock cycle while a frame from the queue is pending but transmission has not started (idleSlope).

CBS decrement value (CDV): Signed negative number
The credit is decremented by this amount every peripheral bus clock cycle while transmission of a frame from the queue is proceeding (sendSlope).

The CBS increment value (CIV) and CBS decrement value (CDV) are defined as follows.

CIV = idleSlope * Mfactor

CDV = sendSlope * Mfactor

Mfactor is a multiplier factor to ensure accuracy for CIV and CDV. CIV and CDV are calculated by using the following equations.

CIV = (portTransmitRate/CHI_freq) * bwFraction * Mfactor

CDV = (portTransmitRate/CHI_freq) * (bwFraction - 1) * Mfactor

CHI_freq is the frequency of the peripheral bus clock. The credit counters are driven by the peripheral bus clock, so calculating the slope parameters for CBS requires (1/CHI_freq).

Use software to prepare Mfactor for the CBS parameters. All queues for the same class must have the same CBS parameters. Mfactor for a specified class c can be changed during operation, unless transmission is pending for that class (i.e. the transmit process status bit in the AVB-DMAC status register (CSR.TPOt) = 0). At that time, the credit counter values for class A and class B are 0. Note that

the credit value will not match a new incrementation or decrementation parameter if Mfactor is changed while the credit counter value is non-zero. Mfactor is not present in the AVB-DMAC registers.

Set the CIV and CDV parameters in the CBS increment value registers (CIVRc) and the CBS decrement value registers (CDVRc). These are treated as dynamic settings since they should be updated when streams are registered and erased in accord with IEEE 802.1Qat.

The AVB-DMAC also has CBS upper limit registers (CULc) (the upper limit registers for classes A and B) and CBS lower limit registers (CLLc) (the lower limit registers for classes A and B). Set Mfactor to match the credit value and set the upper limit (hiCredit) and the lower limit (loCredit) for each class as defined above.

CUL = hiCredit * Mfactor = maxInterferenceSize * bwFraction * Mfactor

CLL = loCredit * Mfactor = maxFrameSize * (bwFraction - 1) * Mfactor

Example:

Assume that portTransmitRate = 100 Mbps, CHI_freq = 130 MHz and bwFraction = 3%. Then idleSlope and sendSlope represented as one bit vs. cycles of the peripheral bus clock are as follows.

idleSlope = (portTransmitRate/CHI_freq) * bwFraction = 100/130 (Mbps/MHz) * 3% = 0.023 of a bit per high-speed peripheral bus clock cycle

sendSlope = idleSlope - (portTransmitRate / CHI_freq) = –0.746 bits per peripheral bus clock cycle

Let Mfactor be 100, then CIV and CDV parameters are determined as follows.

CIV = idleSlope * Mfactor = 2.3

CDV = sendSlope * Mfactor = –74.6

24.4.6.1 Restrictions on CIV, CDV and Mfactor

The maximum value (the minimum value for negative numbers) up to which the credit counter will not overflow determines the maximum values of CIV and CDV that can be set in the CBS registers. This maximum credit value is equivalent to the worst case of the hiCredit value, and the maximum values for class A and class B are calculated as follows.

<Conditions>

- Class A maximum value (hiCredit_max_classA)
  classA bwFraction ≅ 100%
  Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the maximum frame size.
  hiCredit_max_classA ≅ maxInterferenceSize for class A = Interference due to one max. sized frame = header + max. size payload + CRC (2000 bytes) + preamble (8 bytes) + IFG (12 bytes) + processing_delay (≅ 80 bytes) ≅ 2100 bytes
- Class B maximum value (hiCredit_max_classB)
  classB bwFraction ≅ 100%
  Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the maximum size of frames in the class A transmission queue and other transmission queues.
  hiCredit_max_classB ≅ maxInterferenceSize for class B = Interference due to two max-size frames = 2* hiCredit_max_classA ≅ 4200 bytes

hiCredit_max_classA = 16800

hiCredit_max_classB = 33600

The maximum values that can be selected with Mfactor for the 32-bit signed counter without overflow are:

Mfactor_max_classA = 2^{31}-1 / hiCredit_max_classA ≅ 127826 and
Mfactor_max_classB = 2^{31}-1 / hiCredit_max_classB ≅ 63913.

A high degree of accuracy can be achieved even with a low bandwidth. In class B, bandwidthFraction = 0.05% and the bandwidth error < 0.1%.

The maximum value of CIV is calculated from the following equation.

CIV = idleSlope x Mfactor = (portTransmitRate / CHI_freq) * bandwidthFraction × Mfactor

When Mfactor is the maximum value and bandwidthFraction is the maximum value (up to 100%):

```
CIV_max_classA =  (portTransmitRate / CHI_freq) * Mfactor_max_classA and
CIV_max_classB =  (portTransmitRate / CHI_freq) * Mfactor_max_classB.
```

Table 24.87 shows examples of values for portTransmitRate and peripheral clock frequency. Note that the values in the table are the limits of CIV up to which the 32-bit credit counter will not overflow. The CIV parameters are implemented as 16 bits + a sign bit, so a further limit of CIV ≤ 65535 applies to both class A and class B.

Table 24.87 Example of Maximum Values for Class A and Class B CIV Parameters

portTransmitRate	CHI_freq [MHz]	CIV_max_classA	CIV_max_classB
100Mbps	50	255652	127826
100Mbps	80	159782	79891
100Mbps	100	127826	63913
100Mbps	125	102260	51130
100Mbps	133	96109	48054
100Mbps	150	85217	42608

24.4.6.2 Credit Incrementation during Inter-Frame Gaps (IFGs)

The inter-frame gap (IFG) after a frame is transmitted is not treated as part of frame transmission by the CSB credit counter. During an IFG, the credit is incremented for all SR queues that have pending frames or negative credit. **Figure 24.46** illustrates credit operations during IFGs.

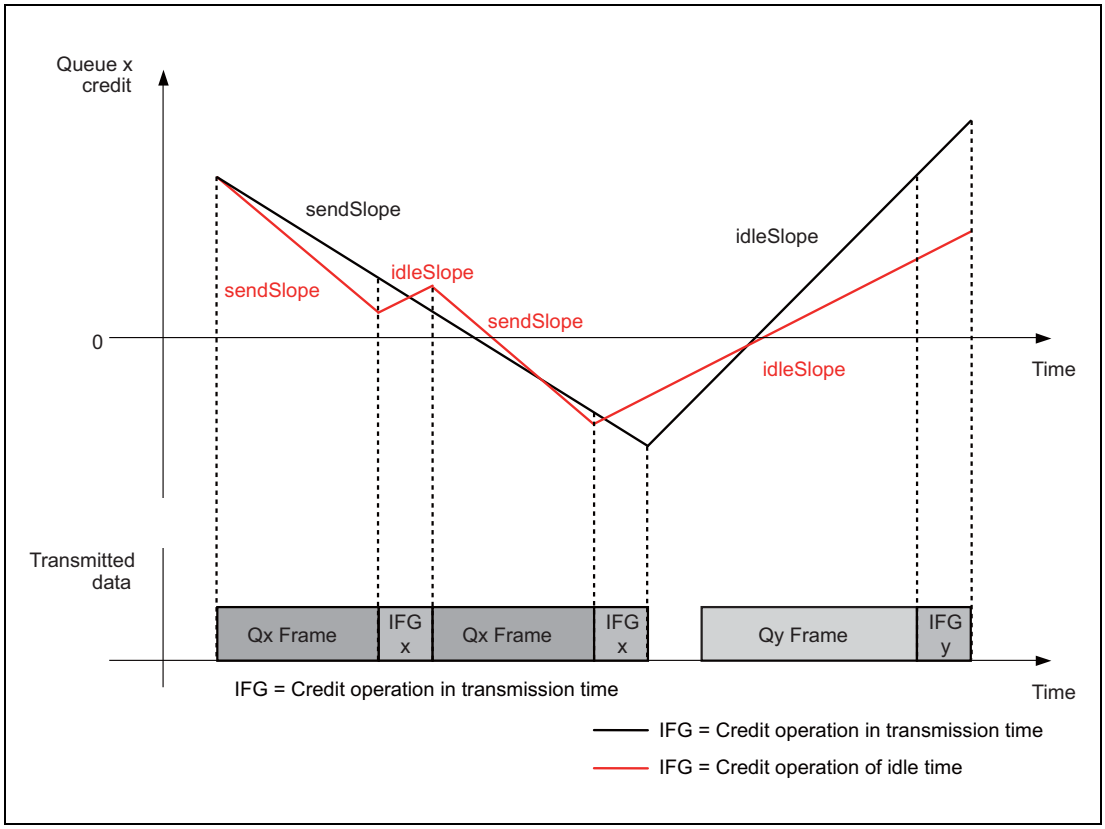

Figure 24.46 Credit Operations during IFGs

Accordingly, the IFG need not be included in calculation of the bandwidth requirements for the specified SR class when deciding the idleSlope, sendSlope, and CIV and CDV parameters. However, IFG must also be included in the calculation in order to confirm that the total bandwidth allocated to all SR classes does not exceed 100% of portTransmitRate. This is described in section 35.2.2.8.4 of IEEE 802.1Q.

24.4.6.3 Example

The case of a class A 48-kHz stereo audio stream among Ethernet frames is described as an example.

After every class A measurement interval (125 us), 80 octets consisting of two sets of six 32-bit samples plus a 32-octet header are stored as audio data within a frame. The IEEE 802.3 also imposes a 42-octet media-specific framing overhead (an 8-octet preamble, 14-octet IEEE 802.3 header, 4-octet IEEE 802.1Q priority/VID Tag, 4-octet CRC, and 12-octet IFG) are also added. Accordingly, the total frame size is 80 + 42 = 122, and one such frame is transmitted after every class measurement interval.

This represents a total bandwidth of about 7.8 Mbits per second (122 octets × 8 bits per octet × 8000 frames per second) for this class.

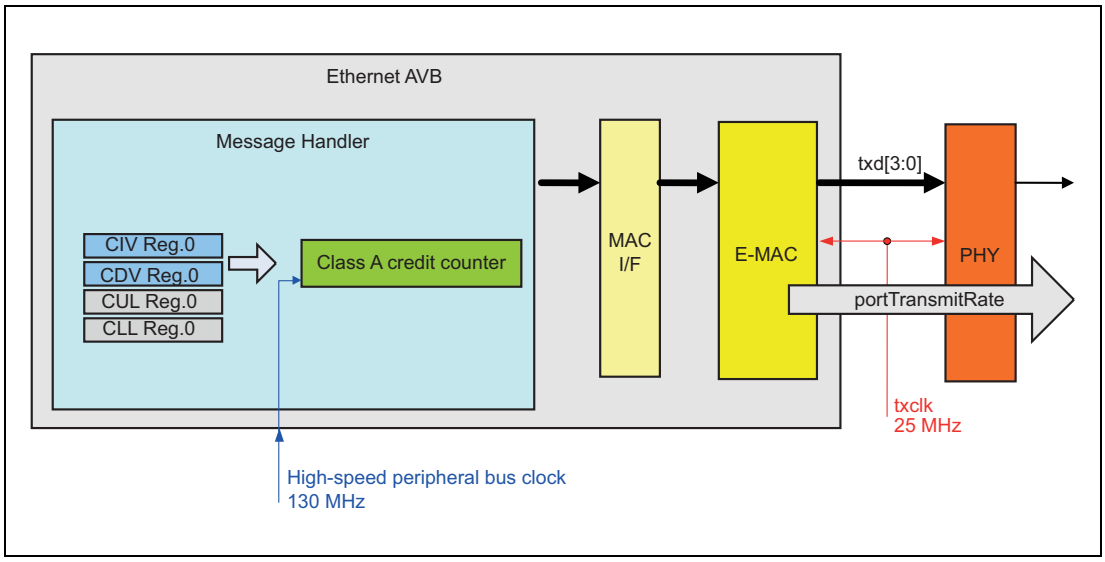

Figure 24.47 Example of CBS Settings

Given that:

- the E-MAC runs at 100 Mbps, so portTransmitRate = 100 Mbps and
- high-speed peripheral bus clock (operating clock for the credit counter) frequency = 130 MHz,

securing a bandwidth of 7.04 Mbits/sec for class A requires configuring the CBS parameters as follows.

- bandwidthFraction = 0.704%
- idleSlope = (portTransmitRate / CHI_freq) * bandwidthFraction ≅ 0.0176 bits per high-speed peripheral bus clock cycle
- sendSlope = idleSlope – (portTransmitRate / CHI_freq) ≅ -2.4824 bits per high-speed peripheral bus clock cycle

When Mfactor = 100000, the parameters are as follows.

- CIV = idleSlope × Mfactor = 1760 bits per high-speed peripheral bus clock cycle
- CDV = sendSlope × Mfactor = 248240 bits per high-speed peripheral bus clock cycle

These are the final values for setting in the CIVR1 and CDVR1 registers.

24.4.7 IEEE802.1: gPTP

24.4.7.1 gPTP Timer

An 84-bit timer is provided to support the gPTP function. **Figure 24.48** shows the definitions of bits for the timer and in related registers.

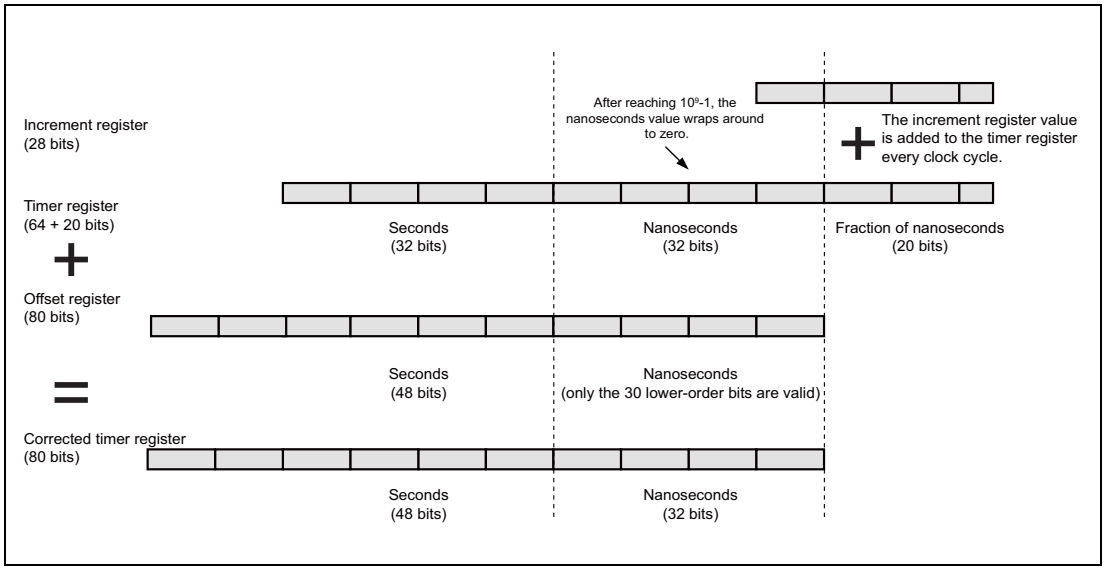

Figure 24.48 Definitions of gPTP Timer Bits and Related Bits

The higher-order 32 bits indicate seconds. For the next 32 bits, counting by one corresponds to the passage of 1 ns. The lower-order 20 bits are a fractional value (less than 1 ns). Software can only read the 32 higher-order bits, indicating seconds, and the subsequent 32-bits, indicating nanoseconds. The 20 lower-order 20 bits, representing less than 1 ns, are not readable. They are only used within the AVB-DMAC to maintain accuracy in time measurement.

The timer can be reset by setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B'01. These bits are set to B'00 on completion of normal resetting of the timer.

After the timer starts, the value in the gPTP timer increment register (GTI.TIV[27:0]) is added to the value of the gPTP timer every clock cycle.

Before setting a value in the gPTP timer increment register (GTI.TIV[27:0]), set the timer increment value setting request bit in the gPTP configuration control register (GCCR.LTI). If this bit is not set to 1, new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed.

An offset to the gPTP timer is also available. If this is required, set the value in the gPTP timer offset register (GTO.TOV[31:0]). Before setting a value in this register, set the timer offset value setting request bit in the gPTP configuration control register (GCCR.LTO). If this bit is not set to 1, new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed. When adding an offset, take care that it does not exceed 80 bits.

The value of the gPTP timer can be read from the gPTP timer capture register (GCTi.CTV[31:0]). Set the timer capture source select bits in the gPTP configuration control register (GCCR.TCSS[1:0]) to select the timer value for capture as the value of the gPTP timer, the corrected value of the gPTP timer (value with the offset added), or the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B'11 initiates the capture. Once normal

capture of the timer is complete, the value of the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) returns to B'00.

The timer for gPTP operates as a free-running timer but can be synchronized with the Grandmaster clock.

24.4.7.2 Free-Running Operation

The IEEE 802.1 AS standard for timing and synchronization does not prescribe the physical adjustment of local clocks to the Grandmaster clock. To avoid negative effects from the correction procedure, we recommend the use of a free-running timer.

As a free-running timer, the timer counts the local time in seconds or nanoseconds. The gPTP timer increment register (GTI.TIV[27:0]) is set to 1 ns (the setting value = H'0010 0000) and the gPTP timer offset register (GTOi.TOV[31:0]) is set to 0. The ratio information captured at the time of the gPTP delay measurement and synchronization procedures is used to correct the frequency ratio to that of the Grandmaster clock. The Grandmaster clock can be calculated from the local clock by using the information collected during the gPTP measurement and synchronization procedures.

24.4.7.3 Synchronization with the Grandmaster Clock

In situations requiring physical synchronization of the local clock with the Grandmaster clock, the fractional nanoseconds value (the 20 lower-order bits of the gPTP timer) is used to make the adjustment. Specifically, the increment value is finely adjusted to correct for deviations of the clock frequency from that of the Grandmaster clock.

Use the timer offset value (in the gPTP timer offset registers, GTOi.TOV[31:0]) to correct for offsets from the theoretical value (at start-up, etc.). The sum of the timer value and the offset register is the "corrected timer" value.

Note that for the nanoseconds part of the Offset register GTOi.TOV[31:0] should be below 10^9.

The following equation gives a method of calculating the increment (GTI.TIV[27:0]) from the frequency of the gPTP clock and its deviation from that of the Grandmaster clock. Variable d is the deviation ($d = 10^{-6}$ for 1 ppm).

$$\mathrm{GTI.TIV[27:0]} = \mathrm{round}\left(\frac{2^{20}\mathrm{GHz}}{f_{GPTP}} \times (1 + d)\right)$$

After adjusting for the current deviation of clock frequency, re-set the gPTP timer increment register (GTI.TIV[27:0]).

After calculating the new offset value, re-set the gPTP timer offset register (GTOi.TOV[31:0]).

24.4.7.4 Support Provided by the gPTP Timer in Transmission and Reception

The timer value described above is used in the time-stamp values captured when start frame delimiters are detected in reception and generated in transmission.

Captured time stamp values for received frames are stored in the corresponding descriptors. Those for transmitted frames are stored with tag information in the time-stamp FIFO. The time stamp values are thus correlated with both transmitted and received frames.

Note that the use of corrected timer values can introduce an error due to the offset correction in the gPTP synchronization procedure.

Errors due to the SDF notification and the asynchronous interface between the timer modules must also be taken into account.

24.4.8 Support for IEEE 1722

For IEEE 1722, the following two functions are supported.

- Output and capture of values in the IEEE 1722 AVTP (Audio/Video Transport Protocol) presentation time format
- Comparison of IEEE 1722 AVTP presentation time stamps

The 32-bit AVTP time stamp field of IEEE 1722 frames holds the AVTP presentation time when the AVTP time-stamp enable bit in the frame is 1. The AVTP time stamp field is generated from the gPTP timer and is given as seconds (gPTP_seconds) and nanoseconds (gPTP_nanoseconds) according to the following equation.

AVTP time stamp = (gPTP_seconds * 10^9 + gPTP_nanoseconds) modulo 2^{32}

The AVTP presentation time can be read from the gPTP timer capture register (GCTi.CTV[31:0]). Set the timer capture source select bits in the gPTP configuration control register (GCCR.TCSS[1:0]) to select the timer value for capture as the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B’11 initiates the capture. The value is obtained by adding the maximum transit time defined in the gPTP maximum transit time register (GMTT.MTTV[31:0]) to the corrected timer value. The AVTP presentation time wraps around approximately every four seconds.

CAUTION

The AVTP presentation time captured in GCTi.CTV[31:0] is only valid when the corrected timer value is in synchronization with the Grandmaster clock. That is, the timer increment and timer offset values for the corrected timer value must be adjusted during the synchronization procedure so that the corrected gPTP clock is physically adjusted to match the time kept by the Grandmaster clock.

24.4.9 Flow Control

The EthernetAVB does not support flow control in the specification. Flow control is only effective when transmitting and receiving normal (non-AVB) packets.

The E-MAC supports flow control for full-duplex operation in compliance with the IEEE 802.3 standards. This flow control is applicable to both reception and transmission. In regard to the transmission of PAUSE frames, flow control operates in the following ways.

(1) PAUSE Frame Transmission

PAUSE frames can also be transmitted in response to software operations. Writing a timer value to the manual PAUSE frame register (MPR) starts the transmission of a PAUSE frame. This only causes the transmission of one PAUSE frame.

(2) PAUSE Frame Reception

After reception of a PAUSE frame, transmission of the next frame does not proceed until the time indicated by the Timer value elapses. However, transmission of a frame currently being transmitted continues. PAUSE frames are only received while the RXF bit in the E-MAC mode register (ECMR) is set to 1. The number of received PAUSE frames is counted.

(3) PAUSE Frames with the Timer Value 0

The setting of the 0-time PAUSE frame enable bit (ECMR.ZPF) enables or disables the reception and transmission of PAUSE frames with the TIME parameter value 0.

- When control of PAUSE frames with the TIME parameter value 0 is enabled
  A PAUSE frame with the TIME parameter value 0 is transmitted when the capacity of the reception FIFO is less than the value of the overflow alert FIFO threshold register (FCFTR) while the time indicated by the TIME parameter value has not elapsed.
  Reception of a PAUSE frame with the TIME parameter value 0 leads to release from the transmission standby state.
- When control of PAUSE frames with the TIME parameter value 0 is disabled
  PAUSE frames with the TIME parameter value 0 are not transmitted. Received PAUSE frames with the TIME parameter value 0 are discarded.

(4) Back Pressure flow control

In half-duplex mode E-MAC uses back pressure for flow control. If receiver function is busy, then E-MAC transmit the imitate of collision frame and E-MAC stop the frame reception.

24.4.10 Magic Packet Detection

The E-MAC has a Magic Packet detection function. This function provides a facility for host devices and other sources to start other peripheral devices connected to a LAN. A peripheral device that handles Magic Packets starts itself in response to receiving a Magic Packet.

When a Magic Packet is detected, data from broadcast packets that were previously being received are stored in the FIFO and the E-MAC is notified of the receiving status. To return to normal operation from the associated interrupt processing, the E-MAC and AVB-DMAC must be initialized by using the operating mode configuration bit in the AVB-DMAC mode register (CCC.OPC[1:0]) to set the operating mode to reset mode.

The procedure for using the Magic Packet detection function with this LSI chip is as follows.

1. Use the various interrupt enabling and masking registers to disable the output of interrupts from interrupt sources.
2. Set the Magic Packet detection enable bit in the E-MAC mode register (ECMR.MPDE).
3. Set the Magic Packet detection interrupt enable bit in the E-MAC interrupt enable register (ECSIPR.MPDIP) to enable the interrupt.
4. Place the CPU in sleep mode and peripheral modules in module standby mode as required.
5. An interrupt is conveyed to the CPU on detection of a Magic Packet.

NOTE

The Magic Packet detection interrupt status can be read in the E-MAC status register (ECSR.MPD). The bit can be cleared by setting the E-MAC status register Magic Packet TM detection bit (ECSR.MPD) to 1.

24.4.11 Interrupts

The EthernetAVB module has three EI level interrupts from the AVB-DMAC and one EI level interrupt from the E-MAC.

Table 24.88 is a list of the interrupts and the relationships between EIINT interrupt channel numbers and source codes.

Table 24.88 EthernetAVB Interrupts

Interrupt Source Name	EIINT Interrupt Channel Number	Source Code
Transmit/receive data management interrupt	244	H'10F4
Error management interrupt	245	H'10F5
Other management (FIFO caution level, etc.) interrupt	246	H'10F6
E-MAC interrupt	247	H'10F7

The AVB-DMAC related interrupts include descriptor interrupts (15 sources), error interrupts (5 sources), reception interrupts (37 sources), transmission interrupts (2 sources), and gPTP interrupts (3 sources). From the CPU's perspective, each appears as one of the above four interrupt sources.

The states of an AVB-DMAC-related interrupt sources can be checked in the following registers.

- Descriptor interrupt status register (DIS)
- Error interrupt status register (EIS)
- Receive interrupt status register (RISi)
- Transmit interrupt status register (TIS)
- gPTP interrupt status register (GIS)

The interrupts are controlled by the corresponding interrupt enable bits. However, the status flags operate independently of the settings of the enable bits.

The states of grouped interrupts can only be checked by reading the interrupt summary status register (ISS) and the queue full error interrupt status bit in the error interrupt status register (EIS.QFS). This reduces the load on the CPU.

NOTE

Target of Descriptor interrupt or Receive interrupt is before address is shown by Current descriptor address register CDARq. There is a possibility CPU start operation before writing to memory for Descriptor interrupt or Receive interrupt.

24.4.11.1 Transmit/Receive Data Management Interrupt

The management interrupt for transmission and reception is conveyed when the interrupt conditions corresponding to the following sources are satisfied.

- Receive frame interrupt in the receive interrupt status register 0 (RIS0.FRFr)
- Descriptor interrupt in the descriptor interrupt status register (DIS.DPFi)

The general error interrupt state can be checked by reading the descriptor interrupt status bits in the interrupt summary status register (ISS.DPSi) or the receive FIFO warning interrupt summary bit (ISS.RFWS).

24.4.11.2 Error Management Interrupt

The error management interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

- Time stamp FIFO full interrupt in the error interrupt status register (EIS.TFFF)
- CBS limitation interrupts in the error interrupt status register (EIS.CULF1, EIS.CULF0, EIS.CLLF1, EIS.CLLF0)
- Receive FIFO full interrupt in the receive interrupt status register 2 (RIS2.RFFF)
- Receive queue full interrupt in the receive interrupt status register 2 (RIS2.QFFr)

The general error interrupt state can be checked by reading the error interrupt summary bit in the interrupt summary status register (ISS.ES).

24.4.11.3 Other Management (FIFO Warning, etc.) Interrupts

The other management (FIFO warning, etc.) interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

(1) Reception related interrupt

Receive FIFO warning interrupt in the receive interrupt status register 1 (RIS1.RFWF)

(2) Transmission related interrupts

Time stamp FIFO warning interrupt in the transmit interrupt status register (TIS.TSWF)

Time stamp FIFO update interrupt in the transmit interrupt status register (TIS.TSUF)

(3) gPTP related interrupts

AVTP presentation target match interrupt in the gPTP interrupt status register (GIS.PTMF)

The general error interrupt state can be checked by reading the receive FIFO warning error interrupt status bit in the interrupt summary status register (ISS.RFWS), the time stamp FIFO warning interrupt status bit (ISS.TFWS), and the time stamp FIFO update interrupt status bit (ISS.TFUS).

24.4.11.4 E-MAC Interrupt

The E-MAC interrupt is conveyed when the E-MAC interrupt source is generated.

The general error interrupt state can be checked by reading the E-MAC interrupt summary bit in the interrupt summary status register (ISS.MS).

24.4.12 Flows of Operations

24.4.12.1 Flow of E-MAC Initialization

24.4.13.3 Accessing MII Registers

MII registers in the PHY-LSI are accessed via PIR in this LSI. PIR is used as a serial interface conforming to the MII frame format specified in IEEE802.3u.

(1) MII Management Frame Format

Figure 24.75 shows the format of an MII management frame. To access an MII register, a management frame is implemented by the program in accordance with the procedures shown in MII Register Access Procedure.

Access Type	MII Management Frame							
Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
Number of bits	32	2	2	5	5	2	16	
Read	1..1	01	10	00001	RRRRR	Z0	D..D	
Write	1..1	01	01	00001	RRRRR	10	D..D	X

[Legend]

PRE: 32 consecutive 1s
ST: Write of 01 indicating start of frame
OP: Write of code indicating access type
PHYAD: Write of 0001 if the PHY-LSI address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI address.
REGAD: Write of 000q if the register address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI register address.
TA: Time for switching data transmission source on MII interface
(a) Write: 10 written
(b) Read: Bus release (notation: Z0) performed
DATA: 16-bit data. Sequential write or read from MSB
(a) Write: 16-bit data write
(b) Read: 16-bit data read
IDLE: Wait time until next MII management format input
(a) Write: Independent bus release (notation: X) performed
(d) Read: Bus already released in TA: control unnecessary

Figure 24.75 MII Management Frame Format

(2) MII Register Access Procedure

The program accesses MII registers via PIR. Access is implemented by a combination of 1-bit-unit data write, 1-bit-unit data read, bus release, and independent bus release. **Figure 24.76** to **Figure 24.79** show the MII register access timing. The timing will differ depending on the PHY-LSI type.

24.4.14 Usage Notes

24.4.14.1 Checksum Calculation of Ethernet Frames

This LSI is capable of calculating the checksum data of the received frames. Only the data fields of the Ethernet frames are subject to checksum calculation. Specifically, a data field follows the length/type field and is followed by the CRC field. **Figure 24.80** shows schematics indicating which parts of the Ethernet frames are calculated. Calculation involves 16-bit addition only; it does not involve bit inversion. Note that when the checksum data is valid, the CRC data (4 bytes) is not transferred as a receive frame, and the checksum data (sum data) is added automatically. **Figure 24.81** shows schematics of Ethernet frames to which the checksum data has been added.

CAUTION

Also for the frames with VLANtag inserted, the 15th byte from the top and the following bytes before the CRC field are subject to calculation.

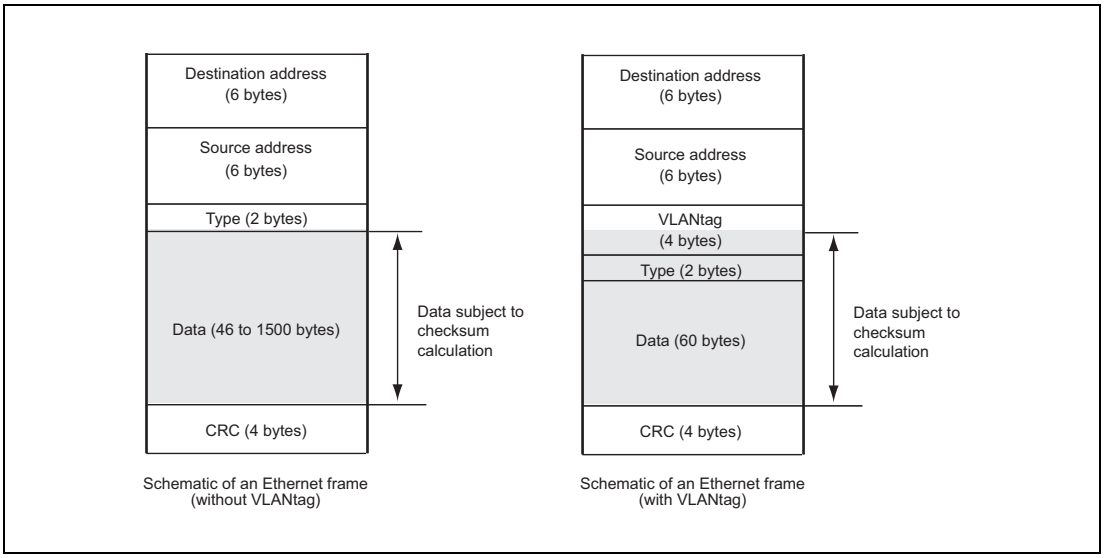

Figure 24.80 Data Subject to Checksum Calculation

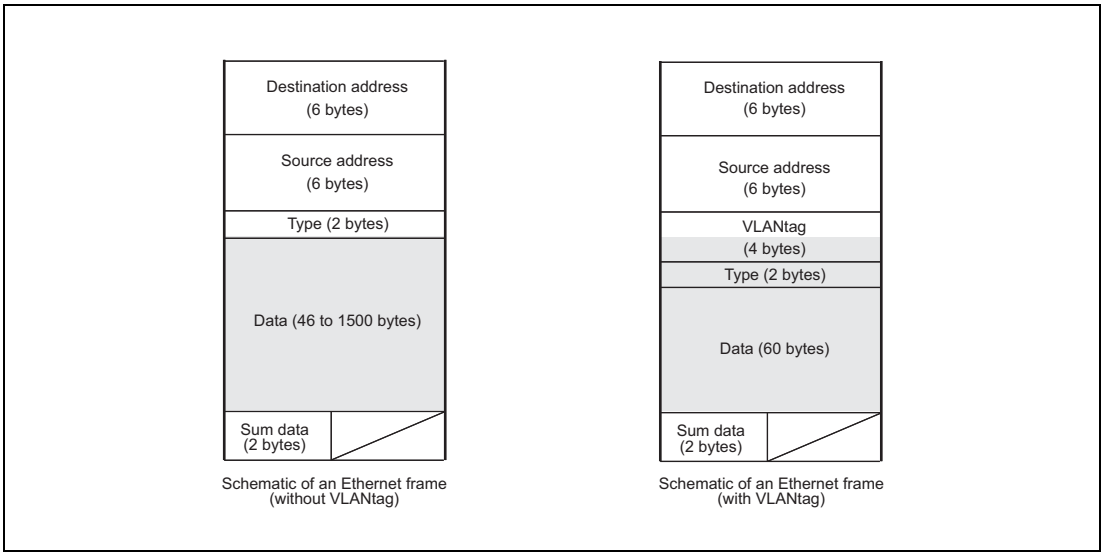

Figure 24.81 Data after Checksum Data Addition

24.4.14.2 Notes on Using the Intelligent Checksum Function

Checksum calculation using the intelligent checksum function is not affected by padding insertion specified by the receive data padding insert register (RPADIR). This is because checksum calculation is performed when transferring receive data from E-MAC to AVB-DMAC, while padding of receive data is performed when transferring receive data from AVB-DMAC to the receive buffer in memory.

24.4.14.3 Rx-FIFO read error may not be flagged when using FEMPTY_ND descriptor

After reading last byte targeted to FEMPTY_ND descriptor, there can be up to 3 bytes read from Rx-FIFO targeting next descriptor of same frame. Rx-FIFO read errors of not stored data due to FEMPTY_ND are neither flagged in DESCR.EI nor by EIS.QEF as per target specification.

When external ECC/parity logic flags Rx-FIFO read error related to last byte targeted to FEMPTY_ND descriptor, data in next descriptor may be corrupted without notification.

The issue is limited to implementations where Rx-FIFO error information is provided to ETNB and to applications using FEMPTY_ND descriptor.

The issue only occurs when the first byte saved in descriptor following FEMPTY_ND is not a multiple of 4 bytes inside the received frame.

Use a FEMPTY descriptor to store unwanted data if consistent error flagging is required.

24.4.14.4 When trying to release non-existing timestamp FIFO entry, new FIFO update flag may be lost

When SW releases an entry of timestamp FIFO by writing TCCR.TFR while this FIFO is empty (TSR.TFFL[2:0] is 000_B), flagging of next FIFO update may be inconsistent. The next timestamp is correctly stored in FIFO and fill level is incremented to 1 but TIS.TFUF is not set to 1.

The issue is limited to applications releasing FIFO entries without checking if there are entries available.

Do not release not existing FIFO entries.

24.4.14.5 gPTP compare may fail for range of compare values

When the comparison value (GPTC.PTCV[31:0]) is in range of [x-1 to x+1] (x is the configured increment value in GTI.TIV[27:0]), it may happen that a comparison match is not detected when Timer wraps around.

The issue is limited to applications using AVPT comparison function.

Do not configure comparison values inside the critical range.

24.4.14.6 UFC stop level triggers RIS2.QFFr even no received frame is lost

When a received frame is dropped due to non-availability of empty descriptor, RIS2.QFFr is correctly set to 1.

Additionally, when UFCVi.CVr reached the configured stop level (UFCS.SLj), the queue full flag (RIS2.QFFr) is set to 1 even before any further received frame is dropped.

The issue is limited to applications using unread frame counter with stop level function.

Such application gets information about lost received frames which in fact might not have lost.

24.4.14.7 RIS0.FRFr may lost when data processing stops close below configured warning level

When SW decrements UFC counter value (CV) to WL-1, resulting CV can still be WL due to recent new storage completion, RIS0.FRFr is set to 0.

Any further reception will set RIS0.FRFr as normal.

The issue is limited to applications using a single frame interrupt triggered by RIS0.FRFr and not be able to process each interrupt in time.

The missing interrupt due to this effect is automatically recovered by next frame reception as usual.

24.4.14.8 Receive frame interrupt and descriptor interrupt may be issued before completion of writing data

When receive frame interrupt is issued, the software should check that the descriptor type is updated correctly before processing the frame data.

The descriptor type is shown in the descriptor field DESCR.DT (the address of the current descriptor is shown by the register CDARq). If DESCR.DT is not yet updated by the DMA hardware (e.g. from FEMPTY to FEND), then the write of data to the memory is not completed. In that case the software should repeat checking the descriptor type until an update has happened.

Alternatively the software can use the Unread Frame Counter (UFC) value to compare with its processed descriptors to confirm there is no missing descriptor from the last received interrupt.

Section 25 Media Local Bus Interface (MLBB)

This section contains the block diagram and a list of all MLBB registers.
For detailed information about the functionality and the registers, refer to the document:

"OS62420 Media LB Device Interface Macro Advanced Product Data Sheet"

Document number OS62420AP2

OASIS SiliconSystems

The RH850/D1L/D1M implements the V1.4 of the Media Local Bus module.

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.

25.1 Overview of RH850/D1L/D1M Media Local Bus (MLBB)

25.1.1 Units

This microcontroller has the following number of units of the Media Local Bus (MLBB).

Table 25.1 Units

Media Local Bus (MLBB)	D1L1	D1L2(H)	D1M1(H) D1M1-V2 D1M1A	D1M2	D1M2H
Units	0	0	0	0	1
Names	–	–	–	–	MLBB0

Units index n

Throughout this section, the individual units of a Medial Local Bus are identified by the index "n" (n = 0), for example, MLBBnMLBC0 for the MLBBn control 0 register.

25.1.2 Buffer RAM

The Media Local Bus Interface is equipped with following RAMs:

- channel table RAM: 128 x 144 bit
- MLBB data buffer RAM: 8 x 16 Kbit

25.1.3 Register addresses

All Media Local Bus register addresses are given as address offsets from the individual base addresses <MLBBn_base>.
The <MLBBn_base> addresses of each MLBBn are listed in the following table:

Table 25.2 Register base addresses <MLBBn_base>

MLBBn unit	<MLBBn_base> address
MLBB0	FFDE 1000_H

25.1.4 Clock supply

All Media Local Bus Interfaces provide two clock inputs.

Table 25.3 Clock supply

MLBBn unit	MLBBn clock	Connected to
MLBB0	sys_clk	• Clock Controller C_ISO_MLBB
	HCLK	• Clock Controller MLBBXCCLK
	PCLK	• Clock Controller MLBBPCLK

25.1.5 Interrupts

The Media Local Bus Interface can generate the following interrupt requests:

Table 25.4 MLBBn interrupt requests

MLBBn signals	Function	Connected to
MLBB0:		
mlb_int	MediaLB system interrupt	Interrupt Controller INTMLBB0SYS
ahb_int[0]	HBUS error interrupts	Interrupt Controller INTMLBB0STA0
ahb_int[1]		Interrupt Controller INTMLBB0STA1

25.1.6 Reset sources

The Media Local Bus Interfaces and their registers are initialized by the following reset signal:

Table 25.5 Reset sources

MLBBn unit	Reset signal
MLBB0	• Reset Controller SYSRES • Reset Controller MLBB0RES • Reset upon wake-up from DEEPSTOP mode

CAUTION

By default the MLBB0RES reset is active.
Thus before accessing this module this reset must be released via the MRSTC register of the Reset Controller. Refer to Section 9, Reset Controller for details.

25.1.7 I/O signals

The following table shows the I/O signals of the Media Local Bus Interface.

Table 25.6 MLBBn I/O signals

MLBBn signals	Function	Connected to
MLBB0		
MLBCLK_IN	Clock input	Port MLBB0CLK
MLBDAT_IO	Data input/output	Port MLBB0DAT
MLBSIG_IO	Signal input/output	Port MLBB0SIG

25.1.8 Bus master ID

The Media Local Bus I/F bus master interface is connected to the XC1 cross-connect system. The master interface has the following master ID:

MLBB0: MSTID7

25.2 Functional Overview

In the following only the block diagram and a list of registers is given.

For detailed information about the functionality and the registers, refer to the document:

"OS62420 Media LB Device Interface Macro Advanced Product Data Sheet"

Document number OS62420AP2

OASIS SiliconSystems

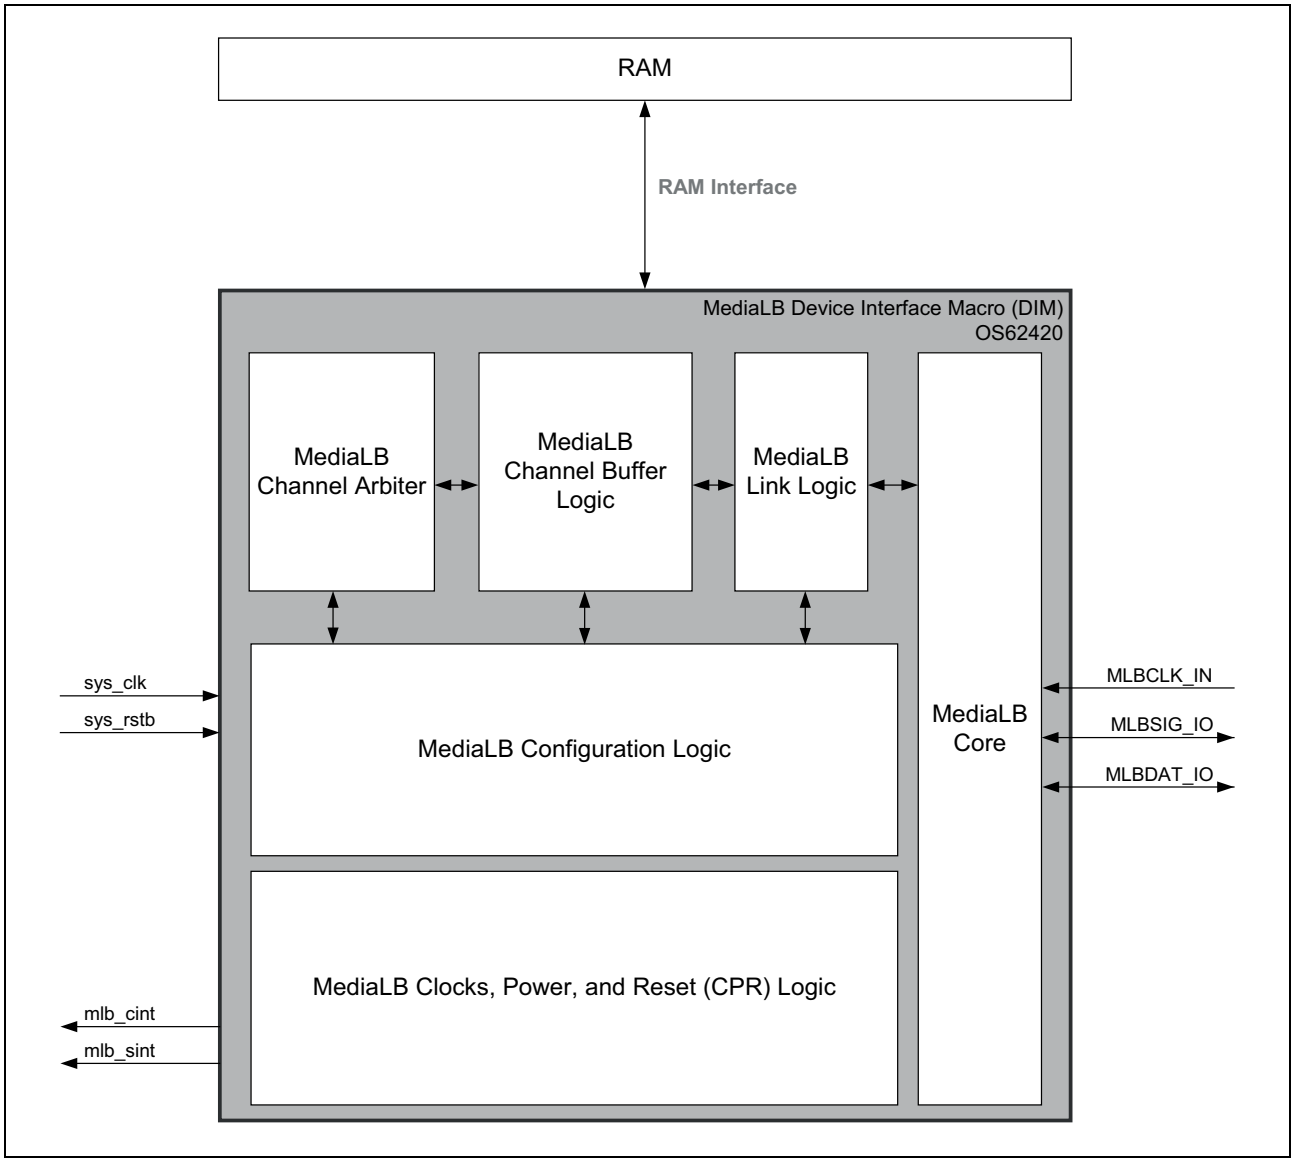

Figure 25.1 Block diagram of the Media Local Bus Interface

25.3 MLBn registers overview

This section contains a list of all registers of the Media Local Bus.

The Media Local Bus is controlled and operated by the following registers:

Table 25.7 MLBBn register overview

Module Name	Register name	Symbol	Address
MLBBn	MLBC0 MediaLB Control 0 Register	MLBC0	<MLBBn_base> + 000
MLBBn	MLBPC0 MediaLB 6-pin Control 0 Register	MLBPC0	<MLBBn_base> + 008
MLBBn	MS0 MediaLB Channel Status 0 Register	MS0	<MLBBn_base> + 00C
MLBBn	MS1 MediaLB Channel Status 1 Register	MS1	<MLBBn_base> + 014
MLBBn	MSS MediaLB System Status Register	MSS	<MLBBn_base> + 020
MLBBn	MSD MediaLB System Data Register (Read-	MSD	<MLBBn_base> + 024
MLBBn	MIEN MediaLB Interrupt Enable Register	MIEN	<MLBBn_base> + 02C
MLBBn	MLBPC2 MediaLB 6-pin Control 2 Register	MLBPC2	<MLBBn_base> + 034
MLBBn	MLBPC1 MediaLB 6-pin Control 1 Register	MLBPC1	<MLBBn_base> + 038
MLBBn	MLBC1 MediaLB Control 1 Register	MLBC1	<MLBBn_base> + 03C
MLBBn	HCTL HBI Control Register	HCTL	<MLBBn_base> + 080
MLBBn	HCMR0 HBI Channel Mask 0 Register	HCMR0	<MLBBn_base> + 088
MLBBn	HCMR1 HBI Channel Mask 1 Register	HCMR1	<MLBBn_base> + 08C
MLBBn	HCER0 HBI Channel Error 0 Register	HCER0	<MLBBn_base> + 090
MLBBn	HCER1 HBI Channel Error 1 Register	HCER1	<MLBBn_base> + 094
MLBBn	HCBR0 HBI Channel Busy 0 Register	HCBR0	<MLBBn_base> + 098
MLBBn	HCBR1 HBI Channel Busy 1 Register	HCBR1	<MLBBn_base> + 09C
MLBBn	MDAT0 MIF Data 0 Register	MDAT0	<MLBBn_base> + 0C0
MLBBn	MDAT1 MIF Data 1 Register	MDAT1	<MLBBn_base> + 0C4
MLBBn	MDAT2 MIF Data 2 Register	MDAT2	<MLBBn_base> + 0C8
MLBBn	MDAT3 MIF Data 3 Register	MDAT3	<MLBBn_base> + 0CC
MLBBn	MDWE0 MIF Data Write Enable 0 Register	MDWE0	<MLBBn_base> + 0D0
MLBBn	MDWE1 MIF Data Write Enable 1 Register	MDWE1	<MLBBn_base> + 0D4
MLBBn	MDWE2 MIF Data Write Enable 2 Register	MDWE2	<MLBBn_base> + 0D8
MLBBn	MDWE3 MIF Data Write Enable 3 Register	MDWE3	<MLBBn_base> + 0DC
MLBBn	MCTL MIF Control Register	MCTL	<MLBBn_base> + 0E0
MLBBn	MADR MIF Address Register	MADR	<MLBBn_base> + 0E4
MLBBn	ACTL AHB Control Register	ACTL	<MLBBn_base> + 3C0
MLBBn	ACSR0 AHB Channel Status 0 Register	ACSR0	<MLBBn_base> + 3D0
MLBBn	ACSR1 AHB Channel Status 1 Register	ACSR1	<MLBBn_base> + 3D4
MLBBn	ACMR0 AHB Channel Mask 0 Register	ACMR0	<MLBBn_base> + 3D8
MLBBn	ACMR1 AHB Channel Mask 1 Register	ACMR1	<MLBBn_base> + 3DC

<MLBBn_base>

The base addresses <MLBBn_base> of the MLBBn is defined in the first section of this chapter under the key word “Register addresses”.

NOTE

In the header files the names of the above registers are defined in the following format:

<ModuleName> + <Symbol>.

<ModuleName> and <Symbol> are defined in the above table.

Section 26 Window Watchdog Timer (WDTA)

This section contains a generic description of the Window Watchdog Timer (WDTA).

The first part of this section describes all RH850/D1L/D1M specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of WDTA.

26.1 Features of RH850/D1L/D1M WDTA

26.1.1 Number of Units and Channels

This microcontroller has the following number of WDTA units.

Table 26.1 Number of Units

Product Name	All products
Number of Units	2
Name	WDTAn (n = 0, 1)

Table 26.2 Index

Index	Meaning
n	Throughout this section, the individual window watchdog timer units are identified by the index “n”: for example, WDTAnWDTE (n = 0, 1) is the WDTAn enable register.

26.1.2 Register Base Addresses

WDTAn base addresses are listed in the following table.

WDTAn register addresses are given as offsets from the base addresses in general.

Table 26.3 Register Base Addresses

Base Address Name	Base Address
<WDTA0_base>	FFED 0000_H
<WDTA1_base>	FFED 1000_H

26.1.3 Clock Supply

The WDTAn clock supply is shown in the following table.

Table 26.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
WDTA0	PCLK	Clock Controller • C_ISO_PCLK in RUN mode • EMCLK in DEEPSTOP mode
	WDTATCKI	Clock Controller C_AWO_WDTA0
WDTA1	PCLK	Clock Controller C_ISO_PCLK
	WDTATCKI	Clock Controller $f_{RL}/4$

26.1.4 Interrupt Request and Error Signals

WDTAn interrupt requests and error signals are listed in the following table.

Table 26.5 WDTAn interrupt requests and error signals

WDTAn signals	Function	Connected to
WDTA0:		
WDTA0TRES	WDTA0 error reset	Reset Controller WDTA0RES
WDTA0TNMI	WDTA0 error NMI	Error Control Module INTWDTA0NMI
INTWDTA0	WDTA0 75% interrupt	Interrupt Controller INTWDTA0
WDTA1:		
WDTA1TRES	WDTA1 error reset	Reset Controller WDTA1RES
WDTA1TNMI	WDTA1 error NMI	Error Control Module INTWDTA1NMI
INTWDTA1	WDTA1 75% interrupt	Interrupt Controller INTWDTA1

26.1.5 Reset Sources

WDTAn reset sources are listed in the following table. WDTAn is initialized by these reset sources.

Table 26.6 Reset Sources

Unit Name	Reset Source
WDTA0	• Reset Controller SYSRES
WDTA1	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

26.1.6 WDTATRTYP

The connection of the WDTA reset type input signals are listed in the table below.

Table 26.7 WDTARTYPE connections

WDTAn unit	WDTAn signals	Connected to
WDTA0	WDTATRTYP	Reset Controller WDTATRTYP
WDTA1		

CAUTION

Confliction of resets

A reset conflict may occur if a reset is asserted before another already active reset is released.

Table 26.8 Conflict factors

		Second asserted			
		PURES, POC1RES		Any except PURES, POC1RES	
		WDTATRTYP	Start mode	WDTATRTYP	Start mode
First asserted	PURES, POC1RES	0	Software trigger	0	Software trigger
	Any except PURES, POC1RES	0	Software trigger*1	1	Default (except ISORES)

Note 1. – While $\overline{\text{RESET}}$, $\overline{\text{CLMA0RES}}$, WDTA0RES, WDTA1RES, SWRES, ECMRES, ISORES is asserted, POC0RES is asserted and released within 15 µs:
WDTATRTYP = 1, start mode is default
– While $\overline{\text{RESET}}$, $\overline{\text{CLMA0RES}}$, WDTA0RES, WDTA1RES, SWRES, ECMRES, ISORES asserted, POC0RES is asserted and released after 15 µs:
WDTATRTYP = 0, start mode is Software trigger

26.2 Overview

26.2.1 Functional Overview

WDTA has the following functions:

- Selection of the operation mode after reset, by using the option bytes

Enabling/disabling of WDTA, starting/stopping of the counter after reset, setting of the counter overflow time, and enabling/disabling of the VAC function can be selected. WDTA startup options to be set by the option bytes are described in **Table 26.9**.

- WDTA trigger function

Writing an activation code to the WDTA trigger register starts WDTA and restarts the counter. Activation codes include fixed activation codes and variable activation codes (VAC function). In a variable activation code, a different value from the previous time (variable value) is written to the WDTA trigger register, which causes the counter to be restarted.

- Interrupt request generation at 75% of the counter overflow value

An interrupt request signal can be generated when the WDTA counter reaches 75% of the overflow interval time (this function can be enabled or disabled by the setting of WDTAnMD.WDTAnWIE).

- Window function

The period during which writing to the WDTA trigger register is valid (window-open period) can be set. Writing to the WDTA trigger register at a time outside the window-open period causes an error.

- WDTA error detection function

When an error is detected, a non-maskable interrupt request or an internal reset is generated.

For details about the error sources, see Section 26.5.3, WDTA Error Detection.

NOTE

The WDTA0 (operating on the AWO area) continues its operation also in the DEEPSTOP mode.
There is no configuration option to change this behaviour.

Table 26.9 WDTA start-up options

Start-up option	Function	Description	Connected to
OPWDEN	WDTA enable/disable	Enables/disables the WDTA: 0: WDTA is disabled 1: WDTA is enabled	• WDTA0: flash option OPBT0.WDT0OPWDEN • WDTA1: flash option OPBT0.WDT1OPWDEN
OPWDOVF[2:0]	Overflow interval time reset value setting	Specifies the reset value of the overflow interval time control bits WDTAnMD.WDTAnOVF[2:0].	• WDTA0: flash option OPBT0.WDT0OPWDOVF[2:0] • WDTA1: flash option OPBT0.WDT1OPWDOVF[2:0]
OPWDTPR	Start mode signal selector	Specifies the signal that sets the start mode: 0: OPWDRUN start-up option 1: WDTATRTYP input signal If WDTATRTYP is selected (OPWDTPR = 1), the start mode depends on the reset type. Refer to Section 26.5.1, WDTA after Reset Release for details.	• WDTA0: flash option OPBT0.WDT0OPWDTPR • WDTA1: flash option OPBT0.WDT1OPWDTPR
OPWDRUN	Start mode setting	Specifies the start mode: 0: Software trigger start mode 1: Default start mode Refer to Section 26.5.1, WDTA after Reset Release for details.	• WDTA0: flash option OPBT0.WDT0OPWDRUN • WDTA1: flash option OPBT0.WDT1OPWDRUN
OPWDVAC	Variable Activation Code (VAC) selection	Specifies the trigger register for the generation of counter re-start triggers to keep the counter from overflowing. 0: WDTAnWDTE (fixed) 1: WDTAnEVAC (variable) When WDTAnWDTE is selected, the value to be written to the register (activation code) is fixed (AC_H). When WDTAnEVAC is selected, the activation code to be written to the register is variable. For details, refer to 26.5.2.1, Calculating an Activation Code when the VAC Function is Used.	• WDTA0: flash option OPBT0.WDT0OPWDVAC • WDTA1: flash option OPBT0.WDT1OPWDVAC

26.2.2 Block Diagram

Figure 26.1 shows the main components of the WDTA.

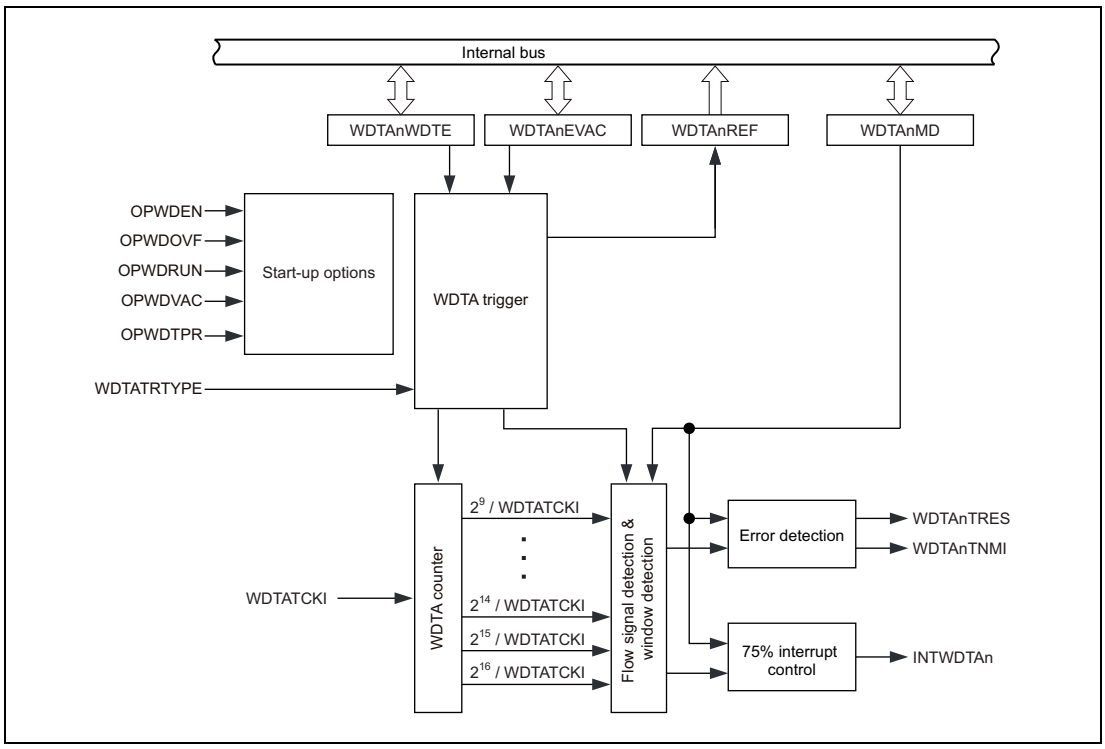

Figure 26.1 Block Diagram of the Window Watchdog Timer A

26.3 Registers

26.3.1 List of Registers

WDTAn registers are listed in the following table.

For details about <WDTAn_base>, see Section 26.1.2, Register Base Addresses.

Table 26.10 Registers

Module	Register	Symbol	Address
WDTAn	WDTA enable register	WDTAnWDTE	<WDTAn_base> + 0000_H
WDTAn	WDTA enable VAC register	WDTAnEVAC	<WDTAn_base> + 0004_H
WDTAn	WDTA reference value register	WDTAnREF	<WDTAn_base> + 0008_H
WDTAn	WDTA mode register	WDTAnMD	<WDTAn_base> + $000C_H$

26.3.2 WDTAnWDTE — WDTA Enable Register

This register is the WDTA trigger register when the VAC function is not used (start-up option OPWDVAC = 0).

Writing AC_H to this register generates a WDTA trigger and starts or restarts the WDTA counter. See Section 26.5.2, WDTA Trigger, for details.

The behavior of this register depends on the setting of the start-up option OPWDVAC, see Table 26.13, WDTAnWDTE Behavior.

Access: This register can be read/written in 8-bit units.

Address: <WDTAn_base> + 0000_H

Value after reset: The initial value depends on the start-up options OPWDEN, OPWDVAC, OPWDTPR, OPWDRUN, and the WDTATRTYP signal. Refer to Table 26.12, Values of WDTAnRUN7 after Reset.
WDTA0 is initialized by SYSRES.
WDTA1 is initialized by SYSRES and wake-up from DEEPSTOP mode.

Bit	7	6	5	4	3	2	1	0
	WDTAnRUN[7:0]							
Value after reset	0/1	0	1	0	1	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.11 WDTAnWDTE Register Contents

Bit Position	Bit Name	Function
7 to 0	WDTAnRUN [7:0]	Writing the fixed activation code (AC_H) generates the WDTA trigger and starts/restarts the WDTAn counting. Writing the value other than AC_H generates an error. The WDTAn cannot be stopped once it was started. See **Table 26.13, WDTAnWDTE Behavior**, when reading from or writing to these bits.

The WDTAnRUN7 bit is only valid if WDTA is enabled (OPWDEN = 1) and the VAC function is disabled (OPWDVAC = 0). **Table 26.12** lists the values of the WDTAnRUN7 bit after reset according to the start-up options.

Table 26.12 Values of WDTAnRUN7 after Reset

Start-up options				Reset type signal WDTATRTYP	Start Mode	Value of WDTAnRUN7 after Reset
OPWDEN	OPWDVAC	OPWDTPR	OPWDRUN			
0	Ignored	Ignored	Ignored	Ignored	WDTA is disabled	0
1	1	Ignored	Ignored	Ignored	Not valid (VAC mode)	0
	0	0	0	Ignored	Software trigger start	0
			1		Default start	1
		1	0	Ignored	Software trigger start	0
			1	0	Software trigger start	0
				1	Default start	1

The behavior of WDTAnWDTE during read/write accesses depends on the OPWDVAC setting, as shown in Table 26.13, WDTAnWDTE Behavior.

Table 26.13 WDTAnWDTE Behavior

		WDTAnWDTE	
OPWDVAC	**Description**	**Read**	**Write**
0	The VAC function is disabled. WDTAnWDTE is enabled.	$2C_H$ is read (in software trigger start mode, before the activation of WDTAn). AC_H is read (after the activation of WDTAn).	WDTA trigger Write AC_H *1.
1	The VAC function is enabled. WDTAnWDTE is disabled.	$2C_H$ is read.	Writing is ignored.

Note 1. Any other write value will cause an error.

26.3.3 WDTAnEVAC — WDTA Enable VAC Register

This register is the WDTA trigger register when the VAC function is used (start-up option OPWDVAC = 1).

Writing a correct activation code to this register generates a WDTA trigger and starts or restarts the WDTA counter. For details, see Section 26.5.2, WDTA Trigger. For details about the activation codes when the VAC function is used, see Section 26.5.2.1, Calculating an Activation Code when the VAC Function is Used.

The behavior of this register depends on the setting of the start-up option OPWDVAC. See Table 26.16, WDTAnEVAC Behavior.

Access: This register can be read/written in 8-bit units.

Address: <WDTAn_base> + 0004_H

Value after reset: The initial value depends on the start-up options OPWDEN, OPWDVAC, OPWDTPR, OPWDRUN, and the WDTATRTYP signal. Refer to Table 26.15, Values of WDTAnEVAC7 after Reset.
WDTA0 is initialized by SYSRES.
WDTA1 is initialized by SYSRES and wake-up from DEEPSTOP mode.

Bit	7	6	5	4	3	2	1	0
	WDTAnEVAC[7:0]							
Value after reset	0/1	0	1	0	1	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.14 WDTAnEVAC Register Contents

Bit Position	Bit Name	Function
7 to 0	WDTAnEVAC [7:0]	Writing an variable activation code generates the WDTA trigger and starts/restarts the WDTAn counting. Writing a wrong activation code generates an error. The WDTAn cannot be stopped once it was started. See Table 26.16, WDTAnEVAC Behavior, when reading from or writing to these bits.

The WDTAnEVAC7 bit is only valid if WDTA is enabled (OPWDEN = 1) and the VAC function is enabled (OPWDVAC = 1). **Table 26.15** lists the values of the WDTAnEVAC7 bit after reset according to the start-up options.

Table 26.15 Values of WDTAnEVAC7 after Reset

Start-up options				Reset type signal		Value of WDTAnEVAC7 after Reset
OPWDEN	OPWDVAC	OPWDTPR	OPWDRUN	WDTATRTYP	Start Mode	
0	Ignored	Ignored	Ignored	Ignored	WDTA is disabled	0
1	0	Ignored	Ignored	Ignored	Not valid (non VAC mode)	0
	1	0	0	Ignored	Software trigger start	0
			1		Default start	1
		1	0	Ignored	Software trigger start	0
			1	0	Software trigger start	0
				1	Default start	1

The behavior of WDTAnEVAC during read/write accesses depends on the OPWDVAC setting, as shown in **Table 26.16**.

Table 26.16 WDTAnEVAC Behavior

		WDTAnEVAC	
OPWDVAC	**Description**	**Read**	**Write**
0	The VAC function is disabled. WDTAnEVAC is disabled.	$2C_H$ is read.	Writing is ignored.
1	The VAC function is enabled. WDTAnEVAC is enabled.	$2C_H$ is read (in software trigger start mode, before the activation of WDTAn). The variable activation code written last is read (after the activation of WDTAn).	Write the variable activation code*1 For details, see **Section 26.5.2.1, Calculating an Activation Code when the VAC Function is Used**.

Note 1. Any other write value will cause an error.

26.3.4 WDTAnREF — WDTA Reference Value Register

This register contains the reference value for calculating the activation code of the VAC function. It is automatically updated after every trigger operation. See Section 26.5.2.1, Calculating an Activation Code when the VAC Function is Used.

If the VAC function is disabled (OPWDVAC = 0), reading this register returns 00_H.

Access: This register can only be read in 8-bit units.

Address: <WDTAn_base> + 0008_H

Value after reset: 00_H
WDTA0 is initialized by SYSRES.
WDTA1 is initialized by SYSRES and wake-up from DEEPSTOP mode.

Bit	7	6	5	4	3	2	1	0
	WDTAnREF[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 26.17 WDTAnREF Register Contents

Bit Position	Bit Name	Function
7 to 0	WDTAnREF[7:0]	Reference value for activation code calculation for the VAC function

26.3.5 WDTAnMD — WDTA Mode Register

This register specifies the overflow interval time, the 75% interrupt enable/disable, the error mode, and the window-open period.

The value of this register can be updated only once after reset release and before the first trigger is generated. The updated value will be effective after a maxium of 3 × Timer count clock cycles since the WDTA trigger register is written to.

Updating this register after the first WDTA trigger is generated causes an error, but an error does not occur if the same value has been written to it.

Access: This register can be read/written in 8-bit units.

Address: <WDTAn_base> + $000C_H$

Value after reset: The initial value depends on the start-up options OPWDOVF[2:0]. See Table 26.9, WDTA start-up options.
WDTA0 is initialized by SYSRES.
WDTA1 is initialized by SYSRES and wake-up from DEEPSTOP mode.

Bit	7	6	5	4	3	2	1	0
	—	WDTAnOVF[2:0]			WDTAnWIE	WDTAnERM	WDTAnWS[1:0]	
Value after reset	0	*1	*1	*1	1	1	1	1
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The WDTAnOVF[2:0] value after reset can be set by the start-up options OPWDOVF[2:0].

Table 26.18 WDTAnMD Register Contents (1/2)

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
6 to 4	WDTAnOVF[2:0]	Selects the overflow interval time:
3	WDTAnWIE	Enables/disables the 75% interrupt request INTWDTAn. 0: INTWDTAn disabled 1: INTWDTAn enabled
2	WDTAnERM	Specifies the error mode. 0: NMI request mode 1: Reset mode

WDTAn OVF2	WDTAn OVF1	WDTAn OVF0	Overflow Interval Time
0	0	0	2^9 / WDTATCKI
0	0	1	2^{10} / WDTATCKI
0	1	0	2^{11} / WDTATCKI
0	1	1	2^{12} / WDTATCKI
1	0	0	2^{13} / WDTATCKI
1	0	1	2^{14} / WDTATCKI
1	1	0	2^{15} / WDTATCKI
1	1	1	2^{16} / WDTATCKI

Table 26.18 WDTAnMD Register Contents (2/2)

Bit Position	Bit Name	Function
1, 0	WDTAnWS[1:0]	Selects the window-open period.

WDTAn WS1	WDTAn WS0	Window-Open Period
0	0	25%
0	1	50%
1	0	75%
1	1	100%

26.4 Interrupt Sources

WDTA detects the status of the WDTA counter value or illegal accesses to the WDTA-related registers, and generates an interrupt request. The following are WDTA interrupt requests:

(1) INTWDTAn (WDTA timer count 75% interrupt request)BodyBracketNum
An interrupt request signal is generated at 75% of the counter overflow time of the WDTA timer. An interrupt request signal can be set to be enabled or disabled by using the WDTA mode register (WDTAnMD).

(2) WDTAnTNMI (WDTA error detection interrupt)
Detection of a WDTA error to generation of an NMI interrupt request. The WDTA mode register (WDTAnMD) can be used to switch an NMI interrupt and a reset. For details about WDTA errors, see Section 26.5.3, WDTA Error Detection.

26.5 Functions

26.5.1 WDTA after Reset Release

26.5.1.1 Start Modes

There are two start modes (software start mode and default start mode) when WDTAn starts after reset release. The start mode can be selected by the start-up option OPWDRUN.

The start mode selection is listed in **Table 26.19**.

Table 26.19 Start Mode Selection

Start-Up Options OPWDRUN	Start Mode	Description
0	Software trigger	• The WDTA counter stops (0000_H) after reset release. • Writing an activation code to the WDTA trigger register starts WDTA.
1	Default	The WDTA counter starts after reset release.

26.5.1.2 Start mode selection

The start mode can be selected as follows:

- By start-up options
- By the WDTATRTYP input signal
  This signal indicates the reset type. Thus, the selected start mode after reset release depends on the

reset type.

The start mode selection is listed in the following table.

Table 26.20 Start mode selection

Start-up options		Input signal		
OPWDTPR	**OPWDRUN**	**WDTATRTYP**	**Reset type**	**Start mode**
0	0	Ignored	Ignored	Software trigger
	1			Default
1	0	Ignored	Ignored	Software trigger
	1	0	PURES*1*2 POC1RES ISORES(WDTA1)*3	Software trigger
		1	Any except PURES, POC1RES, ISORES(WDTA1)*2	Default

Note 1. PURES is asserted by power-up or debugger reset.

Note 2. Refer to Section 26.1.6, WDTATRTYP for reset conflict cases.

Note 3. ISORES does not reset WDTA0.
In case default start mode needed after DEEPSTOP, insert trigger to start WDTA1 operation.

26.5.1.3 WDTA Settings after Reset Release

Table 26.21 shows the WDTA settings after reset release.

Table 26.21 WDTA Settings after Reset Release

Function	Setting	Remark
WDTA enable/disable	Specified by start-up options	
Start mode		
VAC function		
WDTA overflow interval time	Specified by start-up options	Modification is possible only once by the setting of the WDTA mode register (WDTAnMD).
75% interrupt mode	75% interrupt disabled	
Behavior on error detection	Reset generation	
Window-open period	100%	

The setting of the WDTA mode register (WDTAnMD) is enabled when the first WDTA trigger is generated (writing an activation code to WDTAnWDTE and WDTAnEVAC). Perform the WDTAnMD register setting before a WDTA trigger is generated.

Setting of WDTA by using WDTAnMD is possible only once. If the value set for WDTAnMD is changed after a WDTA trigger is generated, an error occurs. However, an error does not occur if the same value has been set.

26.5.1.4 Default Start Mode Timing

The default start mode timing and the changes to the WDTA settings are illustrated in **Figure 26.2**.

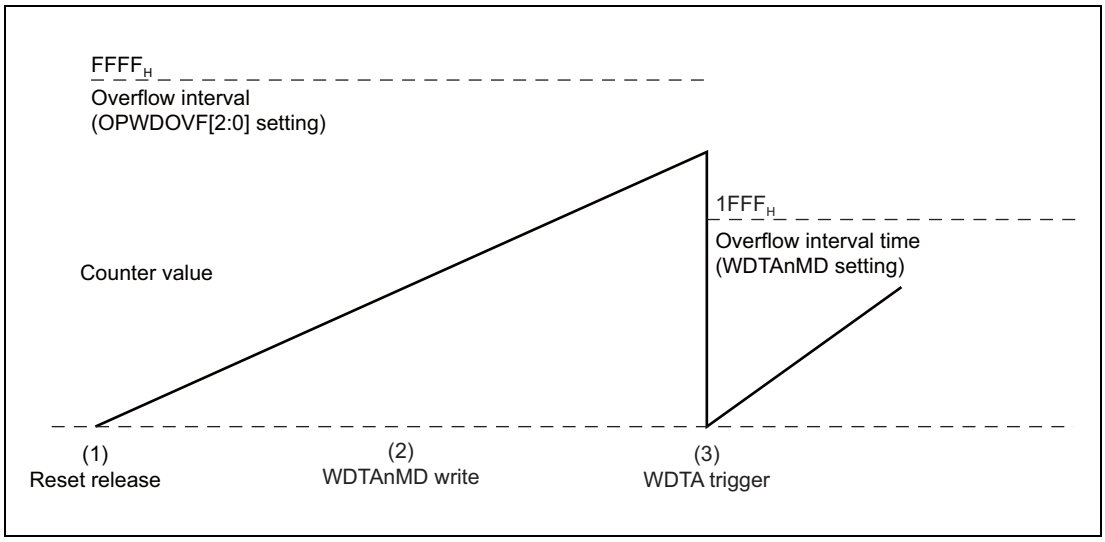

Figure 26.2 Timing Diagram of WDTA Start in Default Start Mode

The timing diagram shown in **Figure 26.2** shows the following behaviors:

(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

Example: Overflow interval time after reset release
$= 2^{16}$/WDTATCKI (OPWDOVF[2:0] = 111_B)

(2) WDTAnMD is set before a WDTA trigger is generated. Note, however, that the setting is not applied immediately.

(3) Write to the WDTA trigger register before the WDTA counter overflows.
The WDTAnMD setting is applied due to the WDTA trigger.

Example: Overflow interval time after a WDTA trigger is generated
$= 2^{13}$/WDTATCKI

26.5.1.5 Software Trigger Start Mode Timing

The software trigger start mode timing and the changes to the WDTA settings are illustrated in **Figure 26.3**.

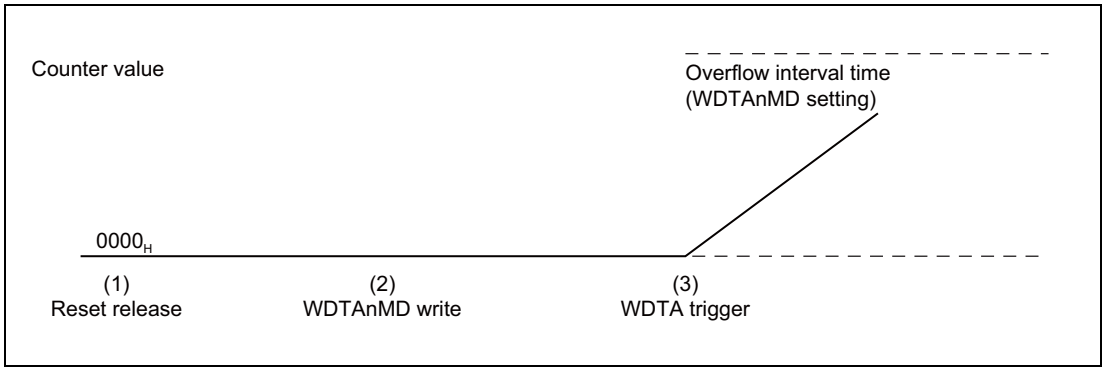

Figure 26.3 Timing Diagram of WDTA Start in Software Trigger Start Mode

The timing diagram shown in **Figure 26.3** shows the following behaviors:

(1) The WDTA counter value remains 0000_H until the first trigger is generated after reset release. The overflow interval time is set by start-up options, but it does not affect because the counter operation has not been performed.

(2) WDTAnMD is set before a WDTA trigger is generated. Note, however, that the setting is not applied immediately.

(3) The WDTA counter starts due a WDTA trigger.
The overflow interval time specified in WDTAnMD and other settings are applied.

26.5.2 WDTA Trigger

Writing a special value called an activation code to the WDTA enable register (WDTAnWDTE) and the WDTA enable VAC register (WDTAnEVAC) leads to generation of a WDTA trigger.

The WDTA trigger has the following functions:

- Starting the WDTA counter in software trigger start mode
- Restarting the WDTA counter
- WDTA mode setting by the WDTAnMD register (only for the first WDTA trigger after reset release)

The WDTA trigger register, which generates a WDTA trigger, is specified by the start-up option OPWDVAC.

Table 26.22 lists the WDTA trigger registers and activation codes.

Table 26.22 WDTA Trigger and Activation Code

Type of Activation Code	Trigger Register	Activation Code
Fixed (OPWDVAC = 0)	WDTAnWDTE	AC_H
Variable (OPWDVAC = 1)	WDTAnEVAC	For details, see 26.5.2.1, Calculating an Activation Code when the VAC Function is Used.

When successively writing the processing to clear WDTA, the clear processing below is not acknowledged for the following period:

12 × CPU clock[*1] cycles + 6 × WDT clock[*2] cycles

After writing the processing to clear WDTA and then changing to standby mode during the above mentioned period, the clear processing below is not acknowledged for the following period after return from stand-by mode:

6 × CPU clock[*1] cycles + 3 × WDT clock[*2] cycles

NOTES

1. CPU clock: C_ISO_CPUCLK
2. WDT clock: Clock domain connected to WDTATCKI

26.5.2.1 Calculating an Activation Code when the VAC Function is Used

Use the following expression to calculate the variable activation code (ExpectWDTE) to be set to the WDTA trigger register (WDTAnEVAC) when the VAC function is used, by using the WDTA reference value register (WDTAnREF):

$$\text{ExpectWDTE} = AC_H - \text{WDTAnREF (previous)}$$

Note that the value in the WDTAnREF register is updated every time a start-code is written to the trigger register WDTAnEVAC. Use the following expression to calculate the updated value of the WDTAnREF register:

WDTAnREF (following) = (rotate the value of ExpectWDTE to the left by 1 bit)

Table 26.23 lists the variable activation codes according to the number of WDTA triggers.

Table 26.23 Expected Variable Activation Code Development

No[*1]	WDTAnREF (Previous)		ExpectWDTE (AC_H - WDTAnREF)		WDTAnREF (Following)	
0	0000 0000	00_H	1010 1100	AC_H	0101 1001	59_H
1	0101 1001	59_H	0101 0011	53_H	1010 0110	$A6_H$
2	1010 0110	$A6_H$	0000 0110	06_H	0000 1100	$0C_H$
…	…	…	…	…	…	…

Note 1. Number of triggers after reset

NOTE

Writing a wrong activation code generates an error.

26.5.3 WDTA Error Detection

WDTA detects an error, including generation of the WDTA count overflow or illegal operations.

The following shows when a WDTA error is detected:

- WDTA counter overflow
- Wrong activation code is written to the WDTA trigger register
- Writing to the trigger register at a time outside the window-open period.
- When the setting value in the WDTA mode register (WDTAnMD) is changed after the first WDTA trigger is generated
- When the setting value in the WDTA mode register (WDTAnMD) is changed twice before the WDTA trigger is generated

26.5.3.1 WDTA Error Mode

When a WDTA error is detected, either an NMI interrupt or a reset is generated according to the setting of the WDTA error mode bit (WDTAnMD.WDTAnERM). The error mode bit after reset release is set to the reset mode.

- WDTAnMD.WDTAnERM = 0: NMI mode
- WDTAnMD.WDTAnERM = 1: reset mode

Figure 26.4 shows the reset or NMI request generation when the counter overflows and default start mode is selected.

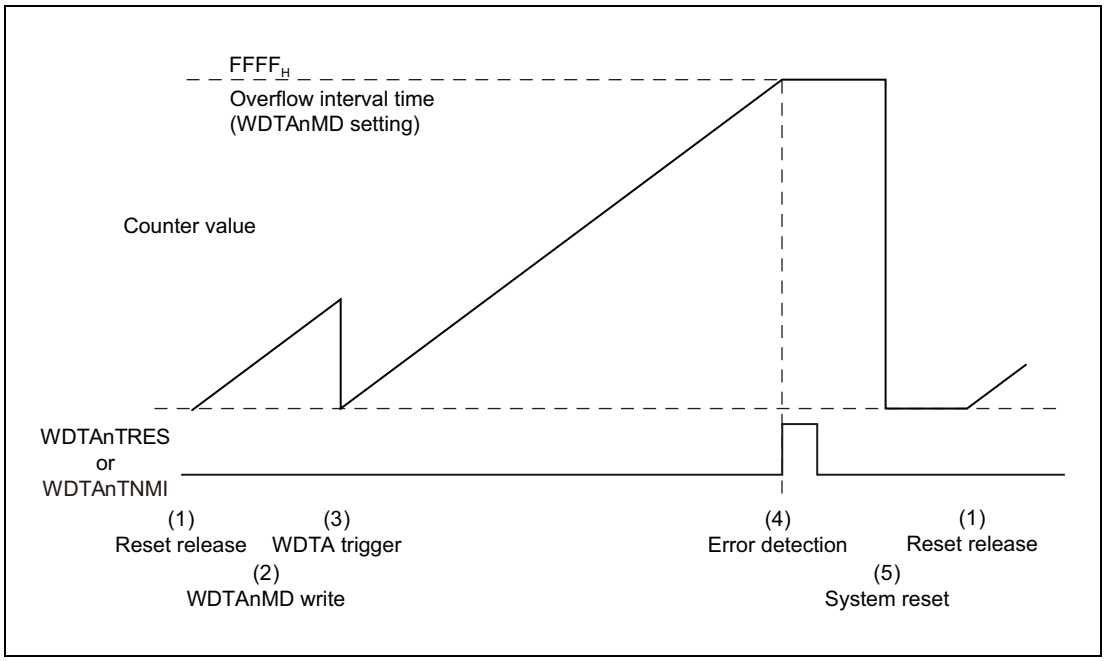

Figure 26.4 Timing Diagram of WDTA NMI Request or Reset Generation

The timing diagram shown in **Figure 26.4** shows the following behaviors:

(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

(2) WDTAnMD is set before a WDTA trigger is generated.
In this case, 2^{16}/WDTATCKI is set for the overflow interval time.

(3) A WDTA trigger is generated, and the WDTAnMD setting is applied.

(4) When the counter overflows, an error is detected. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated.
The counter value remains until a system reset is performed.

(5) When the system is reset, the counter is cleared and stopped until reset release.

26.5.4 75% Interrupt Request Signals

When the WDTA counter reaches 75% of the time set for the overflow interval, the interrupt request INTWDTAn is generated.

By use of the WDTAnMD.WDTAnWIE register, this function can be enabled or disabled afterwards.

Figure 26.5 shows the 75% interrupt request generation under following conditions:

- Default start mode selected
- 75% interrupt request is enabled after the first WDTA trigger is generated
- WDTA overflow interval time: 2^{16}/WDTATCKI

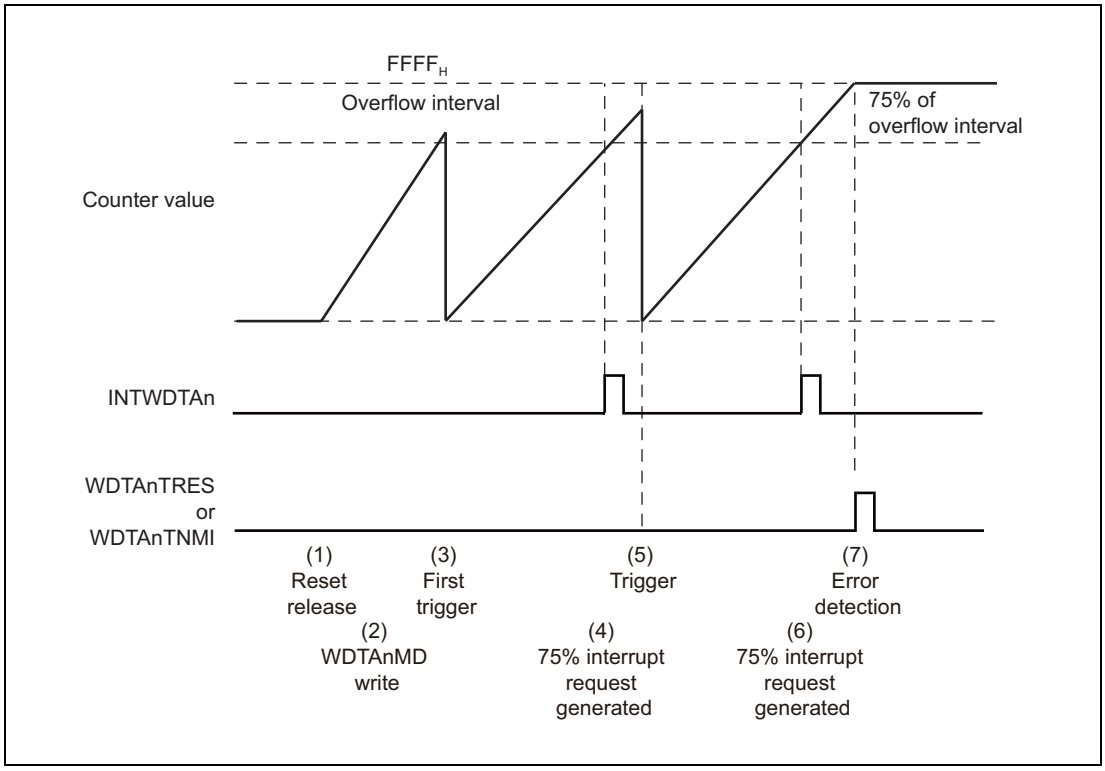

Figure 26.5 Timing Diagram of WDTA 75% Interrupt Request Signals

(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

(2) WDTAnMD is set before a WDTA trigger is generated. In this case, 2^{16}/WDTATCKI is set for the overflow interval time.

(3) A WDTA trigger is generated, and the WDTAnMD setting is applied.

(4) When the WDTA counter reaches 75% of the overflow interval timer, interrupt request INTWDTAn is generated.

(5) The WDTA trigger restarts the counting.

(6) When the WDTA counter reaches 75% of the overflow interval timer, interrupt request INTWDTAn is generated.

(7) When the counter overflows, an error is detected. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated. The counter value remains until a system reset is performed.

26.5.5 Window Function

The period when a WDTA trigger is valid (window-open period) can be set. If the window-open period is set to the value less than 100%, an error occurs by the WDTA trigger generated not in the window-open period. The window-open period after reset release is 100%. The period is set to the value by the WDTAnMD.WDTAnWS[1:0] setting after the first WDTA trigger is generated.

Figure 26.6 shows the behavior of the window function under the following conditions.

- Default start mode selected
- 25% window-open period is enabled after the first WDTA trigger is generated (WDTAnWS[1:0] = 00_B)
- WDTA overflow interval time: 2^{16}/WDTATCKI

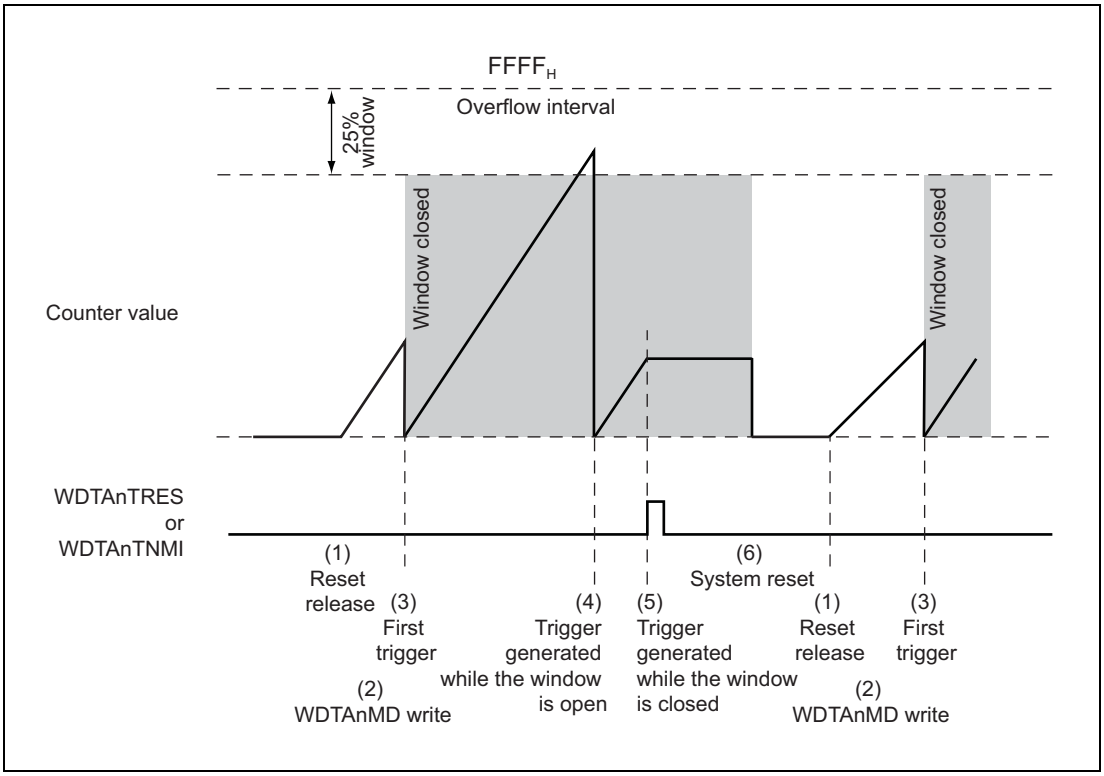

Figure 26.6 Timing Diagram of WDTA Window Function

(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

(2) WDTAnMD is set before a WDTA trigger is generated. In this case, 2^{16}/WDTATCKI is set for the overflow interval time.

(3) A WDTA trigger is generated, and the WDTAnMD setting is applied.

(4) During the window-open period, the WDTA trigger restarts the counting.

(5) During the window-closed period, an error is detected by the WDTA trigger. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated. The counter value remains until a system reset is performed.

(6) When the system is reset, the counter is cleared and stopped until reset release.

Section 27 OS Timer (OSTM)

This section contains a generic description of the OS Timer (OSTM).

The first part of this section describes all RH850/D1L/D1M specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the OSTM.

27.1 Features of RH850/D1L/D1M OSTM

27.1.1 Number of Units

This microcontroller has the following number of units of the OSTM.

Table 27.1 Number of Units

Product Name	All products
Number of Units	2
Name	OSTMn (n = 0, 1)

Table 27.2 Index

Index	Meaning
n	Throughout this section, the individual OSTM units are identified by the index “n” (n = 0, 1); for example, OSTMnCNT is the OSTM counter register.

27.1.2 Register Base Address

OSTM base addresses are listed in the following table.

OSTM register addresses are given as offsets from the base addresses in general.

Table 27.3 Register Base Address

Base Address Name	Base Address
<OSTM0_base>	FFEC 0000_H
<OSTM1_base>	FFEC 1000_H

27.1.3 Clock Supply

The OSTM clock supply is shown in the following table.

Table 27.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
OSTMn	PCLK	C_ISO_OSTM

27.1.4 Interrupt Request

OSTM interrupt requests are listed in the following table.

Table 27.5 Interrupt Requests

OSTMn signals	Function	Connected to
OSTM0TINT	OSTM0 interrupt	Interrupt Controller INTOSTM0
OSTM1TINT	OSTM1 interrupt	Interrupt Controller INTOSTM1 Error Control Module input

27.1.5 Reset Sources

OSTM reset sources are listed in the following table. OSTM is initialized by these reset sources.

Table 27.6 Reset Sources

Unit Name	Reset Source
OSTM0	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode
OSTM1	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

27.1.6 External Input/Output Signals

External input/output signals of OSTM are listed below.

Table 27.7 External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
OSTM0		
OSTM0TTOUT	OSTM output signal	Port OSTM0TTOUT Error Control Module timer input
OSTM1		
OSTM1TTOUT	OSTM output signal	Port OSTM1TTOUT

27.2 Overview

OSTM is a 32-bit timer/counter.

It can be used in interval timer mode or in free-run compare mode. The settings for operating mode specify the direction of counting (up or down) to control the generation of interrupt requests.

27.2.1 Functional Overview

OSTM has the following features.

- Two operating modes
  - Interval timer mode
  - Free-run compare mode
- OSTMnTINT interrupt
- Timer output signal with two modes
  - Software trigger mode
  - Toggle mode

27.2.2 Block Diagram

The following block diagram shows the main components of OSTM.

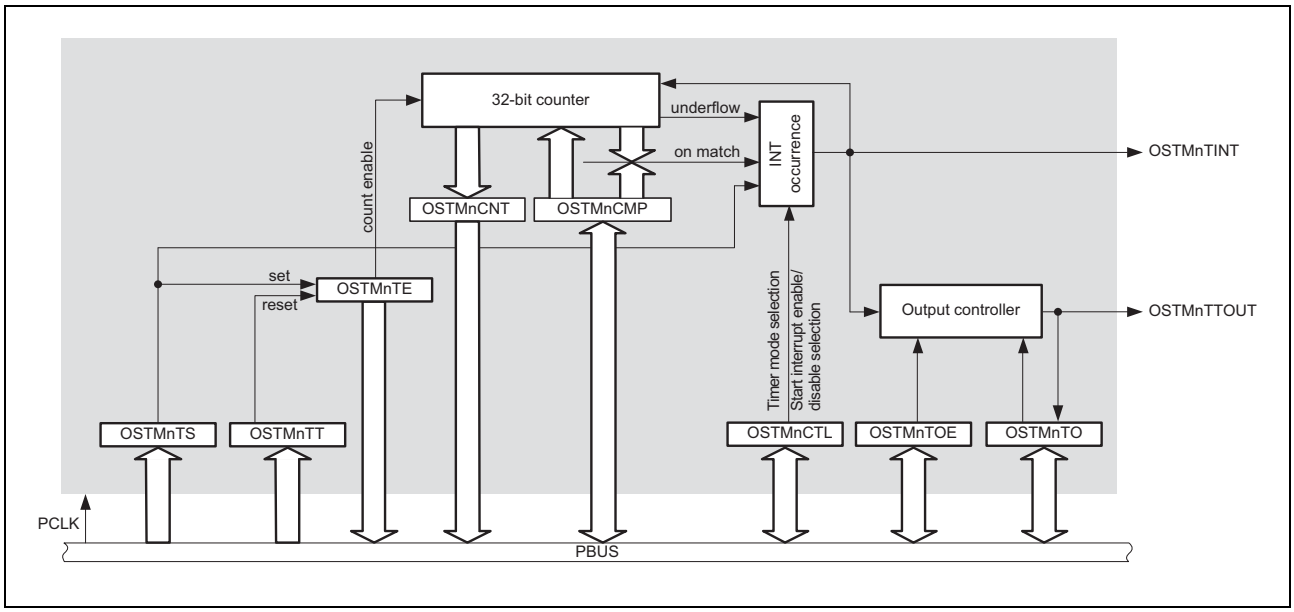

Figure 27.1 Block diagram of OSTM

27.2.3 Count Clock

The count clock used by OSTM is PCLK.

27.2.4 Output Modes

OSTM has the following output modes:

- Software control mode:
  The level set to OSTMnTO.OSTMnTO is output to OSTMnTTOUT.
- Toggle mode:
  OSTMnTTOUT toggles when the OSTMnTINT request is generated.

The output mode is selected by bit OSTMnTOE.OSTMnTOE.

Both output modes are illustrated in the following figure.

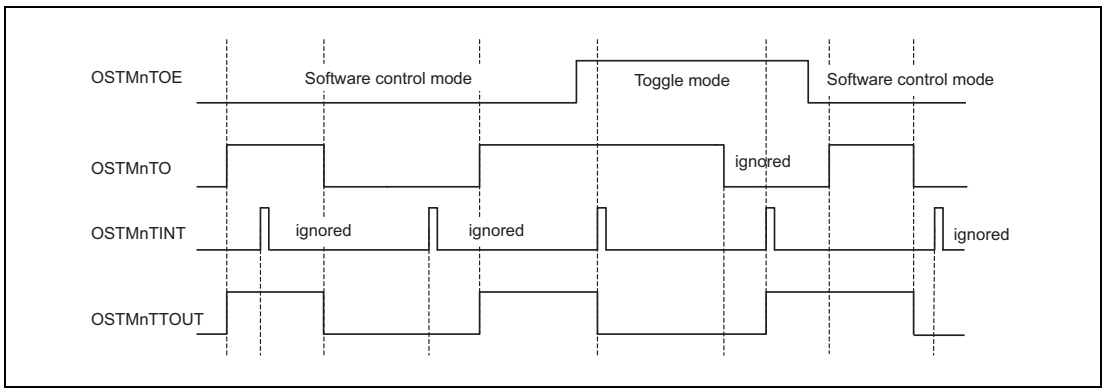

Figure 27.2 Timing diagram of output modes

The timing diagram above shows the following:

- In software control mode, OSTMnTTOUT changes to the value that was set in OSTMnTO.OSTMnTO.
- In toggle mode, OSTMnTTOUT toggles when OSTMnTINT interrupt request is generated.

27.2.5 Interrupt Sources (OSTMnTINT)

By default, an OSTMnTINT interrupt request is generated on counter underflow (interval timer mode) or when the counter matches the compare value (free-run compare mode).

An interrupt request can also be generated on starting and restarting of the counter. This is controlled by the OSTMnCTL.OSTMnMD0 bit.

Since OSTMnTINT triggers the toggling of OSTMnTTOUT in toggle mode (OSTMnTOE.OSTMnTOE = 1), the setting of the OSTMnCTL.OSTMnMD0 bit also influences the output of OSTMnTTOUT.

This is illustrated in the following figure.

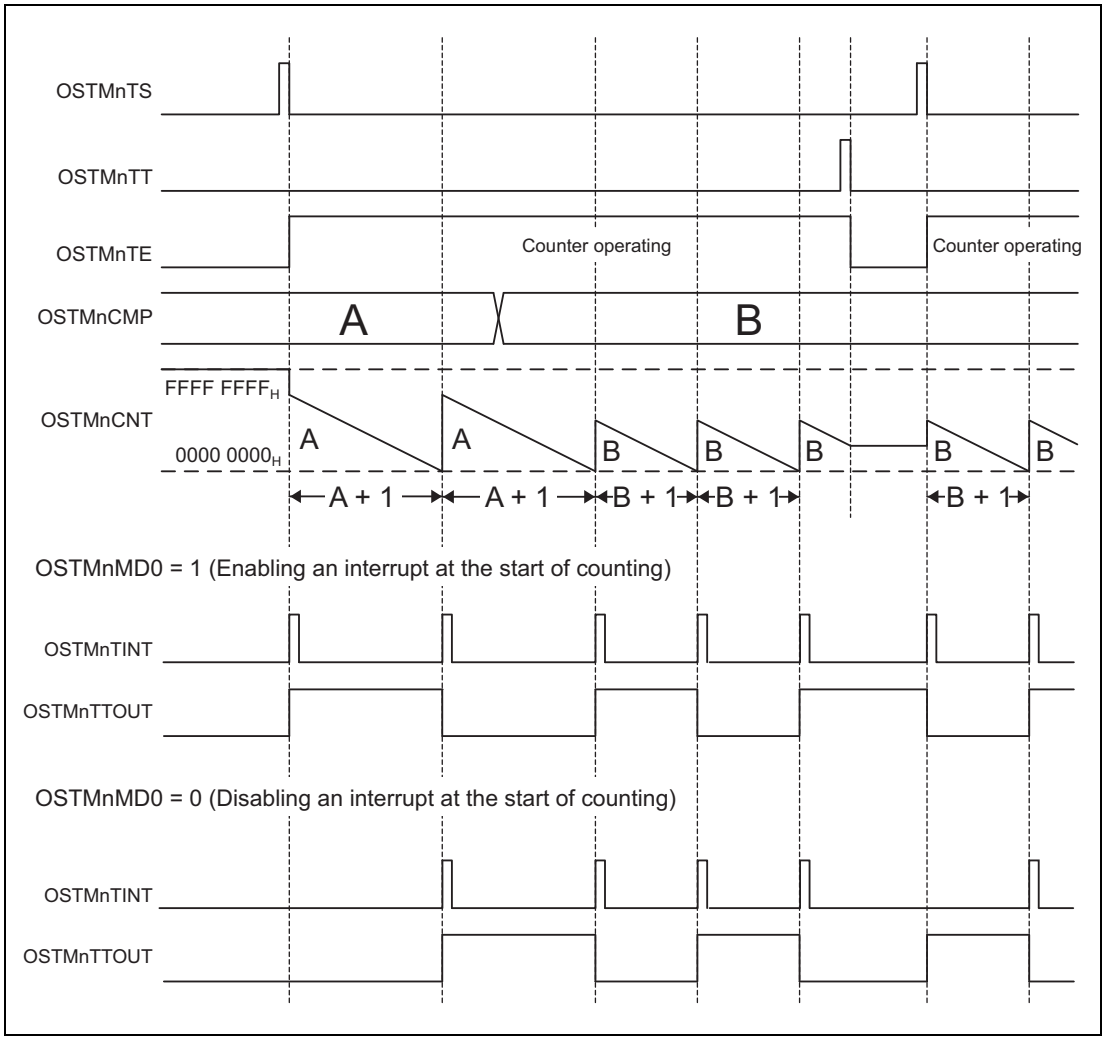

Figure 27.3 Generating an Interrupt when Counting Starts (in Interval Timer Mode)

27.3 Registers

27.3.1 List of Registers

OSTMn registers are listed in the following table.

For details about <OSTMn_base>, see Section 27.1.2, Register Base Address.

Table 27.8 Registers

Module	Register	Symbol	Address
OSTMn	OSTMn compare register	OSTMnCMP	<OSTMn_base> + 00_H
OSTMn	OSTMn counter register	OSTMnCNT	<OSTMn_base> + 04_H
OSTMn	OSTMn output register	OSTMnTO	<OSTMn_base> + 8_H
OSTMn	OSTMn output enable register	OSTMnTOE	<OSTMn_base> + C_H
OSTMn	OSTMn count enable status register	OSTMnTE	<OSTMn_base> + 10_H
OSTMn	OSTMn count start trigger register	OSTMnTS	<OSTMn_base> + 14_H
OSTMn	OSTMn count stop trigger register	OSTMnTT	<OSTMn_base> + 18_H
OSTMn	OSTMn control register	OSTMnCTL	<OSTMn_base> + 20_H
OSTMn	OSTMn emulation register	OSTMnEMU	<OSTMn_base> + 24_H

27.3.2 OSTMnCMP - OSTMn Compare Register

This register stores the start value of the down-counter or the value with which the counter is compared, depending on the operation mode.

Access: This register can be read/written in 32-bit units.

Address: <OSTMn_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCMP[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTMnCMP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.9 OSTMnCMP Register Contents

Bit Position	Bit Name	Function
31 to 0	OSTMnCMP [31:0]	• In interval timer mode: start value of the down-counter • In free-run compare mode: compare value

27.3.3 OSTMnCNT — OSTMn Counter Register

This register indicates the counter value of the timer.

Access: This register can only be read in 32-bit units.

Address: <OSTMn_base> + 04_H

Value after reset: FFFF $FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCNT[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTMnCNT[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.10 OSTMnCNT Register Contents

Bit Position	Bit Name	Function
31 to 0	OSTMnCNT [31:0]	Timer counter value

Table 27.11 lists the correspondence among the operating mode, counting direction, and start value. The start value indicates the value to be read after the operating mode is changed.

Table 27.11 Correspondence among Operating Mode, Counting Direction, and Start Value

Timer Operating Mode	OSTMnCTL.OSTMnMD1	Counting Direction	Start Value
Interval timer mode	0*1	Down	FFFF $FFFF_H$
Free-run compare mode	1	Up	0000 0000_H

Note 1. Value after reset.

27.3.4 OSTMnTO - OSTMn Output Register

This register specifies and reads the level of OSTMnTTOUT.

Access: This register can be read/written in 8-bit units.
It can only be written when the software control mode is enabled (OSTMnTOE.OSTMnTOE = 0).

Address: <OSTMn_base> + 8_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTO
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 27.12 OSTMnTO Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	OSTMn TO	Specifies/reads the level of OSTMnTTOUT: 0: Low level 1: High level

27.3.5 OSTMnTOE - OSTMn Output Enable Register

This register specifies OSTMnTTOUT output mode.

Access: This register can be read/written in 8-bit units.

Address: <OSTMn_base> + C_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTOE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 27.13 OSTMnTOE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	OSTMn TOE	Specifies the OSTMnTTOUT output mode: 0: Software control mode: The level set to OSTMnTO.OSTMnTO is output to OSTMnTTOUT. 1: Toggle mode: OSTMnTTOUT toggles when the interrupt request OSTMnTINT is generated.

27.3.6 OSTMnTE — OSTMn Count Enable Status Register

This register indicates whether the counter is enabled or disabled.

Access: This register can only be read in 8-bit units.

Address: <OSTMn_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 27.14 OSTMnTE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	OSTMnTE	Indicates whether the counter is enabled or disabled: 0: Counter disabled 1: Counter enabled This bit is set to 1 in response to OSTMnTS.OSTMnTS being set to 1. Setting OSTMnTT.OSTMnTT to 1 resets this bit to 0.

NOTE

If the counter is disabled, the counter value retains its value.

If the counter is restarted, it

- restarts counting down from the value in the OSTMnCMP register if it is in interval timer mode or
- restarts counting up from the counter value 0000 0000_H if it is in free-run compare mode.

27.3.7 OSTMnTS — OSTMn Count Start Trigger Register

This register starts the counter.

Access: This register can only be written in 8-bit units.

Address: <OSTMn_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 27.15 OSTMnTS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing to these bits, write the value after reset.
0	OSTMnTS	Starts the counter: 0: This setting is invalid. 1: Starts the counter and sets OSTMnTE.OSTMnTE = 1. • In interval timer mode, a forced restart is executed if this bit is set while OSTMnTE.OSTMnTE = 1. • In free-run compare mode, setting this bit is ignored as long as OSTMnTE.OSTMnTE = 1.

27.3.8 OSTMnTT — OSTMn Count Stop Trigger Register

This register stops the counter.

Access: This register can only be written in 8-bit units.

Address: <OSTMn_base> + 18_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 27.16 OSTMnTT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing to these bits, write the value after reset.
0	OSTMnTT	Stops the counter: 0: This setting is invalid. 1: Stops the counter and clears the OSTMnTE.OSTMnTE bit.

27.3.9 OSTMnCTL — OSTMn Control Register

This register specifies the operating mode for the counter and controls the generation of OSTMnTINT interrupt requests when counting starts.

Although this register is readable and writable, writing to it is only possible when OSTMnTE.OSTMnTE = 0; that is, the register becomes read only when OSTMnTE.OSTMnTE = 1.

Access: This register can be read/written in 8-bit units.

Address: <OSTMn_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OSTMnMD1	OSTMnMD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 27.17 OSTMnCTL Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	OSTMnMD1	Specifies the operating mode for the counter: 0: Interval timer mode 1: Free-run compare mode
0	OSTMnMD0	Controls the generation of OSTMnTINT interrupt requests at the start of counting: 0: Interrupts when counting starts are disabled. 1: Interrupts when counting starts are enabled.

27.3.10 OSTMnEMU — OSTMn Emulation Register

This register controls operation in combination with SVSTOP.

Access: This register can be read/written in 8-bit units.
Only proceed with writing while the counter is stopped (OSTMnTE.OSTMnTE = 0 and EPC.SVSTOP = 0).

Address: <OSTMn_base> + 24_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	OSTMnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 27.18 OSTMnEMU Register Contents

Bit Position	Bit Name	Function
7	OSTMnSVSDIS	When EPC.SVSTOP = 0 Supply of the count clock is continued when the debugger acquires control of the microcontroller (at breakpoints and so on) regardless of the value of this bit (0/1). When EPC.SVSTOP = 1 0: The count clock is stopped when the debugger acquires control of the microcontroller (at breakpoints and so on). 1: Supply of the count clock is continued when the debugger acquires control of the microcontroller (at breakpoints and so on).
6 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

27.4 Operation

27.4.1 Starting and stopping OSTM

OSTM is started and stopped as follows:

Starting the timer

OSTM is started by the following setting.

- Setting the OSTMnTS.OSTMnTS bit to 1

The OSTMnTE.OSTMnTE status bit is set to 1.

The counter starts to count up or down in accordance with the settings for operating mode. For details, see Section 27.4.2, Interval timer mode and Section 27.4.3, Free-Run Compare Mode.

Stopping the timer

Setting the OSTMnTT.OSTMnTT bit to 1 stops OSTM.

This also clears the OSTMnTE.OSTMnTE status bit.

27.4.2 Interval timer mode

In interval timer mode, OSTM can be used as a reference timer generating interrupt requests at fixed intervals.

27.4.2.1 Basic operation in interval timer mode

In interval timer mode, the timer counts down from the value specified in the OSTMnCMP register. An OSTMnTINT interrupt request is generated when the counter underflows (reaches 0000 0000_H).

To select interval timer mode, set OSTMnCTL.OSTMnMD1 = 0.

New values can be written to the OSTMnCMP register at any time. If it is rewritten during count operation, the counter loads the new OSTMnCMP value when the next 0000 0000_H is reached. Then the counter continues with the new value.

OSTMnTINT and OSTMnTTOUT periods

The period of OSTMnTINT and OSTMnTTOUT are:

- OSTMnTINT generation period = counter clock period × (OSTMnCMP + 1)
- OSTMnTTOUT period = OSTMnTINT occurrence period × 2

The following figure shows the basic operation of OSTM when counter-start interrupts is enabled in interval timer mode and OSTMnTTOUT in toggle mode.

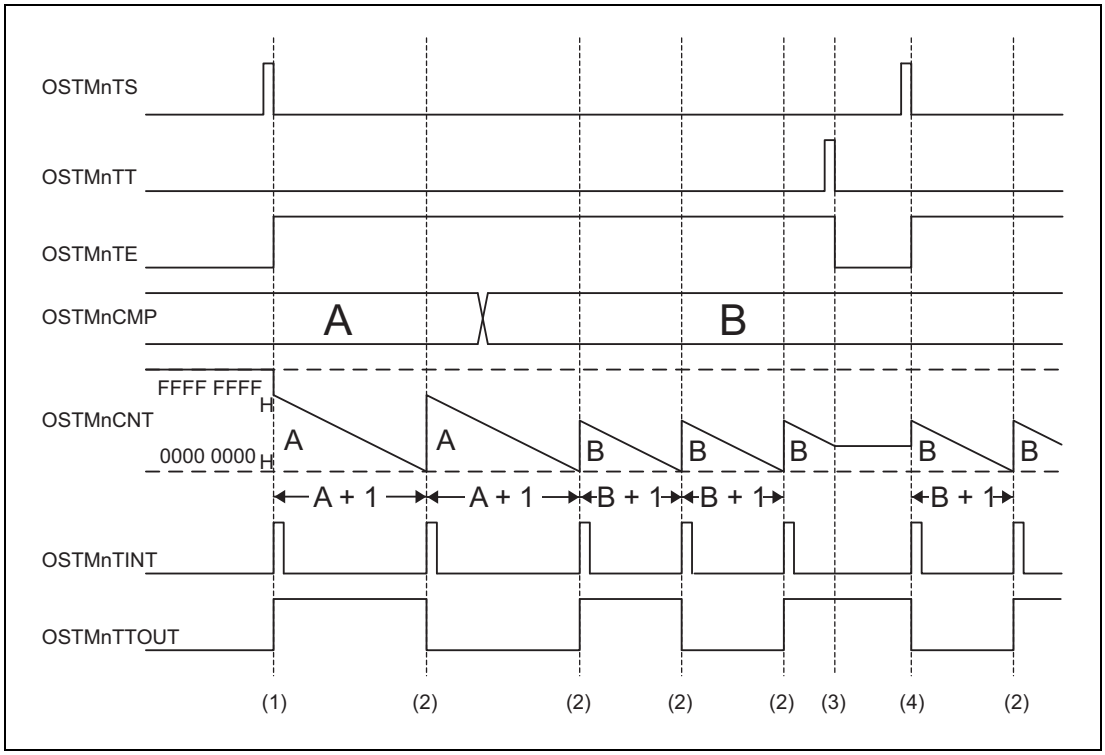

Figure 27.4 Timing Diagram of OSTM in Interval Timer Mode

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter.
The counter starts counting down from the value of OSTMnCMP.
If OSTMnCTL.OSTMnMD0 is 1, OSTMnTINT interrupt requests are generated at the start of counting and the OSTMnTTOUT output toggles. The OSTMnCNT register contains the current value as the counter.

(2) When the counter reaches 0000 0000_H, an OSTMnTINT interrupt request is generated and the OSTMnTTOUT output toggles. The counter loads the new start value from OSTMnCMP and continues counting down.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.

(4) When counting is restarted (OSTMnTS.OSTMnTS = 1), the counter loads the new start value from OSTMnCMP and starts counting down.

Forced restart

The counter is forcibly restarted by setting OSTMnTS.OSTMnTS = 1 during counting.

The counter loads the start value from the OSTMnCMP register and continues to count down.

The following figure shows the forced restart of OSTM in interval timer mode, with counter-start interrupts enabled (OSTMnCTL.OSTMnMD0 = 1) and OSTMnTTOUT in toggle mode (OSTMnTOE.OSTMnTOE = 1).

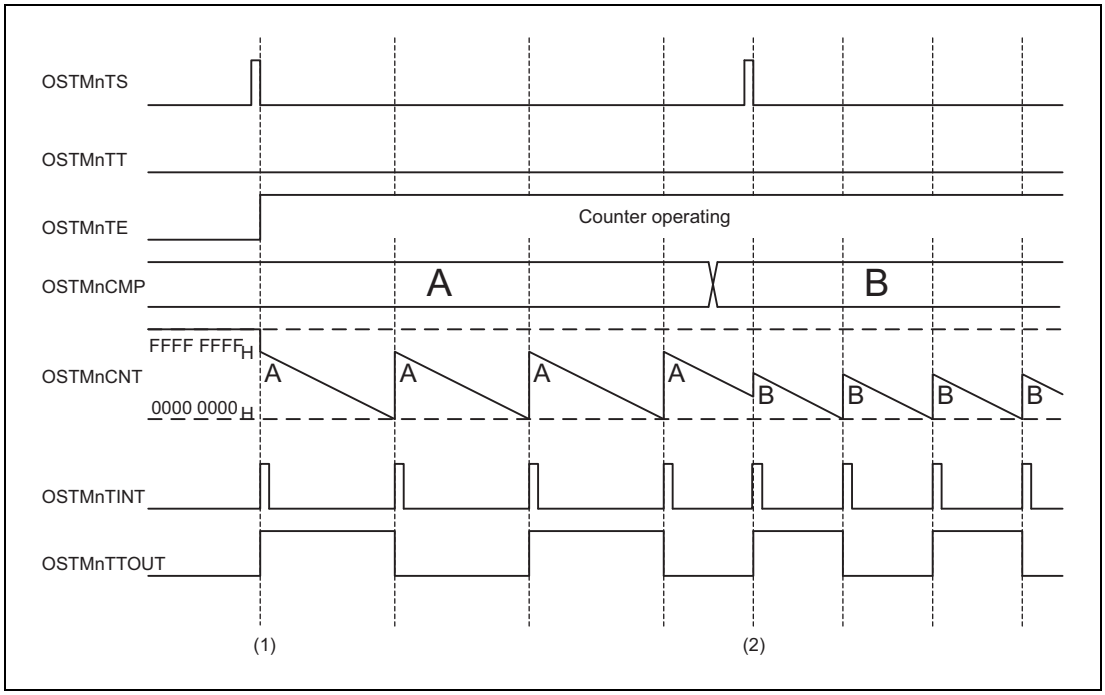

Figure 27.5 Timing Diagram of Forced Restart in Interval Timer Mode

Operations shown in the above timing diagram are as follows.

(1) The counter is started and stopped as described under Figure 27.4, Timing Diagram of OSTM in Interval Timer Mode.

(2) Setting OSTMnTS.OSTMnTS = 1 restarts the counter while counting is in progress (i.e. while OSTMnTE.OSTMnTE = 1).
The counter immediately restarts counting down, starting with the current value of OSTMnCMP. When OSTMnCTL.OSTMnMD0 = 1, an OSTMnTINT interrupt request is generated and the OSTMnTTOUT output toggles when counting starts.

27.4.2.2 Operation when OSTMnCMP = 0000 0000$_H$

When OSTMnCMP = 0000 0000$_H$, OSTM behaves as follows.

- When the counter is enabled, the OSTMnTINT interrupt request is always set to 1.
- If OSTMnTTOUT output is in toggle mode, OSTMnTTOUT toggles with the PCLK period.

The following figure shows operations of OSTM when OSTMnCMP = 0000 0000$_H$, counter-start interrupts are enabled and OSTMnTTOUT is in toggle mode.

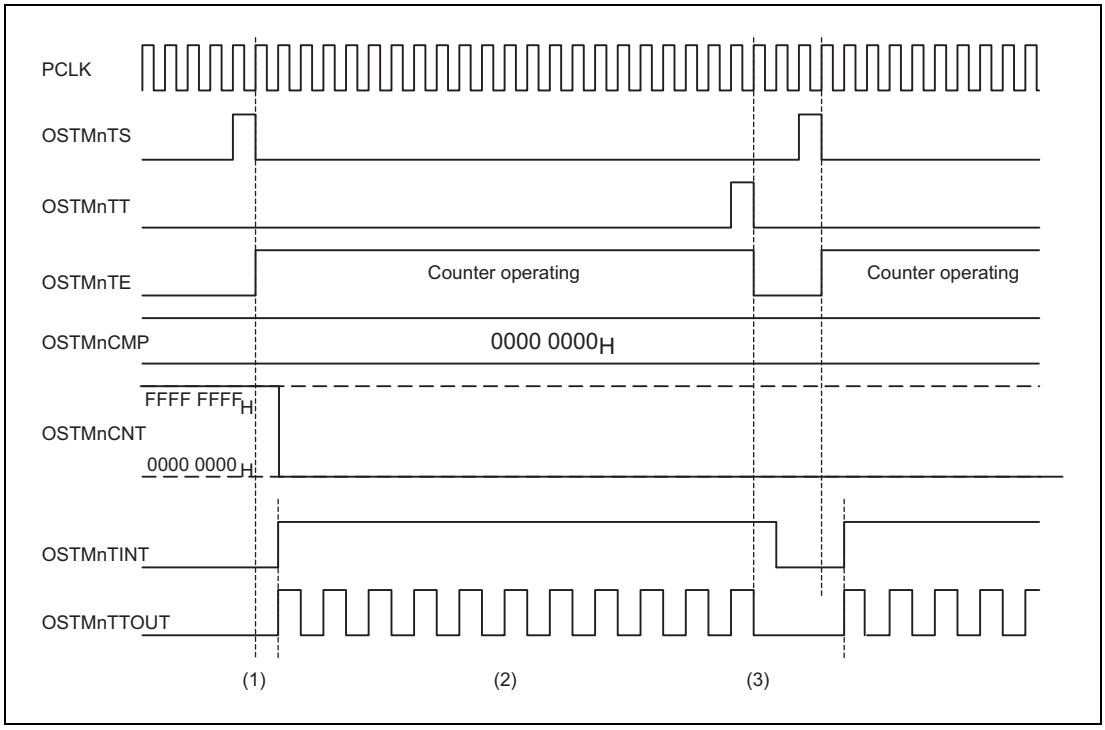

Figure 27.6 Timing Diagram when OSTMnCMP = 0000 0000$_H$ in Interval Timer Mode

The timing diagram above shows the following operations:

(1) The counter is reloaded with the value in OSTMnCMP as soon as it starts counting, so the value 0000 0000$_H$ is retained in OSTMnCMP.

(2) The OSTMnTINT interrupt request is continuously asserted and OSTMnTTOUT starts toggling with the PCLK clock period.

(3) After the counter stops, the OSTMnTINT interrupt request signal is deasserted and OSTMnTTOUT stops toggling.

(4) When interrupts on starting of the counter are disabled, OSTMnTINT and OSTMnTTOUT are not generated for one clock cycle of the count clock when counting starts.

27.4.2.3 Setting Procedure for Interval Timer Mode

The setting procedure in interval timer mode after reset release is described below:

Setting procedure

(1) Set the start value of the counter in the OSTMnCMP register.

(2) Select interval timer mode by clearing the OSTMnCTL.OSTMnMD1 bit.

(3) Enable or disable interrupts when counting starts (OSTMnCTL.OSTMnMD0).

(4) To use the OSTMnTTOUT output pin:
- Select the output mode (OSTMnTOE.OSTMnTOE).
- In software control mode, initialize OSTMnTO.

27.4.3 Free-Run Compare Mode

27.4.3.1 Basic operation in free-run compare mode

In free-run compare mode, the counter counts up from 0000 0000_H to FFFF $FFFF_H$. When the value of the OSTMnCMP register matches the current counter value, an OSTMnTINT interrupt request is output.

In free-run compare mode, set OSTMnCTL.OSTMnMD1 = 1.

New values can be written to the OSTMnCMP register at any time.

The following figure shows the basic operation of OSTM in free-run compare mode with the start of counting enabled (OSTMnCTL.OSTMnMD0 = 1) and OSTMnTTOUT in toggle mode (OSTMnTOE.OSTMnTOE = 1).

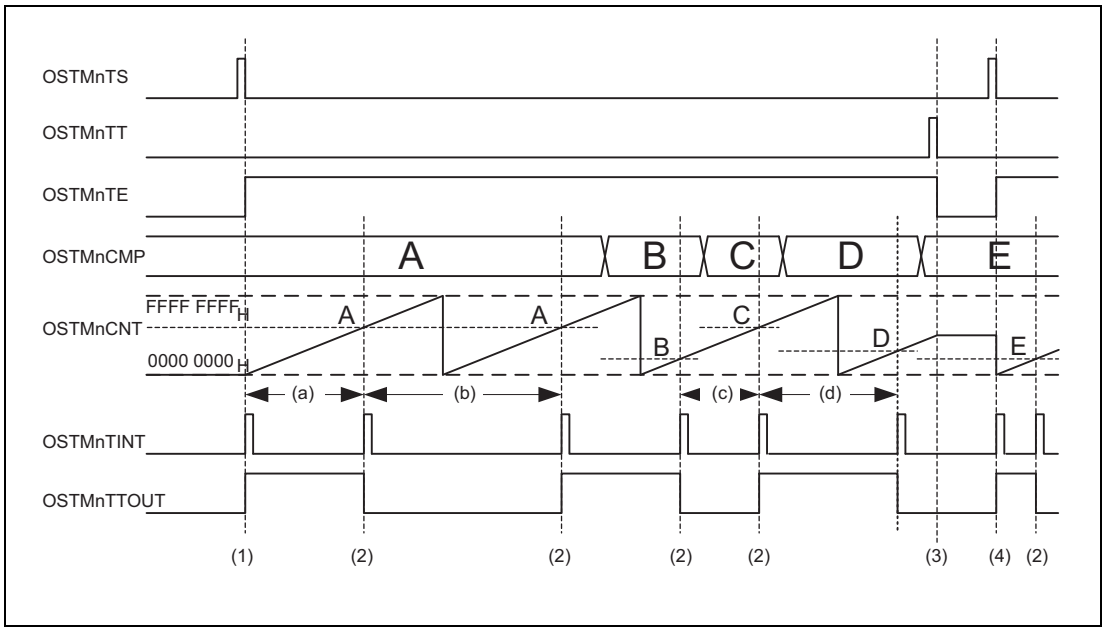

Figure 27.7 Timing Diagram of OSTM in Free-Run Compare Mode

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1.
The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter counts up

from 0000 0000_H to FFFF $FFFF_H$. The OSTMnCNT register is the counter, so it contains the current value.
When OSTMnCTL.OSTMnMD0 = 1, an OSTMnTINT interrupt request is generated at the start of counting.

(2) When the current counter value matches the value in the OSTMnCMP register, an OSTMnTINT interrupt request is generated and the OSTMnTTOUT output toggles.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter.
The counter retains its current value until it is restarted.

(4) Counting by the counter restarts from 0000 0000_H when OSTMnTS.OSTMnTS = 1.

OSTMnTINT period

The OSTMnTINT generation period is different depending on the starting time. If OSTMnCMP is rewritten during operation, the period is changed according to the size of the new and old compare values.

Table 27.19 OSTMnTINT Generation Timing

Old Value for Comparison	New Value for Comparison	Counter Value at Time of Rewriting	Period of OSTMnTINT Generation	Label in Timing Diagram
Counter starts			(A + 1) × counter clock period	(a)
A	A	No rewriting	(FFFF $FFFF_H$ + 1) × counter clock period	(b)
B	C > B	B < counter value < C	(C – B) × counter clock period	(c)
C	D < C	Counter value > D,C	(FFFF $FFFF_H$ – C + D + 1) × counter clock period	(d)

Forced restart

Forced restarting does not proceed during counting even if the OSTMnTS.OSTMnTS bit is set. The counter ignores the attempted setting and continues counting.

27.4.3.2 Operation when OSTMnCMP = 0000 0000$_H$

The following figure shows the operation of OSTM when OSTMnCMP = 0000 0000$_H$, and counter-start interrupts are enabled (OSTMnCTL.OSTMnMD0 = 1) and OSTMnTTOUT is in toggle mode (OSTMnTOE.OSTMnTOE = 1).

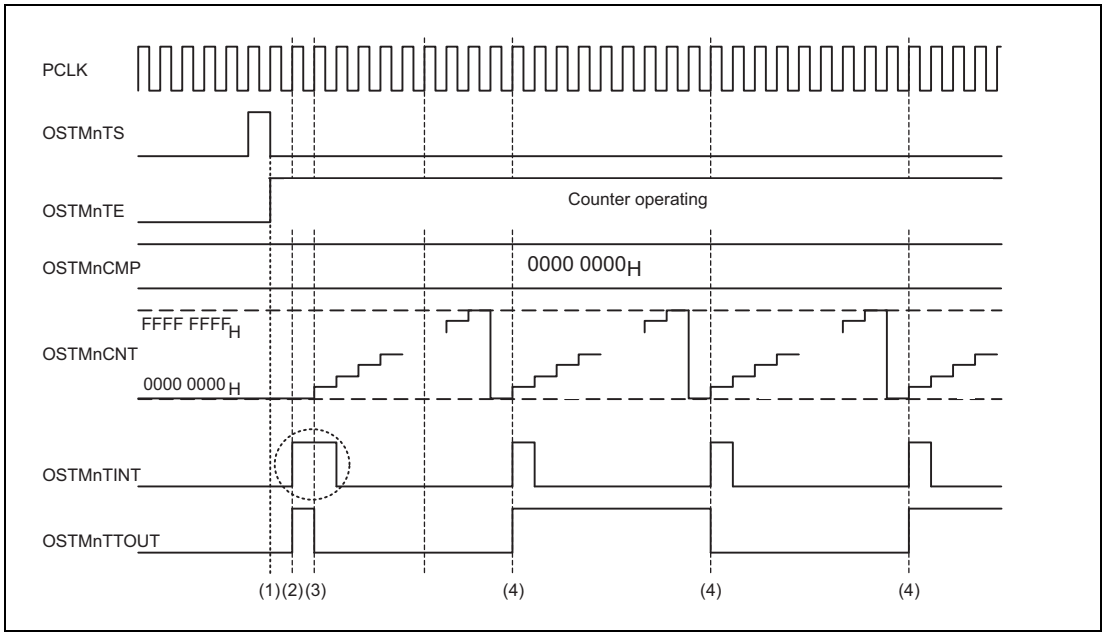

Figure 27.8 Timing Diagram when OSTMnCMP = 0000 0000$_H$ in Free-Run Compare Mode

The timing diagram above shows the following operations.

(1) Once the counter starts, it counts up from 0000 0000$_H$ to FFFF FFFF$_H$.

(2) An OSTMnTINT interrupt request is generated when counting starts.

(3) If the current counter value matches OSTMnCMP, an OSTMnTINT interrupt request is generated. If OSTMnCMP = 0000 0000$_H$ in the above case, OSTMnTINT is generated over two clock cycles.

(4) An OSTMTINT interrupt request is generated and OSTMnTTOUT toggles for each clock cycle (FFFF FFFF$_H$ + 1).

When interrupts on starting of the counter are disabled, OSTMnTINT and OSTMnTTOUT are not generated for one clock cycle of the count clock when counting starts.

27.4.3.3 Setting Procedure for Free-Run Compare Mode

The setting procedure in free-run compare mode after reset release is described below:

Setting procedure

(1) Set the compare value in the OSTMnCMP register.

(2) Select free-run compare mode by setting the OSTMnCTL.OSTMnMD1 bit.

(3) Enable or disable interrupts when counting starts by the OSTMnCTL.OSTMnMD0 bit.

(4) To use the OSTMnTTOUT output pin:
- Select the output mode (OSTMnTOE.OSTMnTOE).
- In software control mode, initialize OSTMnTO.

Section 28 Always-On-Area Timer (AWOT)

This section contains a generic description of the Always-On-Area Timer (AWOT).

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.
The subsequent sections describe the features that apply to all implementations.

28.1 Overview of RH850/D1L/D1M Always-On-Area Timer (AWOT)

28.1.1 Units

This microcontroller has the following number of units of the Always-On-Area Timers AWOTn.

Table 28.1 Units

Always-On-Area Timer (AWOT)	
Units	1
Names	AWOT0

Unit index n

Throughout this section, the individual units of the Always-On-Area Timers are identified by the index "n" (n = 0), for example AWOTnCTL for the Always-On-Area Timer n control register.

28.1.2 Register addresses

All Always-On-Area Timers register addresses are given as address offsets from the individual base addresses <AWOTn_base>.
The <AWOTn_base> addresses of each AWOTn are listed in the following table:

Table 28.2 Register base addresses <AWOTn_base>

AWOTn unit	<AWOTn_base> address
AWOT0	FFE4 0000_H

28.1.3 Clock supply

All Always-On-Area Timers provide one clock input.

Table 28.3 Clock supply

AWOTn unit	AWOTn clock	Connected to
AWOT0	PCLK	Clock Controller • C_ISO_PCLK in RUN mode • EMCLK in DEEPSTOP mode
	AWOTCLK	Clock Controller C_AWO_AWOT

CAUTION

The PCLK frequency must be at least the AWOTCLK frequency.

Pay attention to set a correct C_AWO_AWOT clock frequency in DEEPSTOP mode, since the PCLK frequency is $f_{RH}/2$ (i.e. nominal 4 MHz) in DEEPSTOP mode.

28.1.4 Interrupts

The Always-On-Area Timers can generate the following interrupt requests:

Table 28.4 AWOTn interrupt requests

AWOTn signals	Function	Connected to
AWOTINT	AWOT0 interrupt	Interrupt Controller INTAWOT0

28.1.5 Reset sources

The Always-On-Area Timers and their registers are initialized by the following reset signal:

Table 28.5 Reset sources

AWOTn unit	Reset signal
AWOT0	• Reset Controller SYSRES

28.1.6 Internal signal connections

Following AWOTn signals are connected to other modules internally:

Table 28.6 Internal signals connections

AWOTn unit	Signal	Connected to
AWOT0	AWOTIN	Real-Time Clock RTCA0 output RTCA01HZ

28.1.7 I/O signals

The following table shows the I/O signals of the Always-On-Area Timers.

Table 28.7 I/O signals connections

AWOTn unit	Signal	Connected to
AWOT0	AWOTOUT	Port AWOT0TOUT

28.2 Real-Time Clock correction

The AWOT0 capture input signal AWOTIN is connected to the Real-Time Clock 1 second output signal RTCAT1HZ.

In AWOT0 capture mode the AWOT0 can be used to measure the time between two valid edges of the RTCA01s signals in order to calculate a correction value for the Real-Time Clock.

28.3 Functions Overview

Features summary

The Always-On-Area Timer (AWOT) has the following features:

- Three operation modes
  - Interval timer mode with 32-bit resolution
  - Capture mode with 32-bit resolution
  - PWM mode with 16-bit resolution for PWM cycle duration and duty cycle
- Valid edge of capture signal selectable

Block Diagram

The block diagram shows the main components of the AWOT.

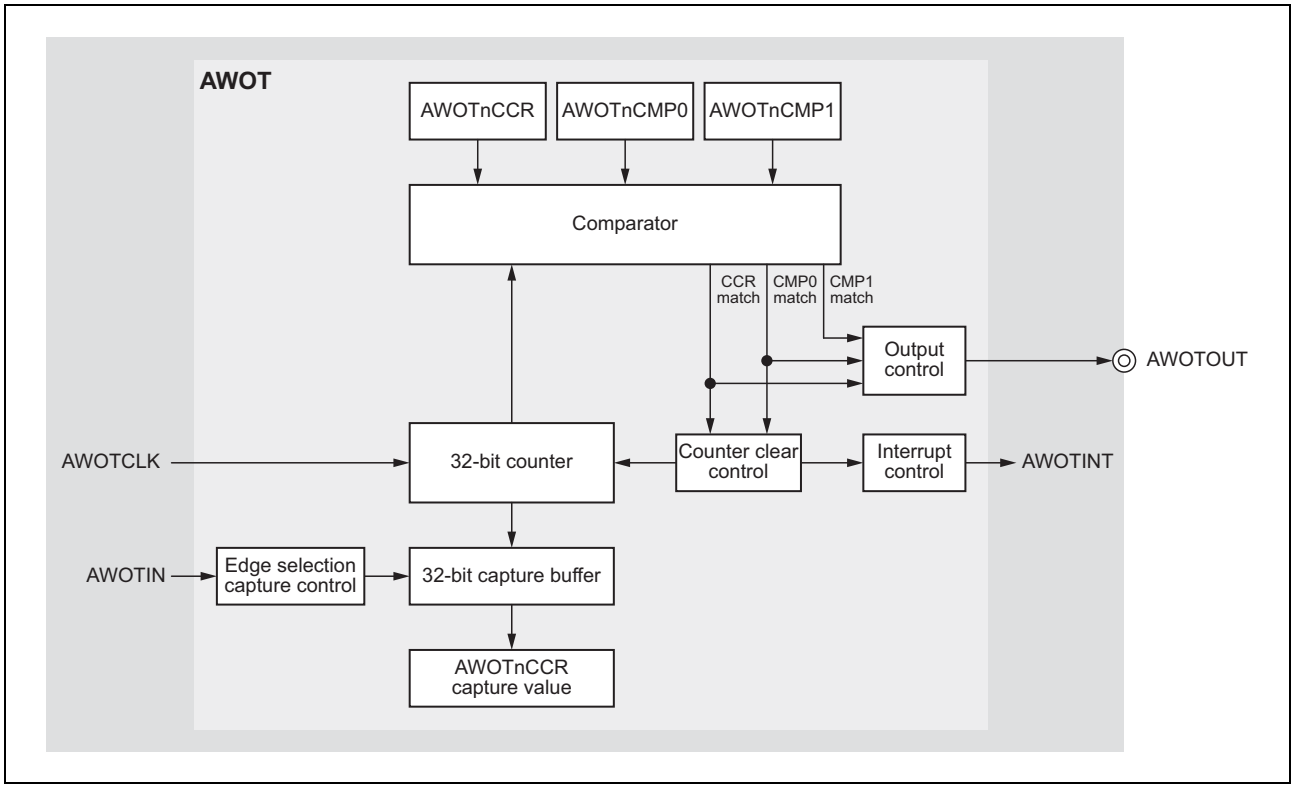

Figure 28.1 Block diagram of the AWOT

28.4 Functional Description

28.4.1 AWOTn Operation Modes

28.4.1.1 Interval timer mode (AWOTnCTL.AWOTnMD[1:0] = 00_B)

In interval counter mode the AWOTINT interrupt is generated periodically.

The period is set up via the 32-bit capture/compare register AWOTnCCR, which acts as a compare register in this mode.
If the counter value equals AWOTnCCR the counter is cleared to 0000 0000_H and the AWOTINT is generated.

If the output signal AWOTOUT is enabled (AWOTnTOE = 1), it toggles with each AWOTINT interrupt. Thus AWOTOUT has a cycle duration of the half of the AWOTINT frequency.

AWOTOUT cycle duration = AWOTCLK clock periods × (AWOT0CCR+1) × 2

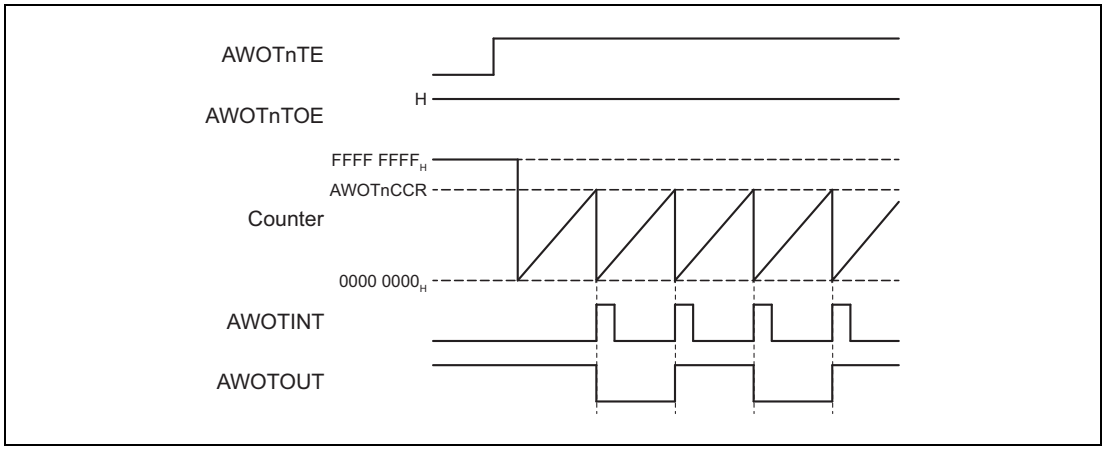

Figure 28.2 Interval timer mode

NOTE

As long as AWOTnTOE = 1, AWOTOUT holds its value while AWOTnTE=0. Again AWOTnTE sets to 1, AWOTOUT starts toggling from its hold value.

Interval timer mode with AWOTnCCR = 0000 0000_H

If the capture/compare register is set to 0000 0000_H, the AWOTINT is asserted and stays active until the AWOT is disabled by AWOTnCTL.AWOTnTE = 0.

28.4.1.2 Capture mode (AWOTnCTL.AWOTnMD[1:0] = 01_B)

In capture mode the number of AWOTCLK cycles between two rising or falling edges of the input signal AWOTIN are counted.

The internal counter starts counting the PCLK clocks from 0000 0000_H. Upon occurrence of a valid AWOTIN edge the counter state is taken over to the AWOTnCCR register and the AWOTINT interrupt is asserted.

Edge selection

The valid AWOTIN edge is selectable:

- AWOTnCTL.AWOTnTIS = 0: falling edge
- AWOTnCTL.AWOTnTIS = 1: rising edge

Capture result

The capture result at each valid AWOTIN edge can be read via the capture/compare register AWOTnCCR, which acts as a capture register in this mode.

In order to avoid conflicts with concurrent counting of the AWOTIN edge and reading of the AWOTnCCR register, AWOTnCCR must not be read while AWOnFLG.AWOTnRPF = 0.
Thus confirm that AWOTnRPF = 1 before reading AWOTnCCR.
After AWOTnCCR reading the AWOTnRPF flag must be cleared by setting AWOTnSTC.AWOTnCLRP = 1.

Count overflow

In case the 32-bit counter overflows the overflow flag AWOTnFLG.AWOTnOVF is set to 1.
This happens at a valid AWOTIN edge, when the counter has reached its maximum value FFFF $FFFF_H$ already before.

With the next valid AWOTIN edge AWOTnOVF is cleared to 0, provided no further overflow did appear in the meantime.

Capture period = AWOTCLK clock periods × ((1 0000 0000_H × AWOT0OVF) + (AWOT0CCR+1))

CAUTIONS

1. **If a second valid AWOTIN edge occurs while the AWOTnRPF flag is 1 (AWOTnCCR read operation not completed) the new capture result will be stored in the internal buffer.**
   The new value will be copied to the AWOTnCCR after the AWOTnRPF was cleared by setting AWOTnSTC.AWOTnCLRP = 1.
2. **As there is only one internal buffer, any succeeding valid AWOTIN edge (while AWOTnRPF flag is still 1) will overwrite the value stored in the internal buffer.**
3. **It takes at least five AWOTCLK clock cycles to store the counter value in the internal buffer and copy it to the AWOTnCCR register (after detecting a valid AWOTIN edge). Thus, in order to ensure proper operation it is necessary that the AWOTCLK clock is at least five times faster than the cycle time of the measured signal. Otherwise the contents of the AWOTnCCR register will become undefined.**

The following diagram illustrates the AWOTn operation in capture mode (valid AWOTIN edge: falling edge).

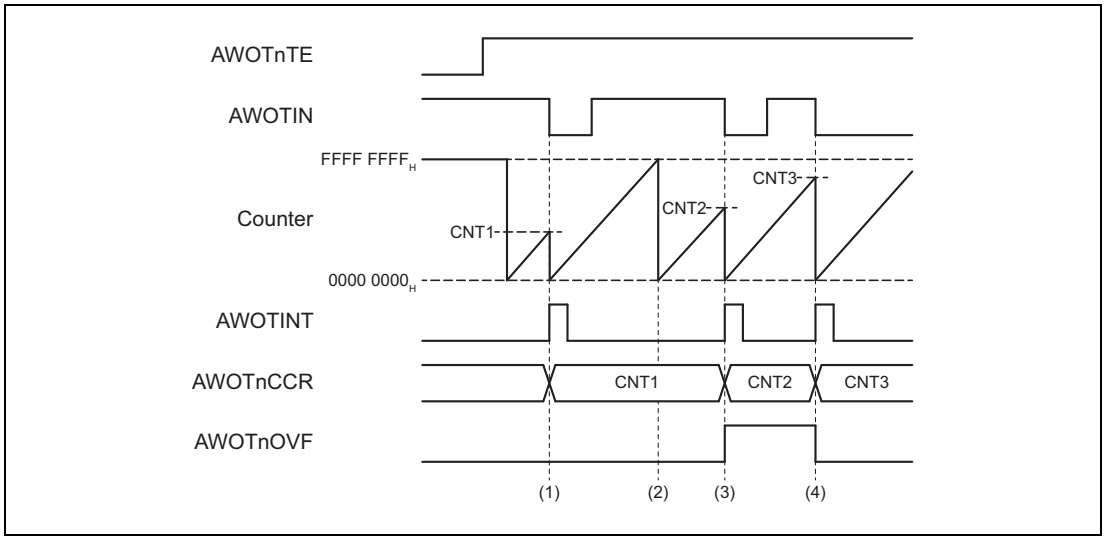

Figure 28.3 Capture mode

(1) Falling AWOTIN edge asserts AWOTINT interrupt and copies counter state CNT1 to AWOTnCCR register, and resets counter to 0000 0000_H.

(2) Counter overflows before next falling AWOTIN edge.

(3) Falling AWOTIN edge copies counter state CNT2 to AWOTnCCR, sets overflow flag AWOTnFLG.AWOTnOVF, and resets counter to 0000 0000_H.

(4) Falling AWOTIN edge copies counter state CNT3 to AWOTnCCR and clears overflow flag AWOTnOVF.

28.4.1.3 PWM mode (AWOTnCTL.AWOTnMD[1:0] = $1x_B$)

In PWM mode the AWOTn can generate a PWM signal at AWOTOUT with 16-bit resolution for the cycle duration and duty cycle.

NOTE

In this section the duty cycle DC is defined by the relation of the output high phase to the PWM cycle duration. Thus a 100% DC means output constant high and 0% DC means output constant low.

The PWM parameters are set via two registers:

- PWM cycle duration = (AWOTnCMP0 + 1) AWOTCLK clock periods
- PWM duty cycle = AWOTnCMP1 AWOTCLK clock periods

The duty cycle DC in % is calculated as follows:

$$DC = \left(1 - \frac{AWOTnCMP1}{AWOTnCMP0 + 1}\right) \times 100$$

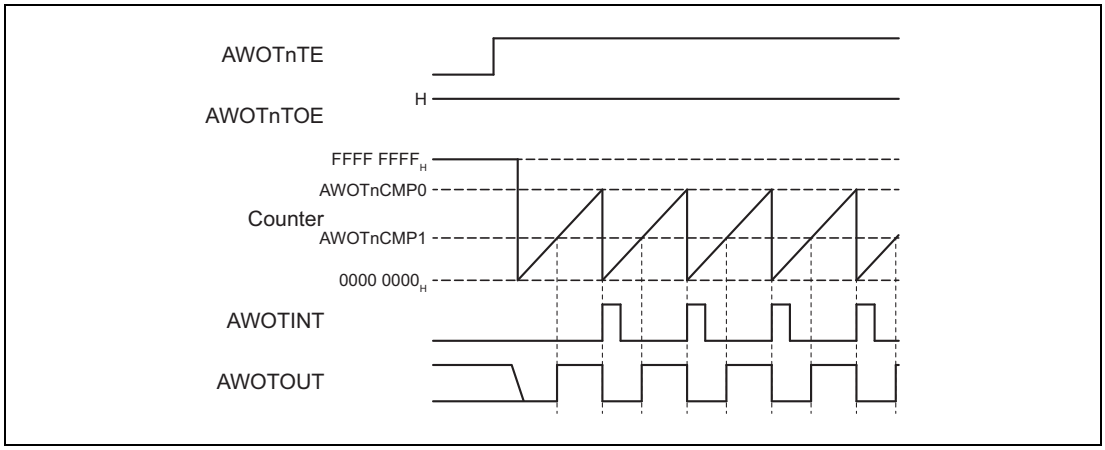

Figure 28.4 PWM mode

PWM with AWOTnCMP0 = 0000_H

Setting AWOTnCMP0 = 0000 0000_H delivers 0 % duty cycle PWM output, i.e. AWOTOUT constant low level.

AWOTINT keeps asserted all the time until AWOTn is disable by AWOTnCTL.AWOTnTE = 0.

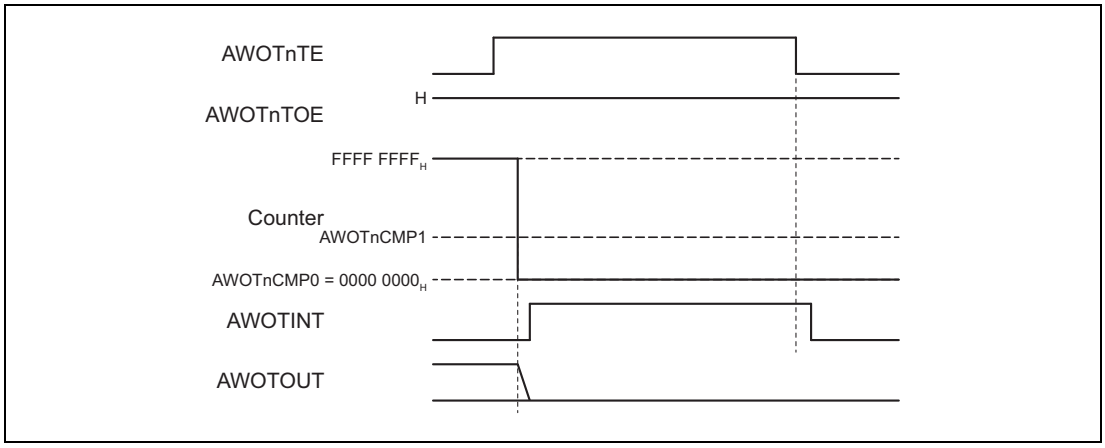

Figure 28.5 PWM mode with AWOTnCMP0 = 0000 0000_H

PWM with 100 % duty cycle

Setting AWOTnCMP1 = 0000 0000_H delivers 100 % duty cycle PWM output, i.e. AWOTOUT constant high level.

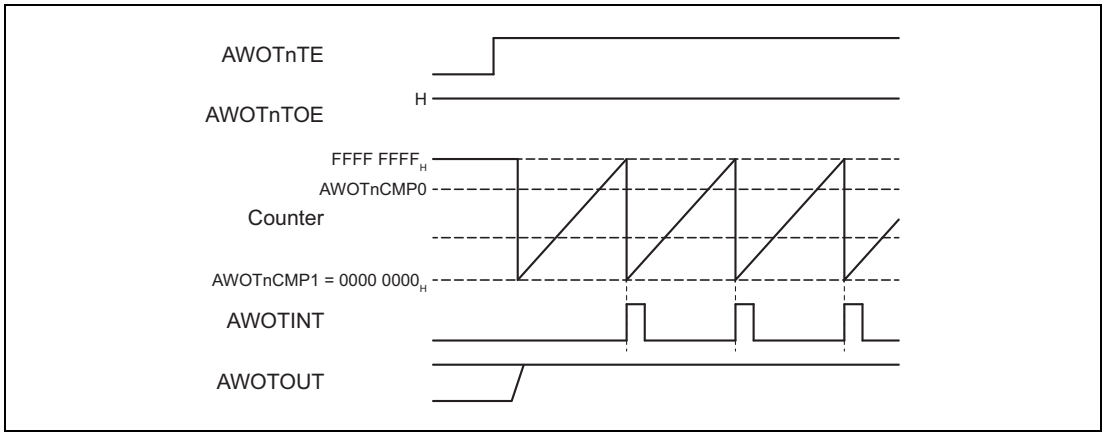

Figure 28.6 PWM mode with 100 % duty cycle

PWM with 0 % duty cycle

Setting AWOTnCMP1 ≥ (AWOTnCMP0 + 1) delivers 0 % duty cycle PWM output, i.e. AWOTOUT constant low level.

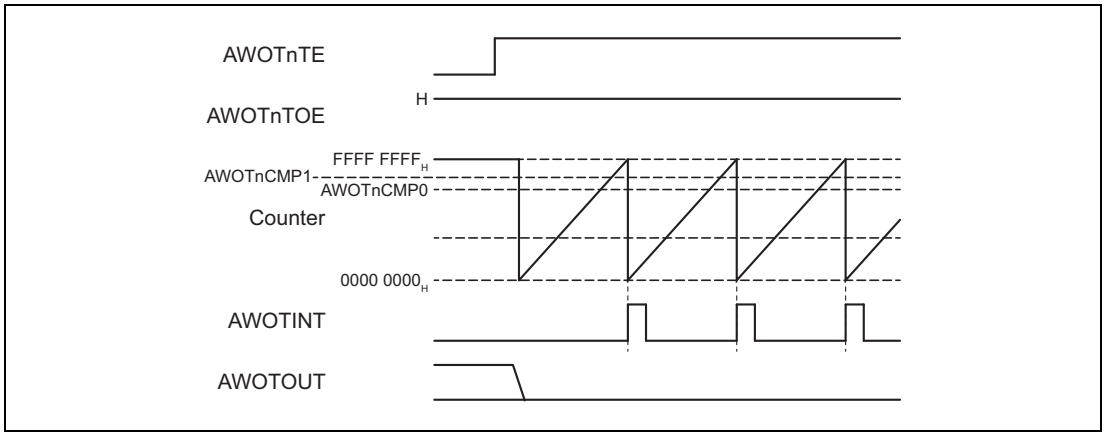

Figure 28.7 PWM mode with 0 % duty cycle

28.4.2 Start and Stop of the AWOTn Operation

28.4.2.1 AWOT disable and registers settings

If the AWOT is disabled (AWOTnCTL.AWOTnTE = 0) all previous register settings become invalid. Thus all registers must be initialized before enabled the AWOT again (AWOTnCTL.AWOTnTE = 1).

28.4.2.2 Start of AWOTn operation

The AWOTn operation is started up properly by the following sequence:

(1) AWOTn must be disabled
All configuration registers must be set up while the AWOTn is disabled, i.e. while AWOTnCTL.AWOTnTE = 0.

(2) Mode dependent registers configuration:
- in interval mode:
interval time AWOTnCCR, enable/disable AWOTOUT by AWOTnTOE
- in PWM mode:
cycle duration AWOTnCMP0, duty cycle AWOTnCMP1, output signal AWOTOUT enable AWOTnTOE = 1.

(3) Set AWOTnCTL register:
- mode selection via AWOTnMD[1:0]
- in capture mode: AWOTIN edge selection via AWOTnTIS
- start operation by AWOTnTE = 1.

Counter start delay

After starting the operation by AWOTnCTL.AWOTnTE = 1 the count operation starts after a delay time of at least three AWOTCLK periods due to synchronization delay of enable signal to AWOTCLK.

28.4.2.3 Stop of AWOTn operation

The AWOTn operation is stopped properly by the following sequence:

(1) Stop operation by AWOTnCTL.AWOTnTE = 0.
After setting AWOTnCTL.AWOTnTE = 0 the AWOTn stops operation after a delay of at least three AWOTCLK periods. Thus make sure to mask the AWOT interrupt before stopping operation.

(2) Disable output signal AWOTOUT (if it was enabled before) by writing AWOTnTOE = 0.
AWOTOUT will output continuous low level.

28.5 Registers

This section contains a description of all registers of the AWOT.

28.5.1 AWOT registers overview

The AWOT is controlled and operated by the following registers:

Table 28.8 AWOT register overview

Register Name	Symbol	Address
Capture compare register	AWOTnCCR	<AWOTn_base>
Compare register 0	AWOTnCMP0	<AWOTn_base> + 04_H
Compare register 1	AWOTnCMP1	<AWOTn_base> + 08_H
Flag register	AWOTnFLG	<AWOTn_base> + $0C_H$
Status clear register	AWOTnSTC	<AWOTn_base> + 10_H
Control register	AWOTnCTL	<AWOTn_base> + 20_H
Output enable register	AWOTnTOE	<AWOTn_base> + 24_H
Emulation register	AWOTnEMU	<AWOTn_base> + 28_H

<AWOTn_base>

The base addresses <AWOTn_base> of the AWOTn is defined in “Register base addresses <AWOTn_base>” in the section above.

28.5.2 AWOTn control registers details

28.5.2.1 AWOTnCTL – Control register

This register is used to enable the AWOT operation, select its operation mode and the valid edge for the capture signal.

Access: This register can be accessed in 8-bit units.

Address: <AWOTn_base> + 20_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	AWOTnTE	–	–	–	AWOTnTIS	–	AWOTnMD[1:0]	
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R	R/W	R/W

Table 28.9 AWOTnCTL register contents

Bit position	Bit name	Function
7	AWOTnTE	Enable/disable control 0: AWOT disabled 1: AWOT enabled
6 to 4	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset
3	AWOTnTIS	Capture input AWOTIN valid edge selection 0: falling edge 1: rising edge
2	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset
1 to 0	AWOTnMD[1:0]	Operation mode selection 00_B: interval timer mode 01_B: capture mode $1x_B$: PWM mode

NOTES

1. If the AWOT is disabled (AWOTnCTL.AWOTnTE = 0) all previous register settings become invalid.
   Thus all registers must be initialized before enabling the AWOT again (AWOTnCTL.AWOTnTE = 1).
2. After writing the AWOTnTE value it can take up to three AWOTCLK periods until the setting becomes effective.
   The interrupt AWOTINT should be masked before AWOTnTE is set to 0.
3. The output AWOTOUT keeps it's current state after writing AWOTnTE = 0.

28.5.2.2 AWOTnTOE – Output enable register

This register is used to enable or disable the AWOT output signal AWOTOUT in interval and PWM mode.

Access: This register can be accessed in 8-bit units.

Address: <AWOTn_base> + 24_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	AWOTnTOE
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 28.10 AWOTnTOE register contents

Bit position	Bit name	Function
7 to 1	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset
0	AWOTnTOE	Output AWOTOUT control 0: AWOTOUT disabled (fixed to low level) 1: AWOTOUT output enabled

NOTE

The output AWOTOUT is not automatically disabled (fixed to low level) after writing AWOTnTE = 0.

28.5.2.3 AWOTnFLG – Flag register

This register provides various AWOT status information in capture mode.

Access: This register can be accessed in 8-bit units.

Address: <AWOTn_base> + $0C_H$

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	AWOTnRPF	–	–	–	–	–	–	AWOTnOVF
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 28.11 AWOTnFLG register contents

Bit position	Bit name	Function
7	AWOTnRPF	AWOTnCCR read status 0: AWOTNCCR not ready to read 1: AWOTNCCR ready to read To clear AWOTnRPF use the AWOTnSTC register.
6 to 1	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset
0	AWOTnOVF	Counter overflow 0: Counter did not overflow 1: Counter overflow AWOTnOVF is cleared or set with a valid edge of the capture input signal AWOTIN.

28.5.2.4 AWOTnSTC – Status clear register

This register allows to clear the AWOTnCCR read status bit of the flag register AWOTnFLG.

Access: This register can be accessed in 8-bit units.

Address: <AWOTn_base> + 10_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	AWOTnCLRP	–	–	–	–	–	–	–
Initial value	0	0	0	0	0	0	0	0
R/W	W	R	R	R	R	R	R	R

Table 28.12 AWOTnSTC register contents

Bit position	Bit name	Function
7	AWOTnCLRP	Clear AWOTnFLG.AWOTnRPF flag 0: no function 1: clear AWOTnFLG.AWOTnRPF
6 to 0	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset

28.5.2.5 AWOTnCCR – Capture compare register

This register

- defines the cycle duration in AWOT interval timer mode
- holds the capture mode result in capture mode

Access: This register can be accessed in 32-bit units.

Address: <AWOTn_base>

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AWOTnCCR[31:16]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AWOTnCCR[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 28.13 AWOTnCCR register contents

Bit position	Bit name	Function
31 to 0	AWOTn CCR[31:0]	The function of this register depends on the AWOTn operation mode, selected by the AWOTnCTL.AWOTnMD[1:0]: • AWOTnMD[1:0] = 00_B: interval timer mode This register defines the interval time in AWOTCLK cycles. • AWOTnMD[1:0] = 01_B: capture mode This register holds the capture result. • AWOTnMD[1:0] = $1x_B$: PWM modes This register has no function.

CAUTIONS

1. **Reading the AWOTnCCR register in capture mode requires to confirm AWOTnFLG.AWOTnRPF = 1.**
   Refer to Section 28.4.1.2, Capture mode (AWOTnCTL.AWOTnMD[1:0] = 01B) for further details.
2. **Writing to this register is prohibited in PWM mode. The AWOT operation is undefined if this register is written when AWOTnMD[1:0] = $1x_B$ (PWM mode).**

NOTE

This register may only be written when the AWOT is disabled (AWOTnCTL.AWOTnTE = 0).

28.5.2.6 AWOTnCMP0 – Compare register 0

This register is used to define the cycle duration of a PWM signal.

Access: This register can be accessed in 16-bit units.

Address: <AWOTn_base> + 04_H

Initial value: 0000_H

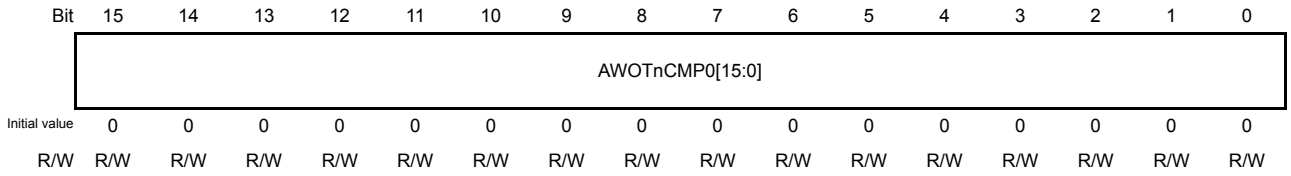

Table 28.14 AWOTnCMP0 register contents

Bit position	Bit name	Function
15 to 0	AWOTn CMP0[15:0]	Cycle duration of a PWM signal. • AWOTnMD[1:0] = $0x_B$: non-PWM modes This register has no function. • AWOTnMD[1:0] = $1x_B$: PWM mode This register defines the PWM cycle duration. PWM cycle duration = (AWOTnCMP0 + 1) AWOTCLK clock periods

CAUTION

Writing to this register is prohibited in any other than PWM mode. The AWOT operation is undefined if this register is written when AWOTnMD[1:0] = $0x_B$ (non PWM mode).

NOTE

This register may only be written when the AWOT is disabled (AWOTnCTL.AWOTnTE = 0).

28.5.2.7 AWOTnCMP1 – Compare register 1

This register is used to define the duty cycle of a PWM signal.

Access: This register can be accessed in 16-bit units.

Address: <AWOTn_base> + 08_H

Initial value: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AWOTnCMP1[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 28.15 AWOTnCMP1 register contents

Bit position	Bit name	Function
15 to 0	AWOTn CMP1[15:0]	Duty cycle of a PWM signal. • AWOTnMD[1:0] = $0x_B$: non-PWM modes This register has no function. • AWOTnMD[1:0] = $1x_B$: PWM modes This register defines the PWM duty cycle. PWM cycle duration = AWOTnCMP1 AWOTCLK clock periods

CAUTION

Writing to this register is prohibited in any other than PWM mode. The AWOT operation is undefined if this register is written when AWOTnMD[1:0] = $0x_B$ (non PWM mode).

NOTE

This register may only be written when the AWOT is disabled (AWOTnCTL.AWOTnTE = 0).

28.5.2.8 AWOTnEMU – Emulation register

This register controls whether the AWOTn can be stopped during emulation, for instance upon a breakpoint hit.

Access: This register can be accessed in 8-bit units.

Address: <AWOTn_base> + 28_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	AWOTnSVSDIS	–	–	–	–	–	–	–
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 28.16 AWOTnEMU register contents

Bit position	Bit name	Function
7	AWOTn SVSDIS	Emulation control 0: AWOTn can be stopped during emulation 1: AWOTn continuous operating during emulation
6 to 0	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset

Section 29 Timer Array Unit B (TAUB)

This section contains a generic description of the timer array unit B (TAUB).

The first part in this section describes all RH850/D1L/D1M specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the TAUB.

29.1 Features of RH850/D1L/D1M TAUB

29.1.1 Number of Units and Channels

This microcontroller has the following number of TAUB units.

Table 29.1 Number of Units

Product Name	All products
Number of Units	3
Name	TAUBn (n = 0 to 2)

TAUBn has the following number of channels of timers.

Table 29.2 Index

Index	Meaning
n	Throughout this section, the individual TAUB units are identified by the index “n”; for example, TAUBnTOM is the TAUBn channel output mode register.
m	The TAUB has 16 channels. Throughout this section, the individual channels are identified by the index “m” (m = 0 to 15), thus a certain channel is denoted as CHm. The even numbered channels (m = 0, 2, 4, 6, 8, 10, 12, 14) are denoted as CHm_even. The odd numbered channels (m = 1, 3, 5, 7, 9, 11, 13, 15) are denoted as CHm_odd.

29.1.2 Register Base Addresses

TAUBn base addresses are listed in the following table.

TAUBn register addresses are given as offsets from the base addresses in general.

Table 29.3 Register Base Addresses <TAUBn_base>

Name	Base Address
<TAUB0_base>	FFE3 0000_H
<TAUB1_base>	FFE3 1000_H
<TAUB2_base>	FFE3 2000_H

29.1.3 Clock Supply

The TAUBn clock supply is shown in the following table.

Table 29.4 TAUBn Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
TAUB0	PCLK	C_ISO_TAUB01
TAUB1	PCLK	C_ISO_TAUB01
TAUB2	PCLK	C_ISO_TAUB2

29.1.4 Interrupt Requests

TAUBn interrupt requests are listed in the following table.

Table 29.5 Interrupt Requests (1/3)

TAUBn signals	Function	Connected to
TAUB0:		
INTTAUB0I0	Channel 0 interrupt	Interrupt Controller INTTAUB0I0 DMA Controller trigger ID 35
INTTAUB0I1	Channel 1 interrupt	Interrupt Controller INTTAUB0I1 DMA Controller trigger ID 36
INTTAUB0I2	Channel 2 interrupt	Interrupt Controller INTTAUB0I2 DMA Controller trigger ID 37
INTTAUB0I3	Channel 3 interrupt	Interrupt Controller INTTAUB0I3 DMA Controller trigger ID 38
INTTAUB0I4	Channel 4 interrupt	Interrupt Controller INTTAUB0I4 DMA Controller trigger ID 39
INTTAUB0I5	Channel 5 interrupt	Interrupt Controller INTTAUB0I5 DMA Controller trigger ID 40
INTTAUB0I6	Channel 6 interrupt	Interrupt Controller INTTAUB0I6 DMA Controller trigger ID 41
INTTAUB0I7	Channel 7 interrupt	Interrupt Controller INTTAUB0I7 DMA Controller trigger ID 42
INTTAUB0I8	Channel 8 interrupt	Interrupt Controller INTTAUB0I8 DMA Controller trigger ID 43
INTTAUB0I9	Channel 9 interrupt	Interrupt Controller INTTAUB0I9 DMA Controller trigger ID 44
INTTAUB0I10	Channel 10 interrupt	Interrupt Controller INTTAUB0I10 DMA Controller trigger ID 45
INTTAUB0I11	Channel 11 interrupt	Interrupt Controller INTTAUB0I11 DMA Controller trigger ID 46
INTTAUB0I12	Channel 12 interrupt	Interrupt Controller INTTAUB0I12 DMA Controller trigger ID 47
INTTAUB0I13	Channel 13 interrupt	Interrupt Controller INTTAUB0I13 DMA Controller trigger ID 48
INTTAUB0I14	Channel 14 interrupt	Interrupt Controller INTTAUB0I14 DMA Controller trigger ID 49
INTTAUB0I15	Channel 15 interrupt	Interrupt Controller INTTAUB0I15 DMA Controller trigger ID 50

Table 29.5 Interrupt Requests (2/3)

TAUBn signals	Function	Connected to
TAUB1:		
INTTAUB1I0	Channel 0 interrupt	Interrupt Controller INTTAUB1I0 DMA Controller trigger ID 51
INTTAUB1I1	Channel 1 interrupt	Interrupt Controller INTTAUB1I1 DMA Controller trigger ID 52
INTTAUB1I2	Channel 2 interrupt	Interrupt Controller INTTAUB1I2 DMA Controller trigger ID 53
INTTAUB1I3	Channel 3 interrupt	Interrupt Controller INTTAUB1I3 DMA Controller trigger ID 54
INTTAUB1I4	Channel 4 interrupt	Interrupt Controller INTTAUB1I4 DMA Controller trigger ID 55
INTTAUB1I5	Channel 5 interrupt	Interrupt Controller INTTAUB1I5 DMA Controller trigger ID 56
INTTAUB1I6	Channel 6 interrupt	Interrupt Controller INTTAUB1I6 DMA Controller trigger ID 57
INTTAUB1I7	Channel 7 interrupt	Interrupt Controller INTTAUB1I7 DMA Controller trigger ID 58
INTTAUB1I8	Channel 8 interrupt	Interrupt Controller INTTAUB1I8 DMA Controller trigger ID 59
INTTAUB1I9	Channel 9 interrupt	Interrupt Controller INTTAUB1I9 DMA Controller trigger ID 60
INTTAUB1I10	Channel 10 interrupt	Interrupt Controller INTTAUB1I10 DMA Controller trigger ID 61
INTTAUB1I11	Channel 11 interrupt	Interrupt Controller INTTAUB1I11 DMA Controller trigger ID 62
INTTAUB1I12	Channel 12 interrupt	Interrupt Controller INTTAUB1I12 DMA Controller trigger ID 63
INTTAUB1I13	Channel 13 interrupt	Interrupt Controller INTTAUB1I13 DMA Controller trigger ID 64
INTTAUB1I14	Channel 14 interrupt	Interrupt Controller INTTAUB1I14 DMA Controller trigger ID 65
INTTAUB1I15	Channel 15 interrupt	Interrupt Controller INTTAUB1I15 DMA Controller trigger ID 66

Table 29.5 Interrupt Requests (3/3)

TAUBn signals	Function	Connected to
TAUB2:		
INTTAUB2I0	Channel 0 interrupt	Interrupt Controller INTTAUB2I0 DMA Controller trigger ID 67
INTTAUB2I1	Channel 1 interrupt	Interrupt Controller INTTAUB2I1 DMA Controller trigger ID 68
INTTAUB2I2	Channel 2 interrupt	Interrupt Controller INTTAUB2I2 DMA Controller trigger ID 69
INTTAUB2I3	Channel 3 interrupt	Interrupt Controller INTTAUB2I3 DMA Controller trigger ID 70
INTTAUB2I4	Channel 4 interrupt	Interrupt Controller INTTAUB2I4 DMA Controller trigger ID 71

INTTAUB2I13	Channel 13 interrupt	Interrupt Controller INTTAUB2I13 DMA Controller trigger ID 80
INTTAUB2I14	Channel 14 interrupt	Interrupt Controller INTTAUB2I14 DMA Controller trigger ID 81
INTTAUB2I15	Channel 15 interrupt	Interrupt Controller INTTAUB2I15 DMA Controller trigger ID 82

29.1.5 Reset Sources

TAUBn reset sources are listed in the following table. TAUBn is initialized by these reset sources.

Table 29.6 Reset Sources

Unit Name	Reset Source
TAUBn	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

29.1.6 External I/O Signals

External input/output signals of TAUBn are listed below.

Table 29.7 External I/O Signals (1/3)

TAUB Signals	Function	Alternative Port Pin Signal
TAUB0		
TAUBTTIN0	Channel 0 input	Port TAUB0I0*1*4
TAUBTTIN1	Channel 1 input	Port TAUB0I1*1
TAUBTTIN2	Channel 2 input	Port TAUB0I2*1
TAUBTTIN3	Channel 3 input	Port TAUB0I3*1
TAUBTTIN4	Channel 4 input	Port TAUB0I4*1*4
TAUBTTIN5	Channel 5 input	Port TAUB0I5*1
TAUBTTIN6	Channel 6 input	Port TAUB0I6*1
TAUBTTIN7	Channel 7 input	Port TAUB0I7*1
TAUBTTIN8	Channel 8 input	Port TAUB0I8*1*3
TAUBTTIN9	Channel 9 input	Port TAUB0I9*1
TAUBTTIN10	Channel 10 input	Port TAUB0I10*1
TAUBTTIN11	Channel 11 input	Port TAUB0I11*1
TAUBTTIN12	Channel 12 input	Port TAUB0I12*1*3
TAUBTTIN13	Channel 13 input	Port TAUB0I13*1
TAUBTTIN14	Channel 14 input	Port TAUB0I14*1
TAUBTTIN15	Channel 15 input	Port TAUB0I15*1

TAUBTTIN8	Channel 8 input	Port TAUB2I8*1
TAUBTTIN9	Channel 9 input	Port TAUB2I9*1
TAUBTTIN10	Channel 10 input	Port TAUB2I10*1
TAUBTTIN11	Channel 11 input	Port TAUB2I11*1
TAUBTTIN12	Channel 12 input	Port TAUB2I12*1
TAUBTTIN13	Channel 13 input	Port TAUB2I13*1
TAUBTTIN14	Channel 14 input	Port TAUB2I14*1
TAUBTTIN15	Channel 15 input	Port TAUB2I15*1
TAUBTTOUT0	Channel 0 output	Port TAUB2O0
TAUBTTOUT1	Channel 1 output	Port TAUB2O1

Table 29.7 External I/O Signals (3/3)

TAUB Signals	Function	Alternative Port Pin Signal
TAUBTTOUT2	Channel 2 output	Port TAUB2O2
TAUBTTOUT3	Channel 3 output	Port TAUB2O3
TAUBTTOUT4	Channel 4 output	Port TAUB2O4
TAUBTTOUT5	Channel 5 output	Port TAUB2O5
TAUBTTOUT6	Channel 6 output	Port TAUB2O6
TAUBTTOUT7	Channel 7 output	Port TAUB2O7
TAUBTTOUT8	Channel 8 output	Port TAUB2O8
TAUBTTOUT9	Channel 9 output	Port TAUB2O9
TAUBTTOUT10	Channel 10 output	Port TAUB2O10
TAUBTTOUT11	Channel 11 output	Port TAUB2O11
TAUBTTOUT12	Channel 12 output	Port TAUB2O12
TAUBTTOUT13	Channel 13 output	Port TAUB2O13
TAUBTTOUT14	Channel 14 output	Port TAUB2O14
TAUBTTOUT15	Channel 15 output	Port TAUB2O15 Error Control Module timer input

Note 1. These input signals are passed through a noise filter, refer to the section “Port Filters” in the section “Port Functions”.

Note 2. For availability of these signals, refer to the Section 2.3.2, List of Alternative Function Pins.

Note 3. The TAUB channel below can not use Clock Divide Function, One-Pulse Output Function, TAUBTTINm Input Interval Timer Function among all RH850/D1L/D1M products.
- TAUB0_8, TAUB0_12
- TAUB1_0, TAUB1_4, TAUB1_8

Note 4. The TAUB channel below can not use Clock Divide Function, One-Pulse Output Function, TAUBTTINm Input Interval Timer Function in D1L1, D1L2(H), D1M1(H) and D1M1A.
- TAUB0_0, TAUB0_4

29.1.7 A/D Converter trigger signals

The following TAUBn output signals can be used for triggering an A/D conversion:

Table 29.8 A/D Converter trigger signals

TAUBn unit	Signals	Connected to A/D Converter hardware trigger expansion of scan group			
		SG0	SG1	SG2	SG3
TAUB0	INTTAUB0I2	yes	yes	yes	yes
	INTTAUB0I4	yes	yes	yes	yes
	INTTAUB0I6	yes	yes	yes	yes
	INTTAUB0I8	yes	yes	yes	yes
	INTTAUB0I10	–	–	yes	–
	INTTAUB0I12	–	–	yes	–
	INTTAUB0I14	–	–	yes	–
TAUB1	INTTAUB1I2	yes	yes	yes	yes
	INTTAUB1I4	yes	yes	yes	yes
	INTTAUB1I6	yes	yes	yes	yes
	INTTAUB1I8	yes	yes	yes	yes
	INTTAUB1I10	–	–	yes	–
TAUB2	INTTAUB2I0	yes	yes	–	yes
	INTTAUB2I1	yes	yes	–	yes
	INTTAUB2I2	yes	yes	–	yes
	INTTAUB2I3	yes	yes	–	yes

29.1.8 XOR Compare Unit check of TAUB output signals

The following TAUBn output signals can be checked by the XOR Compare Unit:

- TAUB0: TAUB0O1, TAUB0O3, TAUB0O5, TAUB0O7, TAUB0O9, TAUB0O11, TAUB0O13
- TAUB1: TAUB1O1, TAUB1O3, TAUB1O5, TAUB1O7, TAUB1O9

29.2 Overview

29.2.1 Features Summary

The TAUB has the following functions:

- Independent channel operation function (operated using a single channel)
- Synchronous channel operation function (operated using a master channel and multiple slave channels)

The TAUB is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 16 channels, each equipped with a 16-bit counter TAUBnCNTm and a 16-bit data register TAUBnCDRm to hold the start or compare value of the counter.

It also contains several control and status registers.

Independent and synchronous operation

Every channel can operate either independently or in combination with other channels (synchronously) When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, it can be operated independent of all other channels. The synchronous operation function is implemented using a combination of channel groups (consisted of master and slave channels).

Several rules apply to the settings of channels.

29.2.2 Terms

In this section, the following terms are used:

- Independent channel operation function/synchronous operation channel operation function

  TAUB has 16 channels, and provides an independent channel operation function that individual channels operate independently and a synchronous channel operation function that is implemented using a combination of channels.

  – The independent channel operation function can use any channel independent of all other channels.
  – The synchronous channel operation function is implemented using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

- Channel group

  In the synchronous channel operation function, all channels that depend on each other are referred to as a “channel group”.
  A channel group has one master channel and one or more slave channels.

- Upper/lower channel

  Depending on the channel number m, a channel with a smaller number or with a larger number is referred to as “upper” or “lower” channel, respectively.

– Upper channel: Channel with a smaller channel number
– Lower channel: Channel with a larger channel number

Example:
For channel 5, channel 3 is an upper channel and channel 9 is a lower channel. Channel 0 is the highest channel and channel 15 is the lowest channel.

The following describes the functional blocks:

Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK3 are derived from PCLK by a configurable prescaler division factor of 2^0 to 2^{15}.

Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)
- TAUBTTINm input signal valid edge

Controller

The controller controls the main operations of the counter:

- Operating mode (selected with the TAUBnCMORm.TAUBnMD[4:0] bits)
- Counter start enable (TAUBnTS. TAUBnTSm) and counter stop (TAUBnTT. TAUBnTTm) When counter start is enabled, status flag TAUBnTE. TAUBnTEm is set.
- Count direction (up/down) (can be controlled by the master channel)

Trigger selector

The counter starts automatically when it is enabled (TAUBnTE.TAUBnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger:

- INTTAUBnIm from the master or any upper channel
- Up/down output trigger signal of the master channel
- Dead-time output signal of the TAUBTTOUTm generation unit.

Simultaneous rewrite controller

Simultaneous rewrite control is a special function that can be used in synchronous operation functions. The data registers of all channels in a channel group (TAUBnCDRm) can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time

TAUBnTO Controller

The output control of every channel enables the generation of various output signal forms such as PWM signals or triangular waves

29.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

Table 29.9 Functional List of TAUB Operations

Operation Function	Setting Example
Independent Channel Operation Functions	**Section 29.12**
Interval Timer Function	**Section 29.12.1**

29.2.4 Input/Output Interrupt Request Signals

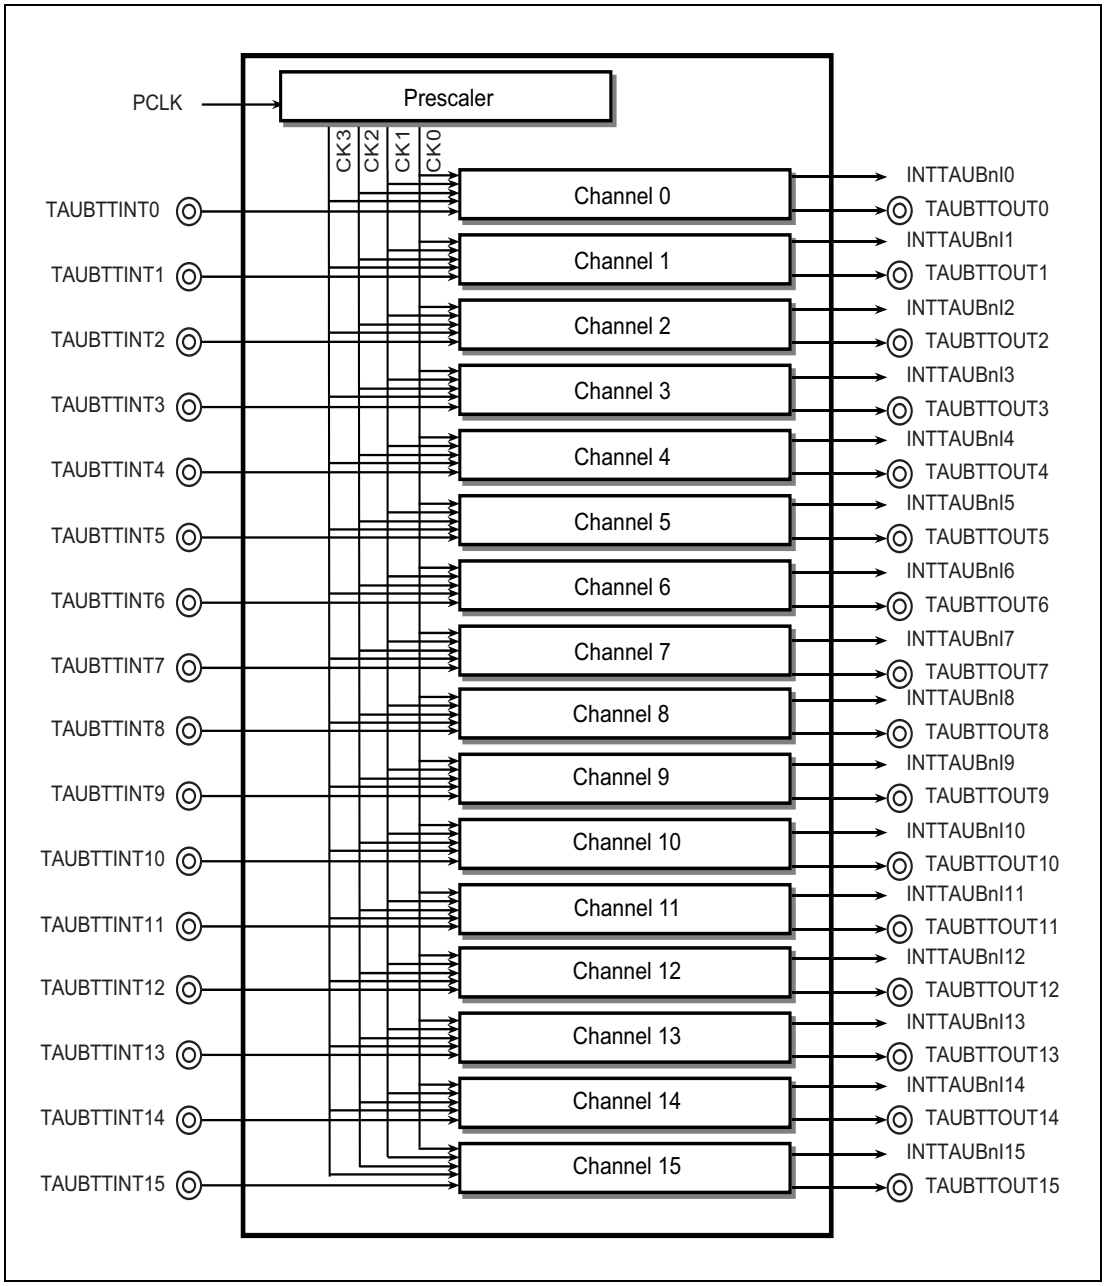

Figure 29.1 TAUB Input/Output and Interrupt Request Signals

29.2.5 Block Diagram

The following figure shows the main components of the TAUB.

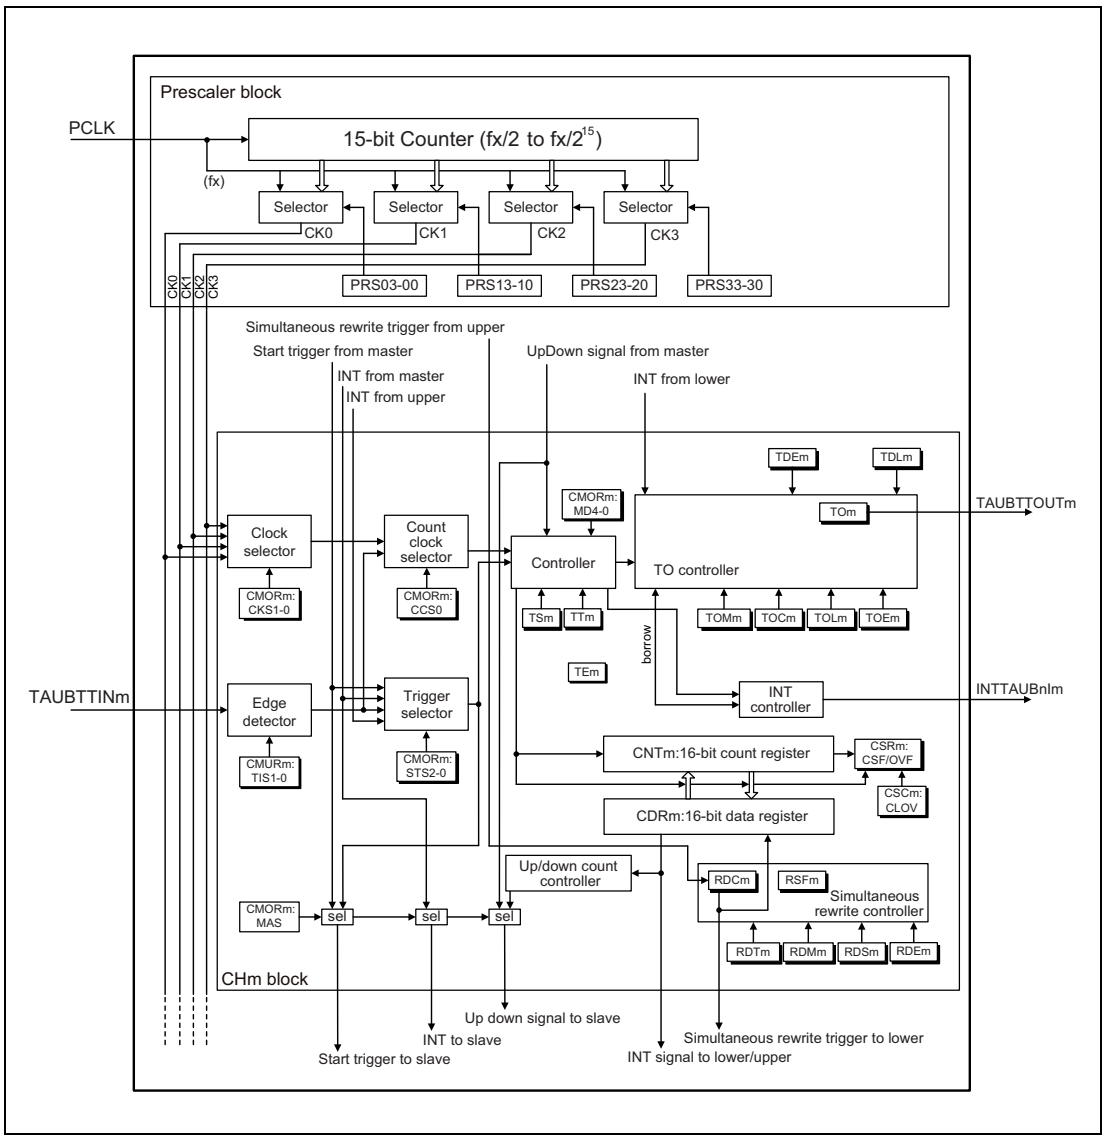

Figure 29.2 Block Diagram of the TAUB

The prefix “TAUBn” has been omitted from the register names for the sake of clarity in the above figure.

29.2.6 Description of Blocks

The following describes the functional blocks:

Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK3 are derived from PCLK by a configurable prescaler division factor of 2^0 to 2^{15}.

Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)
- TAUBTTINm input signal valid edge

Controller

The controller controls the main operations of the counter:

- Operation mode (selected by bits TAUBnCMORm.TAUBnMD[4:0])
- Counter start enable (TAUBnTS.TAUBnTSm) and counter stop (TAUBnTT.TAUBnTTm)
  When counter start is enabled, status flag TAUBnTE.TAUBnTEm is set.
- Count direction (up/down) (can be controlled by master channel)

Trigger selector

Depending on the selected operation mode, the counter starts automatically when it is enabled (TAUBnTE.TAUBnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger:

- Effective TAUBTTINm input edge
- INTTAUBnIm from the master or any upper channel
- Up/down output trigger signal of the master channel
- Dead-time output signal of the TAUBTTOUTm generation unit

Simultaneous rewrite controller

Simultaneous rewrite control is a special function that can be used in synchronous operation functions. The data registers (TAUBnCDRm) of all channels in a channel group can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

TAUBnTO controller

The output control of every channel enables the generation of various output signal forms such as PWM signals or triangular waves.

29.3 Registers

29.3.1 List of Registers

TAUB registers are listed in the following table.

For details about <TAUBn_base>, see Section 29.1.2, Register Base Addresses.

Table 29.10 List of Registers

Module Name	Register Name	Symbol	Address
TAUBn prescaler registers			
TAUBn	TAUBn prescaler clock select register	TAUBnTPS	<TAUBn_base> + 240_H
TAUBn control registers			
TAUBn	TAUBn channel data register m	TAUBnCDRm	<TAUBn_base> + 0_H + m × 4_H
TAUBn	TAUBn channel counter register m	TAUBnCNTm	<TAUBn_base> + 80_H + m × 4_H
TAUBn	TAUBn channel mode OS register m	TAUBnCMORm	<TAUBn_base> + 200_H + m × 4_H
TAUBn	TAUBn channel mode user register m	TAUBnCMURm	<TAUBn_base> + $C0_H$ + m × 4_H
TAUBn	TAUBn channel status register m	TAUBnCSRm	<TAUBn_base> + 140_H + m × 4_H
TAUBn	TAUBn channel status clear trigger register m	TAUBnCSCm	<TAUBn_base> + 180_H + m × 4_H
TAUBn	TAUBn channel start trigger register	TAUBnTS	<TAUBn_base> + $1C4_H$
TAUBn	TAUBn channel enable status register	TAUBnTE	<TAUBn_base> + $1C0_H$
TAUBn	TAUBn channel stop trigger register	TAUBnTT	<TAUBn_base> + $1C8_H$
TAUBn output registers			
TAUBn	TAUBn channel output enable register	TAUBnTOE	<TAUBn_base> + $5C_H$
TAUBn	TAUBn channel output register	TAUBnTO	<TAUBn_base> + 58_H
TAUBn	TAUBn channel output mode register	TAUBnTOM	<TAUBn_base> + 248_H
TAUBn	TAUBn channel output configuration register	TAUBnTOC	<TAUBn_base> + $24C_H$
TAUBn	TAUBn channel output active level register	TAUBnTOL	<TAUBn_base> + 040_H
TAUBn	TAUBn channel dead time output enable register	TAUBnTDE	<TAUBn_base> + 250_H
TAUBn	TAUBn channel dead time output level register	TAUBnTDL	<TAUBn_base> + 54_H
TAUBn reload data registers			
TAUBn	TAUBn channel reload data enable register	TAUBnRDE	<TAUBn_base> + 260_H
TAUBn	TAUBn channel reload data mode register	TAUBnRDM	<TAUBn_base> + 264_H
TAUBn	TAUBn channel reload data control CH select register	TAUBnRDS	<TAUBn_base> + 268_H
TAUBn	TAUBn channel reload data control register	TAUBnRDC	<TAUBn_base> + $26C_H$
TAUBn	TAUBn channel reload data trigger register	TAUBnRDT	<TAUBn_base> + 44_H
TAUBn	TAUBn channel reload status register	TAUBnRSF	<TAUBn_base> + 48_H
TAUBn emulation register			
TAUBn	TAUBn emulation register	TAUBnEMU	<TAUBn_base> + 290_H

NOTE

In the IO header files, availability of each register depends on whether they can be used by each product. The register has no corresponding function terminal has been removed from the IO header file by 1-bit. For availability of terminals, refer to the Section 2.3.2, List of Alternative Function Pins.

29.3.2 Details of TAUBn Prescaler Registers

29.3.2.1 TAUBnTPS — TAUBn Prescaler Clock Select Register

This register specifies the PCLK predeclares for clocks CK0, CK1, CK2, and CK3 for all channels.

Access: This register can be read/written in 16-bit units.

Address: <TAUBn_base> + 240_H

Value after reset: $FFFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnPRS3[3:0]				TAUBnPRS2[3:0]				TAUBnPRS1[3:0]				TAUBnPRS0[3:0]			
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.11 TAUBnTPS Register Contents (1/3)

Bit Position	Bit Name	Function
15 to 12	TAUBnPRS3 [3:0]	Specifies the CK3 clock.

TAUBnPRS3[3:0]	CK3 clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

These bits can only be rewritten when all counters using CK3 are stopped (TAUBnTE.TAUBnTEm = 0).

Table 29.11 TAUBnTPS Register Contents (2/3)

Bit Position	Bit Name	Function
11 to 8	TAUBnPRS2 [3:0]	Specifies the CK2 clock.

TAUBnPRS2[3:0]	CK2 Clock
0000_B	$PCLK/2^0$
0001_B	$PCLK/2^1$
0010_B	$PCLK/2^2$
0011_B	$PCLK/2^3$
0100_B	$PCLK/2^4$
0101_B	$PCLK/2^5$
0110_B	$PCLK/2^6$
0111_B	$PCLK/2^7$
1000_B	$PCLK/2^8$
1001_B	$PCLK/2^9$
1010_B	$PCLK/2^{10}$
1011_B	$PCLK/2^{11}$
1100_B	$PCLK/2^{12}$
1101_B	$PCLK/2^{13}$
1110_B	$PCLK/2^{14}$
1111_B	$PCLK/2^{15}$

These bits can only be rewritten when all counters using CK2 are stopped (TAUBnTE.TAUBnTEm = 0).

7 to 4	TAUBnPRS1 [3:0]	Specifies the CK1 clock.

TAUBnPRS1[3:0]	CK1 Clock
0000_B	$PCLK/2^0$
0001_B	$PCLK/2^1$
0010_B	$PCLK/2^2$
0011_B	$PCLK/2^3$
0100_B	$PCLK/2^4$
0101_B	$PCLK/2^5$
0110_B	$PCLK/2^6$
0111_B	$PCLK/2^7$
1000_B	$PCLK/2^8$
1001_B	$PCLK/2^9$
1010_B	$PCLK/2^{10}$
1011_B	$PCLK/2^{11}$
1100_B	$PCLK/2^{12}$
1101_B	$PCLK/2^{13}$
1110_B	$PCLK/2^{14}$
1111_B	$PCLK/2^{15}$

These bits can only be rewritten when all counters using CK1 are stopped (TAUBnTE.TAUBnTEm = 0).

Table 29.11 TAUBnTPS Register Contents (3/3)

Bit Position	Bit Name	Function
3 to 0	TAUBnPRS0 [3:0]	Specifies the CK0 clock.

TAUBnPRS0[3:0]	CK0 Clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

These bits can only be rewritten when all counters using CK0 are stopped (TAUBnTE.TAUBnTEm = 0).

NOTE

The TAUBn clock input PCLK is specified in the first part of this section, Section 29.1.3, Clock Supply.

29.3.3 Details of TAUBn Control Registers

29.3.3.1 TAUBnCDRm — TAUBn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operation mode specified in TAUBnCMORm.TAUBnMD[4:1].

Access: This register can be read/written in 16-bit units.
- When this register functions as a capture register, only reading is possible. Write operation is ignored.
- When this register functions as a compare register, reading and writing is possible.

Address: <TAUBn_base> + m × 4_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.12 TAUBnCDRm Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnCDR [15:0]	Data register for the capture/compare value.

29.3.3.2 TAUBnCNTm — TAUBn Channel Counter Register

This register is the channel m counter register.

Access: This register can only be read in 16-bit units.

Address: <TAUBn_base> + 80_H + m × 4_H

Value after reset: $FFFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCNT[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.13 TAUBnCNTm Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnCNT [15:0]	16-bit counter value.

The read value depends on the counter, the operation mode change, and the values of the TAUBnTS.TAUBnTSm and TAUBnTT.TAUBnTTm bits.

The initial counter read value depends on the operation mode and how the counter was stopped:

- by a reset
- by a counter stop trigger (TAUBnTT.TAUBnTTm = 1)

The following table lists the initial counter read values after the counter has stopped (TAUBnTE.TAUBnTEm = 0) and re-enabled (TAUBnTS.TAUBnTSm = 1).

The table also contains the counter read value one count after the counter is enabled (TAUBnTS.TAUBnTSm = 1) for modes where the counter waits for a start trigger.

Table 29.14 TAUBnCNTm Read Values after Re-Enabling Counter

		TAUBnCNTm		
Mode Name	Count Method (Up/Down)	Start Value*1	After Stop Trigger	After One Count
Interval timer mode	Count down	$FFFF_H$	Stop value	—
Judge mode	Count down	$FFFF_H$	Stop value	—
Capture mode	Count up	0000_H	Stop value	—
Event count mode	Count down	$FFFF_H$	Stop value	—
One-count mode	Count down	$FFFF_H$	Stop value	Stop value
Capture and one-count mode	Count up	0000_H	Stop value	Capture value + 1 (TAUBnCDRm)
Judge and one-count mode	Count down	$FFFF_H$	Stop value	TAUBnCNTm value – 1
Count-up/-down mode	Count up/down	$FFFF_H$	Stop value	—
Pulse one-count mode	Count down	$FFFF_H$	Stop value	0000_H
Count capture mode	Count up	0000_H	Stop value	—
Gate count mode	Count down	$FFFF_H$	Stop value	Stop value
Capture and gate count mode	Count up	0000_H	Stop value	Stop value

Note 1. The value set for TAUBnCNTm when operation mode is changed after reset release

29.3.3.3 TAUBnCMORm — TAUBn Channel Mode OS Register

This register controls channel m operation.

Access: This register can be read/written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

Address: <TAUBn_base> + 200_H + m × 4_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS [1:0]		—	TAUBn CCS0	TAUBn MAS	TAUBnSTS[2:0]			TAUBnCOS [1:0]		—	TAUBnMD[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 29.15 TAUBnCMORm Register Contents (1/3)

Bit Position	Bit Name	Function
15, 14	TAUBnCKS [1:0]	Selects the operation clock. The operation clock is used for the TAUBTTINm input edge detection circuit. It can also be used as the count clock of TAUBnCNTm depending on bit TAUBnCMORm.TAUBnCCS0. **TAUBn CKS1 / TAUBn CKS0 / Selected Operation Clock** 0 / 0 / CK0 0 / 1 / CK1 1 / 0 / CK2 1 / 1 / CK3
13	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
12	TAUBnCCS0	Selects the count clock for TAUBnCNTm counter: **TAUBnCCS0 / Selected Count Clock** 0 / Operation clock as specified by TAUBnCMORm.TAUBnCKS[1:0]. 1 / Valid edge of TAUBTTINm input signal
11	TAUBnMAS	Specifies the channel as master or slave channel during synchronous channel operation: 0: Slave 1: Master This bit is only valid for even channels (CHm_even). For odd channels (CHm_odd), it is fixed to 0.

</table>

29.3.3.4 TAUBnCMURm — TAUBn Channel Mode User Register

This register specifies the type of valid edge detection used for the TAUBTTINm input.

Access: This register can be read/written in 8-bit units.

Address: <TAUBn_base> + $C0_H$ + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 29.16 TAUBnCMURm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUBnTIS [1:0]	Specifies the valid edge of the TAUBTTINm input:

TAUBn TIS1	TAUBn TIS0	Description
0	0	Falling edge
0	1	Rising edge
1	0	Rising and falling edges (low-width measurement selection). Start trigger: falling edge Stop trigger (capture): rising edge
1	1	Rising and falling edges (high-width measurement selection). Start trigger: rising edge Stop trigger (capture): falling edge

- Edge detection for TAUBTTINm input signals is performed based on the operation clock selected by TAUBnCMORm.TAUBnCKS[1:0].

29.3.3.5 TAUBnCSRm — TAUBn Channel Status Register

This register indicates the count direction and the overflow status of channel m's counter.

Access: This register can only be read in 8-bit units.

Address: <TAUBn_base> + 140_H + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnCSF	TAUBnOVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 29.17 TAUBnCSRm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	TAUBnCSF	Indicates the count direction: 0: Counts up 1: Counts down The read value of this bit is only valid in the following mode: • Up Down Count mode
0	TAUBnOVF	Indicates the counter overflow status: 0: No overflow occurred 1: Overflow occurred This bit is used only in the following modes: • Capture mode • Capture and one-count mode The function of this bit depends on the setting of control bits TAUBnCMORm.TAUBnCOS[1:0].

29.3.3.6 TAUBnCSCm — TAUBn Channel Status Clear Register

This register is a trigger register for clearing the overflow flag TAUBnCSRm.TAUBnOVF of a channel m.

Access: This register can only be written in 8-bit units. It is always read as 00_H

Address: <TAUBn_base> + 180_H + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUBnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 29.18 TAUBnCSCm Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing to these bits, write the value after reset.
0	TAUBnCLOV	0: No function 1: Clears the overflow flag TAUBnCSRm.TAUBnOVF

29.3.3.7 TAUBnTS — TAUBn Channel Start Trigger Register

This register enables the counter for each channel.

Access: This register can only be written in 16-bit units. It is always read as 0000_H

Address: <TAUBn_base> + $1C4_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnTS15	TAUBnTS14	TAUBnTS13	TAUBnTS12	TAUBnTS11	TAUBnTS10	TAUBnTS09	TAUBnTS08	TAUBnTS07	TAUBnTS06	TAUBnTS05	TAUBnTS04	TAUBnTS03	TAUBnTS02	TAUBnTS01	TAUBnTS00

R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 29.19 TAUBnTS Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTSm	Enables the counter for channel m: 0: No function 1: Enables the counter and sets TAUBnTE.TAUBnTEm = 1. TAUBnTE.TAUBnTEm = 1 only enables counter. Whether the counter starts depends on the selected operation mode.

Note that index m is representing a double-digit number for this register. See above.

29.3.3.8 TAUBnTE — TAUBn Channel Enable Status Register

This register indicates whether counter is enabled or disabled.

Access: This register can only be read in 16-bit units.

Address: <TAUBn_base> + $1C0_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnTE15	TAUBnTE14	TAUBnTE13	TAUBnTE12	TAUBnTE11	TAUBnTE10	TAUBnTE09	TAUBnTE08	TAUBnTE07	TAUBnTE06	TAUBnTE05	TAUBnTE04	TAUBnTE03	TAUBnTE02	TAUBnTE01	TAUBnTE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.20 TAUBnTE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTEm	Indicates whether counter for channel m is enabled or disabled: 0: Counter disabled 1: Counter enabled Setting TAUBnTS.TAUBnTSm to 1 sets this bit to 1. Setting TAUBnTT.TAUBnTTm to 1 resets this bit to 0.

Note that index m is representing a double-digit number for this register. See above.

29.3.3.9 TAUBnTT — TAUBn Channel Stop Trigger Register

This register stops the counter for each channel.

Access: This register can only be written in 16-bit units. It is always read as 0000_H.

Address: <TAUBn_base> + $1C8_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnTT15	TAUBnTT14	TAUBnTT13	TAUBnTT12	TAUBnTT11	TAUBnTT10	TAUBnTT09	TAUBnTT08	TAUBnTT07	TAUBnTT06	TAUBnTT05	TAUBnTT04	TAUBnTT03	TAUBnTT02	TAUBnTT01	TAUBnTT00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 29.21 TAUBnTT Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTTm	Stops the counter of channel m: 0: No function 1: Stops the counter and resets TAUBnTE.TAUBnTEm = 0. TAUBnCNTm, TAUBnTO.TAUBnTOm, and TAUBTTOUTm all retain the values they had before the counter was stopped.

Note that index m is representing a double-digit number for this register. See above.

29.3.4 Details of TAUBn Simultaneous Rewrite Registers

29.3.4.1 TAUBnRDE — TAUBn Channel Reload Data Enable Register

This register enables and disables simultaneous rewrite of the data register TAUBnCDRm/TAUBnTOLm.

Access: This register can be read/written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0.

Address: <TAUBn_base> + 260_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn RDE15	TAUBn RDE14	TAUBn RDE13	TAUBn RDE12	TAUBn RDE11	TAUBn RDE10	TAUBn RDE09	TAUBn RDE08	TAUBn RDE07	TAUBn RDE06	TAUBn RDE05	TAUBn RDE04	TAUBn RDE03	TAUBn RDE02	TAUBn RDE01	TAUBn RDE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.22 TAUBnRDE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDEm	Enables/disables simultaneous rewrite of the data register of channel m: 0: Disables simultaneous rewrite 1: Enabled simultaneous rewrite

Note that index m is representing a double-digit number for this register. See above.

29.3.4.2 TAUBnRDS — TAUBn Channel Reload Data Control Channel Select Register

This register selects the control channel for simultaneous rewrite.

Access: This register can be read/written in 16-bit. It can only be written when TAUBnTE.TAUBnTEm = 0.

Address: <TAUBn_base> + 268_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn RDS15	TAUBn RDS14	TAUBn RDS13	TAUBn RDS12	TAUBn RDS11	TAUBn RDS10	TAUBn RDS09	TAUBn RDS08	TAUBn RDS07	TAUBn RDS06	TAUBn RDS05	TAUBn RDS04	TAUBn RDS03	TAUBn RDS02	TAUBn RDS01	TAUBn RDS00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 29.23 TAUBnRDS Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDSm	Specifies which channel is controlled for the simultaneous rewrite trigger: 0: Master channel 1: Another upper channel

Note that index m is representing a double-digit number for this register. See above.

29.3.4.3 TAUBnRDM — TAUBn Channel Reload Data Mode Register

This register selects when the signal that controls simultaneous rewrite is loaded.

Access: This register can be read/written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0.

Address: <TAUBn_base> + 264_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn RDM15	TAUBn RDM14	TAUBn RDM13	TAUBn RDM12	TAUBn RDM11	TAUBn RDM10	TAUBn RDM09	TAUBn RDM08	TAUBn RDM07	TAUBn RDM06	TAUBn RDM05	TAUBn RDM04	TAUBn RDM03	TAUBn RDM02	TAUBn RDM01	TAUBn RDM00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.24 TAUBnRDM Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDMm	Selects when the signal that triggers simultaneous is generated: 0: When the master channel counter starts counting 1: At the top of a triangle wave cycle These bits only apply when TAUBnRDE.TAUBnRDEm = 1 and TAUBnRDS.TAUBnRDSm = 0.

Note that index m is representing a double-digit number for this register. See above.

29.3.4.4 TAUBnRDC — TAUBn Channel Reload Data Control Register

This register specifies the channel that generates the INTTAUBnIm signal that triggers simultaneous rewrite.

Access: This register can be read/written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0

Address: <TAUBn_base> + $26C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn RDC15	TAUBn RDC14	TAUBn RDC13	TAUBn RDC12	TAUBn RDC11	TAUBn RDC10	TAUBn RDC09	TAUBn RDC08	TAUBn RDC07	TAUBn RDC06	TAUBn RDC05	TAUBn RDC04	TAUBn RDC03	TAUBn RDC02	TAUBn RDC01	TAUBn RDC00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 29.25 TAUBnRDC Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDCm	Specifies whether the channel generates a simultaneous rewrite trigger signal or not. 0: Does not operate as a simultaneous rewrite trigger channel. 1: Operates as a simultaneous rewrite trigger channel. These bits only apply when TAUBnRDE.TAUBnRDEm = 1 and TAUBnRDS.TAUBnRDSm = 1.

Note that index m is representing a double-digit number for this register. See above.

29.3.4.5 TAUBnRDT — TAUBn Channel Reload Data Trigger Register

This register triggers the simultaneous rewrite enabling state.

Access: This register can only be written in 16-bit units. It is always read as 0000_H.

Address: <TAUBn_base> + 044_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn RDT15	TAUBn RDT14	TAUBn RDT13	TAUBn RDT12	TAUBn RDT11	TAUBn RDT10	TAUBn RDT09	TAUBn RDT08	TAUBn RDT07	TAUBn RDT06	TAUBn RDT05	TAUBn RDT04	TAUBn RDT03	TAUBn RDT02	TAUBn RDT01	TAUBn RDT00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 29.26 TAUBnRDT Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDTm	Triggers the simultaneous rewrite enabling state: 0: No function. The operation writing 0 is ignored. 1: The simultaneous rewrite enabling flag (TAUBnRSFm) is set to 1. The system waits for the simultaneous rewrite trigger. These bits only apply when: • TAUBnRDE.TAUBnRDEm = 1

Note that index m is representing a double-digit number for this register. See above.

29.3.4.6 TAUBnRSF — TAUBn Channel Reload Status Register

This flag register indicates the simultaneous rewrite status.

Access: This register can only be read in 16-bit units.

Address: <TAUBn_base> + 048_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn RSF15	TAUBn RSF14	TAUBn RSF13	TAUBn RSF12	TAUBn RSF11	TAUBn RSF10	TAUBn RSF09	TAUBn RSF08	TAUBn RSF07	TAUBn RSF06	TAUBn RSF05	TAUBn RSF04	TAUBn RSF03	TAUBn RSF02	TAUBn RSF01	TAUBn RSF00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.27 TAUBnRSF Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRSFm	Indicates the simultaneous rewrite status: 0: Indicates simultaneous rewrite is completed due to the generation of the simultaneous rewrite trigger. 1: Indicates the simultaneous rewrite trigger waiting state when simultaneous rewrite is enabled (TAUBnRDTm = 1).

Note that index m is representing a double-digit number for this register. See above.

29.3.5 Details of TAUBn Output Registers

29.3.5.1 TAUBnTOE — TAUBn Channel Output Enable Register

This register enables and disables independent channel output mode controlled by software.

Access: This register can be read/written in 16-bit units.

Address: <TAUBn_base> + $5C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn TOE15	TAUBn TOE14	TAUBn TOE13	TAUBn TOE12	TAUBn TOE11	TAUBn TOE10	TAUBn TOE09	TAUBn TOE08	TAUBn TOE07	TAUBn TOE06	TAUBn TOE05	TAUBn TOE04	TAUBn TOE03	TAUBn TOE02	TAUBn TOE01	TAUBn TOE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.28 TAUBnTOE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTOEm	Enables/disables independent channel output mode: 0: Disables independent channel output mode (controlled by software) 1: Enables independent channel output mode

Note that index m is representing a double-digit number for this register. See above.

29.3.5.2 TAUBnTO — TAUBn Channel Output Register

This register specifies and reads the level of TAUBTTOUTm.

Access: This register can be read/written in 16-bit units.

Address: <TAUBn_base> + 58_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn TO15	TAUBn TO14	TAUBn TO13	TAUBn TO12	TAUBn TO11	TAUBn TO10	TAUBn TO09	TAUBn TO08	TAUBn TO07	TAUBn TO06	TAUBn TO05	TAUBn TO04	TAUBn TO03	TAUBn TO02	TAUBn TO01	TAUBn TO00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.29 TAUBnTO Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTOm	Specifies/reads the level of TAUBTTOUTm: 0: Low 1: High Only TAUBnTOm bits for which Independent Channel Output function is disabled (TAUBnTOEm = 0) can be written.

Note that index m is representing a double-digit number for this register. See above.

29.3.5.3 TAUBnTOM — TAUBn Channel Output Mode Register

This register specifies the output mode of each channel.

Access: This register can be read/written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

Address: <TAUBn_base> + 248_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn TOM15	TAUBn TOM14	TAUBn TOM13	TAUBn TOM12	TAUBn TOM11	TAUBn TOM10	TAUBn TOM09	TAUBn TOM08	TAUBn TOM07	TAUBn TOM06	TAUBn TOM05	TAUBn TOM04	TAUBn TOM03	TAUBn TOM02	TAUBn TOM01	TAUBn TOM00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 29.30 TAUBnTOM Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTOMm	Specifies the channel output mode: 0: Independent channel output mode 1: Synchronous channel output mode

Note that index m is representing a double-digit number for this register. See above.

29.3.5.4 TAUBnTOC — TAUBn Channel Output Configuration Register

This register specifies the output mode of each channel in combination with TAUBnTOMm.

Access: This register can be read/written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

Address: <TAUBn_base> + $24C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn TOC15	TAUBn TOC14	TAUBn TOC13	TAUBn TOC12	TAUBn TOC11	TAUBn TOC10	TAUBn TOC09	TAUBn TOC08	TAUBn TOC07	TAUBn TOC06	TAUBn TOC05	TAUBn TOC04	TAUBn TOC03	TAUBn TOC02	TAUBn TOC01	TAUBn TOC00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.31 TAUBnTOC Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTOCm	Specifies the output mode: 0: Operation mode 1 1: Operation mode 2 The output mode also depends on TAUBnTOM.TAUBnTOMm, as can be seen in the following table.

TOMm	TOCm	Description
0	0	Toggle mode: TAUBTTOUTm toggles when INTTAUBnIm occurs.
	1	Set/reset mode: TAUBTTOUTm set when INTTAUBnIm occurs upon count start and reset when INTTAUBnIm occurs due to detection of a match between TAUBnCNTm and TAUBnCDRm.
1	0	Synchronous Channel Operation Mode 1: TAUBTTOUTm set when INT occurs on the master channel and reset when INT occurs on the slave channel.
	1	Synchronous Channel Operation Mode 2: TAUBTTOUTm set when INTTAUBnIm occurs while the slave channel is counting down and reset when INTTAUBnIm occurs while the slave channel is counting up

Note that index m is representing a double-digit number for this register. See above.

29.3.5.5 TAUBnTOL — TAUBn Channel Output Level Register

This register specifies the output logic of the channel output bit (TAUBnTO.TAUBnTOm).

Access: This register can be read/written in 16-bit units.

Address: <TAUBn_base> + 040_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnTOL15	TAUBnTOL14	TAUBnTOL13	TAUBnTOL12	TAUBnTOL11	TAUBnTOL10	TAUBnTOL09	TAUBnTOL08	TAUBnTOL07	TAUBnTOL06	TAUBnTOL05	TAUBnTOL04	TAUBnTOL03	TAUBnTOL02	TAUBnTOL01	TAUBnTOL00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.32 TAUBnTOL Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTOLm	Specifies the output logic of the channel m output bit (TAUBnTO.TAUBnTOm): 0: Positive logic (active high) 1: Negative logic (active low) The setting of these bits applies to all channel output modes other than independent channel output mode controlled by software and independent channel output mode 1.

Note that index m is representing a double-digit number for this register. See above.

29.3.6 Details of TAUBn Dead Time Output Registers

29.3.6.1 TAUBnTDE — TAUBn Channel Dead Time Output Enable Register

This register enables/disables dead time operation for each channel.

Access: This register can be read/written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

Address: <TAUBn_base> + 250_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn TDE15	TAUBn TDE14	TAUBn TDE13	TAUBn TDE12	TAUBn TDE11	TAUBn TDE10	TAUBn TDE09	TAUBn TDE08	TAUBn TDE07	TAUBn TDE06	TAUBn TDE05	TAUBn TDE04	TAUBn TDE03	TAUBn TDE02	TAUBn TDE01	TAUBn TDE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.33 TAUBnTDE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTDEm	Enables/disables dead time control operation of channel m: 0: Disables dead time operation 1: Enables dead time operation The same settings must be set for the even and the odd slave channel that comprise a set. These bits only apply when: • TAUBnTOE.TAUBnTOEm, TAUBnTOM.TAUBnTOMm, TAUBnTOC.TAUBnTOCm = 1

Note that index m is representing a double-digit number for this register. See above.

29.3.6.2 TAUBnTDL — TAUBn Channel Dead Time Output Level Register

This register selects the phase period to which dead time is added.

Access: This register can be read/written in 16-bit units.

Address: <TAUBn_base> + 54_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn TDL15	TAUBn TDL14	TAUBn TDL13	TAUBn TDL12	TAUBn TDL11	TAUBn TDL10	TAUBn TDL09	TAUBn TDL08	TAUBn TDL07	TAUBn TDL06	TAUBn TDL05	TAUBn TDL04	TAUBn TDL03	TAUBn TDL02	TAUBn TDL01	TAUBn TDL00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.34 TAUBnTDL Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTDLm	Selects the phase period to which dead time is added: 0: Positive phase period 1: Negative phase period These bits only apply when: • TAUBnTOE.TAUBnTOEm, TAUBnTOM.TAUBnTOMm, TAUBnTOC.TAUBnTOCm, TAUBnTDE.TAUBnTDEm = 1

Note that index m is representing a double-digit number for this register. See above.

29.3.7 TAUBn Emulation Register

29.3.7.1 TAUBnEMU — TAUBn Emulation Register

This register controls SVSTOP operations.

Access: This register can be read/written in 8-bit units only when TAUBnTE.TEm = 0. This register can be written only while the counter is stopped (TAUBnTE.TAUBnTEm = 0 and EPC.SVSTOP=0).

Address: <TAUBn_base> + 290_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	TAUBnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 29.35 TAUBnEMU Register Contents

Bit Position	Bit Name	Function
7	TAUBnSVSDIS	(When EPC.SVSTOP = 0) Regardless of the value of this bit (1/0), the count clock is continuously supplied when the debugger obtains the control of the microcontroller (e.g., at a breakpoint). (When EPC.SVSTOP = 1) 0: The count clock stops when the debugger obtains the control of the microcontroller (e.g., at a breakpoint). 1: The count clock is continuously supplied when the debugger obtains the control of the microcontroller (e.g., at a breakpoint).
6 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

29.4 General Operating Procedure

The following lists the general operation procedure for the TAUBn:

After reset release, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUBTTOUTm is also initialized and outputs a low level.

1. Set the TAUBnTPS register to specify the clock frequency of CK0 to CK3.
2. Configure the desired TAUBn function:
   - Set the operation mode
   - Set the channel output mode
   - Set any other control bits
3. Enable the counter by setting the TAUBnTS.TAUBnTSm bit to 1.
   The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.
4. If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUBnTT.TAUBnTTm bit to 1. The counter can be forcibly restarted by setting the TAUBnTS.TAUBnTSm bit to 1.
5. Stop the function by setting the TAUBnTT.TAUBnTTm bit to 1.

NOTE

- A detailed description of the required control bits and the operation of the individual functions is given below.
  - Section 29.12, Independent Channel Operation Functions
  - Section 29.14, Synchronous Channel Operation Functions
- The function can be changed while the counter is stopped (TAUBnTE.TAUBnTEm=0).

29.5 Concepts of Synchronous Channel Operation

The synchronous channel operation function is implemented using a combination of channel groups (consisted of master and slave channels).

Several rules apply to the settings of channels.

These rules are detailed in Section 29.5.1, Rules of Synchronous Channel Operation Function.

Two special features for synchronous channel operation are detailed in the following:

- Section 29.5.2, Simultaneous Start and Stop of Synchronous Channel Counters
- Section 29.6, Simultaneous Rewrite

29.5.1 Rules of Synchronous Channel Operation Function

Number of masters and slaves

- Only even channels (CH0, CH2, CH4, …) can be set as master channels.
  Any channel apart from CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and several slave channels can be set for one master channel.
  Example: If CH2 is a master channel, CH3 and the lower channels (CH3, CH4, CH5, …) can be set as slave channels.
- If multiple master channels are used, slave channels cannot cross the master channels.
  Example: If CH0 and CH4 are master channels, CH1 to CH3 can be set as slave channels for CH0, but CH5 to CH15 cannot.

Operation clock

- The same operation clock must be set for the master channel and the synchronized slave channel. This is achieved by setting the same value to the TAUBnCMORm.TAUBnCKS[1:0] bits of the slave and master channel.

The basic concepts of master/slave channel usage and operation clocks are illustrated in the following figure.

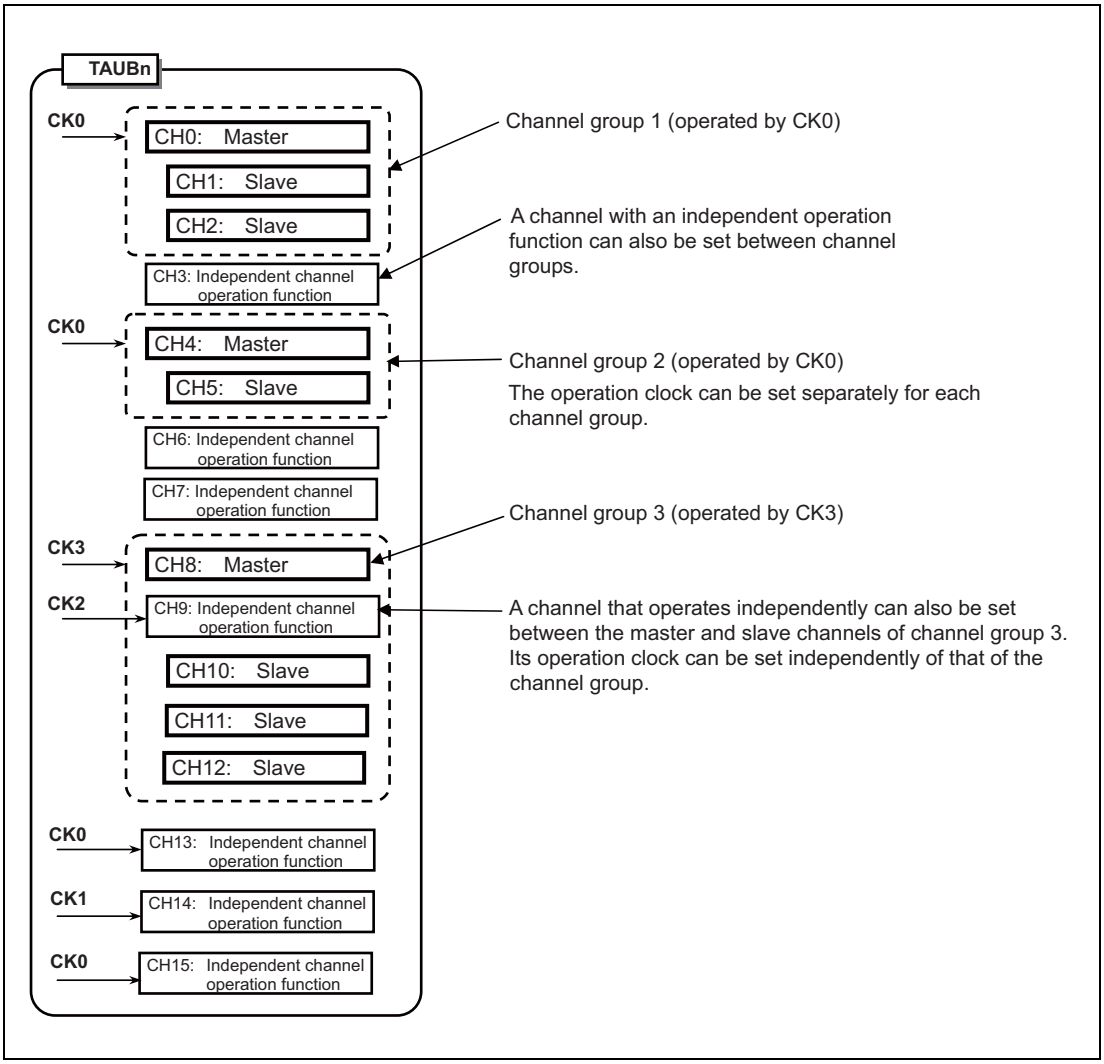

Figure 29.3 Grouping of the Channels and Assignment of Operation Clocks

29.5.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously within the same unit and between the units.

29.5.2.1 Simultaneous Start and Stop within the Same Unit

- To simultaneously start synchronized channels, the TAUBnTS.TAUBnTSm bits of the channels must be set at the same time.
- To simultaneously stop synchronized channels, the TAUBnTT.TAUBnTTm bits of the channels must be set at the same time.

Setting the TAUBnTS.TAUBnTSm bits to 1 sets the corresponding TAUBnTE.TAUBnTEm bits to 1, enabling counting. The exact time that it starts depends on the operation mode.

29.5.2.2 Simultaneous Start between TAUB Units

Counters in different TAUB units can also be started simultaneously if the corresponding counters are enabled before receiving the simultaneous trigger signal.

29.6 Simultaneous Rewrite

29.6.1 Introduction

Simultaneous rewrite describes the ability to change the compare/start value and the output logic of multiple channels at the same time.

The corresponding data and control registers (TAUBnCDRm and TAUBnTOLm) can nevertheless be written at any time. The new value does not affect the counter operation or the output signal until simultaneous rewrite is triggered.

Simultaneous rewrite can be triggered by:

- The counter on the master channel or upper channel (depending on the selected operation mode) reaching a certain value
- INTTAUBnIm being issued on the upper channel specified by TAUBnRDC.TAUBnRDCm

There are three methods for simultaneous rewrite. These are listed in the following table, along with how to specify them and when they cause simultaneous rewrite to be triggered.

Table 29.36 Simultaneous Rewrite Methods and when They are Triggered

Method	Simultaneous Rewrite Triggered when	TAUBnRDE.TAUBnRDEm	TAUBnRDS.TAUBnRDSm	TAUBnRDM.TAUBnRDMm
—	No simultaneous rewrite	0	0	0
A	The master channel (re)starts counting	1	0	0
B	Counting is started in the master channel. The master channel starts counting down at the peak of triangular wave of the corresponding slave channel.	1	0	1
C1	INTTAUBnIm is generated on an upper channel specified by TAUBnRDC.TAUBnRDCm	1	1	0/1

The following table lists which of these three methods is available for each channel operation function. For more information about the individual channel operation functions, see the corresponding sections in **Section 29.13, Independent Channel Simultaneous Rewrite Functions** and Section 29.14, Synchronous Channel Operation Functions.

Table 29.37 Simultaneous Rewrite Methods and when They are Triggered

Functions	A	B	C	TAUBnTOL.TAUBnTOLm
Simultaneous Rewrite Trigger Output Function Type 1			X	
PWM Output Function	X		X	X
One-Shot Pulse Output Function	X			
Delay Pulse Output Function	X			
Triangle PWM Output Function		X	X	X
Triangle PWM Output Function with Dead Time		X	X	
AD Conversion Trigger Output Function Type 1	X		X	
AD Conversion Trigger Output Function Type 2		X	X	

29.6.2 How to Control Simultaneous Rewrite

The following figure shows the general procedure for simultaneous rewrite.
The three main blocks (Initial settings, Start counter & count operation, and Simultaneous rewrite) are explained afterwards.

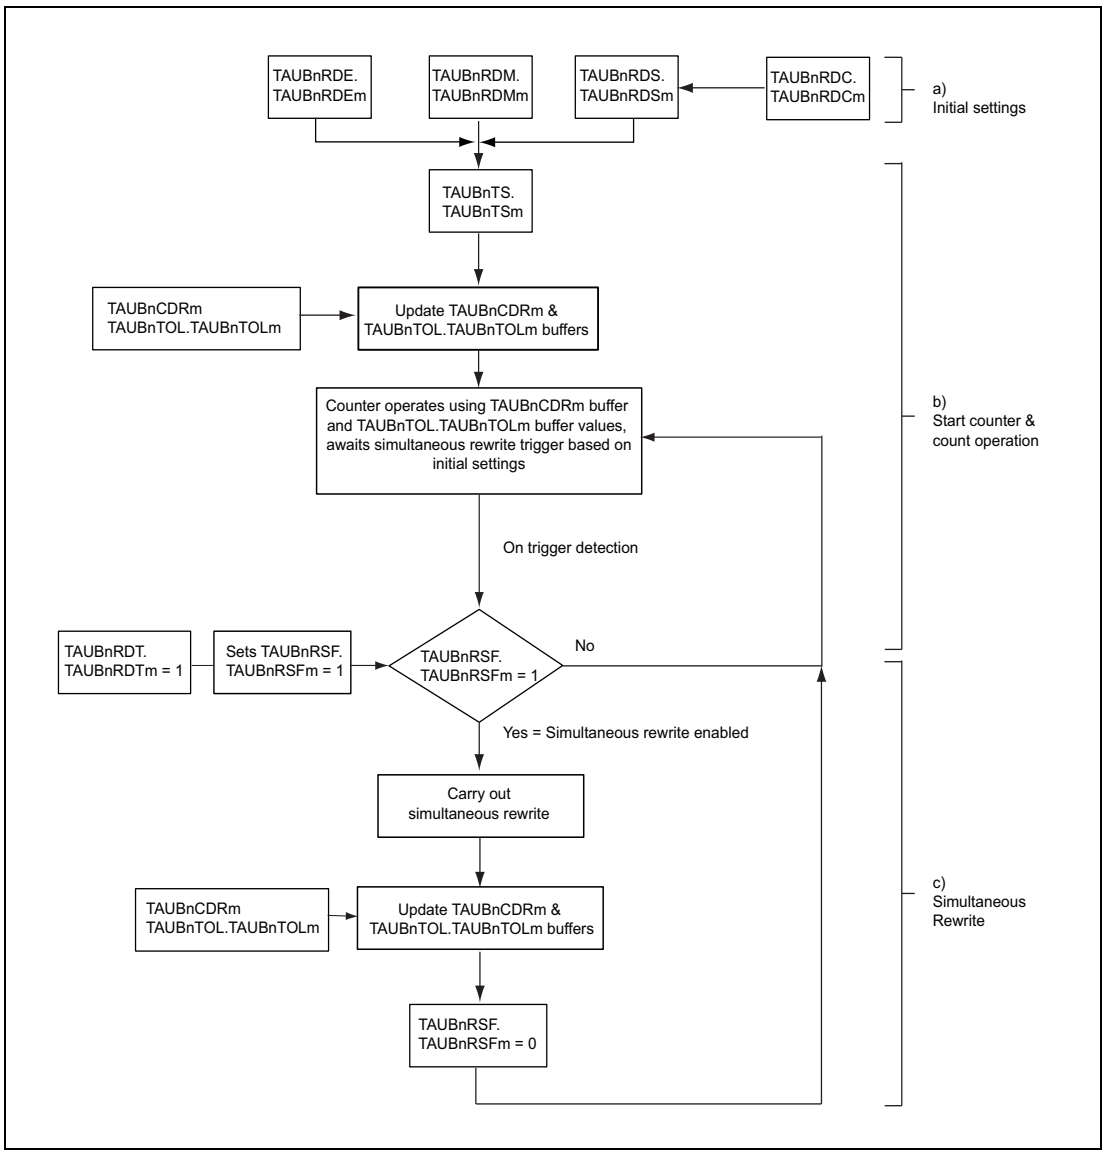

Figure 29.4 General Procedure for Simultaneous Rewrite

29.6.2.1 Initial Settings

- To enable simultaneous rewrite in channel m, set TAUBnRDE.TAUBnRDEm = 1
- To select the type of simultaneous rewrite, set TAUBnRDM.TAUBnRDMm and TAUBnRDS.TAUBnRDSm according to the values in **Table 29.36, Simultaneous Rewrite Methods and when They are Triggered**.
- To select which upper channel is monitored for the simultaneous rewrite trigger use TAUBnRDC.TAUBnRDCm (prerequisite: TAUBnRDS.TAUBnRDSm is set to upper channel)

29.6.2.2 Start Counter and Count Operation

- To start all the TAUBnCNTm counters in the channel group, set the corresponding TAUBnTS.TAUBnTSm bits to 1. TAUBnTOL.TAUBnTOLm and the values in the data registers (TAUBnCDRm) are written to the corresponding TAUBnTOL.TAUBnTOLm buffer (TAUBnTOL.TAUBnTOLm buf) and data buffer registers (TAUBnCDRm buf) and the counters start.
- Setting the reload data trigger bit (TAUBnRDT.TAUBnRDTm) to 1 sets the reload flag (TAUBnRSF.TAUBnRSFm) to 1, enabling simultaneous rewrite. TAUBnRSF.TAUBnRSFm remains at 1 until simultaneous rewrite has taken place.
- When the specified trigger for simultaneous rewrite is detected, the TAUBnRSF.TAUBnRSFm bit is checked to see if simultaneous rewrite is enabled (TAUBnRSF.TAUBnRSFm = 1). If it is, simultaneous rewrite is carried out.
  Otherwise, simultaneous rewire is not carried out, and the system awaits the next simultaneous rewrite trigger detection.

29.6.2.3 Simultaneous Rewrite

- When simultaneous rewrite is enabled (TAUBnRSF.TAUBnRSFm = 1) and the simultaneous rewrite trigger is detected, the current values of the data registers are copied to their buffers. These values are then written to the corresponding counters and the values are applied the next time the counter starts or restarts.
- When simultaneous rewrite is finished, the TAUBnRSF.TAUBnRSFm bit is set to 0, and the system awaits the next simultaneous rewrite trigger.

29.6.3 Other General Rules of Simultaneous Rewrite

The following rules also apply:

- TAUBnRDE.TAUBnRDEm, TAUBnRDS.TAUBnRDSm, TAUBnRDM.TAUBnRDMm, and TAUBnRDC.TAUBnRDCm cannot be changed while the counter is in operation (TAUBnTE.TAUBnTEm = 1).
- TAUBnTOL.TAUBnTOLm can only be rewritten during operation when in PWM output function or triangle PWM output function. For all other output functions, TAUBnTOL.TAUBnTOLm must be written before the counter starts. If it is rewritten in another function, TAUBTTOUTm outputs an invalid wave.
- When an upper channel is used as the channel issuing the simultaneous rewrite trigger generation channel(TAUBnRDS.TAUBnRDSm = 1), the TAUBnRDC.TAUBnRDCm bit controls all the lower channels. This means that if the TAUBnRDC.TAUBnRDCm bits of CH2 and CH7 are set to 1 and the TAUBnRDC.TAUBnRDCm bits of other channels are set to 0, CH2 and CH7 serve as simultaneous rewrite trigger generation channels. CH2 controls the lower channels CH3 to CH6, and CH7 controls the lower channels CH8 to CH15.
- If simultaneous rewrite is enabled and an upper channel is selected for the simultaneous rewrite trigger generation channel (TAUBnRDE.TAUBnRDEm and TAUBnRDS.TAUBnRDSm = 1) but no upper channel is set (TAUBnRDC.TAUBnRDC[15:0] = 0), simultaneous rewrite cannot take place.

29.6.4 Types of Simultaneous Rewrite

In the following section, the three simultaneous rewrite methods are explained using timing diagrams.

29.6.4.1 Simultaneous Rewrite when the Master Channel (Re)Starts Counting (Method A)

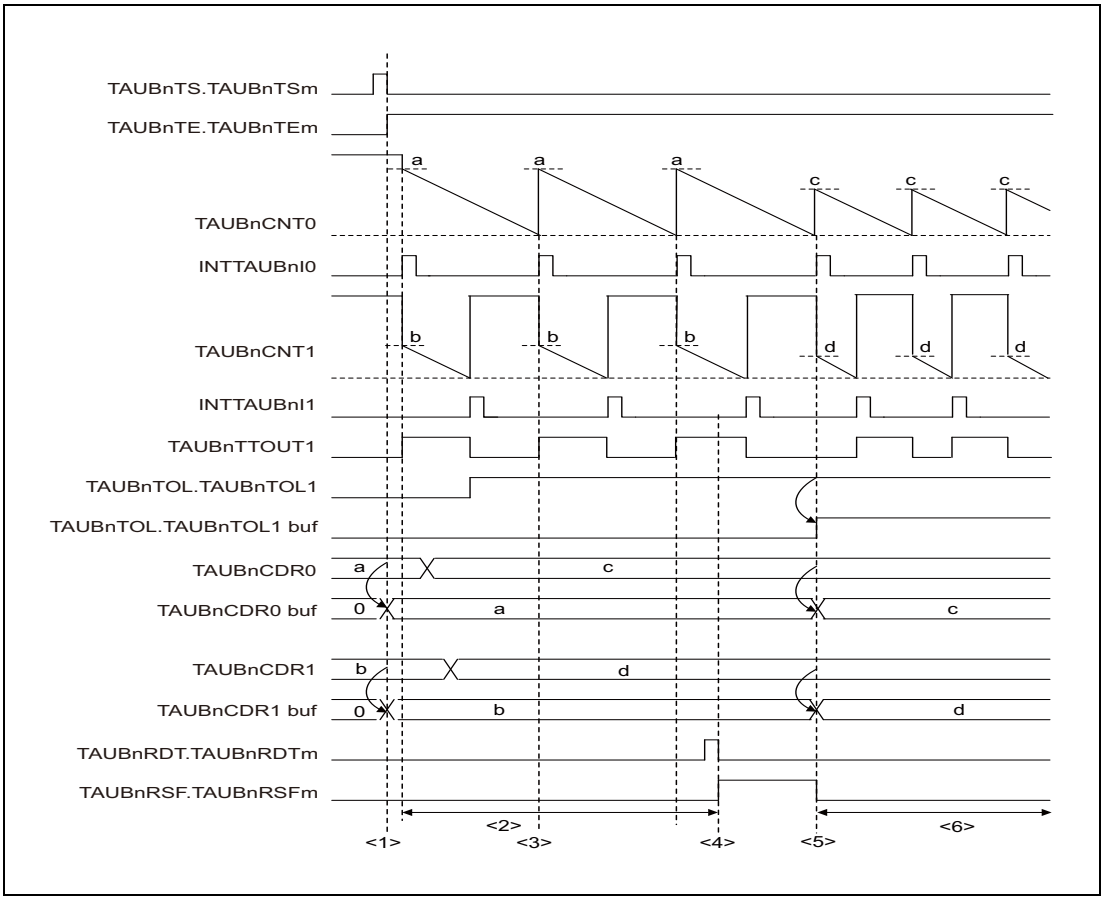

Figure 29.5 Simultaneous Rewrite when the Master Channel (Re)Starts Counting

Setting:

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method A is applied.

Description:

(1) When TAUBnTS.TAUBnTSm = 1 is set, the value of TAUBnCDRm is copied to the TAUBnCDRm buffer and the value of TAUBnTOL.TAUBnTOLm is copied to the TAUBnTOL.TAUBnTOLm buffer.

(2) The TAUBnCDRm and TAUBnTOL.TAUBnTOLm registers can be written at any time.

(3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUBnRSF.TAUBnRSFm = 0)

(4) The reload data trigger bit (TAUBnRDT.TAUBnRDTm) is set to 1 which sets the status flag (TAUBnRSF.TAUBnRSFm = 1), enabling simultaneous rewrite.

(5) Because simultaneous rewrite is enabled, it is triggered when CH0 restarts counting. The TAUBnCDRm value is loaded into the TAUBnCDRm buffer, and the TAUBnTOL.TAUBnTOLm value is loaded into the TAUBnTOL.TAUBnTOLm buffer.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUBnCDRm and TAUBnTOL.TAUBnTOLm can be changed again.

29.6.4.2 Simultaneous Rewrite at the Peak of a Triangular Wave of the Slave Channel (Method B)

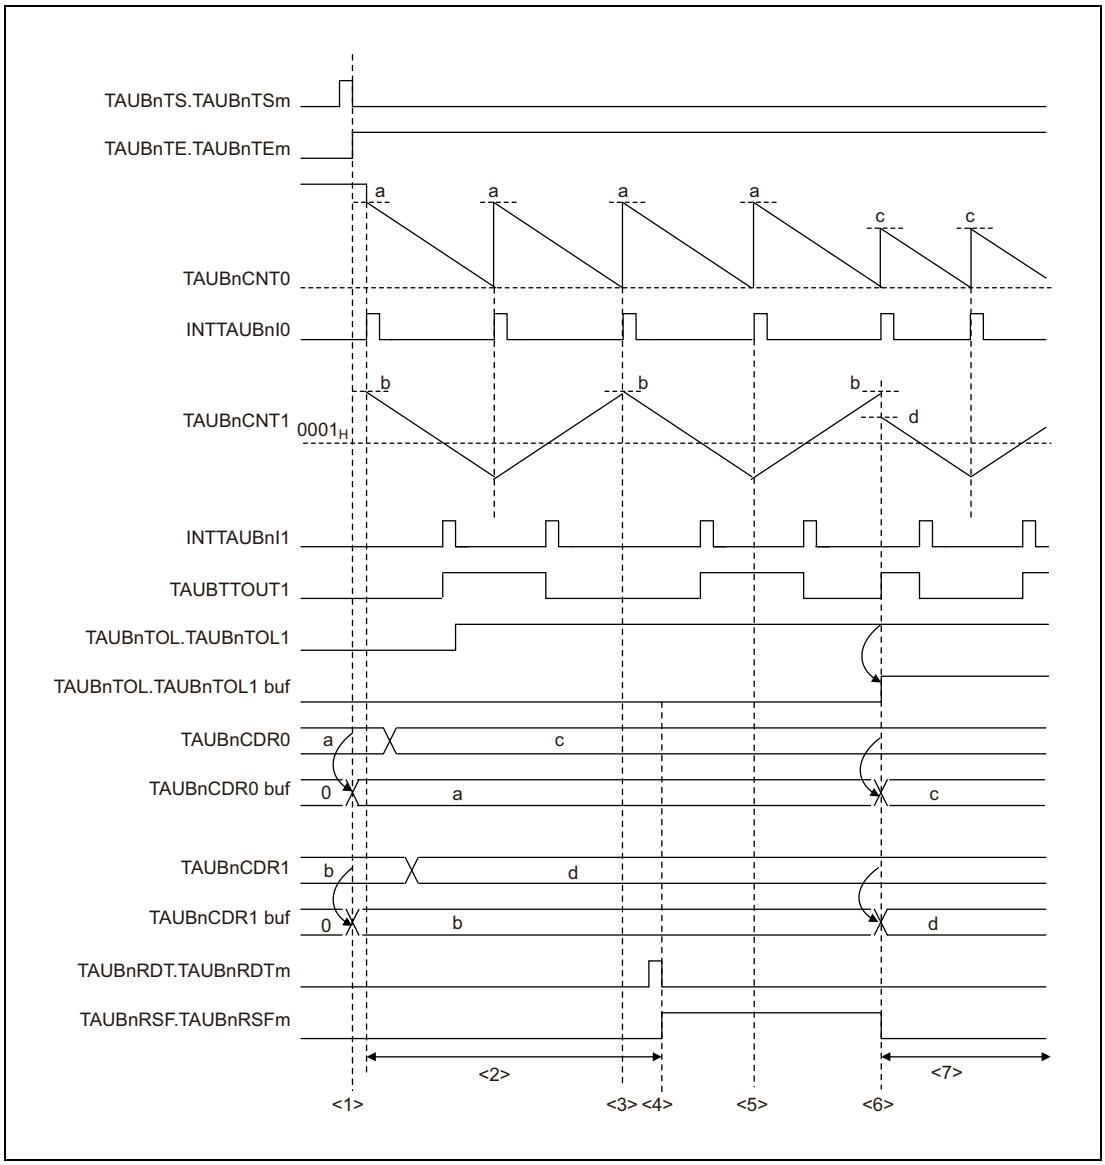

Figure 29.6 Simultaneous Rewrite at the Peak of a Triangular Wave of the Slave Channel

Setting:

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method B is applied.

Description:

(1) When TAUBnTS.TAUBnTSm = 1 is set, the value of TAUBnCDRm is copied to the TAUBnCDRm buffer.

(2) The TAUBnCDRm and TAUBnTOL registers can be written at any time.

(3) Simultaneous rewrite does not occur because it is disabled (TAUBnRSF.TAUBnRSFm = 0).

(4) The reload data trigger bit (TAUBnRDT.TAUBnRDTm) is set to 1 which sets the status flag (TAUBnRSF.TAUBnRSFm = 1), enabling simultaneous rewrite.

(5) Simultaneous rewrite does not take place at the bottom of the triangular cycle.

(6) Simultaneous rewrite takes place at the start timing of the top of the triangular cycle. The TAUBnCDRm value is loaded into the TAUBnCDRm buffer, and the TAUBnTOL.TAUBnTOLm value is loaded into the TAUBnTOL.TAUBnTOLm buffer.

(7) The counters count down and await the next simultaneous rewrite trigger. The values of TAUBnCDRm and TAUBnTOL.TAUBnTOLm can be changed again.

29.6.4.3 Simultaneous Rewrite when INTTAUBnIm is Generated on an Upper Channel Specified by TAUBnRDC.TAUBnRDCm (Method C1)

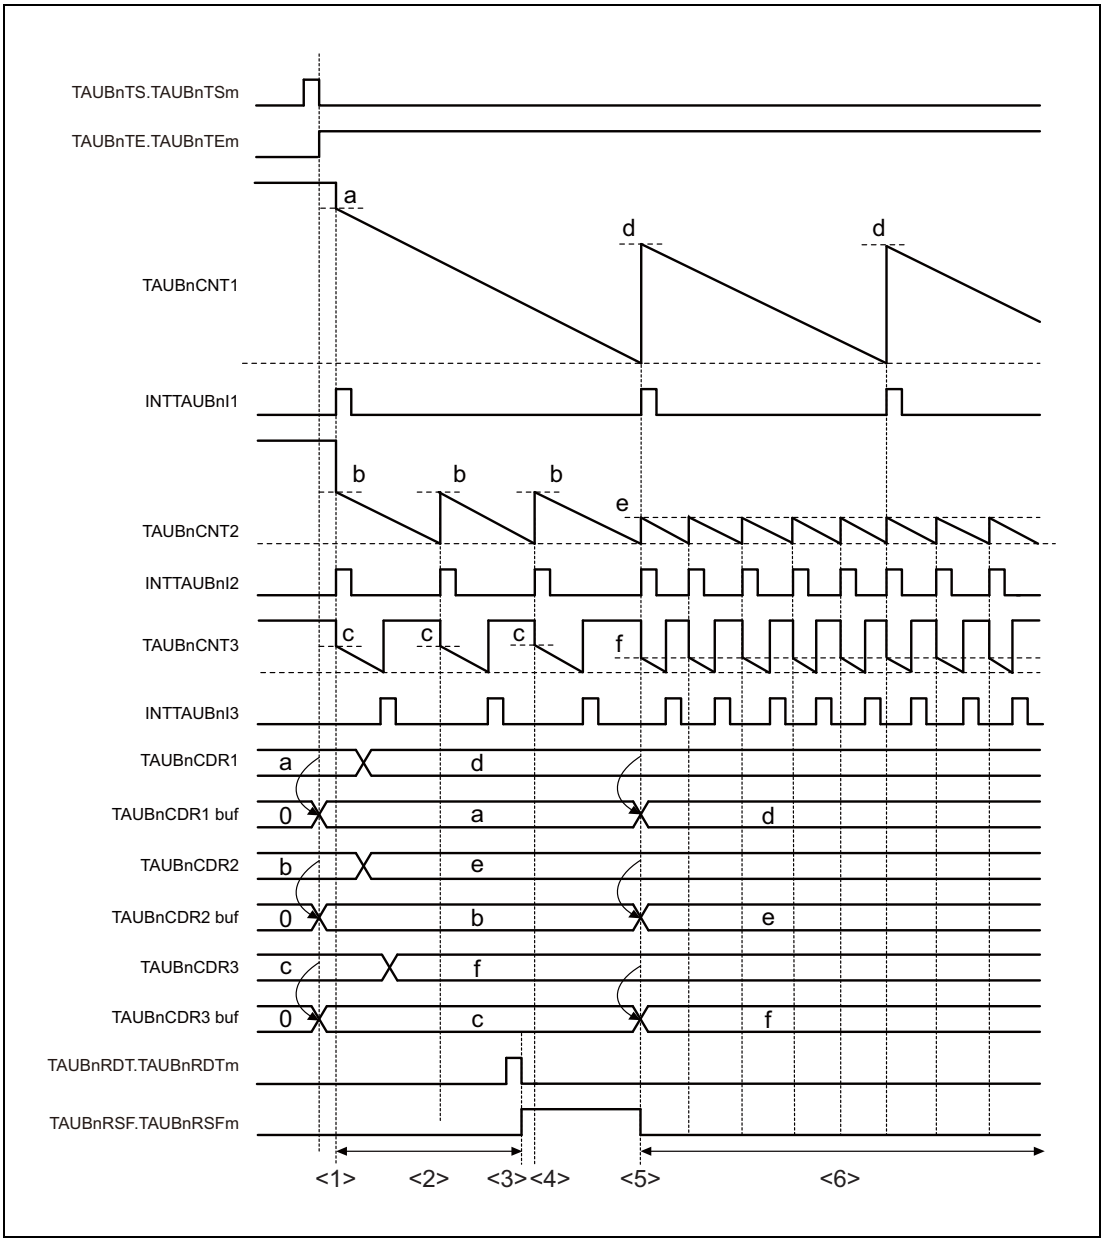

Figure 29.7 Simultaneous Rewrite when INTTAUBnIm is Generated on an Upper Channel Specified by TAUBnRDC.TAUBnRDCm

Setting:

CH1 is an upper channel used counting down, CH2 is a master channel, and CH3 is the slave channel. The simultaneous rewrite method C1 is applied. The TAUBnRDC register specifies a channel which generates simultaneous rewrite triggers.

Description:

(1) When TAUBnTS.TAUBnTSm is set to 1, the TAUBnCDRm value is copied to the TAUBnCDRm buffer.

(2) The TAUBnCDRm register is always ready to write.

(3) By setting the reload data trigger bit (TAUBnRDT.TAUBnRDTm) to 1, the status flag is set (TAUBnRSF.TAUBnRSFm = 1) to enable simultaneous rewrite.

(4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.

(5) Simultaneous rewrite is triggered by INT1 which is generated when counter 1 reaches 0000_H. The TAUBnCDRm values are loaded into the corresponding TAUBnCDRm buffers.

(6) The counter counts down and awaits the next simultaneous rewrite trigger. The values of the TAUBnCDRm registers can be rechanged.

29.7 Channel Output Modes

The output of the TAUBTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUBnTOE.TAUBnTOEm = 0)
  When controlled by software, the value written in the output register bit (TAUBnTO.TAUBnTOm) is sent to the output pin (TAUBTTOUTm).
- By TAUB signals (TAUBnTOE.TAUBnTOEm = 1)
  When controlled by TAUB signals, the output level of TAUBTTOUTm is set or reset or toggled by internal signals. The value of TAUBnTO.TAUBnTOm is updated accordingly to reflect the value of TAUBTTOUTm.
  - Independently (TAUBnTOM.TAUBnTOMm = 0)
    In case of independent operation, the output of the TAUBTTOUTm pin is only affected by settings of channel m. Therefore, independent channel operation should be selected (TAUBnTOM.TAUBnTOMm = 0).
  - Synchronously (TAUBnTOM.TAUBnTOMm = 1)
    In case of synchronous operation, the output of the TAUBTTOUTm pin is affected by settings of channel m and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUBnTOM.TAUBnTOMm = 1).

The TAUBnTO.TAUBnTOm bit can always be read to determine the current value of TAUBTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

Control bits

The settings of the control bits required to select a specific channel output mode are listed in Table 29.38, Channel Output Modes.

The channel output modes are described in details below.

- Section 29.7.2, Channel Output Modes Controlled Independently by TAUBn Signals
- Section 29.7.3, Channel Output Modes Controlled Synchronously by TAUBn Signals

Batch operation of TAUBnTOm bit

Whether a set value is reflected to the TAUBnTOm bit or not is controlled by the TAUBnTOE.TAUBnTOEm bit.

The TAUBnTOm setting is written only to the bit (channel) set with TAUBnTOE.TAUBnTOEm bit = 0 when a write to the TAUBnTO register is attempted. No TAUBnTOm setting is reflected to the bit (channel) set with TAUBnTOE.TAUBnTOEm bit = 1.

NOTE

TAUBnTO.TAUBnTOm bit is placed so that its bit number corresponds to a channel number.

Output logic

Positive logic or negative logic of the output is specified by control bit TAUBnTOL.TAUBnTOLm.

The value of TAUBnTOL.TAUBnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function or triangle PWM output function. Otherwise, changes to TAUBnTOL.TAUBnTOLm result in an invalid TAUBTTOUTm signal output.

See Section 29.6, Simultaneous Rewrite.

The various channel output modes and the channel output control bits are listed in **Table 29.38**.

Table 29.38 Channel Output Modes

Channel Output Mode	TAUBnTOE. TAUBnTOEm	TAUBnTOM. TAUBnTOMm	TAUBnTOC. TAUBnTOCm	TAUBnTDE. TAUBnTDEm
By software				
Independent channel output mode controlled by software	0	x		
By TAUB signals, independently				
Independent channel output mode 1	1	0	0	0
Independent channel output mode 2			1	
By TAUB signals, synchronously				
Synchronous channel output mode 1	1	1	0	0
Synchronous channel output mode 2			1	0
Synchronous channel output mode 2 with dead time output				1

- All combinations not listed in this table are forbidden.
- Bits marked with an x can be set to any value.

NOTE

The following bits cannot be changed during count operation (TAUBnTE.TAUBnTEm = 1):

- TAUBnTOM.TAUBnTOMm
- TAUBnTOC.TAUBnTOCm
- TAUBnTDE.TAUBnTDEm

29.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUBTTOUTm channel output mode. The prerequisite is that timer output operation is disabled (TAUBnTOE.TAUBnTOEm = 0).

(1) Set TAUBnTO.TAUBnTOm to specify the initial level of the TAUBTTOUTm output.

(2) Set channel output mode according to Table 29.38, Channel Output Modes, and the output logic using the TAUBnTOL.TAUBnTOLm bit.

(3) Start the counter (TAUBnTS.TAUBnTSm = 1).

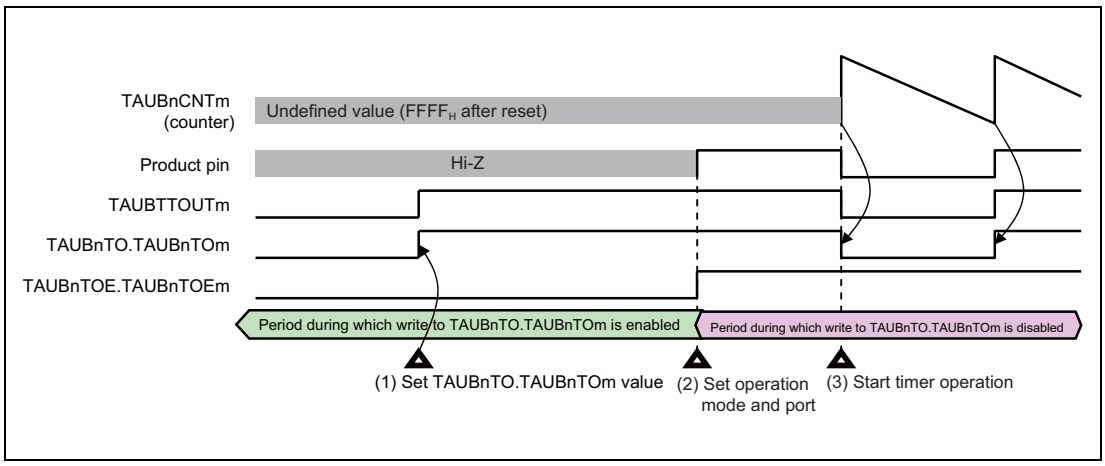

Figure 29.8 General Procedure for Specifying a TAUBTTOUTm Channel Output Mode

29.7.2 Channel Output Modes Controlled Independently by TAUBn Signals

This section lists the channel output modes that are controlled independently by TAUBn signals. The control bits used to specify a mode are listed in Table 29.38, Channel Output Modes.

29.7.2.1 Independent Channel Output Mode 1

Set/reset conditions

In this output mode, TAUBTTOUTm toggles when INTTAUBnIm is detected. The value of TAUBnTOL.TAUBnTOLm is ignored.

Prerequisites

There are no prerequisites other than those shown in Table 29.38, Channel Output Modes.

29.7.2.2 Independent Channel Output Mode 2

Set/reset conditions

In this output mode, TAUBTTOUTm is set when INTTAUBnIm occurs at the time of count start, and reset when INTTAUBnIm occurs due to a match between TAUBnCNTm and TAUBnCDRm.

Prerequisites

There are no prerequisites other than those shown in Table 29.38, Channel Output Modes.

29.7.3 Channel Output Modes Controlled Synchronously by TAUBn Signals

This section lists the channel output modes that are controlled synchronously by TAUBn signals. The control bits used to specify a mode are listed in Table 29.38, Channel Output Modes.

29.7.3.1 Synchronous Channel Output Mode 1

Set/reset conditions

In this output mode, INTTAUBnIm of master channel serves as a set signal and INTTAUBnIm of the slave channel as a reset signal. If INTTAUBnIm of master channel and INTTAUBnIm of the slave channel are generated at the same time, INTTAUBnIm of the slave channel (reset signal) has priority over INTTAUBnIm (set signal) of master channel, i.e., the master channel is ignored.

Prerequisites

There are no prerequisites other than those shown in Table 29.38, Channel Output Modes.

29.7.3.2 Synchronous Channel Output Mode 2

In this output mode, the operating mode should be set to count-up/-down mode. The result is a triangle PWM wave at TAUBTTOUTm. For details, see Section 29.14.5, Triangle PWM Output Function.

Set/reset conditions

TAUBnCNTm of the slave channel counts down and up alternatively. When it passes 0001_H it generates an interrupt, causing TAUBTTOUTm to toggle.

Prerequisites

A set of two channels is required to generate the triangle PWM output. TAUBTTOUTm should be set to 0 before the function starts.

29.7.3.3 Synchronous Channel Output Mode 2 with Dead Time Output

In this output mode, a dead time delay is added to TAUBTTOUTm. The set/reset conditions are shown in **Figure 29.9**.

Set/reset conditions

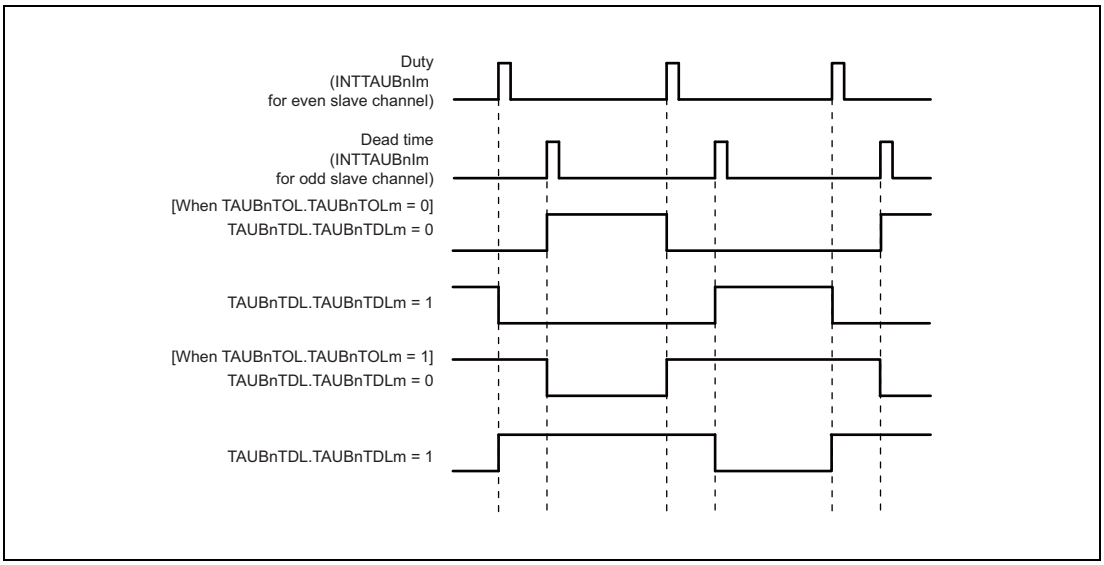

Figure 29.9 Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output

With regard to the edge to which dead time is added, set TAUBnTDL.TAUBnTDLm = 0 for rising edges and TAUBnTDL.TAUBnTDLm = 1 for falling edges.

Prerequisites

Dead time control requires a set of three channels, each operating in the following modes:

- One master channel
  The master channel should be set to interval timer mode.
- One even slave channel
  The even slave channel should be set to count-up/-down mode.
- One odd slave channel (even channel + 1)
  The odd slave channel should be set to one-count mode.

The values of the following bits should be the same for the odd channel and the even channel:

- TAUBnTOE.TAUBnTOEm
- TAUBnTOM.TAUBnTOMm
- TAUBnTOC.TAUBnTOCm
- TAUBnTDE.TAUBnTDEm

29.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUBnTS.TAUBnTSm is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

CAUTION

The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.

29.8.1 Interval Timer Mode, Judge Mode, Capture Mode, Count-Up/-Down Mode, and Count Capture Mode

The counter starts operating with the next count clock after TAUBnTS.TAUBnTSm is set to 1. The value of data register is also loaded when the counter starts.

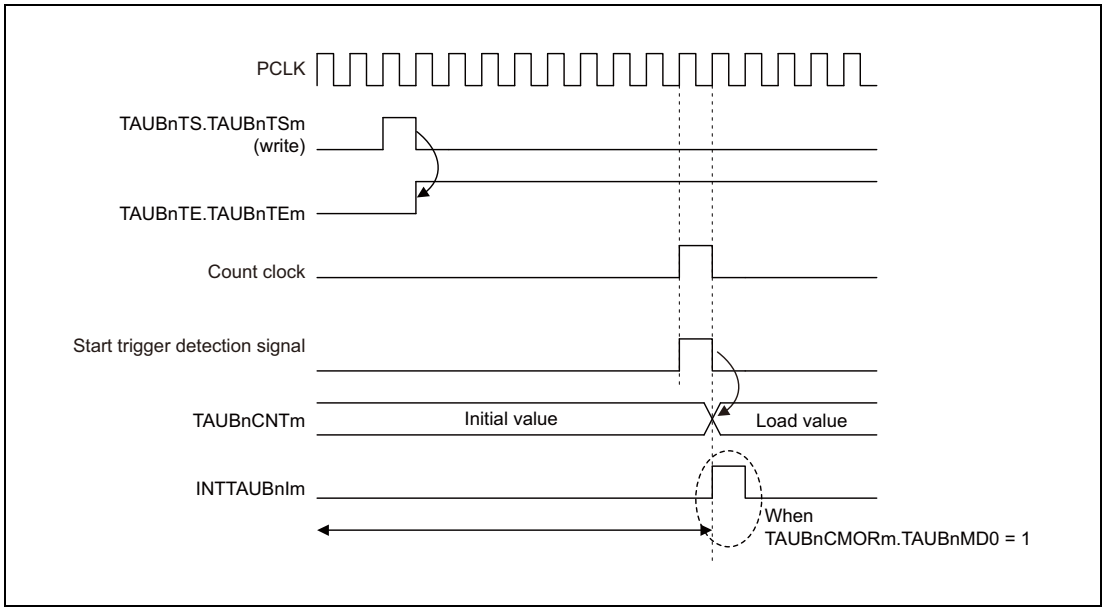

Figure 29.10 Start Timing in Interval Timer Mode, Judge Mode, Capture Mode, Up/Down Count Mode, and Count Capture Mode

NOTE

Make sure to set TAUBnCMORm.TAUBnMD0 to 0 when using the count-up/-down mode.

29.8.2 Event Count Mode

The value of data register is loaded as soon as TAUBnTS.TAUBnTSm is set to 1. The counter also starts immediately. The value of data register decrements when the subsequent count clock cycle starts.

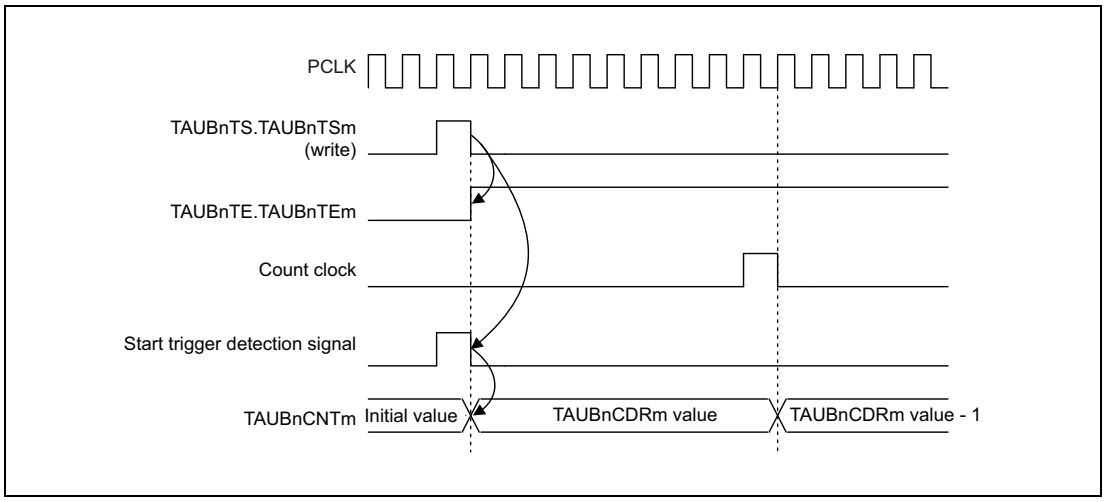

Figure 29.11 Start Timing in Event Count Mode

29.8.3 Other Operating Modes

In other operating modes, the counter operation start timing is triggered only upon detection of a valid edge of TAUBTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which is irrelevant to start of counter operation, determine the frequency with which all operations take place.

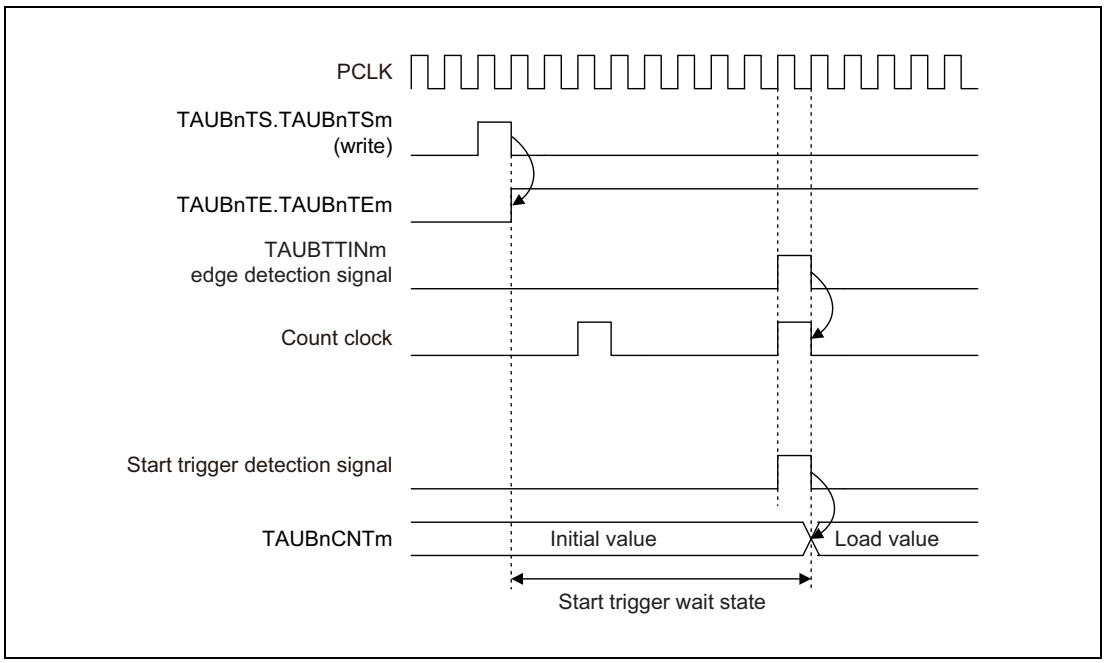

Figure 29.12 Start Timing in Other Operating Modes

29.9 TAUBTTOUTm Output and INTTAUBnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUBnIm is generated using the TAUBnCMORm.TAUBnMD0 bit. The generation of INTTAUBnIm when the TAUBnCMORm.TAUBnMD0 bit starts counting and the effect to TAUBTTOUTm depend on the selected function. For details, refer to the description of TAUBnCMORm.TAUBnMD0 of each function.

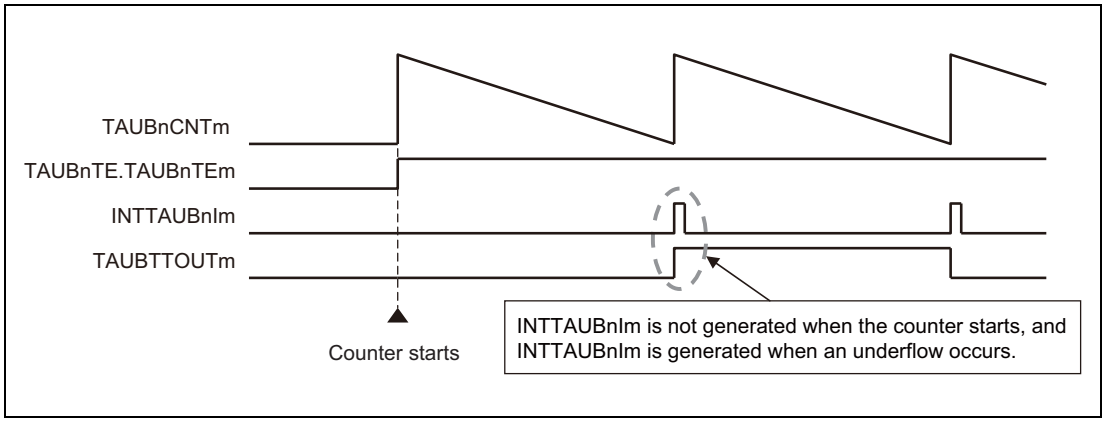

Figure 29.13 INTTAUBnIm Generation Timing (TAUBnCMORm.TAUBnMD0=0)

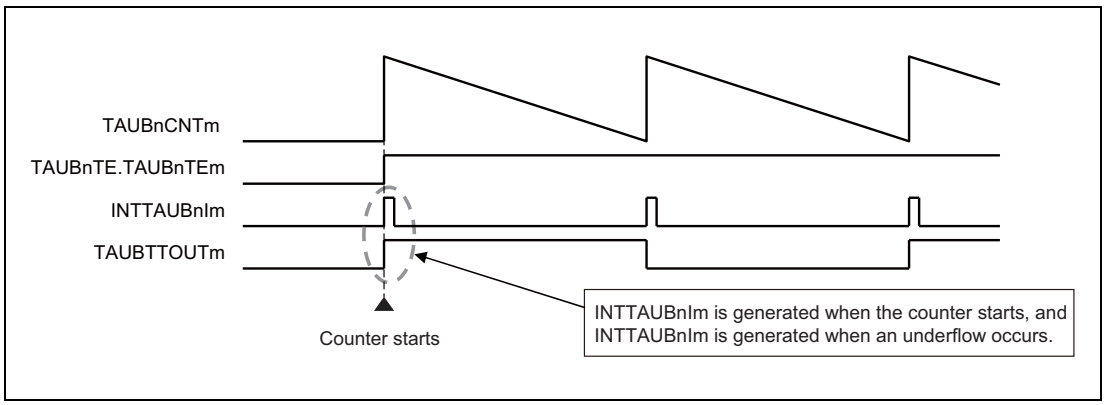

Figure 29.14 INTTAUBnIm Generation Timing (TAUBnCMORm.TAUBnMD0=1)

29.10 Interrupt Generation upon Overflow

Certain independent functions that count up, overflow without generating an interrupt when they reach $FFFF_H$. This section describes how it is possible to generate an interrupt, by combining a channel operating in one of these modes with a channel in a different operation mode which counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel. Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches 0000_H at the same time as the first channel overflows (TAUBnCNTm = $FFFF_H$).
- Set TAUBnCDRm of the second channel to $FFFF_H$.
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same TAUBTTINm input.
- The trigger detection settings (TAUBnCMORm.TAUBnSTS[2:0] and TAUBnCMURm.TAUBnTIS[1:0]) must be identical for both channels.

Result:

The down-counter of the second channel reaches 0000_H at exactly the same time as the up-counter of the first channel overflows (TAUBnCNTm = $FFFF_H$). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

29.10.1 Example of Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the TAUBTTINm input interval timer function can detect the overflow when TAUBnCNTm of the TAUBTTINm input pulse interval measurement function exceeds $FFFF_H$.

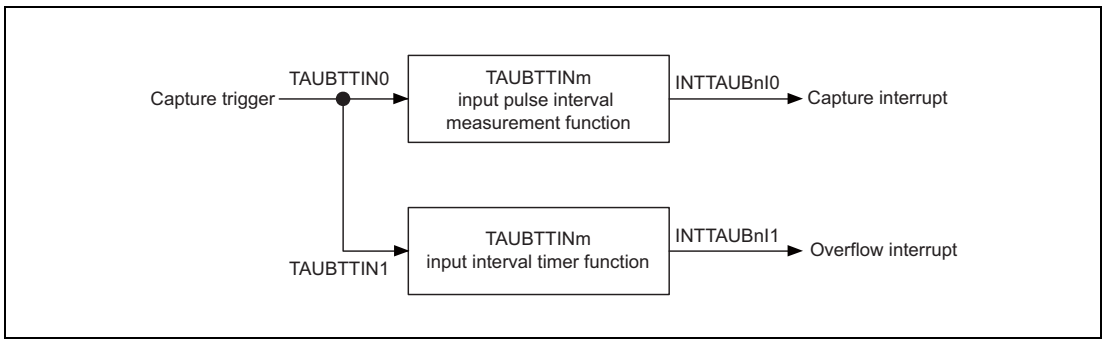

Figure 29.15 Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function

Timing diagram

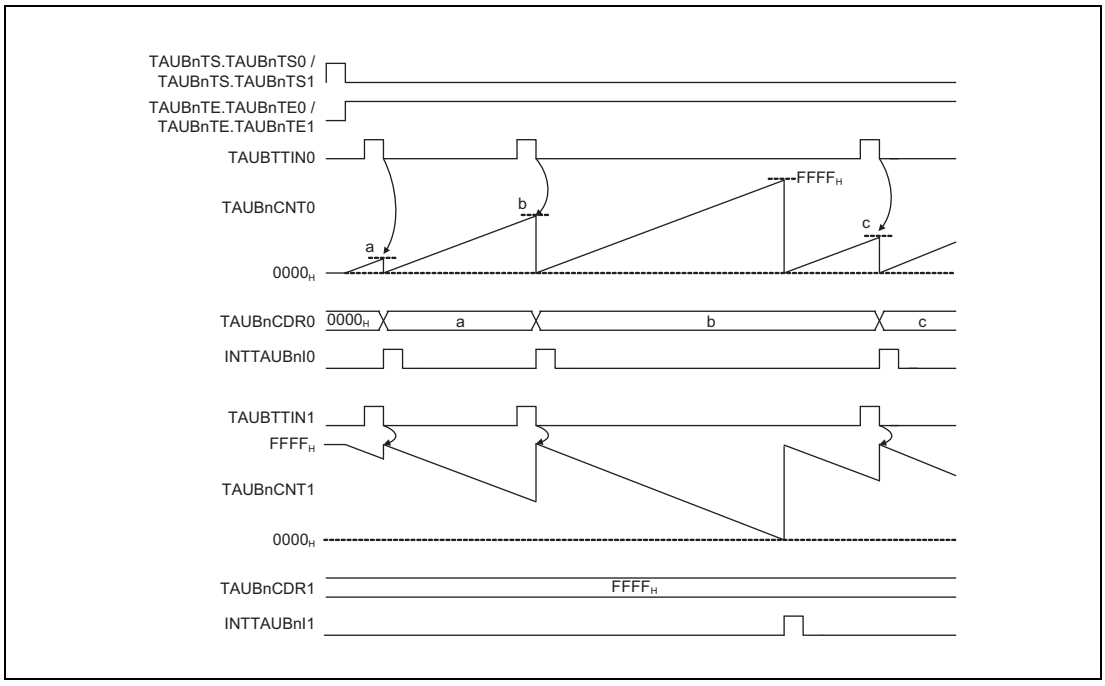

Figure 29.16 Interrupt Generation by Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function

29.10.2 Example of Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the overflow interrupt output function (during TAUBTTINm width measurement) can detect the overflow when TAUBnCNTm of the TAUBTTINm input signal width measurement function exceeds $FFFF_H$.

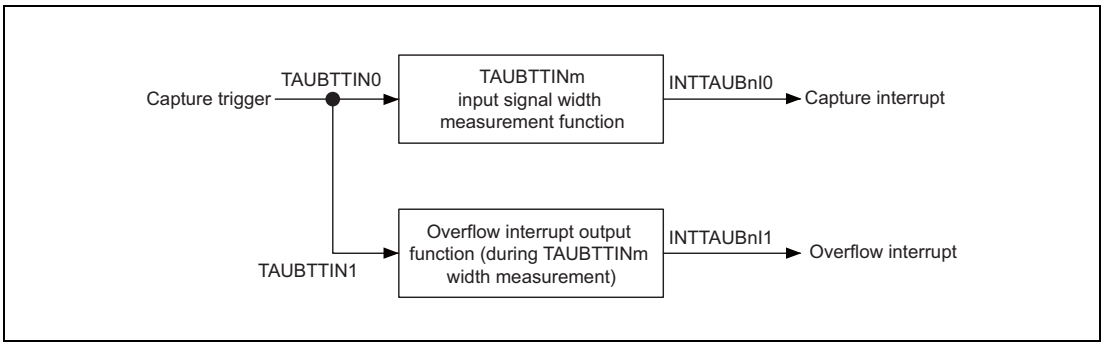

Figure 29.17 Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

Timing diagram

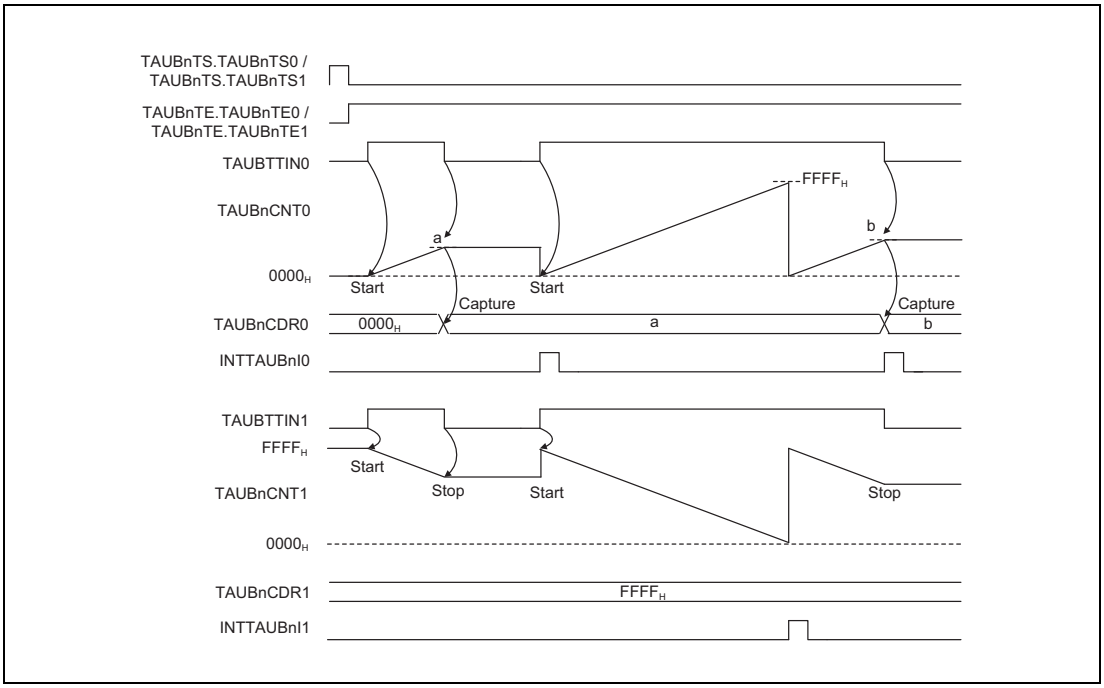

Figure 29.18 Interrupt Generation by Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

29.10.3 Example of Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function

When the counters of both channels are started simultaneously, INTTAUBnIm of the interval timer function can detect the overflow when TAUBnCNTm of the TAUBTTINm input position detection function exceeds $FFFF_H$.

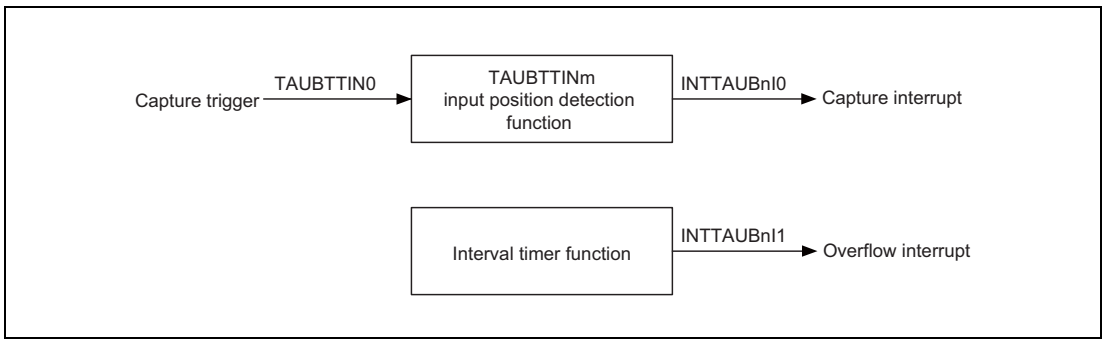

Figure 29.19 Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function

Timing diagram

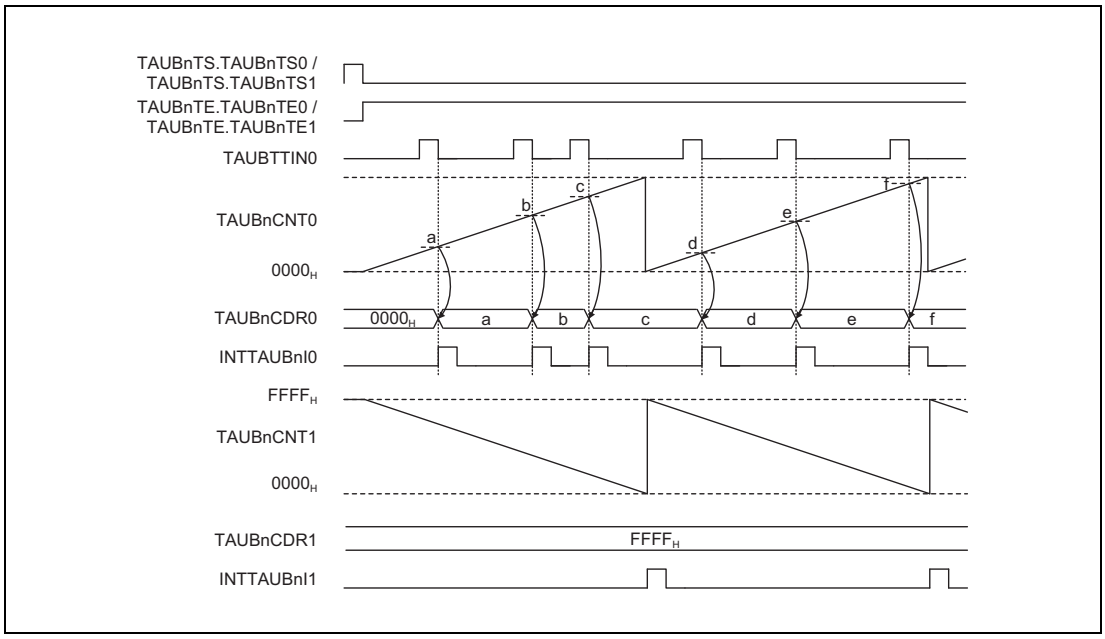

Figure 29.20 Interrupt Generation by Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function

29.10.4 Example of Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the overflow interrupt output function (during TAUBTTINm input period count detection) can detect the overflow when TAUBnCNTm of the TAUBTTINm input period count detection function exceeds $FFFF_H$.

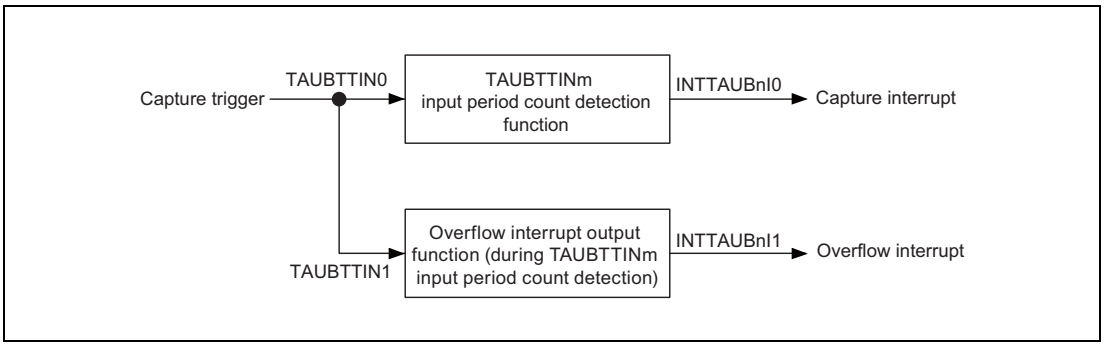

Figure 29.21 Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (TAUBTTINm Input Period Count Detection)

Timing diagram

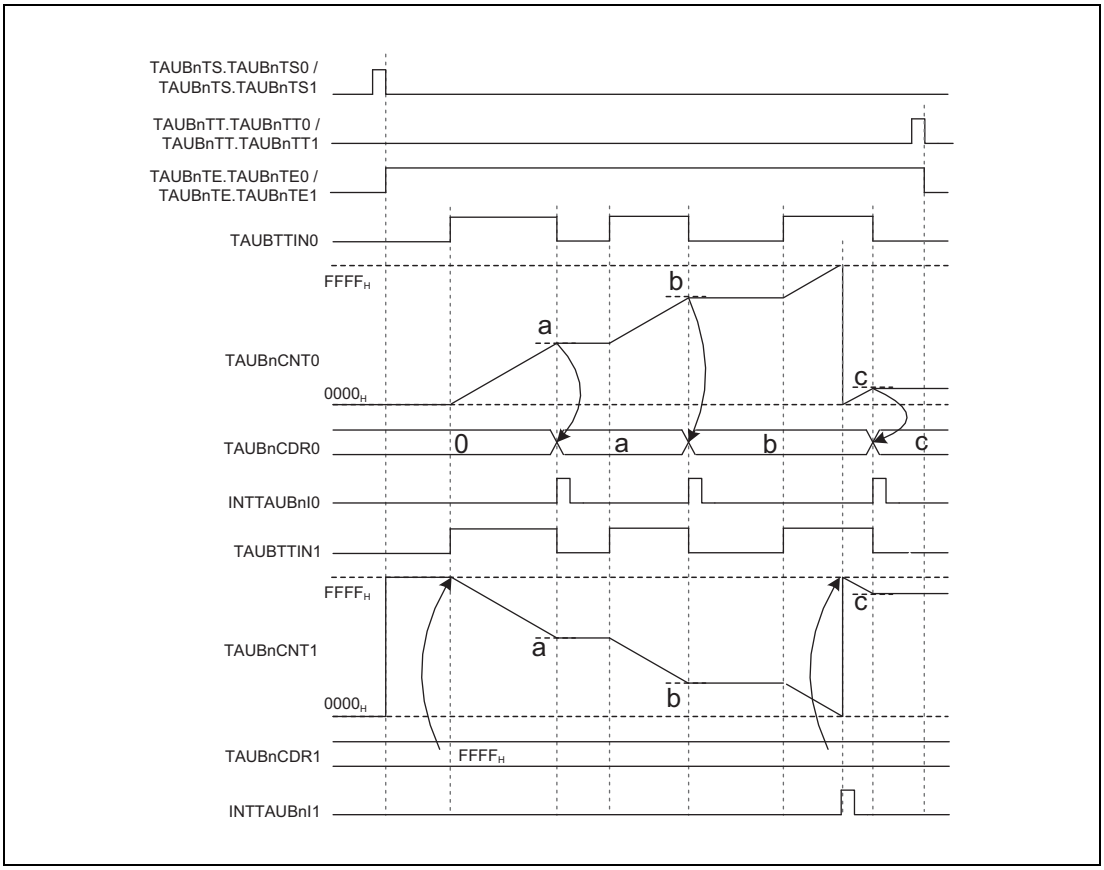

Figure 29.22 Interrupt Generation by Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

29.11 TAUBTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

The following figure shows when edge detection takes place.

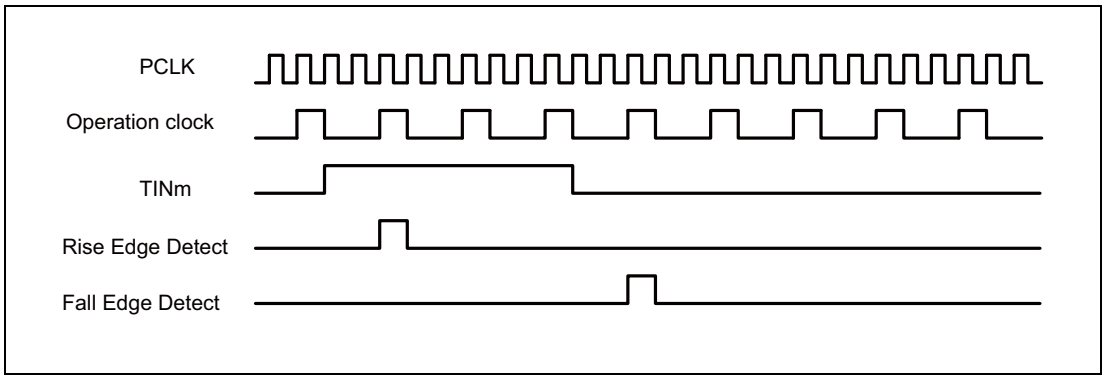

Figure 29.23 Basic Edge Detection Timing

Figure 29.23 is an image of the operation timing. Actually, the delay time caused by the noise filter and the synchronization circuit between the TAUBnIm terminal and TAUBn will be generated.

29.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the TAUB. For a general overview of independent channel operation functions, see Section 29.2, Overview.

29.12.1 Interval Timer Function

29.12.1.1 Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUBnIm) at regular intervals. When an interrupt is generated, the TAUBTTOUTm signal toggles, resulting in a square wave.

Description

The counter is started by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is loaded to TAUBnCNTm and the counter starts to count down from this value.

When the counter reaches 0000_H, INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm stop but retain their values. The counter can be reset by setting TAUBnTS.TAUBnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.

Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUBTTOUTm does not toggle. This results in an inverted TAUBTTOUTm signal compared to when TAUBnCMORm.TAUBnMD0 is set to 1.

29.12.1.2 Equations

INTTAUBnIm cycle = count clock cycle × (TAUBnCDRm + 1)

TAUBTTOUTm square wave cycle = count clock cycle × (TAUBnCDRm + 1) × 2

29.12.1.3 Block Diagram and General Timing Diagram

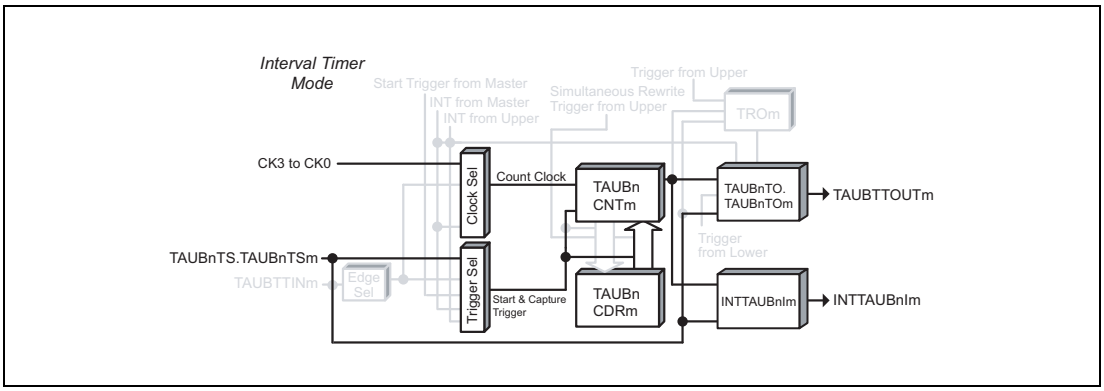

Figure 29.24 Block Diagram for Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

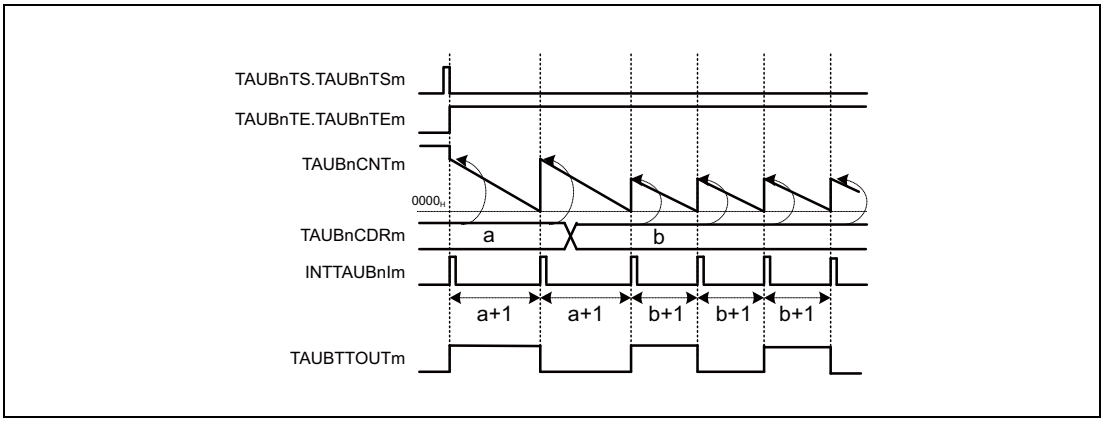

Figure 29.25 General Timing Diagram for Interval Timer Function

29.12.1.4 Register Settings

(1) TAUBnCMORm

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 29.40 Contents of the TAUBnCMURm Register for Interval Timer Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode

Table 29.41 Control Bit Settings for Independent Channel Output Mode 1

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 0_B.
TAUBnTOC.TAUBnTOCm	Write 0_B.
TAUBnTOL.TAUBnTOLm	Write 0_B.
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

NOTE

The channel output mode can also be set to channel output mode controlled by software by setting TAUBnTOE.TAUBnTOEm = 0. TAUBTTOUTm can then be controlled independently of the interrupts.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the Interval Timer Function. Therefore, these registers must be set to 0.

Table 29.42 Simultaneous Rewrite Settings for Interval Timer Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

29.12.1.5 Operating Procedure for Interval Timer Function

Table 29.43 Operating Procedure for Interval Timer Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm register and TAUBnCMURm registers as described in Table 29.39, Contents of the TAUBnCMORm Register for Interval Timer Function and **Table 29.40, Contents of the TAUBnCMURm Register for Interval Timer Function** Set the value of the TAUBnCDRm register Set the channel output mode by setting the control bits as described in Table 29.41, Control Bit Settings for Independent Channel Output Mode 1	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated and TAUBTTOUTm toggles.
During operation	The TAUBnCDRm register value can be changed at any time. The TAUBnCNTm register can be read at all times.	TAUBnCNTm counts down. When the counter reaches 0000_H: • TAUBnCNTm reloads the TAUBnCDRm value and continues count operation • INTTAUBnIm is generated and TAUBTTOUTm toggles.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

Restart operation

29.12.1.6 Specific Timing Diagrams

(1) TAUBnCDRm = 0000_H, count clock = PCLK/2

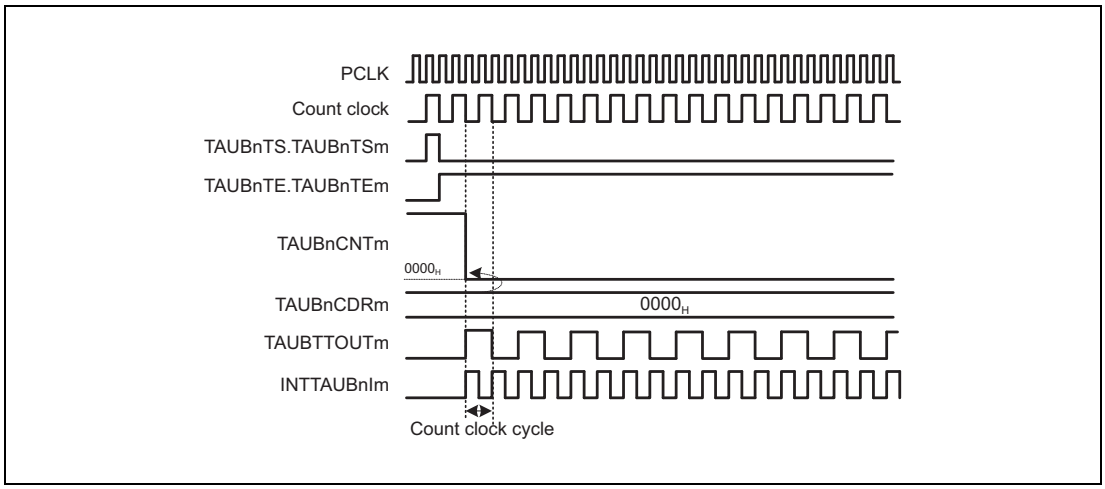

Figure 29.26 TAUBnCDRm = 0000_H, Count Clock = PCLK/2

- TAUBnCDRm = 0000_H, and the count clock = PCLK/2, the TAUBnCDRm value is written to TAUBnCNTm every count clock, meaning that TAUBnCNTm is always 0000_H.
- INTTAUBnIm is generated every count clock, resulting in TAUBTTOUTm toggling every count clock.

(2) TAUBnCDRm = 0000_H, count clock = PCLK

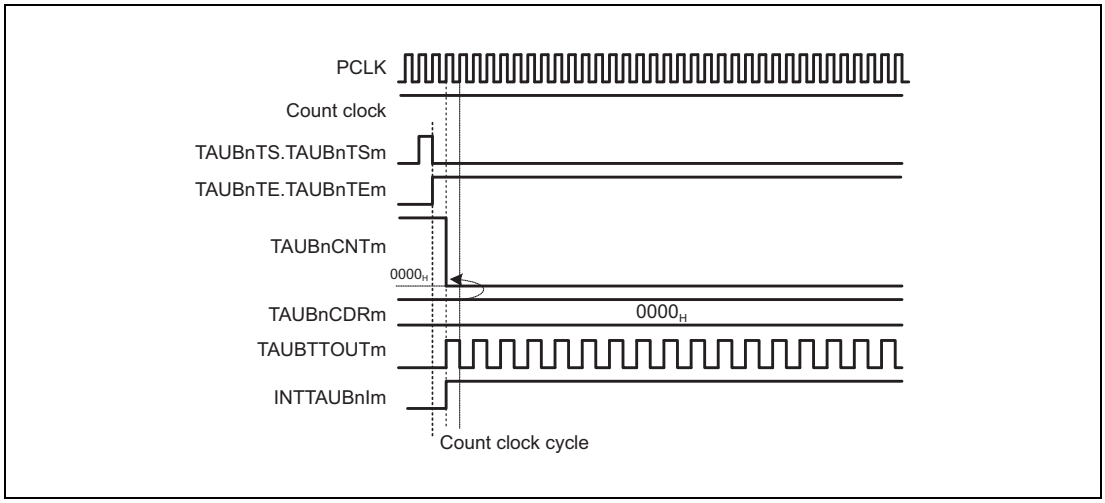

Figure 29.27 TAUBnCDRm = 0000_H, Count Clock = PCLK

- TAUBnCDRm = 0000_H, and the count clock = PCLK, the TAUBnCDRm value is written to TAUBnCNTm every PCLK clock, meaning that TAUBnCNTm is always 0000_H.
- INTTAUBnIm is fixed to the high level. Though the first interrupt is generated, subsequent interrupts are not generated. TAUBTTOUTm is toggling every PCLK clock.

(3) Operation stop and restart (TAUBnCMORm TAUBnMD0 = 1)

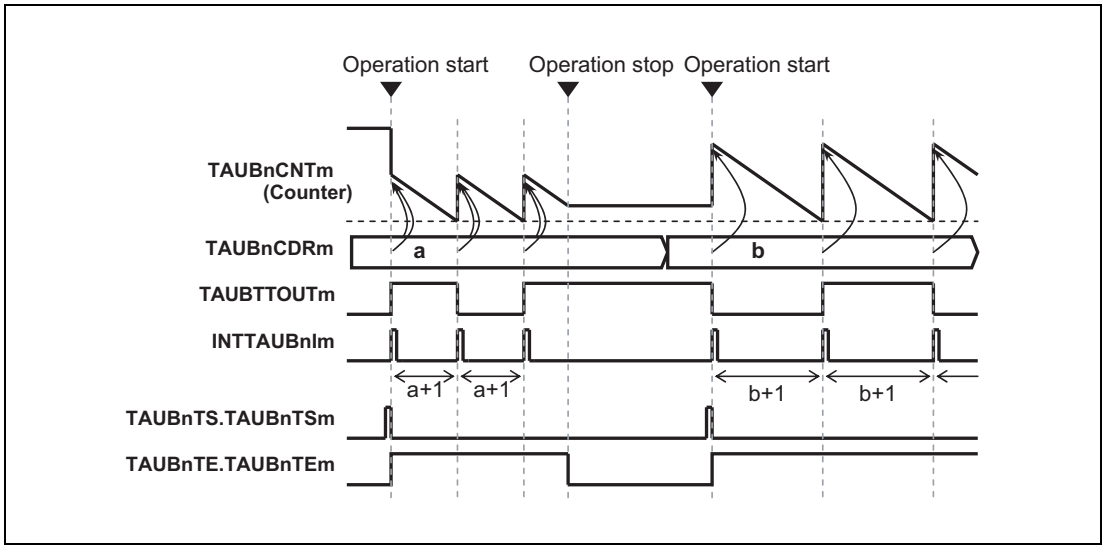

Figure 29.28 Operation Stop and Restart, TAUBnCMORm.TAUBnMD0 = 1

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm and TAUBTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1.

(4) Operation stop and restart (TAUBnCMORm.TAUBnMD0 = 0)

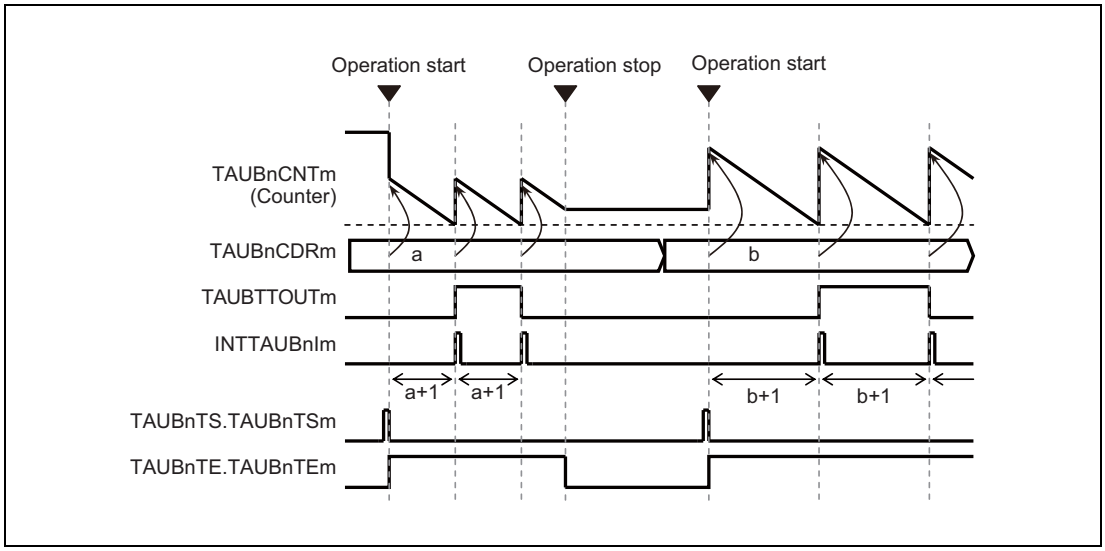

Figure 29.29 Operation Stop and Restart, TAUBnCMORm.TAUBnMD0 = 0

(5) Forced restart (TAUBnCMORm.TAUBnMD0 = 1)

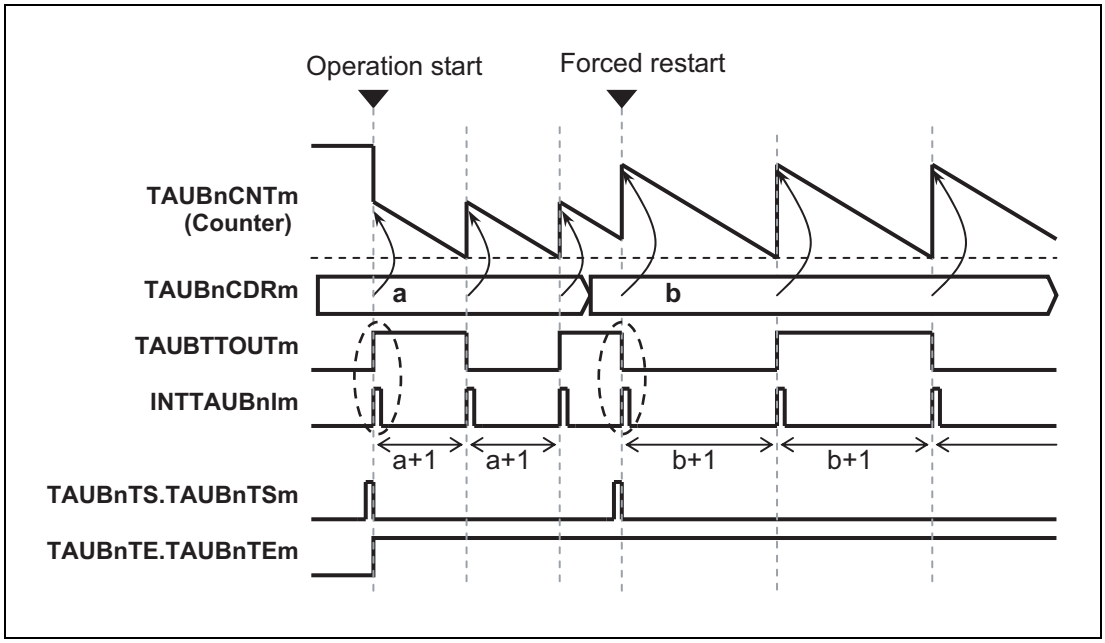

Figure 29.30 Forced Restart Operation, TAUBnCMORm.TAUBnMD0 = 1

- The counter can be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.
- If the TAUBnCMORm.TAUBnMD0 bit is set to 1, an interrupt at start or restart is generated and the output TAUBTTOUTm toggles.

(6) Forced restart (TAUBnCMORm.TAUBnMD0 = 0)

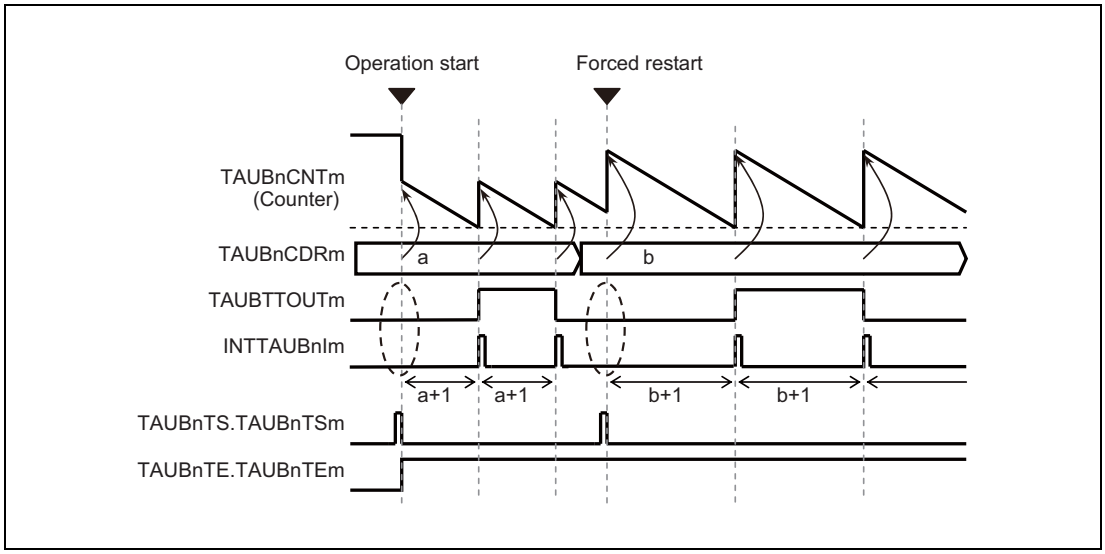

Figure 29.31 Forced Restart Operation (TAUBnCMORm.TAUBnMD0 = 0)

- The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm = 1 during operation.
- If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUBTTOUTm does not toggle.

29.12.2 TAUBTTINm Input Interval Timer Function

29.12.2.1 Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUBnIm) at regular intervals or when a valid TAUBTTINm input edge is detected. When an interrupt is generated, the TAUBTTOUTm signal toggles, resulting in a square wave.

Description

The counter is started by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The current value of TAUBnCDRm is loaded to TAUBnCNTm and the counter starts to count down from this value.

INTTAUBnIm is generated when the counter reaches 0000H or by an effective TAUBTTINm input edge. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm stop but retain their values. The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.

The type of edge used as the trigger is specified using the TAUBnCMURm.TAUBnTIS[1:0] bits.

Either rising edge, falling edge, or rising and falling edges can be selected.

29.12.2.2 Equations

INTTAUBnIm cycle = count clock cycle × (TAUBnCDRm + 1)

TAUBTTOUTm square wave cycle = count clock cycle × (TAUBnCDRm + 1) × 2

29.12.2.3 Block Diagram and General Timing Diagram

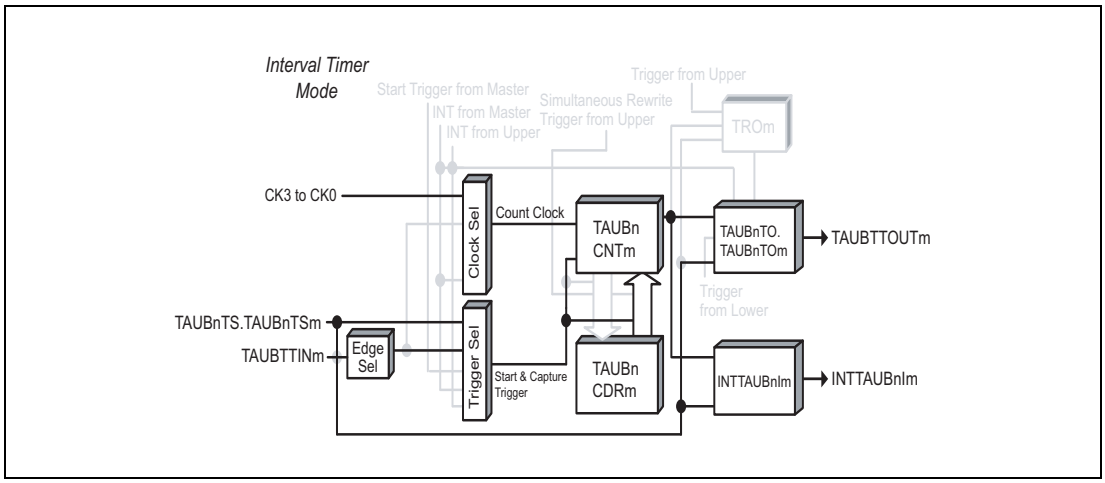

Figure 29.32 Block Diagram for TAUBTTINm Input Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1).
- Rising edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

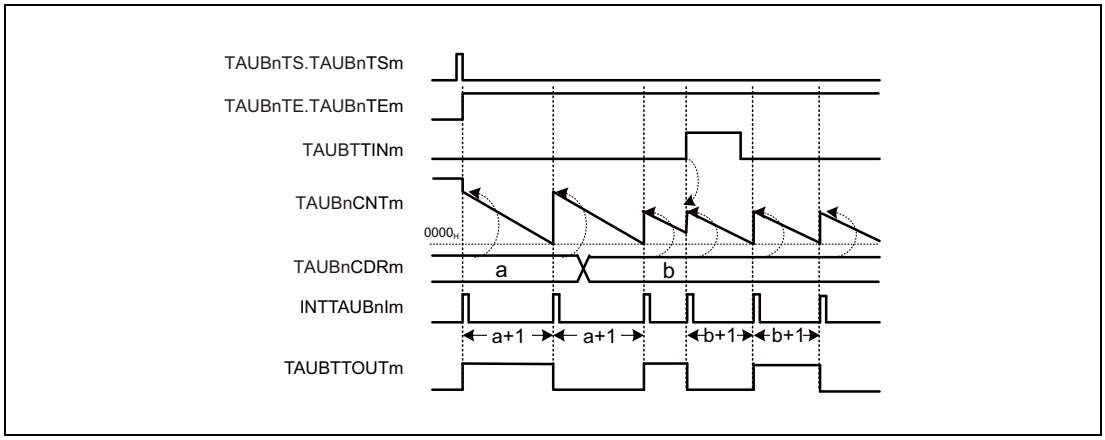

Figure 29.33 General Timing Diagram for TAUBTTINm Input Interval Timer Function

1, 0	TAUBnTIS[1:0]	00: Falling edge detection 01: Rising edge detection 10: Rising and falling edge detection 11: Setting prohibited

(3) Channel output mode

Table 29.46 Control Bit Settings for Independent Channel Output Mode 1

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 0_B.
TAUBnTOC.TAUBnTOCm	Write 0_B.
TAUBnTOL.TAUBnTOLm	Write 0_B.
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

NOTE

The channel output mode can also be set to channel output mode controlled by software by setting TAUBnTOE.TAUBnTOEm = 0. TAUBTTOUTm can then be controlled independently of the interrupts.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the TAUBTTINm Input Interval Timer Function. Therefore, these registers must be set to 0.

Table 29.47 Simultaneous Rewrite Settings for TAUBTTINm Input Interval Timer Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

29.12.2.5 Operating Procedure for TAUBTTINm Input Interval Timer Function

Table 29.48 Operating Procedure for TAUBTTINm Input Interval Timer Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm register and TAUBnCMURm registers as described in Table 29.44, Contents of the TAUBnCMORm Register for TAUBTTINm Input Interval Timer Function and Table 29.45, Contents of the TAUBnCMURm Register for TAUBTTINm Input Interval Timer Function Set the value of the TAUBnCDRm register Set the channel output mode by setting the control bits as described in Table 29.46, Control Bit Settings for Independent Channel Output Mode 1	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated and TAUBTTOUTm toggles.
During operation	The values of the TAUBnCMURm.TAUBnTIS[1:0] and the TAUBnCDRm register can be changed at any time. The TAUBnCNTm register can be read at all times. Detection of TAUBTTINm edge	TAUBnCNTm counts down. When the counter reaches 0000_H: • TAUBnCNTm reloads the TAUBnCDRm value and continues count operation • INTTAUBnIm is generated and TAUBTTOUTm toggles When a TAUBTTINm input valid edge is detected during count operation, TAUBnCNTm reloads the TAUBnCDRm value and continues count operation. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1 TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

Restart operation

29.12.2.6 Specific Timing Diagrams

The timing diagrams in Section 29.12.1, Interval Timer Function apply, and in addition the counter can also be restarted by an effective TAUBTTINm input edge.

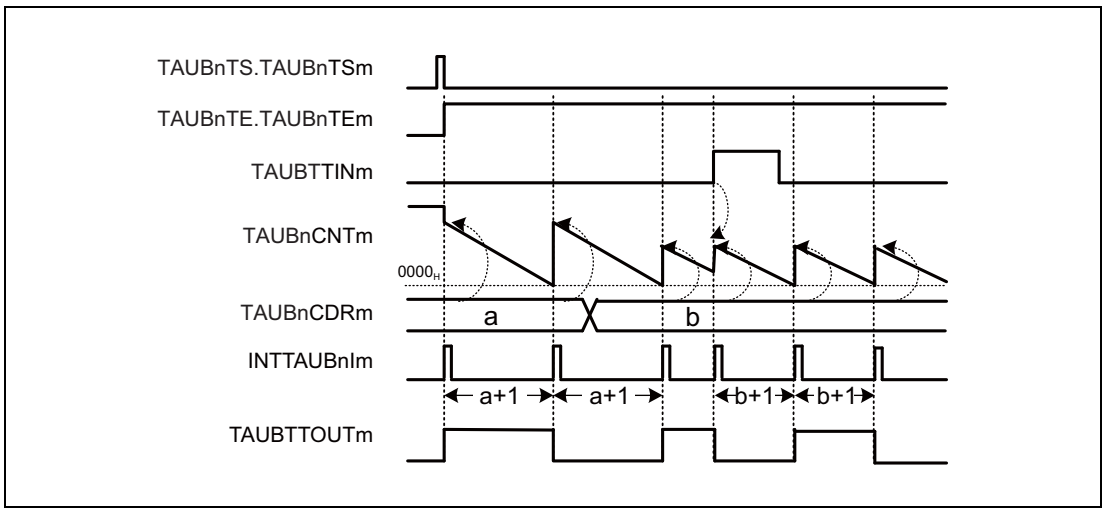

Figure 29.34 Counter Triggered by Rising TAUBTTINm Input Edge (TAUBnCMURm.TAUBnTIS[1:0] = 01_B), TAUBnCMORm.TAUBnMD0 = 1

- If a valid TAUBTTINm input edge is detected, an interrupt is generated which causes TAUBTTOUTm to toggle. In this example, the valid edge is a rising edge (TAUBnCMURm.TAUBnTIS[1:0] = 01_B).

29.12.3 Clock Divide Function

29.12.3.1 Overview

Summary

This function is used as a frequency divider. The frequency of the input signal TAUBTTINm is divided by a factor related to TAUBnCDRm, and the resulting signal is output to TAUBTTOUTm.

Prerequisites

- TAUBTTINm must have a fixed frequency
- The operation mode must be set to interval timer mode, see **Table 29.49, Contents of the TAUBnCMORm Register for Clock Divide Function**
- The channel output mode must be set to independent channel output mode 1.

Description

The counter is started by setting the channel trigger bit (TAUBnTS.TSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value, using TAUBTTINm as the count clock.

When the counter value reaches 0000_H, INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm = 1, which in turn sets TAUBnTE.TAUBnTEm = 0. TAUBnCNTm and TAUBTTOUTm stop but retain their values. The function can be restarted by setting TAUBnTS.TAUBnTSm = 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm = 1 during operation.

Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUBTTOUTm does not toggle. This results in an inverted TAUBTTOUTm signal compared to when TAUBnCMORm.TAUBnMD0 is set to 1.

NOTE

The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by TAUBnCMORm.TAUBnCKS[1:0] bits. As a result, the output cycle of TAUBTTOUTm has an error of ± 1 operation clock cycle.

29.12.3.2 Equations

- When rising edge detection is selected:
  TAUBTTOUTm frequency = TAUBTTINm frequency /
  [(TAUBnCDRm + 1) × 2]
- When falling edge detection is selected:
  TAUBTTOUTm frequency = TAUBTTINm frequency /
  [(TAUBnCDRm + 1) × 2]
- When rising and falling edge detection is selected:
  TAUBTTOUTm frequency = TAUBTTINm frequency / (TAUBnCDRm + 1)

29.12.3.3 Block Diagram and General Timing Diagram

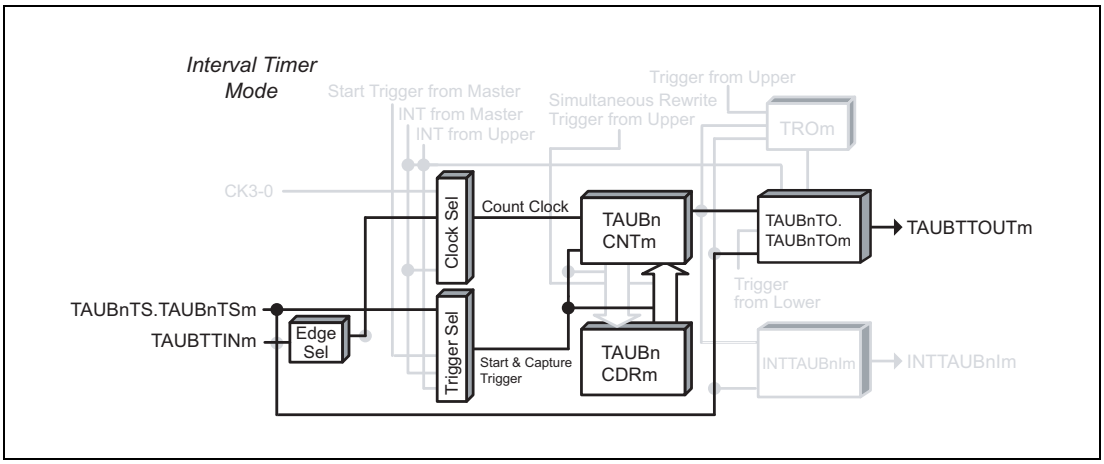

Figure 29.35 Block Diagram for Clock Divide Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
- Rising edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

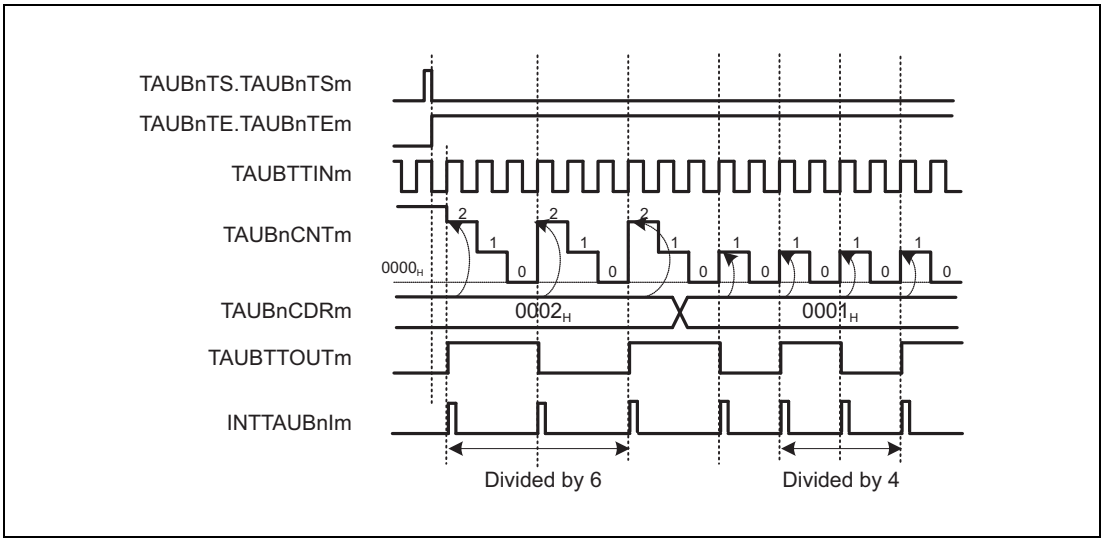

Figure 29.36 General Timing Diagram for Clock Divide Function

29.12.3.4 Register Settings

1, 0	TAUBnTIS[1:0]	00: Falling edge detection 01: Rising edge detection 10: Rising and falling edge detection 11: Setting prohibited

(3) Channel output mode

Table 29.51 Control Bit Settings for Independent Channel Output Mode 1

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 0_B.
TAUBnTOC.TAUBnTOCm	Write 0_B.
TAUBnTOL.TAUBnTOLm	Write 0_B.
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

NOTE

The channel output mode can also be set to channel output mode controlled by software by setting TAUBnTOE.TAUBnTOEm = 0. TAUBTTOUTm can then be controlled independently of the interrupts.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the Clock Divide Function. Therefore, these registers must be set to 0.

Table 29.52 Simultaneous Rewrite Settings for Clock Divide Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

29.12.3.5 Operating Procedure for Clock Divide Function

Table 29.53 Operating Procedure for Clock Divide Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm register and TAUBnCMURm registers as described in Table 29.49, Contents of the TAUBnCMORm Register for Clock Divide Function and **Table 29.50, Contents of the TAUBnCMURm Register for Clock Divide Function** Set the value of the TAUBnCDRm register Set the channel output mode by setting the control bits as described in **Table 29.50, Contents of the TAUBnCMURm Register for Clock Divide Function**	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORm.TAUBnMD0 is set to 1, INTTAUBnIm is generated and TAUBTTOUTm toggles.
During operation	The value of TAUBnCDRm can be changed at any time. The TAUBnCNTm register can be read at all times.	When a TAUBTTINm input edge is detected, TAUBnCNTm counts down. When the counter reaches 0000_H: • TAUBnCNTm loads the TAUBnCDRm value and continues count operation • INTTAUBnIm is generated • TAUBTTOUTm toggles. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

29.12.3.6 Specific Timing Diagrams

(1) TAUBnCDRm = 0000_H

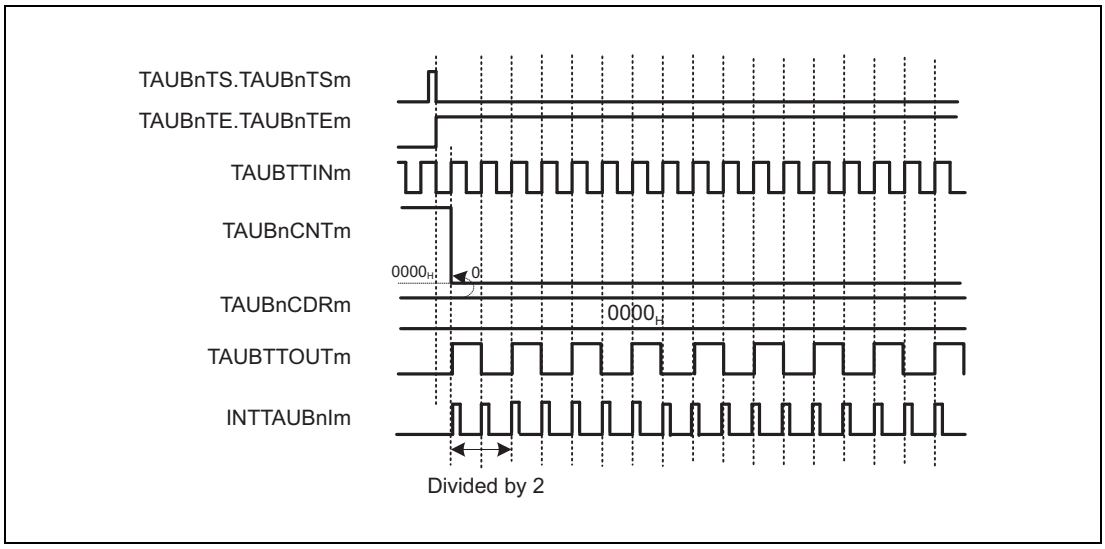

Figure 29.37 TAUBnCDRm = 0000_H, TAUBnCMORm.TAUBnMD0 = 1, TAUBnCMURm.TAUBnTIS[1:0] = 01_B

- If TAUBnCDRm is 0000_H, TAUBnCNTm is also always 0000_H.
- INTTAUBnIm is generated every count clock, resulting in TAUBTTOUTm toggling every count clock.

Figure 29.37 is an image of the operation timing. Actually, the delay time caused by the noise filter and the synchronization circuit between the TAUBnIm terminal and TAUBn will cause a delay from the TINm detection to the TOUTm output.

(2) Restart

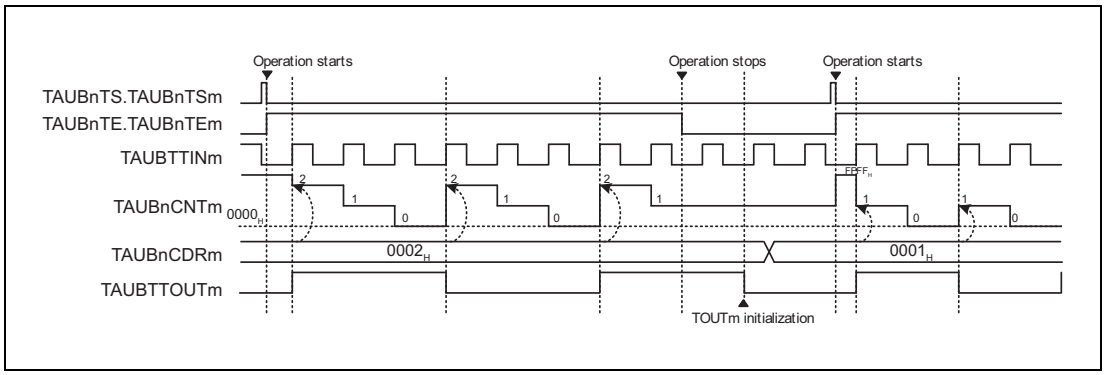

Figure 29.38 Restart (TAUBnCMORm.TAUBnMD0 = 1, TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

To reset the value of TAUBTTOUTm:

- Set TAUBnTOE.TAUBnTOEm = 0 when the counter is stopped (TAUBnTE.TAUBnTEm = 0)
- Then write either 0 or 1 to TAUBnTO.TAUBnTOm to set the new start value of TAUBTTOUTm

(3) Forced restart

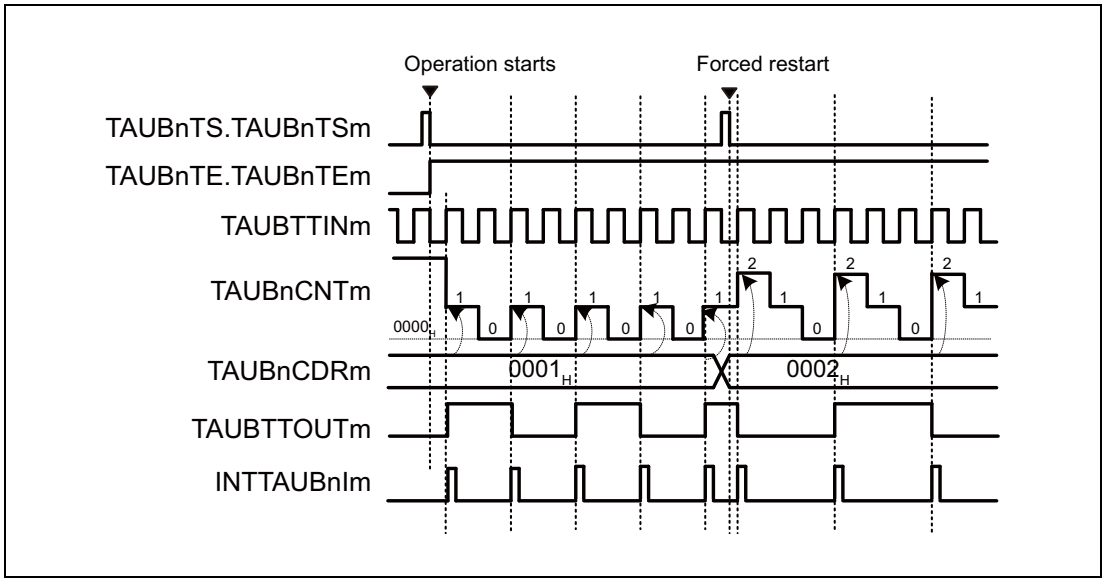

Figure 29.39 Forced Restart, (TAUBnCMORm.TAUBnMD0 = 1, TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

To reset the value of TAUBTTOUTm.

- The counter can be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm = 1 during operation.
- The value of TAUBnCDRm is written to TAUBnCNTm and the count operation restarts.
- TAUBTTOUTm restarts at the same level as before the forced restart.

29.12.4 External Event Count Function

29.12.4.1 Overview

Summary

This function is used as an event timer. It generates an interrupt (INTTAUBnIm) when a specific number of valid edges of TAUBTTINm input are detected.

Prerequisites

- The operation mode must be set to event count mode, see **Table 29.54, Contents of the TAUBnCMORm Register for External Event Count Function**
- TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When the counter starts, the current value of TAUBnCDRm is written to TAUBnCNTm.

When a valid TAUBTTINm input edge is detected, the value of TAUBnCNTm reduces by 1. TAUBnCNTm retains this value until a valid TAUBTTINm input edge is detected or the counter is restarted.

When effective edges are detected (TAUBnCDRm + 1) times, INTTAUBnIm is generated. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues to operate.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0. The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. The counter can also be restarted without stopping it first (forced restart) by setting TAUBnTS.TAUBnTSm to 1 during operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

Conditions

The type of edge used as the trigger is specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 00_B, falling edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = 01_B, rising edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = 10_B, rising and falling edges trigger the counter.

29.12.4.2 Equations

Number of valid edges,
detected before INTTAUBnIm is generated = TAUBnCDRm + 1

29.12.4.3 Block Diagram and General Timing Diagram

(3) Channel output mode

The channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the External Event Count Function.

Therefore, these registers must be set to 0.

Table 29.56 Simultaneous Rewrite Settings for External Event Count Function

Bit Name	Setting

TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

29.12.4.5 Operating Procedure for External Event Count Function

Table 29.57 Operating Procedure for External Event Count Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm register and TAUBnCMURm registers as described in Table 29.54, Contents of the TAUBnCMORm Register for External Event Count Function and Table 29.55, Contents of the TAUBnCMURm Register for External Event Count Function Set the value of the TAUBnCDRm register	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value and waits for detection of the TAUBTTINm input edge.
During operation	Detection of TAUBTTINm edges. The value of TAUBnCDRm can be changed at any time. The TAUBnCNTm register can be read at any time.	TAUBnCNTm performs count-down operation each time a TAUBTTINm input edge is detected. When the effective edges are detected (TAUBnCDRm + 1) times: • TAUBnCNTm loads the TAUBnCDRm value and continues count operation • INTTAUBnIm is generated. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

29.12.4.6 Specific Timing Diagrams

(1) TAUBnCDRm = 0000_H

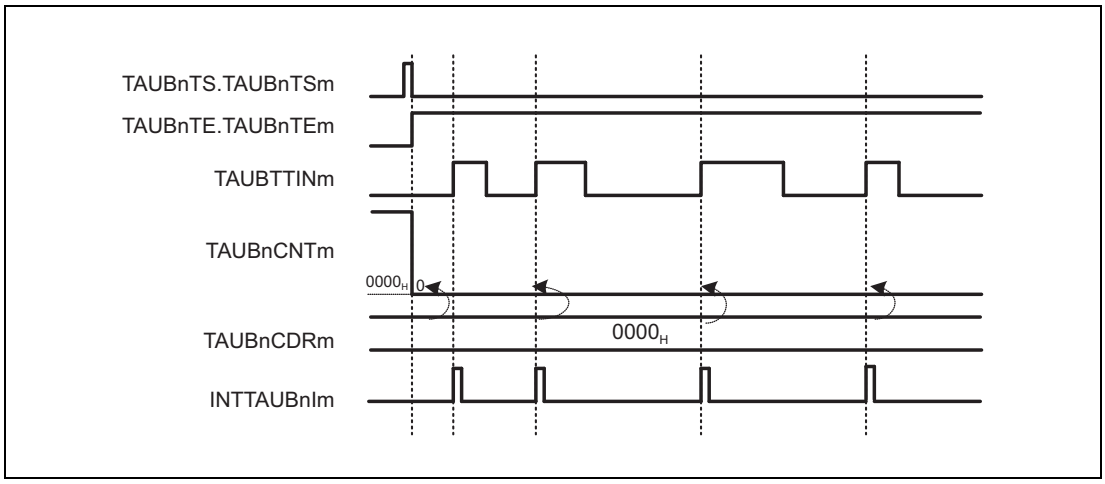

Figure 29.42 TAUBnCDRm = 0000_H, TAUBnCMURm.TAUBnTIS[1:0] = 01_B

- If 0000_H = TAUBnCDRm, 0000_H is loaded to TAUBnCNTm every time a valid TAUBTTINm input edge is detected.

  This means, INTTAUBnIm is generated every time a valid TAUBTTINm input edge is detected.

(2) Operation stop and restart

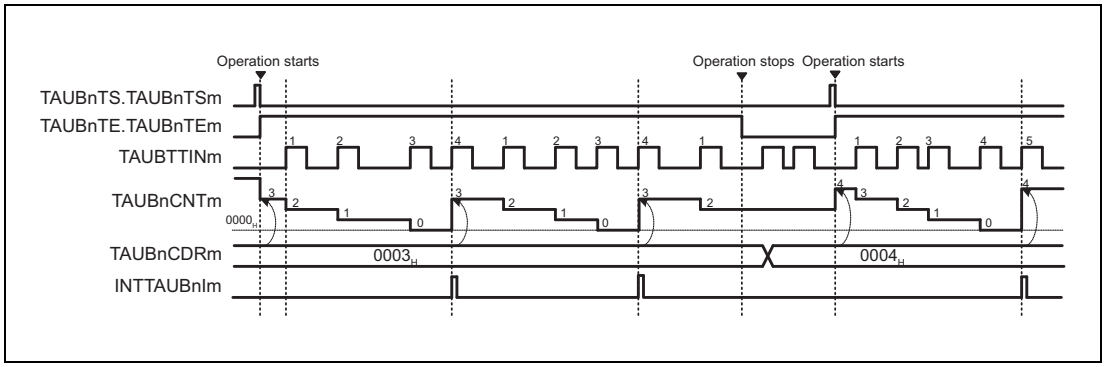

Figure 29.43 Operation Stop and Restart, (TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm stops and the current value is retained. TAUBTTINm continues and TAUBnCNTm ignores the valid edge.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. TAUBnCNTm loads the TAUBnCDRm value and restarts count operation.

(3) Forced restart

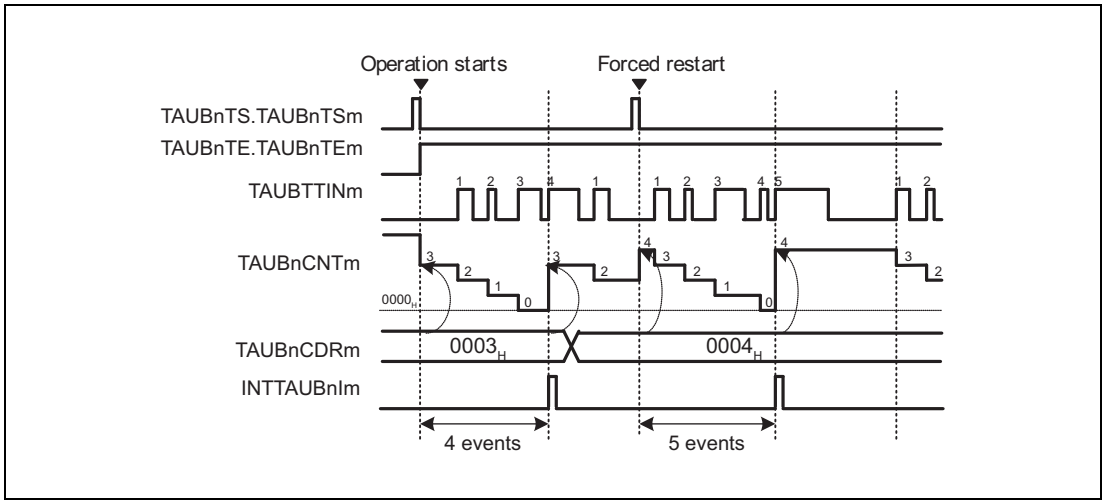

Figure 29.44 Forced Restart, (TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

A forced restart applies the new TAUBnCDRm value to TAUBnCNTm immediately.

- The counter can be restarted (without stopping it first), by setting TAUBnTS.TAUBnTSm to 1 during operation.
- The value of TAUBnCDRm is loaded to TAUBnCNTm and the counter awaits the next valid TAUBTTINm input edge.

29.12.5 One-Pulse Output Function

29.12.5.1 Overview

Summary

This function generates an interrupt (INTTAUBnIm) when a valid TAUBTTINm input edge is detected and continues to generate interrupts at the specified interval.

TAUBTTINm input signal pulses that occur within the defined interval are ignored. When an interrupt is generated, the TAUBTTOUTm signal toggles, resulting in a square wave.

Prerequisites

- The operation mode must be set to pulse one-count mode. (See Table 29.58, Contents of the TAUBnCMORm Register for One-Pulse Output Function).
- The channel output mode must be set to independent channel output mode 2. (See **Table 29.60, Control Bit Settings for Independent Channel Output Mode 2**.)
- Trigger detection must be disabled during counting (TAUBnCMORm.TAUBnMD0 = 0).

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The counter starts when a valid TAUBTTINm input edge is detected. The value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from the TAUBnCDRm value. An interrupt is generated and TAUBTTOUTm is set to the active level.

When the counter reaches 0001_H an interrupt is generated and TAUBTTOUTm is set to the active level. The counter stops at 0000_H and awaits the next valid TAUBTTINm input edge.

When the counter is counting down, further TAUBTTINm input signals are ignored, i.e. the counter does not reset.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

Conditions

The type of edge used as the trigger is specified by the TAUBnCMURm.TIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 00_B, falling edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = 01_B, rising edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = 10_B, rising and falling edges trigger the counter.

29.12.5.2 Equations

Interval between TAUBTTINm and INTTAUBnIm = TAUBTTOUTm (timer output) width = count clock cycle × TAUBnCDRm

29.12.5.3 Block Diagram and General Timing Diagram

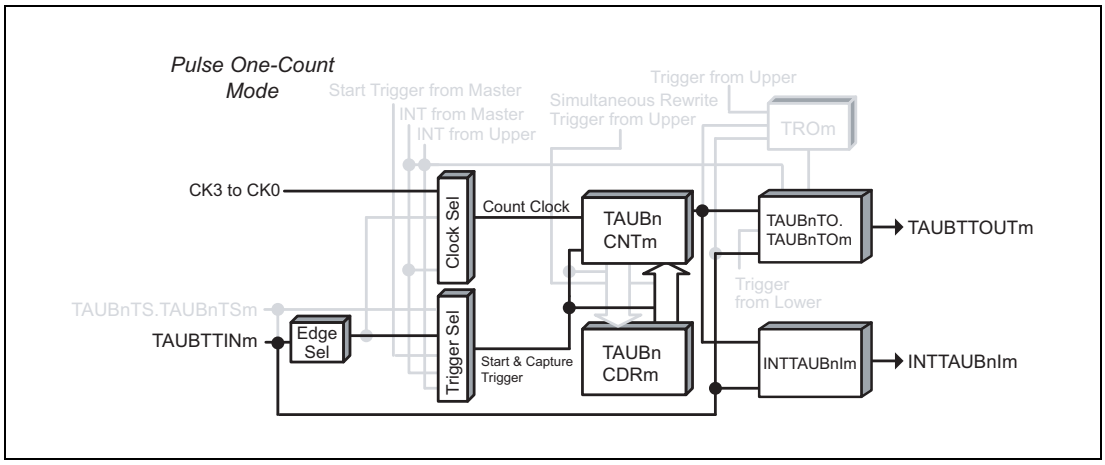

Figure 29.45 Block Diagram for One-Pulse Output Function

(3) Channel output mode

Table 29.60 Control Bit Settings for Independent Channel Output Mode 2

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 0_B.
TAUBnTOC.TAUBnTOCm	Write 1_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

NOTE

The channel output mode can also be set to channel output mode controlled by software by setting TAUBnTOE.TAUBnTOEm = 0. TAUBTTOUTm can then be controlled independently of the interrupts.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the One-Pulse Output Function.
Therefore, these registers must be set to 0.

Table 29.61 Simultaneous Rewrite Settings for One-Pulse Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

29.12.5.5 Operating Procedure for One-Pulse Output Function

Table 29.62 Operating Procedure for One-Pulse Output Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm register and TAUBnCMURm registers as described in Table 29.58, Contents of the TAUBnCMORm Register for One-Pulse Output Function and Table 29.59, Contents of the TAUBnCMURm Register for One-Pulse Output Function Set the value of the TAUBnCDRm register Set the channel output mode by setting the control bits as described in Table 29.60, Control Bit Settings for Independent Channel Output Mode 2	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUBTTINm start edge	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge. When a start edge is detected, TAUBnCNTm loads the TAUBnCDRm value.
During operation	The value of TAUBnCDRm can be changed at any time. The TAUBnCNTm register can be read at all times.	INTTAUBnIm is generated when TAUBnCNTm starts and TAUBTTOUTm is set to its active level. TAUBnCNTm counts down. When the counter reaches 0001_H: • INTTAUBnIm is generated • TAUBTTOUTm is set to its inactive level. TAUBnCNTm stops counting and waits for a trigger. If a trigger occurs while TAUBnCNTm is counting, the trigger is ignored. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

Restart operation

29.12.6 TAUBTTINm Input Pulse Interval Measurement Function

29.12.6.1 Overview

Summary

This function captures the count value and uses this value and the overflow bit TAUBnCSRm.TAUBnOVF to measure the interval of the TAUBTTINm input signal.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is started by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The counter TAUBnCNTm starts counting up from 0000_H. When a valid TAUBTTINm edge is detected, the value of TAUBnCNTm is captured, transferred to TAUBnCDRm, and an interrupt INTTAUBnIm is generated. The counter resets to 0000_H and subsequently continues operation.

If the counter reaches $FFFF_H$ before a valid TAUBTTINm edge is detected, it overflows to 0000_H. The counter is reset to 0000_H and subsequently continues operation. The values transferred to TAUBnCDRm and TAUBnCSRm.TAUBnOVF respectively depend on the values of bits TAUBnCMORm.TAUBnCOS[1:0].

Table 29.63 Effects of an Overflow

TAUBnCMORm.COS[1:0]	When Overflow Occurs		When a Valid TAUBTTINm Input is then Detected	
	TAUBnCDRm	TAUBnCSRm.TAUBnOVF	TAUBnCDRm, TAUBnCNTm	TAUBnCSRm.TAUBnOVF
00	Unchanged	0	TAUBnCNTm loaded to TAUBnCDRm	1
01		1		
10	Set to $FFFF_H$	0	TAUBnCNTm set to 0, TAUBnCDRm unchanged	Unchanged
11		1		

If TAUBnCMORm.TAUBnCOS[0] is 1, the overflow bit TAUBnCSRm.TAUBnOVF can only be cleared by a CPU command that sets TAUBnCSCm.TAUBnCLOV = 1.

The combination of the value of TAUBnCDRm and TAUBnCSRm.TAUBnOVF can be used to deduce the interval of the TAUBTTINm signal. However, if an overflow occurs multiple times before a valid TAUBTTINm input is detected, the overflow bit TAUBnCSRm.TAUBnOVF cannot indicate this.

The function can be stopped by setting TAUBnTT.TAUBnTTm = 1, which in turn sets TAUBnTE.TAUBnTEm = 0. TAUBnCNTm stops but retains its value. While the function is stopped, TAUBTTINm input valid edge detection and TAUBnCNTm capture are not performed.

The counter is reset to 0000_H and subsequently continues operation.

Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the interrupt at start or restart is not generated.

NOTE

When TAUBnCMORm.TAUBnCOS[1:0] = 10_B or 11_B, the value of TAUBnCNTm is not written to TAUBnCDRm when the first valid TAUBTTINm input edge occurs after an overflow. However, an interrupt is generated.

29.12.6.2 Equations

TAUBTTINm input pulse interval = count clock cycle ×

[(TAUBnCSRm.TAUBnOVF × ($FFFF_H$ + 1)) + TAUBnCDRm capture value + 1]

29.12.6.3 Block Diagram and General Timing Diagram

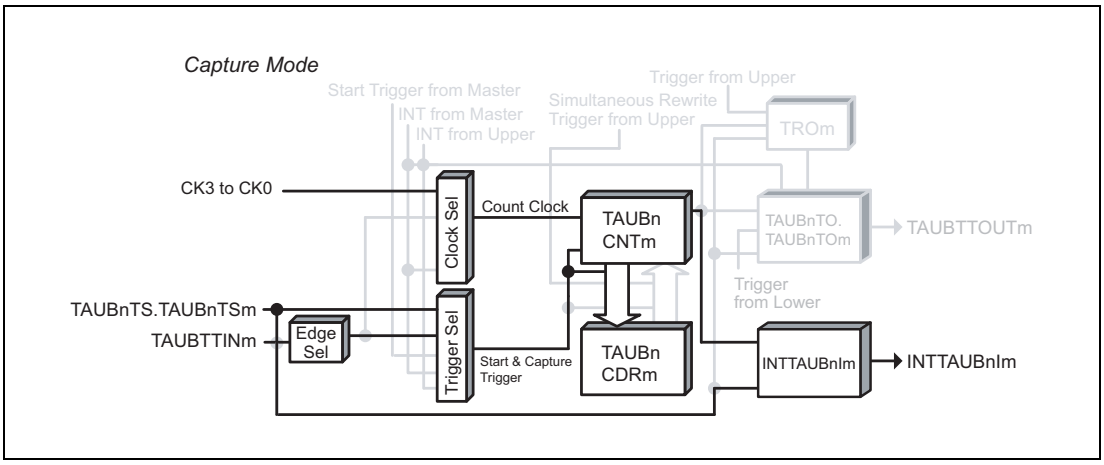

Figure 29.47 Block Diagram for TAUBTTINm Input Pulse Interval Measurement Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)
- When a valid TAUBTTINm input is detected after an overflow TAUBnCDRm is changed and TAUBnCSRm.TAUBnOVF is set to 1 (TAUBnCMORm.TAUBnCOS[1:0] = 00_B)

(3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the TAUBTTINm Input Pulse Interval Measurement Function. Therefore, these registers must be set to 0.

Table 29.66 Simultaneous Rewrite Settings for TAUBTTINm Input Pulse Interval Measurement Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

29.12.6.5 Operating Procedure for TAUBTTINm Input Pulse Interval Measurement Function

Table 29.67 Operating Procedure for TAUBTTINm Input Pulse Interval Measurement Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm register and TAUBnCMURm registers as described in **Table 29.64, Contents of the TAUBnCMORm Register for TAUBTTINm Input Pulse Interval Measurement Function** and **Table 29.65, Contents of the TAUBnCMURm Register for TAUBTTINm Input Pulse Interval Measurement Function** The TAUBnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm is cleared to 0000_H. INTTAUBnIm is generated when TAUBnCMORm.TAUBnMD0 is set to 1.
During operation	Detection of TAUBTTINm edges. The values of TAUBnCMURm.TAUBnTIS[1:0] bits can be changed at any time. The TAUBnCDRm and TAUBnCSRm registers can be read at any time. The TAUBnCSCm.TAUBnCLOV bit can be set to 1. (The TAUBnCSRm.TAUBnOVF bit can be cleared to 0.	TAUBnCNTm starts to count up from 0000_H. When a TAUBTTINm valid edge is detected: • TAUBnCNTm transfers (captures) its value to TAUBnCDRm, and returns to 0000_H • INTTAUBnIm is then generated. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and both it and TAUBnCSRm.TAUBnOVF retain their current values.

Restart operation

29.12.6.6 Specific Timing Diagrams: Overflow Behavior

(1) TAUBnCMORm.TAUBnCOS[1:0] = 00_B

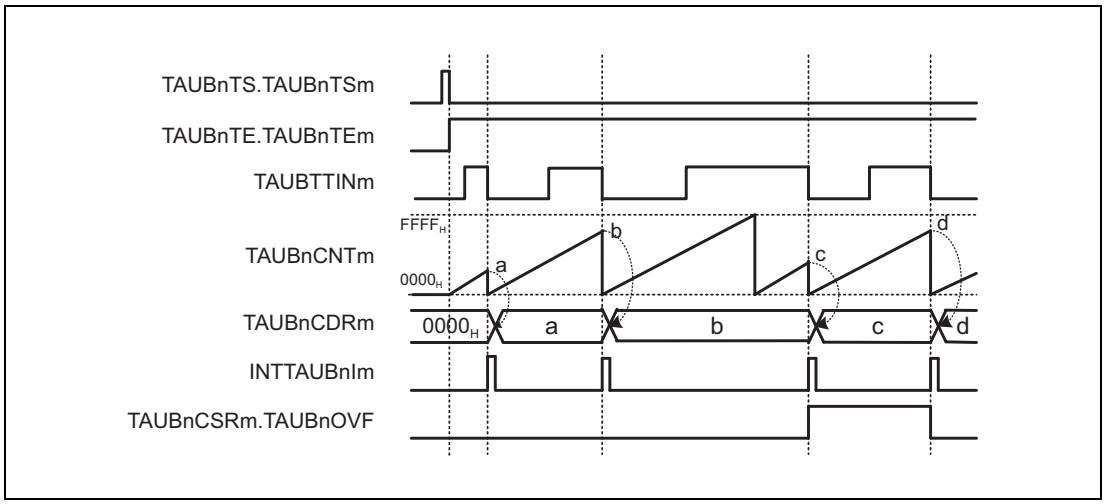

Figure 29.49 TAUBnCMORm.TAUBnCOS[1:0] = 00_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is loaded to TAUBnCDRm and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, while any overflow has not occurred, TAUBnCSRm.TAUBnOVF is cleared to 0.

(2) TAUBnCMORm.TAUBnCOS[1:0] = 01_B

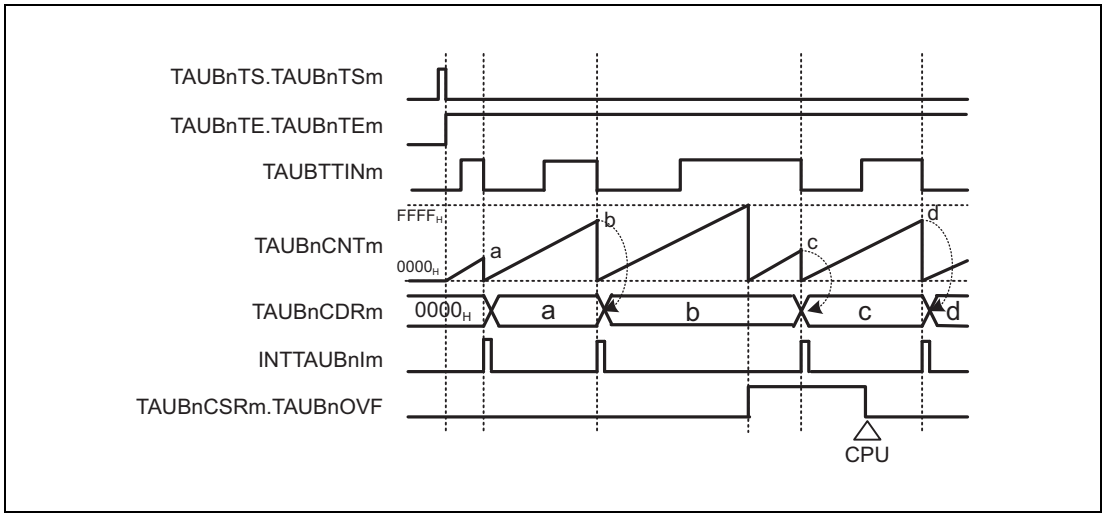

Figure 29.50 TAUBnCMORm.TAUBnCOS[1:0] = 01_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm.
- TAUBnCSRm.TAUBnOVF is only cleared by a CPU command. (TAUBnCSCm.TAUBnCLOV bit = 1)

(3) TAUBnCMORm.TAUBnCOS[1:0] = 10_B

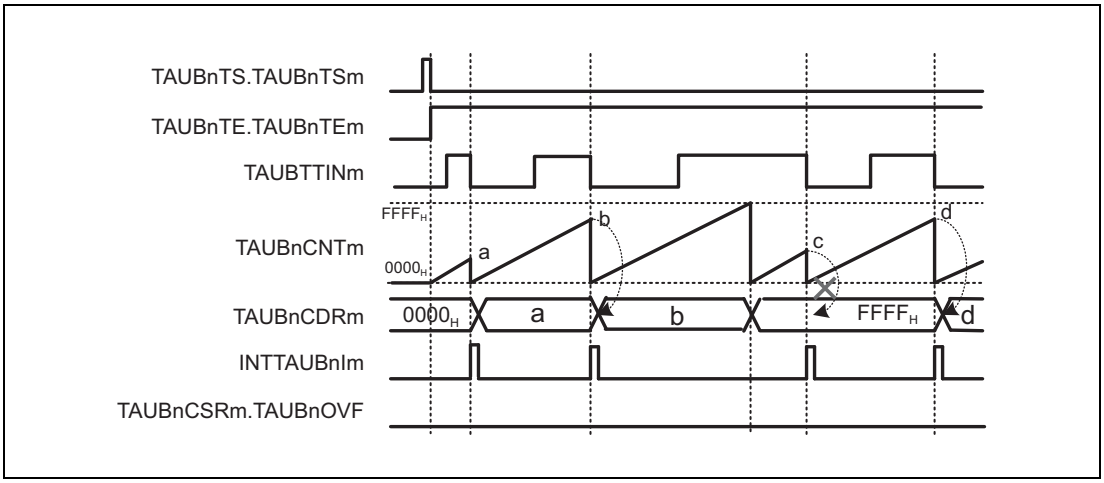

Figure 29.51 TAUBnCMORm.TAUBnCOS[1:0] = 10_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 00_B

- When an overflow occurs, TAUBnCDRm is set to $FFFF_H$ and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm is reset to 0, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.

(4) TAUBnCMORm.TAUBnCOS[1:0] = 11_B

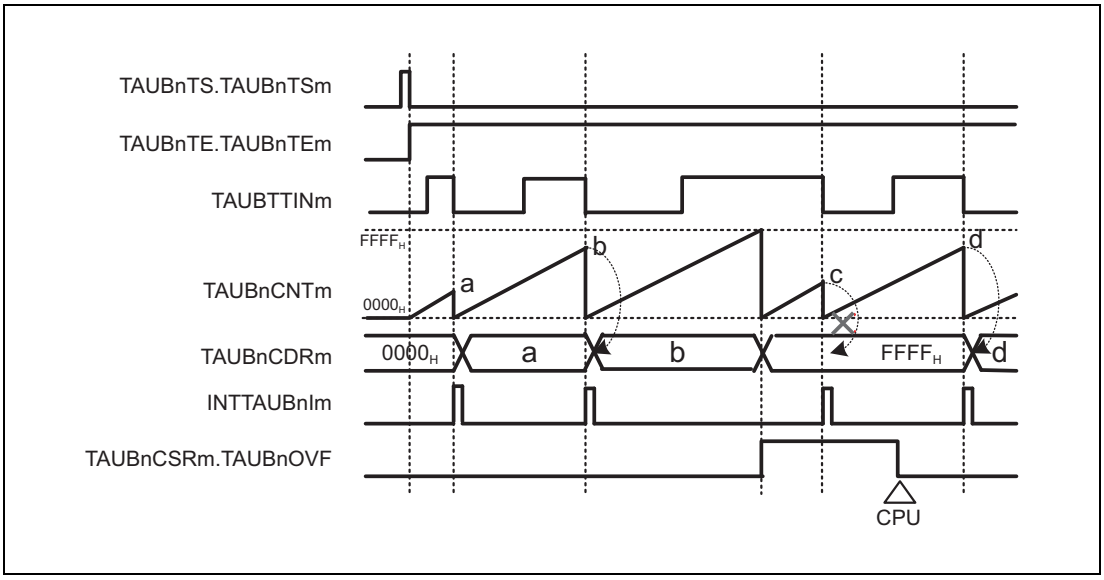

Figure 29.52 TAUBnCMORm.TAUBnCOS[1:0] = 11_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 00_B

- When an overflow occurs, TAUBnCDRm is set to $FFFF_H$, and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm is reset to 0, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.
- TAUBnCSRm.TAUBnOVF is cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

(5) When rising and falling edge detection are selected (TAUBnCMORm.TAUBnMD0 = 1)

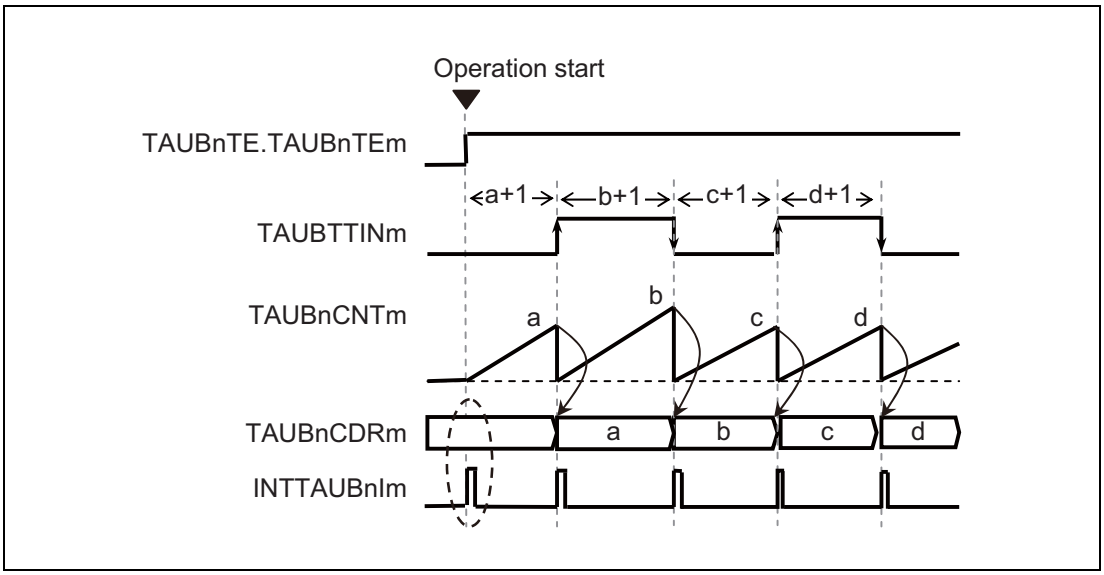

Figure 29.53 TAUBnCMORm.TAUBnMD0 = 1

Setting TAUBnCMURm.TAUBnTIS[1:0] to 10_B (detection of both edges selected) measures the TAUBTTINm rising and falling edge intervals.

(6) Operation stop and operation restart (TAUBnCMORm.TAUBnMD0 = 0)

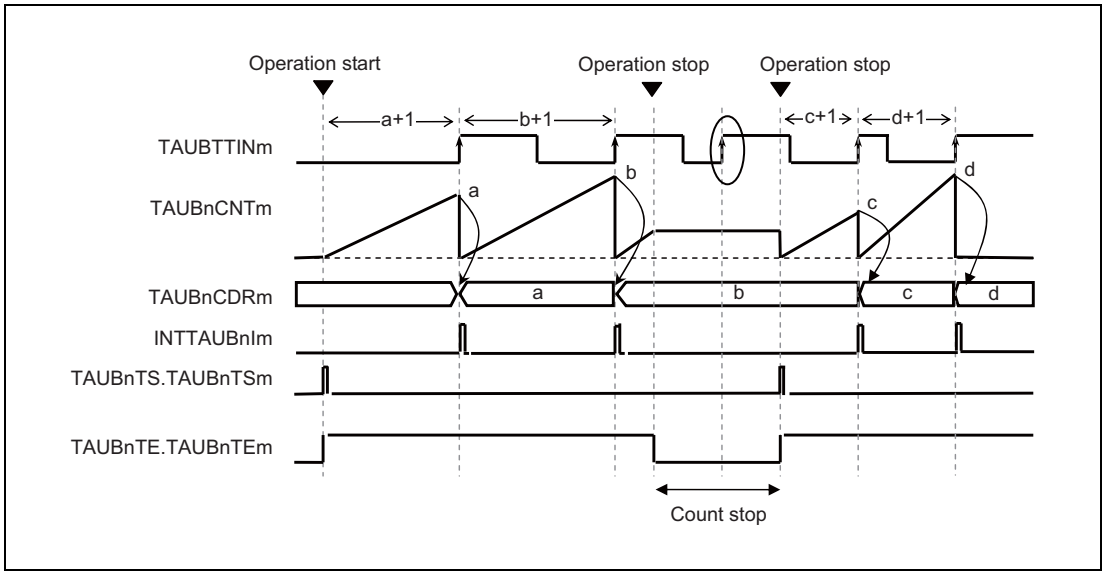

Figure 29.54 Operation Stop and Operation Restart (TAUBnCMORm.TAUBnMD0 = 0)

Setting TAUBnTT.TAUBnTTm to 1 clears TAUBnTE.TAUBnTEm to 0, which stops the count operation. At this time, TAUBnCNTm retains the status and stops.

When TAUBnTE.TAUBnTEm retains 0 (operation stopped), TAUBTTINm input is ignored (edge detection is ignored and capture operation is not performed).

Setting TAUBnTS.TAUBnTSm to 1 clears the counter to 0000_H and restarts count-up operation.

29.12.7 TAUBTTINm Input Signal Width Measurement Function

29.12.7.1 Overview

Summary

This function measures the width of a TAUBTTINm signal by starting counting on one edge of the TAUBTTINm signal and capturing the counter value on the opposite edge.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is started by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.

This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When a valid TAUBTTINm start edge is detected, the counter TAUBnCNTm starts counting up from 0000_H. When a valid TAUBTTINm stop edge is detected, the value of TAUBnCNTm is captured, transferred to TAUBnCDRm, and an interrupt INTTAUBnIm is generated. The counter retains its value (TAUBnCDRm + 1) and awaits the next valid TAUBTTINm input start edge.

If the counter reaches $FFFF_H$ before a valid TAUBTTINm stop edge is detected, it overflows. The counter is reset to 0000_H and subsequently continues operation. The values transferred to TAUBnCDRm and TAUBnCSRm.TAUBnOVF respectively depend on the values of bits TAUBnCMORm.TAUBnCOS[1:0].

Table 29.68 Effects of an Overflow

	When Overflow Occurs		When a Valid TAUBTTINm Input Stop Edge is Detected	
TAUBnCMORm.COS[1:0]	TAUBnCDRm	TAUBnCSRm.TAUBnOVF	TAUBnCDRm, TAUBnCNTm	TAUBnCSRm.TAUBnOVF
00	Unchanged	0	TAUBnCNTm written to TAUBnCDRm	1
01		1		
10	Set to $FFFF_H$	0	TAUBnCNTm stops counting TAUBnCDRm unchanged	Unchanged
11		1		

If TAUBnCMORm.TAUBnCOS[0] = 1, the overflow bit TAUBnCSRm.TAUBnOVF can only be cleared by a CPU command that sets TAUBnCSCm.TAUBnCLOV = 1.

The combination of the value of TAUBnCDRm and TAUBnCSRm.TAUBnOVF can be used to deduce the width of the TAUBTTINm signal. However, if an overflow occurs multiple times before a valid TAUBTTINm input is detected, the overflow bit TAUBnCSRm.TAUBnOVF cannot indicate this.

This function cannot be forcibly restarted.

NOTE

When TAUBnCMORm.TAUBnCOS[1] = 1, the value of TAUBnCNTm is not written to TAUBnCDRm when the first valid TAUBTTINm input edge occurs after an overflow. However, an interrupt is generated.

29.12.7.2 Equations

TAUBTTINm input signal width = count clock cycle ×

[(TAUBnCSRm.OVF × ($FFFF_H$ + 1)) + TAUBnCDRm capture value + 1]

29.12.7.3 Block Diagram and General Timing Diagram

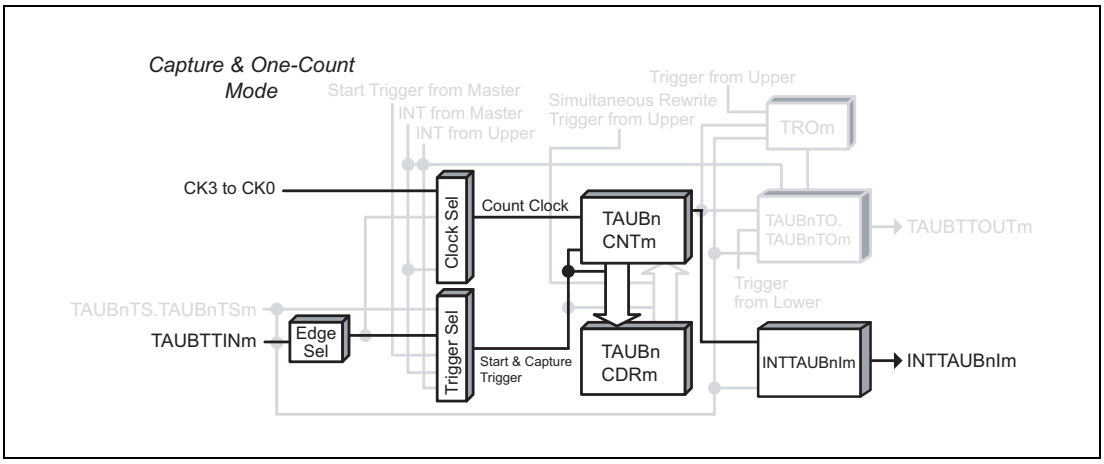

Figure 29.55 Block Diagram for TAUBTTINm Input Signal Width Measurement Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = 11_B)
- When a valid TAUBTTINm input is detected after an overflow TAUBnCDRm is changed and TAUBnCSRm.TAUBnOVF is set to 1 (TAUBnCMORm.TAUBnCOS[1:0] = 00_B)

1, 0	TAUBnTIS[1:0]	10: Rising and falling edge detection (low width measurement) 11: Rising and falling edge detection (high width measurement)

(3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the TAUBTTINm Input Signal Width Measurement Function. Therefore, these registers must be set to 0.

Table 29.71 Simultaneous Rewrite Settings for TAUBTTINm Input Signal Width Measurement Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

29.12.7.5 Operating Procedure for TAUBTTINm Input Signal Width Measurement Function

Table 29.72 Operating Procedure for TAUBTTINm Input Signal Width Measurement Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm register and TAUBnCMURm registers as described in **Table 29.69, Contents of the TAUBnCMORm Register for TAUBTTINm Input Signal Width Measurement Function** and **Table 29.70, Contents of the TAUBnCMURm Register for TAUBTTINm Input Signal Width Measurement Function** The TAUBnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge. When a TAUBTTINm start edge is detected, TAUBnCNTm start edge to count up.
During operation	The TAUBnCDRm, TAUBnCNTm, and TAUBnCSRm registers can be read at any time. The TAUBnCSC.TAUBnCLOV bit can be set to 1.	TAUBnCNTm starts to count up from 0000_H. When a TAUBTTINm valid edge is detected: • TAUBnCNTm transfers (captures) its value to TAUBnCDRm, and retains its value • INTTAUBnIm is then generated. • The count stops at the value transferred to TAUBnCDRm + 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TEm is cleared to 0 and the counter stops. TAUBnCNTm stops and both it and TAUBnCSRm.TAUBnOVF retain their current values.

Restart operation

29.12.7.6 Specific Timing Diagrams: Overflow Behavior

(1) TAUBnCMORm.TAUBnCOS[1:0] = 00_B

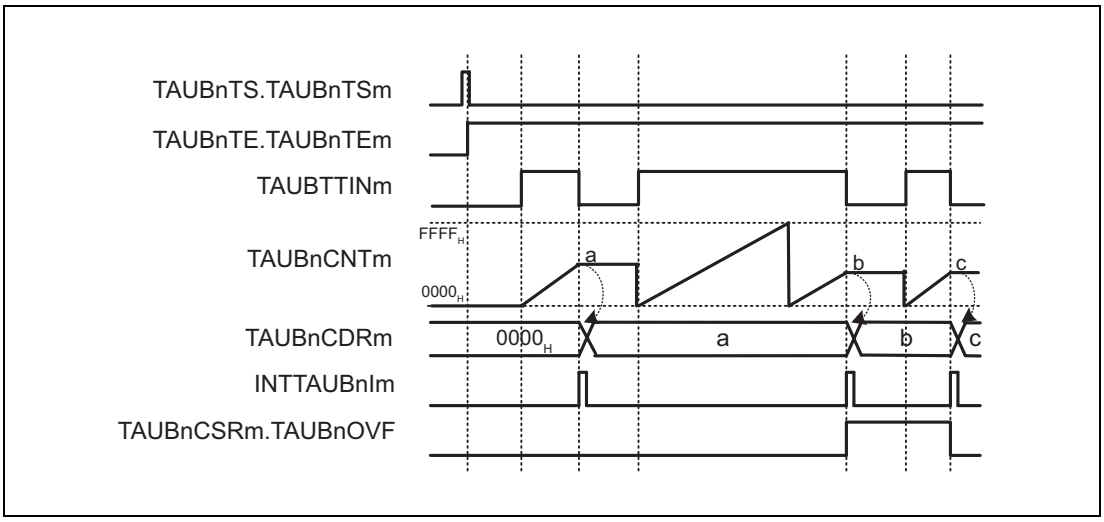

Figure 29.57 TAUBnCMORm.TAUBnCOS[1:0] = 00_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, while any overflow has not occurred, TAUBnCSRm.TAUBnOVF is cleared to 0.

(2) TAUBnCMORm.TAUBnCOS[1:0] = 01_B

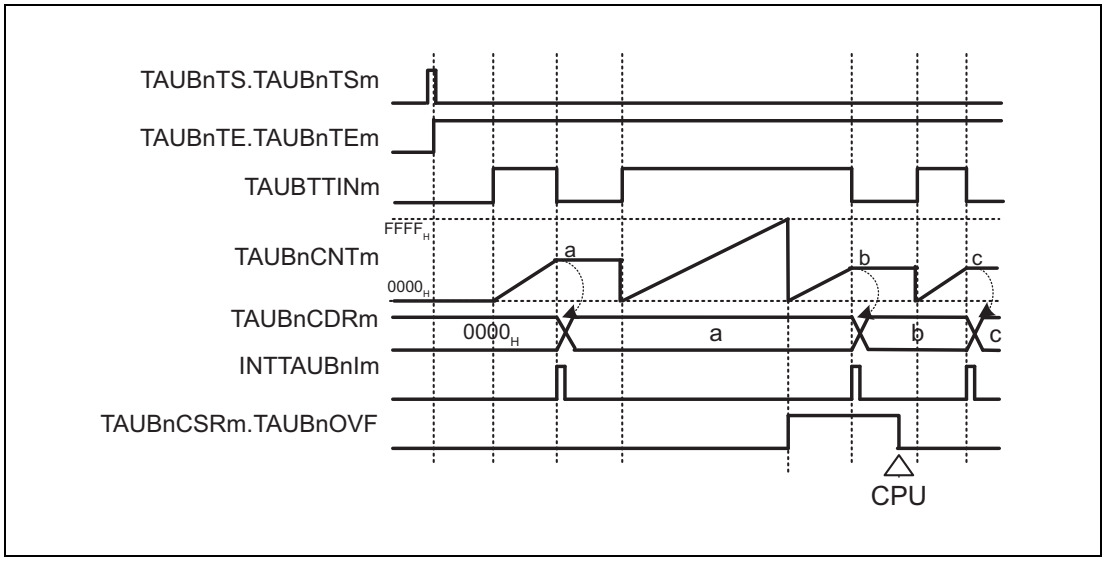

Figure 29.58 TAUBnCMORm.TAUBnCOS[1:0] = 01_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm.
- TAUBnCSRm.TAUBnOVF is only cleared by a CPU command (The TAUBnCSCm.TAUBnCLOV bit = 1).

(3) TAUBnCMORm.TAUBnCOS[1:0] = 10_B

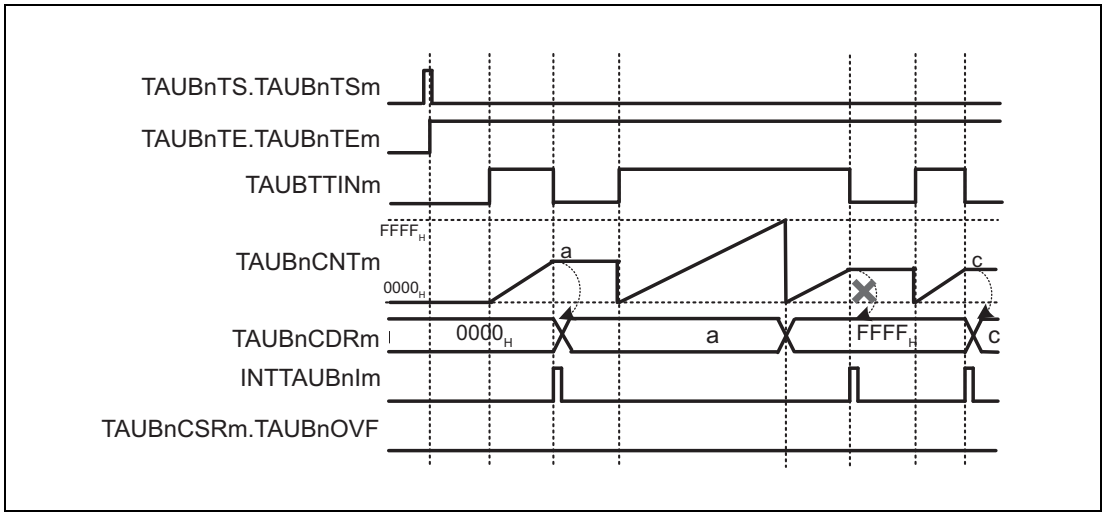

Figure 29.59 TAUBnCMORm.TAUBnCOS[1:0] = 10_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 11_B

- When an overflow occurs, TAUBnCDRm is set to $FFFF_H$ and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm stops counting, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.

(4) TAUBnCMORm.TAUBnCOS[1:0] = 11_B

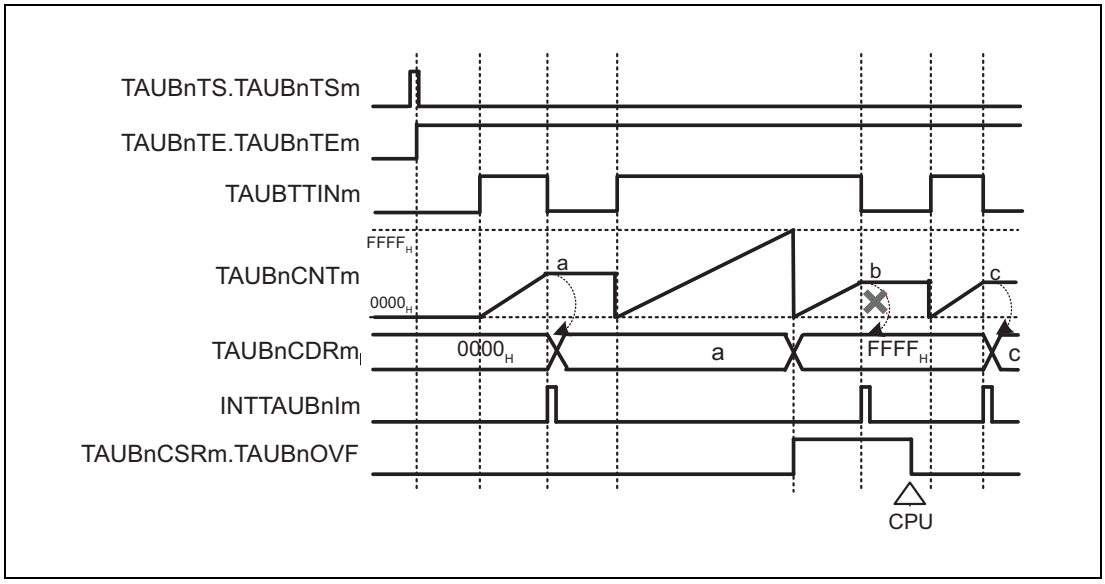

Figure 29.60 TAUBnCMORm.TAUBnCOS[1:0] = 11_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 11_B

- When an overflow occurs, TAUBnCDRm is set to $FFFF_H$, and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm stops counting, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.
- TAUBnCSRm.TAUBnOVF is cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

(5) When an overflow occurs (high width measurement)

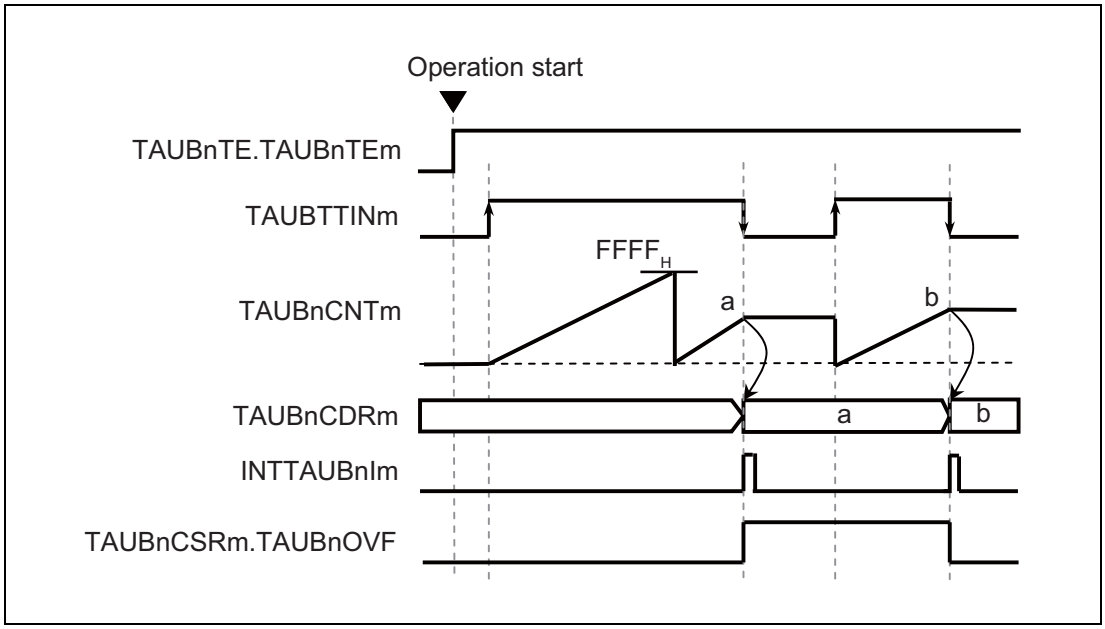

Figure 29.61 When an Overflow Occurs

When a capture trigger is input after the counter value has overflowed, the counter value is transferred to TAUBnCDRm and at the same time TAUBnCSRm.TAUBnOVF is set to 1.

TAUBnCSRm.TAUBnOVF is kept at 1 until the next capture trigger occurs.

If the next capture trigger is not accompanied by an overflow, TAUBnCSRm.TAUBnOVF is cleared to 0.

TAUBTTINm input signal width (example when TAUBnCSRm.TAUBnOVF is 1 and TAUBnCDRm is a)
= count clock cycle × ((10000_H × TAUBnCSRm.TAUBnOVF) + (TAUBnCDRm capture value + 1))
= count clock cycle × ((10000_H × 1) + (a+1))
= count clock cycle × (10000_H + a+1)

29.12.8 TAUBTTINm Input Position Detection Function

29.12.8.1 Overview

Summary

This function measures the interval of an input signal by capturing the counter value on a valid edge of the TAUBTTINm signal.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1. The counter starts to count from 0000_H. When a valid TAUBTTINm input stop edge is detected, the current TAUBnCNTm value is written to TAUBnCDRm and an interrupt (INTTAUBnIm) is generated. The counter continues to count from the current value until the next valid TAUBTTINm input edge is detected.

When the counter reaches $FFFF_H$, the counter restarts from 0000_H.

NOTE

The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by the TAUBnCMORm.TAUBnCKS[1:0] bits. As a result, the output cycle of TAUBTTOUTm has an error of ± 1 operation clock cycle.

Conditions

If the TAUBnCMORm.MD0 bit is set to 0, the first interrupt after a start or restart is not generated.

29.12.8.2 Equations

Function duration at a TAUBTTINm input pulse =

count clock cycle × (TAUBnCDRm capture value + 1)

29.12.8.3 Block Diagram and General Timing Diagram

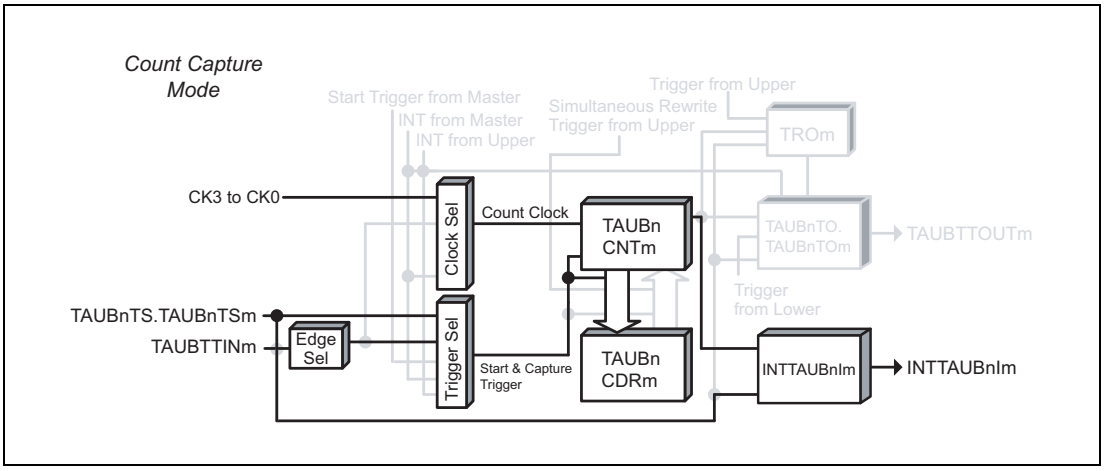

Figure 29.62 Block Diagram for TAUBTTINm Input Position Detection Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

(3) Channel output mode

The channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the TAUBTTINm Input Position Detection Function. Therefore, these registers must be set to 0.

Table 29.75 Simultaneous Rewrite Settings for TAUBTTINm Input Position Detection Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

29.12.8.5 Operating Procedure for TAUBTTINm Input Position Detection Function

Table 29.76 Operating Procedure for TAUBTTINm Input Position Detection Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm register and TAUBnCMURm registers as described in Table 29.73, Contents of the TAUBnCMORm Register for TAUBTTINm Input Position Detection Function and Table 29.74, Contents of the TAUBnCMURm Register for TAUBTTINm Input Position Detection Function The TAUBnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. INTTAUBnIm is generated when TAUBnCMORm.TAUBnMD0 is set to 1.
During operation	The values of TAUBnCMURm.TAUBnTIS[1:0] bits can be changed at any time. The TAUBnCDRm and TAUBnCSRm registers can be read at any time.	TAUBnCNTm starts to count up from 0000_H. When a TAUBTTINm valid edge is detected: • TAUBnCNTm transfers (captures) its value to TAUBnCDRm • INTTAUBnIm is output. • The counter value is not cleared to 0000_H and TAUBnCNTm continues count operation. Afterwards, this procedure is repeated. If TAUBnCNTm reaches $FFFF_H$, the counter restarts from 0000_H.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

29.12.8.6 Specific Timing Diagrams

(1) Operation stop and restart

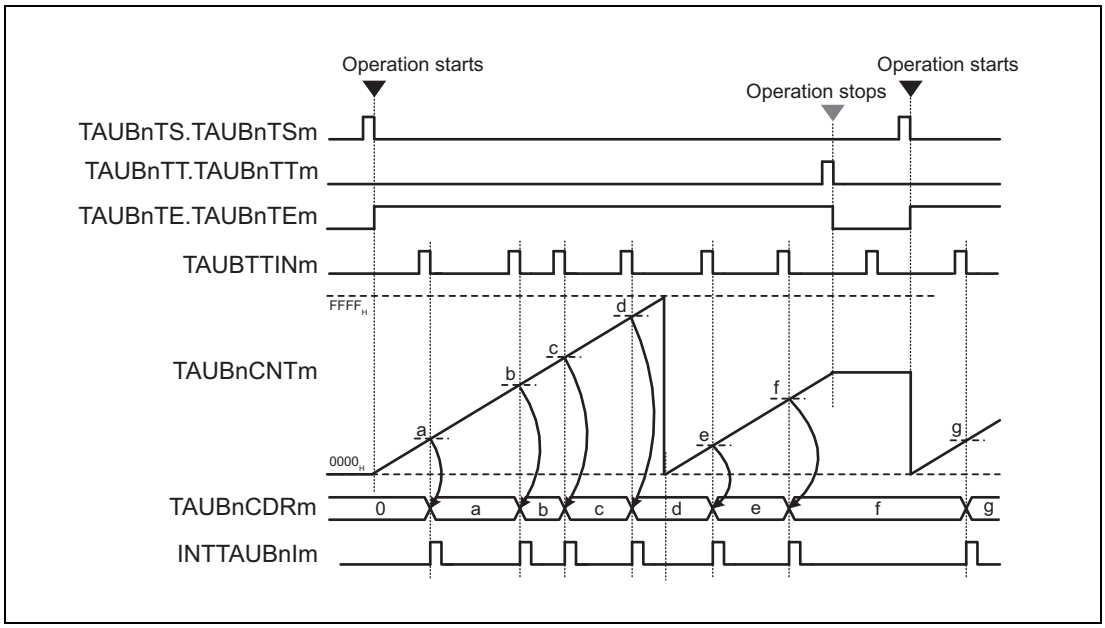

Figure 29.64 Operation Stop and Restart, (TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TEm to 0.
- TAUBnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUBTTINm input edges are ignored.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. TAUBnCNTm restarts to count from 0000_H.

29.12.9 TAUBTTINm Input Period Count Detection Function

29.12.9.1 Overview

Summary

This function measures the cumulative width of a TAUBTTINm input signal.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.

This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The counter awaits a valid TAUBTTINm input edge.

When a valid TAUBTTINm input start edge is detected, the counter starts to count from 0000_H.

When a valid TAUBTTINm input stop edge is detected, the current TAUBnCNTm value is written to TAUBnCDRm and an interrupt (INTTAUBnIm) is generated. The counter stops and retains its value (TAUBnCDRm + 1) until the next valid TAUBTTINm input start edge is detected.

When a next valid TAUBTTINm input start edge is detected, the counter restarts from the value retained while stopping.

If the counter reaches $FFFF_H$, the counter restarts from 0000_H.

NOTES

1. The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by the TAUBnCMORm.TAUBnCKS[1:0] bits.
2. As this function is to measure the TAUBTTINm input signal width, setting TAUBnTS.TAUBnTSm to 1 is disabled while TAUBnTE.TAUBnTEm = 1.

Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 10_B, the TAUBTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = 11_B, the TAUBTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

29.12.9.2 Equations

Cumulative TAUBTTINm input width =

count clock cycle × (TAUBnCDRm capture value + 1)

29.12.9.3 Block Diagram and General Timing Diagram

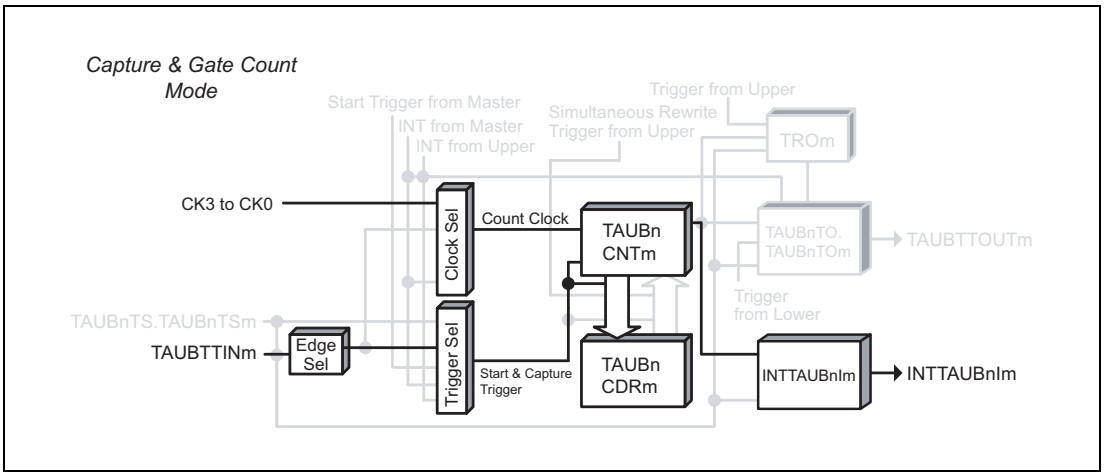

Figure 29.65 Block Diagram for TAUBTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = 11_B)

29.12.9.5 Operating Procedure for TAUBTTINm Input Period Count Detection Function

Table 29.80 Operating Procedure for TAUBTTINm Input Period Count Detection Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm register and TAUBnCMURm registers as described in **Table 29.77, Contents of the TAUBnCMORm Register for TAUBTTINm Input Period Count Detection Function** and **Table 29.78, Contents of the TAUBnCMURm Register for the TAUBTTINm Input Period Count Detection Function** The TAUBnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge.
During operation	Detection of TAUBTTINm edges. The TAUBnCDRm, TAUBnCNTm, and TAUBnCSRm registers can be read at any time.	When a TAUBTTINm start edge (rising edge for high width measurement, falling edge for low width measurement) is detected, TAUBnCNTm starts to count up from the stop value. When TAUBnCNTm detects a capture edge (falling edge for high width measurement, rising edge for low width measurement), it transfers the value to TAUBnCDRm and INTTAUBnIm is generated. Counting stops at the “value transferred to TAUBnCDRm + 1” value and TAUBnCNTm waits for detection of the TAUBTTINm start edge. When TAUBnCNTm reaches $FFFF_H$, the counter restarts from 0000_H. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

29.12.9.6 Specific Timing Diagrams

(1) Operation stop and restart

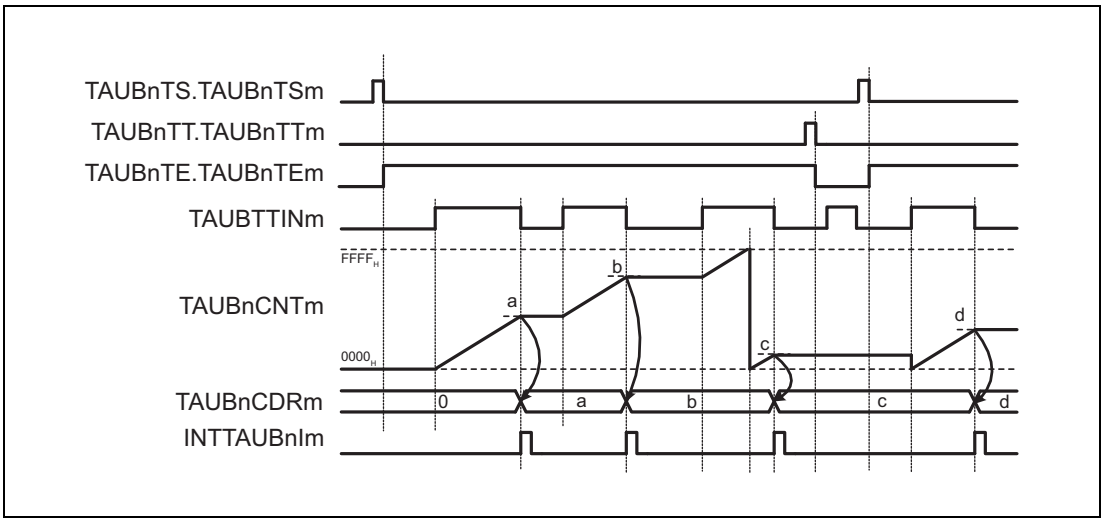

Figure 29.67 Operation Stop and Restart, (TAUBnCMURm.TAUBnTIS[1:0] = 11_B)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUBTTINm input edges are ignored.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. TAUBnCNTm restarts to count from 0000_H.

29.12.10 TAUBTTINm Input Pulse Interval Judgment Function

29.12.10.1 Overview

Summary

This function outputs the result of a comparison between the count value (TAUBnCNTm) and the value in the channel data register (TAUBnCDRm) when a TAUBTTINm input pulse occurs. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is started by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value.

When a TAUBTTINm valid edge is detected or TAUBnTS.TAUBnTSm is set to 1, the function compares the current values of TAUBnCNTm and TAUBnCDRm. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true. TAUBnCNTm reloads the value of TAUBnCDRm and subsequently continues operation, regardless of the result of the comparison.

If the counter reaches 0000_H before a TAUBTTINm valid edge is detected, TAUBnCNTm overflows and is set to $FFFF_H$. It then continues to count down.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

Conditions

The TAUBnCMORm.TAUBnMD0 bit specifies the type of comparison:

- If TAUBnCMORm.TAUBnMD0 = 0, INTTAUBnIm is generated when TAUBnCNTm ≤ TAUBnCDRm.
- If TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated when TAUBnCNTm > TAUBnCDRm.

29.12.10.4 Operating Procedure for TAUBTTINm Input Pulse Interval Judgment Function

Table 29.84 Operating Procedure for TAUBTTINm Input Pulse Interval Judgment Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm register and TAUBnCMURm registers as described in **Table 29.81, Contents of the TAUBnCMORm Register for TAUBTTINm Input Pulse Interval Judgment Function** and **Table 29.82, Contents of the TAUBnCMURm Register for TAUBTTINm Input Pulse Interval Judgment Function** Set the value of the TAUBnCDRm register	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value.
During operation	The following register can be changed at any time: • TAUBnCDRm register	When TAUBnCMORm.TAUBnMD0 = 0 If TAUBnCNTm ≤ TAUBnCDRm when a TAUBTTINm input edge is detected, INTTAUBnIm is generated. When TAUBnCMORm.TAUBnMD0 = 1 If TAUBnCNTm > TAUBnCDRm when a TAUBTTINm input edge is detected, INTTAUBnIm is generated. If a TAUBTTINm input edge is detected, then TAUBnCNTm starts to count down from the value of TAUBnCDRm. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

29.12.11 TAUBTTINm Input Signal Width Judgment Function

29.12.11.1 Overview

Summary

This function compares the count value (TAUBnCNTm) for the high or low level width of a TAUBTTINm input signal and the TAUBnCDRm value, and outputs the judgment result from the interrupt request signal INTTAUBnIm.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is started by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When a valid TAUBTTINm input start edge is detected, the current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value.

When a TAUBTTINm valid stop edge is detected, the function compares the current values of TAUBnCNTm and TAUBnCDRm. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true. The counter TAUBnCNTm retains its value until the next TAUBTTINm valid start edge is detected, regardless of the result of the comparison.

If the counter reaches 0000_H before a valid TAUBTTINm stop edge is detected, TAUBnCNTm overflows and is set to $FFFF_H$. It then continues to count down.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

Conditions

- The TAUBnCMORm.TAUBnMD0 bit specifies the type of comparison:
  - If TAUBnCMORm.TAUBnMD0 = 0, INTTAUBnIm is generated when TAUBnCNTm ≤ TAUBnCDRm.
  - If TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated when TAUBnCNTm > TAUBnCDRm.
- The TAUBnCMURm.TAUBnTIS[1:0] bits specify the type of width measurement:
  - For high width measurement, (When TAUBnCMURm.TAUBnTIS[1:0] = 11_B) the start edge is a rising TAUBTTINm edge and the stop edge is a falling TAUBTTINm edge.
  - For low width measurement, (TAUBnCMURm.TAUBnTIS[1:0] = 10_B) the start edge is a falling TAUBTTINm edge and the stop edge is a rising TAUBTTINm edge.
- Forced restart is not possible for this function.

29.12.11.2 Block Diagram and General Timing Diagram

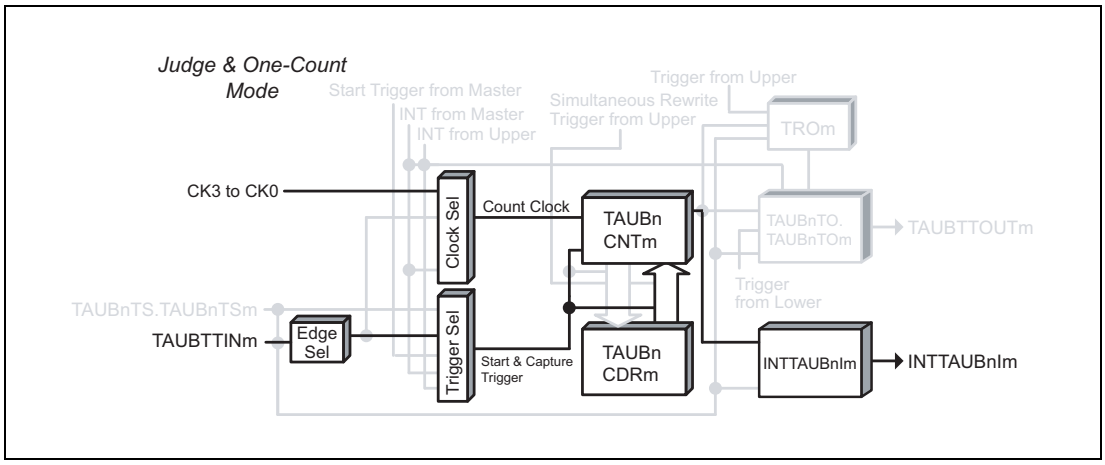

Figure 29.70 Block Diagram for TAUBTTINm Input Signal Width Judgment Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated when TAUBnCNTm ≤ TAUBnCDRm (TAUBnCMORm.TAUBnMD0 = 0)
- TAUBTTINm valid start edge = rising edge, TAUBTTINm valid stop edge = falling edge (TAUBnCMURm.TAUBnTIS[1:0] = 11_B)

Table 29.88 Operating Procedure for TAUBTTINm Input Signal Width Judgment Function

	Operation	Status of TAUBn
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge.
During operation	The following register can be changed at any time: • TAUBnCDRm register	If a TAUBTTINm start edge is detected, then TAUBnCNTm starts to count down from the value of TAUBnCDRm. When TAUBnCMORm.TAUBnMD0 = 0 If TAUBnCNTm ≤ TAUBnCDRm when a TAUBTTINm input stop edge is detected, INTTAUBnIm is generated. When TAUBnCMORm.TAUBnMD0 = 1 If TAUBnCNTm > TAUBnCDRm when a TAUBTTINm input stop edge is detected, INTTAUBnIm is generated. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

29.12.12 Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

29.12.12.1 Overview

Summary

This function measures the width of an individual TAUBTTINm input signal. An interrupt is generated if the TAUBTTINm input width is longer than $FFFF_H + 1$.

Prerequisites

- TAUBTTOUTm is not used for this function
- The value of TAUBnCDRm must be set to $FFFF_H$.

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The counter starts when a valid TAUBTTINm input start edge is detected. $FFFF_H$ is written to TAUBnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.

When the next TAUBTTINm input start edge is detected, TAUBnCNTm loads $FFFF_H$ and starts to count down.

If the counter reaches 0000_H before a stop edge is detected, an interrupt is generated.

Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 10_B, the TAUBTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = 11_B, the TAUBTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE

The counter cannot be restarted during operation.

29.12.12.4 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

Table 29.92 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm register and TAUBnCMURm registers as described in **Table 29.89, Contents of the TAUBnCMORm Register for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)** and **Table 29.90, Contents of the TAUBnCMURm Register for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)** Set the value of the TAUBnCDRm register to $FFFF_H$.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUBTTINm start edge	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the start edge. When a start edge is detected, TAUBnCNTm loads the TAUBnCDRm value ($FFFF_H$).
During operation	The TAUBnCNTm register can be read at any time.	TAUBnCNTm counts down. When the counter reaches 0000_H: • INTTAUBnIm is generated When a TAUBTTINm input stop edge is detected during count operation: • TAUBnCNTm stops and retains its current value. When a TAUBTTINm input start edge is detected while the counter is stopped: • The TAUBnCDRm value ($FFFF_H$) is loaded to TAUBnCNTm again and the counter starts to count down. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

29.12.13 Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

29.12.13.1 Overview

Summary

This function measures the cumulative width of a TAUBTTINm input signal. An interrupt is generated if the cumulative TAUBTTINm input width is longer than $FFFF_H$.

Prerequisites

- TAUBTTOUTm is not used for this function
- The value of TAUBnCDRm must be set to $FFFF_H$

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The counter starts when a valid TAUBTTINm input start edge is detected. $FFFF_H$ is written to TAUBnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUBTTINm input start edge and then continues to count down from the current value.

When the counter reaches 0000_H an interrupt is generated. $FFFF_H$ is written to TAUBnCNTm and the counter continues to count down until a TAUBTTINm input stop edge is detected.

Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 10_B, the TAUBTTINm input low period is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = 11_B, the TAUBTTINm input high period is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE

The counter cannot be restarted during operation.

29.12.13.2 Block Diagram and General Timing Diagram

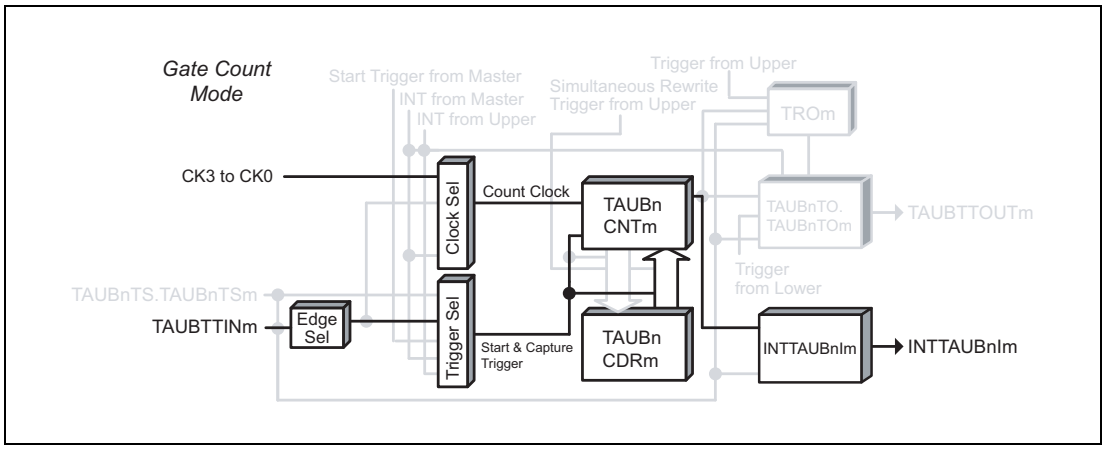

Figure 29.74 Block Diagram for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

11	TAUBnMAS	Write 0_B.
10 to 8	TAUBnSTS[2:0]	Write 010_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 1100_B.
0	TAUBnMD0	Write 0_B.

(2) TAUBnCMURm

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 29.94 Contents of the TAUBnCMURm Register for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUBnTIS[1:0]	10: Rising and falling edge detection (Low width measurement) 11: Rising and falling edge detection (High width measurement)

(3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection). Therefore, these registers must be set to 0.

Table 29.95 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

29.12.13.4 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

Table 29.96 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm register and TAUBnCMURm registers as described in Table 29.93, Contents of the TAUBnCMORm Register for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection) and Table 29.94, Contents of the TAUBnCMURm Register for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection) Set the value of the TAUBnCDRm register to $FFFF_H$.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1 TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUBTTINm start edge	TAUBnTE.TAUBnTEm is set to 1 TAUBnCNTm waits for detection of the start edge. When a start edge is detected, TAUBnCNTm loads the TAUBnCDRm value ($FFFF_H$).
During operation	The TAUBnCNTm register can be read at all times.	TAUBnCNTm counts down. When the counter reaches 0000_H: • INTTAUBnIm is generated • TAUBnCNTm loads the TAUBnCDRm value ($FFFF_H$) and continues count operation When a TAUBTTINm input stop edge is detected during count operation: • TAUBnCNTm stops and retains its current value. When a TAUBTTINm input start edge is detected while the counter is stopped: • TAUBnCNTm starts to count down from the stop value. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

29.13 Independent Channel Simultaneous Rewrite Functions

The following describes functions that carry out simultaneous rewrite:

29.13.1 Simultaneous Rewrite Trigger Generation Function Type 1

29.13.1.1 Overview

Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. The interrupt is generated at regular intervals. The upper channel is for generating the simultaneous rewrite trigger (TAUBnRDC.TAUBnRDCm = 1), and the lower channels are for conducting simultaneous rewrite when triggered from the upper channel (TAUBnRDC.TAUBnRDCm = 0).

Prerequisites

- Two (or more) channels that are lower than the channel used as the upper channel, each with simultaneous rewrite enabled (TAUBnRDE.TAUBnRDEm = 1)
- The operation mode of the upper channel must be set to interval timer mode, see **Table 29.97, Contents of the TAUBnCMORm Register for the Upper Channel of the Simultaneous Rewrite Trigger Generation Function Type 1**
- For the operation modes that can be set to the lower channels, see **Table 29.37, Simultaneous Rewrite Methods and when They are Triggered**
- In this function, TAUBTTOUTm is not used for all the channels.

Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) of the upper and lower channel(s) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of the data register buffer of the upper channel (TAUBnCDRm buf) is written to the counter (TAUBnCNTm) and the counter starts to count down from this value.
The counter(s) of the lower channel(s) start to count as specified by their selected operating modes.

When a counter reaches 0000_H, an interrupt is generated from the channel.
The corresponding TAUBnCNTm then reloads the current TAUBnCDRm buffer value and subsequently continues operation.

If the channel where the interrupt occurs is specified as the trigger channel for simultaneous rewrite (TAUBnRDC.TAUBnRDCm = 1) and is an upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible (TAUBnRSF.TAUBnRSFm = 1).

The values of the data registers are copied to the corresponding data register buffers. Each time a counter starts to count down, it reads the value in the data register buffer and counts down from this value.

The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

Conditions

- The channel which is monitored for INTTAUBnIm is specified by setting TAUBnRDC.TAUBnRDCm = 1 for the corresponding channel. The TAUBnRDC.TAUBnRDCm bit must be 0 for all other channels in which simultaneous rewrite should take place.

29.13.1.2 Equations

Simultaneous rewrite trigger generation cycle = count clock cycle × (TAUBnCDRm + 1)

To control simultaneous rewrite, the following condition must be satisfied:

[For PWM]

TAUBnCDRm = [(value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1) × number of interrupts] – 1

[For triangle PWM]

TAUBnCDRm = [(value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1) × 2 × number of interrupts] – 1

That is, the ratio of TAUBnCDRm + 1 and value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1 must be an integer. This integer corresponds to the number of interrupts.

Note that the cycle for the triangle PWM is twice the cycle for the PWM

29.13.1.3 Block Diagram and General Timing Diagram

7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the upper channel

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function. However, it can be used in independent channel output mode controlled by software.

(4) Simultaneous rewrite for the upper channel

Table 29.99 Simultaneous Rewrite Settings for Simultaneous Rewrite Trigger Generation Function Type 1

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	1: Selects an upper channel as the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The signal that controls simultaneous rewrite is loaded when the master channel starts counting
TAUBnRDC.TAUBnRDCm	1: Channel is monitored for an INTTAUBnIm signal that is used as the simultaneous rewrite trigger

29.13.1.5 Register Settings for the Lower Channel(s)

(1) Register settings for the lower channel(s)

For the TAUBnCMORm register of the lower channels, follow the TAUBnCMORm register settings for the operation mode that can be set. (See Table 29.37, Simultaneous Rewrite Methods and when They are Triggered)

(2) TAUBnCMURm for the lower channel(s)

For the TAUBnCMURm register of the lower channels, follow the TAUBnCMURm register settings for the operation mode that can be set. (See Table 29.37, Simultaneous Rewrite Methods and when They are Triggered)

(3) Channel output mode for the lower channel(s)

Output can be made according to the setting for lower channels (master/slave). As for the available function for simultaneous rewrite trigger generation function type 1, see **Table 29.37, Simultaneous Rewrite Methods and when They are Triggered**.

(4) Simultaneous rewrite for the lower channel(s)

Table 29.100 Simultaneous Rewrite Settings for the Lower Channel in Simultaneous Rewrite Trigger Generation Function Type 1

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	1: Selects an upper channel as the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The signal that controls simultaneous rewrite is loaded when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

29.13.1.6 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

Table 29.101 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm register and TAUBnCMURm registers for the upper channel as described in Table 29.97, Contents of the TAUBnCMORm Register for the Upper Channel of the Simultaneous Rewrite Trigger Generation Function Type 1 and **Table 29.98, Contents of the TAUBnCMURm Register for the Upper Channel of the Simultaneous Rewrite Trigger Generation Function Type 1** Set the TAUBnCMORm register and TAUBnCMURm registers for the lower channel as described in **Section 29.13.1.5, Register Settings for the Lower Channel(s)** Set the value of the TAUBnCDRm register	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated.
During operation	TAUBnRDT.TAUBnRDTm, TAUBnCDR.TAUBnCDRm can be changed. TAUBnRSF.TAUBnRSFm can be read at all times.	TAUBnCNTm counts down. When the counter reaches 0000_H: • TAUBnCNTm reloads the TAUBnCDRm value and continues count operation • INTTAUBnIm is generated Simultaneous rewrite is controlled when INTTAUBnIm is generated from the channel where TAUBnRDC.TAUBnRDCm is set to 1. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

29.14 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the Timer Array Unit B. For a general overview of synchronous channel operation, see Section 29.2, Overview.

29.14.1 PWM Output Function

29.14.1.1 Overview

Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the pulse width (duration) of the TAUBTTOUTm to be set. The pulse cycle is set in the master channel. The pulse width is set in the slave channel.

Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode, see **Table 29.102, Contents of the TAUBnCMORm Register for the Master Channel of the PWM Output Function**
- The operation mode of the slave channel(s) must be set to one-count mode, see **Table 29.105, Contents of the TAUBnCMORm Register for the Slave Channel of the PWM Output Function**
- TAUBTTOUTm is not used for the master channel of this function
- The channel output mode of the slave channel(s) must be set to synchronous channel output mode 1.

Description

The counters are started by setting the channel trigger bits (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counters start to count down from these values. INTTAUBnIm is generated on the master channel and TAUBTTOUTm (slave) toggles, which realizes a PWM output.

- Master channel:

  When the counter of the master channel reaches 0000_H, pulse cycle time has elapsed and INTTAUBnIm is generated. The counter loads the TAUBnCDRm value and counts down.

- Slave channel:

  The INTTAUBnIm of the master channel triggers the counter of the slave channel(s). The current value of TAUBnCDRm (slave) is written to TAUBnCNTm (slave) and the counter starts to count down from this value. The TAUBTTOUTm signal is set to the active level.

  When the counter reaches 0000_H, i.e. duty time has elapsed, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset to the inactive level. The counter returns to $FFFF_H$ and awaits the next INTTAUBnIm of the master channel, and thus the start of the next pulse cycle.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channel(s) stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1.

Conditions

Simultaneous rewrite can be used with this function. Please see Section 29.6, Simultaneous Rewrite.

29.14.1.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = (TAUBnCDRm (slave) / (TAUBnCDRm (master) + 1)) × 100

– Duty cycle = 0%
  TAUBnCDRm (slave) = 0000_H
– Duty cycle = 100%
  TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1

29.14.1.3 Block Diagram and General Timing Diagram

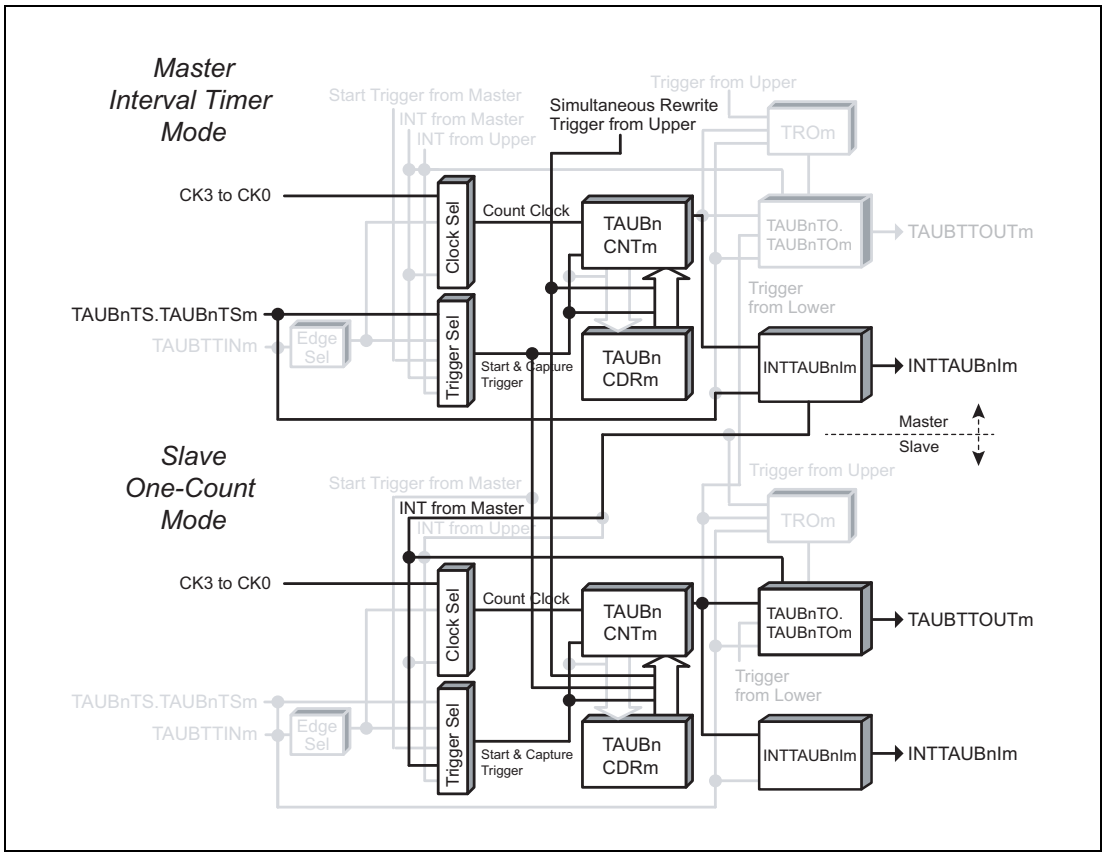

Figure 29.78 Block Diagram for PWM Output Function

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUBnTOL.TAUBnTOLm = 0)

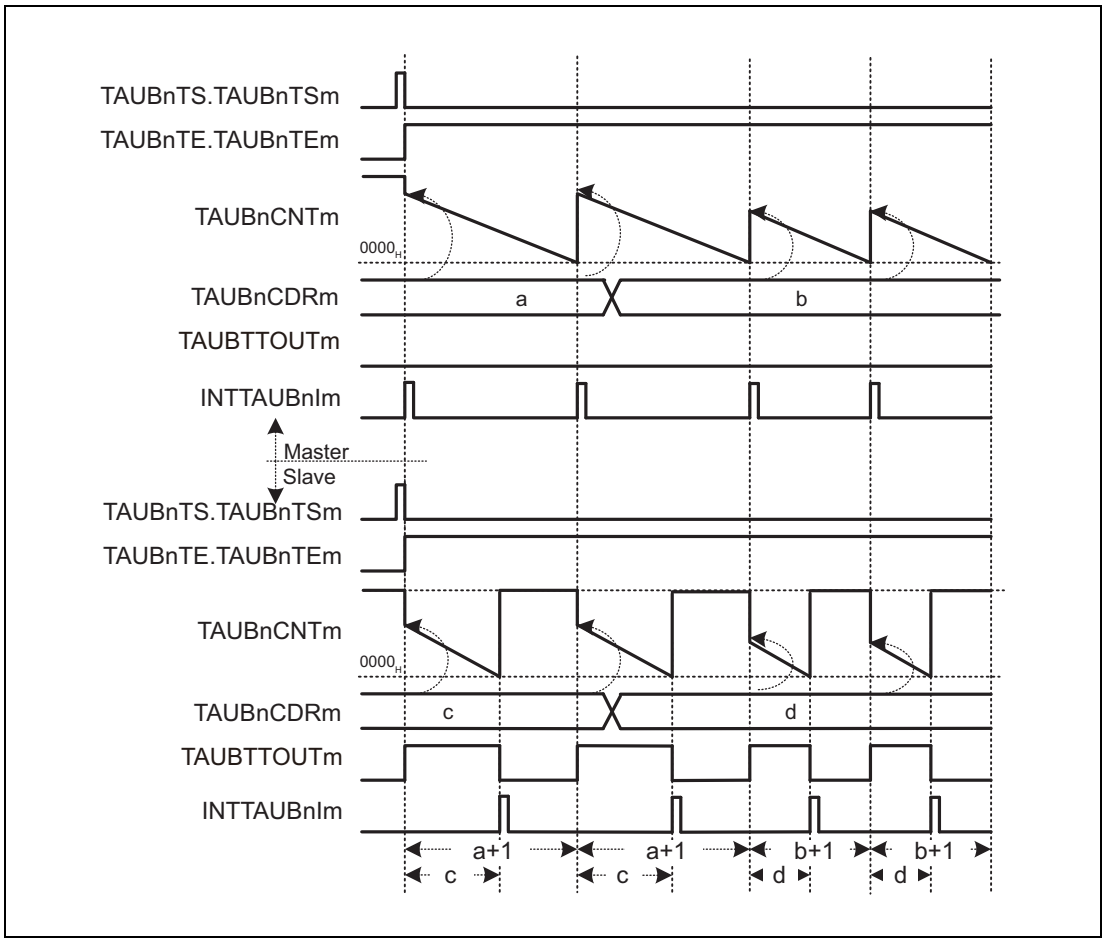

Figure 29.79 General Timing Diagram for PWM Output Function

NOTE

The interval between the slave channel starting to count and an interrupt being generated is the value of corresponding TAUBnCDRm + 1.

29.14.1.4 Register Settings for the Master Channel

(1) TAUBnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS [1:0]		—	TAUBn CCS0	TAUBn MAS	TAUBnSTS[2:0]			TAUBnCOS [1:0]		—	TAUBnMD[4:1]				TAUBn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 29.102 Contents of the TAUBnCMORm Register for the Master Channel of the PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 1_B.
10 to 8	TAUBnSTS[2:0]	Write 000_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0000_B.
0	TAUBnMD0	Write 1_B.

(2) TAUBnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 29.103 Contents of the TAUBnCMURm Register for the Master Channel of the PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the master channel

The channel output mode is not used by this function.

(4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channel must be identical.

Table 29.104 Simultaneous Rewrite Settings for the Master Channel of the PWM Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

NOTE

When used in TAUBnRDS.TAUBnRDSm = 1, the master channel requires an upper channel operating in Section 29.13.1, Simultaneous Rewrite Trigger Generation Function Type 1.

Configure the operation following the conditions below.

- The channel set to Simultaneous Rewrite Trigger Output Function Type 1: TAUBnRDCm = 1, TAUBnRDSm = 1
  The setting value of TAUBnCDRm to this channel is as follows.
  = ((setting value of TAUBnCDRm of the master channel subject to simultaneous rewrite + 1) × number of interrupts) – 1
- Master channel: TAUBnRDCm = 0, TAUBnRDSm = 1
- Slave channel: TAUBnRDCm = 0, TAUBnRDSm = 1

Although the value of duty exceeds 100% when the setting value of TAUBnCDRm (slave) > the setting value of TAUBnCDRm (master) + 1, the output will be aggregated to 100%.

29.14.1.5 Register Settings for the Slave Channel(s)

(1) TAUBnCMORm for the slave channel(s)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 0_B.
10 to 8	TAUBnSTS[2:0]	Write 100_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0100_B.
0	TAUBnMD0	Write 1_B.

(2) TAUBnCMURm for the slave channel(s)

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 29.106 Contents of the TAUBnCMURm Register for the Slave Channel of the PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the slave channel(s)

Table 29.107 Control Bit Settings for Synchronous Channel Output Mode 1

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 1_B.
TAUBnTOC.TAUBnTOCm	Write 0_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

(4) Simultaneous rewrite for the slave channel(s)

The simultaneous rewrite settings of the master and slave channel must be identical.

Table 29.108 Simultaneous Rewrite Settings for the Slave Channel of the PWM Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

29.14.1.6 Operating Procedure for PWM Output Function

Table 29.109 Operating Procedure for PWM Output Function

	Operation	Status of TAUBn
Initial channel setting	Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 29.14.1.4, Register Settings for the Master Channel**. Slave channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 29.14.1.5, Register Settings for the Slave Channel(s)**. Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start. INTTAUBnIm is generated on the master channel and TAUBTTOUTm (slave) is set.
During operation	TAUBnCDRm can be changed at any time. TAUBnTOL.TAUBnTOLm can be changed. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. TAUBnRDT.TAUBnRDTm can be changed during operation.	TAUBnCNTm of the master channel loads TAUBnCDRm and counts down. When the counter reaches 0000_H: • INTTAUBnIm (master) is generated • TAUBnCNTm (master) loads the TAUBnCDRm value and continues count operation • TAUBnCNTm (slave) loads the TAUBnCDRm value and counts down • TAUBTTOUTm (slave) is set to the active level When TAUBnCNTm (slave) reaches 0000_H: • The counter of TAUBnCNTm (slave) stops. • INTTAUBnIm (slave) is generated • TAUBTTOUTm (slave) is set to the inactive level
Stop operation	Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

Restart operation

29.14.1.7 Specific Timing Diagrams

(1) Duty cycle = 0%

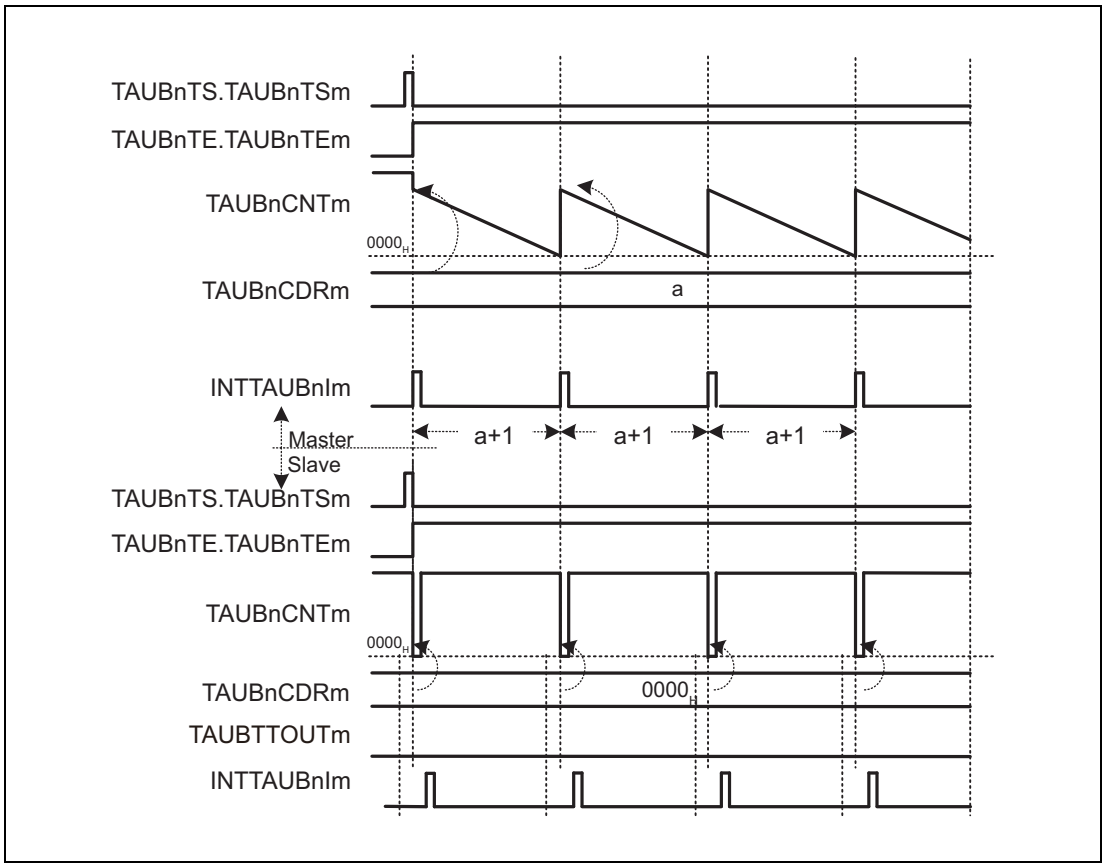

Figure 29.80 TAUBnCDRm (slave) = 0000_H, Positive Logic (TAUBnTOL.TAUBnTOLm (slave) = 0)

- Every time the master channel generates an interrupt (INTTAUBnIm), 0000_H is written to TAUBnCNTm (slave). As a result, a slave channel interrupt (INTTAUBnIm) is generated at the same time and TAUBTTOUTm remains inactive.
- TAUBnCNTm (slave) generates an interrupt every time the value of TAUBnCDRm is loaded.

(2) Duty cycle = 100%

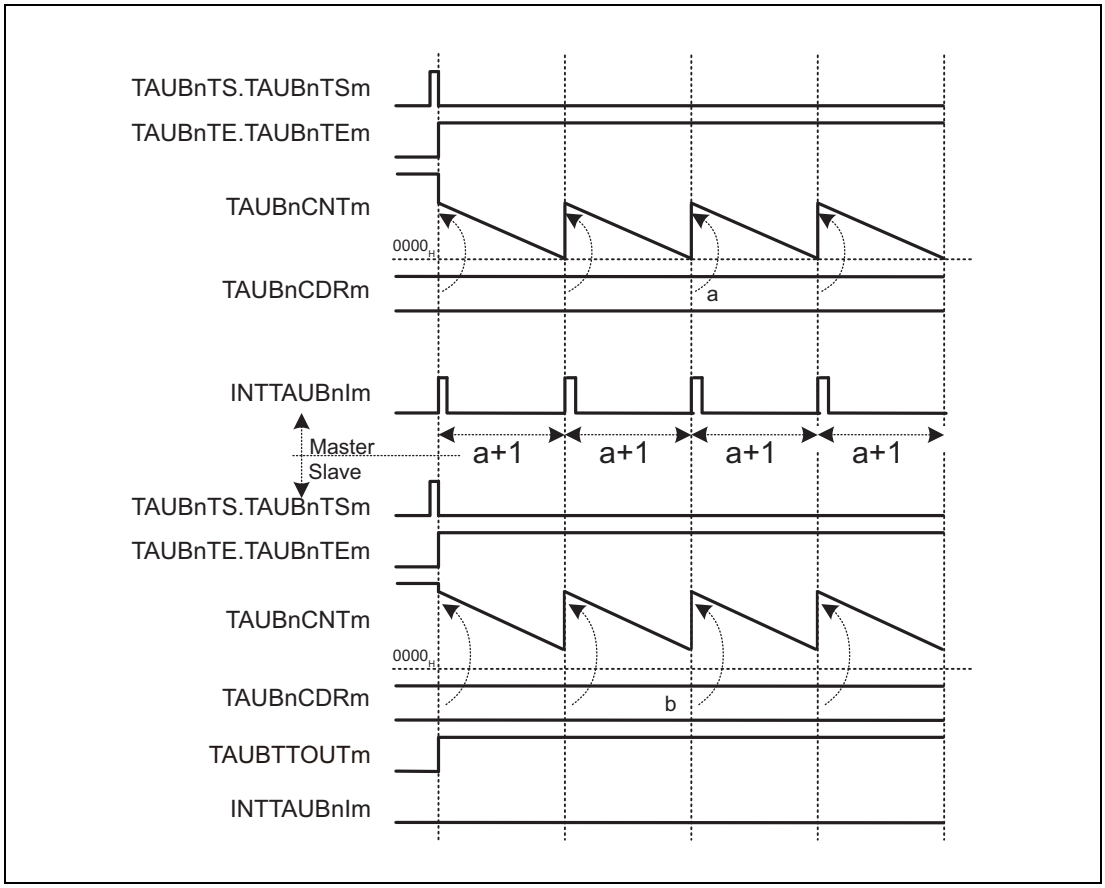

Figure 29.81 TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1, Positive Logic (TAUBnTOL.TAUBnTOLm (slave) = 0)

If the value TAUBnCDRm (slave) is higher than the value TAUBnCDRm (master), the counter of the slave channel cannot reach 0000_H and cannot generate interrupts. The TAUBTTOUTm remains at active state.

(3) Operation stop and restart

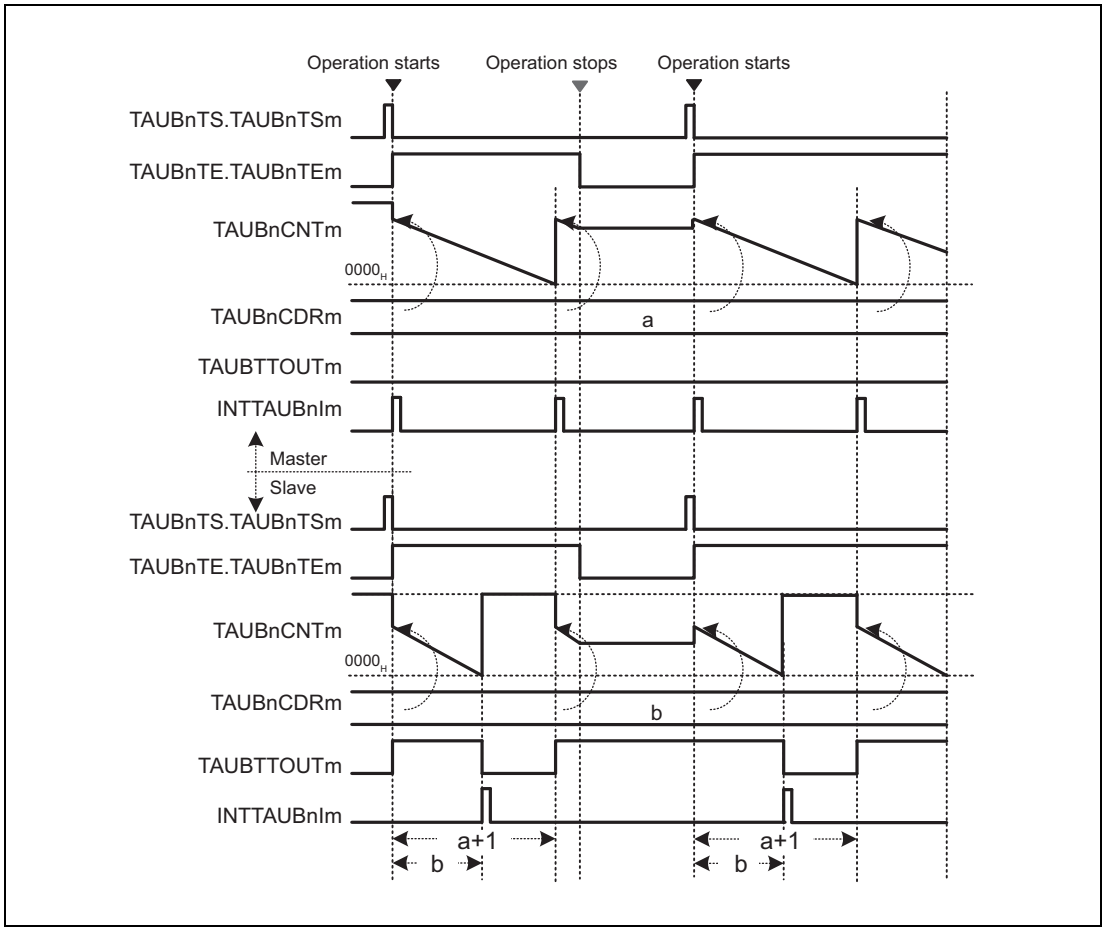

Figure 29.82 Stop and Restart Operation, Positive Logic (TAUBnTOL.TAUBnTOLm (slave) = 0)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm of the master and slave channel(s) to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm and TAUBTTOUTm of all channels stop and the current values are retained. No interrupts are generated.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm of master and slave channel(s) to 1. TAUBnCNTm of master and slave channel reload the current values of TAUBnCDRm and start to count down from these values.

(4) Operation stop and restart (Slave output, Initialization)

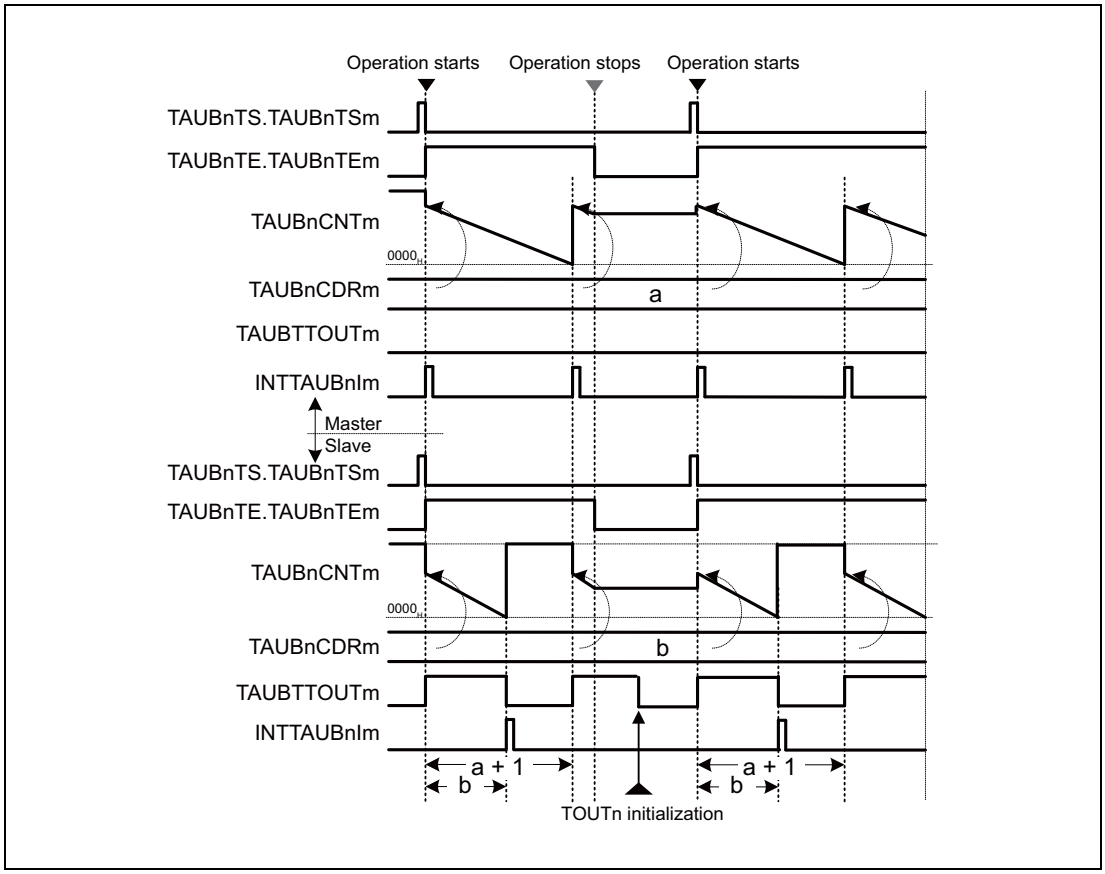

Figure 29.83 Operation Stop and Restart (Slave Output, Initialization)

When TAUBnTOE.TAUBnTOEm of the slave channel is set to 0 while TAUBnTE.TAUBnTEm = 0 and the inactive level of TAUBTTOUTm is written in the TAUBnTO.TAUBnTOm, the output level of TAUBTTOUTm (slave channel) becomes active when INTTAUBnIm is issued when the count operation is started.

29.14.2 One-Shot Pulse Output Function

29.14.2.1 Overview

Summary

This function outputs a signal pulse with a defined pulse width and a specific delay time compared to an external input signal pulse by using a master and a slave channel. The delay time is specified using the master channel. The pulse width is specified using the slave channel.

Prerequisites

- Two channels
- The operation mode of the master channel must be set to one-count mode, see **Table 29.110, Contents of the TAUBnCMORm Register for the Master Channel of the One-Shot Pulse Output Function**
- The operation mode of the slave channel must be set to pulse one-count mode, see **Table 29.113, Contents of the TAUBnCMORm Register for the Slave Channel of the One-Shot Pulse Output Function**
- TAUBTTOUTm is not used for the master channel of this function
- The channel output mode of the slave channel must be set to independent channel output mode 2.
- TAUBTTINm (master) has to be detected while TAUBnCNTm (master) and TAUBnCNTm (slave) await a trigger. Furthermore, the slave is only triggered by an interrupt from the master channel and not by TAUBTTINm (slave).

Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) for master and slave channels to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

- Master channel:
  When the next valid TAUBTTINm input edge is detected, the current value of TAUBnCDRm is written to TAUBnCNTm. The counter starts to count down from this value. If TAUBnCMORm.TAUBnMD0 = 0, a trigger (TAUBTTINm) which is detected within the delay time is ignored.
  When the counter of the master channel reaches 0000_H, INTTAUBnIm is generated. The counter returns to $FFFF_H$ and awaits the next valid TAUBTTINm input edge.
- Slave channel:
  The INTTAUBnIm of the master channel triggers the counter of the slave channel. The current value of TAUBnCDRm (slave) is written to TAUBnCNTm (slave) and the counter starts to count down from this value.
  An interrupt is generated and the TAUBTTOUTm signal is set.
  When the counter reaches 0001_H, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset. The counter remains at 0000_H and awaits the next INTTAUBnIm of the master channel.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channel stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1.

The counter of the master channel can be restarted without stopping it first (forced restart) by setting TAUBnTS.TAUBnTSm to 1 during operation.

NOTES

1. If a forced restart of the counter is executed during operation, the width of the output signal does not correspond to the value of TAUBnCDRm (slave).
2. The TAUBTTINm input signal is sampled at the frequency of the operating clock, specified by TAUBnCMORm.TAUBnCKS[1:0] bits. As a result, the output cycle of TAUBTTOUTm has an error of ± 1 operation clock cycle.

Conditions

- If TAUBnCMORm.TAUBnMD0 of the master channel is set to 0, during counting detected TAUBTTINm input edges are ignored.
- Simultaneous rewrite can be used with this function. Please see Section 29.6, Simultaneous Rewrite.

29.14.2.2 Equations

Delay from trigger input to pulse output
= (TAUBnCDRm (master) + 1) × count clock cycle

Pulse width = (TAUBnCDRm (slave)) × count clock cycle

29.14.2.3 Block Diagram and General Timing Diagram

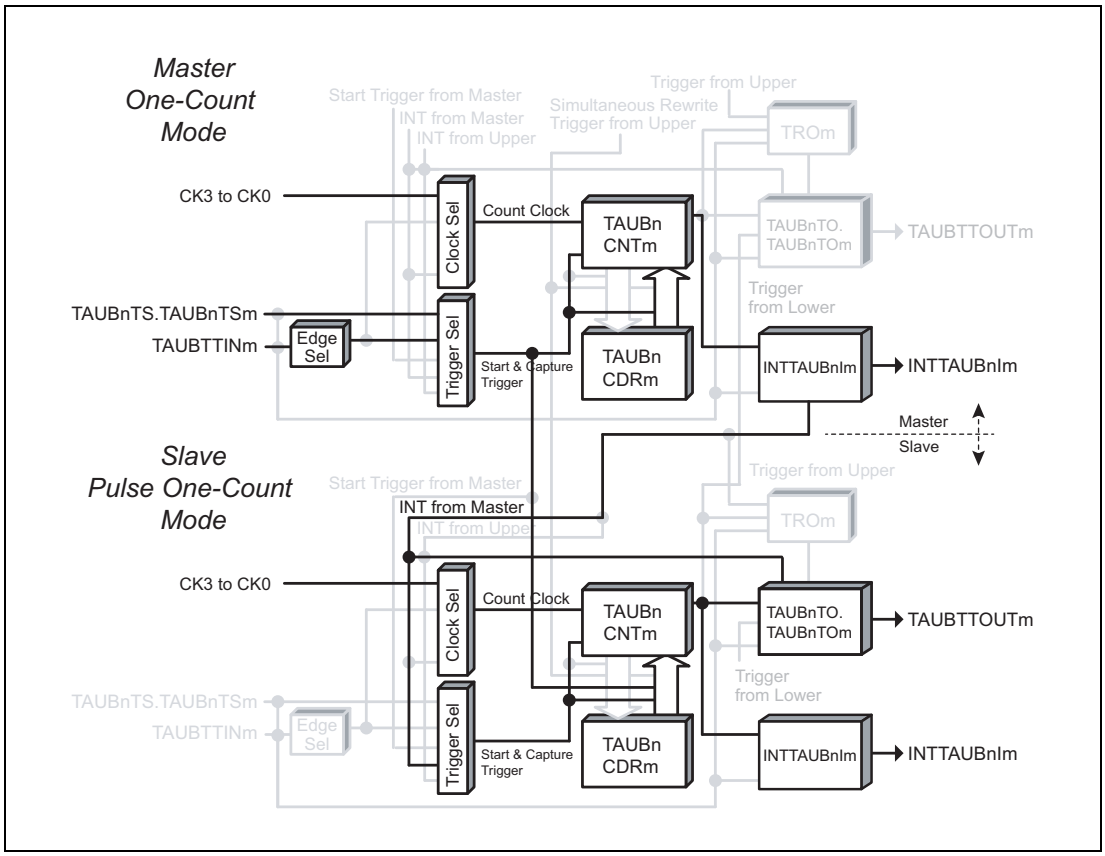

Figure 29.84 Block Diagram for One-Shot Pulse Output Function

The following settings apply to the general basic diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

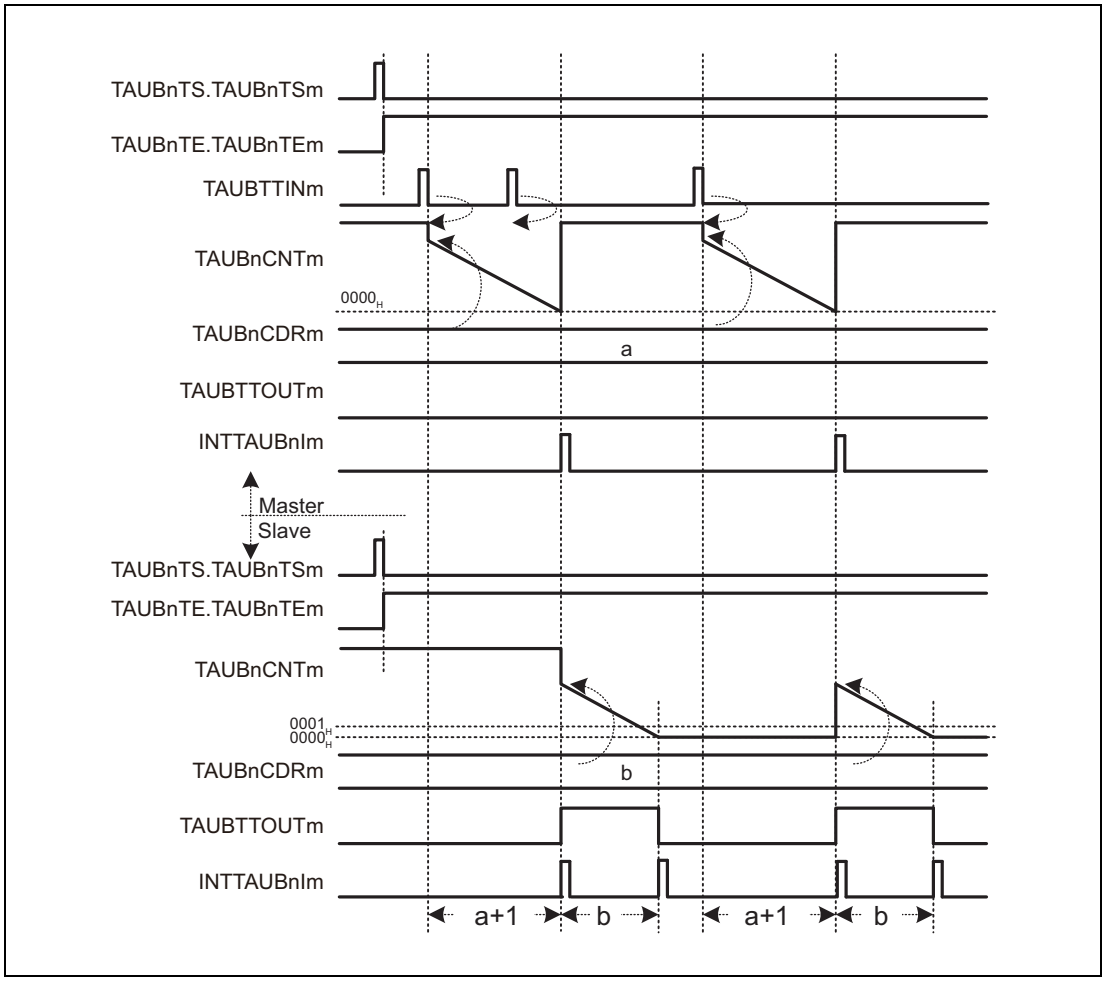

Figure 29.85 General Timing Diagram for One-Shot Pulse Output Function

29.14.2.4 Register Settings for the Master Channel

(1) TAUBnCMORm for the master channel

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Falling edge detection 01: Rising edge detection 10: Rising and falling edge detection 11: Setting prohibited

(3) Channel output mode for the master channel

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

(4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channel must be identical.

Table 29.112 Simultaneous Rewrite Settings for the Master Channel of the One-Shot Pulse Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: The master channel is the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

29.14.2.5 Register Settings for the Slave Channel

(1) TAUBnCMORm for the slave channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS [1:0]		—	TAUBn CCS0	TAUBn MAS	TAUBnSTS[2:0]			TAUBnCOS [1:0]		—	TAUBnMD[4:1]				TAUBn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel must be identical.
13	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 0_B.
10 to 8	TAUBnSTS[2:0]	Write 100_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 1010_B.
0	TAUBnMD0	0: Disables start trigger detection during counting 1: Enables start trigger detection during counting The value of the MD0 bit of the master and slave channel must be identical.

(2) TAUBnCMURm for the slave channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 29.114 Contents of the TAUBnCMURm Register for the Slave Channel of the One-Shot Pulse Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the slave channel

Table 29.115 Control Bit Settings for Independent Channel Output Mode 2

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	1: Enables independent channel output mode
TAUBnTOM.TAUBnTOMm	0: Independent channel output
TAUBnTOC.TAUBnTOCm	1: Operating mode 2
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	0: Disables dead time operation
TAUBnTDL.TAUBnTDLm	0: When dead time operation is disabled (TAUBnTDE.TAUBnTDEm = 0), set these bits to 0

(4) Simultaneous rewrite for the slave channel

The simultaneous rewrite settings of the master and slave channel must be identical.

Table 29.116 Simultaneous Rewrite Settings for the Slave Channel of the One-Shot Pulse Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: The master channel is the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

29.14.2.6 Operating Procedure for One-Shot Pulse Output Function

Table 29.117 Operating Procedure for One-Shot Pulse Output Function

		Operation	Status of TAUBn
	Initial channel setting	Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 29.14.2.4, Register Settings for the Master Channel**. Slave channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 29.14.2.5, Register Settings for the Slave Channel**. Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.
Restart operation	Start operation	Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the master channel awaits a TAUBTTINm input.
	During operation	TAUBnCDRm can be changed at any time. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. TAUBnRDT.TAUBnRDTm can be changed during operation.	When a valid TAUBTTINm input edge is detected, TAUBnCNTm of the master channel loads the TAUBnCDRm value and counts down. When the counter reaches 0000_H: • INTTAUBnIm (master) is generated • TAUBnCNTm (master) is reset to $FFFF_H$ and waits for the next valid TAUBTTINm input edge. • TAUBnCNTm (slave) loads the TAUBnCDRm value and starts to count down • INTTAUBnIm (slave) is generated • TAUBTTOUTm (slave) is set to the active level. When TAUBnCNTm (slave) reaches 0001_H: • The counter of TAUBnCNTm (slave) stops. • INTTAUBnIm (slave) is generated • TAUBTTOUTm (slave) is set to an inactive level.
	Stop operation	Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

29.14.2.7 Specific Timing Diagrams

(1) TAUBnCDRm (master) = 0000_H

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

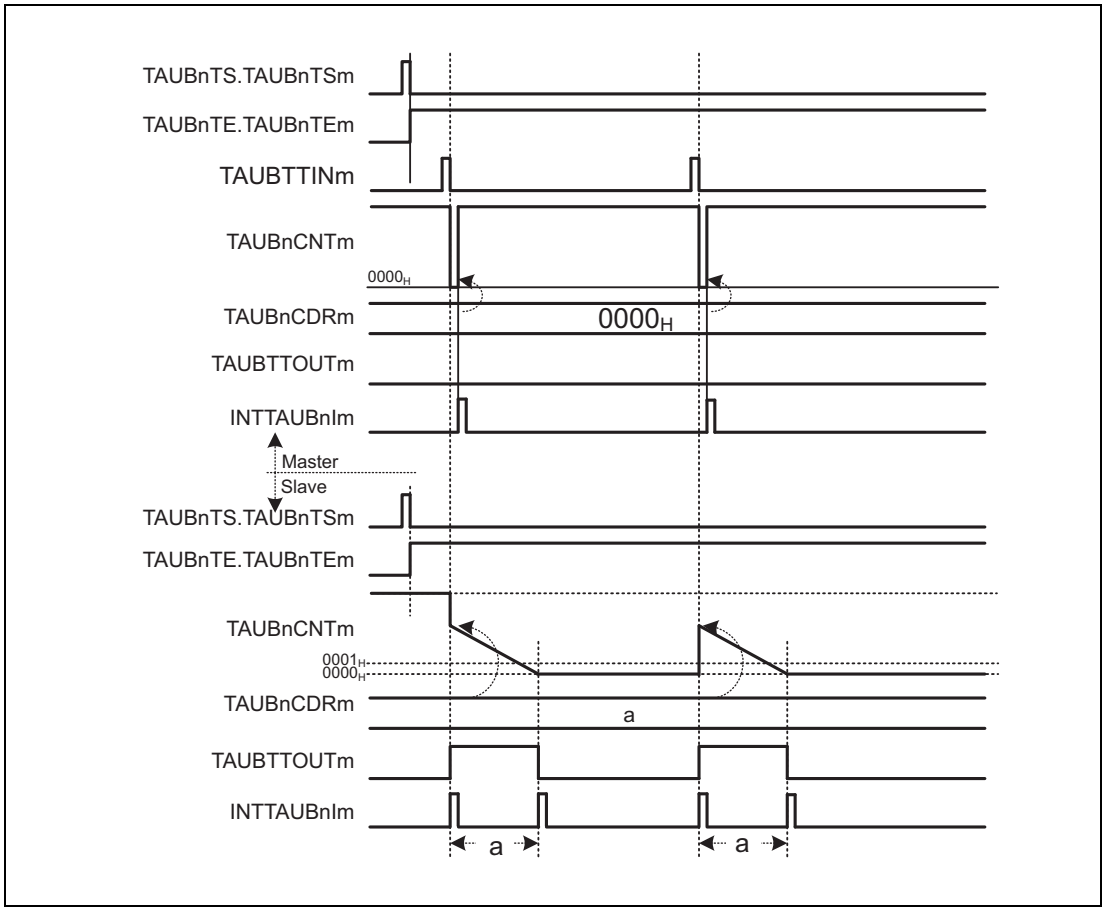

Figure 29.86 TAUBnCDRm (master) = 0000_H

- When a valid TAUBTTINm input edge is detected, the value 0000_H is written to TAUBnCNTm (master). The counter is set to 0000_H for one count and returns to $FFFF_H$.
  Thus, the slave channel starts to count down one count clock later to TAUBTTINm (master).

(2) TAUBnCDRm (slave) = 0000_H

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

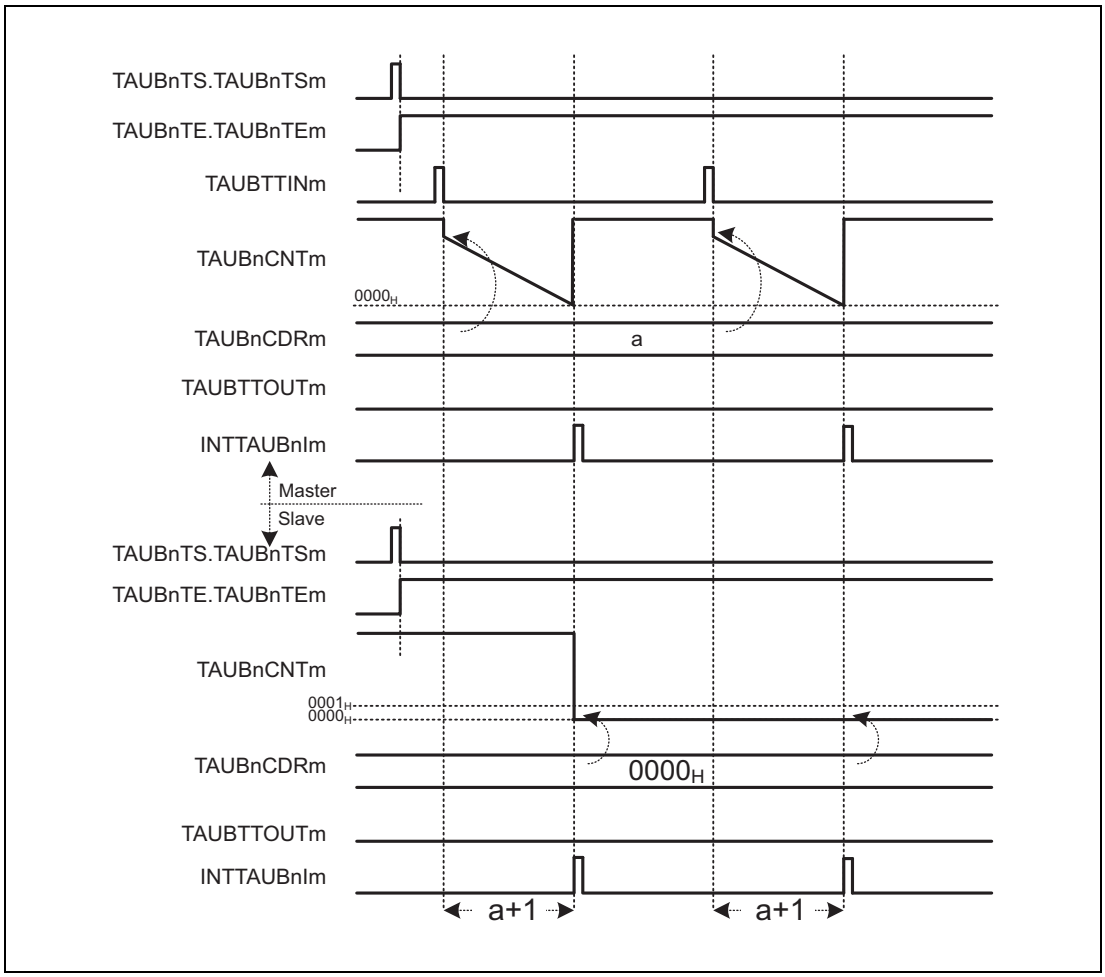

Figure 29.87 TAUBnCDRm (slave) = 0000_H

- TAUBTTOUTm remains at not active state, because the pulse width is zero.

(3) TAUBnCMORm.TAUBnMD0 = 0 (disables start trigger during count operation)

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

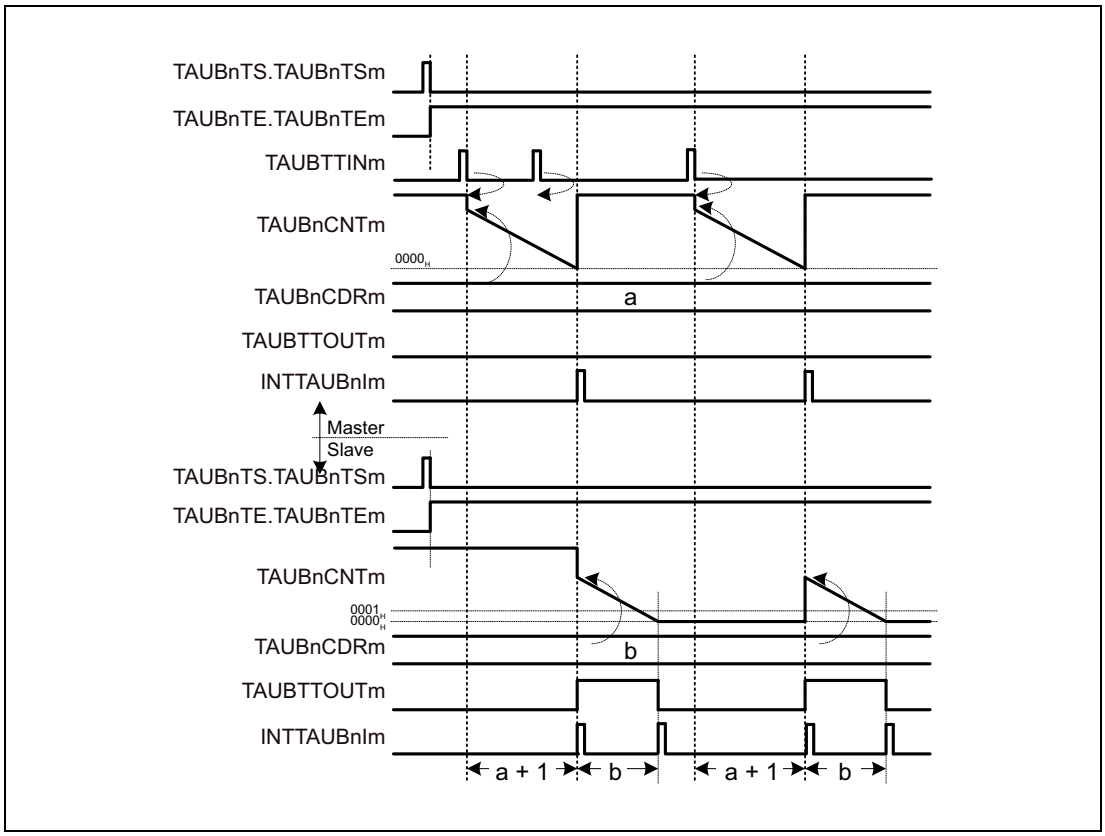

Figure 29.88 TAUBnCMORm.TAUBnMD0 = 0

- Even when an effective edge is input to TAUBTTINm while the counter of the master channel counts down, the counter continues counting down.

(4) TAUBnCMORm.TAUBnMD0 = 1

The following settings apply to this diagram.

- Start trigger detection enabled during counting (TAUBnCMORm.TAUBnMD0 = 1)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

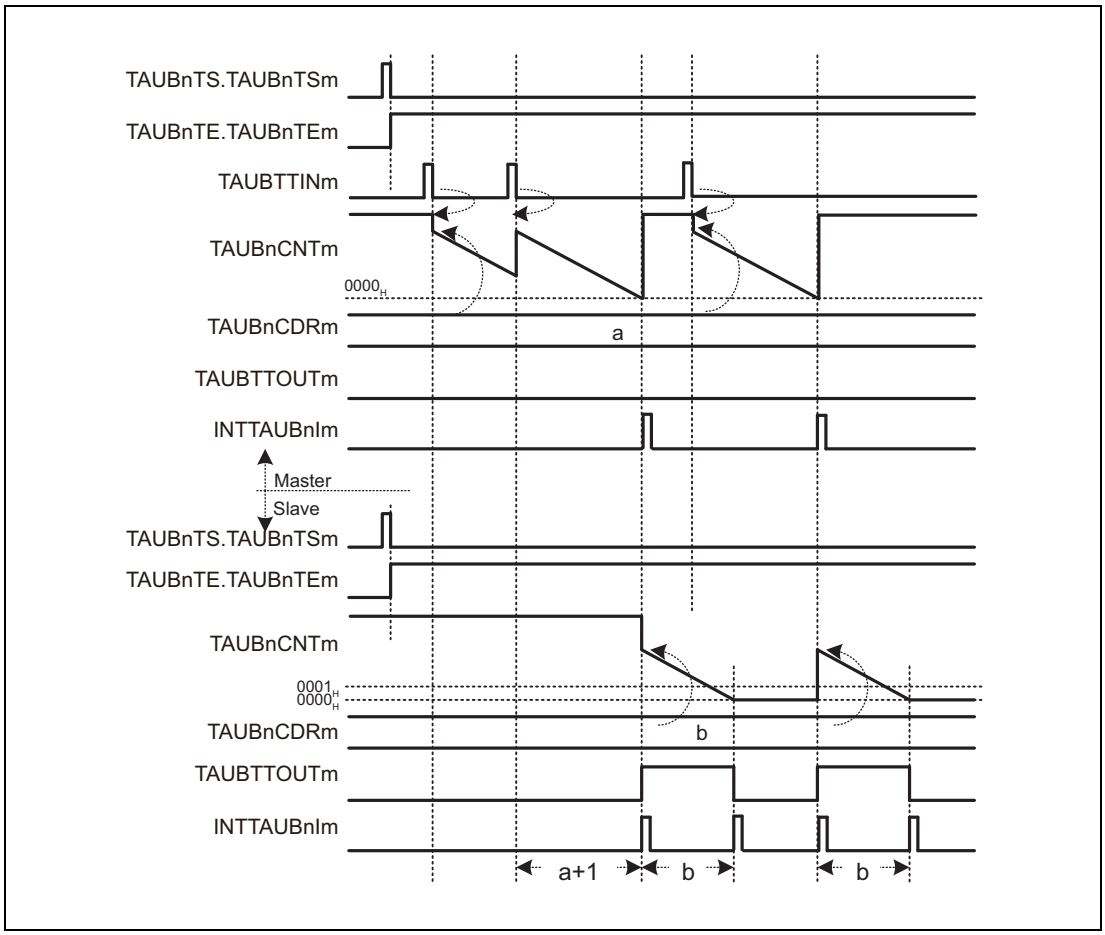

Figure 29.89 TAUBnCMORm.TAUBnMD0 = 1

- If a valid TAUBTTINm input edge is detected while the counter of the master channel counts down, TAUBnCNTm reloads the value of TAUBnCDRm. The counter restarts to count down.

This means the delay for INTTAUBnIm generation interval is extended by the value of TAUBnCNTm at the time when a valid TAUBTTINm input edge is detected.

(5) Stopping and restarting the operation

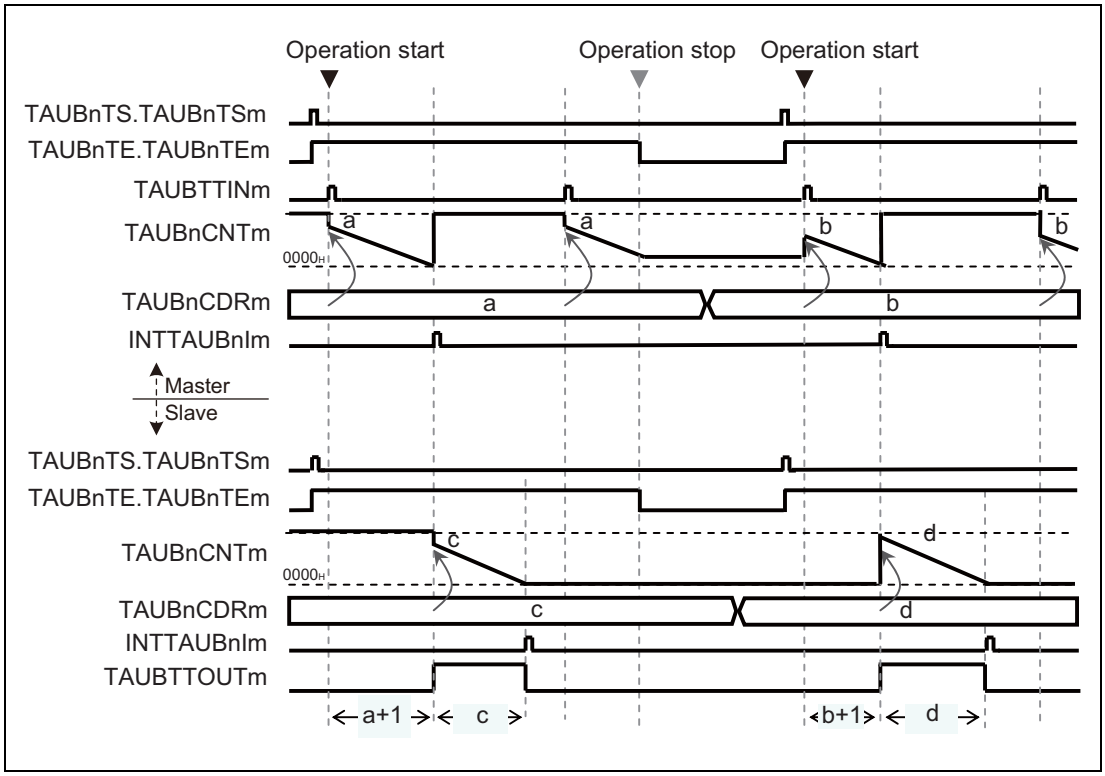

Figure 29.90 Stopping and Restarting the Operation

Setting TTm of the master and slave channels to 1 clears TAUBnTE.TAUBnTEm to 0, thereby stopping the count operation. If this happens, TAUBnCNTm and TAUBTTOUTm stop operation with the values retained.

Setting TAUBnTS.TAUBnTSm of the master and slave channels to 1 concurrently sets TAUBnTE.TAUBnTEm to 1.

When the start trigger is detected while the TAUBnTE.TAUBnTEm is set to 1, the TAUBnCDRm value is transferred to TAUBnCNTm and the operation restarts.

(6) Restarting the master channel while the slave channel is counting

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

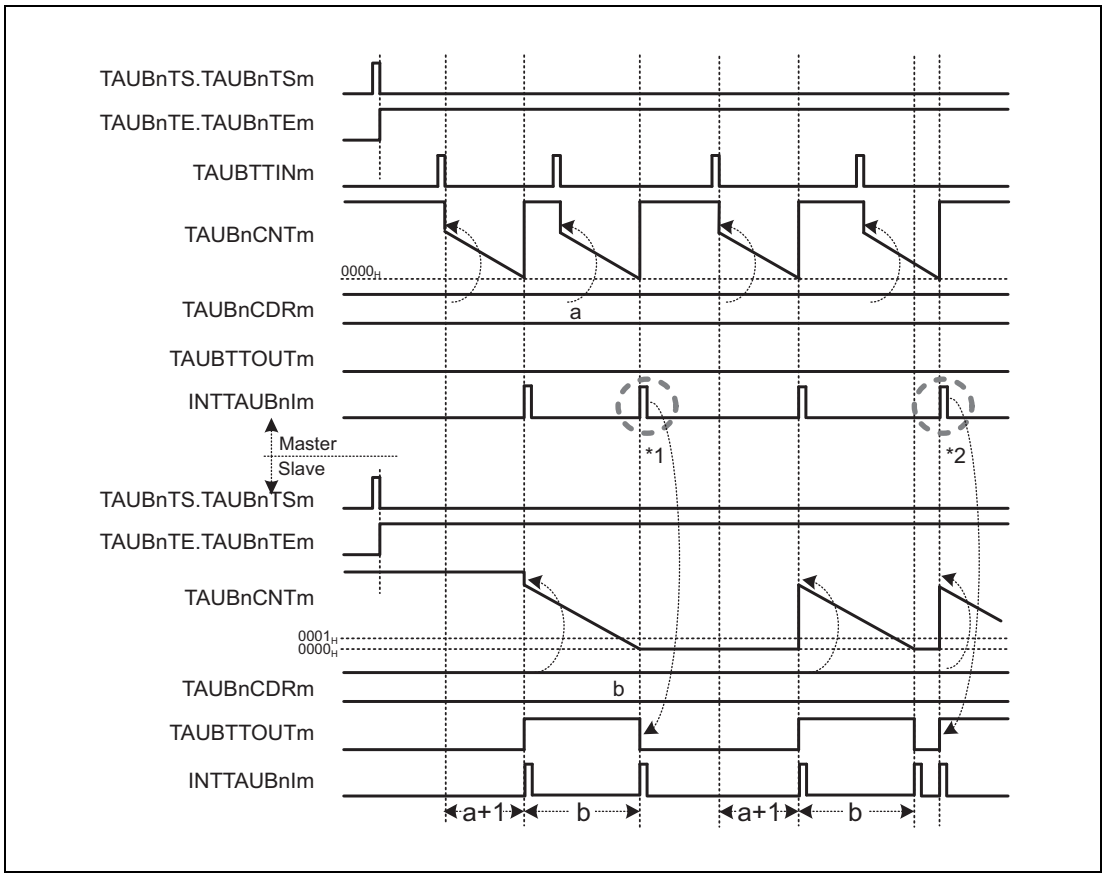

Figure 29.91 Interval of TAUBTTINm ≤ Delay Time + Pulse Width + 1

- If the master channel generates an interrupt before the counter of the slave channel has reached 0001_H or exactly when 0001_H is reached (*1), the interrupt (master) is ignored.
- If an interrupt of the master channel occurs when the counter of the slave channel awaits the next trigger, the value of TAUBnCDRm (slave) is reloaded. An interrupt is generated and TAUBTTOUTm toggles. If TAUBnCNTm (master) has started to count down while the TAUBnCNTm (slave) is still counting (*2), TAUBTTOUTm is not output with the expected delay time.
- To generate the correct one-shot pulse, the start trigger for the master channel must be detected while the master and slave channels are waiting for the start trigger, and not while they are counting.

29.14.3 Delay Pulse Output Function

29.14.3.1 Overview

Summary

This function outputs two signals. The reference signal has a defined pulse width and pulse cycle specified using the master channel and slave channel 1.
Slave channels 2 and 3 output the reference signal with a specified delay. The delay signal is identical to the reference signal, but delayed by amount specified in slave channel 2.

The signal values are specified in the following way:

- The pulse cycle is specified using the master channel.
- The duty cycle of the reference signal is specified using slave channel 1.
  The duty cycle of the delay signal is specified using slave channel 3.
- The delay is specified in slave channel 2.

Prerequisites

- Four channels
- The operation mode of the master channel must be set to interval timer mode, see **Table 29.118, Contents of the TAUBnCMORm Register for the Master Channel of the Delay Pulse Output Function**.
- The operation mode of slave channels 1 and 2 must be set to one-count mode, see **Table 29.121, Contents of the TAUBnCMORm Register for the Slave Channel 1 of the Delay Pulse Output Function** and Table 29.125, Contents of the TAUBnCMORm Register for the Slave Channel 2 of the Delay Pulse Output Function.
- The operation mode of slave channel 3 must be set to pulse one-count mode, see **Table 29.128, Contents of the TAUBnCMORm Register for the Slave Channel 3 of the Delay Pulse Output Function**
- TAUBTTOUTm is not used for the master channel and slave channel 2
- The channel output mode of slave channel 1 must be set to synchronous channel output mode 1.
- The channel output mode of slave channel 3 must be set to independent channel output mode 1.

Description

The counters of the channel group are started by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm to 1, enabling count operation.

- Master channel:

  The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value. INTTAUBnIm is generated on the master channel.
  When the counter of the master channel reaches 0000_H, pulse cycle time has elapsed and INTTAUBnIm is generated. The counter reloads the TAUBnCDRm value and counts down.

- Slave channels 1 and 2:

When the slave channels 1 and 2 detect an interrupt from the master channel, they start to count down from the current value of TAUBnCDRm. The TAUBTTOUTm signal (slave 1) is set.

– Slave channel 1:
When the counter of slave channel 1 reaches 0000_H (duty time has elapsed) INTTAUBnIm is generated and the TAUBTTOUTm signal is reset. The counter returns to $FFFF_H$ and awaits the next INTTAUBnIm of the master channel.

– Slave channel 2:
When the counter of slave channel 2 reaches 0000_H, delay time has elapsed and INTTAUBnIm is generated. The counter returns to $FFFF_H$ and awaits the next INTTAUBnIm of the master channel.
INTTAUBnIm (slave channel 2) triggers the counter of slave channel 3

- Slave channel 3:
When slave channel 3 detects an interrupt from slave channel 2, it starts to count down from the current value of TAUBnCDRm. INTTAUBnIm is generated and the TAUBTTOUTm signal (slave 3) is set.
When the counter of slave channel 3 reaches 0001_H, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset.
The output from slave channel 3 is the delayed PWM pulse.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channels, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1.

Conditions

Simultaneous rewrite can be used with this function. Please see Section 29.6, Simultaneous Rewrite.

29.14.3.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

Duty width 1 = (TAUBnCDRm (slave 1)) × count clock cycle

Delay = (TAUBnCDRm (slave 2) + 1) × count clock cycle

Duty width 2 = (TAUBnCDRm (slave 3)) × count clock cycle

Where the setting of the delay is within the following range:

$0000_H \leq$ TAUBnCDRm (slave 2) < TAUBnCDRm (master)

NOTES

1. The output waveform of TAUBTTOUTm (slave 3) is the output waveform of TAUBTTOUTm (slave 1) delayed for the delay generated by slave 2. It cannot be delayed for more than the pulse cycle.
2. When INTTAUBnIm of slave 2 occurs while slave 3 is counting, slave 3 restarts the operation. Therefore, the output waveform of TAUBTTOUTm (slave 3) retains the active level. (In this case, TAUBTTOUTm (Slave-CH-3) cannot output the waveform of the delayed basic pulse of TAUBTTOUTm (Slave-CH-1).)

29.14.3.3 Block Diagram and General Timing Diagram

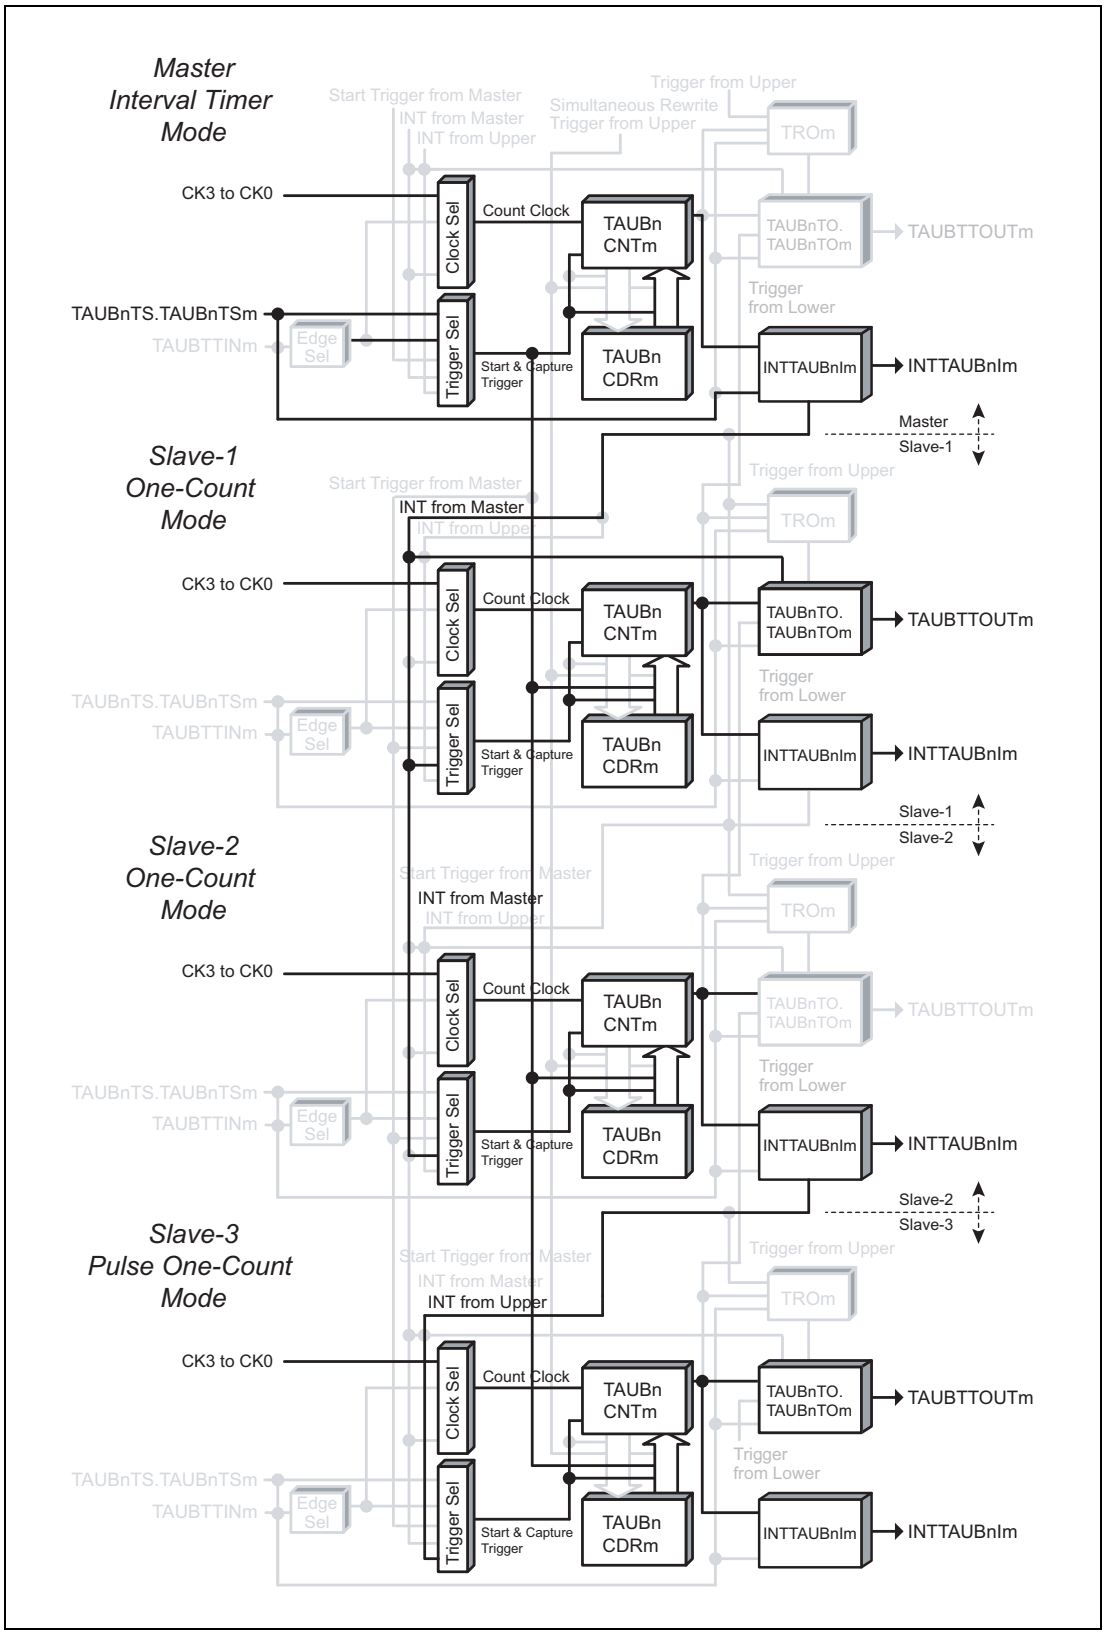

Figure 29.92 Block Diagram for Delay Pulse Output Function

The following settings apply to the general timing diagram.

- Slave channel 1: Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3: Positive logic (TAUBnTOL.TAUBnTOLm = 0)

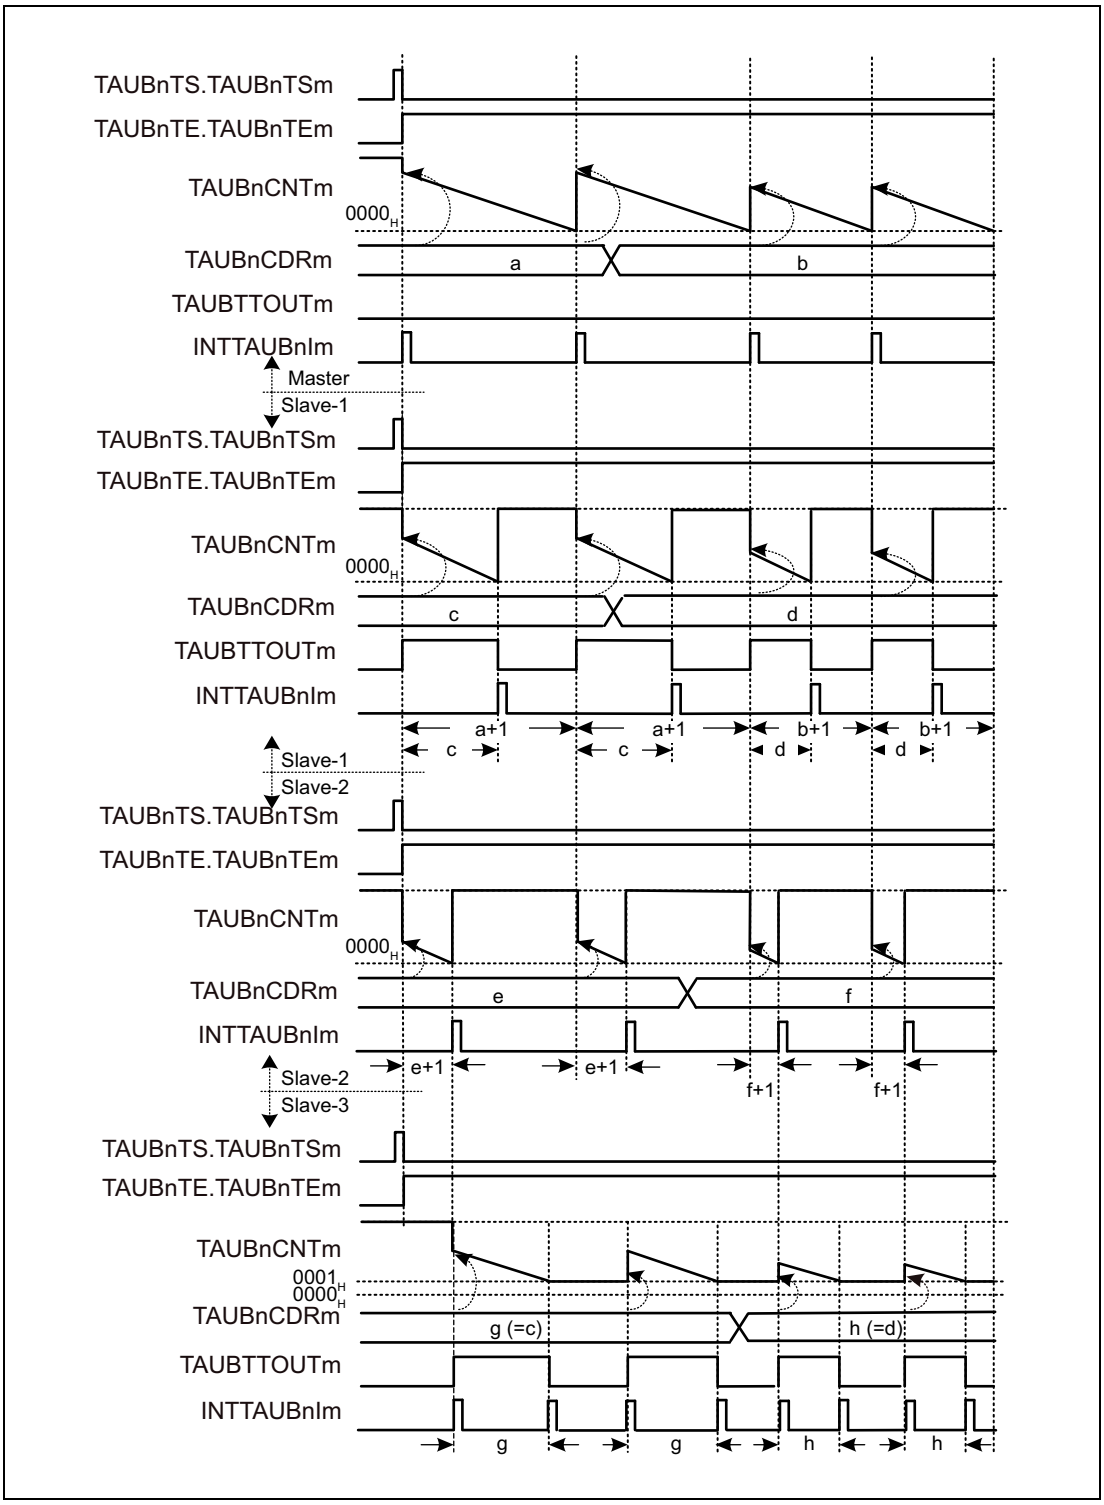

Figure 29.93 General Timing Diagram for Delay Pulse Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for slave channel 1

Table 29.123 Control Bit Settings for Slave Channel 1 of the Synchronous Channel Output Mode 1

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 1_B.
TAUBnTOC.TAUBnTOCm	Write 0_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

(4) Simultaneous rewrite for slave channel 1

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 29.124 Simultaneous Rewrite Settings for Slave Channel 1 of the Delay Pulse Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: The master channel is the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

29.14.3.6 Register Settings For Slave Channel 2

(1) TAUBnCMORm for slave channel 2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS[1:0]		—	TAUBnCCS0	TAUBnMAS	TAUBnSTS[2:0]			TAUBnCOS[1:0]		—	TAUBnMD[4:1]				TAUBnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 29.125 Contents of the TAUBnCMORm Register for the Slave Channel 2 of the Delay Pulse Output Function

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel must be identical.
13	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 0_B.
10 to 8	TAUBnSTS[2:0]	Write 100_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0100_B.
0	TAUBnMD0	Write 1_B.

(2) TAUBnCMURm for slave channel 2

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for slave channel 3

Table 29.130 Control Bit Settings for Independent Channel Output Mode 2

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 0_B.
TAUBnTOC.TAUBnTOCm	Write 1_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

(4) Simultaneous rewrite for slave channel 3

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 29.131 Simultaneous Rewrite Settings for Slave Channel 3 of the Delay Pulse Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: The master channel is the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

29.14.3.8 Operating Procedure for Delay Pulse Output Function

Table 29.132 Operating Procedure for Delay Pulse Output Function (1/2)

	Operation	Status of TAUBn
Initial channel setting	Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 29.14.3.4, Register Settings for the Master Channel**. Slave channel 1: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 29.14.3.5, Register Settings for Slave Channel 1**. Slave channel 2: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 29.14.3.6, Register Settings For Slave Channel 2**. Slave channel 3: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 29.14.3.7, Register Settings for Slave Channel 3**. Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.

Table 29.132 Operating Procedure for Delay Pulse Output Function (2/2)

	Operation	Status of TAUBn
Start operation	Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master channel and slave channels 1 and 2 start. INTTAUBnIm is generated on the master channel and TAUBTTOUTm (slave 1) is set.
During operation	TAUBnCDRm can be changed at any time. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. TAUBnRDT.TAUBnRDTm can be changed during operation.	TAUBnCNTm of the master channel and slave channels 1 and 2 load TAUBnCDRm and count down. When the counter of the master channel reaches 0000_H: • INTTAUBnIm (master) is generated • TAUBnCNTm (master) loads the TAUBnCDRm value and continues count operation • TAUBnCNTm (slave 1 and slave 2) reload the TAUBnCDRm value and start counting down • TAUBTTOUTm (slave 1) is set When TAUBnCNTm (slave 1) reaches 0000_H: • INTTAUBnIm (slave 1) is generated • TAUBTTOUTm (slave 1) is reset When TAUBnCNTm (slave 2) reaches 0000_H: • INTTAUBnIm (slave 2) is generated • INTTAUBnIm (slave 3) is generated • TAUBTTOUTm (slave 3) is set • TAUBnCNTm (slave 3) reloads the TAUBnCDRm value and starts counting down When TAUBnCNTm (slave 3) reaches 0001_H: • INTTAUBnIm (slave 3) is generated • TAUBTTOUTm (slave 3) is reset
Stop operation	Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

Restart operation

29.14.3.9 Specific Timing Diagrams

(1) Duty cycle (slave 3) = 100%

The following values apply to the figure below.

- TAUBnCDRm (master) = $000A_H$
- TAUBnCDRm (slave 1) = $000B_H$
- TAUBnCDRm (slave 2) = 0000_H
- TAUBnCDRm (slave 3) = $000B_H$

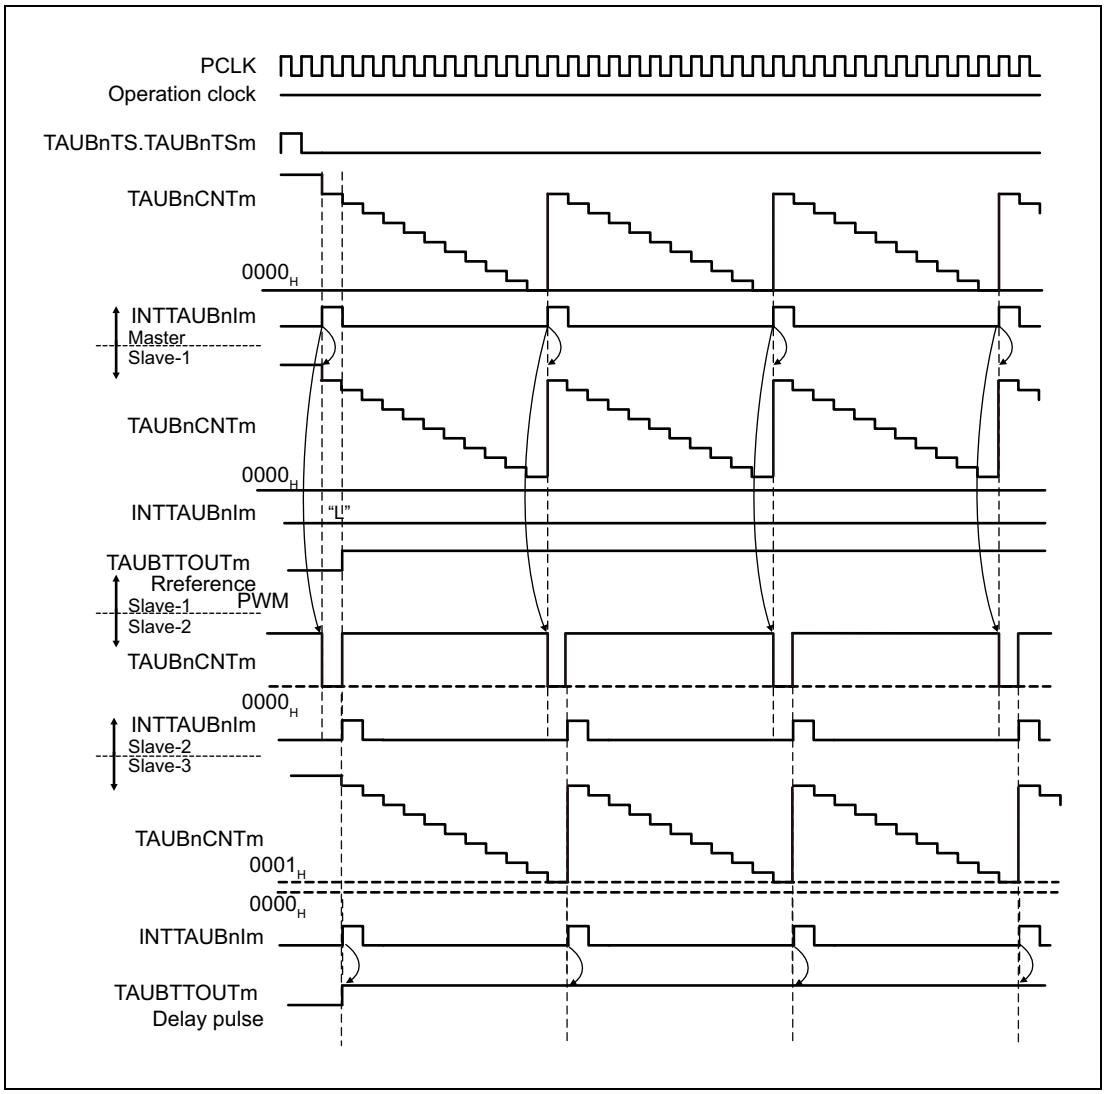

Figure 29.94 Duty Cycle (slave 3) = 100%

- If the value of TAUBnCDRm (slave 1 and 3) is higher than the value of TAUBnCDRm (master), the counter of the slave channel 1 cannot reach 0000_H and cannot generate interrupt request signals. TAUBTTOUTm of channels 1 and 3 remain in the active state.

(2) TAUBTTOUTm (slave 1) = TAUBTTOUTm (slave 3)

The following values apply to the figure below.

- TAUBnCDRm (master) = $000A_H$
- TAUBnCDRm (slave 1) = 0005_H
- TAUBnCDRm (slave 2) = 0000_H
- TAUBnCDRm (slave 3) = 0005_H

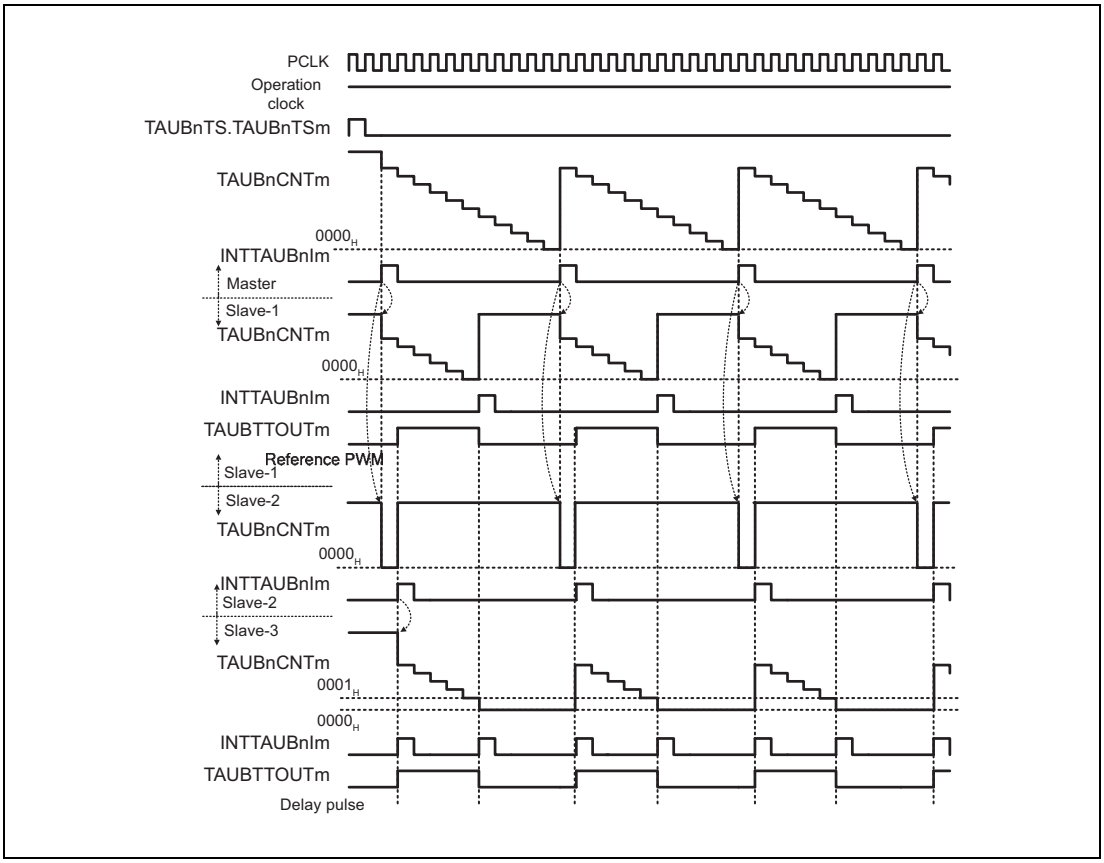

Figure 29.95 TAUBTTOUTm (slave 1) = TAUBTTOUTm (slave 3)

- If TAUBnCDRm (slave 2) = 0000_H, the counter of slave channel 3 starts counting one count clock later than the counter of slave channel 1. The reference pulse and the delay pulse are output with a delay of one clock count.

29.14.4 AD Conversion Trigger Output Function Type 1

29.14.4.1 Overview

Summary

This function is identical to Section 29.14.1, PWM Output Function except that TAUBTTOUTm is not output.

This is achieved by setting the channel output mode of the slave to independent channel output mode controlled by software.

29.14.4.2 Block Diagram and General Timing Diagram

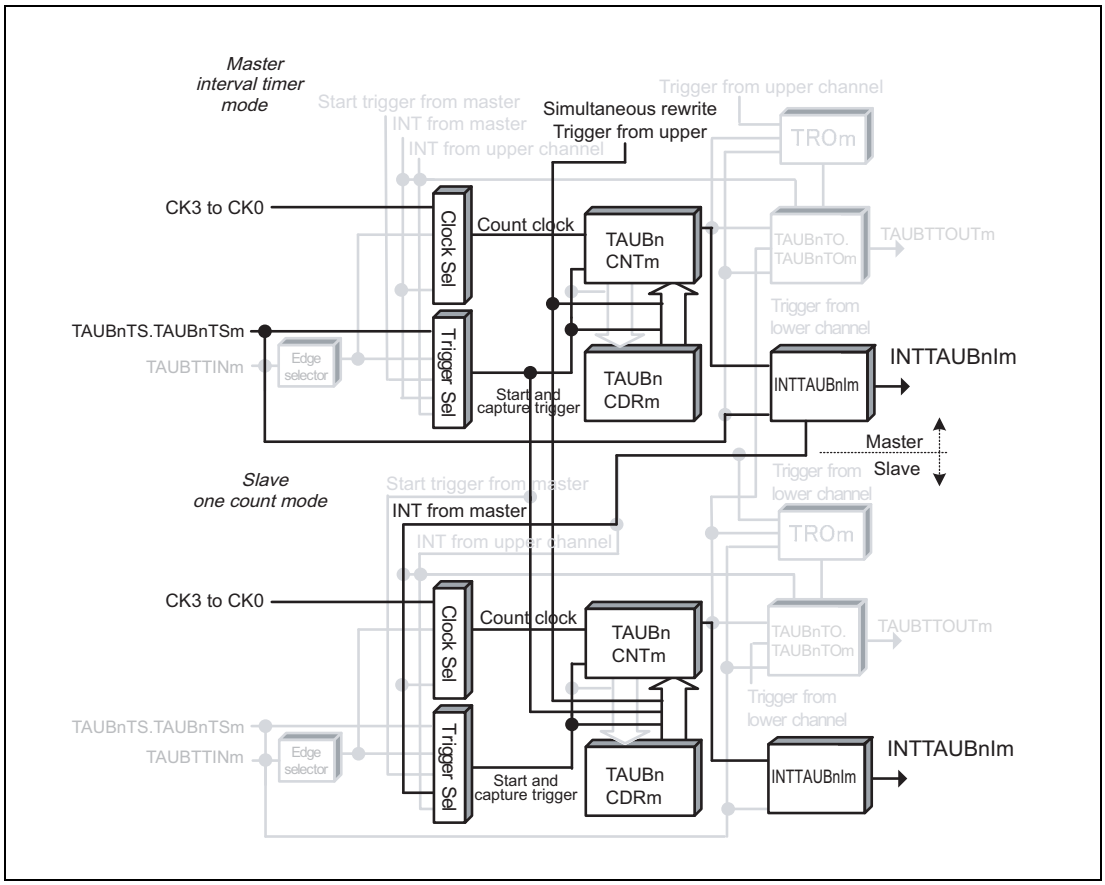

Figure 29.96 Block Diagram for AD Conversion Trigger Output Function Type 1

The following settings apply to the general timing diagram.

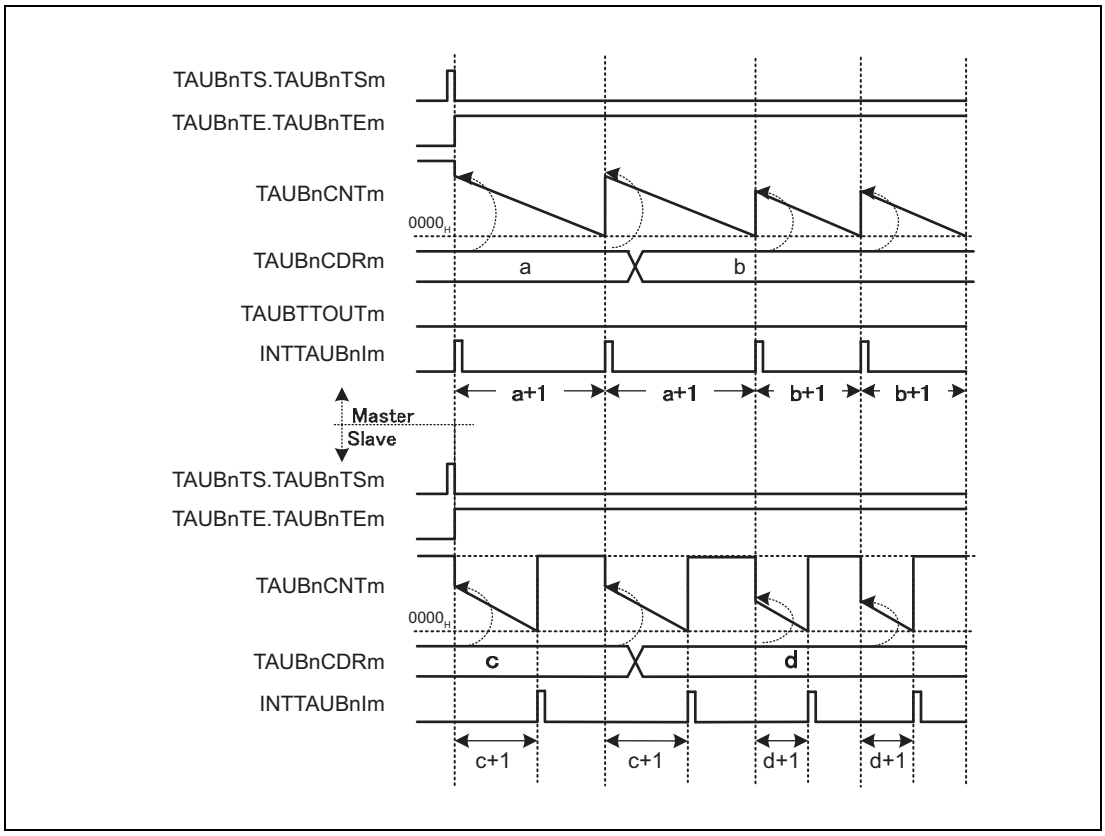

Figure 29.97 General Timing Diagram for AD Conversion Trigger Output Function Type 1

29.14.5 Triangle PWM Output Function

29.14.5.1 Overview

Summary

This function generates multiple triangle PWM outputs by using a master and one or more slave channels. It enables the pulse cycle (frequency) and the duty cycle of TAUBTTOUTm to be set using the master and slave channel(s) respectively.

The master channel generates a carrier cycle from two pulse cycles. The first cycle of the master channel controls the down status and the second cycle controls the up status of the slaves counter.

Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode, see **Table 29.133, Contents of the TAUBnCMORm Register for the Master Channel of the Triangle PWM Output Function**.
- The operation mode of the slave channel(s) must be set to up down count mode, see Table 29.137, Contents of the TAUBnCMORm Register for the Slave Channel of the Triangle PWM Output Function.
- The channel output mode of the master channel must be set to independent channel output mode 1.
- The channel output mode of the slave channel(s) must be set to synchronous channel output mode 2.
- The following settings establish TAUBTTOUTm at high level for the down status of the carrier cycle.
  - If the TAUBnCMORm.TAUBnMD0 (master) bit is set to 0,TAUBnTO.TAUBnTOm must be set to 1 while TAUBnTOE.TAUBnTOEm is 0. (recommended)
  - If the TAUBnCMORm.TAUBnMD0 (master) bit is set to 1, TAUBnTO.TAUBnTOm must be set to 0 while TAUBnTOE.TAUBnOEm is 0.

Functional description

The counters are started by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1 for every channel. This in turn sets TAUBnTE.TAUBnTEm, enabling count operation. The current values of TAUBnCDRm (master and slave) are written to TAUBnCNTm (master and slave) and the counters start to count down from these values. If the master channel TAUBnCMORm.TAUBnMD0 bit is set to 1, an interrupt is generated and TAUBTTOUTm signal of the master toggles.

- Master channel:
  When the counter of the master channel reaches 0000_H (pulse cycle time has elapsed) INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. TAUBnCNTm then reloads the TAUBnCDRm value and counts down.
- Slave channel:
  The INTTAUBnIm of the master channel triggers the counter of the slave channel:

– If the slave counter currently counts down, it changes count direction.
– If the slave counter currently counts up, the value of TAUBnCDRm is reloaded and the counter counts down.

When the counter of the slave channel reaches 0001_H while counting up or down, INTTAUBnIm is generated and the TAUBTTOUTm (slave) signal is set or reset.

The counter continues to count down or up and awaits the next INTTAUBnIm of the master channel.

TAUBTTOUTm can be switched between positive and negative phase setting TAUBnTOL.TAUBnTOLm during operation.

The counters can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channel(s) stop but retain their values.

Conditions

Simultaneous rewrite can be used with this function. Please see Section 29.6, Simultaneous Rewrite.

29.14.5.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUBnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUBnCDRm (master) + 1) × 2 × count clock cycle

Duty cycle =

[(TAUBnCDRm (master) + 1 - TAUBnCDRm (slave))/ (TAUBnCDRm (master) + 1)] × 100

– Duty cycle = 100%
  TAUBnCDRm (slave) = 0000_H
– Duty cycle = 0%
  TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1

29.14.5.3 Block Diagram and General Timing Diagram

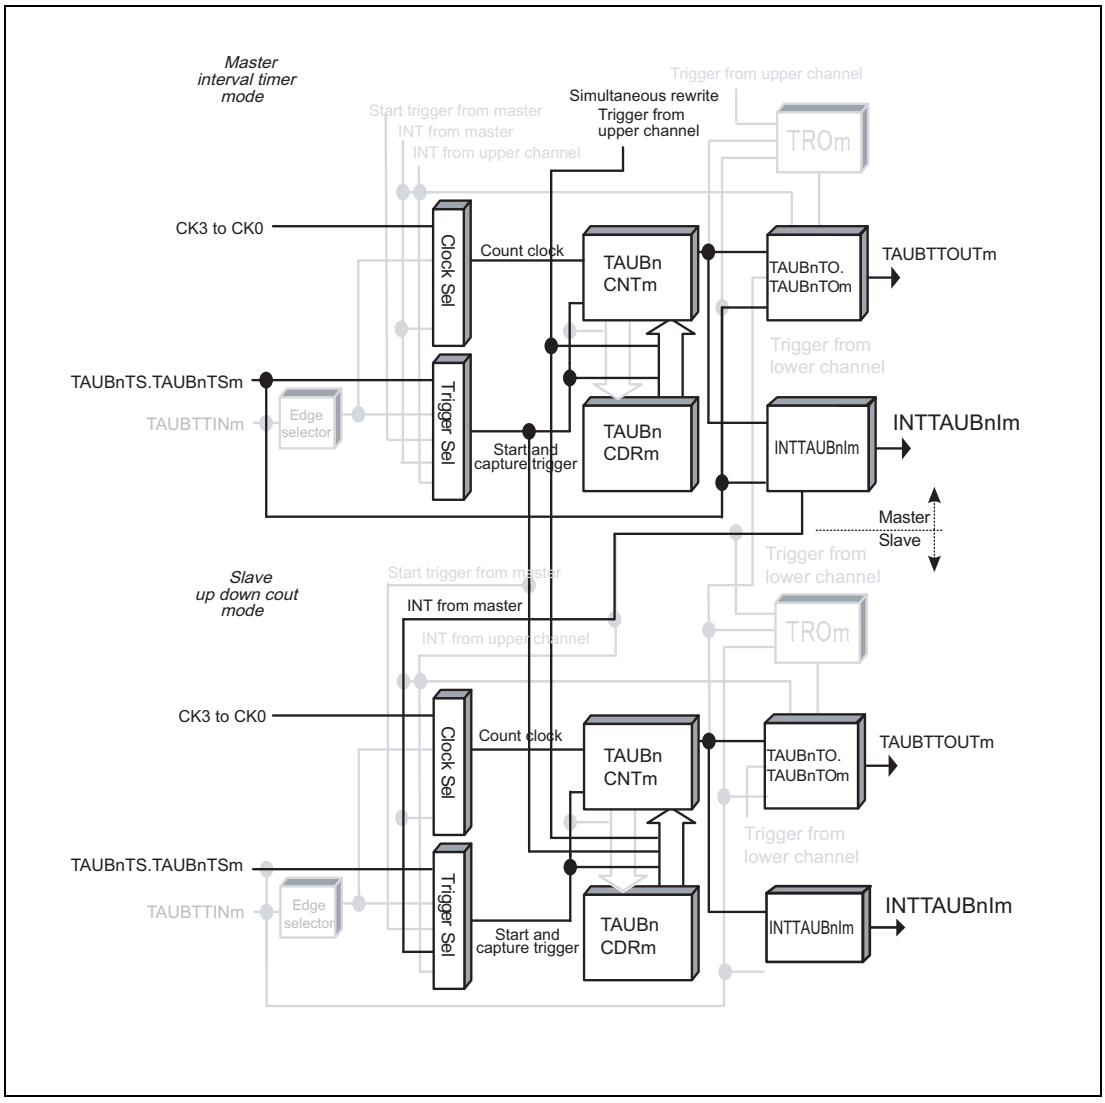

Figure 29.98 Block Diagram for Triangle PWM Output Function

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

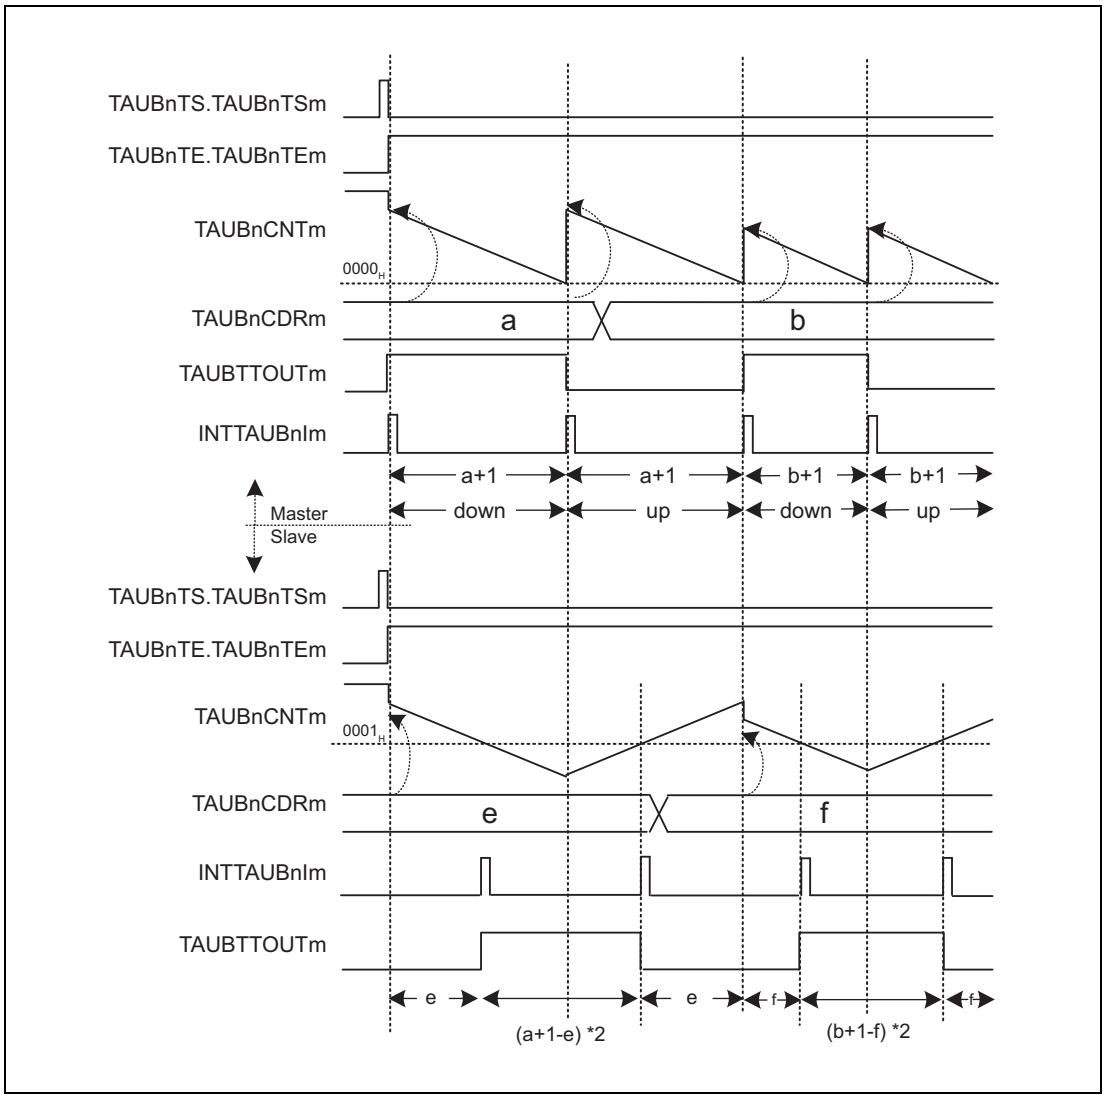

Figure 29.99 General Timing Diagram for Triangle PWM Output Function

29.14.5.4 Register Settings for the Master Channel

Table 29.133 Contents of the TAUBnCMORm Register for the Master Channel of the Triangle PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 1_B.
10 to 8	TAUBnSTS[2:0]	Write 000_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0000_B.
0	TAUBnMD0	0: INTTAUBnIm not generated and TAUBTTOUTm does not toggle at operation start 1: Generates INTTAUBnIm and toggles TAUBTTOUTm at operation start

(2) TAUBnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 29.134 Contents of the TAUBnCMURm Register for the Master Channel of the Triangle PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the master channel

Table 29.135 Control Bit Settings for Independent Channel Output Mode 1

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 0_B.
TAUBnTOC.TAUBnTOCm	Write 0_B.
TAUBnTOL.TAUBnTOLm	Write 0_B.
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

(4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channel must be identical.

Table 29.136 Simultaneous Rewrite Settings for the Master Channel of the Triangle PWM Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

NOTE

If TAUBnRDS.TAUBnRDSm = 1, the master channel requires an upper channel that generates the simultaneous rewrite trigger signal.

29.14.5.5 Register Settings for the Slave Channel(s)

(1) TAUBnCMORm for the slave channel(s)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS [1:0]		—	TAUBn CCS0	TAUBn MAS	TAUBnSTS[2:0]			TAUBnCOS [1:0]		—	TAUBnMD[4:1]				TAUBn MD0

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the slave channel(s)

Table 29.139 Control Bit Settings for Synchronous Channel Output Mode 2

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 1_B.
TAUBnTOC.TAUBnTOCm	Write 1_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

(4) Simultaneous rewrite for the slave channel(s)

The simultaneous rewrite settings of the master and slave channel must be identical.

Table 29.140 Simultaneous Rewrite Settings for the Slave Channel of the Triangle PWM Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

29.14.5.6 Operating Procedure for Triangle PWM Output Function

Table 29.141 Operating Procedure for Triangle PWM Output Function

		Operation	Status of TAUBn
	Initial channel setting	Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 29.14.5.4, Register Settings for the Master Channel** Slave channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 29.14.5.5, Register Settings for the Slave Channel(s)** Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.
Restart operation	Start operation	Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start. INTTAUBnIm (master) is generated on the master channel when TAUBnCMORm.TAUBnMD0 set to 1.
	During operation	TAUBnCDRm can be changed at any time. TAUBnTOL.TAUBnTOLm can be changed. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. TAUBnRDT.TAUBnRDTm can be changed during operation.	TAUBnCNTm of the master and slave channel loads TAUBnCDRm and counts down. When the counter of the master channel reaches 0000_H: • INTTAUBnIm (master) is generated • TAUBTTOUTm (master) toggles • TAUBnCNTm (master) loads the TAUBnCDRm value and continues count operation. • TAUBnCNTm (slave) loads the TAUBnCDRm value or counts in the reverse direction. When TAUBnCNTm of the slave = 0001_H: • INTTAUBnIm (slave) is generated • TAUBTTOUTm (slave) is set (in count-down status) or reset (in count-up status)
	Stop operation	Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

29.14.5.7 Specific Timing Diagrams

(1) Duty cycle = 0%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
  - TAUBnCDRm = a = 5_H
- Slave channel:
  - TAUBnCDRm = 6_H

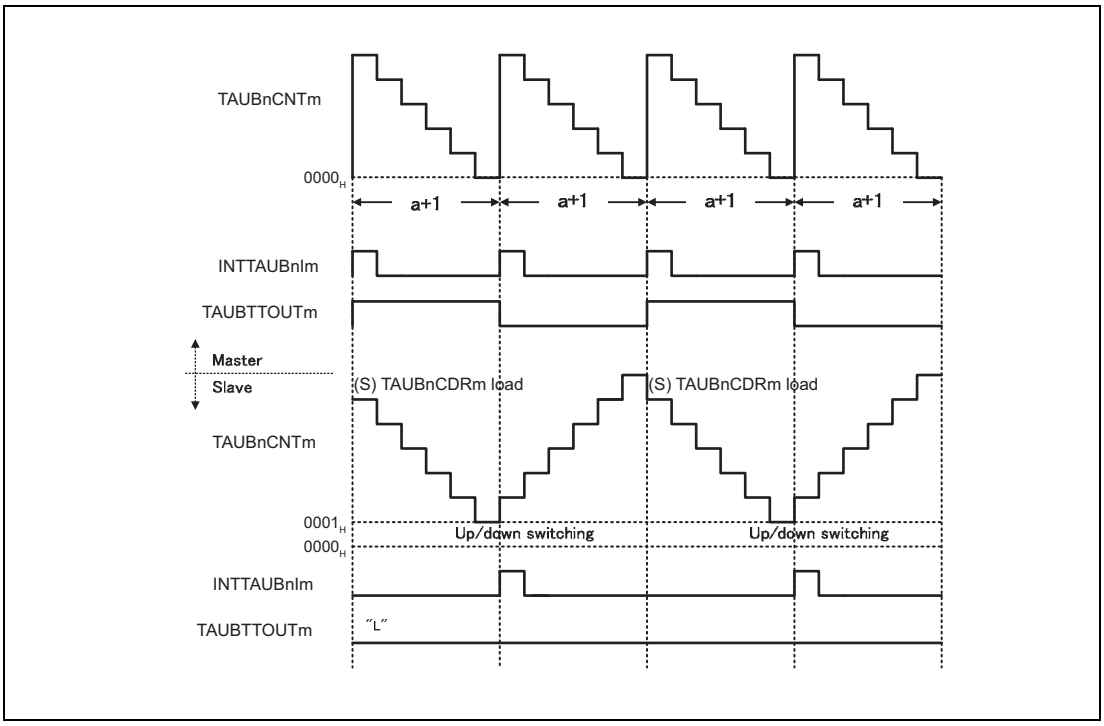

Figure 29.100 TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1

- If TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1, INTTAUBnIm of slave channel is not generated during counting down. The set signal is never detected, so TAUBTTOUTm remains at low state.

(2) Duty cycle = 100%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
  - TAUBnCDRm = a = 5_H
- Slave channel:
  - TAUBnCDRm = 0_B

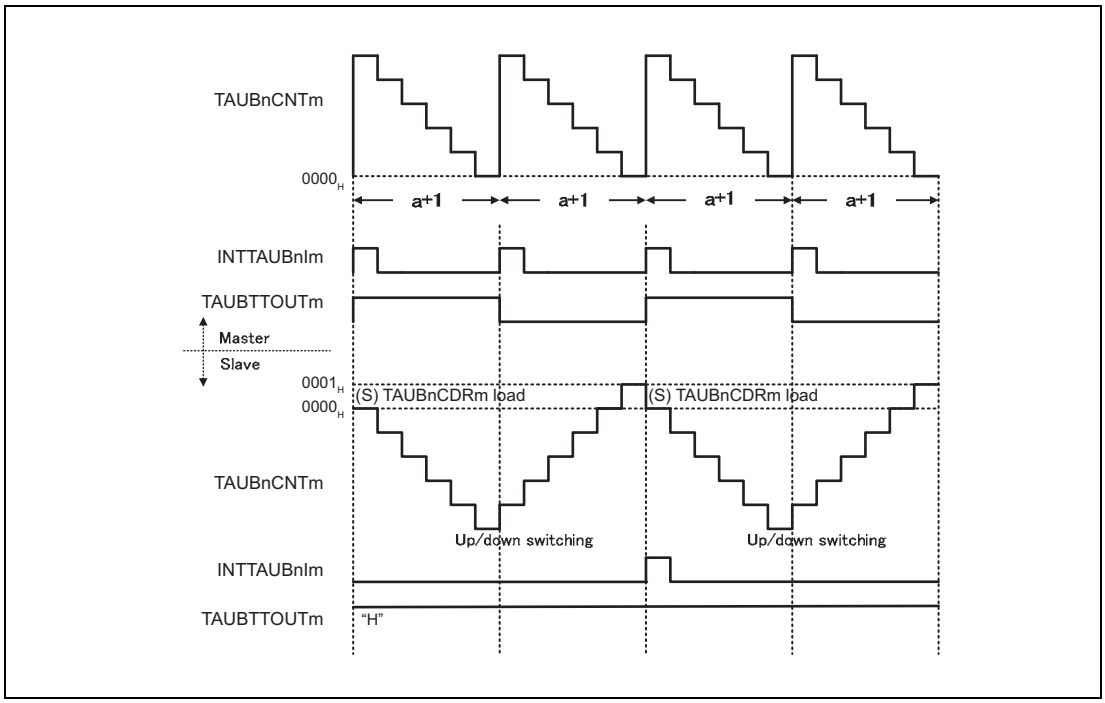

Figure 29.101 TAUBnCDRm (slave) = 0000_H

- If TAUBnCDRm (slave) = 0000_H, INTTAUBnIm of slave channel is not generated during counting up. The reset signal is never detected, so TAUBTTOUTm remains at high state.

29.14.6 Triangle PWM Output Function with Dead Time

29.14.6.1 Overview

Summary

This function generates multiple triangle PWM outputs with a defined dead time by using a master and two or more slave channels. The resulting PWM signals with the dead time are output via TAUBTTOUTm of the slave channels 2 and 3. It enables the pulse cycle (frequency) and the duty cycle of TAUBTTOUTm to be set using the master and slave channel(s) respectively.

The master generates a carrier cycle. The first pulse controls the down status and the second pulse controls the up status of the slaves counter.

An interrupt on slave 2 causes TAUBTTOUTm of the slave channels to be set or reset.
Depending on the settings of TAUBnTDL.TAUBnTDLm, delay time is added to positive or negative logic side of the signal (i.e. whether TAUBTTOUTm is set or reset immediately or after dead time has elapsed). The duration of the dead time is specified by slave channel 3.

Prerequisites

- Three channels. Select an even channel CH (a) and an odd channel CH (a + 1) for slave channel 2 and 3 respectively.
- The operation mode of the master channel must be set to interval timer mode, see **Table 29.143, Contents of the TAUBnCMORm Register for the Master Channel of the Triangle PWM Output Function with Dead Time**
- Slave channel 1 is not used for this function. This ensures that slave channel 2 is an even channel (a), and slave channel 3 is an odd channel (a + 1).
  Slave channel 1 can be used as a separate timer (independent function).
- The operation mode of slave channel 2 must be set to up down mode, see **Table 29.147, Contents of the TAUBnCMORm Register for the Slave Channel 2 of the Triangle PWM Output Function with Dead Time**
  Furthermore, slave channel 2 must be an even channel
- The operation mode of slave channel 3 must be set to one-count mode, see **Table 29.151, Contents of the TAUBnCMORm Register for the Slave Channel 3 of the Triangle PWM Output Function with Dead Time**
  Furthermore, slave channel 3 must be an odd channel
- The channel output mode of the master channel must be set to independent channel output mode 1
- The channel output mode of the slave channels 2 and 3 must be set to synchronous channel output mode 2
- The following settings establish TAUBTTOUTm at high level for the down status of the carrier cycle.
  - If the TAUBnCMORm.MD0 (master) bit is set to 0,TAUBnTO.TAUBnTOm must be set to 1 while TAUBnTOE.TAUBnTOEm is 0. (recommended)
  - If the TAUBnCMORm.MD0 (master) bit is set to 1, TAUBnTO.TAUBnTOm must be set to 0 while TAUBnTOE.TAUBnTOEm is 0.

NOTE

Slave channel 1 is not used for Triangle PWM Output Function with Dead Time.
Slave channel 1 can be used as a separate timer (independent function).

Functional description

The counters are started by setting the channel trigger bits (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm, enabling count operation. The current values of TAUBnCDRm is written to TAUBnCNTm and the counters start to count down from these values. If the master channel TAUBnCMORm.TAUBnMD0 bit is set to 1, an interrupt is generated and TAUBTTOUTm signal of the master toggles.

- Master channel:
  When the counter of the master channel reaches 0000_H, INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. The counter reloads the TAUBnCDRm value and counts down.
- Slave channel 2:
  The INTTAUBnIm of the master channel triggers the counter of the slave channel 2:
  - If the slave counter currently counts down, it changes count direction.
  - If the slave counter currently counts up, the value of TAUBnCDRm is reloaded and the counter counts down.

  The counter continues to count down or up and awaits the next INTTAUBnIm of the master channel.

  When the counter value of slave channel 2 reaches 0001_H, INTTAUBnIm is generated.
- Slave channel 3:
  INTTAUBnIm of slave channel 2 triggers the counter of slave channel 3. The current value of TAUBnCDRm (slave 3) is written to TAUBnCNTm (slave 3) and the counter starts to count down from this TAUBnCDRm value.
  When the counter reaches 0000_H, INTTAUBnIm is generated. The counter returns to $FFFF_H$ and awaits the next INTTAUBnIm of slave channel 2.

The TAUBnTDL.TAUBnTDLm settings of the corresponding channel specify whether it is set/reset immediately, or after dead time has elapsed, as shown in **Table 29.142, Behavior of TAUBTTOUTm when an Interrupt Occurs on Slave Channel 2**.

The TAUBnTOL.TOLm settings specify whether set corresponds to a high signal (TAUBnTOL.TAUBnTOLm = 0) or a low signal (TAUBnTOL.TAUBnTOLm = 1).

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channel(s) stop but retain their values.

TAUBnCDRm value of slave channel 2 can be set to 0000_H to output 100% TAUBTTOUTm.

NOTE

If a forced restart is executed during operation, TAUBTTOUTm is not output as a triangle PWM signal.

Conditions

Simultaneous rewrite can be used with this function. Please see Section 29.6, Simultaneous Rewrite.

TAUBnTOL.TAUBnTOLm and TAUBnTDL.TAUBnTDLm bits should be set before the counter starts, and slave channels 2 and 3 should have opposite TAUBnTOL.TAUBnTOLm settings or opposite TAUBnTDL.TAUBnTDLm settings.

Table 29.142 Behavior of TAUBTTOUTm when an Interrupt Occurs on Slave Channel 2

TAUBnTDL.TAUBnTDLm	Count Direction of Slave Channel 2 when Interrupt is Generated	TAUBTTOUTm Set/Reset Timing
0	Down	Set after dead time has elapsed
	Up	Reset immediately
1	Down	Set immediately
	Up	Reset after dead time has elapsed

29.14.6.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUBnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUBnCDRm (master) + 1) × 2 × count clock cycle

PWM signal width (positive phase) = [(TAUBnCDRm (master) + 1 – TAUBnCDRm (slave 2)) × 2 – (TAUBnCDRm (slave 3) + 1)] × count clock cycle

PWM signal width (negative phase) = [(TAUBnCDRm (master) + 1 – TAUBnCDRm (slave 2)) × 2 + (TAUBnCDRm (slave 3) + 1)] × count clock cycle

29.14.6.3 Block Diagram and General Timing Diagram

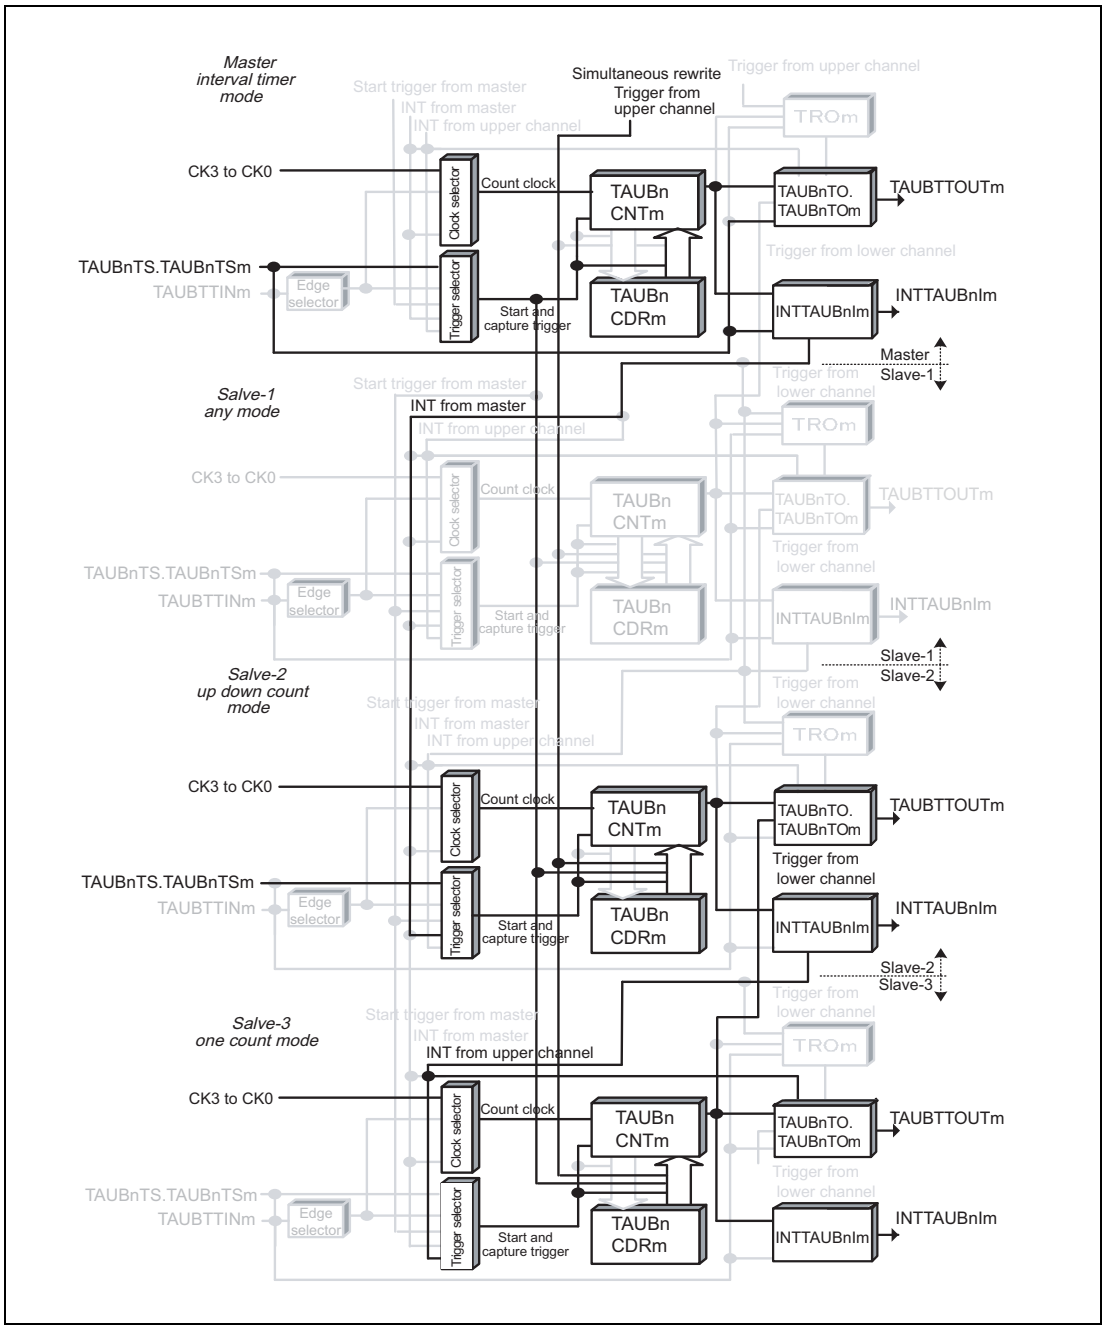

Figure 29.102 Block Diagram for Triangle PWM Output Function with Dead Time

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
- Slave channel 2:

– INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 = 0)
– TAUBnTDL.TAUBnTDLm = 0
– Positive logic (TAUBnTOL.TAUBnTOLm = 0)

- Slave channel 3:
  – Enables start trigger detection during counting(TAUBnCMORm.TAUBnMD0 = 1)
  – TAUBnTDL.TAUBnTDLm = 1
  – Positive logic (TAUBnTOL.TAUBnTOLm = 0)

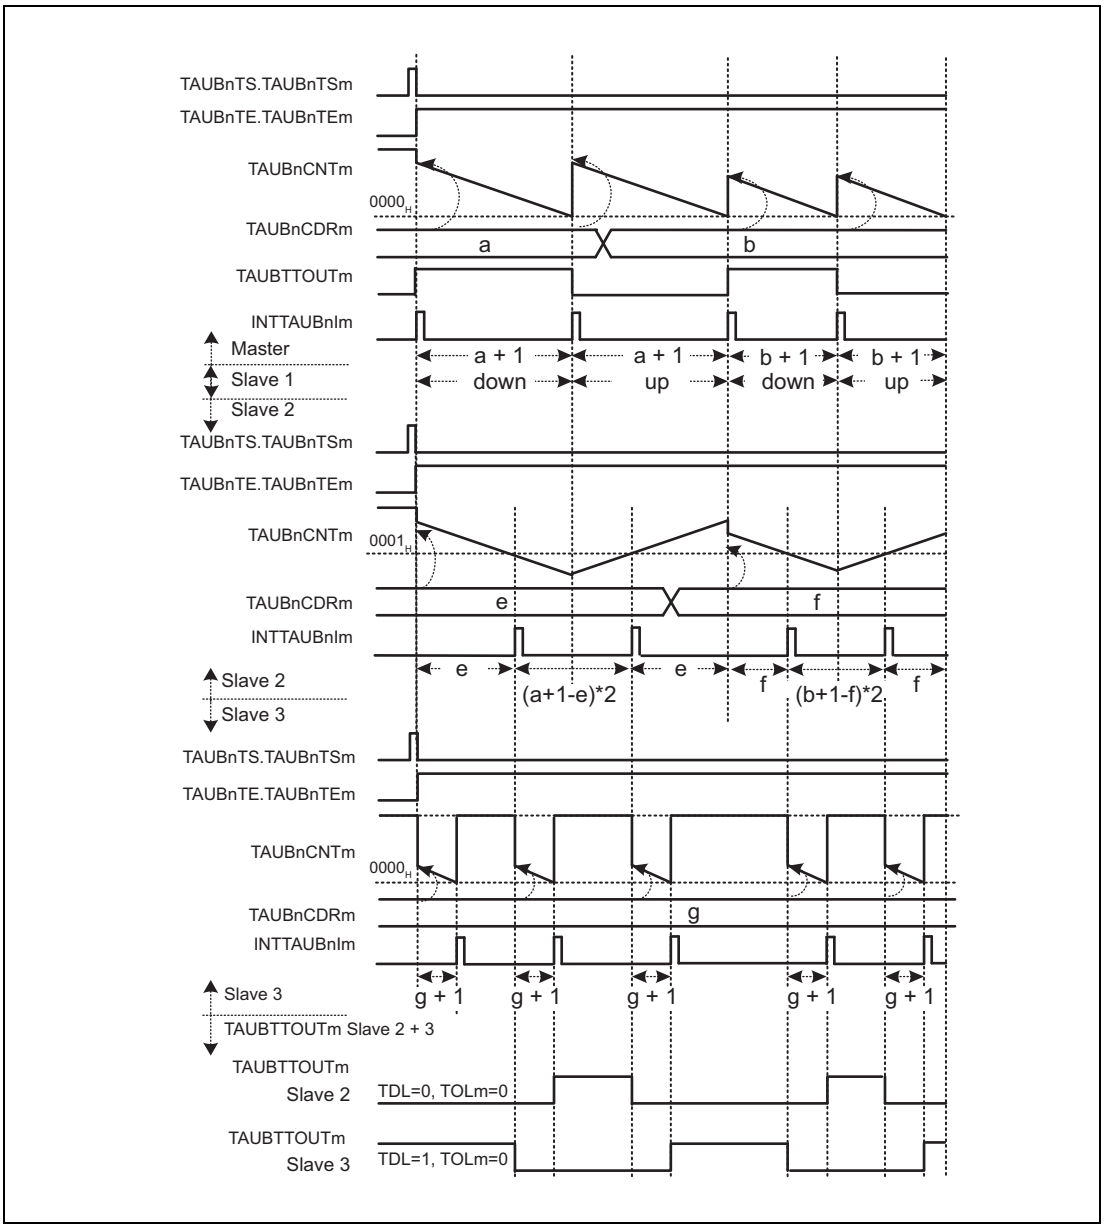

Figure 29.103 General Timing Diagram for Triangle PWM Output Function with Dead Time

29.14.6.4 Register Settings for the Master Channel

(1) TAUBnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 29.143 Contents of the TAUBnCMORm Register for the Master Channel of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 1_B.
10 to 8	TAUBnSTS[2:0]	Write 000_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0000_B.
0	TAUBnMD0	0: INTTAUBnIm not generated and TAUBTTOUTm does not toggle at operation start 1: Generates INTTAUBnIm and toggles TAUBTTOUTm at operation start

(2) TAUBnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 29.144 Contents of the TAUBnCMURm Register for the Master Channel of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the master channel

Table 29.145 Control Bit Settings for Independent Channel Output Mode 1

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 0_B.
TAUBnTOC.TAUBnTOCm	Write 0_B.
TAUBnTOL.TAUBnTOLm	Write 0_B.
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

(4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 29.146 Simultaneous Rewrite Settings for the Master Channel of the Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

NOTE

If TAUBnRDS.TAUBnRDSm = 1, the master channel requires an upper channel that generates the simultaneous rewrite trigger signal.

29.14.6.5 Register Settings for Slave Channel 2

(1) TAUBnCMORm for slave channel 2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 0_B.
10 to 8	TAUBnSTS[2:0]	Write 111_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 1001_B.
0	TAUBnMD0	Write 0_B.

(2) TAUBnCMURm for slave channel 2

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 29.148 Contents of the TAUBnCMURm Register for the Slave Channel 2 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for slave channel 2

Table 29.149 Control Bit Settings for Synchronous Channel Output Mode 2 with Dead Time Output

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 1_B.
TAUBnTOC.TAUBnTOCm	Write 1_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 1_B.
TAUBnTDL.TAUBnTDLm	0: Dead time is added to the positive phase 1: Dead time is added to the negative phase

CAUTION

Set TAUBnTDL.TAUBnTDLm exclusively to the odd channel.

(4) Simultaneous rewrite for slave channel 2

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 29.150 Simultaneous Rewrite Settings for Slave Channel 2 of the Triangle PWM Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

29.14.6.6 Register Settings for Slave Channel 3

(1) TAUBnCMORm for slave channel 3

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS[1:0]		—	TAUBnCCS0	TAUBnMAS	TAUBnSTS[2:0]			TAUBnCOS[1:0]		—	TAUBnMD[4:1]				TAUBnMD0

Table 29.152 Contents of the TAUBnCMURm Register for the Slave Channel 3 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for slave channel 3

Table 29.153 Control Bit Settings for Synchronous Channel Output Mode 2 with Dead Time Output

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 1_B.
TAUBnTOC.TAUBnTOCm	Write 1_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 1_B.
TAUBnTDL.TAUBnTDLm	0: Dead time is added to the positive phase 1: Dead time is added to the negative phase

CAUTION

Set TAUBnTDL.TAUBnTDLm exclusively to the even channel.

(4) Simultaneous rewrite for slave channel 3

The simultaneous rewrite settings of the master and slave channel must be identical.

Table 29.154 Simultaneous Rewrite Settings for Slave Channel 3 of the Triangle PWM Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

29.14.6.7 Operating Procedure for Triangle PWM Output Function with Dead Time

Table 29.155 Operating Procedure for Triangle PWM Output Function with Dead Time

	Operation	Status of TAUBn
Initial channel setting	Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 29.14.6.4, Register Settings for the Master Channel** Slave channel 2: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 29.14.6.5, Register Settings for Slave Channel 2** Slave channel 3: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 29.14.6.6, Register Settings for Slave Channel 3** Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start. INTTAUBnIm (master) is generated when TAUBnCMORm.TAUBnMD0 is set to 1 on the master channel. TAUBnCMORm.TAUBnMD0 is set to 1.
During operation	TAUBnCDRm can be changed at any time. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. TAUBnRDT.TAUBnRDTm can be changed during operation.	TAUBnCNTm of the master channel and slave channel 2 load TAUBnCDRm and count down. When the counter of the master channel reaches 0000_H: • INTTAUBnIm (master) is generated • TAUBnCNTm (master) reloads the TAUBnCDRm value and continues count operation • TAUBnCNTm (slave 2) reloads the TAUBnCDRm value or counts in the reverse direction When TAUBnCNTm (slave 2) reaches 0001_H: • INTTAUBnIm (slave 2) is generated • TAUBnCNTm of slave channel 3 loads the TAUBnCDRm value and counts down When TAUBnCNTm of slave channel 3 = 0000_H: • INTTAUBnIm is generated
Stop operation	Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

Restart operation

29.14.6.8 Specific Timing Diagrams

(1) Duty cycle = 0%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

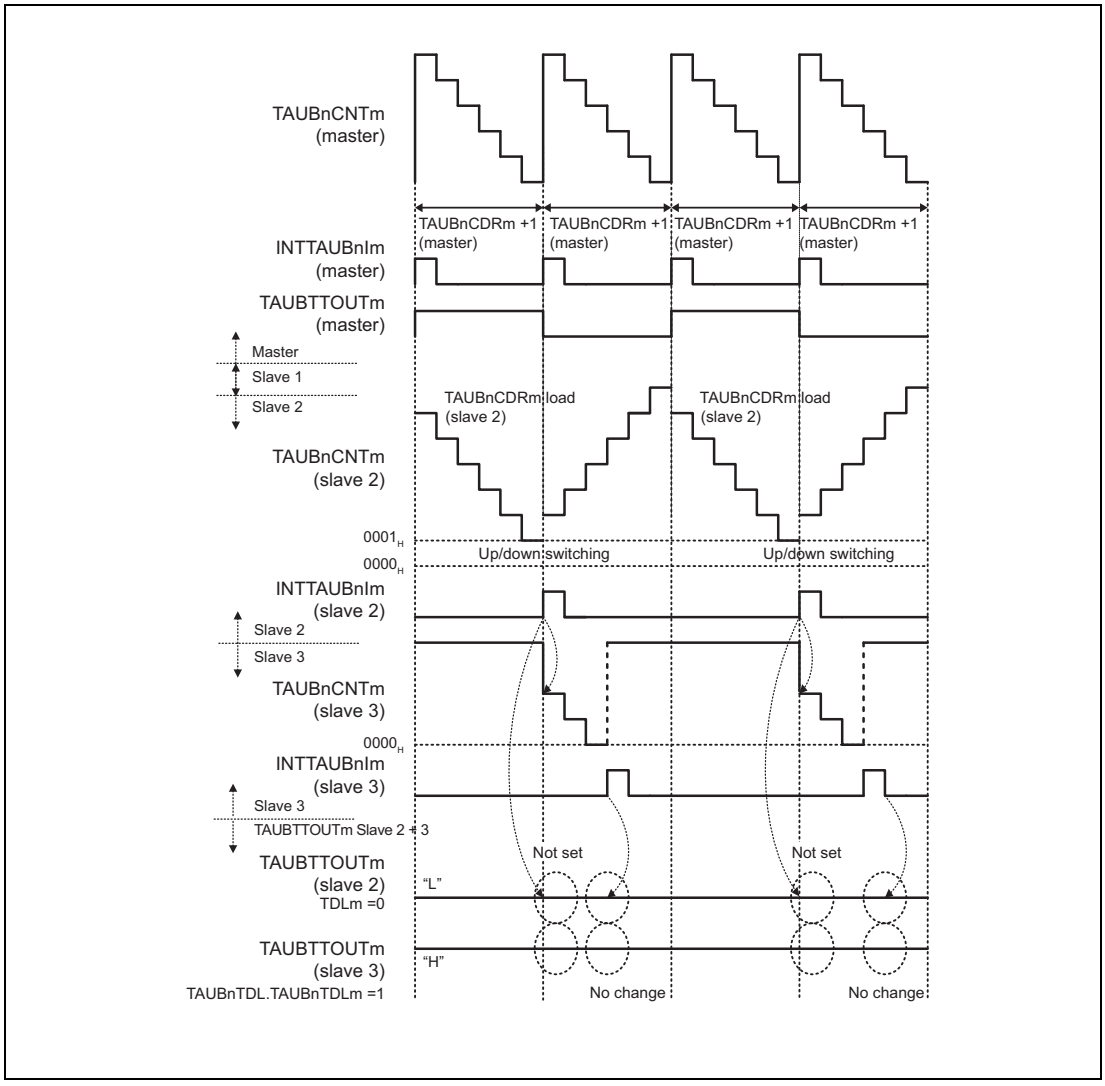

Figure 29.104 TAUBnCDRm (slave 2) ≥ TAUBnCDRm (master) + 1

- If TAUBnCDRm (slave 2) ≥ TAUBnCDRm (master), the counter of slave channel cannot reach 0000_H during counting down. Therefore TAUBTTOUTm cannot toggle, i.e. it remains at its initial state. The interrupt from slave channel 2 occurs during count up, therefore it is a reset signal.

(2) Duty cycle = 100%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

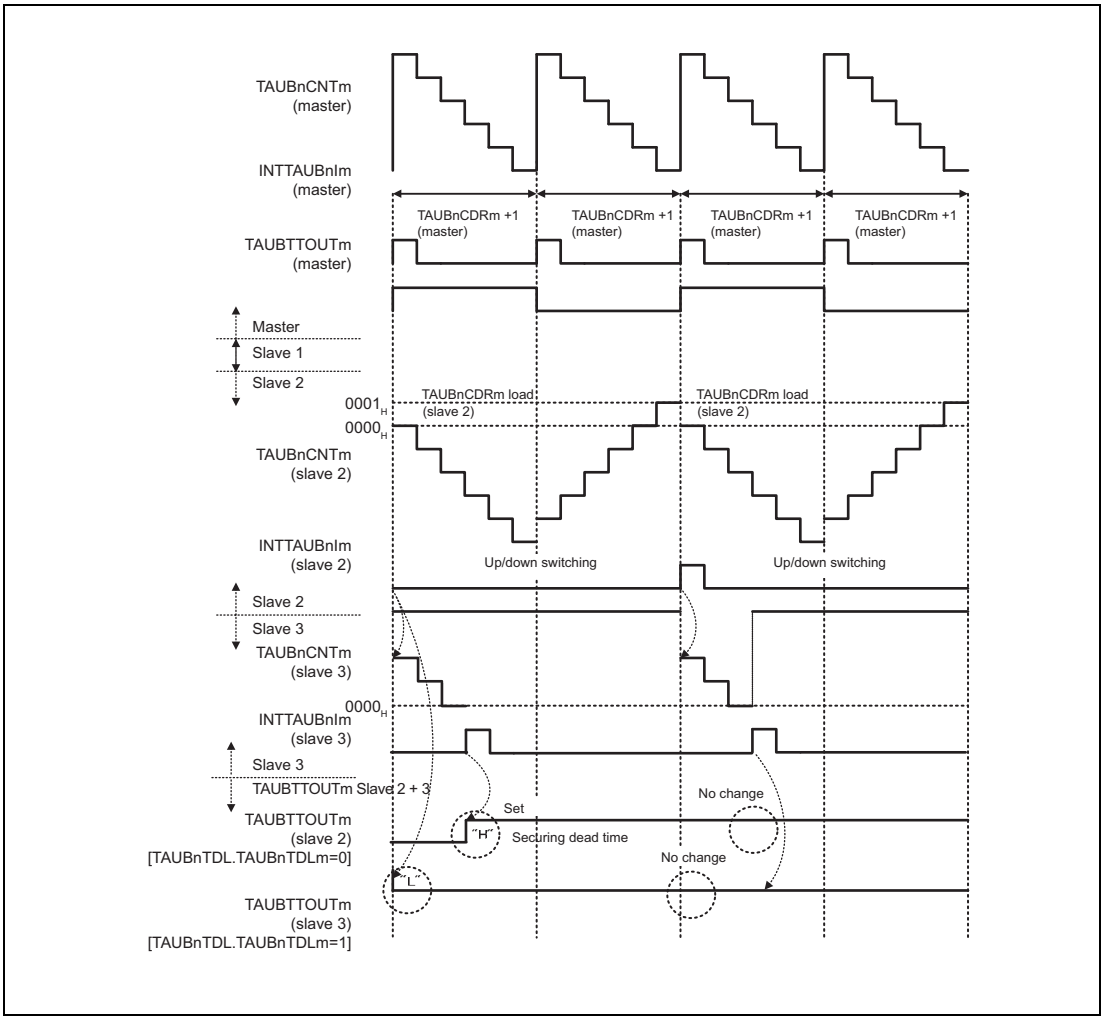

Figure 29.105 TAUBnCDRm (slave 2) = 0000_H

- If TAUBnCDRm (slave 2) = 0000_H the counter of slave channel cannot reach 0001_H while counting up and therefore cannot generate an INTTAUBnIm while counting up.
  - The set conditions for a channel in which TAUBnTDL.TAUBnTDLm = 0 are met after dead time has elapsed. TAUBTTOUTm toggles but remains in the new state because the reset conditions never occur for such a channel.
  - Slave channel 3 in the diagram above is set when the counter starts.
    However, the reset conditions for a channel in which TAUBnTDL.TAUBnTDLm = 1 never occur so TAUBTTOUTm remains in its initial state for such a slave channel.

(3) TAUBTTOUTm (slave 2) = 0% and TAUBTTOUTm (slave 3) ≥ 0%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

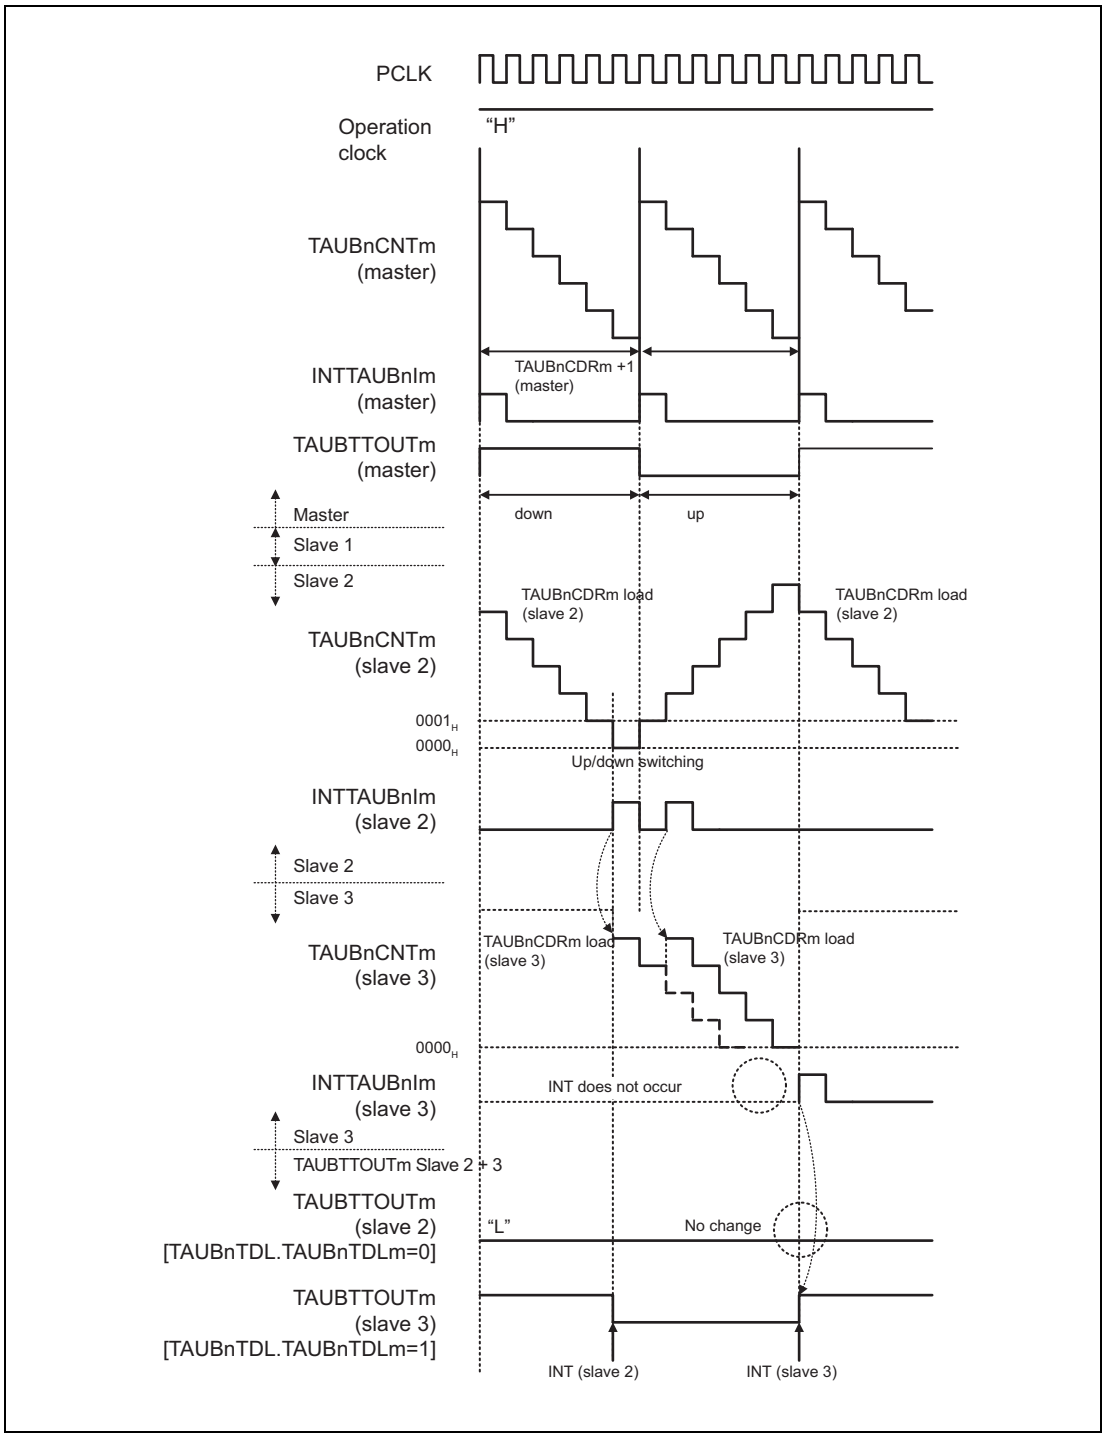

Figure 29.106 TAUBnCDRm (master) = 0005_H, TAUBnCDRm (slave 2) = 0005_H TAUBnCDRm (slave 3) = 0004_H

- When the counter of slave channel 2 reaches 0000_H after detecting that the counter reached 0001_H, INTTAUBnIm (slave 2) is generated. The counter of slave channel 3 starts to count down.
- If another INTTAUBnIm (slave 2) is generated while the counter of slave channel 3 is still counting down, the value of TAUBnCDRm (slave 3) is reloaded and the counter restarts counting down from this value.
- In the diagram above, the first interrupt on channel 2 occurs while the counter is counting down, and the second while it is counting up.
- After the first interrupt, a slave for which TAUBnTDL.TAUBnTDLm = 0 waits for dead time to elapse before setting. However, if another interrupt occurs on slave 2 before the dead time has elapsed, the counter is counting up, so the signal acts as a reset signal, meaning that a channel for which TAUBnTDL.TAUBnTDLm = 0 always remains inactive.
- TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 1 is set and reset as normal when the corresponding INTTAUBnIm is generated.

(4) TAUBTTOUTm (slave 2) > 0% and TAUBTTOUTm (slave 3) = 100%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

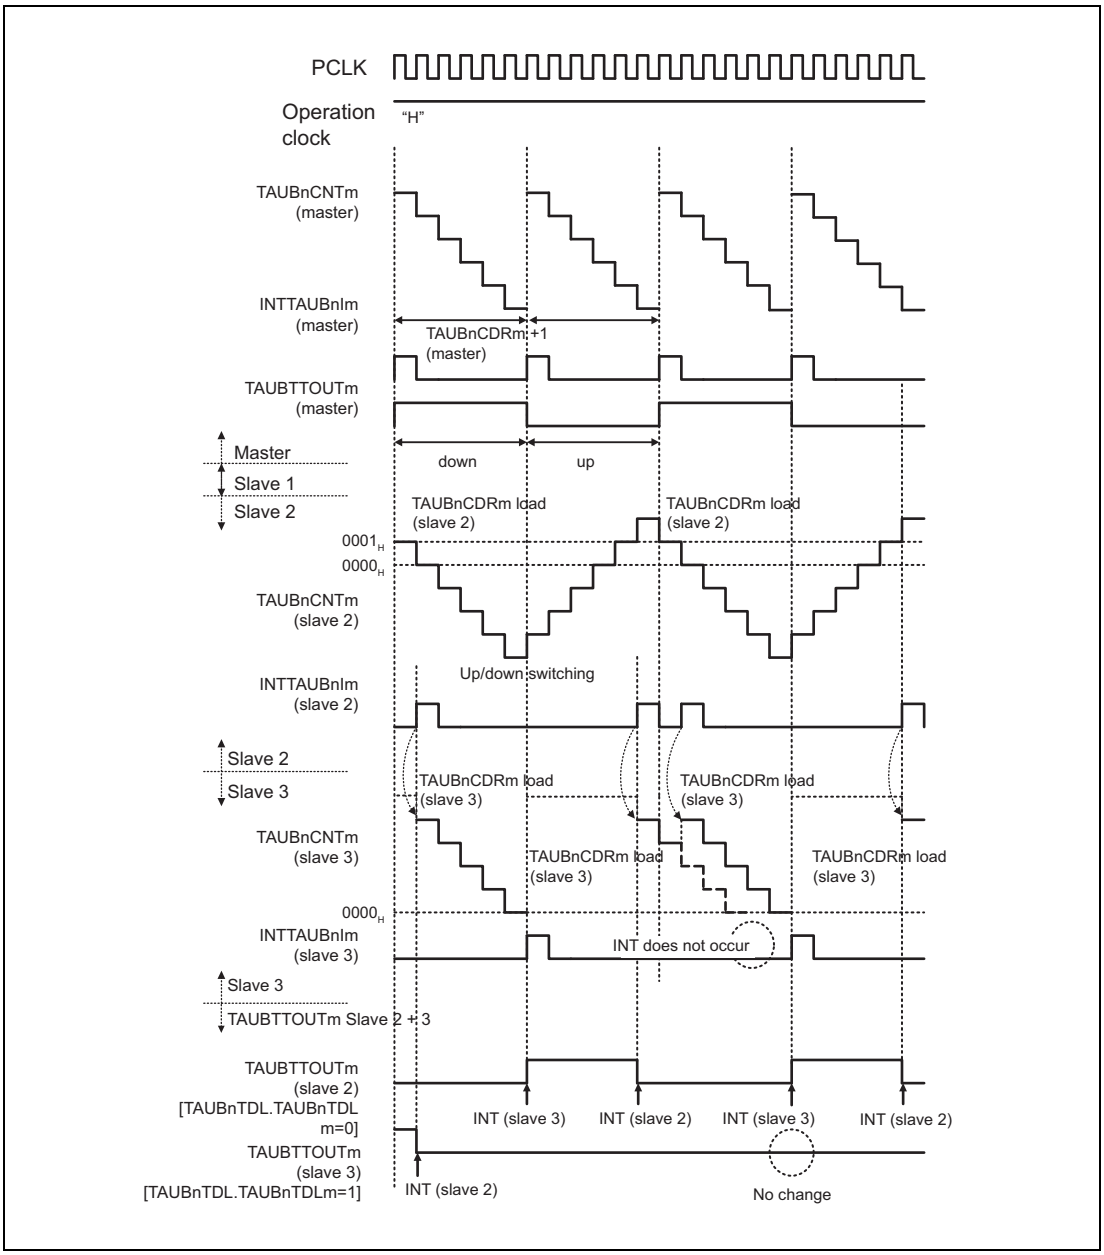

Figure 29.107 TAUBnCDRm (master) = 0005_H, TAUBnCDRm (slave 2) = 0001_H TAUBnCDRm (slave 3) = 0004_H PWM Signal Width (negative phase) ≥ Carrier Cycle

- After the second interrupt on slave channel 2, a slave for which TAUBnTDL.TAUBnTDLm = 1 is reset after the dead time has elapsed. However if another interrupt occurs on slave 2 before the

dead time has elapsed, slave 3 is restarted, and then if an interrupt on slave channel 3 is generated, the counter is counting up, so the signal acts as a setting signal, meaning that a channel for which TAUBnTDL.TAUBnTDLm = 1 always remains active.

- TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 0 is set and reset as normal when the corresponding INTTAUBnIm is generated.

(5) Inhibited INTTAUBnIm to set TAUBTTOUTm positive phase period

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

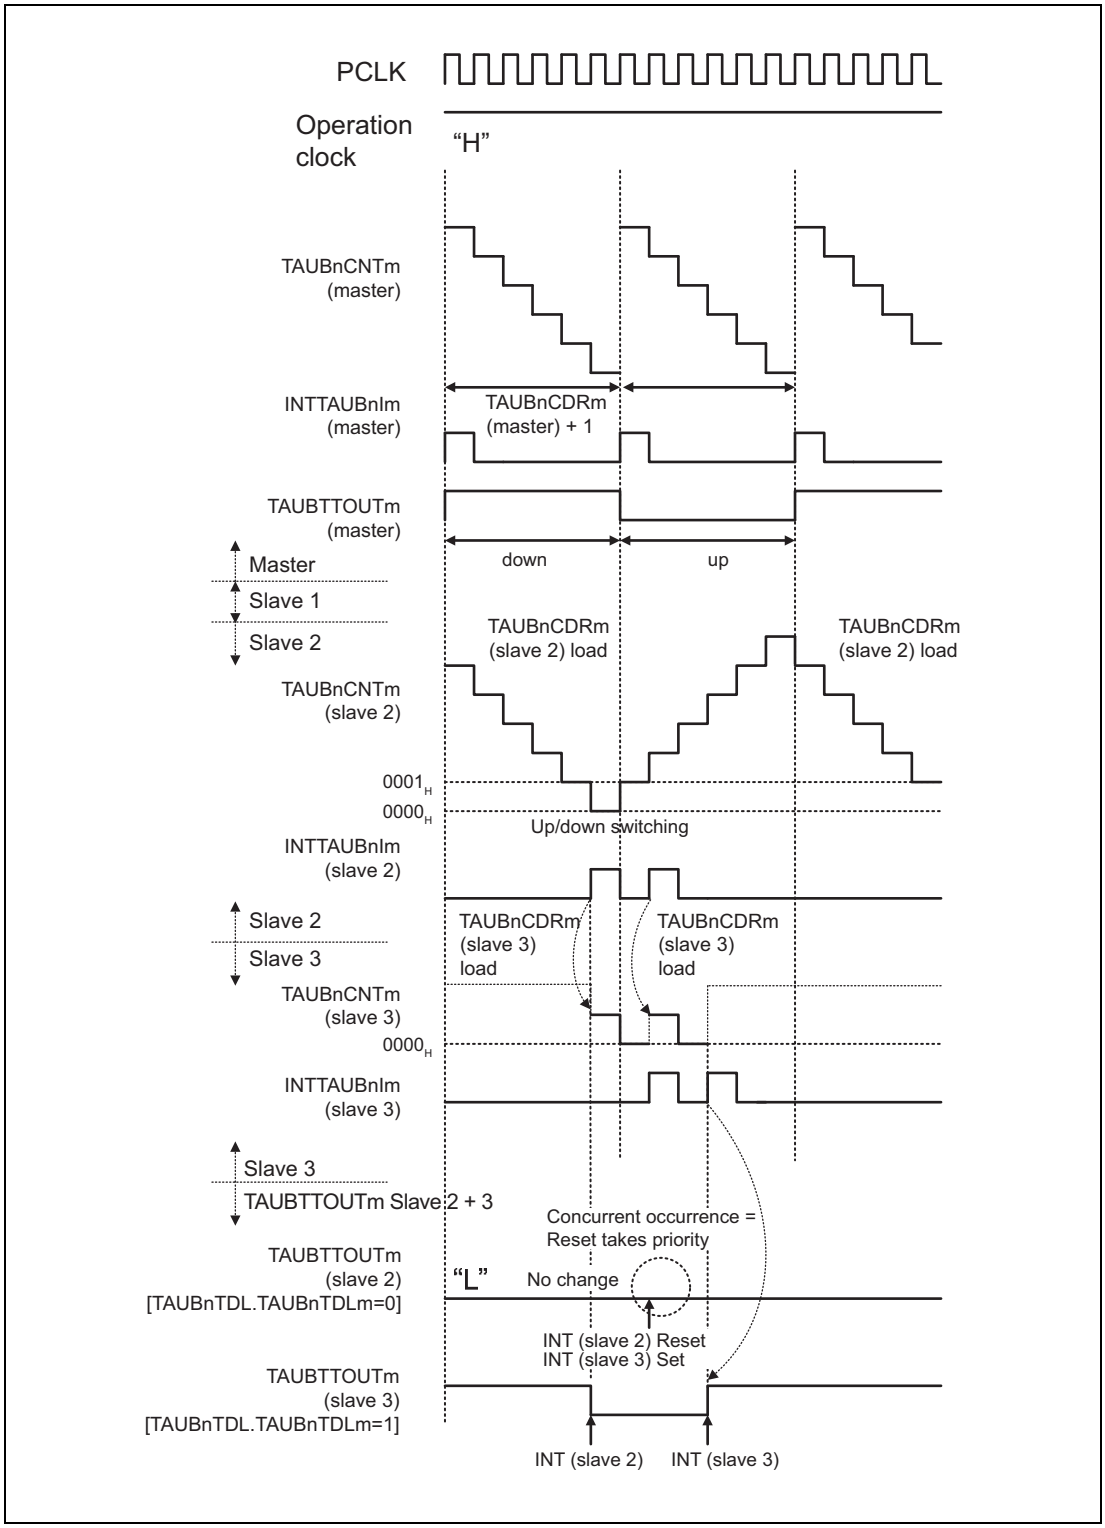

Figure 29.108 TAUBnCDRm (master) = 0005_H, TAUBnCDRm (slave 2) = 0005_H, TAUBnCDRm (slave 3) = 0001_H PWM Signal Width (positive phase) = 0

- The counter of slave channel 3 reaches 0000_H and generates an INTTAUBnIm to set the TAUBTTOUTm of slave channel for which TAUBnTDL.TAUBnTDLm = 0 (slave channel 2 in this example).
- If channel 2 generates an INTTAUBnIm and resets TAUBTTOUTm simultaneously, the reset

signal has priority (assuming TAUBnTOL.TAUBnTOLm = 0, otherwise the set signal has priority).

- Therefore, TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 0 remains in the value after reset.

(6) Inhibited INTTAUBnIm to set TAUBTTOUTm negative phase period

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:

– Negative logic (TAUBnTOL.TAUBnTOLm = 1)

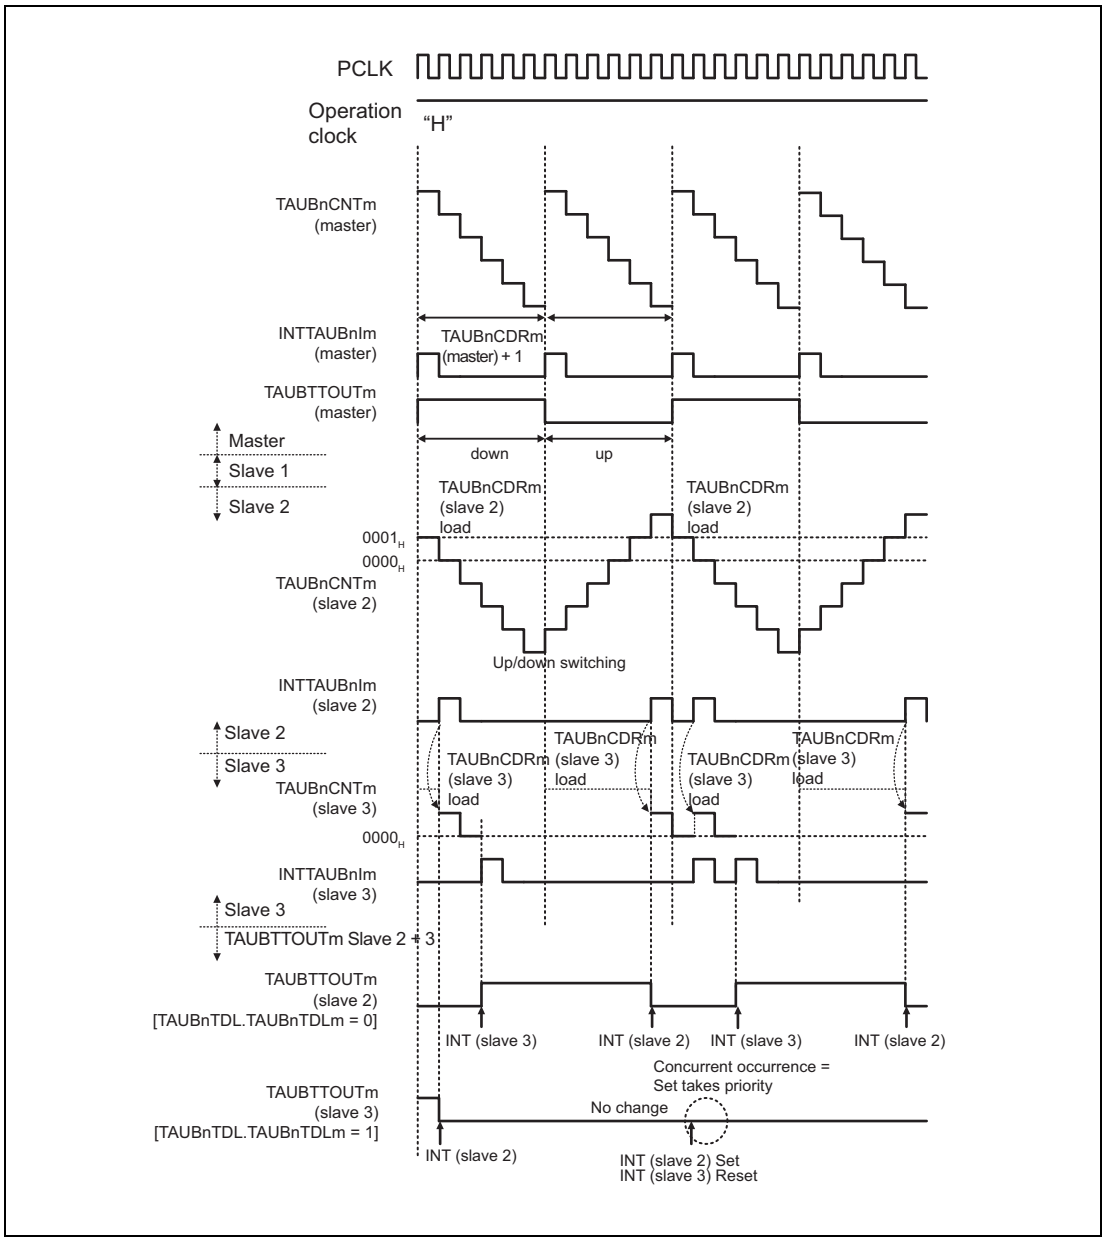

Figure 29.109 TAUBnCDRm (master) = 0005_H, TAUBnCDRm (slave 2) = 0001_H, TAUBnCDRm (slave 3) = 0001_H PWM Signal Width (negative phase) = Carrier Cycle

- The counter of slave channel 3 reaches 0000_H and generates an INTTAUBnIm to set the TAUBTTOUTm of slave channel for which TAUBnTDL.TAUBnTDLm = 1 (slave 3 in this example).
- If slave channel 2 generates an INTTAUBnIm and resets TAUBTTOUTm simultaneously, the set signal is given priority if TAUBnTOL.TAUBnTOLm = 1 (if TAUBnTOL.TAUBnTOLm = 0, the reset signal is given priority).
- Therefore, TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 1 remain in the value after reset.

(7) Slave 2 TAUBnCDRm = 0000_H (Duty cycle = 100%)

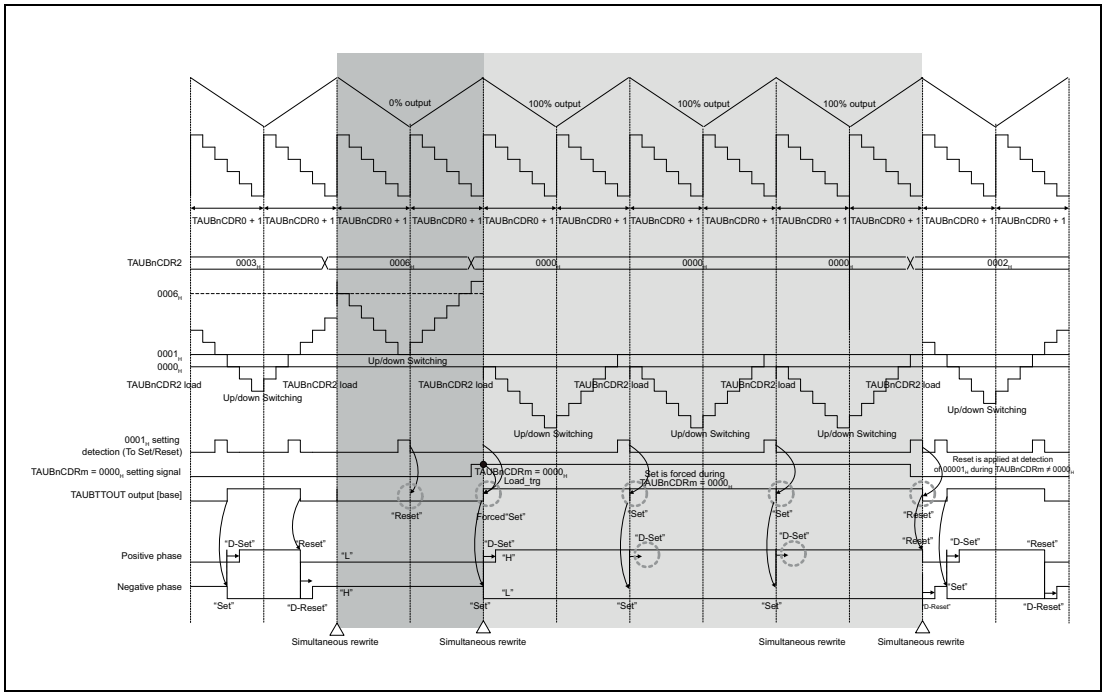

Figure 29.110 Slave 2 TAUBnCDRm = 0000_H (Duty cycle = 100%)

When rewriting (slave channel 2) TAUBnCDRm ≠ 0000_H to (slave channel 2) TAUBnCDRm = 0000_H (100% output), set the negative phase side at the start of the carrier cycle, and set the positive phase side after dead time is secured.

When rewriting (slave channel 2) TAUBnCDRm = 0000_H (100% output) to (slave channel 2) TAUBnCDRm ≠ 0000_H, reset the positive phase side at the end of the carrier cycle, and reset the negative phase side after dead time is secured.

29.14.7 AD Conversion Trigger Output Function Type 2

29.14.7.1 Overview

Summary

This function is identical to Section 29.14.5, Triangle PWM Output Function, except that TAUBTTOUTm is not output.

This is enabled by setting the channel output mode of the slave to independent channel output mode controlled by software.

29.14.7.2 Block Diagram and General Timing Diagram

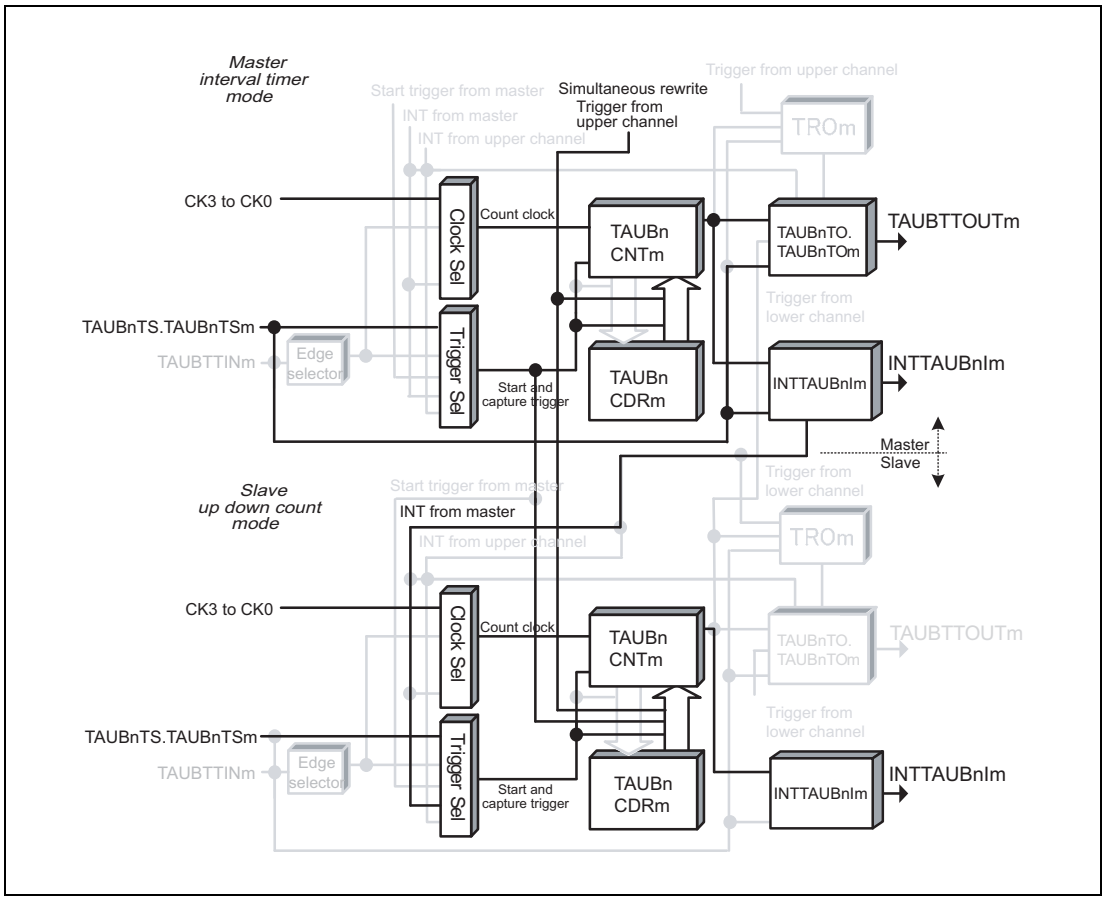

Figure 29.111 Block Diagram for AD Conversion Trigger Output Function Type 2

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

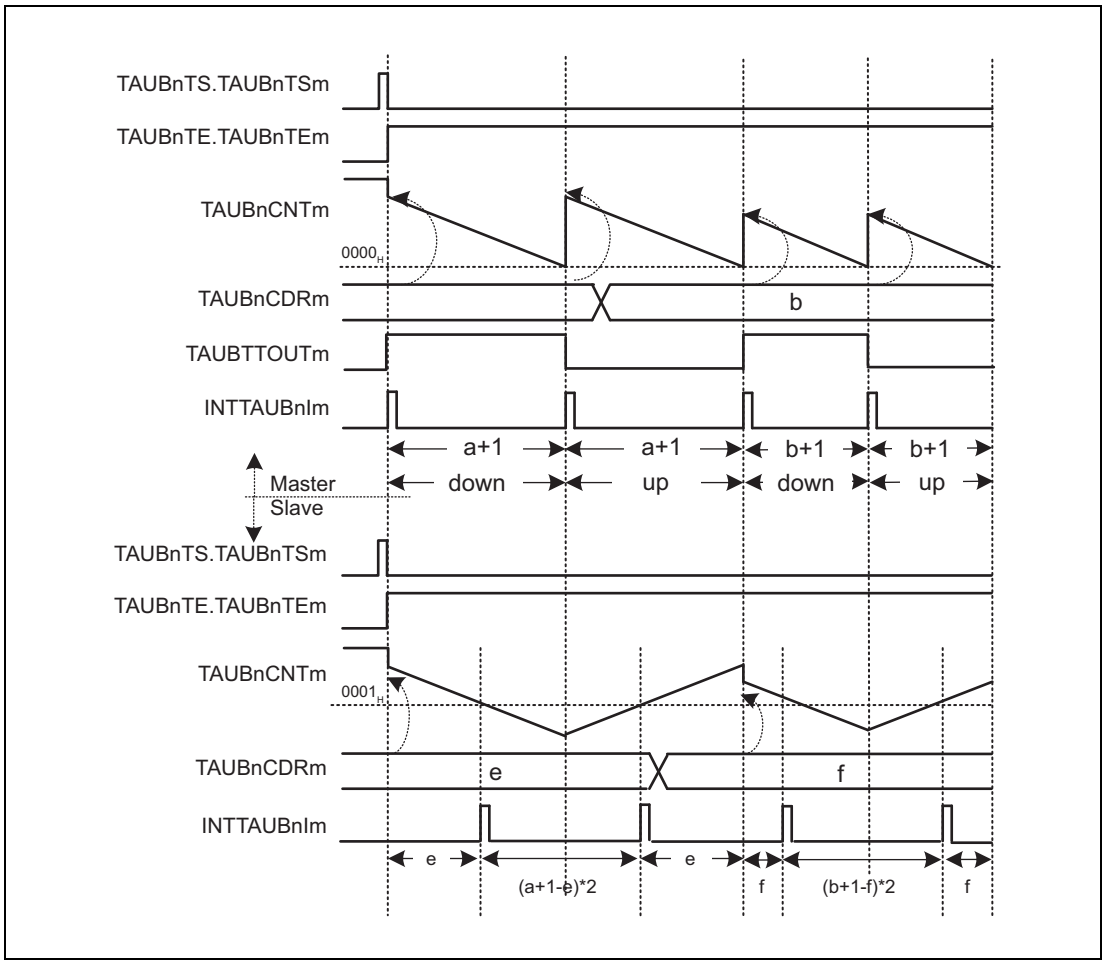

Figure 29.112 General Timing Diagram for AD Conversion Trigger Output Function Type 2

Section 30 Timer Array Unit J (TAUJ)

This section contains a generic description of the timer array unit J (TAUJ).

The first part of this section describes all RH850/D1L/D1M specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the TAUJ.

30.1 Features of RH850/D1L/D1M TAUJ

30.1.1 Number of Units

This microcontroller has the following number of TAUJ units.

Table 30.1 Number of Units

Product Name	All products
Number of Units	1
Name	TAUJn (n = 0)

Table 30.2 Index

Index	Meaning
n	Throughout this section, the individual TAUJ units are identified by the index “n”; for example, TAUJnTOM is the TAUJn channel output mode register.
m	The TAUJ has 4 channels. Throughout this section, the individual channels are identified by the index “m” (m = 0 to 3), thus a certain channel is denoted as CHm. The even numbered channels (m = 0, 2) are denoted as CHm_even. The odd numbered channels (m = 1, 3) are denoted as CHm_odd.

30.1.2 Register Base Address

TAUJn base address is listed in the following table.

TAUJn register addresses are given as offsets from the base addresses.

Table 30.3 Register Base Address

Base Address Name	Base Address
<TAUJ0_base>	FFE5 0000_H

30.1.3 Clock Supply

The TAUJn clock supply is shown in the following table.

Table 30.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
TAUJ0	PCLK	C_ISO_TAUJ

30.1.4 Interrupt Requests

TAUJn interrupt requests are listed in the following table.

Table 30.5 Interrupt Requests

TAUJn signals	Function	Connected to
TAUJ0		
INTTAUJ0I0	Channel 0 interrupt	Interrupt Controller INTTAUJ0I0 DMA Controller trigger ID 83
INTTAUJ0I1	Channel 1 interrupt	Interrupt Controller INTTAUJ0I1 DMA Controller trigger ID 84
INTTAUJ0I2	Channel 2 interrupt	Interrupt Controller INTTAUJ0I2 DMA Controller trigger ID 85
INTTAUJ0I3	Channel 3 interrupt	Interrupt Controller INTTAUJ0I3 DMA Controller trigger ID 86

30.1.5 Reset Sources

TAUJn reset sources are listed in the following table. TAUJn is initialized by these reset sources.

Table 30.6 Reset Sources

Unit Name	Reset Source
TAUJ0	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

30.1.6 External Input/Output Signals

External input/output signals of TAUJn are listed below.

Table 30.7 External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
TAUJ0		
TAUJTTIN0 to TAUJTTIN3	Channel 0 to 3 input	TAUJ0I0 to TAUJ0I3*1
TAUJTTOUT0 to TAUJTTOUT3	Channel 0 to 3 output	TAUJ0O0 to TAUJ0O3

Note 1. These input signals are passed through a noise filter, refer to the section “Port Filters” in the section “Port Functions”.

30.2 Overview

30.2.1 Functional Overview

The TAUJ has the following functions:

- Independent channel operation function (operated using a single channel)
- Synchronous channel operation function (operated using a master channel and multiple slave channels)

The TAUJ is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 4 channels, each equipped with a 32-bit counter TAUJnCNTm and a 32-bit data register TAUJnCDRm to hold the count start value or compare value.

It also contains several control and status registers.

Independent and synchronous operation

Every channel can operate in two operating modes, either independently or in combination with other channels (synchronously). When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, it can be operated independent of all other channels.

The synchronous operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

30.2.2 Terms

In this section, the following terms are used.

Independent channel operation function/synchronous operation channel operation function

TAUJ has 4 channels, and provides an independent channel operation function that individual channels operate independently and a synchronous channel operation function that is implemented by using a combination of channels.

- The independent channel operation function can use any channel independent of all other channels.
- The synchronous channel operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

Channel group

In the synchronous channel operation function, all channels that depend on each other are referred to as a “channel group”.

A channel group has one master channel and one or more slave channels.

Upper/lower channel

Depending on the channel number m, a channel with a smaller channel number or higher channel number can be referred to as “upper” or “lower” channel:

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

For instance, as to channel 2, channel 1 is an upper channel and channel 3 is a lower channel. Channel 0 is the highest channel and channel 3 is the lowest channel.

30.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

Table 30.8 Functional List of TAUJ Operations

Operation Function	Example
Independent Channel Operation Functions	**Section 30.12**
Interval Timer Function	**Section 30.12.1**
TAUJTTINm Input Interval Timer Function	**Section 30.12.2**
TAUJTTINm Input Pulse Interval Measurement Function	**Section 30.12.3**
TAUJTTINm Input Signal Width Measurement Function	**Section 30.12.4**
TAUJTTINm Input Position Detection Function	**Section 30.12.5**
TAUJTTINm Input Period Count Detection Function	**Section 30.12.6**
Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)	**Section 30.12.7**
Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)	**Section 30.12.8**
Synchronous Channel Operation Functions	**Section 30.13**
PWM Output Function	**Section 30.13.1**

30.2.4 TAUJ I/O and Interrupt Request Signals

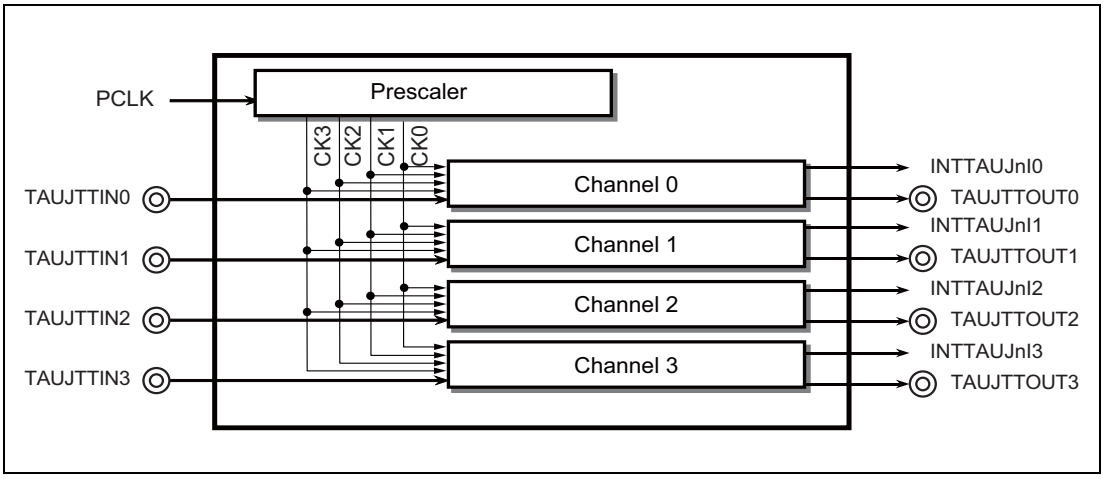

Figure 30.1 TAUJ I/O and Interrupt Request Signals

30.2.5 Block Diagram

The following figure shows the main components of the TAUJ.

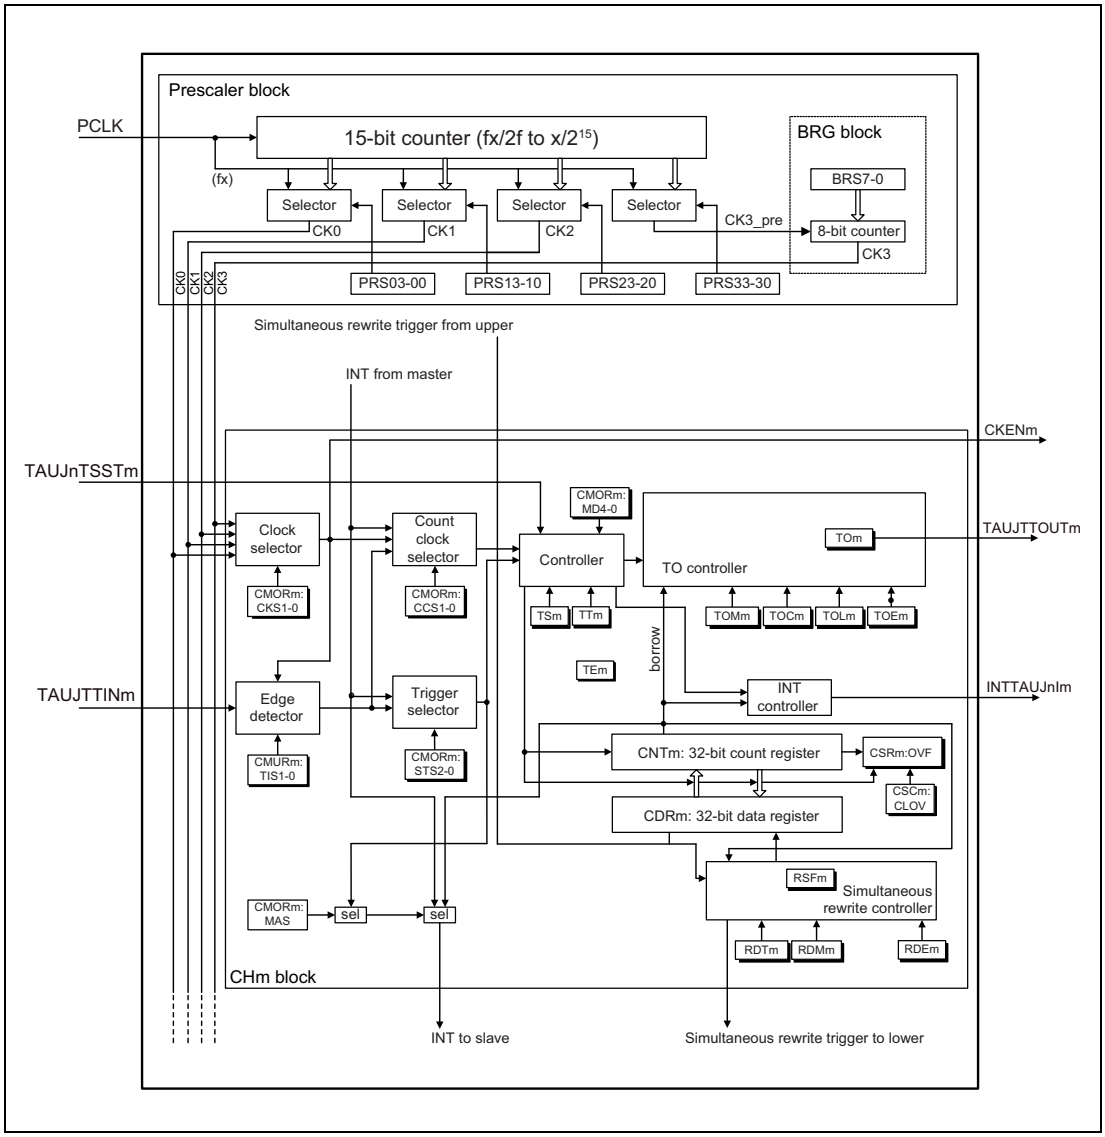

Figure 30.2 Block Diagram of the TAUJ

The prefix “TAUJn” has been omitted from the register names for the sake of clarity in the above figure.

30.2.6 Description of Blocks

The following describes the functional blocks.

Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK2 are derived from PCLK by a configurable prescaler division factor of 2^0 to 2^{15}. The fourth count clock CK3 can be adjusted more precisely by an additional division factor that is not a power of 2 by using the baud rate generator.

Clock and count selection

For every channel, the count clock selector selects which of the following is used as the clock source.

- One of CK0 to CK3 clocks (selected by the clock selector)

Controller

The controller controls the main operations of the counter.

- Operating mode (selected with the TAUJnCMORm.TAUJnMD[4:0] bits)
- Counter start enable (TAUJnTS.TAUJnTSm) and counter stop (TAUJnTT.TAUJnTTm)

When counter start is enabled, status flag TAUJnTE.TAUJnTEm is set.

Trigger selector

The counter starts automatically when it is enabled (TAUJnTE.TAUJnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger.

- Synchronous channel start trigger input TAUJnTSSTm
- Valid edge of the TAUJTTINm input signal
- INTTAUJnIm from master channel

Simultaneous rewrite controller

Simultaneous rewrite control is enabled in synchronous operating modes. The data registers of all channels in a channel group (TAUJnCDRm) can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

TAUJnTO controller

The output control of every channel enables the generation of various output signals such as PWM signals.

30.3 Registers

30.3.1 List of Registers

TAUJ registers are listed in the following table.

For details about <TAUJn_base>, see Section 30.1.2, Register Base Address.

Table 30.9 List of Registers

Module Name	Register Name	Symbol	Address
TAUJn prescaler registers			
TAUJn	TAUJn prescaler clock select register	TAUJnTPS	<TAUJn_base> + 90_H
TAUJn	TAUJn prescaler baud rate setting register	TAUJnBRS	<TAUJn_base> + 94_H
TAUJn control registers			
TAUJn	TAUJn channel data register m	TAUJnCDRm	<TAUJn_base> + m × 4_H
TAUJn	TAUJn channel counter register m	TAUJnCNTm	<TAUJn_base> + 10_H + m × 4_H
TAUJn	TAUJn channel mode OS register m	TAUJnCMORm	<TAUJn_base> + 80_H + m × 4_H
TAUJn	TAUJn channel mode user register m	TAUJnCMURm	<TAUJn_base> + 20_H + m × 4_H
TAUJn	TAUJn channel status register m	TAUJnCSRm	<TAUJn_base> + 30_H + m × 4_H
TAUJn	TAUJn channel status clear trigger register m	TAUJnCSCm	<TAUJn_base> + 40_H + m × 4_H
TAUJn	TAUJn channel start trigger register	TAUJnTS	<TAUJn_base> + 54_H
TAUJn	TAUJn channel enable status register	TAUJnTE	<TAUJn_base> + 50_H
TAUJn	TAUJn channel stop trigger register	TAUJnTT	<TAUJn_base> + 58_H
TAUJn output registers			
TAUJn	TAUJn channel output enable register	TAUJnTOE	<TAUJn_base> + 60_H
TAUJn	TAUJn channel output register	TAUJnTO	<TAUJn_base> + $5C_H$
TAUJn	TAUJn channel output mode register	TAUJnTOM	<TAUJn_base> + 98_H
TAUJn	TAUJn channel output configuration register	TAUJnTOC	<TAUJn_base> + $9C_H$
TAUJn	TAUJn channel output active level register	TAUJnTOL	<TAUJn_base> + 64_H
TAUJn reload data registers			
TAUJn	TAUJn channel reload data enable register	TAUJnRDE	<TAUJn_base> + $A0_H$
TAUJn	TAUJn channel reload data mode register	TAUJnRDM	<TAUJn_base> + $A4_H$
TAUJn	TAUJn channel reload data trigger register	TAUJnRDT	<TAUJn_base> + 68_H
TAUJn	TAUJn channel reload status register	TAUJnRSF	<TAUJn_base> + $6C_H$
TAUJn emulation register			
TAUJn	TAUJn emulation register	TAUJnEMU	<TAUJn_base> + $A8_H$

30.3.2 Details of TAUJn Prescaler Registers

30.3.2.1 TAUJnTPS — TAUJn Prescaler Clock Select Register

This register specifies clocks CK0, CK1, CK2, and CK3_PRE for all channels of the PCLK prescalers. CK3 is generated by dividing CK3_PRE by the factor specified in TAUJnBRS.

Access: Readable/writable in 16-bit units.

Address: <TAUJn_base> + 90_H

Value after reset: $FFFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUJnPRS3[3:0]				TAUJnPRS2[3:0]				TAUJnPRS1[3:0]				TAUJnPRS0[3:0]			
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.10 TAUJnTPS Register Contents (1/3)

Bit Position	Bit Name	Function
15 to 12	TAUJnPRS3 [3:0]	Specifies a CK3_PRE clock. The CK3_PRE clock is an input clock of the BRG unit which supplies CK3 operation clocks to all channels.

TAUJnPRS3[3:0]	CK3_PRE clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

The above bits are rewritable only when all the counters using CK3 are stopped (TAUJnTE.TAUJnTEm = 0).

Table 30.10 TAUJnTPS Register Contents (2/3)

Bit Position	Bit Name	Function
11 to 8	TAUJnPRS2 [3:0]	Specifies a CK2 clock.

TAUJnPRS2[3:0]	CK2 clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

The above bits are rewritable only when all the counters using CK2 are stopped (TAUJnTE.TAUJnTEm = 0).

7 to 4	TAUJnPRS1 [3:0]	Specifies a CK1 clock.

TAUJnPRS1[3:0]	CK1 clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

The above bits are rewritable only when all the counters using CK1 are stopped (TAUJnTE.TAUJnTEm = 0).

Table 30.10 TAUJnTPS Register Contents (3/3)

Bit Position	Bit Name	Function
3 to 0	TAUJnPRS0 [3:0]	Specifies a CK0 clock.

TAUJnPRS0[3:0]	CK0 clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

The above bits are rewritable only when all the counters using CK0 are stopped (TAUJnTE.TAUJnTEm = 0).

NOTE

TAUJn clock input PCLK is defined in the first part of this section, **Section 30.1.3, Clock Supply**.

30.3.2.2 TAUJnBRS — TAUJn Prescaler Baud Rate Setting Register

This register specifies the division factor of prescaler clock CK3.

CK3 is generated by dividing CK3_PRE by the factor specified in this register plus one. The PCLK prescaler for CK3_PRE is specified in TAUJnTPS. TAUJnPRS3[3:0].

Access: Readable/writable in 8-bit units.

Address: <TAUJn_base> + 94_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	TAUJnBRS[7:0]							
Value after reset	0	0	0	0	0	0	0	0

30.3.3 Details of TAUJn Control Registers

30.3.3.1 TAUJnCDRm — TAUJn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operating mode specified in TAUJnCMORm.TAUJnMD[4:1].

Access: Readable/writable in 32-bit units.
- When this register functions as a capture register, only reading is possible. Write operation is ignored.
- When this register functions as a compare register, reading and writing is possible.

Address: <TAUJn_base> + 0_H + m × 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 30.13 TAUJnCNTm Register Contents

Bit Position	Bit Name	Function
31 to 0	TAUJnCNT [31:0]	32-bit counter value

The read value depends on a counter, an operating mode change, or TAUJnTS.TAUJnTSm/TAUJnTT.TAUJnTTm bit value.

The initial counter read value depends on the operating mode and how the counter is stopped.

- By a reset
- By a counter stop trigger (TAUJnTT.TAUJnTTm = 1)

The following table lists the initial counter read values after the counter is stopped (TAUJnTE.TAUJnTEm = 0) and re-enabled (TAUJnTS.TAUJnTSm = 1).

The table also contains the counter read value one count after the counter is enabled (TAUJnTS.TAUJnTSm = 1) with the counter waiting for a start trigger.

Table 30.14 TAUJnCNTm Read Values after Re-Enabling Counter

Mode Name	Count Method (Up/Down)	TAUJnCNTm		
		Start Value*1	After Stop Trigger	After One Count
Interval timer mode	Count down	FFFF FFFF$_H$	Stop value	—
Capture mode	Count up	0000 0000$_H$	Stop value	—
One-count mode	Count down	FFFF FFFF$_H$	Stop value	Stop value
Capture and one-count mode	Count up	0000 0000$_H$	Stop value	Capture value + 1 (TAUJnCDRm)
Count capture mode	Count up	0000 0000$_H$	Stop value	—
Gate count mode	Count down	FFFF FFFF$_H$	Stop value	Stop value
Capture and gate count mode	Count up	0000 0000$_H$	Stop value	Stop value

Note 1. The value set for TAUJnCNTm when operating mode is changed after reset release.

30.3.3.3 TAUJnCMORm — TAUJn Channel Mode OS Register

This register controls channel m operation.

Access: Readable/writable in 16-bit units.
Writable only when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

Address: <TAUJn_base> + 80_H + m × 4_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUJnCKS[1:0]		TAUJnCCS[1:0]		TAUJn MAS	TAUJnSTS[2:0]			TAUJnCOS[1:0]		—	TAUJnMD[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 30.15 TAUJnCMORm Register Contents (1/3)

Bit Position	Bit Name	Function
15, 14	TAUJnCKS[1:0]	Selects an operation clock, which is used with the TAUJTTINm input edge detection circuit. Setting of TAUJnCMORm.TAUJnCCS[1:0] bits also allows the operation clock to serve as the TAUJnCNTm count clock.

TAUJn CKS1	TAUJn CKS0	Selection of Operation Clock
0	0	CK0
0	1	CK1
1	0	CK2
1	1	CK3

Bit Position	Bit Name	Function
13, 12	TAUJnCCS[1:0]	Selects a count clock for TAUJnCNTm counter.

TAUJn CCS1	TAUJn CCS0	Selection of Operation Clock
0	0	Operation clock specified by TAUJnCMORm.TAUJnCKS[1:0].
0	1	Setting prohibited
1	0	
1	1	

Bit Position	Bit Name	Function
11	TAUJnMAS	Specifies whether the channel is a master or slave channel during synchronous channel operation. 0: Slave 1: Master This bit setting is valid only for even channels (CHm_even). Odd channels (CHm-odd) are fixed to 0.

Table 30.15 TAUJnCMORm Register Contents (2/3)

Table 30.15 TAUJnCMORm Register Contents (3/3)

Bit Position	Bit Name	Function
4 to 0	TAUJnMD[4:0]	Specifies an operating mode.

TAUJn MD4	TAUJn MD3	TAUJn MD2	TAUJn MD1	TAUJn MD0	Functional Description
0	0	0	0	1/0	Interval timer mode
0	0	0	1	1/0	Setting prohibited
0	0	1	0	1/0	Capture mode
0	0	1	1	0	Setting prohibited
0	1	0	0	1/0	One-count mode
0	1	0	1	1/0	Setting prohibited
0	1	1	0	0	Capture and one-count mode
0	1	1	1	1/0	Setting prohibited
1	0	0	0	0	Setting prohibited
1	0	0	1	0	Setting prohibited
1	0	1	0	1/0	Setting prohibited
1	0	1	1	1/0	Count capture mode
1	1	0	0	0	Gate count mode
1	1	0	1	0	Capture and gate count mode
Others					Setting prohibited

Mode	Role of TAUJnMD0 Bit
Interval timer mode Capture mode Count capture mode	Specifies whether INTTAUJnIm is generated at the beginning of count operation (when a start trigger is entered) or not. 0: INTTAUJnIm is not generated. 1: INTTAUJnIm is generated.
One-count mode	Enables/disables start trigger detection during counting. 0: Disables detection. 1: Enables detection. **CAUTION** In one-count mode, INTTAUJnIm signal is not output at the beginning of count operation.
Capture and one-count mode Gate count mode Capture and gate count mode	This bit should be set to 0. **CAUTION** INTTAUJnIm signal is not output at the beginning of count operation. In addition, start trigger detected during counting is disabled.

30.3.3.4 TAUJnCMURm — TAUJn Channel Mode User Register

This register specifies a type of valid edge detection used for TAUJTTINm input.

Access: Readable/writable in 8-bit units.

Address: <TAUJn_base> + 20_H + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUJnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 30.16 TAUJnCMURm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUJnTIS[1:0]	Specifies a valid edge of TAUJTTINm input signal.

TAUJn TIS1	TAUJn TIS0	Functional Description
0	0	Falling edge
0	1	Rising edge
1	0	Detection of falling and rising edges (selection of low width measurement) Start trigger: Falling edge Stop trigger (capture): Rising edge
1	1	Detection of falling and rising edges (selection of high width measurement) Start trigger: Rising edge Stop trigger (capture): Falling edge

Edge detection of TAUJTTINm input signal is based on the operation clock selected by TAUJnCMORm.TAUJnCKS[1:0].

30.3.3.5 TAUJnCSRm — TAUJn Channel Status Register

This register indicates the overflow status of channel m.

Access: Only readable in 8-bit units.

Address: <TAUJn_base> + 30_H + m × 4_H

Value after reset: 000000x0_B

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUJnOVF
Value after reset	0	0	0	0	0	0	×	0
R/W	R	R	R	R	R	R	R	R

Table 30.17 TAUJnCSRm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	Reserved	When read, undefined value is returned.
0	TAUJnOVF	Indicates the counter overflow status: 0: No overflow occurs 1: Overflow occurs This bit is used only in the following modes: • Capture mode • Capture and one-count mode The function of this bit depends on the setting of control bits TAUJnCMORm.TAUJnCOS[1:0].

30.3.3.6 TAUJnCSCm — TAUJn Channel Status Clear Trigger Register

This register is a trigger register for clearing the overflow flag TAUJnCSRm.TAUJnOVF of channel m.

Access: Only writable in 8-bit units. It is always read as 00_H.

Address: <TAUJn_base> + 40_H + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUJnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 30.18 TAUJnCSCm Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing to these bits, write the value after reset.
0	TAUJnCLOV	0: No function 1: Clears the overflow flag TAUJnCSRm.TAUJnOVF

30.3.3.7 TAUJnTS — TAUJn Channel Start Trigger Register

This register enables the counter operation for each channel.

Access: Only writable in 8-bit units. It is always read as 00_H.

Address: <TAUJn_base> + 54_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTS03	TAUJnTS02	TAUJnTS01	TAUJnTS00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 30.19 TAUJnTS Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing to these bits, write the value after reset.
3 to 0	TAUJnTSm	Enables the counter operation for channel m: 0: No function 1: Enables the counter operation and sets TAUJnTE.TAUJnTEm = 1. Only the counter operation is enabled even if TAUJnTE.TAUJnTEm = 1. Whether the counter is started or not depends on the selected operating mode.

Note that index m is representing a double-digit number for this register. See above.

30.3.3.8 TAUJnTE — TAUJn Channel Enable Status Register

This register indicates whether a counter operation is enabled.

Access: Only readable in 8-bit units.

Address: <TAUJn_base> + 50_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTE03	TAUJnTE02	TAUJnTE01	TAUJnTE00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 30.20 TAUJnTE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned.
3 to 0	TAUJnTEm	Indicates whether channel m's counter operation is enabled. 0: Counter operation is disabled 1: Counter operation is enabled This bit is set to 1 when trigger input of TAUJnTSSTm (synchronous channel start trigger signal) is detected or when TAUJnTS.TAUJnTSm is set to 1. This bit is reset to 0 when TAUJnTT.TAUJnTTm is set to 1.

Note that index m is representing a double-digit number for this register. See above.

30.3.3.9 TAUJnTT — TAUJn Channel Stop Trigger Register

This register stops the counter operation of each channel.

Access: Only writable in 8-bit units. It is always read as 00_H.

Address: <TAUJn_base> + 58_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTT03	TAUJnTT02	TAUJnTT01	TAUJnTT00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 30.21 TAUJnTT Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing to these bits, write the value after reset.
3 to 0	TAUJnTTm	Stops channel m's counter operation. 0: No function 1: Stops the counter operation and resets TAUJnTE.TAUJnTEm. TAUJnCNTm, TAUJnTO.TAUJnTOm, and TAUJTTOUTm retain the values provided before the counter is stopped.

Note that index m is representing a double-digit number for this register. See above.

30.3.4 Details of TAUJn Simultaneous Rewrite Register

30.3.4.1 TAUJnRDE — TAUJn Channel Reload Data Enable Register

This register enables and disables simultaneous rewrite of the data register TAUJnCDRm. It also enables and disables simultaneous rewrite of the data register TAUJnTOLm for the PWM output function.

Access: This register can be read/written in 8-bit units. It can only be written when TAUJnTE.TAUJnTEm = 0.

Address: <TAUJn_base> + $A0_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRDE03	TAUJnRDE02	TAUJnRDE01	TAUJnRDE00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 30.22 TAUJnRDE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3 to 0	TAUJnRDEm	Enables/disables simultaneous rewrite of the data register of channel m: 0: Disables simultaneous rewrite 1: Enabled simultaneous rewrite

Note that index m is representing a double-digit number for this register. See above.

30.3.4.2 TAUJnRDM — TAUJn Channel Reload Data Mode Register

This register selects when the signal that controls simultaneous rewrite is generated.

Access: This register can be read/written in 8-bit units. It can only be written when TAUJnTE.TAUJnTEm = 0.

Address: <TAUJn_base> + $A4_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRDM03	TAUJnRDM02	TAUJnRDM01	TAUJnRDM00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 30.23 TAUJnRDM Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3 to 0	TAUJnRDMm	Specifies when the signal that triggers simultaneous rewrite is generated: 0: When the master channel counter starts counting 1: No function These bits only apply when TAUJnRDE.TAUJnRDEm = 1.

Note that index m is representing a double-digit number for this register. See above.

30.3.4.3 TAUJnRDT — TAUJn Channel Reload Data Trigger Register

This register triggers the simultaneous rewrite enabling state.

Access: This register can only be written in 8-bit unit. It is always read as 00_H.

Address: <TAUJn_base> + 68_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRDT03	TAUJnRDT02	TAUJnRDT01	TAUJnRDT00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 30.24 TAUJnRDT Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing to these bits, write the value after reset.
3 to 0	TAUJnRDTm	Triggers the simultaneous rewrite enabling state. 0: No function 1: Simultaneous rewrite enabling state is triggered. The simultaneous rewrite enabling flag (TAUJnRSFm) is set to 1. The system waits for the simultaneous rewrite trigger. These bits only apply when: • TAUJnRDE.TAUJnRDEm = 1

Note that index m is representing a double-digit number for this register. See above.

30.3.4.4 TAUJnRSF — TAUJn Channel Reload Status Register

This flag register indicates the simultaneous rewrite status.

Access: This register can only be read in 8-bit units.

Address: <TAUJn_base> + $6C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRSF03	TAUJnRSF02	TAUJnRSF01	TAUJnRSF00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 30.25 TAUJnRSF Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned.
3 to 0	TAUJnRSFm	Indicates the simultaneous rewrite status. 0: Indicates that simultaneous rewrite has been completed due to the generation of simultaneous rewrite trigger. 1: Indicates that the system waits for a simultaneous rewrite trigger in the simultaneous rewrite enabling state (TAUJnRDTm = 1).

Note that index m is representing a double-digit number for this register. See above.

30.3.5 Details of TAUJn Output Registers

30.3.5.1 TAUJnTOE — TAUJn Channel Output Enable Register

This register enables and disables independent channel output mode controlled by software.

Access: This register can be read/written in 8-bit units.

Address: <TAUJn_base> + 60_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOE03	TAUJnTOE02	TAUJnTOE01	TAUJnTOE00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 30.26 TAUJnTOE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3 to 0	TAUJnTOEm	Enables/disables independent channel output function: 0: Disables independent timer output function (controlled by software) 1: Enables independent timer output function

Note that index m is representing a double-digit number for this register. See above.

30.3.5.2 TAUJnTO — TAUJn Channel Output Register

This register specifies and reads the level of TAUJTTOUTm.

Access: This register can be read/written in 8-bit units.

Address: <TAUJn_base> + $5C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTO03	TAUJnTO02	TAUJnTO01	TAUJnTO00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 30.27 TAUJnTO Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3 to 0	TAUJnTOm	Specifies and reads the level of TAUJTTOUTm: 0: Low 1: High Only TAUJnTOm bits for which Independent Channel Output function is disabled (TAUJnTOEm = 0) can be written.

Note that index m is representing a double-digit number for this register. See above.

30.3.5.3 TAUJnTOM — TAUJn Channel Output Mode Register

This register specifies the output mode of each channel.

Access: This register can be read/written in 8-bit units. It can only be written when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

Address: <TAUJn_base> + 98_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOM03	TAUJnTOM02	TAUJnTOM01	TAUJnTOM00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 30.28 TAUJnTOM Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3 to 0	TAUJnTOMm	Specifies the channel output mode: 0: Independent channel output mode 1: Synchronous channel output mode The output mode depends on the settings of channel output control (TAUJnTOE.TAUJnTOEm) bits.

Note that index m is representing a double-digit number for this register. See above.

30.3.5.4 TAUJnTOC — TAUJn Channel Output Configuration Register

This register specifies the output mode of each channel in combination with TAUJnTOMm.

Access: This register can be read/written in 8-bit units. It can only be written when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

Address: <TAUJn_base> + $9C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOC03	TAUJnTOC02	TAUJnTOC01	TAUJnTOC00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 30.29 TAUJnTOC Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3 to 0	TAUJnTOCm	Specifies the output mode: 0: Operation mode 1 (= Toggle mode) 1: No function This bit must be set to 0 for all output modes except independent channel output mode controlled by software. The output mode also depends on TAUJnTOM.TAUJnTOMm, as shown in the following table.

TAUjnTOMm	TAUJnTOCm	Function
0	0	Toggle mode: Toggling proceeds when INTTAUJnIm occurs.
0	1	No function
1	0	Synchronous channel operation mode 1: Set when INT occurs on the master channel and reset when INT occurs on the slave channel.
1	1	No function

Note that index m is representing a double-digit number for this register. See above.

30.3.5.5 TAUJnTOL — TAUJn Channel Output Level Register

This register specifies the output logic of the channel output bit (TAUJnTO.TAUJnTOm).

Access: This register can be read/written in 8-bit units.

Address: <TAUJn_base> + 64_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOL03	TAUJnTOL02	TAUJnTOL01	TAUJnTOL00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 30.30 TAUJnTOL Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3 to 0	TAUJnTOLm	Specifies the output logic of the channel m output bit (TAUJnTO.TAUJnTOm): 0: Positive logic (active high) 1: Negative logic (active low) These bits apply in all channel output modes except independent channel output mode controlled by software and independent channel output mode 1.

Note that index m is representing a double-digit number for this register. See above.

30.3.5.6 TAUJnEMU — TAUJn Emulation Register

This register controls operation by SVSTOP.

Access: This register can be read/written in 8-bit units.
A write should be performed when counters are stopped (TAUJnTE.TAUJnTEm = 0) and EPC.SVSTOP = 0.

Address: <TAUJn_base> + $A8_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	TAUJn SVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 30.31 TAUJnEMU Register Contents

Bit Position	Bit Name	Function
7	TAUJnSVSDIS	When EPC.SVSTOP bit = 0: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint), regardless of the value of this bit (1 or 0). When EPC.SVSTOP bit = 1: 0: The count clock is stopped when the debugger takes control of the microcontroller (as in the breakpoint). 1: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint).
6 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

30.4 Operating Procedure

The following lists the general operation procedure for the TAUJn:

After reset release, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUJTTOUTm is also initialized and outputs a low level.

1. Set the TAUJnTPS and TAUJnBRS registers to specify the clock frequency of CK0 to CK3.
2. Configure the desired TAUJn function:
   - Set the operation mode
   - Set any other control bits
3. Enable the counter by setting the TAUJnTS.TAUJnTSm bit to 1.
   The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.
4. If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUJnTT.TAUJnTTm bit to 1. The counter can be forcibly restarted by setting the TAUJnTS.TAUJnTSm bit to 1.
5. Stop the function by setting the TAUJnTT.TAUJnTTm bit to 1.

NOTES

1. A detailed description of the required control bits and the operation of the individual functions are given in Section 30.12, Independent Channel Operation Functions and Section 30.13, Synchronous Channel Operation Functions.
2. The function can be changed while the counter is stopped (TAUJnTE.TAUJnTEm = 0).

30.5 Concepts of Synchronous Channel Operation Function

The synchronous channel operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

These rules are detailed in Section 30.5.1, Rules of Synchronous Channel Operation Function.

The synchronous channel operation function are detailed in the following section.

- **Section 30.13, Synchronous Channel Operation Functions**

30.5.1 Rules of Synchronous Channel Operation Function

Number of master and slave channels

- Only even channels (CH0, CH2) can be set as master channels. Any channel other than CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and several slave channels can be set for one master channel.
  Example: If CH2 is a master channel, CH3 can be set as slave channel.
- If two master channels are used, slave channels cannot cross the master.
  Example: If CH0 and CH2 are master channels, CH1 can be set as slave channel for CH0, but CH3 cannot.

Operation clock

- The same operation clock should be set for the master channel and the slave channels synchronizing to the master channel. This is achieved by setting the same value in the TAUJnCMORm.TAUJnCKS[1:0] bits of the master and slave channels.

The basic concepts of master/slave usage and operation clocks are illustrated in **Figure 30.3**.

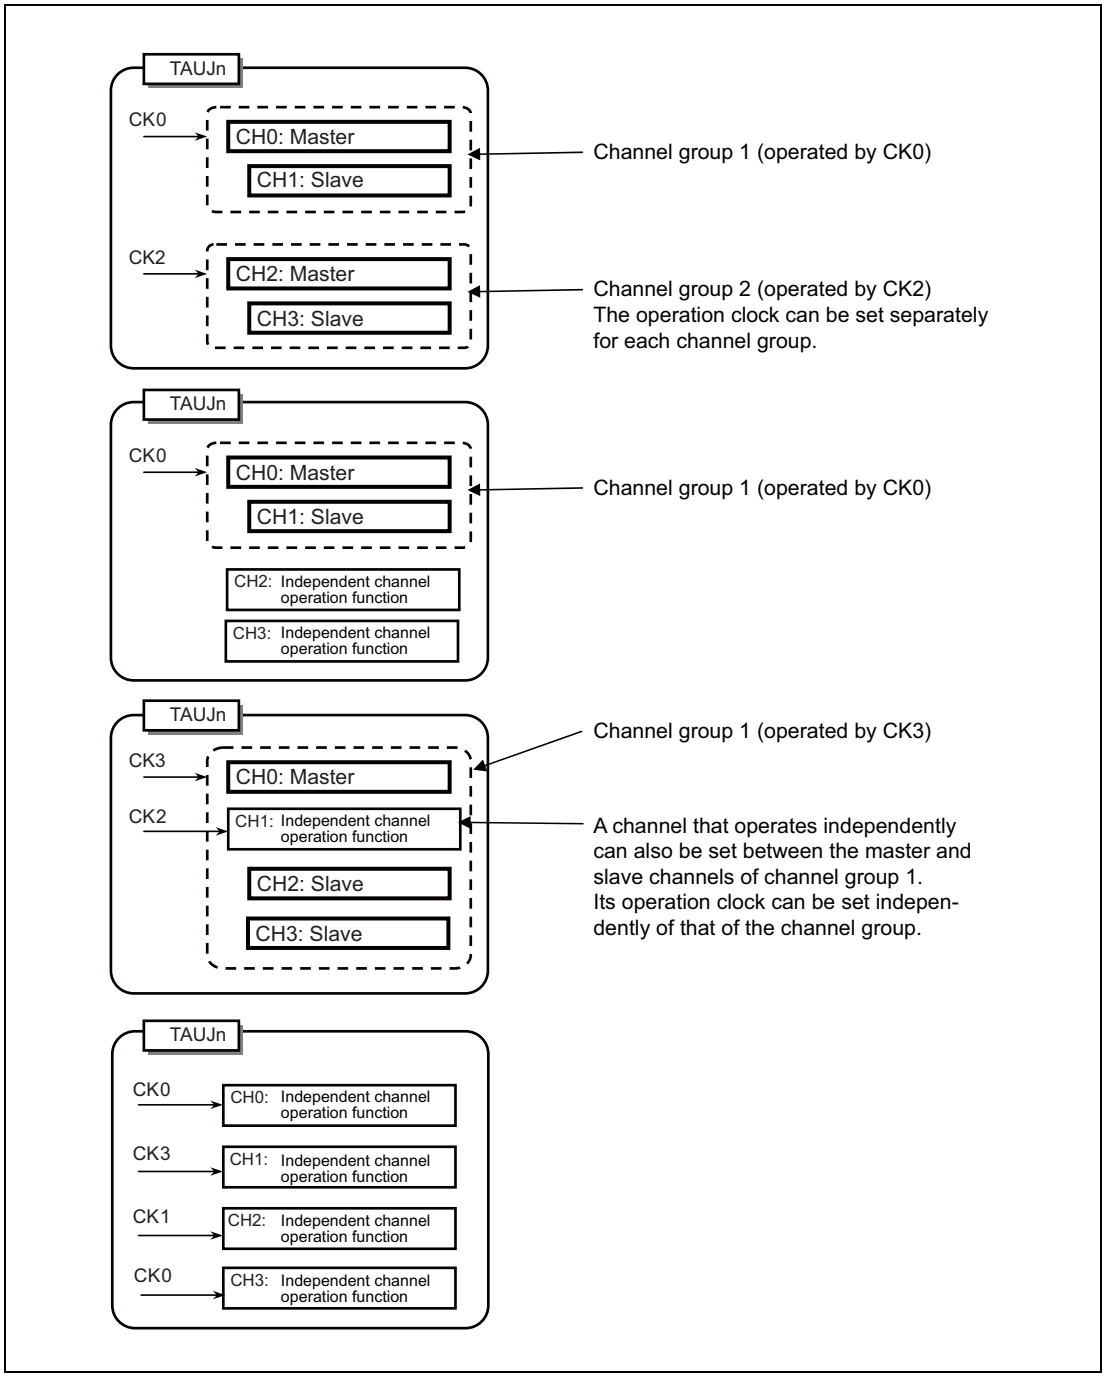

Figure 30.3 Grouping of Channels and Assignment of Operation Clocks

30.5.2 Simultaneous Start and Stop Of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously, both within a TAUJ unit and between TAUJ units.

30.5.2.1 Simultaneous Start and Stop within a TAUJ Unit

- To simultaneously start synchronized channels, the TAUJnTS.TAUJnTSm bits of the channels should be set at the same time.
- To simultaneously stop synchronized channels, the TAUJnTT.TAUJnTTm bits of the channels should be set at the same time.

Setting 1 in the TAUJnTS.TAUJnTSm bits sets the corresponding TAUJnTE.TAUJnTEm bits to 1, enabling counting. The count start timing of the counter depends on the operating mode.

30.6 Simultaneous Rewrite

30.6.1 How to Control Simultaneous Rewrite

The following figure shows the general procedure for simultaneous rewrite. The three main blocks (Initial settings, Start counter & count operation, and Simultaneous rewrite) are explained afterwards.

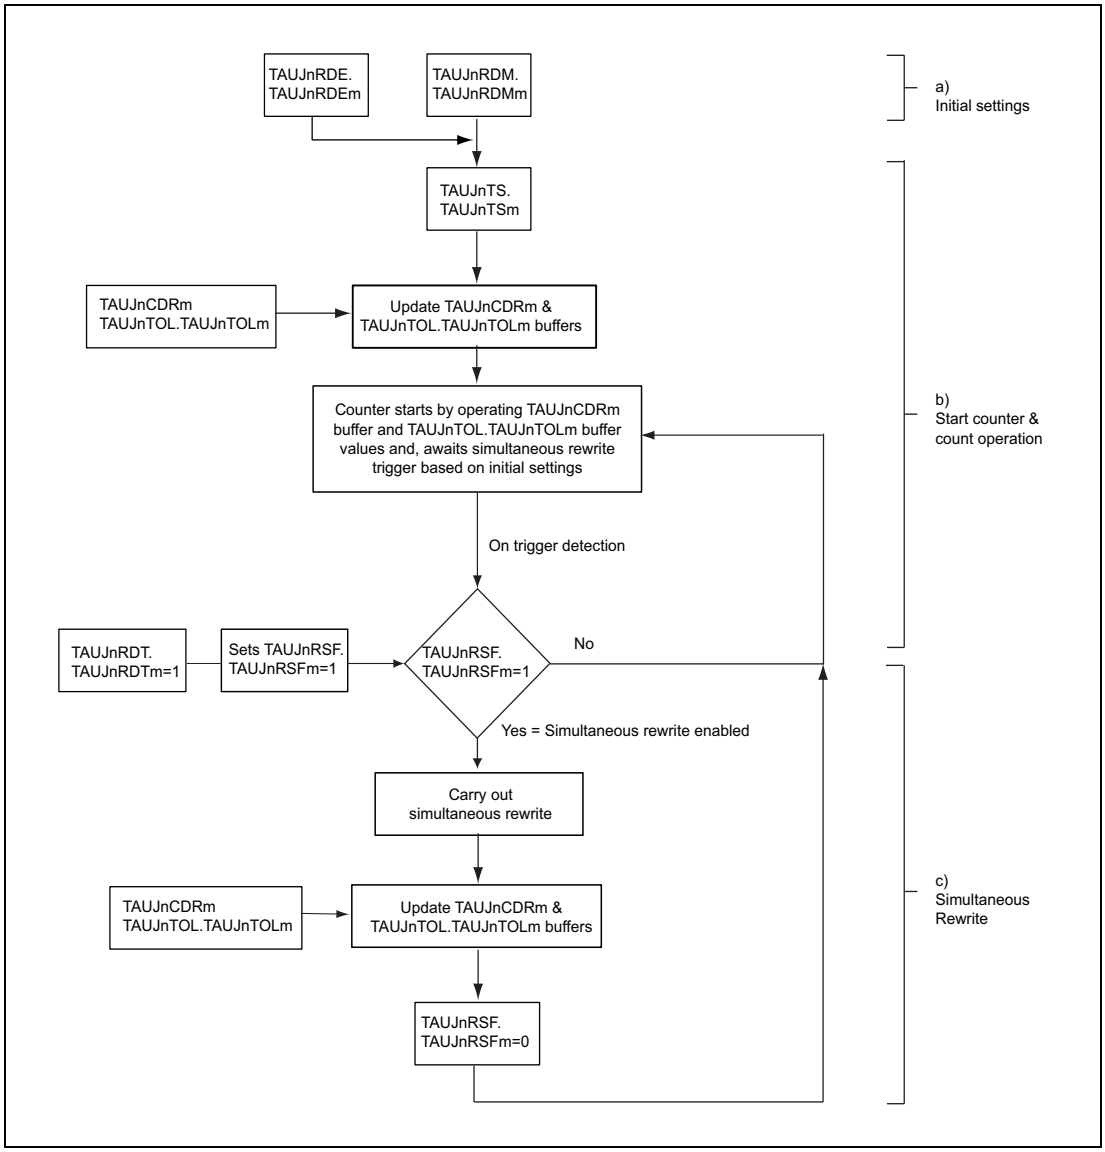

Figure 30.4 General Procedure for Simultaneous Rewrite

30.6.1.1 Initial Settings

- To enable simultaneous rewrite in channel m, set TAUJnRDE.TAUJnRDEm = 1.
- To select simultaneous rewrite when the master channel starts counting, set TAUJnRDM.TAUJnRDMm.

30.6.1.2 Start Counter and Count Operation

- To start all the TAUJnCNTm counters in the channel group, set the corresponding TAUJnTS.TAUJnTSm bits to 1. The values of TAUJnTOL.TAUJnTOLm and the data registers (TAUJnCDRm) are loaded into the corresponding TAUJnTOL.TAUJnTOLm buffer (TAUJnTOL.TAUJnTOLm buf) and data buffer registers (TAUJnCDRm buf) and the counters start.
- Setting the reload data trigger bit (TAUJnRDT.TAUJnRDTm) to 1 sets the reload flag (TAUJnRSF.TAUJnRSFm) to 1, enabling simultaneous rewrite. TAUJnRSF.TAUJnRSFm remains set to 1 until simultaneous rewrite is completed.
- When a specified trigger for simultaneous rewrite is detected, the TAUJnRSF.TAUJnRSFm bit is checked to see if simultaneous rewrite is enabled (TAUJnRSF.TAUJnRSFm = 1). If enabled, simultaneous rewrite is carried out. Otherwise simultaneous rewrite is not carried out and the system waits for detection of the next simultaneous rewrite trigger.

30.6.1.3 Simultaneous Rewrite

- When the simultaneous rewrite trigger is detected and simultaneous rewrite is enabled (TAUJnRSF.TAUJnRSFm = 1), the current values of the data registers are copied to their buffers. These values are then loaded into the corresponding counters and the values are applied the next time the counter starts or restarts.
- When the simultaneous rewrite is completed, the TAUJnRSF.TAUJnRSFm bit is set to 0, and the system awaits the next simultaneous rewrite trigger.

30.6.2 Other General Rules for Simultaneous Rewrite

The following rules also apply.

- TAUJnRDE.TAUJnRDEm and TAUJnRDM.TAUJnRDMm cannot be changed while the counter is in operation (TAUJnTE.TAUJnTEm = 1).
- TAUJnTOL.TAUJnTOLm can be rewritten only during operation using the PWM output function. For all other functions, TAUJnTOL.TAUJnTOLm should be written before the counter starts. If it is rewritten while any other function is used, TAUJTTOUTm outputs an invalid waveform.

30.6.3 Simultaneous Rewrite Procedure

The simultaneous rewrite procedure with PWM output function is described in the following figure.

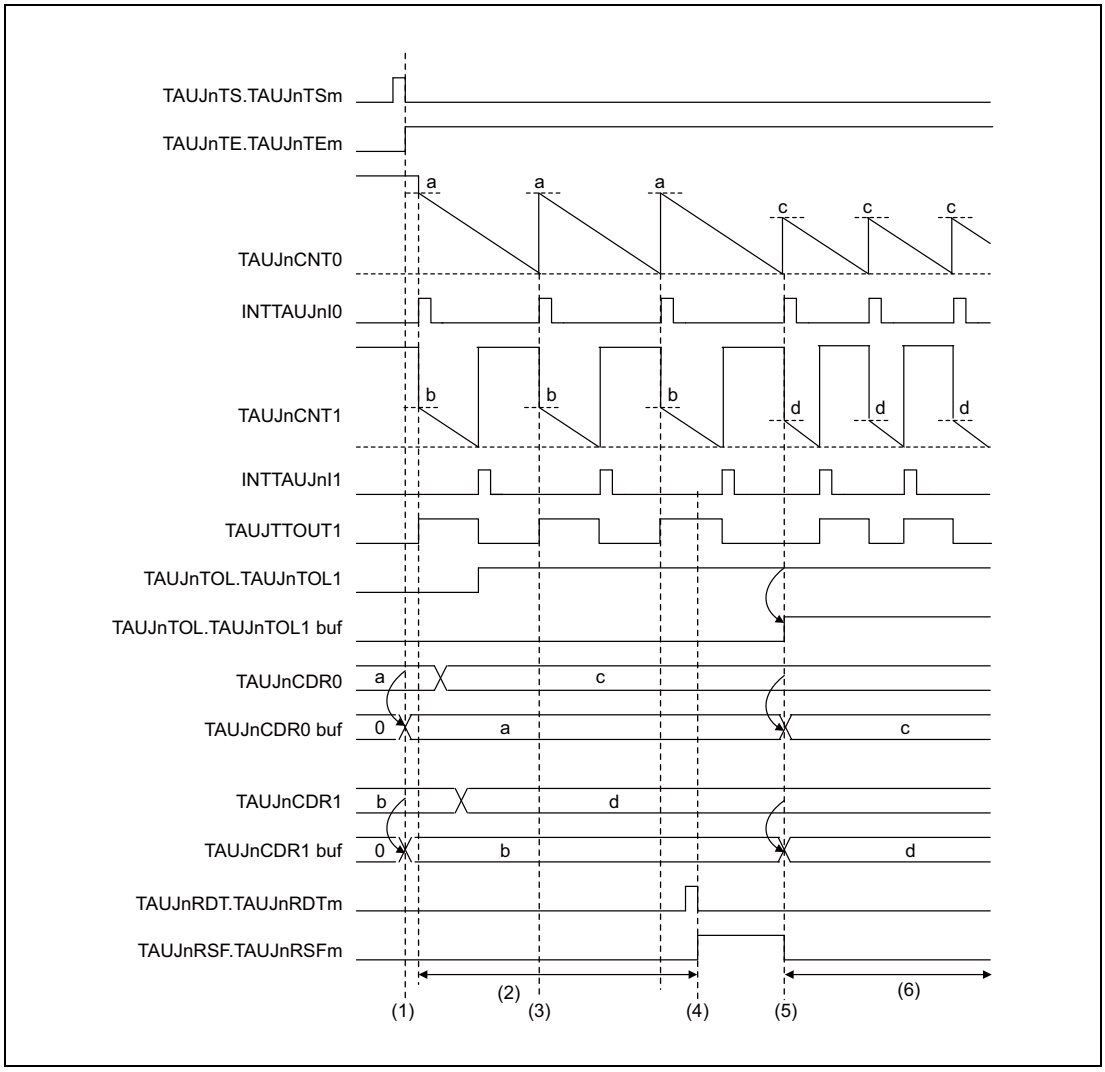

Figure 30.5 Simultaneous Rewrite with PWM Output Function

Setting:

CH0 is a master channel of PWM output function, and CH1 is a slave channel of PWM output function. Simultaneous rewrite is applied when the master channel starts counting.

Description:

(1) When TAUJnTS.TAUJnTSm = 1 is set, the value of TAUJnCDRm is copied to the TAUJnCDRm buffer and the value of TAUJnTOL.TAUJnTOLm is copied to the TAUJnTOL.TAUJnTOLm buffer.

(2) The TAUJnCDRm and TAUJnTOL.TAUJnTOLm registers can be written at any time.

(3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUJnRSF.TAUJnRSFm = 0).

(4) The reload data trigger bit (TAUJnRDT.TAUJnRDTm) is set to 1 which sets the status flag (TAUJnRSF.TAUJnRSFm = 1), enabling simultaneous rewrite.

(5) Simultaneous rewrite is triggered when CH0 restarts counting, because simultaneous rewrite is enabled. The TAUJnCDRm value is loaded into the TAUJnCDRm buffer and the TAUJnTOL.TAUJnTOLm value is loaded into the TAUJnTOL.TAUJnTOLm buffer.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUJnCDRm and TAUJnTOL.TAUJnTOLm can be changed again.

30.7 Channel Output Modes

The output of the TAUJTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUJnTOE.TAUJnTOEm = 0)
  When controlled by software, the value written in the output register bit (TAUJnTO.TAUJnTOm) is sent to the output pin (TAUJTTOUTm).
- By TAUJ signals (TAUJnTOE.TAUJnTOEm = 1)
  When controlled by TAUJ signals, the output level of TAUJTTOUTm is set or reset or toggled by internal signals. The value of TAUJnTO.TAUJnTOm is updated accordingly to reflect the value of TAUJTTOUTm.
  - Independently (TAUJnTOM.TAUJnTOMm = 0)
    In case of independent operation, the output of the TAUJTTOUTm pin is only affected by settings of channel m. Therefore, independent channel operation should be selected (TAUJnTOM.TAUJnTOMm = 0).
  - Synchronously (TAUJnTOM.TAUJnTOMm = 1)
    In case of synchronous operation, the output of the TAUJTTOUTm pin is affected by settings of channel m and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUJnTOM.TAUJnTOMm = 1).

The TAUJnTO.TAUJnTOm bit can always be read to determine the current value of TAUJTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

Control bits

The settings of the control bits required to select a specific channel output mode are listed in Table 30.32, Channel Output Modes.

The channel output modes are described in details below.

- Section 30.7.2, Channel Output Modes Controlled Independently by TAUJn Signals
- Section 30.7.3, Channel Output Modes Controlled Synchronously by TAUJn Signals

Batch operation of TAUJnTOm bit

Whether a set value is reflected to the TAUJnTOm bit or not is controlled by the TAUJnTOE.TAUJnTOEm bit.

The TAUJnTOm setting is written only to the bit (channel) set with TAUJnTOE.TAUJnTOEm bit = 0 when a write to the TAUJnTO register is attempted. No TAUJnTOm setting is reflected to the bit (channel) set with TAUJnTOE.TAUJnTOEm bit = 1.

NOTE

TAUJnTO.TAUJnTOm bit is placed so that its bit number corresponds to a channel number.

Output logic

Positive logic or negative logic of the output is specified by control bit TAUJnTOL.TAUJnTOLm.

The value of TAUJnTOL.TAUJnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function. Otherwise, changes to TAUJnTOL.TAUJnTOLm result in an invalid TAUJTTOUTm signal output.

See Section 30.6, Simultaneous Rewrite.

The various channel output modes and the channel output control bits are listed in **Table 30.32**.

Table 30.32 Channel Output Modes

Channel Output Mode	TAUJnTOE.TAUJnTOEm	TAUJnTOM.TAUJnTOMm
By software		
Independent channel output mode controlled by software	0	x
By TAUJ signals, independently		
Independent channel output mode 1	1	0
By TAUJ signals, synchronously		
Synchronous channel output mode 1	1	1

- All combinations not listed in this table are forbidden.
- Bits marked with an x can be set to any value.

NOTE

The following bits cannot be changed during count operation (TAUJnTE.TAUJnTEm = 1):

- TAUJnTOM.TAUJnTOMm
- TAUJnTOC.TAUJnTOCm

30.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUJTTOUTm channel output mode. The prerequisite is that timer output operation is disabled (TAUJnTOE.TAUJnTOEm = 0).

(1) Set TAUJnTO.TAUJnTOm to specify the initial level of the TAUJTTOUTm output.

(2) Set channel output mode according to Table 30.32, Channel Output Modes, and the output logic using the TAUJnTOL.TAUJnTOLm bit.

(3) Start the counter (TAUJnTS.TAUJnTSm = 1).

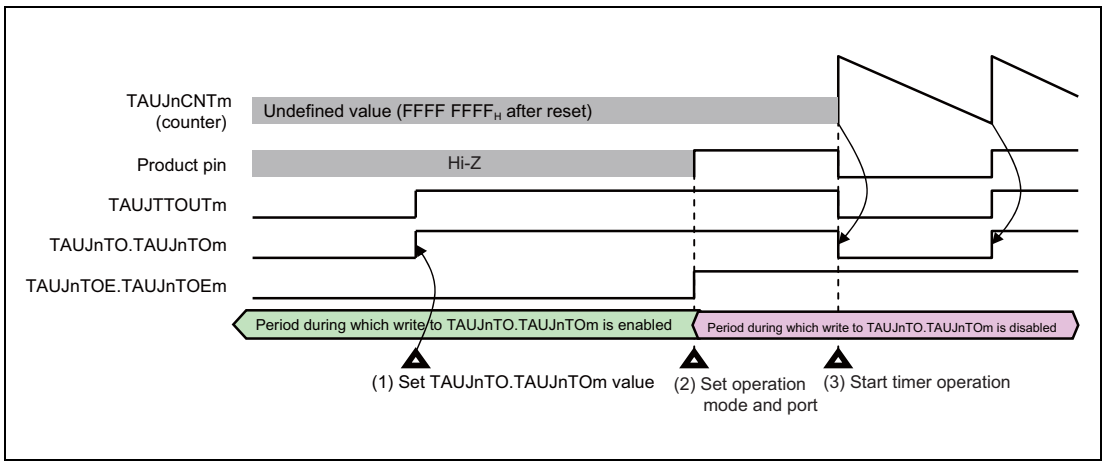

Figure 30.6 General Procedure for Specifying a TAUJTTOUTm Channel Output Mode

30.7.2 Channel Output Modes Controlled Independently by TAUJn Signals

This section lists the channel output modes that are controlled independently by TAUJn signals. The control bits used to specify a mode are listed in Table 30.32, Channel Output Modes.

30.7.2.1 Independent Channel Output Mode 1

Set/reset conditions

In this output mode, TAUJTTOUTm toggles when INTTAUJnIm is detected. The value of TAUJnTOL.TAUJnTOLm is ignored.

Prerequisites

There are no prerequisites other than those shown in Table 30.32, Channel Output Modes.

30.7.3 Channel Output Modes Controlled Synchronously by TAUJn Signals

This section lists the channel output modes that are controlled synchronously by TAUJn signals. The control bits used to specify a mode are listed in Table 30.32, Channel Output Modes.

30.7.3.1 Synchronous Channel Output Mode 1

Set/reset conditions

In this output mode, INTTAUJnIm of master channel serves as a set signal and INTTAUJnIm of the slave channel as a reset signal. If INTTAUJnIm of master channel and INTTAUJnIm of the slave channel are generated at the same time, INTTAUJnIm of the slave channel (reset signal) has priority over INTTAUJnIm (set signal) of master channel, i.e., the master channel is ignored.

Prerequisites

There are no prerequisites other than those shown in Table 30.32, Channel Output Modes.

30.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUJnTS.TAUJnTSm is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

CAUTION

The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.

30.8.1 Interval Timer Mode, Judge Mode, Capture Mode, Count-Up/-Down Mode, and Count Capture Mode

The counter starts operating with the next count clock cycle after TAUJnTS.TAUJnTSm is set to 1. The value of data register is also loaded when the counter starts.

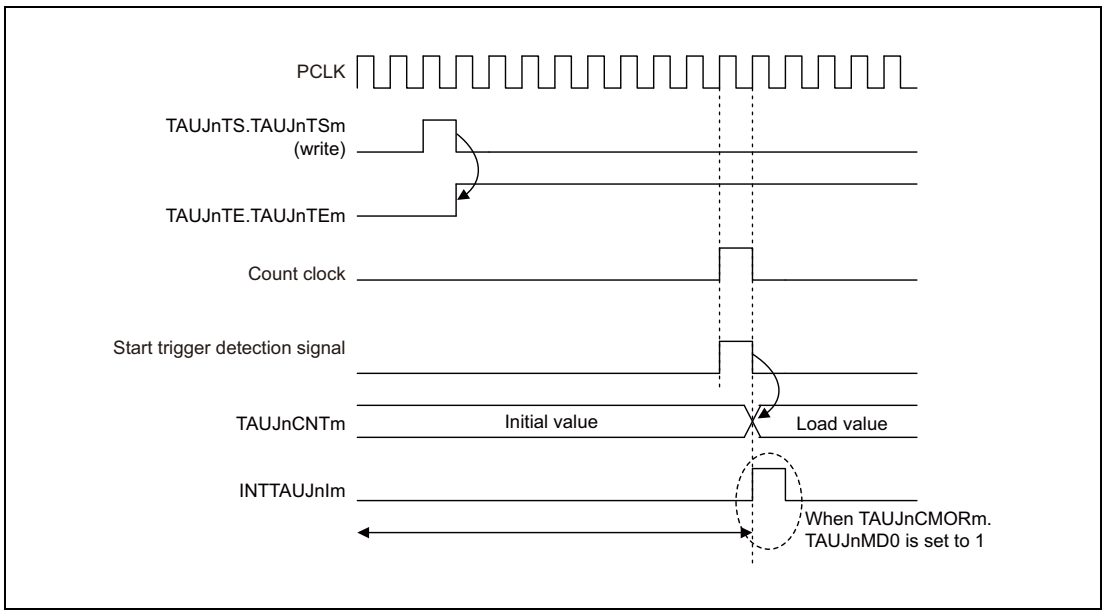

Figure 30.7 Start Timing in Interval Timer Mode, Capture Mode, and Count Capture Mode

30.8.2 Other Operating Modes

In other operating modes, count clock cycle is irrelevant to start of counter operation. The counter operation start timing is triggered only upon detection of a valid edge of TAUJTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which is irrelevant to start of counter operation, determine the frequency with which all operations take place.

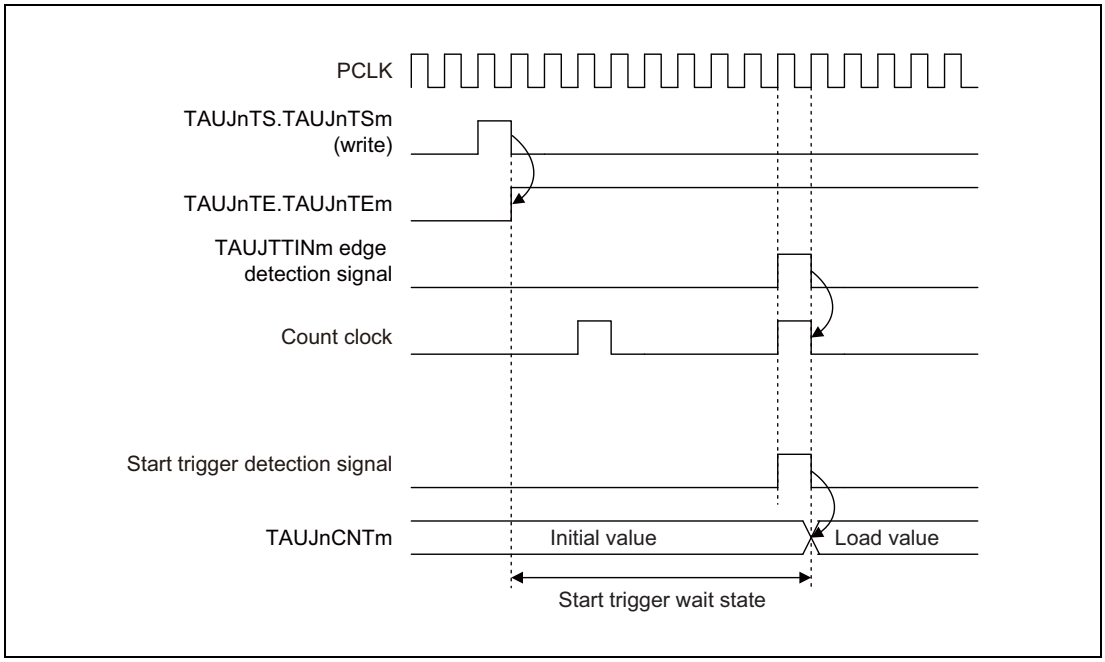

Figure 30.8 Start Timing in Other Operating Modes

30.9 TAUJTTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUJnIm is generated using the TAUJnCMORm.TAUJnMD0 bit. The generation of INTTAUJnIm when the MD0 bit starts counting and the effect to TAUJTTOUTm depend on the selected function. For details, refer to the description of TAUJnCMORm.TAUJnMD0 of each function.

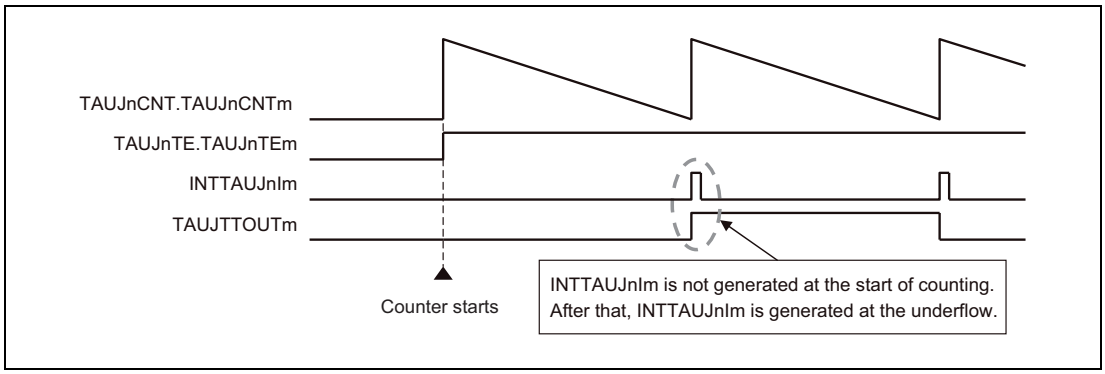

Figure 30.9 INTTAUJnIm Generation Timing (when TAUJnCMORm.TAUJnMD0 = 0)

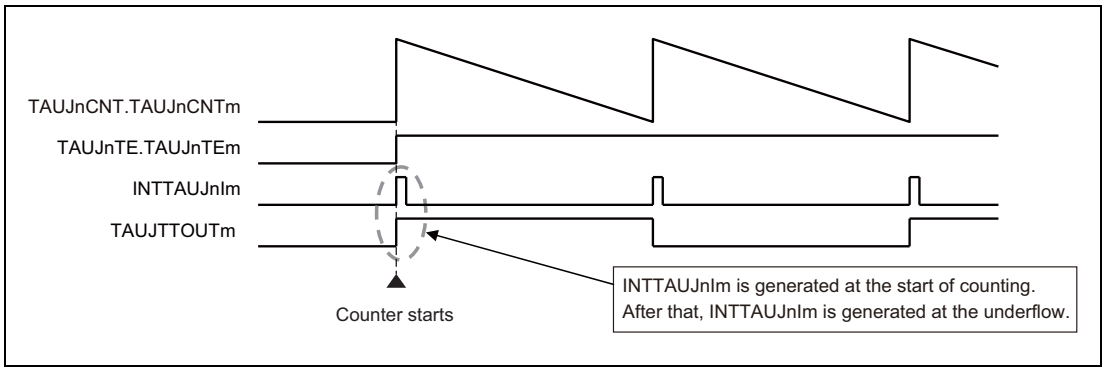

Figure 30.10 INTTAUJnIm Generation Timing (when TAUJnCMORm.TAUJnMD0 = 1)

30.10 Interrupt Generation upon Overflow

Certain independent functions that count up, overflow without generating an interrupt when they reach FFFF $FFFF_H$. This section describes how it is possible to generate an interrupt, by combining a channel operating in one of these modes with a channel in a different operation mode which counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel. Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches 0000 0000_H at the same time as the first channel overflows (TAUJnCNTm = FFFF $FFFF_H$).
- Set TAUJnCDRm of the second channel to FFFF $FFFF_H$.
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same TAUJTTINm input.
- The trigger detection settings (TAUJnCMORm.TAUJnSTS[2:0] and TAUJnCMURm.TAUJnTIS[1:0]) must be identical for both channels.

Result:

The down-counter of the second channel reaches 0000 0000_H at exactly the same time as the up-counter of the first channel overflows (TAUJnCNTm = FFFF $FFFF_H$). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

30.11 TAUJTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

The following figure shows when edge detection takes place.

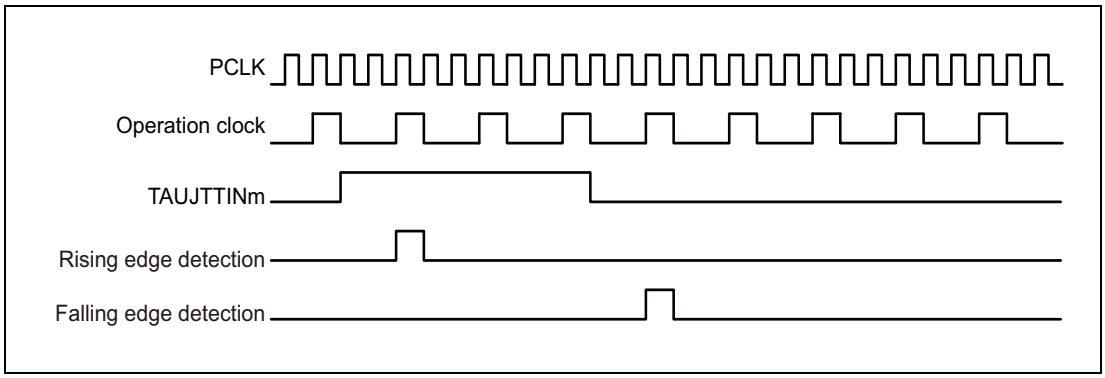

Figure 30.11 Basic Edge Detection Timing

Figure 30.11 shows an image of operation timing. In the actual operation, delay time occurs due to noise filter and synchronization circuit between the TAUJnIm pin and TAUJn.

30.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the TAUJ. For a general overview of independent channel operation functions, see Section 30.2, Overview.

30.12.1 Interval Timer Function

30.12.1.1 Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUJnIm) at regular intervals. When an interrupt is generated, the TAUJTTOUTm signal toggles, resulting in a square wave.

Functional description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The current value of TAUJnCDRm is loaded to TAUJnCNTm and the counter starts to count down from this value.

When the counter reaches 0000 0000_H, INTTAUJnIm is generated and the TAUJTTOUTm signal toggles. TAUJnCNTm then loads the TAUJnCDRm value and subsequently continues operation.

The value of TAUJnCDRm can be rewritten at any time, and the changed value of TAUJnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0. TAUJnCNTm and TAUJTTOUTm stop but retain their values. The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUJnTS.TAUJnTSm to 1 during operation.

Conditions

If the TAUJnCMORm.TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUJTTOUTm does not toggle. This results in a negative TAUJTTOUTm signal compared to when TAUJnCMORm.TAUJnMD0 is set to 1.

30.12.1.2 Equations

INTTAUJnIm cycle = count clock cycle × (TAUJnCDRm + 1)

TAUJTTOUTm square wave cycle = count clock cycle × (TAUJnCDRm+1) × 2

30.12.1.3 Block Diagram and General Timing Diagram

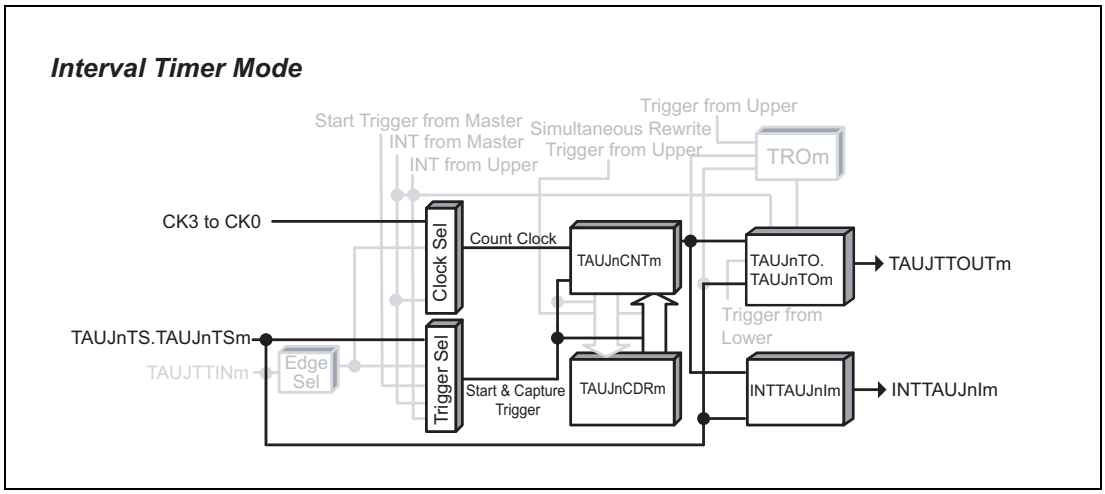

Figure 30.12 Block Diagram for Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is generated at operation start (TAUJnCMORm.(TAUJnMD0 = 1)

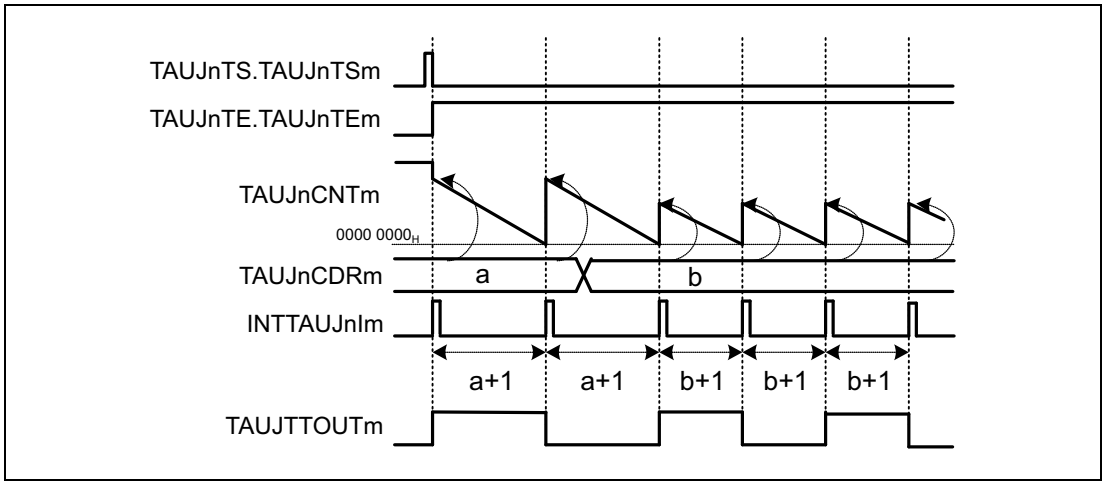

Figure 30.13 General Timing Diagram for Interval Timer Function

30.12.1.4 Register Settings

Table 30.33 Contents of the TAUJnCMORm register for Interval Timer Function

Bit Position	Bit Name	Function
15, 14	TAUJnCKS[1:0]	Operation Clock Selection 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3
13, 12	TAUJnCCS[1:0]	Write 00_B.
11	TAUJnMAS	Write 0_B.
10 to 8	TAUJnSTS[2:0]	Write 000_B.
7, 6	TAUJnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
4 to 1	TAUJnMD[4:1]	Write 0000_B.
0	TAUJnMD0	0: INTTAUJnIm is not generated and TAUJTTOUTm does not toggle when operation starts or restarts. 1: Generates INTTAUJnIm and toggles TAUJTTOUTm when operation starts or restarts.

(2) TAUJnCMURm

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUJnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 30.34 Contents of the TAUJnCMURm register for Interval Timer Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUJnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode

Table 30.35 Control Bit Settings in Independent Channel Output Mode 1

Bit name	Setting
TAUJnTOE.TAUJnTOEm	Write 1_B.
TAUJnTOM.TAUJnTOMm	Write 0_B.
TAUJnTOC.TAUJnTOCm	Write 0_B.
TAUJnTOL.TAUJnTOLm	Write 0_B.

NOTE

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUJnTOE.TAUJnTOEm = 0. TAUJTTOUTm can then be controlled independently of the interrupts. For details refer to Section 30.7, Channel Output Modes.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the interval timer function. Therefore, these registers must be set to 0.

Table 30.36 Simultaneous Rewrite Settings for Interval Timer Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

30.12.1.5 Operating Procedure for Interval Timer Function

Table 30.37 Operating Procedure for Interval Timer Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 30.33, Contents of the TAUJnCMORm register for Interval Timer Function** and **Table 30.34, Contents of the TAUJnCMURm register for Interval Timer Function**. Set the value of the TAUJnCDRm register. Set the channel output mode by setting the control bits as described in **Table 30.35, Control Bit Settings in Independent Channel Output Mode 1**.	Channel operation is stopped.

Table 30.37 Operating Procedure for Interval Timer Function

	Operation	Status of TAUJn
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. TAUJnCNTm loads the TAUJnCDRm value. When TAUJnCMORm.TAUJnMD0 = 1, INTTAUJnIm is generated and TAUJTTOUTm toggles.
During operation	The TAUJnCDRm register value can be changed at any time. The TAUJnCNTm register can be read at all times.	TAUJnCNTm counts down. When the counter reaches 0000 0000_H: • TAUJnCNTm reloads the TAUJnCDRm value and continues count operation. • INTTAUJnIm is generated and TAUJTTOUTm toggles.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm and TAUJTTOUTm stop and retain their current values.

Restart operation

30.12.1.6 Specific Timing Diagrams

(1) TAUJnCDRm = 0000 0000_H, count clock = PCLK/2

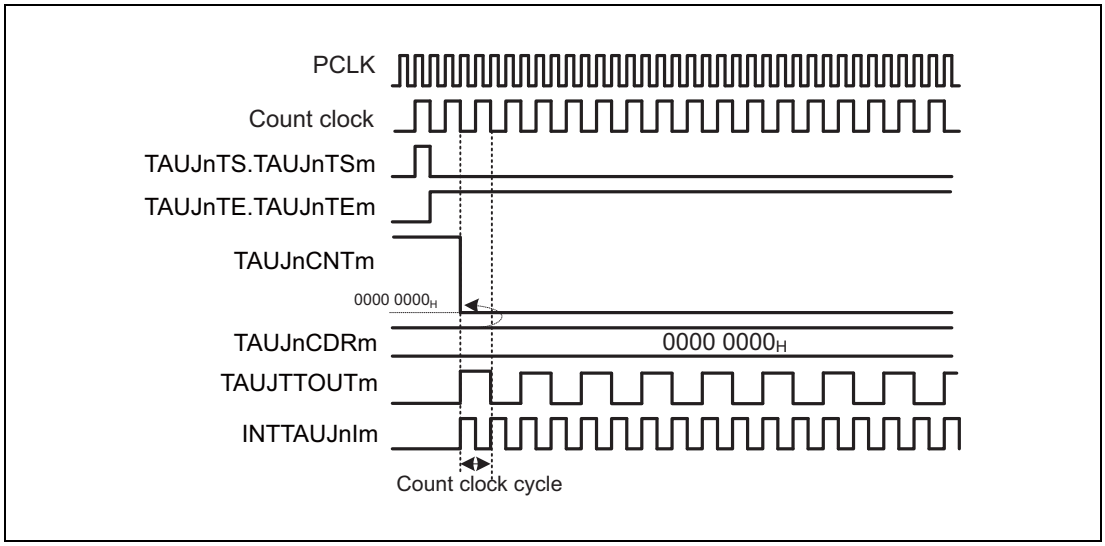

Figure 30.14 TAUJnCDRm = 0000 0000_H, Count Clock = PCLK/2

- If TAUJnCDRm = 0000 0000_H and the count clock = PCLK/2, the TAUJnCDRm value is loaded to TAUJnCNTm every count clock, meaning that TAUJnCNTm is always 0000 0000_H.
- INTTAUJnIm is generated every count clock, resulting in TAUJTTOUTm toggling every count clock.

(2) TAUJnCDRm = 0000 0000_H, count clock = PCLK

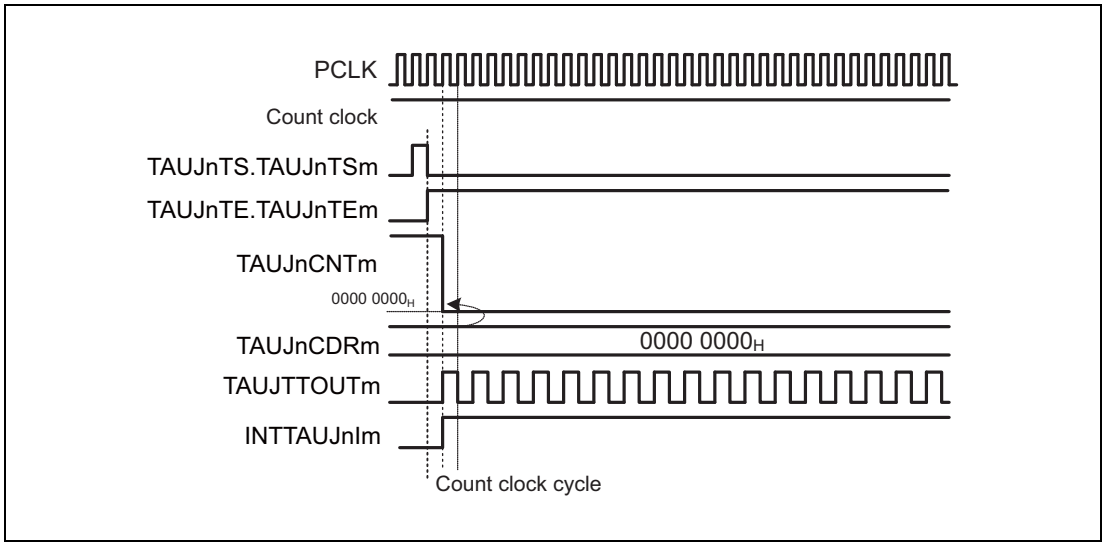

Figure 30.15 TAUJnCDRm = 0000 0000_H, Count Clock = PCLK

- If TAUJnCDRm = 0000 0000_H and the count clock = PCLK, the TAUJnCDRm value is loaded to TAUJnCNTm every PCLK clock, meaning that TAUJnCNTm is always 0000 0000_H.
- INTTAUJnIm is fixed to high level.
  Though the first interrupt is generated, subsequent interrupts are not generated. TAUJTTOUTm is toggled every PCLK clock.

(3) Operation stop and restart

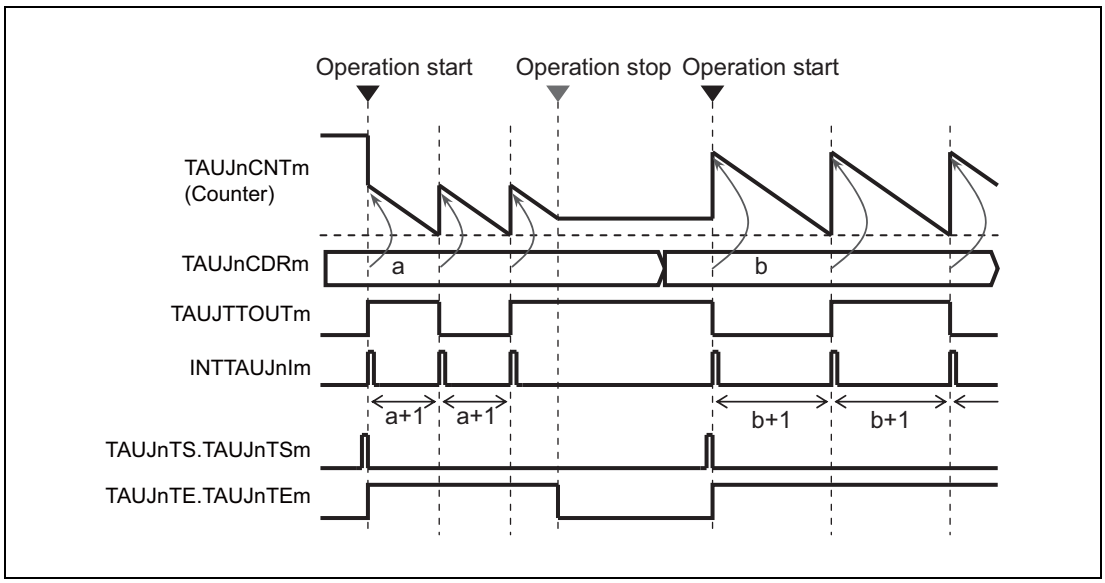

Figure 30.16 Operation Stop and Restart (TAUJnCMORm.TAUJnMD0 = 1)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm and TAUJTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1.

(4) Forced restart

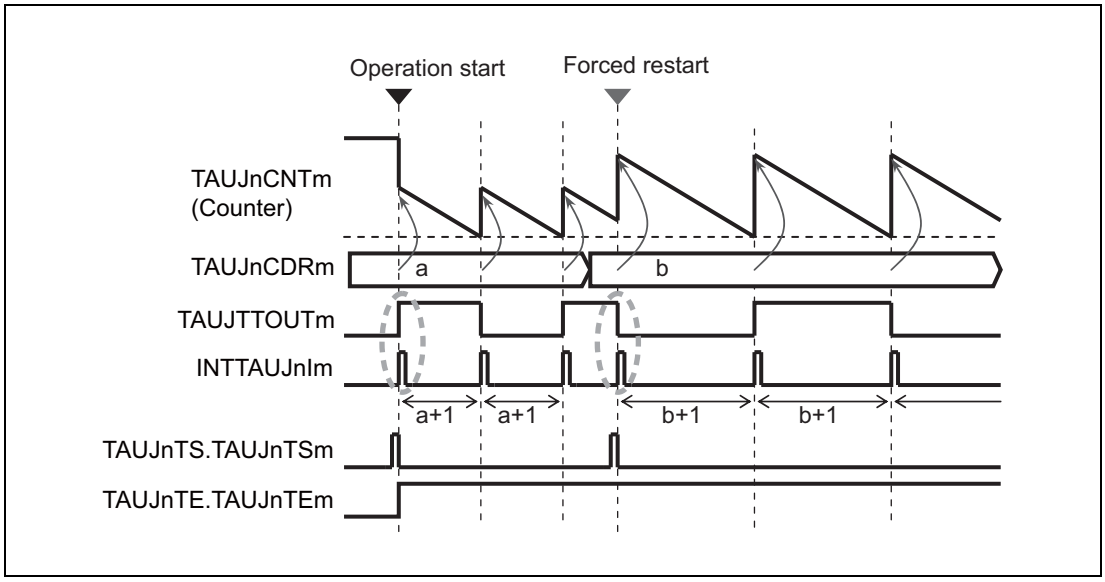

Figure 30.17 Forced Restart Operation (TAUJnCMORm.TAUJnMD0 = 1)

- The counter can be forcibly restarted (without stopping it first) by setting TAUJnTS.TAUJnTSm to 1 during operation.
- If the TAUJnCMORm.TAUJnMD0 bit is set to 1, the first interrupt after a start or restart is generated.
- When a forced restart is made, the TAUJnCDRm value is reflected to TAUJnCNTm and counting starts. Execute a forced restart to reflect the changed TAUJnCDRm value immediately.

30.12.2 TAUJTTINm Input Interval Timer Function

30.12.2.1 Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUJnIm) at regular intervals or when a valid TAUJTTINm input edge is detected. When an interrupt is generated, the TAUJTTOUTm signal toggles, resulting in a square wave.

Description

This function operates in an identical manner to the interval timer function (see **Section 30.12.1, Interval Timer Function**), except that this function is restarted by a valid TAUJTTINm input edge. The type of edge used as the trigger is specified using the TAUJnCMURm.TAUJnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edges can be selected.

30.12.2.2 Equations

INTTAUJnIm cycle = count clock cycle × (TAUJnCDRm + 1)

TAUJTTOUTm square wave cycle = count clock cycle × (TAUJnCDRm + 1) × 2

30.12.2.3 Block Diagram and General Timing Diagram

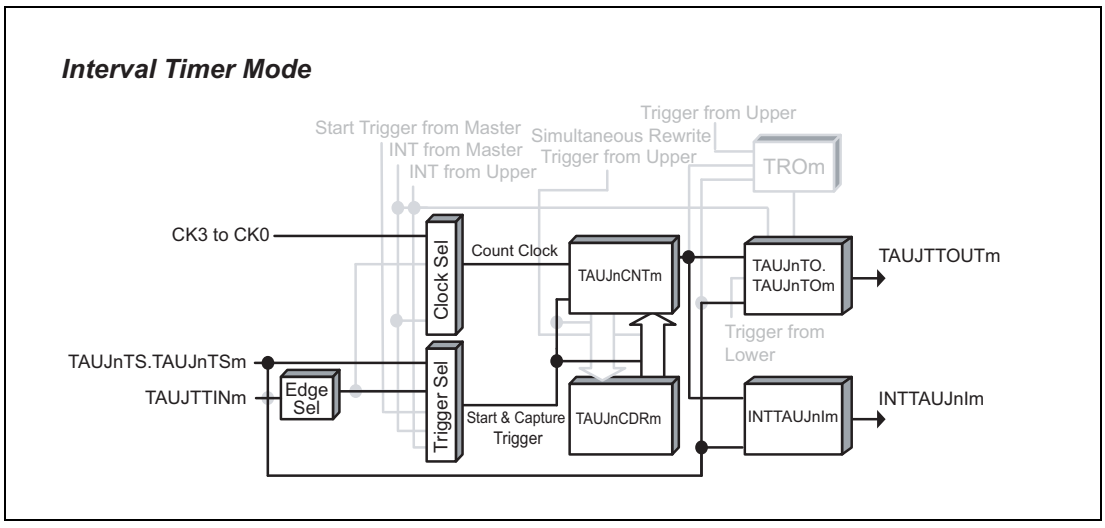

Figure 30.18 Block Diagram for TAUJTTINm Input Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is generated at operation start (TAUJnCMORm.TAUJnMD0 = 1)
- Rising edge detection (TAUJnCMURm.TAUJnTIS[1:0] = 01_B)

Bit name	Setting
TAUJnTOE.TAUJnTOEm	Write 1_B.
TAUJnTOM.TAUJnTOMm	Write 0_B.
TAUJnTOC.TAUJnTOCm	Write 0_B.
TAUJnTOL.TAUJnTOLm	Write 0_B.

NOTE

The channel output mode can also be set to channel output mode controlled by software by setting TAUJnTOE.TAUJnTOEm = 0. TAUJTTOUTm can then be controlled independently of the interrupts. For details refer to Section 30.7, Channel Output Modes.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input interval timer function. Therefore, these registers must be set to 0.

Table 30.41 Simultaneous Rewrite Settings for TAUJTTINm Input Interval Timer Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

30.12.2.5 Operating Procedure for TAUJTTINm Input Interval Timer Function

Table 30.42 Operating Procedure for TAUJTTINm Input Interval Timer Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 30.38, Contents of the TAUJnCMORm register for TAUJTTINm Input Interval Timer Function** and **Table 30.39, Contents of the TAUJnCMURm register for TAUJTTINm Input Interval Timer Function**. Set the value of the TAUJnCDRm register Set the channel output mode by setting the control bits as described in Table 30.40, Control Bit Settings for Independent Channel Output Mode 1.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. TAUJnCNTm loads the TAUJnCDRm value. When TAUJnCMORm.TAUJnMD0 = 1, INTTAUJnIm is generated and TAUJTTOUTm toggles.
During operation	The values of the TAUJnCMURm.TAUJnTIS[1:0] and TAUJnCDRm registers can be changed at any time. The TAUJnCNTm register can be read at all times. Detection of TAUJTTINm edge	TAUJnCNTm counts down. When the counter reaches 0000 0000_H: • TAUJnCNTm reloads the TAUJnCDRm value and continues count operation. • INTTAUJnIm is generated and TAUJTTOUTm toggles. When a TAUJTTINm input valid edge is detected during count operation, TAUJnCNTm reloads the TAUJnCDRm value and continues count operation. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm and TAUJTTOUTm stop and retain their current values.

Restart operation

30.12.2.6 Specific Timing Diagrams

The timing diagrams in Section 30.12.1, Interval Timer Function apply, and in addition the counter can also be restarted by an effective TAUJTTINm input edge.

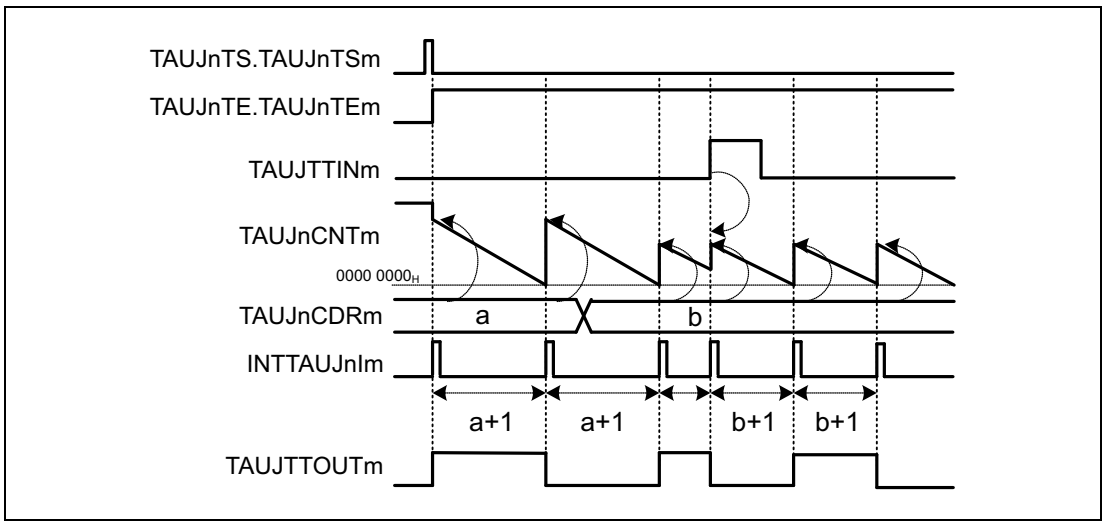

Figure 30.20 Counter Triggered By Rising TAUJTTINm input edge (TAUJnCMURm.TAUJnTIS[1:0] = 01_B), TAUJnCMORm.TAUJnMD0 = 1

If a valid TAUJTTINm input edge is detected, an interrupt is generated which causes TAUJTTOUTm to toggle. In this example, the valid edge is a rising edge (TAUJnCMURm.TAUJnTIS[1:0] = 01_B).

30.12.3 TAUJTTINm Input Pulse Interval Measurement Function

30.12.3.1 Overview

Summary

This function captures the count value and uses this value and the overflow bit TAUJnCSRm.TAUJnOVF to measure the interval of the TAUJTTINm input signal.

Prerequisites

TAUJTTOUTm is not used for this function.

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter TAUJnCNTm starts counting up from 0000 0000_H. When a valid TAUJTTINm edge is detected, the value of TAUJnCNTm is captured, transferred to TAUJnCDRm, and an interrupt INTTAUJnIm is generated. The counter resets to 0000 0000_H and subsequently continues operation.

If the counter reaches FFFF $FFFF_H$ before a valid TAUJTTINm edge is detected, it overflows to 0000 0000_H. The counter is reset to 0000 0000_H and subsequently continues operation. The values transferred to TAUJnCDRm and TAUJnCSRm.TAUJnOVF respectively depend on the values of bits TAUJnCMORm.TAUJnCOS[1:0].

Table 30.43 Effects of an Overflow

	When Overflow Occurs		When a Valid TAUJTTINm Input is then Detected	
TAUJnCMORm.COS[1:0]	TAUJnCDRm	TAUJnCSRm.TAUJnOVF	TAUJnCDRm and TAUJnCNTm	TAUJnCSRm.TAUJnOVF
00	Unchanged	0	TAUJnCNTm loaded to TAUJnCDRm	1
01		1		
10	Set to FFFF $FFFF_H$	0	TAUJnCNTm set to 0, TAUJnCDRm unchanged	Unchanged
11		1		

When TAUJnCMORm.TAUJnCOS[0] = 1, the overflow by (TAUJnCSRm.TAUJnOVF = 1) can only be cleared by setting TAUJnCSCm.TAUJnCLOV = 1.

The combination of the values of TAUJnCDRm and TAUJnCSRm.TAUJnOVF can be used to deduce the interval of the TAUJTTINm signal. However, if an overflow occurs multiple times before a valid TAUJTTINm input is detected, the overflow bit TAUJnCSRm.TAUJnOVF cannot indicate this.

The function can be stopped by setting TAUJnTT.TAUJnTTm = 1, which in turn sets TAUJnTE.TAUJnTEm = 0. TAUJnCNTm stops but retains its value. While the function is stopped, TAUJTTINm input valid edge detection and TAUJnCNTm capture are not performed.

Conditions

If the TAUJnCMORm.TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details, refer to Section 30.9, TAUJTTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts.

NOTE

When TAUJnCMORm.TAUJnCOS[1] = 1, the value of TAUJnCNTm is not loaded to TAUJnCDRm when the first valid TAUJTTINm input edge occurs after an overflow. However, an interrupt is generated.

30.12.3.2 Equations

TAUJTTINm input pulse interval = count clock cycle ×
[(TAUJnCSRm.TAUJnOVF × (FFFF $FFFF_H$ + 1)) + TAUJnCDRm capture value + 1]

30.12.3.3 Block Diagram and General Timing Diagram

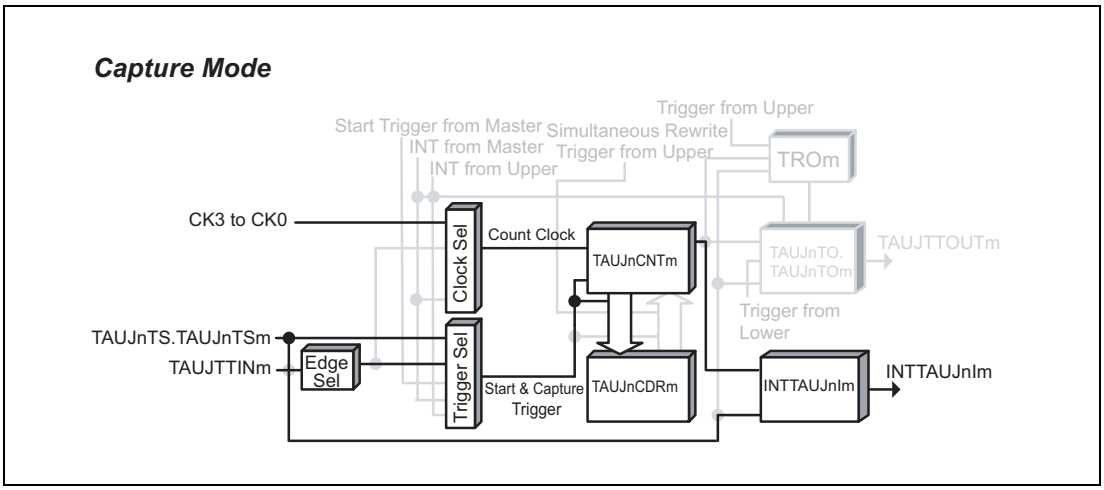

Figure 30.21 Block Diagram for TAUJTTINm Input Pulse Interval Measurement Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is not generated when operation starts (TAUJnCMORm.TAUJnMD0 = 0).
- Falling edge detection (TAUJnCMURm.TAUJnTIS[1:0] = 00_B)
- When a valid TAUJTTINm input is detected after an overflow, TAUJnCDRm is changed and TAUJnCSRm.TAUJnOVF is set to 1 (TAUJnCMORm.TAUJnCOS[1:0] = 00_B).

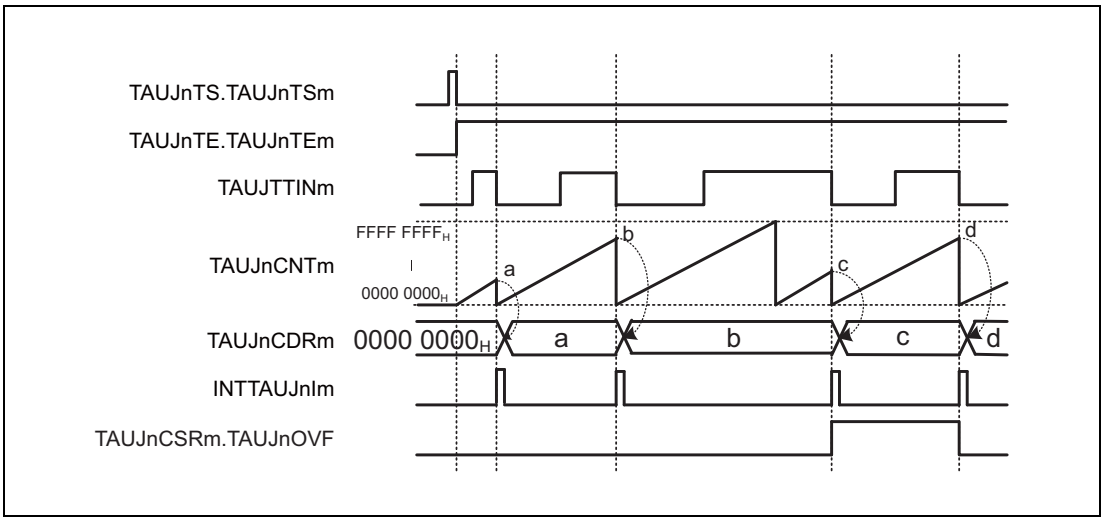

Figure 30.22 General Timing Diagram For TAUJTTINm Input Pulse Interval Measurement Function

30.12.3.4 Register Settings

Table 30.45 Contents of the TAUJnCMURm Register for TAUJTTINm Input Pulse Interval Measurement Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUJnTIS[1:0]	00: Falling edge detection 01: Rising edge detection 10: Rising and falling edge detection 11: Setting prohibited

(3) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input pulse interval measurement function. Therefore, these registers must be set to 0.

Table 30.46 Simultaneous Rewrite Settings for TAUJTTINm Input Pulse Interval Measurement Function

Bit name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

30.12.3.5 Operating Procedure for TAUJTTINm Input Pulse Interval Measurement Function

Table 30.47 Operating Procedure for TAUJTTINm Input Pulse Interval Measurement Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 30.44, Contents of the TAUJnCMORm Register for TAUJTTINm Input Pulse Interval Measurement Function** and **Table 30.45, Contents of the TAUJnCMURm Register for TAUJTTINm Input Pulse Interval Measurement Function**. The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. TAUJnCNTm is cleared to 0000 0000_H. INTTAUJnIm is generated when TAUJnCMORm.TAUJnMD0 is set to 1.
During operation	Detection of TAUJTTINm edges. The values of the TAUJnCMURm. TAUJnTIS[1:0] bits can be changed at any time. The TAUJnCDRm and TAUJnCSRm registers can be read at any time. TAUJnCSCm.TAUJnCLOV bit can be written to 1. (TAUJnCSRm.TAUJnOVF bit is cleared to 0.)	TAUJnCNTm starts to count up from 0000 0000_H. When a TAUJTTINm valid edge is detected: • TAUJnCNTm transfers (captures) its value to TAUJnCDRm, and returns to 0000 0000_H. • INTTAUJnIm is then generated. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and both it and TAUJnCSRm.TAUJnOVF retain their current values.

Restart operation

30.12.3.6 Specific Timing Diagrams: Overflow Behavior

(1) TAUJnCMORm.TAUJnCOS[1:0] = 00_B

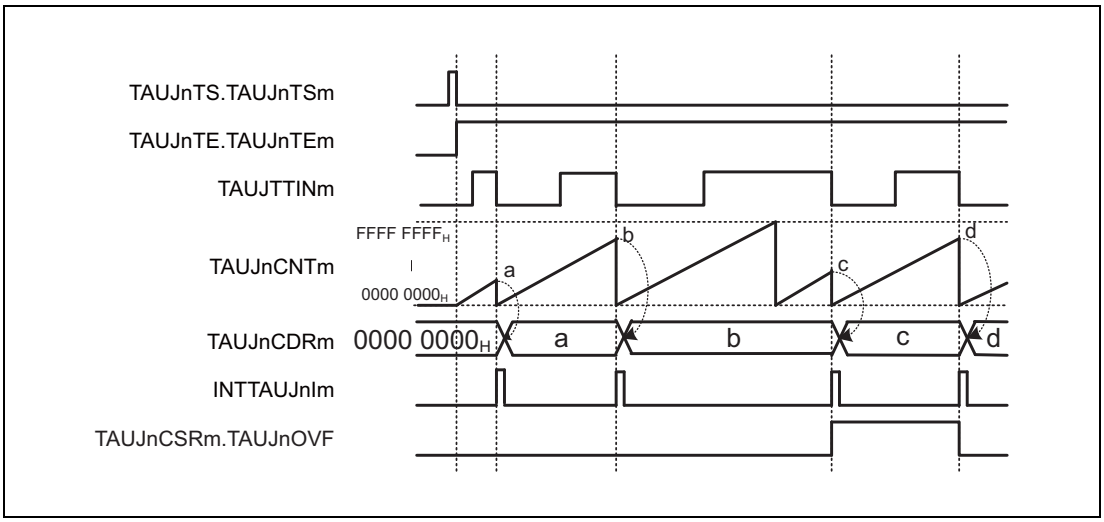

Figure 30.23 TAUJnCMORm.TAUJnCOS[1:0] = 00_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm and TAUJnCSRm.TAUJnOVF is set to 1.
- If the next valid TAUJTTINm input edge is detected when no overflow occurs, TAUJnCSRm.TAUJnOVF is cleared to 0.

(2) TAUJnCMORm.TAUJnCOS[1:0] = 01_B

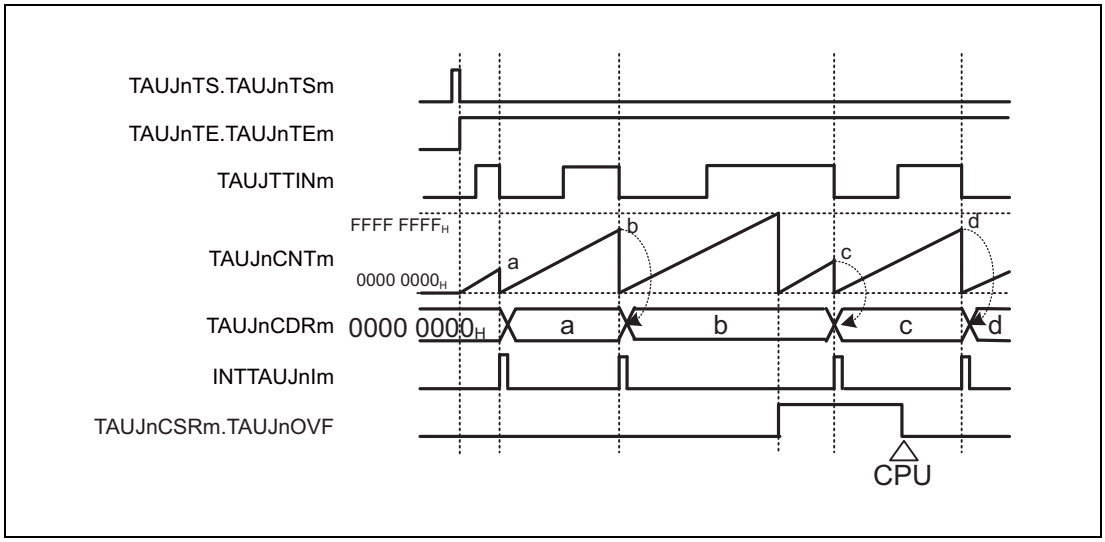

Figure 30.24 TAUJnCMORm.TAUJnCOS[1:0] = 01_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and TAUJnCSRm.TAUJnOVF is set to1.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm.
- TAUJnCSRm.TAUJnOVF is only cleared by a CPU command (by setting the TAUJnCSCm.TAUJnCLOV bit to 1).

(3) TAUJnCMORm.TAUJnCOS[1:0] = 10_B

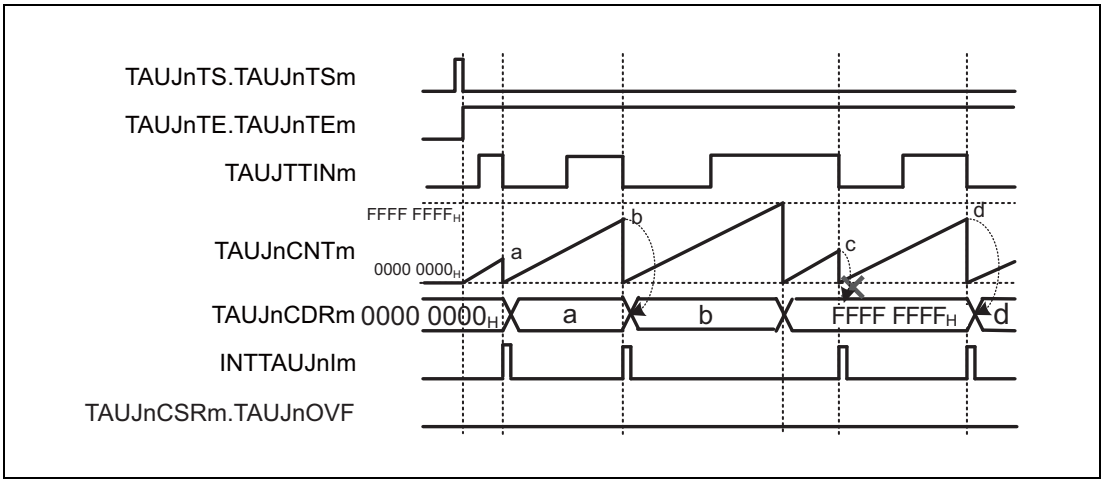

Figure 30.25 TAUJnCMORm.TAUJnCOS[1:0] = 10_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- When an overflow occurs, TAUJnCDRm is set to FFFF $FFFF_H$ and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm is reset to 0, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.

(4) TAUJnCMORm.TAUJnCOS[1:0] = 11_B

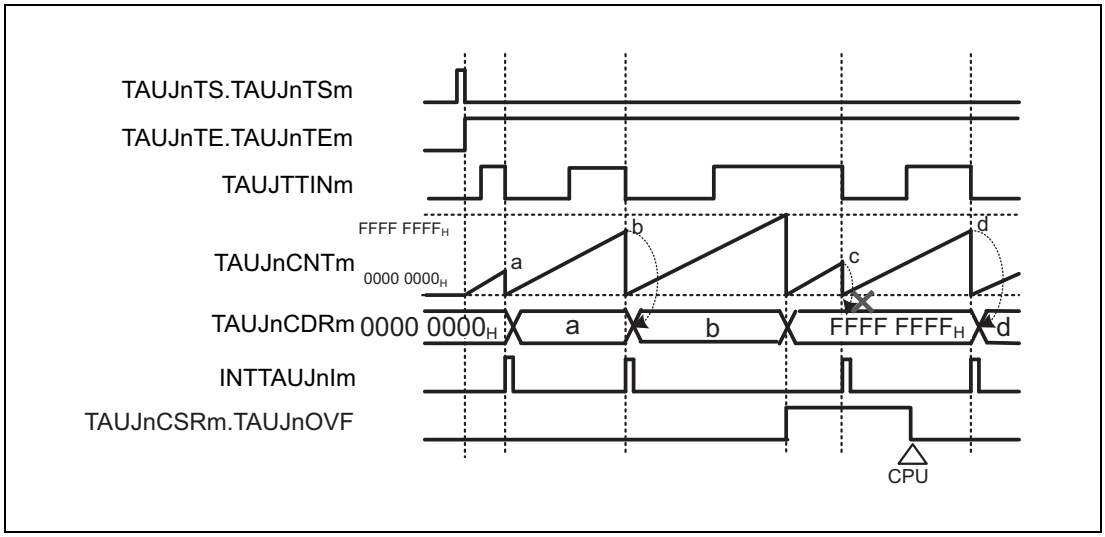

Figure 30.26 TAUJnCMORm.TAUJnCOS[1:0] = 11_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF$_H$, and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm is reset to 0, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.
- TAUJnCSRm.TAUJnOVF is cleared by setting the TAUJnCSCm.TAUJnCLOV bit to 1.

30.12.4 TAUJTTINm Input Signal Width Measurement Function

30.12.4.1 Overview

Summary

This function measures the width of a TAUJTTINm signal by starting counting on one edge of the TAUJTTINm signal and capturing the counter value on the opposite edge.

Prerequisites

TAUJTTOUTm is not used for this function.

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. When a valid TAUJTTINm start edge is detected, the counter TAUJnCNTm starts counting up from 0000 0000_H. When a valid TAUJTTINm stop edge is detected, the value of TAUJnCNTm is captured, transferred to TAUJnCDRm, and an interrupt INTTAUJnIm is generated. The counter retains its value and awaits the next valid TAUJTTINm input start edge.

If the counter reaches FFFF $FFFF_H$ before a valid TAUJTTINm stop edge is detected, it overflows. The counter is reset to 0000 0000_H and subsequently continues operation. The values transferred to TAUJnCDRm and TAUJnCSRm.TAUJnOVF respectively depend on the values of bits TAUJnCMORm.TAUJnCOS[1:0].

Table 30.48 Effects of an Overflow

	When Overflow Occurs		When a Valid TAUJTTINm Input Stop Edge is Detected	
TAUJnCMORm.COS[1:0]	TAUJnCDRm	TAUJnCSRm.TAUJnOVF	TAUJnCDRm and TAUJnCNTm	TAUJnCSRm.TAUJnOVF
00	Unchanged	0	TAUJnCNTm is loaded to TAUJnCDRm.	1
01		1		
10	Set to FFFF $FFFF_H$	0	TAUJnCNTm stops counting, TAUJnCDRm unchanged	Unchanged
11		1		

When TAUJnCMORm.TAUJnCOS[0] = 1, the overflow bit TAUJnCSRm.TAUJnOVF can only be cleared by setting TAUJnCSCm.TAUJnCLOV to 1.

The combination of the values of TAUJnCDRm and TAUJnCSRm.TAUJnOVF can be used to deduce the width of the TAUJTTINm signal. However, if an overflow occurs multiple times before a valid TAUJTTINm input is detected, the overflow bit TAUJnCSRm.TAUJnOVF cannot indicate this.

This function cannot be forcibly restarted.

NOTE

When TAUJnCMORm.COS[1] = 1, the value of TAUJnCNTm is not loaded to TAUJnCDRm when the first valid TAUJTTINm input edge occurs after an overflow. However, an interrupt is generated.

30.12.4.2 Equations

TAUJTTINm input signal width = count clock cycle ×
[(TAUJnCSRm.TAUJnOVF × (FFFF FFFF$_H$ + 1)) + TAUJnCDRm capture value + 1]

30.12.4.3 Block Diagram and General Timing Diagram

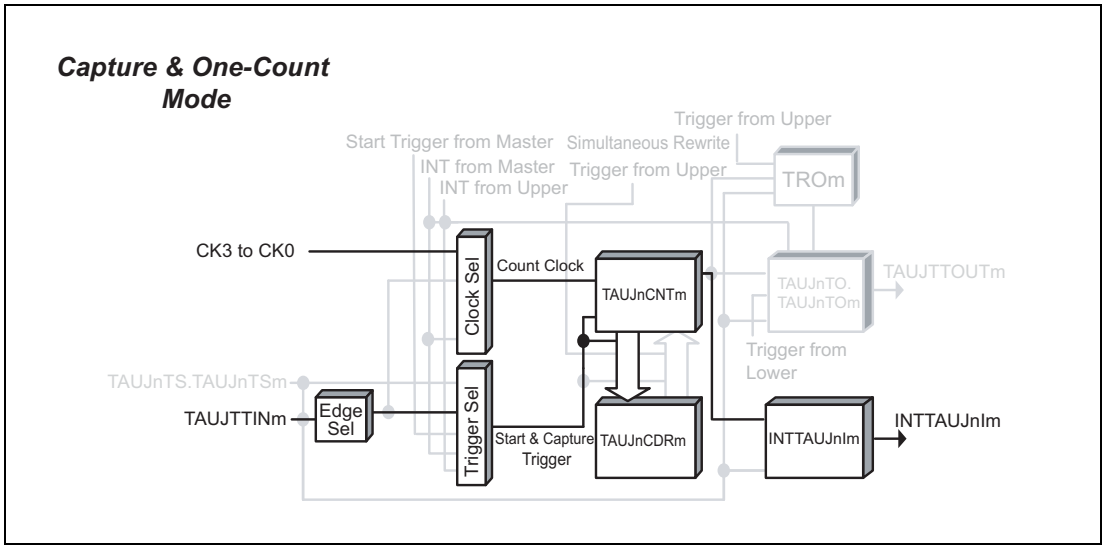

Figure 30.27 Block Diagram for TAUJTTINm Input Signal Width Measurement Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11_B)
- When a valid TAUJTTINm input is detected after an overflow, TAUJnCDRm is changed and TAUJnCSRm.TAUJnOVF is set to 1 (TAUJnCMORm.TAUJnCOS[1:0] = 00_B).

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUJnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 30.50 Contents of the TAUJnCMURm Register for TAUJTTINm Input Signal Width Measurement Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUJnTIS[1:0]	10: Rising and falling edge detection (low width measurement) 11: Rising and falling edge detection (high width measurement)

(3) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input signal width measurement function. Therefore, these registers must be set to 0.

Table 30.51 Simultaneous Rewrite Settings for TAUJTTINm Input Signal Width Measurement Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

30.12.4.5 Operating Procedure for TAUJTTINm Input Signal Width Measurement Function

Table 30.52 Operating Procedure for TAUJTTINm Input Signal Width Measurement Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 30.49, Contents of the TAUJnCMORm Register for TAUJTTINm Input Signal Width Measurement Function** and **Table 30.50, Contents of the TAUJnCMURm Register for TAUJTTINm Input Signal Width Measurement Function**. The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the TAUJTTINm start edge. When a TAUJTTINm start edge is detected, TAUJnCNTm starts to count up.
During operation	The TAUJnCDRm, TAUJnCNTm, and TAUJnCSRm registers can be read at any time. The TAUJnCSCm.TAUJnCLOV bit can be set to 1.	TAUJnCNTm starts to count up from 0000 0000_H. When a TAUJTTINm valid edge is detected: • TAUJnCNTm transfers (captures) its value to TAUJnCDRm, and retains its value. • INTTAUJnIm is then generated. • Counting stops at the “value that transferred to TAUJnCDRm + 1” and TAUJnCNTm waits for detection of the TAUJTTINm start edge. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and both it and TAUJnCSRm.TAUJnOVF retain their current values.

Restart operation

30.12.4.6 Specific Timing Diagrams: Overflow Behavior

(1) TAUJnCMORm.TAUJnCOS[1:0] = 00_B

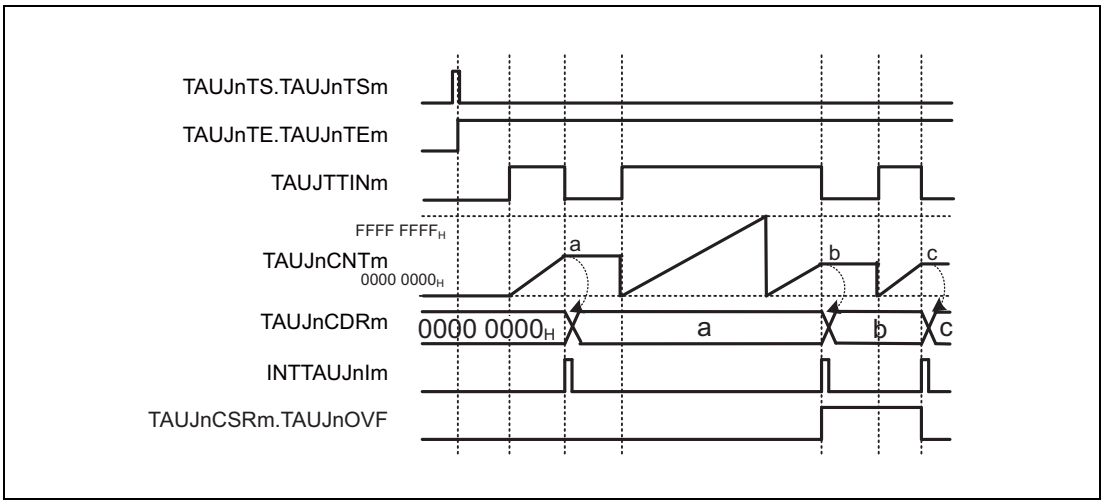

Figure 30.29 TAUJnCMORm.TAUJnCOS[1:0] = 00_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge with no overflow occurring, TAUJnCSRm.TAUJnOVF is cleared to 0.

(2) TAUJnCMORm.TAUJnCOS[1:0] = 01_B

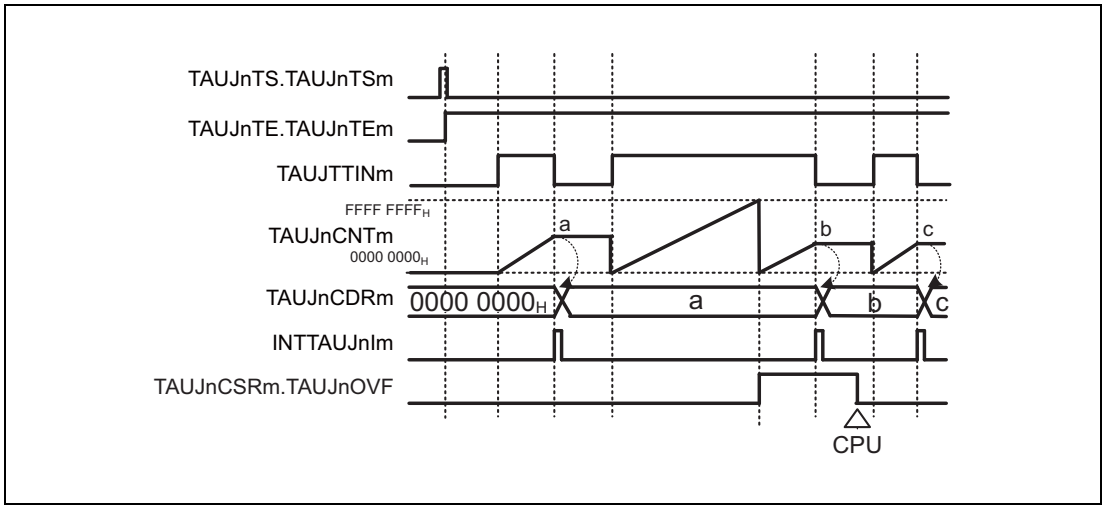

Figure 30.30 TAUJnCMORm.TAUJnCOS[1:0] = 01_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm.
- TAUJnCSRm.TAUJnOVF is only cleared by a CPU command (by setting the TAUJnCSCm.TAUJnCLOV bit to 1).

(3) TAUJnCMORm.TAUJnCOS[1:0] = 10_B

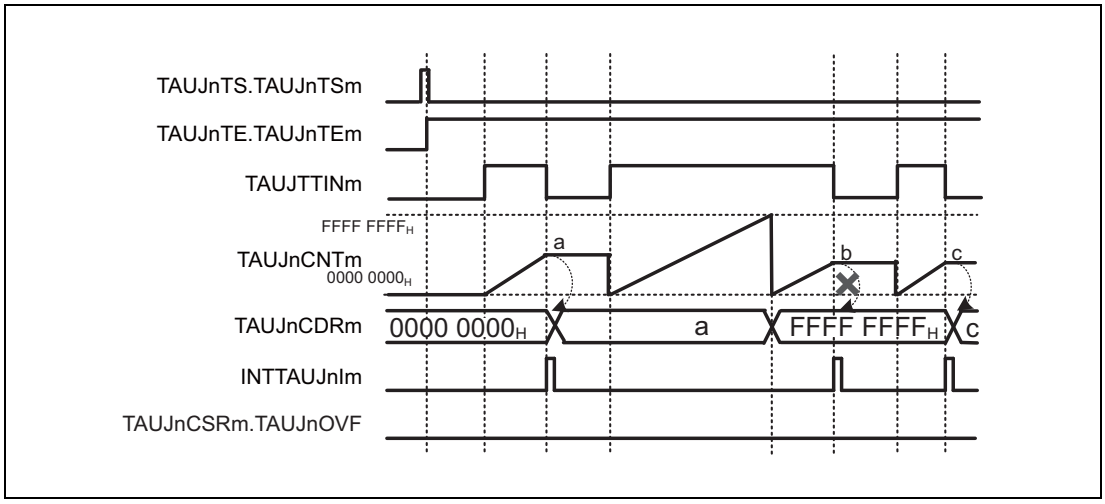

Figure 30.31 TAUJnCMORm.TAUJnCOS[1:0] = 10_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF$_H$ and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm stops counting, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.

(4) TAUJnCMORm.TAUJnCOS[1:0] = 11_B

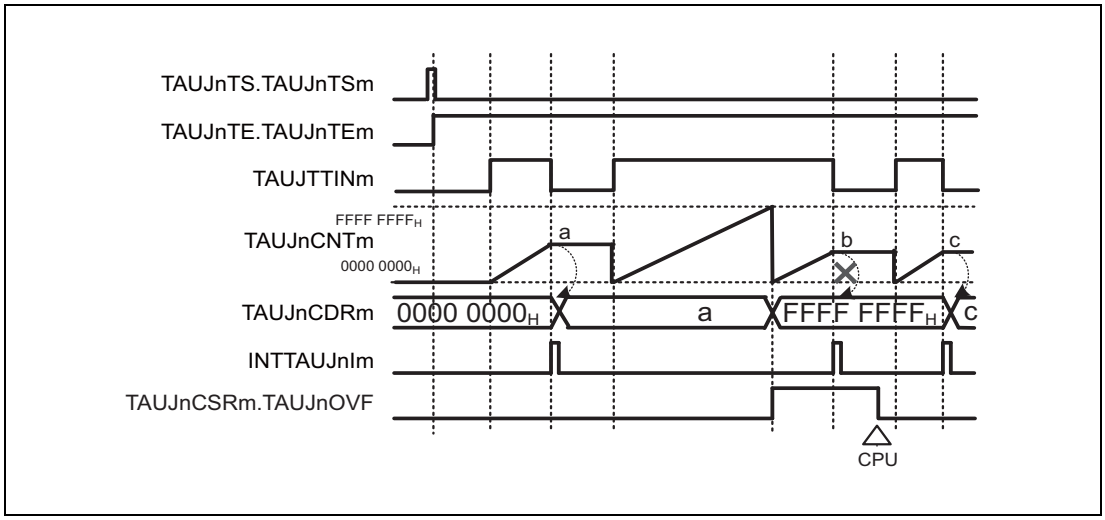

Figure 30.32 TAUJnCMORm.TAUJnCOS[1:0] = 11_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF$_H$, and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm stops counting, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.
- TAUJnCSRm.TAUJnOVF is cleared by setting the TAUJnCSCm.TAUJnCLOV bit to 1.

30.12.5 TAUJTTINm Input Position Detection Function

30.12.5.1 Overview

Summary

This function measures the interval of an input signal by capturing the counter value on a valid edge of the TAUJTTINm signal.

Prerequisites

TAUJTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter starts to count from 0000 0000_H. When a valid TAUJTTINm input edge is detected, the current TAUJnCNTm value is loaded to TAUJnCDRm and an interrupt (INTTAUJnIm) is generated. The counter continues to count.

When the counter reaches FFFF $FFFF_H$, the counter restarts from 0000 0000_H.

Conditions

If the TAUJnCMORm. TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated.

NOTE

The input TAUJTTINm is sampled at the frequency of the operation clock, specified by TAUJnCMORm.TAUJnCKS[1:0] bits. As a result, the output cycle of TAUJTTOUTm has an error of ± 1 operation clock cycle.

30.12.5.2 Equations

Function duration at a TAUJTTINm input pulse =
count clock cycle × (TAUJnCDRm capture value + 1)

30.12.5.3 Block Diagram and General Timing Diagram

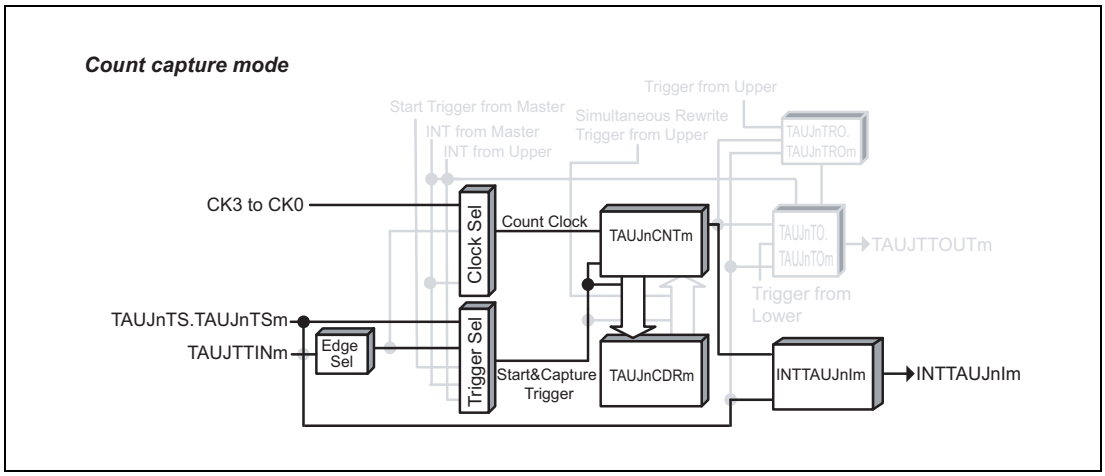

Figure 30.33 Block Diagram of TAUJTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is not generated when operation starts (TAUJnCMORm.TAUJnMD0 = 0).
- Falling edge detection (TAUJnCMURm.TAUJnTIS[1:0] = 00_B)

(3) Channel output mode

The channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input position detection function. Therefore, these registers must be set to 0.

Table 30.55 Simultaneous Rewrite Settings for TAUJTTINm Input Position Detection Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm=0), set these bits to 0

30.12.5.5 Operating Procedure for TAUJTTINm Input Position Detection Function

Table 30.56 Operating Procedure for TAUJTTINm Input Position Detection Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm register and TAUJnCMURm registers as described in **Table 30.53, Contents of the TAUJnCMORm Register for TAUJTTINm Input Position Detection Function** and Table 30.54, Contents of the TAUJnCMURm Register for TAUJTTINm Input Position Detection Function. The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. INTTAUJnIm is generated when TAUJnCMORm.TAUJnMD0 is set to 1.
During operation	The values of the TAUJnCMURm.TAUJnTIS[1:0] bits can be changed at any time. The TAUJnCDRm and TAUJnCSRm registers can be read at any time.	TAUJnCNTm starts to count up from 0000 0000_H. When a TAUJTTINm valid edge is detected: • TAUJnCNTm transfers (captures) its value to TAUJnCDRm. • INTTAUJnIm is output. • The counter value is not cleared to 0000 0000_H and TAUJnCNTm continues count operation. Afterwards, this procedure is repeated. When TAUJnCNTm reaches FFFF $FFFF_H$, the counter restarts from 0000 0000_H.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and retains its current value.

Restart operation

30.12.5.6 Specific Timing Diagrams

(1) Operation stop and restart

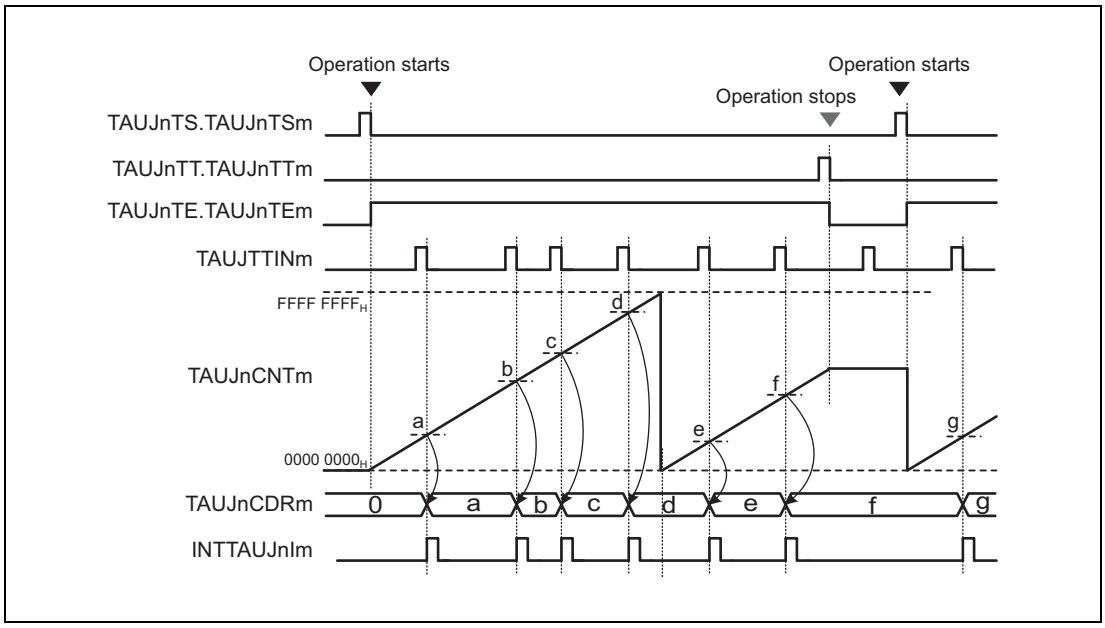

Figure 30.35 Operation Stop and Restart (TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUJTTINm input edges are ignored.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1. TAUJnCNTm restarts to count from $0000\ 0000_H$.

30.12.6 TAUJTTINm Input Period Count Detection Function

30.12.6.1 Overview

Summary

This function measures the cumulative width of a TAUJTTINm input signal.

Prerequisites

TAUJTTOUTm is not used for this function.

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter awaits a valid TAUJTTINm input edge.

When a valid TAUJTTINm input start edge is detected, the counter starts to count from 0000 0000_H.

When a valid TAUJTTINm input stop edge is detected, the current TAUJnCNTm value is loaded to TAUJnCDRm and an interrupt (INTTAUJnIm) is generated. The counter stops and retains its value until the next valid TAUJTTINm input start edge is detected.

When the next valid TAUJTTINm input start edge is detected, the counter restarts counting from the stop value.

When the counter reaches FFFF $FFFF_H$, the counter restarts from 0000 0000_H.

This function cannot be forcibly restarted.

NOTE

The input TAUJTTINm signal is sampled at the frequency of the operation clock, specified by the TAUJnCMORm.TAUJnCKS[1:0] bits.

Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = 10_B, the TAUJTTINm input low period is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = 11_B, the TAUJTTINm input high period is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

30.12.6.2 Equations

Cumulative TAUJTTINm input width =
count clock cycle × (TAUJnCDRm capture value + 1)

30.12.6.3 Block Diagram and General Timing Diagram

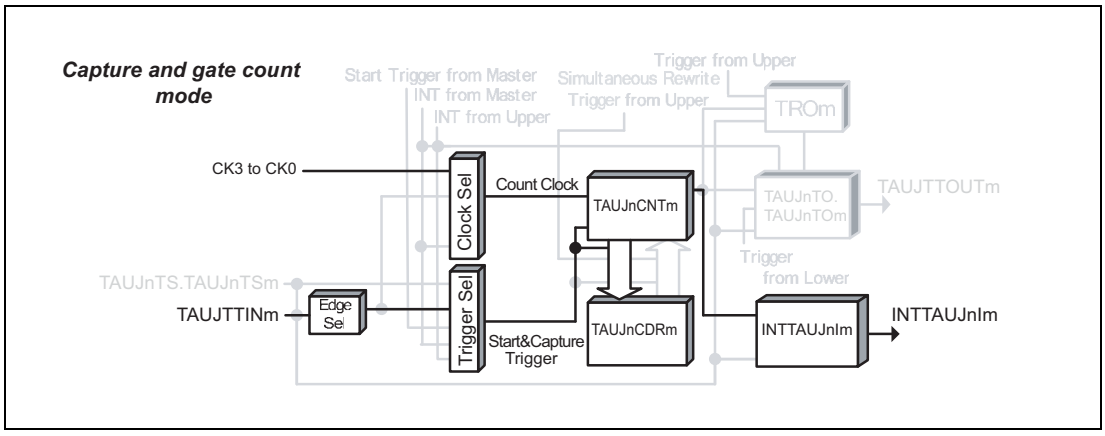

Figure 30.36 Block Diagram for TAUJTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11_B)

1, 0	TAUJnTIS[1:0]	10: Rising and falling edge detection (Low width measurement) 11: Rising and falling edge detection (High width measurement)

(3) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input period count detection function. Therefore, these registers must be set to 0.

Table 30.59 Simultaneous Rewrite Settings for TAUJTTINm Input Period Count Detection Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm=0), set these bits to 0

30.12.6.5 Operating Procedure for TAUJTTINm Input Period Count Detection Function

Table 30.60 Operating Procedure for TAUJTTINm Input Period Count Detection Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 30.57, Contents of the TAUJnCMORm Register for TAUJTTINm Input Period Count Detection Function** and **Table 30.58, Contents of the TAUJnCMURm Register for TAUJTTINm Input Period Count Detection Function**. The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUJTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the TAUJTTINm start edge.
During operation	TAUJTTINm edge detection The TAUJnCDRm, TAUJnCNTm, and TAUJnCSRm registers can be read at any time.	When a TAUJTTINm start edge (rising edge for high width measurement, falling edge for low width measurement) is detected, TAUJnCNTm starts to count up from the stop value. When TAUJnCNTm detects a stop edge (falling edge for high width measurement, rising edge for low width measurement), it transfers the value to TAUJnCDRm and INTTAUJnIm is generated. Counting stops at the “value transferred to TAUJnCDRm + 1” and TAUJnCNTm waits for detection of the TAUJTTINm start edge. When TAUJnCNTm reaches FFFF FFFF$_H$, the counter restarts from 0000 0000$_H$. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and retains its current value.

Restart operation

30.12.6.6 Specific Timing Diagrams

(1) Operation Stop and Restart

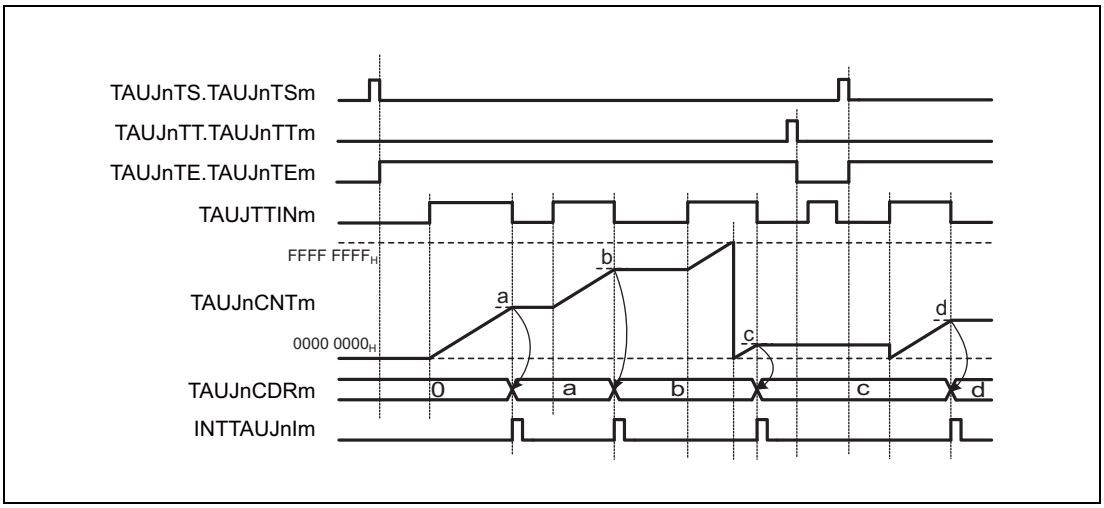

Figure 30.38 Operation Stop and Restart (TAUJnCMURm.TAUJnTIS[1:0] = 11_B)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUJTTINm input edges are ignored.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1. TAUJnCNTm restarts to count from 0000 0000_H.

30.12.7 Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

30.12.7.1 Overview

Summary

This function measures the width of an individual TAUJTTINm input signal. An interrupt is generated if the TAUJTTINm input width is longer than FFFF $FFFF_H$ + 1.

Prerequisites

- TAUJTTOUTm is not used for this function.
- The value of TAUJnCDRm must be set to FFF $FFFF_H$.

Description

he counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation.

The counter starts when a valid TAUJTTINm input start edge is detected. FFFF $FFFF_H$ is loaded to TAUJnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.

When the next TAUJTTINm input start edge is detected, TAUJnCNTm loads FFFF $FFFF_H$ and starts to count down.

If the counter reaches 0000 0000_H before a stop edge is detected, an interrupt is generated.

Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = 10_B, the TAUJTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = 11_B, the TAUJTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE

The counter cannot be restarted during operation.

30.12.7.2 Block Diagram and General Timing Diagram

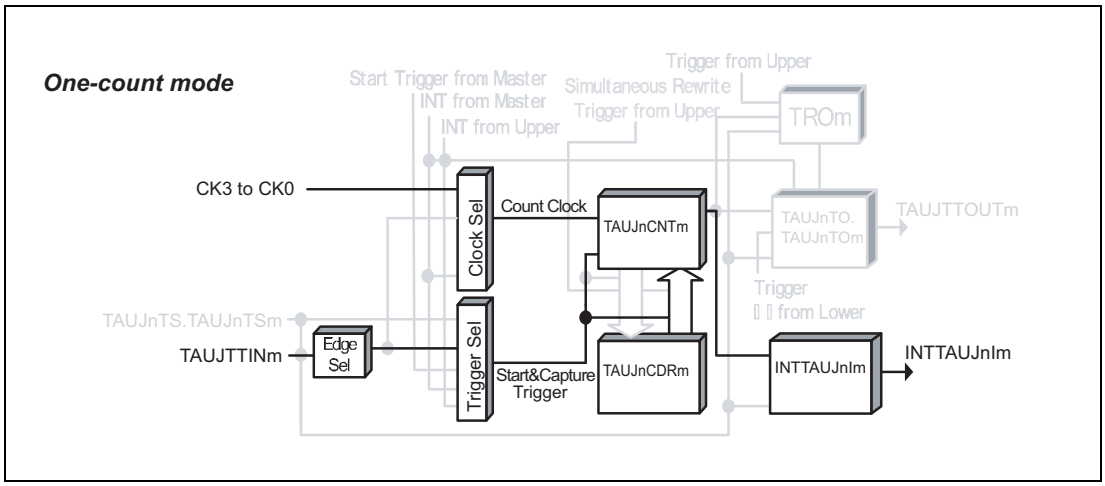

Figure 30.39 Block Diagram for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11_B)

(3) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the overflow interrupt output function (during TAUJTTINm width measurement). Therefore, these registers must be set to 0.

Table 30.63 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

Bit name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0

30.12.7.4 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

Table 30.64 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm register and TAUJnCMURm registers as described in **Table 30.61, Contents of the TAUJnCMORm Register for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)** and **Table 30.62, Contents of the TAUJnCMURm Register for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)**. Set the value of the TAUJnCDRm register to FFFF FFFF$_H$.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUJTTINm start edge.	TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the start edge. When a start edge is detected, TAUJnCNTm loads the TAUJnCDRm value (FFFF FFFF$_H$).
During operation	The TAUJnCNTm register can be read at any time.	TAUJnCNTm counts down. When the counter reaches 0000 0000$_H$: • INTTAUJnIm is generated. When a reverse edge of TAUJTTINm is detected during count operation: • TAUJnCNTm stops counting and waits for a trigger. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and retains its current value.

Restart operation

30.12.8 Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

30.12.8.1 Overview

Summary

This function measures the cumulative width of a TAUJTTINm input signal. An interrupt is generated if the cumulative TAUJTTINm input width is longer than FFFF FFFF$_H$, and an overflow interrupt can be output.

Prerequisites

- TAUJTTOUTm is not used for this function.
- The value of TAUJnCDRm must be set to FFFF FFFF$_H$.

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation.

The counter starts when a valid TAUJTTINm input start edge is detected. FFFF FFFF$_H$ is loaded to TAUJnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUJTTINm input start edge and then continues to count down from the current value.

When the counter reaches 0000 0000$_H$ an interrupt is generated. FFFF FFFF$_H$ is loaded to TAUJnCNTm and the counter continues to count down until a TAUJTTINm input stop edge is detected.

Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = 10$_B$, the TAUJTTINm input low period is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = 11$_B$, the TAUJTTINm input high period is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE

The counter cannot be restarted during operation.

30.12.8.2 Block Diagram and General Timing Diagram

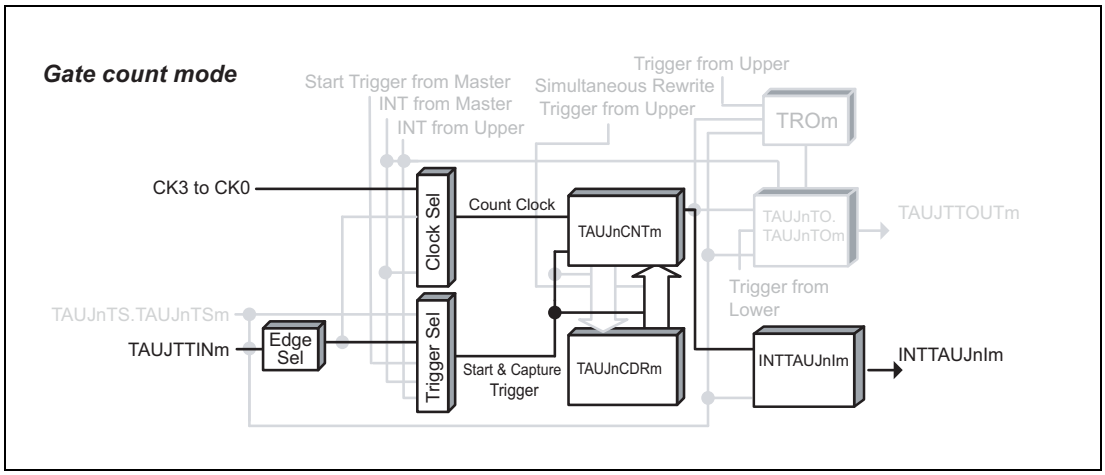

Figure 30.41 Block Diagram for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

(3) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the Overflow Interrupt Output Function (During TAUJTTINm Input Period Count Detection). Therefore, these registers must be set to 0.

Table 30.67 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

30.12.8.4 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

Table 30.68 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 30.65, Contents of the TAUJnCMORm Register for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)** and **Table 30.66, Contents of the TAUJnCMURm Register for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)**. Set the value of the TAUJnCDRm register to FFFF FFFF$_H$.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUJTTINm start edge.	TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the start edge. When a start edge is detected, TAUJnCNTm the TAUJnCDRm value (FFFF FFFF$_H$).
During operation	The TAUJnCNTm register can be read at all times	TAUJnCNTm counts down. When the counter reaches 0000 0000$_H$: • INTTAUJnIm is generated. • TAUJnCNTm loads the TAUJnCDRm value (FFFF FFFF$_H$) and continues to count down. When a reverse edge of TAUJTTINm is detected during count operation: • TAUJnCNTm stops and retains the stop value. When a TAUJTTINm valid edge is detected while the counter is stopped: • TAUJnCNTm counts down from the stop value. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and retains its current value.

Restart operation

30.13 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the TAUJ. For a general overview of synchronous channel operation, see Section 30.2, Overview.

30.13.1 PWM Output Function

30.13.1.1 Overview

Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the duty of the TAUJTTOUTm to be set. The pulse cycle is set in the master channel. The duty is set in the slave channel.

Prerequisites

- Two channels
- The operation mode for the master channel should be set to the interval timer mode. (See Table 30.69, Contents of the TAUJnCMORm Register for the Master Channel of the PWM Output Function.)
- The operation mode for the slave channel should be set to the one-count mode. (See **Table 30.72, Contents of the TAUJnCMORm Register for the Slave Channel of the PWM Output Function**.)
- TAUJTTOUTm is not used for the master channel of this function.
- The channel output mode for the slave channels should be set to synchronous channel output mode 1. (See 30.7, Channel Output Modes.)

Description

The counters are enabled by setting the channel trigger bits (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The current value of TAUJnCDRm is loaded to TAUJnCNTm and the counters start to count down from these values. INTTAUJnIm is generated on the master channel and TAUJTTOUTm (slave) is set or reset to realize the PWM output.

- Master channel:

  When the counter of the master channel reaches 0000 0000_H and pulse cycle time has elapsed, INTTAUJnIm is generated. The TAUJnCDRm value is loaded to TAUJnCNTm, and the counter counts down.

- Slave channel(s):

  The INTTAUJnIm of the master channel triggers the counter of the slave channel(s). The current value of TAUJnCDRm (slave) is loaded to TAUJnCNTm (slave) and the counter starts to count down from this value. The TAUJTTOUTm signal is set, to the active level.
  When the counter reaches 0000 0000_H, i.e. duty time has elapsed, INTTAUJnIm is generated and the TAUJTTOUTm signal is set to the inactive level. The counter returns to FFFF $FFFF_H$ and awaits the next INTTAUJnIm of the master channel, and thus the start of the next pulse cycle.

The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1 for the master and slave channel(s), which in turn sets TAUJnTE.TAUJnTEm to 0. TAUJnCNTm and TAUJTTOUTm of master and slave

channel(s) stop but retain their values. The counters can be restarted by setting TAUJnTS.TAUJnTSm to 1.

Conditions

Simultaneous rewrite can be used with this function. Please refer to Section 30.6, Simultaneous Rewrite.

30.13.1.2 Equations

Pulse cycle = (TAUJnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = (TAUJnCDRm (slave)/(TAUJnCDRm (master) +1)) × 100

– Duty cycle = 0%
  TAUJnCDRm (slave) = 0000 0000_H
– Duty cycle = 100%
  TAUJnCDRm (slave) ≥ TAUJnCDRm (master) + 1

30.13.1.3 Block Diagram and General Timing Diagram

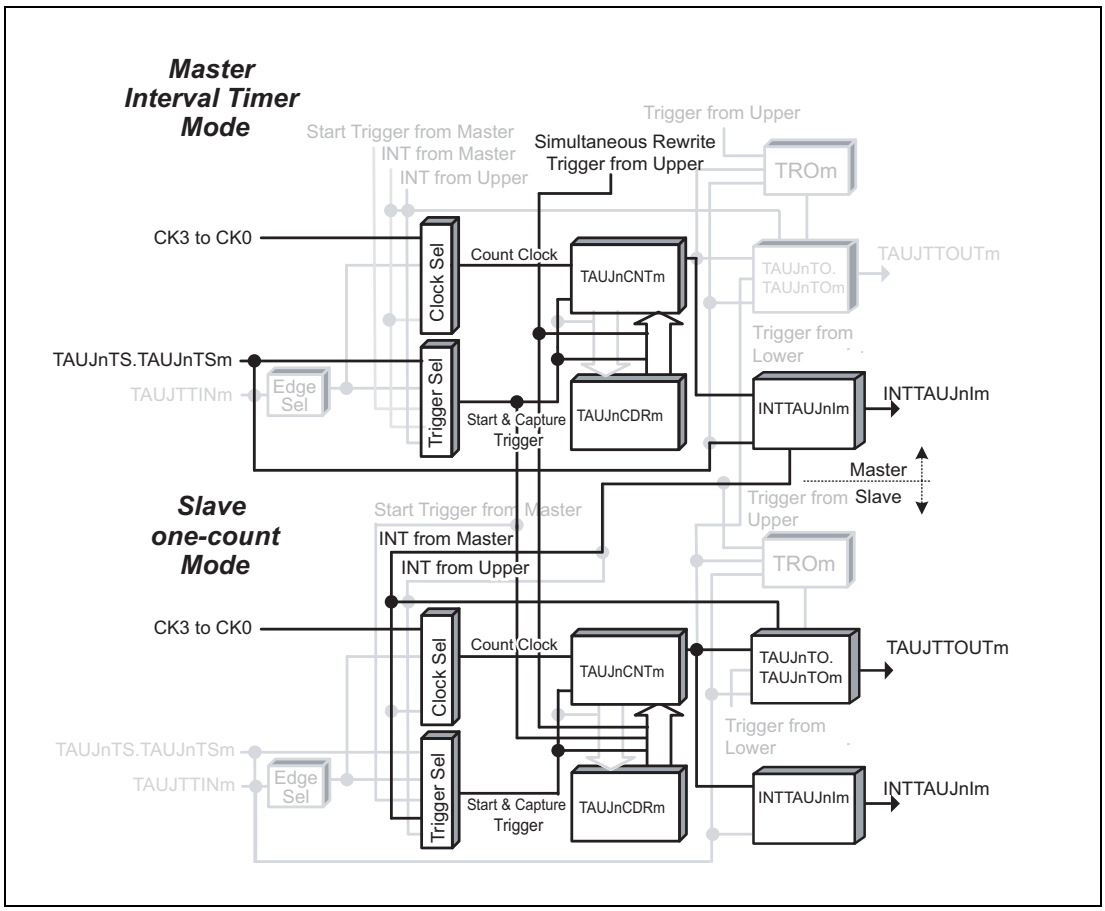

Figure 30.43 Block Diagram for PWM Output Function

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUJnTOL.TAUJnTOLm = 0)

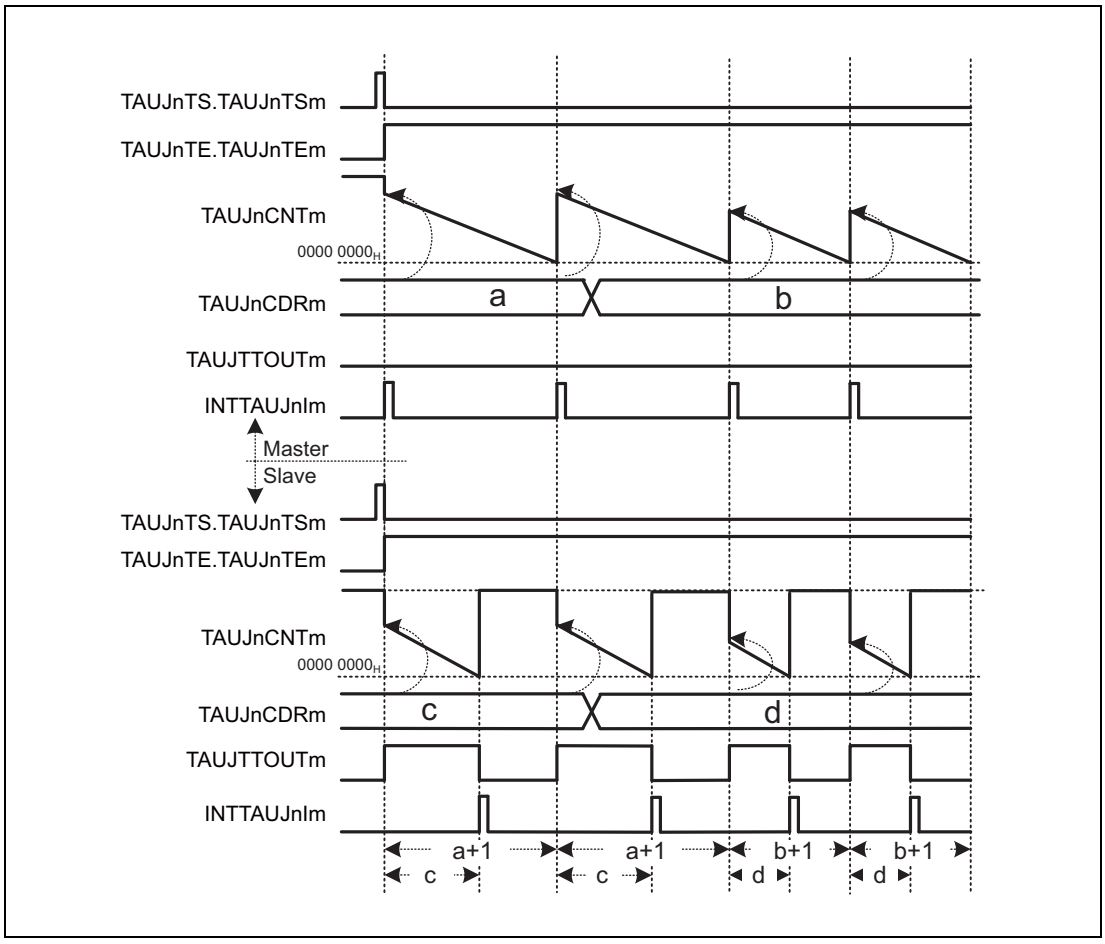

Figure 30.44 General Timing Diagram for PWM Output Function

NOTE

- The interval between the slave channel starting to count and an interrupt being generated is the value of corresponding TAUJnCDRm + 1.
- The slave channel TAUJTTOUTm will rise with a delay of one count clock after the rising of the master channel INTTAUJnIm.

30.13.1.4 Register Settings for the Master Channel

(1) TAUJnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUJnCKS[1:0]		TAUJnCCS[1:0]		TAUJn MAS	TAUJnSTS[2:0]			TAUJnCOS[1:0]		—	TAUJnMD[4:1]				TAUJn MD0

Table 30.69 Contents of the TAUJnCMORm Register for the Master Channel of the PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUJnCKS[1:0]	Operation Clock Selection 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3 The value of the TAUJnCKS[1:0] bits of the master and slave channel(s) must be identical.
13, 12	TAUJnCCS[1:0]	Write 00_B.
11	TAUJnMAS	Write 1_B.
10 to 8	TAUJnSTS[2:0]	Write 000_B.
7, 6	TAUJnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
4 to 1	TAUJnMD[4:1]	Write 0000_B.
0	TAUJnMD0	Write 1_B.

(2) TAUJnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUJnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 30.70 Contents of the TAUJnCMURm Register for the Master Channel of the PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUJnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the master channel

The channel output mode is not used by this function.

(4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channel must be identical.

Table 30.71 Simultaneous Rewrite Settings for the Master Channel of the PWM Output Function

Bit name	Setting
TAUJnRDE.TAUJnRDEm	1: Enables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting.

30.13.1.5 Register Settings for the Slave Channel(s)

(1) TAUJnCMORm for the slave channel(s)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUJnCKS[1:0]		TAUJnCCS[1:0]		TAUJn MAS	TAUJnSTS[2:0]			TAUJnCOS[1:0]		—	TAUJnMD[4:1]				TAUJn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 30.72 Contents of the TAUJnCMORm Register for the Slave Channel of the PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUJnCKS[1:0]	Operation Clock Selection 00: Prescaler output CK0 01: Prescaler output CK1 10: Prescaler output CK2 11: Prescaler output CK3 The value of the TAUJnCKS[1:0] bits of the master and slave channel(s) must be identical.
13, 12	TAUJnCCS[1:0]	Write 00_B.
11	TAUJnMAS	Write 0_B.
10 to 8	TAUJnSTS[2:0]	Write 100_B.
7, 6	TAUJnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
4 to 1	TAUJnMD[4:1]	Write 0100_B.
0	TAUJnMD0	Write 1_B.

(2) TAUJnCMURm for the slave channel(s)

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUJnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 30.73 Contents of the TAUJnCMURm Register for the Slave Channel of the PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	TAUJnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the slave channel(s)

Table 30.74 Control Bit Settings for Synchronous Channel Output Mode 1

Bit Name	Setting
TAUJnTOE.TAUJnTOEm	Write 1_B.
TAUJnTOM.TAUJnTOMm	Write 1_B.
TAUJnTOC.TAUJnTOCm	Write 0_B.
TAUJnTOL.TAUJnTOLm	0: Positive logic 1: Negative logic

(4) Simultaneous rewrite for the slave channel(s)

The simultaneous rewrite settings of the master and slave channel must be identical.

Table 30.75 Simultaneous Rewrite Settings for the Slave Channel of the PWM Output Function

Bit name	Setting
TAUJnRDE.TAUJnRDEm	1: Enables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting.

30.13.1.6 Operating Procedure for PWM Output Function

Table 30.76 Operating Procedure for PWM Output Function

	Operation	Status of TAUJn
Initial channel setting	Master channel: Set the TAUJnCMORm and TAUJnCMURm registers and the channel output mode as described in **Section 30.13.1.4, Register Settings for the Master Channel**. Slave channel: Set the TAUJnCMORm and TAUJnCMURm registers and the channel output mode as described in **Section 30.13.1.5, Register Settings for the Slave Channel(s)**. Set the values of the TAUJnCDRm registers of all channels.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm of the master and slave channels to 1 simultaneously. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start. INTTAUJnIm is generated on the master channel and TAUJTTOUTm (slave) is set.
During operation	TAUJnCDRm can be changed at any time. TAUJnCNTm and TAUJnRSF.TAUJnRSFm can be read at any time. TAUJnRDT.TAUJnRDTm can be changed during operation.	TAUJnCNTm of the master channel loads TAUJnCDRm and counts down. When the counter reaches 0000 0000_H: • INTTAUJnIm (master) is generated. • TAUJnCNTm (master) loads the TAUJnCDRm value and continues count operation. • TAUJnCNTm (slave) loads the TAUJnCDRm value and counts down. • TAUJTTOUTm (slave) is set to the active level. When TAUJnCNTm (slave) reaches 0000 0000_H: • INTTAUJnIm (slave) is generated. • TAUJTTOUTm (slave) is set to the inactive level.
Stop operation	Set TAUJnTT.TAUJnTTm of the master and slave channels to 1 simultaneously. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm and TAUJTTOUTm stop and retain their current values.

Restart operation

30.13.1.7 Specific Timing Diagrams

(1) Duty cycle = 0%

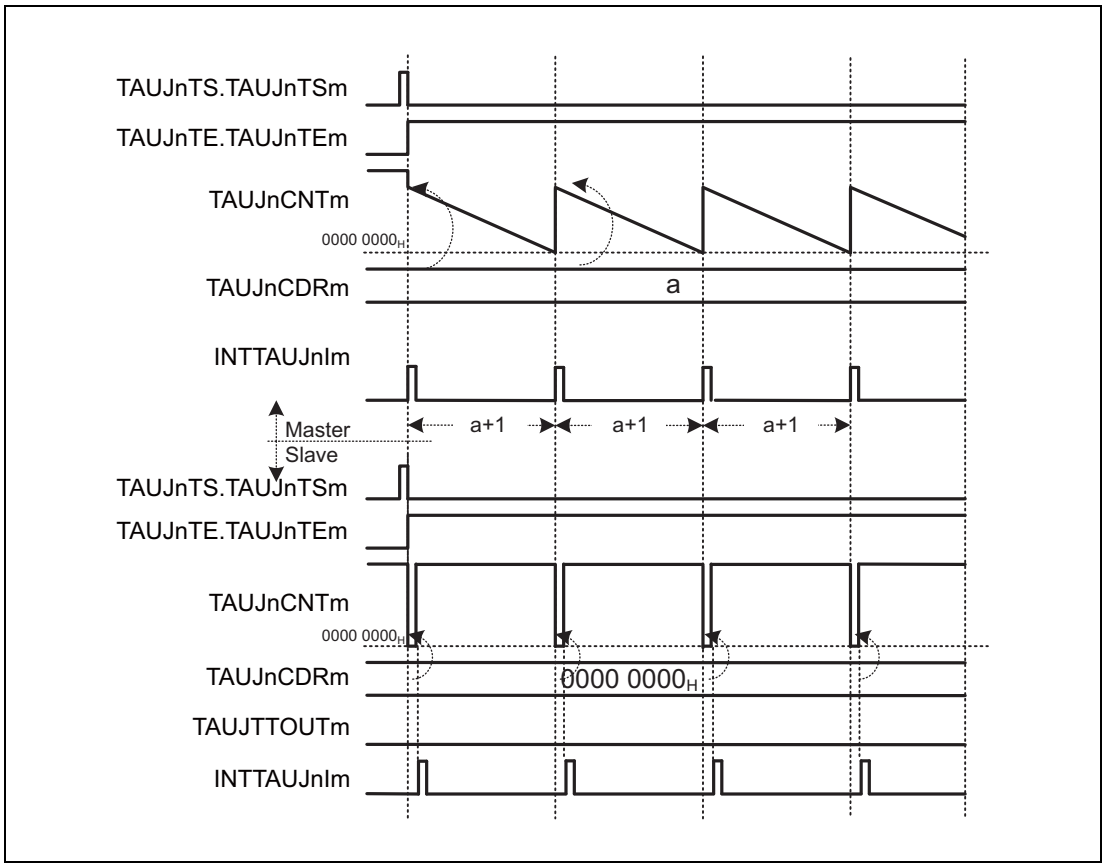

Figure 30.45 TAUJnCDRm (slave) = 0000 0000$_H$, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)

Every time the master channel generates an interrupt (INTTAUJnIm), 0000 0000$_H$ is loaded to TAUJnCNTm (slave). As a result, a slave channel interrupt (INTTAUJnIm) is generated at the same time and TAUJTTOUTm remains inactive.

- The value of TAUJnCDRm is loaded into TAUJnCNTm (slave) to generate an interrupt.

(2) Duty cycle = 100%

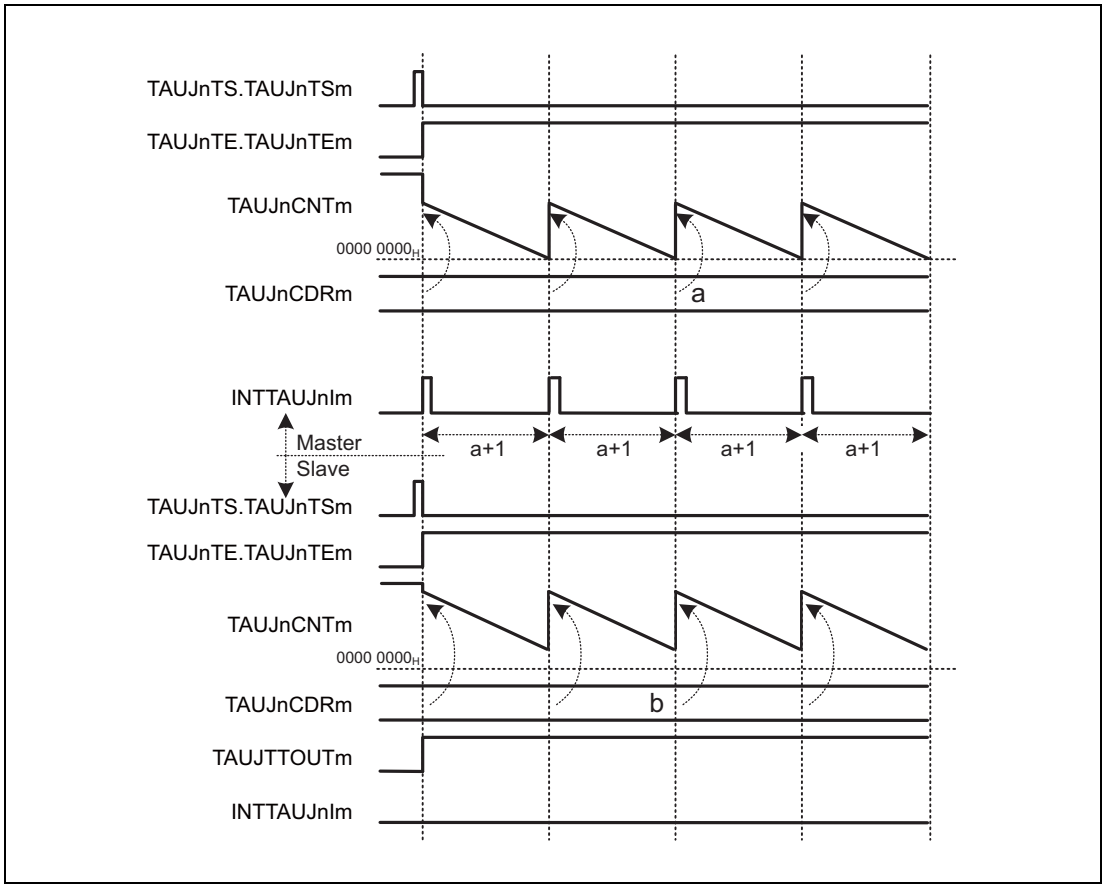

Figure 30.46 TAUJnCDRm (slave) ≥ TAUJnCDRm (master) + 1, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)

If the TAUJnCDRm (slave) value is greater than the TAUJnCDRm (master) value, no interrupt occurs because the counter of the slave channel does not reach $0000\ 0000_H$. TAUJTTOUTm remains active.

(3) Operation stop and restart

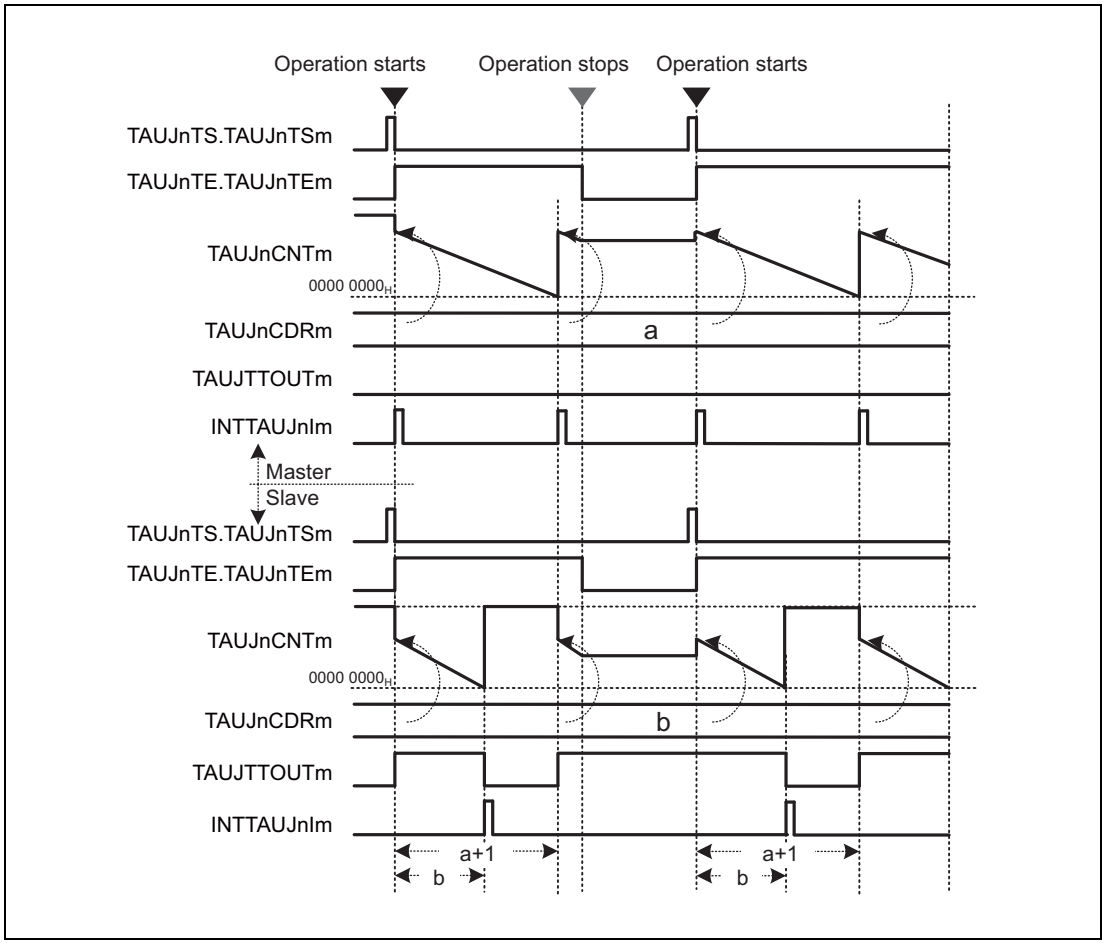

Figure 30.47 Stop and Restart Operation, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm of master and slave channels to 1. This sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm and TAUJTTOUTm of every channel stop and retain their current values. No interrupt occurs.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm of master and slave channels to 1. The TAUJnCDRm value of master and slave channels is loaded into TAUJnCNTm. The counter starts to count down from this value.

Section 31 Real-Time Clock (RTCA)

This section contains a generic description of the Real-Time Clock (RTCA).

The first part of this section describes all RH850/D1L/D1M specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the RTCA.

31.1 Features of RH850/D1L/D1M RTCA

31.1.1 Number of Units and Channels

This microcontroller has the following number of RTCA units.

Each RTCA unit has one channel RTCA. “Number of channels” is used with the same meaning as “number of units” in this section.

Table 31.1 Number of Units

Product Name	All Products
Number of Units	1
Name	RTCAn (n = 0)

Table 31.2 Index

Index	Meaning
n	Throughout this section, the individual RTCA units are identified by the index “n” (n = 0); for example, RTCAnCTL0 is the RTCAn control register 0.

31.1.2 Register Base Address

RTCAn base address is listed in the following table.

RTCAn register addresses are given as offsets from the base address in general.

Table 31.3 Register Base Address

Base Address Name	Base Address
<RTCA0_base>	FFE4 1000_H

31.1.3 Clock Supply

The RTCAn clock supply is shown in the following table.

Table 31.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
RTCA0	RTCATCKI	C_AWO_RTCA
	PCLK	• C_ISO_PCLK in RUN mode • EMCLK in DEEPSTOP mode

31.1.4 Interrupt Requests

RTCAn interrupt requests are listed in the following table.

Table 31.5 Interrupt Requests

RTCAn signals	Function	Connected to
RTCA0		
RTCATINT1S	1 second interval interrupt	Interrupt Controller INTRTCA01S
RTCATINTAL	Alarm interrupt	Interrupt Controller INTRTCA0AL
RTCATINTR	Fixed interval interrupt	Interrupt Controller INTRTCA0R

All Real-Time Clock interrupts can be used as wake-up factors for terminating the DEEPSTOP mode.

NOTE

In all devices except for D1M1A and D1M1-V2, when CPU is operating under EMCLK, there are possibility to miss interrupts' request of INTRTCA01S, INTRTCA0AL and INTRTCA0R. Use wake-up flags instead of interrupt flags, when CPU is running by EMCLK. (Wake-up factors for those interrupts (WUF0[13], WUF0[14], WUF0[15]) are not missed.)

31.1.5 Reset Sources

RTCAn reset sources are listed in the following table. RTCAn is initialized by these reset sources.

Table 31.6 Reset Sources

Unit Name	Reset Source
RTCA0	Reset Controller SYSRES

31.1.6 External Input/Output Signals

External input/output signals of RTCAn are listed below.

Table 31.7 External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
RTCA0		
RTCAT1HZ	1-Hz pulse output	RTCA0OUT*1

Note 1. RTCA0OUT is connected to AWOT0. For details, see Section 28, Always-On-Area Timer (AWOT).

31.2 Overview

31.2.1 Functional Overview

The Real-Time Clock RTCA has the following features:

- Count clock selection from 32 kHz to 4 MHz
- Counters for years, months, day of the month, day of the week, hours, minutes, seconds, and a sub-counter. The calendar covers 99 years. Leap years are handled by hardware automatically.
- One Hz pulse output function
- Fixed interval interrupt function
- Alarm interrupt function
- Clock error correction function if a 32.768-kHz count clock is used

31.2.2 Block Diagram

The block diagram shows the main components of the RTCA.

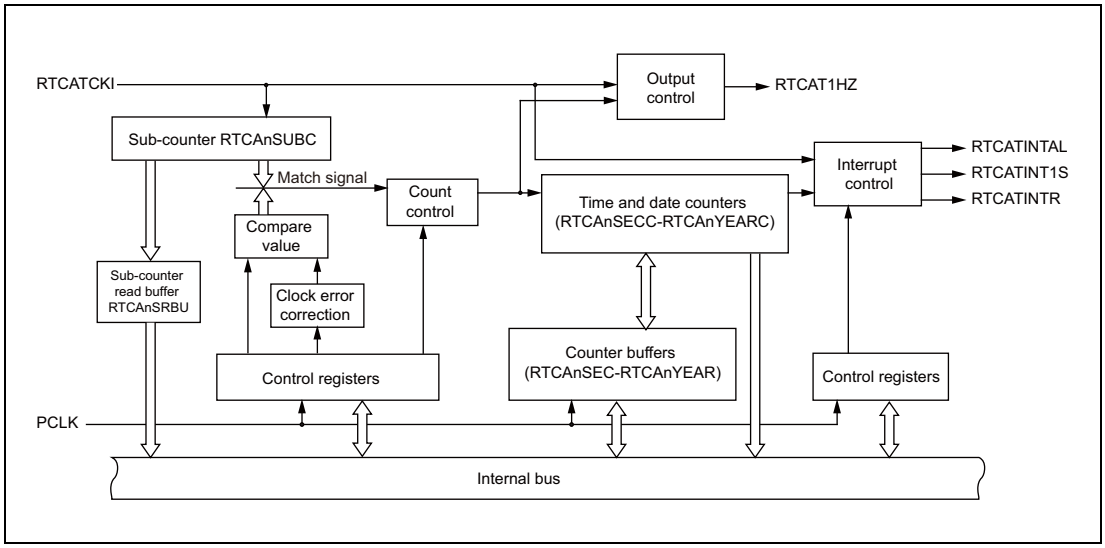

Figure 31.1 Block Diagram of the RTCA

31.2.3 Description of Blocks

The Real-Time Clock RTCA provides information about the present time and date and can generate wake-up signals (interrupts, alarms). This information is derived from the count clock RTCATCKI.

Sub-counter

RTCATCKI is the input to the sub-counter RTCAnSUBC. The sub-counter counts up from zero until it reaches the compare value. The compare value is always defined as the frequency of RTCATCKI – 1 (in Hz). Thus, the sub-counter overflows after one second. It is then reset to zero and triggers the seconds counter RTCAnSECC (and, if desired, the interrupt RTCATINT1S).

The sub-counter can generate a fixed interval interrupt every 0.25 seconds, 0.5seconds, or 1 second, and a 1-Hz output pulse.

Time and date counters

The counters for minutes, hours, day of the week, day of the month, months, and years also count up. They have their own overflow limits. If all the lower counters overflow, the upper counter counts up.

The overflow limit of the counter for the day of the month (RTCAnDAYC) depends on the present month (28, 30, or 31 days) and (in February) on the year counter RTCAnYEARC (years 0, 4, 8, 12, etc. are considered leap years).

The hours counter RTCAnHOURC can be switched between 12- and 24-hour format.

The counters for seconds, minutes, hours, day of the month, and month can generate a fixed interval interrupt upon overflow (RTCATINTR).

The counters for minutes, hours, and day of the week can also generate an alarm interrupt (RTCATINTAL), e.g. every Tuesday and Thursday at 10:32.

Counter buffers

All counters can be read directly at any time. The clock signal used to access the read/write registers and the count clock are usually asynchronous. An overflow of the sub-counter during the read operation can make all read values obsolete. Therefore, reading the counters must be performed using a special procedure. For details, see Section 31.5.3, Reading Clock Counters.

For reasons of synchronization, the counters cannot be written directly.

For reading and writing, all counters are accompanied by buffer registers. The buffer registers provide a synchronized way for reading the counters and for setting time and date. When they are used, the operation of the sub-counter must first be suspended and then re-activated (see also **Section 31.5.3, Reading Clock Counters** and Section 31.5.2, Updating Clock Counters.

The RTCAnTIMEC and RTCAnCALC registers and their corresponding buffer registers can be used to access the time (hours, minutes and seconds) or the date (day of the week, day of the month, month, and year) with one read/write operation.

31.3 Registers

31.3.1 List of Registers

RTCA registers are listed in the following table.

<RTCAn_base> is defined in Section 31.1.2, Register Base Address.

Table 31.8 Registers

Module	Register	Symbol	Address
Control registers			
RTCAn	Control register 0	RTCAnCTL0	<RTCAn_base> + 00_H
RTCAn	Control register 1	RTCAnCTL1	<RTCAn_base> + 04_H
RTCAn	Control register 2	RTCAnCTL2	<RTCAn_base> + 08_H
Sub-counter registers			
RTCAn	Sub-count register	RTCAnSUBC	<RTCAn_base> + $0C_H$
RTCAn	Sub-count register read buffer	RTCAnSRBU	<RTCAn_base> + 10_H
RTCAn	Clock error correction register	RTCAnSUBU	<RTCAn_base> + 38_H
RTCAn	Sub-counter compare register	RTCAnSCMP	<RTCAn_base> + $3C_H$
Clock counter and buffer registers			
RTCAn	Seconds count register	RTCAnSECC	<RTCAn_base> + $4C_H$
RTCAn	Seconds count buffer register	RTCAnSEC	<RTCAn_base> + 14_H
RTCAn	Minute count register	RTCAnMINC	<RTCAn_base> + 50_H
RTCAn	Minute count buffer register	RTCAnMIN	<RTCAn_base> + 18_H
RTCAn	Hour count register	RTCAnHOURC	<RTCAn_base> + 54_H
RTCAn	Hour count buffer register	RTCAnHOUR	<RTCAn_base> + $1C_H$
RTCAn	Day of the week count register	RTCAnWEEKC	<RTCAn_base> + 58_H
RTCAn	Day of the week count buffer register	RTCAnWEEK	<RTCAn_base> + 20_H
RTCAn	Day count register	RTCAnDAYC	<RTCAn_base> + $5C_H$
RTCAn	Day count buffer register	RTCAnDAY	<RTCAn_base> + 24_H
RTCAn	Month count register	RTCAnMONC	<RTCAn_base> + 60_H
RTCAn	Month count buffer register	RTCAnMONTH	<RTCAn_base> + 28_H
RTCAn	Year count register	RTCAnYEARC	<RTCAn_base> + 64_H
RTCAn	Year count buffer register	RTCAnYEAR	<RTCAn_base> + $2C_H$
Special counter and buffer registers			
RTCAn	Time count register	RTCAnTIMEC	<RTCAn_base> + 68_H
RTCAn	Time count buffer register	RTCAnTIME	<RTCAn_base> + 30_H
RTCAn	Calendar count register	RTCAnCALC	<RTCAn_base> + $6C_H$
RTCAn	Calendar count buffer register	RTCAnCAL	<RTCAn_base> + 34_H
Alarm setting registers			
RTCAn	Alarm minute setting register	RTCAnALM	<RTCAn_base> + 40_H
RTCAn	Alarm hour setting register	RTCAnALH	<RTCAn_base> + 44_H
RTCAn	Alarm day of the week setting register	RTCAnALW	<RTCAn_base> + 48_H
Emulation register			
RTCAn	Emulation register	RTCAnEMU	<RTCAn_base> + 74_H

31.3.2 Details of RTCA Control Registers

31.3.2.1 RTCAnCTL0 — RTCA Control Register 0

This register controls the count operation of the sub-counter RTCAnSUBC, the format (12-hour/24-hour) of the hours counter RTCAnHOURC and the alarm hour setting register RTCAnALH, and the operation mode.

Access: This register can be read/written in 8-bit or 1-bit units.

Address: <RTCAn_base> + 00_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnCE	RTCAnCEST	RTCAnAMPM	RTCAnSLSB	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R/W	R	R	R	R

Table 31.9 RTCAnCTL0 Register Contents

Bit Position	Bit Name	Function
7	RTCAnCE	Starts/stops the sub-counter RTCAnSUBC operation. 0: Stops the sub-counter operation. All output pins and all status flags in control register RTCAnCTL2 are cleared. 1: Starts the sub-counter operation. The sub-counter counts up.
6	RTCAnCEST	Indicates the operation enabled/stopped status of the sub-counter: 0: Operation stopped status 1: Operation enabled status For details on how to use this status flag, see Section 31.5.1, Initial Setting of the RTCA.
5	RTCAnAMPM	Selects the format of the hours counter RTCAnHOURC and the alarm hour setting register RTCAnALH: 0: 12-hour format (1 to 12, am/pm) 1: 24-hour format (0 to 23, military time) For details on the format, see Table 31.21, 12- and 24-Hour Format.
4	RTCAnSLSB	Selects the operation mode: 0: 32.768 kHz mode 1: Frequency selection mode For details on the operation modes, see Section 31.4, Operation. The operation mode must not be changed while sub-counter operation is enabled (RTCAnCTL0.RTCAnCEST = 1). For details on the initialization of RTCAn, see Section 31.5.1, Initial Setting of the RTCA.
3 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

31.3.2.2 RTCAnCTL1 — RTCA Control Register 1

This register controls the interrupt request generation and the 1-Hz pulse output.

Access: This register can be read/written in 8-bit or 1-bit units.

Address: <RTCAn_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnEN1HZ	RTCAnENALM	RTCAnEN1S	RTCAnCT2	RTCAnCT1	RTCAnCT0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.10 RTCAnCTL1 Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	RTCAnEN1HZ	Enables/stops 1-Hz pulse output (RTCAT1HZ): 0: RTCAT1HZ disabled (RTCAT1HZ is fixed to 0) 1: RTCAT1HZ enabled
4	RTCAnENALM	Enables/disables alarm interrupt request generation (RTCATINTAL): 0: RTCATINTAL disabled 1: RTCATINTAL enabled
3	RTCAnEN1S	Enables/disables 1-second interrupt request generation (RTCATINT1S): 0: RTCATINT1S disabled 1: RTCATINT1S enabled
2 to 0	RTCAnCT[2:0]	Specifies the fixed interval interrupt request (RTCATINTR) setting:

	RTCATINTR Interrupt Request Generation	
RTCAnCT[2:0]	**Interval**	**Timing**
000	No interrupt request generation	
001	Every 0.25 seconds	Every 0.25, 0.5, 0.75 and 1 second
010	Every 0.5 seconds	Every 0.5 and 1 second
011	Every second	Every 1 second
100	Every minute	Every 1 minute 00 seconds
101	Every hour	Every 1 hour 0 minutes 0 seconds
110	Every day	Every 1 day 0 hours 0 minutes 0 seconds (i.e., every midnight)
111	Every month	Every 1 month first day 0 hours 0 minutes 0 seconds (i.e., every first midnight of a month)

If the settings of RTCAnCT[2:0] are changed while sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), a glitch may be output to RTCATINTR. Implement appropriate interrupt mask processing procedures.

31.3.2.3 RTCAnCTL2 — RTCA Control Register 2

This register contains status information and controls the data transfer from the sub-counter RTCAnSUBC to the dedicated sub-counter read buffer RTCAnSRBU and the operation setting of the clock counters (RTCAnSECC to RTCAnYEARC).

Access: This register can be read/written in 8-bit or 1-bit units.

Address: <RTCAn_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnWUST	RTCAnWSST	RTCAnRSST	RTCAnRSUB	RTCAnWST	RTCAnWAIT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R	R/W

Table 31.11 RTCAnCTL2 Register Contents (1/2)

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	RTCAnWUST	Indicates whether RTCAnSUBU write operation has been completed: 0: RTCAnSUBU write completed 1: RTCAnSUBU write in progress The write operation ends with the next sub-counter overflow. While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1) and if write operation to RTCAnSUBU is completed, this bit is set to 1. See Section 31.5.5, Writing to RTCAnSUBU, for details.
4	RTCAnWSST	Indicates whether RTCAnSCMP write operation has been completed: 0: RTCAnSCMP write completed 1: RTCAnSCMP write in progress The write operation ends with the next sub-counter overflow. While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1) and if write operation to RTCAnSCMP is completed, this bit is set to 1. See Section 31.5.6, Writing to RTCAnSCMP, for details.
3	RTCAnRSST	Indicates whether the value of the sub-counter (RTCAnSUBC) has been transferred to the sub-count register read buffer (RTCAnSRBU): 0: Transfer in progress, or waiting for a transfer trigger 1: Transfer completed This bit is cleared (transfer is triggered) by RTCAnRSUB=1.This bit is automatically set when the transfer is completed. See Section 31.5.4, Reading RTCAnSRBU, for details.
2	RTCAnRSUB	Triggers transfer of the value of the sub-counter (RTCAnSUBC) to the dedicated read buffer (RTCAnSRBU) or clears the transfer state of the sub-counter: 0: Transfer status (RTCAnRSST) is cleared. 1: Transfer is triggered. This bit is used to read the value of RTCAnSRBU when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1). The value of RTCAnSUBC is synchronized with RTCATCKI and loaded to RTCAnSRBU. For details, see Section 31.5.4, Reading RTCAnSRBU.

Table 31.11 RTCAnCTL2 Register Contents (2/2)

Bit Position	Bit Name	Function
1	RTCAnWST	Indicates the status of all clock counters (RTCAnSECC to RTCAnYEARC): 0: All clock counters are running. 1: All clock counters are stopped The sub-counter is still running. The clock counters must be stopped before reading or writing clock counter values during sub-counter operation (RTCAnCTL0.RTCAnCE = 1). To stop the clock counters, set RTCAnWAIT = 1.
0	RTCAnWAIT	Restarts/stops all clock counters (RTCAnSECC to RTCAnYEARC): 0: Restarts all clock counters either immediately or immediately after the clock counter write operation finishes. 1: Stops all clock counters temporarily. The sub-counter is still running. The clock counters must be stopped before reading or writing counter buffers during sub-counter operation (RTCAnCTL0.RTCAnCE = 1). **CAUTION** Only one overflow can be held internally. When two overflows occur, the seconds counter is incremented only by one when it is restarted. Thus, the procedure must be completed within one second.

31.3.3 Details of RTCA Sub-Counter Registers

31.3.3.1 RTCAnSUBC — RTCA Sub-Count Register

This counter counts the 1-second reference time. It operates using the count clock RTCATCKI.

Access: This register can only be read in 32-bit units.

Address: <RTCAn_base> + $0C_H$

Value after reset: $0000\ 0000_H$

This register is initialized:

– When write operation is performed to the seconds count buffer register (RTCAnSEC) or to the time count buffer register (RTCAnTIME) and the value is reflected to the seconds count register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnSUBC[21:16]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 31.12 RTCAnSUBC Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned.
21 to 0	RTCAnSUBC [21:0]	Sub-counter value The sub-counter only operates while RTCAnCTL0.RTCAnCEST = 1.

NOTES

1. This sub-counter operates with RTCATCKI while the read operation is clocked by PCLK. Reading this sub-counter during operation (RTCAnCTL0.RTCAnCEST = 1) is asynchronous to RTCATCKI and can lead to wrong results.
   Use the sub-count register read buffer (RTCAnSRBU) to read the sub-counter value during operation.
   For details, see Section 31.5.4, Reading RTCAnSRBU.
2. The count-operation of this sub-counter depends on the selected operation mode. See Section 31.4, Operation, for details.

31.3.3.2 RTCAnSRBU — RTCA Sub-Count Register Read Buffer

This register is the read buffer for the sub-counter RTCAnSUBC.

Access: This register can only be read in 32-bit units.

Address: <RTCAn_base> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnSRBU[21:16]

Table 31.13 RTCAnSRBU Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned.
21 to 0	RTCAnSRBU [21:0]	Sub-counter value at the time of the last RTCAnSUBC read. When RTCAnCTL2.RTCAnRSUB is set to 1, the value of the RTCAnSUBC is loaded to the read buffer in synchronization with RTCATCKI.

NOTE

Perform RTCAnSRBU read according to the flow described in Section 31.5.4, Reading RTCAnSRBU.

31.3.3.3 RTCAnSUBU — RTCA Clock Error Correction Register

This register enables and specifies clock error correction. This register only applies in 32.768-kHz mode (RTCAnCTL0.RTCAnSLSB = 0).

For details on clock error correction, see Section 31.4.4, Clock Error Correction.

Access: This register can be read/written in 8-bit units.
Note the following when writing this register during sub-counter operation:
- Previous RTCAnSUBU write must be completed (RTCAnCTL2.RTCAnWUST = 0).
- The write operation ends with the next sub-counter overflow.

Address: <RTCAn_base> + 38_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnDEV	RTCAnF6	RTCAnF[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.14 RTCAnSUBU Register Contents

Bit Position	Bit Name	Function
7	RTCAnDEV	Specifies how often clock error correction is performed per minute: 0: Three times every minute (when RTCAnSECC equals 00, 20, and 40) 1: Once every minute (when RTCAnSECC equals 00)
6	RTCAnF6	Specifies whether the sub-counter value is incremented or decremented: 0: Incremented (+ correction) Incrementation value = (RTCAnF[5:0] value – 1) × 2 1: Decremented (– correction) Decrementation value = (inverted data of RTCAnF[5:0] value + 1) × 2
5 to 0	RTCAnF[5:0]	Error correction value

NOTES

1. When RTCAnF[5:1] = 00000_B, clock error correction is not performed.
2. Perform RTCAnSUBU write as described in
   - Section 31.5.1, Initial Setting of the RTCA, and
   - Section 31.5.5, Writing to RTCAnSUBU.

31.3.3.4 RTCAnSCMP — RTCA Sub-Counter Compare Register

This register sets the compare value of the sub-counter RTCAnSUBC in frequency selection mode (RTCAnCTL0.RTCAnSLSB = 1).

When the sub-counter values matches the value of this register, an overflow signal is output to the seconds counter RTCAnSECC and the sub-counter is cleared.

Set the value for this register according to the frequency of the input clock RTCATCKI.

Access: This register can be read/written in 32-bit units.
Note the following when writing this register during sub-counter operation:
- Previous RTCAnSCMP write must be completed (RTCAnCTL2.RTCAnWSST = 0).
- The write operation ends with the next sub-counter overflow.

Address: <RTCAn_base> + $3C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnSCMP[21:16]

R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RTCAnSCMP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.15 RTCAnSCMP Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
21 to 0	RTCAnSCMP [21:0]	Sub-counter compare value in frequency selection mode.

Example

The following example illustrates the setting of RTCAnSCMP:

- RTCATCKI = 4 MHz = 4,000,000 Hz
- RTCAnSCMP[21:0] = 4,000,000 – 1 = 3,999,999 (decimal code) = $3D08FF_H$
- The seconds counter RTCAnSECC is triggered when the sub-counter value changes from $3D08FF_H$ to 0_H.

NOTES

1. The operation of the RTCA cannot be guaranteed if a value of 3198 (decimal code) or lower is set in this register.
2. Perform RTCAnSCMP write as described in Section 31.5.1, Initial Setting of the RTCA and Section 31.5.6, Writing to RTCAnSCMP.

31.3.4 Details of RTCA Clock Counter and Buffer Registers

31.3.4.1 RTCAnSECC — RTCA Seconds Count Register

This register is the seconds counter. It counts seconds from 00 to 59 in BCD.

This register counts as follows.

- It is triggered by every overflow of the sub-counter RTCAnSUBC.

  If the sub-counter overflows while the seconds counter is stopped (RTCAnCTL2.RTCAnWST = 1), the seconds counter behaves as follows:

  – If one sub-counter overflow occurs while the seconds counter is stopped, the overflow is held internally.
  The seconds counter is incremented by one when it is restarted.

  – If two or more overflows occur while the seconds counter is stopped, the overflow count cannot be held internally.
  The seconds counter is incremented by one when it is restarted.

  – If the seconds counter was updated while the seconds counter is stopped, the sub-counter overflow(s) are ignored.

- It outputs an overflow signal when the value changes from 59 to 00. The overflow signal triggers the minutes counter (RTCAnMINC).

Access: This register can only be read in 8-bit units.

Address: <RTCAn_base> + $4C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnSECC[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 31.16 RTCAnSECC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	RTCAnSECC [6:0]	Seconds in BCD

NOTES

1. Perform RTCAnSECC read according to the flow described in Section 31.5.3, Reading Clock Counters.
2. A start value can be assigned to this register by writing to the seconds count buffer register RTCAnSEC or to the clock time setting register RTCAnTIME. See
   - **Section 31.5.1, Initial Setting of the RTCA**, and
   - **Section 31.5.2, Updating Clock Counters**

31.3.4.2 RTCAnSEC — RTCA Seconds Count Buffer Register

This register is a buffer register to read/write the seconds counter RTCAnSECC.

Access: This register can be read/written in 8-bit units.

Address: <RTCAn_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnSEC[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.17 RTCAnSEC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
6 to 0	RTCAnSEC [6:0]	Seconds in BCD

NOTES

1. When writing this register, only decimal values between 00 and 59 in BCD are allowed.
2. Perform RTCAnSEC read/write as described in
   - **Section 31.5.1, Initial Setting of the RTCA,**
   - **Section 31.5.2, Updating Clock Counters**, and
   - **Section 31.5.3, Reading Clock Counters.**

31.3.4.3 RTCAnMINC — RTCA Minutes Count Register

This register is the minutes counter. It counts minutes from 00 to 59 in BCD.

This register counts as follows.

- It is triggered by every overflow of the seconds counter RTCAnSECC.
- It outputs an overflow signal when the value changes from 59 to 00. The overflow signal triggers the hours counter (RTCAnHOURC).

Access: This register can only be read in 8-bit units.

Address: <RTCAn_base> + 50_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnMINC[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 31.18 RTCAnMINC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	RTCAnMINC [6:0]	Minutes in BCD

NOTES

1. Perform RTCAnMINC read according to the flow described in Section 31.5.3, Reading Clock Counters.
2. A start value can be assigned to this register by writing to the minutes count buffer register RTCAnMIN or to the time count buffer register RTCAnTIME. See
   - **Section 31.5.1, Initial Setting of the RTCA**, and
   - **Section 31.5.2, Updating Clock Counters.**

31.3.4.4 RTCAnMIN — RTCA Minutes Count Buffer Register

This register is a buffer register to read/write the minutes counter RTCAnMINC.

Access: This register can be read/written in 8-bit units.

Address: <RTCAn_base> + 18_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnMIN[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.19 RTCAnMIN Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
6 to 0	RTCAnMIN [6:0]	Minutes in BCD

NOTES

1. When writing this register, only decimal values between 00 and 59 in BCD are allowed.
2. Perform RTCAnMIN read/write as described in
   - **Section 31.5.1, Initial Setting of the RTCA,**
   - **Section 31.5.2, Updating Clock Counters**, and
   - **Section 31.5.3, Reading Clock Counters.**

31.3.4.5 RTCAnHOURC — RTCA Hours Count Register

This register is the hours counter. It counts the hours in BCD. The count range depends on the selected hour format. See Table 31.21, 12- and 24-Hour Format.

This register counts as follows.

- It is triggered by every overflow of the minutes counter RTCAnMINC.
- It outputs an overflow signal when the value changes from 23 to 00 (in 24-hour format) or from 31 to 12 (in 12-hour format). The overflow signal triggers two counters:
  - Day of the week counter (RTCAnWEEKC)
  - Day of the month counter (RTCAnDAYC)

Access: This register can only be read in 8-bit units.

Address: <RTCAn_base> + 54_H

Value after reset: 12_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnHOURC[5:0]					
Value after reset	0	0	0	1	0	0	1	0
R/W	R	R	R	R	R	R	R	R

Table 31.20 RTCAnHOURC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned.
5 to 0	RTCAnHOURC [5:0]	Hours in BCD. See Table 31.21, 12- and 24-Hour Format, for details.

NOTES

1. Perform RTCAnHOURC read according to the flow described in Section 31.5.3, Reading Clock Counters.
2. A start value can be assigned to this register by writing to the hours count buffer register RTCAnHOUR or to the time count buffer register RTCAnTIME. See
   - **Section 31.5.1, Initial Setting of the RTCA**, and
   - **Section 31.5.2, Updating Clock Counters.**

12- or 24-hour format

The count values of RTCAnHOURC depend on the selected hour format.

If 12-hour format is selected (RTCAnCTL0.RTCAnAMPM = 0), bit 5 in the RTCAnHOURC register is the am/pm indicator:

- RTCAnHOURC[5] = 0: am
- RTCAnHOURC[5] = 1: pm

The following table shows the count range of RTCAnHOURC in both 12- and 24-hour format.

Table 31.21 12- and 24-Hour Format

12-Hour Format (RTCAnAMPM = 0)			24-Hour Format (RTCAnAMPM = 1)	
Time	RTCAnHOURC		Time	RTCAnHOURC
0 am	12_H		0	00_H
1 am	01_H		1	01_H
2 am	02_H		2	02_H
3 am	03_H		3	03_H
4 am	04_H		4	04_H
5 am	05_H		5	05_H
6 am	06_H		6	06_H
7 am	07_H		7	07_H
8 am	08_H		8	08_H
9 am	09_H		9	09_H
10 am	10_H		10	10_H
11 am	11_H		11	11_H
0 pm	32_H	↓ pm indicator in 12-hour format: RTCAnHOUR.RTCAnHOUR[5] = 1	12	12_H
1 pm	21_H		13	13_H
2 pm	22_H		14	14_H
3 pm	23_H		15	15_H
4 pm	24_H		16	16_H
5 pm	25_H		17	17_H
6 pm	26_H		18	18_H
7 pm	27_H		19	19_H
8 pm	28_H		20	20_H
9 pm	29_H		21	21_H
10 pm	30_H		22	22_H
11 pm	31_H		23	23_H

31.3.4.6 RTCAnHOUR — RTCA Hours Count Buffer Register

This register is a buffer register to read/write the hours counter RTCAnHOURC.

Access: This register can be read/written in 8-bit units.

Address: <RTCAn_base> + $1C_H$

Value after reset: 12_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnHOUR[5:0]					
Value after reset	0	0	0	1	0	0	1	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.22 RTCAnHOUR Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5 to 0	RTCAnHOUR [5:0]	Hours in BCD See Table 31.21, 12- and 24-Hour Format, for details.

NOTES

1. When writing this register, only the following decimal values in BCD are allowed:
   - 12-hour format (RTCAnCTL0.RTCAnAMPM = 0):
     01 to 12 or 21 to 32
   - 24-hour format (RTCAnCTL0.RTCAnAMPM = 1):
     00 to 23
2. Perform RTCAnHOUR read/write as described in
   - **Section 31.5.1, Initial Setting of the RTCA,**
   - **Section 31.5.2, Updating Clock Counters**, and
   - **Section 31.5.3, Reading Clock Counters.**

31.3.4.7 RTCAnWEEKC — RTCA Day of the Week Count Register

This register is the day of the week counter. It counts from 0 to 6.

This register counts as follows.

- It is triggered by every overflow of the hours counter RTCAnHOURC.

Access: This register can only be read in 8-bit units.

Address: <RTCAn_base> + 58_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	RTCAnWEEKC[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 31.23 RTCAnWEEKC Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned.
2 to 0	RTCAnWEEKC [2:0]	Day of the week

NOTES

1. Perform RTCAnWEEKC read according to the flow described in Section 31.5.3, Reading Clock Counters.
2. A start value can be assigned to this register by writing to the day of the week count buffer register RTCAnWEEK or to the calendar count buffer register RTCAnCAL. See
   - **Section 31.5.1, Initial Setting of the RTCA**, and
   - **Section 31.5.2, Updating Clock Counters.**

31.3.4.8 RTCAnWEEK — RTCA Day of the Week Count Buffer Register

This register is a buffer register to read/write the day of the week counter RTCAnWEEKC.

There is no particular correspondence between the value of RTCAnWEEK and the day of the week. Set the correspondence according to the application to be used.

Example: 0 = Sunday, 1 = Monday, …, 6 = Saturday

Access: This register can be read/written in 8-bit units.

Address: <RTCAn_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	RTCAnWEEK[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 31.24 RTCAnWEEK Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2 to 0	RTCAnWEEK [2:0]	Day of the week

NOTES

1. When writing this register, only decimal values between 0 and 6 in BCD are allowed.
2. Perform RTCAnWEEK read/write as described in
   - **Section 31.5.1, Initial Setting of the RTCA,**
   - **Section 31.5.2, Updating Clock Counters**, and
   - **Section 31.5.3, Reading Clock Counters.**

31.3.4.9 RTCAnDAYC — RTCA Day of the Month Count Register

This register is the day of the month counter. It counts from 01 to a maximum of 31 in BCD, depending on the value of the month counter (RTCAnMONC) and the year counter (RTCAnYEARC):

- 01 to 31 (January, March, May, July, August, October, December)
- 01 to 30 (April, June, September, November)
- 01 to 29 (February, leap year)
- 01 to 28 (February, non-leap year)

Years 0, 4, 8, 12, etc., are considered leap years.

This register counts as follows.

- It is triggered by every overflow of the hours of the day counter RTCAnHOURC.
- It outputs an overflow signal when the value changes from 28, 29, 30, or 31 to 01, depending on the current month and year. The overflow signal triggers the month counter (RTCAnMONC).

Access: This register can only be read in 8-bit units.

Address: <RTCAn_base> + $5C_H$

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnDAYC[5:0]					
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R

Table 31.25 RTCAnDAYC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned.
5 to 0	RTCAnDAYC [5:0]	Day of the month in BCD

NOTES

1. Perform RTCAnDAYC read according to the flow described in Section 31.5.3, Reading Clock Counters.
2. A start value can be assigned to this register by writing to the day of the month count buffer register RTCAnDAY or to the calendar count buffer register RTCAnCAL. See
   - **Section 31.5.1, Initial Setting of the RTCA**, and
   - **Section 31.5.2, Updating Clock Counters.**

31.3.4.10 RTCAnDAY — RTCA Day of the Month Count Buffer Register

This register is a buffer register to read/write the day of the month counter RTCAnDAYC.

Access: This register can be read/written in 8-bit units.

Address: <RTCAn_base> + 24_H

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnDAY[5:0]					
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.26 RTCAnDAY Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5 to 0	RTCAnDAY [5:0]	Day of the month in BCD

NOTES

1. When writing this register, only decimal values between 01 and 31 in BCD are allowed:
   - 01 to 31 (January, March, May, July, August, October, December)
   - 01 to 30 (April, June, September, November)
   - 01 to 29 (February, leap year)
   - 01 to 28 (February, non-leap year)
2. Perform RTCAnDAY read/write as described in
   - **Section 31.5.1, Initial Setting of the RTCA,**
   - **Section 31.5.2, Updating Clock Counters**, and
   - **Section 31.5.3, Reading Clock Counters.**

31.3.4.11 RTCAnMONC — RTCA Month Count Register

This register is the month counter. It counts the month of the year, starting from 01 to 12 in BCD.

This register counts as follows.

- It is triggered by every overflow of the counter for the day of the month RTCAnDAYC.
- It outputs an overflow signal when the value changes from 12 to 01. The overflow signal triggers the year counter (RTCAnYEARC).

Access: This register can only be read in 8-bit units.

Address: <RTCAn_base> + 60_H

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	RTCAnMONC[4:0]				
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R

Table 31.27 RTCAnMONC Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned.
4 to 0	RTCAnMONC [4:0]	Month of the year in BCD

NOTES

1. Perform RTCAnMONC read according to the flow described in **Section 31.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the month count buffer register RTCAnMONTH or to the calendar count buffer register RTCAnCAL. See
   - **Section 31.5.1, Initial Setting of the RTCA**, and
   - **Section 31.5.2, Updating Clock Counters.**

31.3.4.12 RTCAnMONTH — RTCA Month Count Buffer Register

This register is a buffer register to read/write the month counter RTCAnMONC.

Access: This register can be read/written in 8-bit units.

Address: <RTCAn_base> + 28_H

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	RTCAnMONTH[4:0]				
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 31.28 RTCAnMONTH Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
4 to 0	RTCAnMONTH [4:0]	Month of the year in BCD

NOTES

1. When writing this register, only decimal values between 01 and 12 in BCD are allowed.
2. Perform RTCAnMONTH read/write as described in
   - **Section 31.5.1, Initial Setting of the RTCA,**
   - **Section 31.5.2, Updating Clock Counters**, and
   - **Section 31.5.3, Reading Clock Counters.**

31.3.4.13 RTCAnYEARC — RTCA Year Count Register

This register is the year counter. It counts years from 00 to a maximum of 99 in BCD.

Years 00, 04, 08, …, 92, and 96 (every four years) are considered leap years.

This register counts as follows.

- It is triggered by every overflow of the month counter RTCAnMONC.

Access: This register can only be read in 8-bit units.

Address: <RTCAn_base> + 64_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnYEARC[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 31.29 RTCAnYEARC Register Contents

Bit Position	Bit Name	Function
7 to 0	RTCAnYEARC [7:0]	Year in BCD

NOTES

1. Perform RTCAnYEARC read according to the flow described in **Section 31.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the year count buffer register RTCAnYEAR or to the calender count buffer register RTCAnCAL. See
   - Section 31.5.1, Initial Setting of the RTCA, and
   - **Section 31.5.2, Updating Clock Counters.**

31.3.4.14 RTCAnYEAR — RTCA Year Count Buffer Register

This register is a buffer register to read/write the year counter RTCAnYEARC.

Access: This register can be read/written in 8-bit units.

Address: <RTCAn_base> + $2C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnYEAR[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.30 RTCAnYEAR Register Contents

Bit Position	Bit Name	Function
7 to 0	RTCAnYEAR [7:0]	Year in BCD

NOTES

1. When writing this register, only decimal values between 00 and 99 in BCD are allowed.
2. Perform RTCAnYEAR read/write as described in
   - **Section 31.5.1, Initial Setting of the RTCA,**
   - Section 31.5.2, Updating Clock Counters, and
   - **Section 31.5.3, Reading Clock Counters.**

31.3.5 Details of RTCA Special Counter and Buffer Registers

31.3.5.1 RTCAnTIMEC — RTCA Time Count Register

This register enables the RTCAnHOURC, RTCAnMINC, and RTCAnSECC counters to be read simultaneously.

Access: This register can only be read in 32-bit units.

Address: <RTCAn_base> + 68_H

Value after reset: 0012 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnHOURC[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.31 RTCAnTIMEC Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned.
21 to 16	RTCAnHOURC [5:0]	Hours in BCD. See Table 31.21, 12- and 24-Hour Format, for details.
15	Reserved	When read, the value after reset is returned.
14 to 8	RTCAnMINC [6:0]	Minutes in BCD
7	Reserved	When read, the value after reset is returned.
6 to 0	RTCAnSECC [6:0]	Seconds in BCD

NOTES

1. Perform RTCAnTIMEC read according to the flow described in **Section 31.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the time count buffer register RTCAnTIME. See
   - **Section 31.5.1, Initial Setting of the RTCA**, and
   - **Section 31.5.2, Updating Clock Counters.**

31.3.5.2 RTCAnTIME — RTCA Time Count Buffer Register

This register enables the RTCAnHOUR, RTCAnMIN, and RTCAnSEC buffer registers to be read/written simultaneously.

Access: This register can be read/written in 32-bit units.

Address: <RTCAn_base> + 30_H

Value after reset: $0012\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnHOUR[5:0]

Table 31.32 RTCAnTIME Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
21 to 16	RTCAnHOUR [5:0]	Hours in BCD See Table 31.21, 12- and 24-Hour Format, for details.
15	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
14 to 8	RTCAnMIN [6:0]	Minutes in BCD
7	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
6 to 0	RTCAnSEC [6:0]	Seconds in BCD

NOTE

Perform RTCAnTIME read/write as described in

- **Section 31.5.1, Initial Setting of the RTCA,**
- Section 31.5.2, Updating Clock Counters, and
- **Section 31.5.3, Reading Clock Counters.**

31.3.5.3 RTCAnCALC — RTCA Calendar Count Register

This register enables the RTCAnYEARC, RTCAnMONC, RTCAnDAYC, and RTCAnWEEKC counters to be read simultaneously.

Access: This register can only be read in 32-bit units.

Address: <RTCAn_base> + $6C_H$

Value after reset: $0001\ 0100_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RTCAnYEARC[7:0]								—	—	—	RTCAnMONC[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.33 RTCAnCALC Register Contents

Bit Position	Bit Name	Function
31 to 24	RTCAnYEARC [7:0]	Year in BCD
23 to 21	Reserved	When read, the value after reset is returned.
20 to 16	RTCAnMONC [4:0]	Month of the year in BCD
15, 14	Reserved	When read, the value after reset is returned.
13 to 8	RTCAnDAYC [5:0]	Day of the month in BCD
7 to 3	Reserved	When read, the value after reset is returned.
2 to 0	RTCAnWEEKC [2:0]	Day of the week in BCD

NOTES

1. Perform RTCAnCALC read according to the flow described in **Section 31.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the clock time setting register RTCAnCAL. See
   - **Section 31.5.1, Initial Setting of the RTCA**, and
   - **Section 31.5.2, Updating Clock Counters.**

31.3.5.4 RTCAnCAL — RTCA Calendar Count Buffer Register

This register enables the RTCAnYEAR, RTCAnMONTH, RTCAnDAY, and RTCAnWEEK buffer registers to be read/written simultaneously.

Access: This register can be read/written in 32-bit units.

Address: <RTCAn_base> + 34_H

Value after reset: $0001\ 0100_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RTCAnYEAR[7:0]								—	—	—	RTCAnMONTH[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

	—	—	RTCAnDAY[5:0]						—	—	—	—	—	RTCAnWEEK[2:0]		
Value after reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Table 31.34 RTCAnCAL Register Contents

Bit Position	Bit Name	Function
31 to 24	RTCAnYEAR [7:0]	Year in BCD
23 to 21	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
20 to 16	RTCAnMONTH [4:0]	Month of the year in BCD
15, 14	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
13 to 8	RTCAnDAY [5:0]	Day of the month in BCD
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2 to 0	RTCAnWEEK [2:0]	Day of the week in BCD

NOTE

Perform RTCAnCAL read/write as described in

- **Section 31.5.1, Initial Setting of the RTCA.**
- **Section 31.5.2, Updating Clock Counters**, and
- **Section 31.5.3, Reading Clock Counters.**

31.3.6 Details of RTCA Alarm Setting Registers

31.3.6.1 RTCAnALM — RTCA Alarm Minute Setting Register

This register specifies the minute of the alarm interrupt.

For details and example settings, see Section 31.4.3, Alarm Interrupt Function.

Access: This register can be read/written in 8-bit units.

Address: <RTCAn_base> + 40_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnALM[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.35 RTCAnALM Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
6 to 0	RTCAnALM [6:0]	Minute of the alarm interrupt in BCD

NOTES

1. If decimal values outside the range of 00 to 59 in BCD are set, no alarm interrupt request will be generated.
2. When the setting of RTCAnALM is changed during sub-counter operation (RTCAnCTL0.RTCAnCEST = 1), a glitch may be output to RTCATINTAL. Implement appropriate interrupt mask processing procedures.

31.3.6.2 RTCAnALH — RTCA Alarm Hour Setting Register

This register specifies the hour of the alarm interrupt.

For details and example settings, see Section 31.4.3, Alarm Interrupt Function.

Access: This register can be read/written in 8-bit units.

Address: <RTCAn_base> + 44_H

Value after reset: 12_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnALH[5:0]					
Value after reset	0	0	0	1	0	0	1	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.36 RTCAnALH Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5 to 0	RTCAnALH [5:0]	Hour of the alarm interrupt in BCD

NOTES

1. If decimal values outside the following range are set, no alarm interrupt request will be generated:
   - 12-hour format (RTCAnCTL0.RTCAnAMPM = 0): 01 to 12 or 21 to 32
   - 24-hour format (RTCAnCTL0.RTCAnAMPM = 1): 00 to 23
2. When the setting of RTCAnALH is changed during sub-counter operation (RTCAnCTL0.RTCAnCEST = 1), a glitch may be output to RTCATINTAL. Implement appropriate interrupt mask processing procedures.

31.3.6.3 RTCAnALW — RTCA Alarm Day of the Week Setting Register

This register specifies the day(s) of the week of the alarm interrupt.

Access: This register can be read/written in 8-bit units.

Address: <RTCAn_base> + 48_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnALW[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.37 RTCAnALW Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
6 to 0	RTCAnALW [6:0]	Specifies day of the week m (m = 0 to 6) as a day, when an alarm interrupt request is generated: 0: No alarm interrupt request is generated on day m. 1: Alarm interrupt request is generated on day m at the time set using RTCAnALM and RTCAnALH. The bits of this register correspond to the count value of the day of the week counter (RTCAnWEEKC).

NOTE

When the setting of RTCAnALW is changed during sub-counter operation (RTCAnCTL0.RTCAnCE = 1), a glitch may be output to RTCATINTAL. Implement appropriate interrupt mask processing procedures.

Example

If Sunday is RTCAnWEEK = 0, Monday is RTCAnWEEK = 1, Tuesday is RTCAnWEEK = 2, …, Saturday is RTCAnWEEK = 6:

- To set the alarm for Sunday, set RTCAnALW = $0000\ 0001_B$.
- To set the alarm for Monday and Wednesday, set RTCAnALW = $0000\ 1010_B$.
- To set the alarm for Tuesday, Thursday, and Saturday, set RTCAnALW = $0101\ 0100_B$.

For more examples, see Section 31.4.3, Alarm Interrupt Function.

31.3.7 RTCA Emulation Register

31.3.7.1 RTCAnEMU — RTCA Emulation Register

This register controls operation by SVSTOP.

Access: This register can be read/written in 8- or 1-bit units.
A write should be performed when EPC.SVSTOP = 0.

Address: <RTCAn_base> + 74_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 31.38 RTCAnEMU Register Contents

Bit Position	Bit Name	Function
7	RTCAnSVSDIS	When the EPC.SVSTOP bit is set to 0: Count clock is supplied when the debugger gains microcontroller control (at a breakpoint, etc.) regardless of the value of this bit. When the EPC.SVSTOP bit is set to 1: 0: Count clock is stopped when the debugger gains microcontroller control (at a breakpoint, etc.). 1: Count clock continues to be supplied when the debugger gains microcontroller control (at a breakpoint, etc.).
6 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

31.4 Operation

The RTCA provides two operation modes:

- Frequency selection mode
- 32.768-kHz mode

The operation mode that can be used depends on the available input clock RTCATCKI. The operation mode specifies the sub-counter compare value that is used to trigger the seconds counter and thus all subsequent counters. Clock error correction is only possible in 32.768-kHz mode.

The following table provides an overview of the properties of the two operation modes.

Table 31.39 RTCA Operation Mode Overview

		32.768-kHz Mode	
	Frequency Selection Mode	**Clock Correction Disabled**	**Clock Correction Enabled**
Allowed input clock RTCATCKI	Any frequency from 32 kHz to 4.194304MHz	32.768 kHz	Any frequency from 32.76180000 kHz to 32.77420000 kHz
Sub-counter RTCAnSUBC operation	• Counter overflow at value of RTCAnSCMP • RTCAnSCMP must be set to RTCATCKI-1 (in Hz)	Counter overflow at $7FFF_H$	Counter overflow at $7FFF_H$ or Every 20 or 60 seconds: $7FFF_H$ ±RTCAnSUBU.RTCAnF[5:0]

The operation mode is selected by control bit RTCAnCTL0.RTCAnSLSB. For details on how to set the operation mode during RTCA initialization, see Section 31.5.1, Initial Setting of the RTCA.

CAUTIONS

1. **The input clock RTCATCKI must not be outside the allowed frequency range.**
2. **The operation mode must not be changed while sub-counter operation is enabled (RTCAnCTL0.RTCAnCEST = 1).**

31.4.1 Clock Counter Format

The clock counters (RTCAnSECC to RTCAnYEARC) operate on binary coded decimals (BCD): Each digit is represented by its own binary sequence.

Depending on the valid data range, the number of bits for a digit differs. For example, the tens digit of the month of the year counter has only one bit (for 0 and 1) whereas the tens digit of the minutes counter has 3 bits (for 0 to 5).

The following table lists the decimals 0 to 59 in binary and BCD.

Table 31.40 Example of BCD Code – Seconds or Minutes Counter (0 to 59)

Decimal	Binary	BCD
0	000000	000 0000
1	000001	000 0001
2	000010	000 0010
3	000011	000 0011
4	000100	000 0100
5	000101	000 0101
6	000110	000 0110
7	000111	000 0111
8	001000	000 1000
9	001001	000 1001
10	001010	001 0000
11	001011	001 0001
12	001100	001 0010
:	:	:
58	111010	101 1000
59	111011	101 1001

31.4.2 Fixed Interval Interrupt Function

Interrupt RTCATINTR can be specified to occur after every 0.25 seconds, 0.5 seconds, 1 (full) second, 1 (full) minute, 1 (full) hour, 1 (full) day, or 1 (full) month.

The fixed interval interrupt function is controlled by bits RTCAnCTL1.RTCAnCT[2:0].

31.4.3 Alarm Interrupt Function

Interrupt RTCATINTAL can be specified to occur at a certain time on one or several days of the week. This interrupt can be used as a wake-up signal.

The alarm interrupt function is enabled and disabled by bit RTCAnCTL1.RTCAnENALM.

The alarm setting is specified by the following control registers:

- RTCAnALW selects the weekday(s).

The allocation of bits to weekdays is defined by the day of the week count buffer register RTCAnWEEK.

- RTCAnALH and RTCAnALM specify the hour and minute in BCD.

Examples

The following tables show some exemplary settings of the alarm control registers for both 12-hour and 24-hour format.

In this example, Sunday is RTCAnWEEK = 0, Monday is RTCAnWEEK = 1, Tuesday is RTCAnWEEK = 2, …, Saturday is RTCAnWEEK = 6:

Table 31.41 Alarm Setting in 12-Hour Format (RTCAnCTL0.RTCAnAMPM = 0)

Alarm Setting Time	RTCAnALW	RTCAnALH	RTCAnALM
Sunday 7:00 am	01_H	07_H	00_H

31.4.4 Clock Error Correction

Clock error correction compensates for deviations of the oscillator from the nominal clock rate. With clock error correction input clock rates from 32.76180 kHz to 32.77420 kHz are possible.

The clock error correction function is only available in 32.768-kHz operation mode. In this operation mode, a nominal clock rate of 32.768 kHz is expected and the sub-counters overflow value is fixed to $7FFF_H$.

The following figures illustrate the clock error when the input clock rate deviates from the nominal clock.

RTCATCKI = 32.768 kHz

Figure 31.2, RTCATCKI = 32.768 kHz, No Clock Error Correction Required shows the timing diagram if RTCATCKI matches the nominal clock rate of 32.768 kHz. No clock error correction is required.

Counting from 0 to 32767 (0 to $7FFF_H$) with a 32.768-kHz clock is exactly equal to one second.

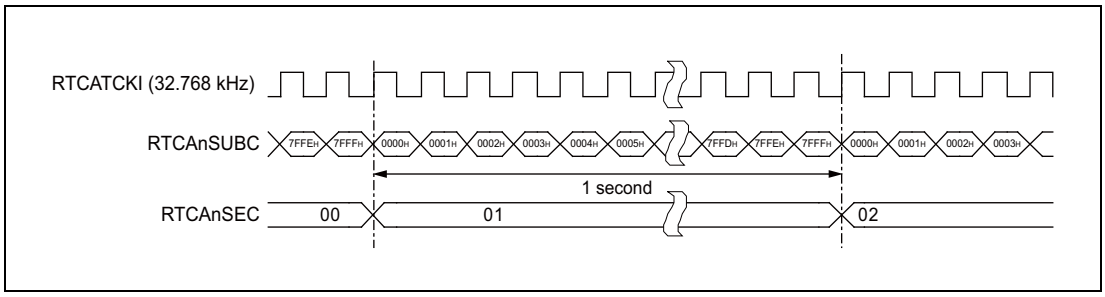

Figure 31.2 RTCATCKI = 32.768 kHz, No Clock Error Correction Required

RTCATCKI = 32.769 kHz

Figure 31.3, RTCATCKI = 32.769 kHz, No Clock Error Correction Enabled shows the timing diagram if RTCATCKI deviates from the nominal clock rate of 32.768 kHz. In this example, RTCATCKI is connected to a 32.769-kHz oscillator. Clock error correction is not enabled.

Counting from 0 to 32767 (0 to $7FFF_H$) with a 32.769-kHz clock is equal to approximately 0.99997 seconds (32768/32769). A "+ error" (faster than 32.768-kHz) occurs. In one month, RTCA deviates approximately –79 seconds from the real time.

Error = (32768/32769 - 1) × 60 (s) × 60 (min) × 24 (h) × 30 (d)

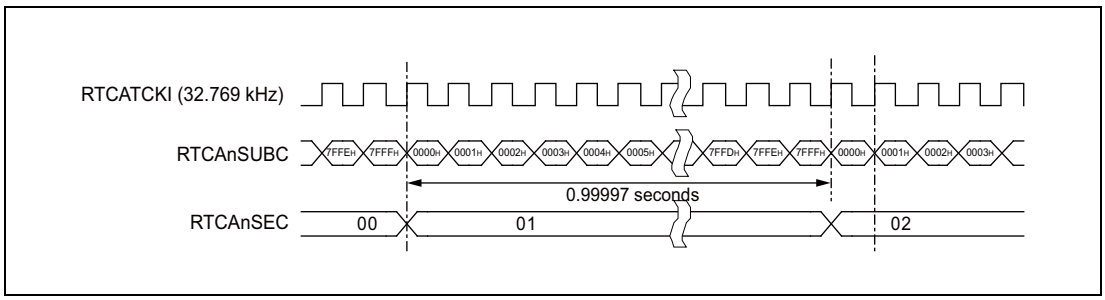

Figure 31.3 RTCATCKI = 32.769 kHz, No Clock Error Correction Enabled

Clock error correction is performed by stretching/reducing the 1-second period of the sub-counter at regular intervals. The sub-counter's upper limit of $7FFF_H$ is increased or decreased by setting the following parameters in register RTCAnSUBU:

- A correction value greater than one
- An operator (add/subtract)
- An interval (20 or 60 seconds)

The corrected overflow value becomes effective every 20 or 60 seconds, so that on the average RTCAnSECC is triggered exactly every second.

31.4.4.1 Setting the Correction Value and the Operator

The correction value and operator are specified by the RTCAnF6, RTCAnF[5:0] bits of the RTCAnSUBU register:

- RTCAnF6 specifies whether the overflow value is incremented or decremented.
- RTCAnF[5:0] specifies the correction value.

The correction values are calculated as follows:

Table 31.43 Correction Value Settings

RTCAnF6	Increment/Decrement	Correction Value
0	Increment	(Value of RTCAnF[5:0] – 1) × 2
1	Decrement	(Inverted value of RTCAnF[5:0] + 1) × 2

Some examples are given in the following table:

Table 31.44 Correction Value Examples

RTCAnF6	RTCAnF[5:0]	Correction Value	Count Limit of RTCAnSUBC
0	15_H	$(15_H - 1) \times 2 = 40$	32768 + 40 = 32808
1	15_H	$(\overline{15}_H + 1) \times 2$ $= (2A_H + 1) \times 2$ $= 86$	32768 – 86 = 32682

31.4.4.2 Impact of the Repetition Interval

The correction value set by RTCAnF6, RTCAnF[5:0] does not change the count limit of RTCAnSUBC every second. The repetition interval at which the correction value becomes effective is specified by bit RTCAnDEV.

This bit also influences the size of the correctable frequency range and the correction accuracy.

The following table summarizes the RTCAnDEV settings.

Table 31.45 Setting of Bit RTCAnSUBU.RTCAnDEV

RTCAn DEV	Count Limit of RTCAnSUBC is Changed	Frequency Range that can be Corrected	Correction Accuracy
0	Every 20 seconds when RTCAnSECC = 00, 20, or 40	32.76180000 to 32.77420000 kHz	
1	Every 60 seconds when RTCAnSECC = 00	32.76593333 to 32.77006667 kHz	Three times higher than for RTCAnDEV = 0

31.4.4.3 Sample Settings

The frequencies that can be corrected, as well as the setting values of bits RTCAnDEV, RTCAnF6, and RTCAnF[5:0], are listed in the following table.

Table 31.46 Correctable Frequency Range when RTCAnDEV = 0

Input Clock Frequency	RTCAnF6	RTCAnF[5:0]	Correction Value of RTCAnSUBC
—	0	000000	No correction
—	0	000001	No correction
32.76810000 kHz	0	000010	Once every 20 s, RTCAnSUBC count value + 2

Table 31.46 Correctable Frequency Range when RTCAnDEV = 0

Input Clock Frequency	RTCAnF6	RTCAnF[5:0]	Correction Value of RTCAnSUBC
32.76820000 kHz	0	000011	Once every 20 s, RTCAnSUBC count value + 4
32.76830000 kHz	0	000100	Once every 20 s, RTCAnSUBC count value + 6
:	:	:	:
32.77400000 kHz	0	111101	Once every 20 s, RTCAnSUBC count value + 120
32.77410000 kHz	0	111110	Once every 20 s, RTCAnSUBC count value + 122
32.77420000 kHz (upper limit)	0	111111	Once every 20 s, RTCAnSUBC count value + 124
—	1	000000	No correction
—	1	000001	No correction
32.76180000 kHz (lower limit)	1	000010	Once every 20 s, RTCAnSUBC count value – 124
32.76190000 kHz	1	000011	Once every 20 s, RTCAnSUBC count value – 122

:	:	:	:
32.76790000 kHz	1	111101	Once every 60 s, RTCAnSUBC count value – 6
32.76793333 kHz	1	111110	Once every 60 s, RTCAnSUBC count value – 4
32.76796667 kHz	1	111111	Once every 60 s, RTCAnSUBC count value – 2

31.5 Procedures for Setup, Writing and Reading

The following subsections provide flow charts that illustrate the procedures for RTCA setup and for reading and writing the RTCA clock counters.

31.5.1 Initial Setting of the RTCA

The RTCA must be stopped before setting the initial setting value of each counter.

31.5.1.1 RTCA Stop Procedure

Stop the RTCA according to the following flow.

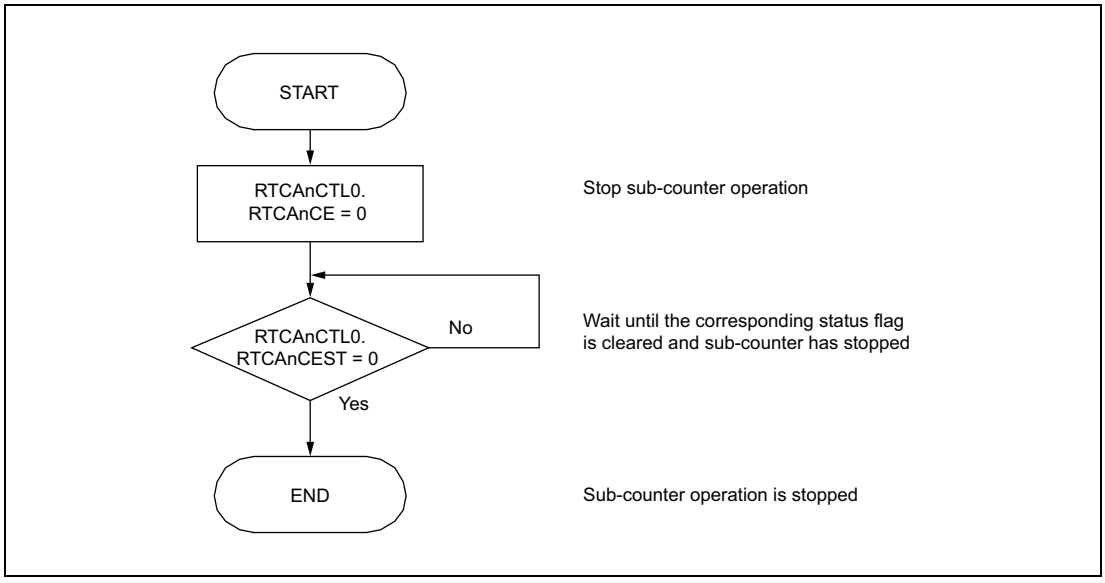

Figure 31.4 RTCA Stop Procedure

31.5.1.2 RTCA Initialization Procedure

Perform the initial setting of the RTCA according to the following flow:

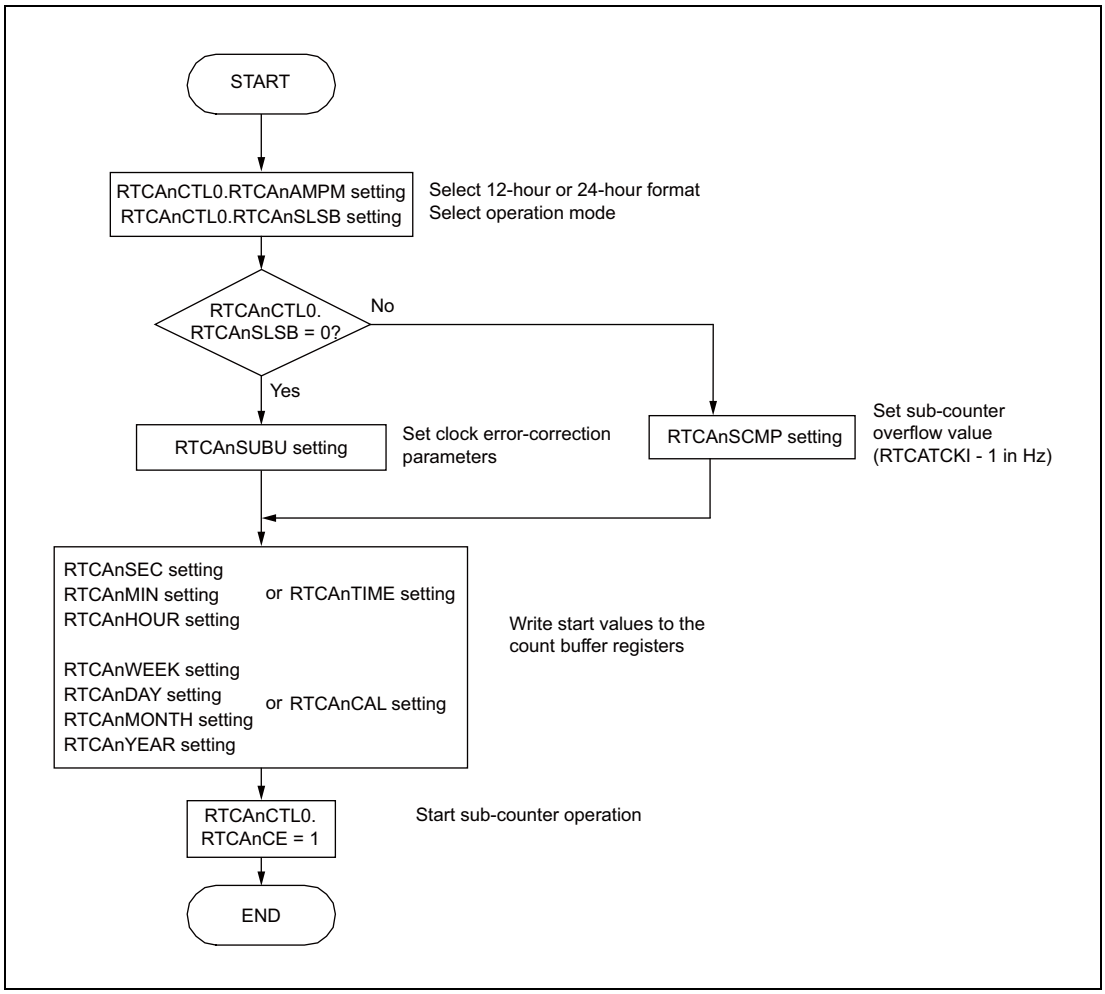

Figure 31.5 RTCA Initial Setup Procedure

CAUTION

The internal clock counter is synchronized with RTCATCKI.

In addition, two RTCATCKI periods are required before the clock counter starting behind END of the above flow.

Therefore, PCLK must be continuously supplied until the completion of the initial setting.

Check that RTCAnCTL0.RTCAnCEST = 1, when the supply of PCLK is stopped after setting the initial setting value of RTCA.

31.5.2 Updating Clock Counters

The clock counters RTCAnSECC to RTCAnYEARC can be stopped and updated while the sub-counter is running.

To update the clock counter when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), follow the flowchart shown below.

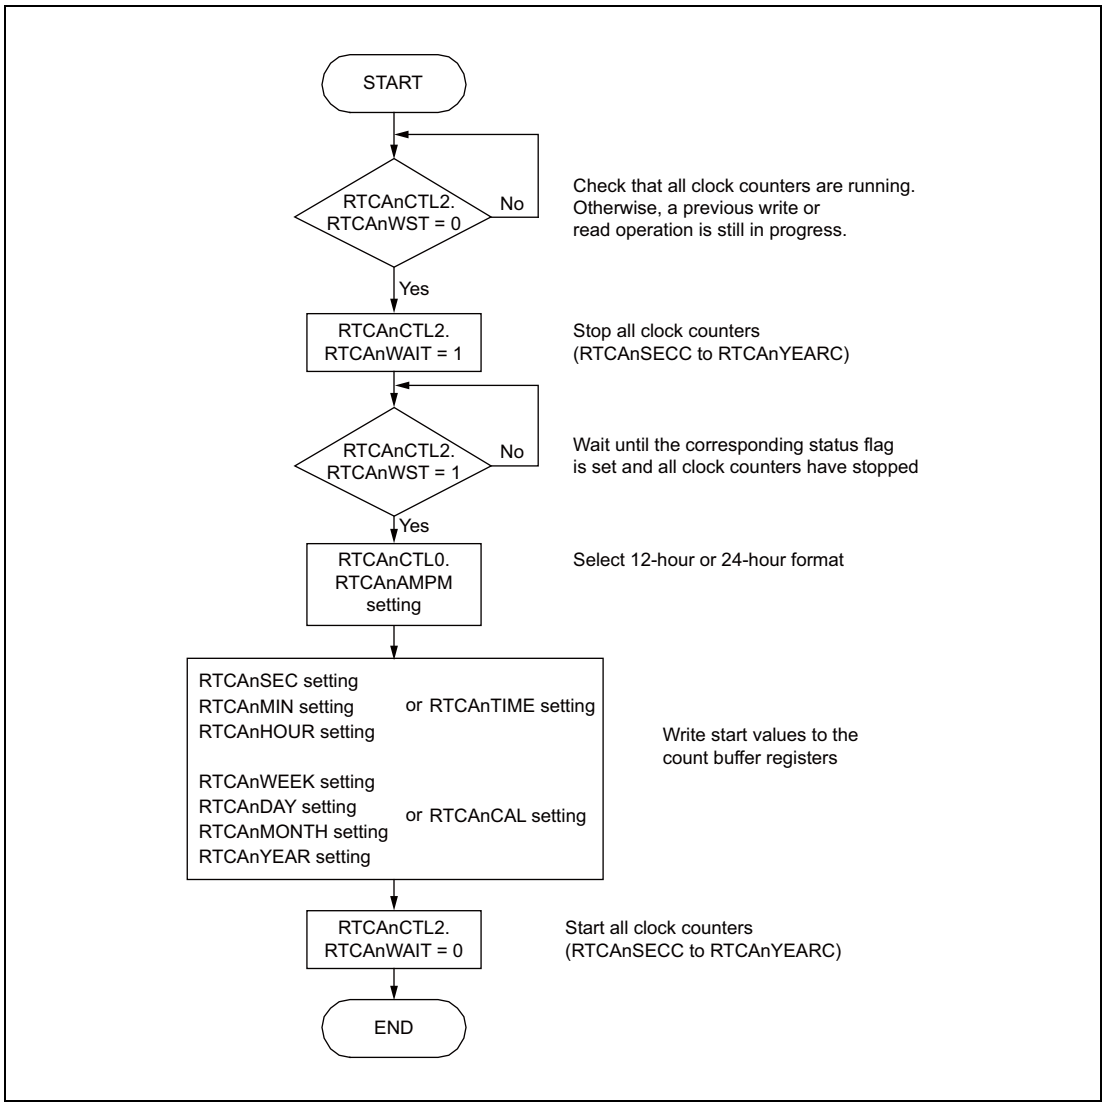

Figure 31.6 Updating Clock Counter Values

CAUTIONS

1. **The internal clock counter is synchronized with RTCATCKI.**
   In addition, two RTCATCKI periods are required before the clock counter updating behind END of the above flow.
   Therefore, PCLK must be continuously supplied until the completion of the clock counter updating.
   Check that RTCAnCTL2.RTCAnWST = 0 before stopping the supply of PCLK after the completion of clock counter updating.
2. **The update procedure must be completed within one second. Otherwise the Real-Time Clock will not count correctly any more:**

3. **Only one sub-counter overflow can be held internally and increment the seconds counter after restarting the clock counters if the value is held.**
4. **If the sub-counter overflows more than once during clock counter stop, the overflow count cannot be held internally. Thus the seconds counter is incremented by one instead of by two when it is restarted.**

31.5.3 Reading Clock Counters

There are two methods to read the clock counters while sub-counter operation is enabled:

- Reading count buffer registers
- Reading counter registers

The advantages and disadvantages of the two methods are summarized in the following table.

Table 31.48 Comparison of the Two Read Methods

	Advantage	Disadvantage
Reading count buffer registers	It is unnecessary to read clock counters several times because the clock counters are read synchronously.	A program wait state occurs between setting RTCAnCTL2.RTCAnWAIT = 1 and completion of data transfer.
Reading count registers	Program wait state does not occur.	If the sub-counter increments, the clock counters must be read several times because they are read asynchronously to RTCATCKI.

31.5.3.1 Procedure for Reading Count Buffer Registers

The following operations are necessary:

1. Stop all clock counters (RTCAnCTL2.RTCAnWAIT = 1). The value of the clock counters is transferred to the corresponding count buffer registers.
2. Read the count buffer registers.

A program wait state occurs between setting RTCAnCTL2.RTCAnWAIT = 1 and completion of data transfer.

The maximum delay is three PCLK periods plus two RTCATCKI periods. For example, if the RTCA operates with PCLK = 40 MHz and RTCATCKI = 32.768 kHz, the delay is about 61 µs.

To read the count buffer register when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCEST = 1), follow the flowchart shown below.

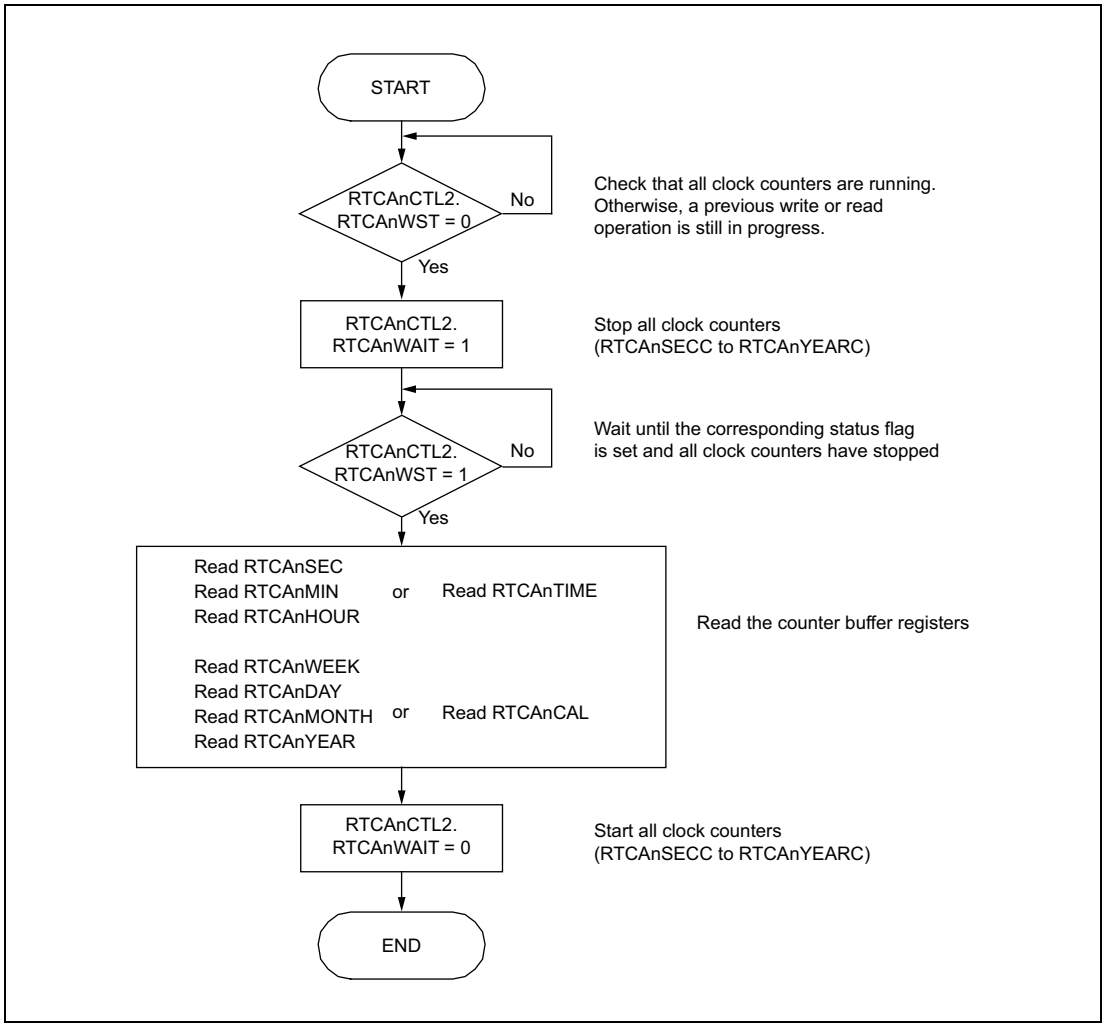

Figure 31.7 Reading Clock Count Buffer Registers

CAUTIONS

1. **The internal clock counter is synchronized with RTCATCKI.**
   In addition, two RTCATCKI periods are required before resuming counter behind END of the above flow.
   Therefore, PCLK must be continuously supplied until the counter resuming.
   Check that RTCAnCTL0.RTCAnCEST= 1 first to stop the supply of PCLK after count buffer register reading.
2. **The reading procedure must be completed within one second. Otherwise the Real-Time Clock will not count correctly any more:**
3. **Only one sub-counter overflow can be held internally. If there is a value held internally when the clock counter restarts, the seconds counter will be incremented by 1.**
4. **If the sub-counter overflows more than once during clock counter stop, the overflow count cannot be held internally. Thus the seconds counter is incremented by one instead of by two when it is restarted.**

31.5.3.2 Procedure for Reading Counter Registers Directly

To ensure that the sub-counter did not overflow while reading the counters, the seconds counter RTCAnSECC must be read twice in the beginning and at the end of the procedure. The first read value is compared with the second read value.

- First read value = second read value:
  No overflow of sub-counter occurred during counter read operation.
- First read value ≠ second read value:
  Overflow of the sub-counter occurred during counter read operation. The counters must be read again to get the current counter values.

To read the counter register directly when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), follow the flowchart shown below.

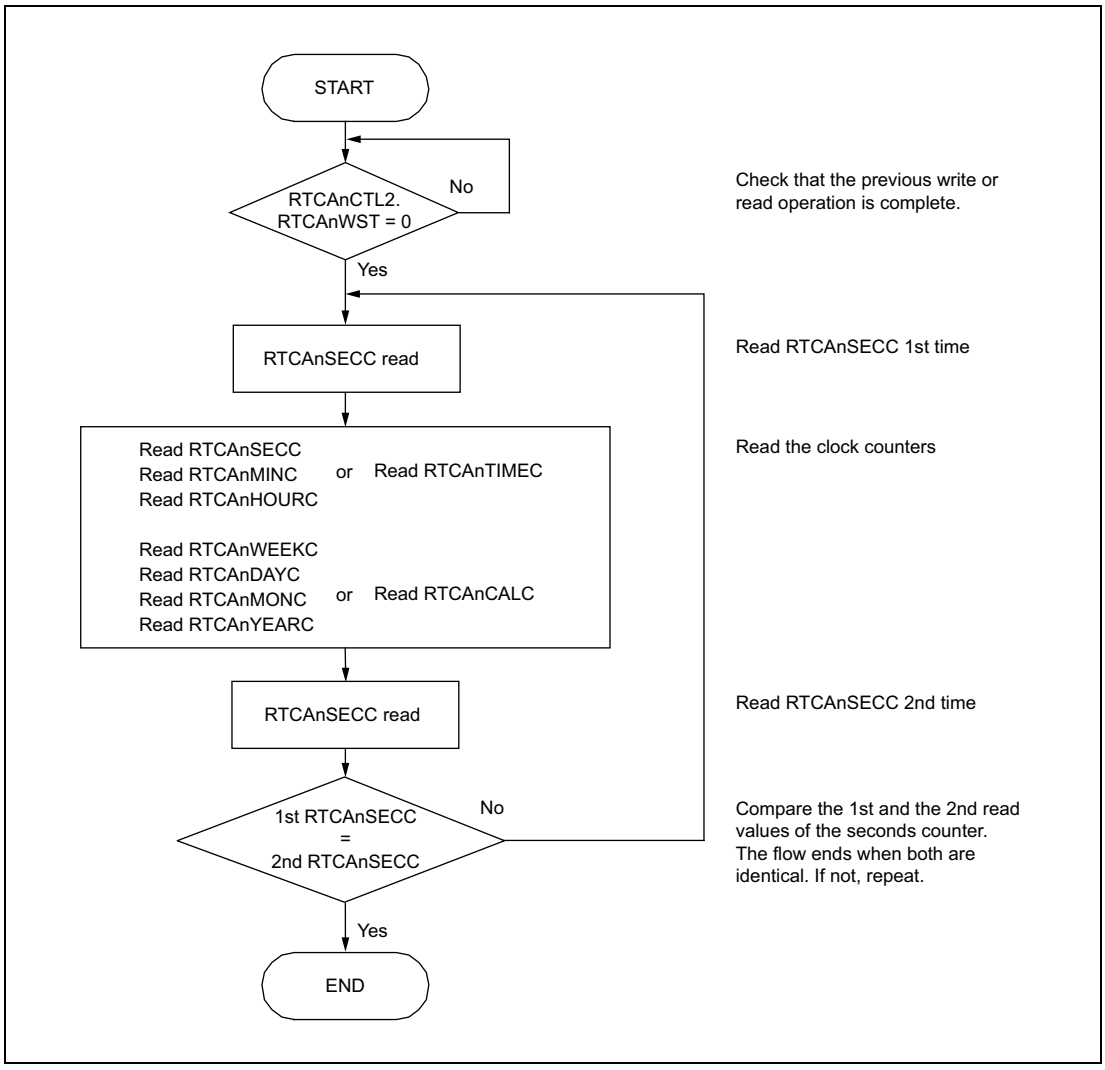

Figure 31.8 Reading Clock Counter Registers

NOTE

The procedure must be completed within one second.

31.5.4 Reading RTCAnSRBU

RTCAnSRBU is the read buffer register for the sub-counter.

When the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), read RTCAnSRBU according to the following flow.

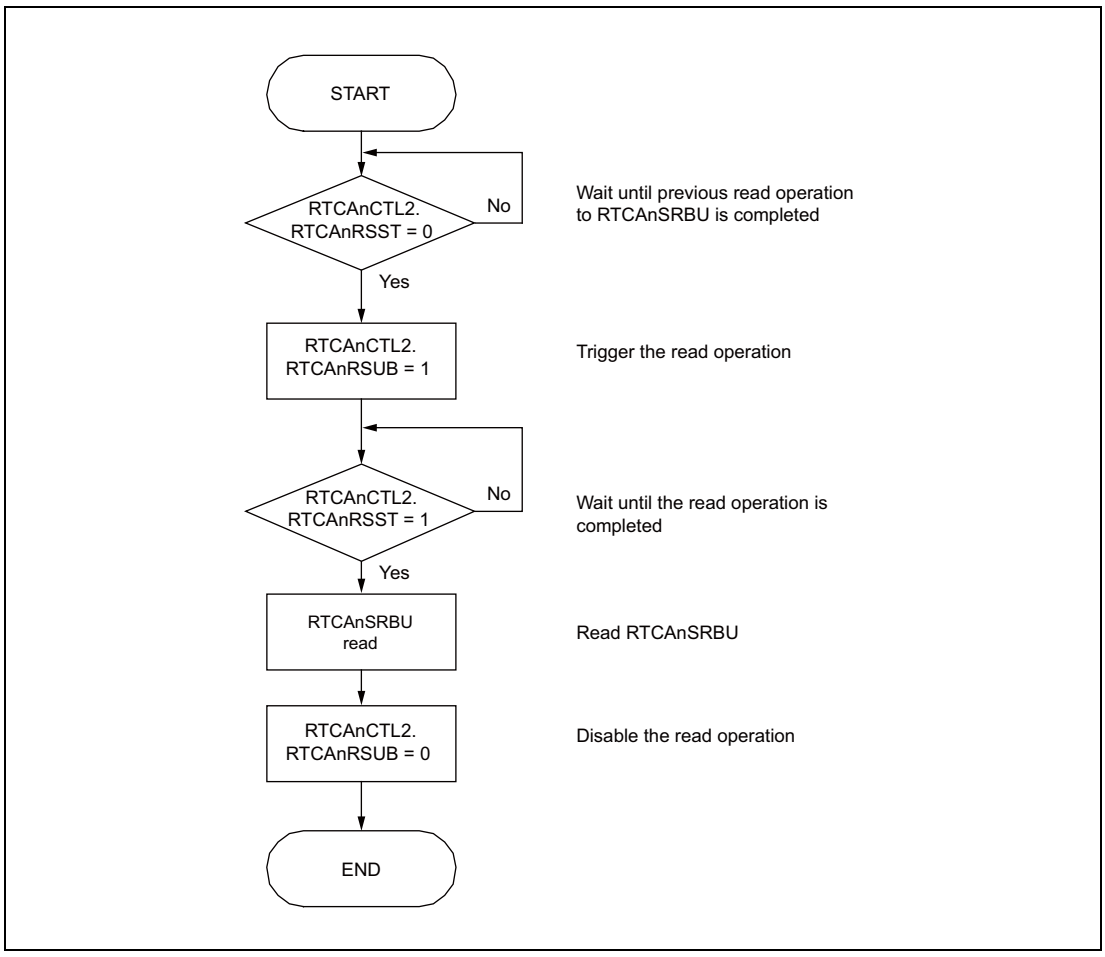

Figure 31.9 Reading the RTCAnSRBU Register

31.5.5 Writing to RTCAnSUBU

RTCAnSUBU is the clock error correction register for the sub-counter.

When the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), write to RTCAnSUBU according to the flow described below.

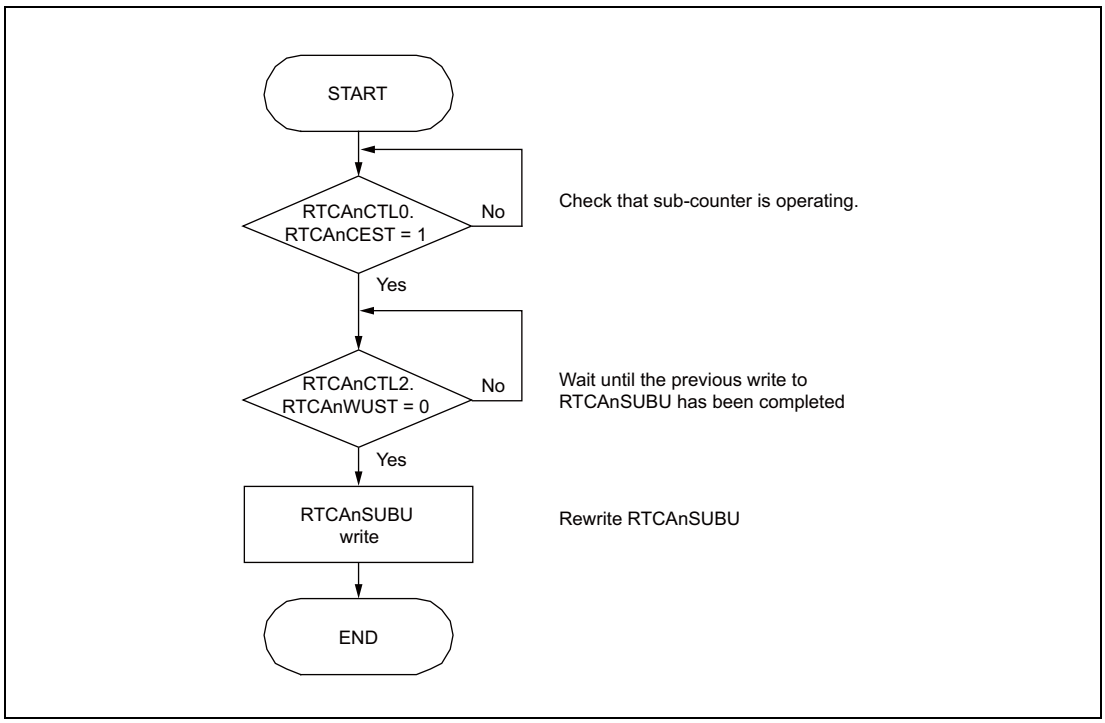

Figure 31.10 Writing to the RTCAnSUBU Register

NOTE

While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), the status flag RTCAnCTL2.RTCAnWUST is set when RTCAnSUBU is written to. It is cleared when the write operation to RTCAnSUBU is completed. This is synchronous with the next RTCAnSUBC overflow.
RTCAnCTL2.RTCAnWUST can be set for up to one second. Be careful when performing polling (checking if RTCAnCTL2.RTCAnWUST = 1 at the beginning of this flow).

31.5.6 Writing to RTCAnSCMP

RTCAnSCMP is the sub-counter compare register.

When the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), write to RTCAnSCMP according to the flow described below.

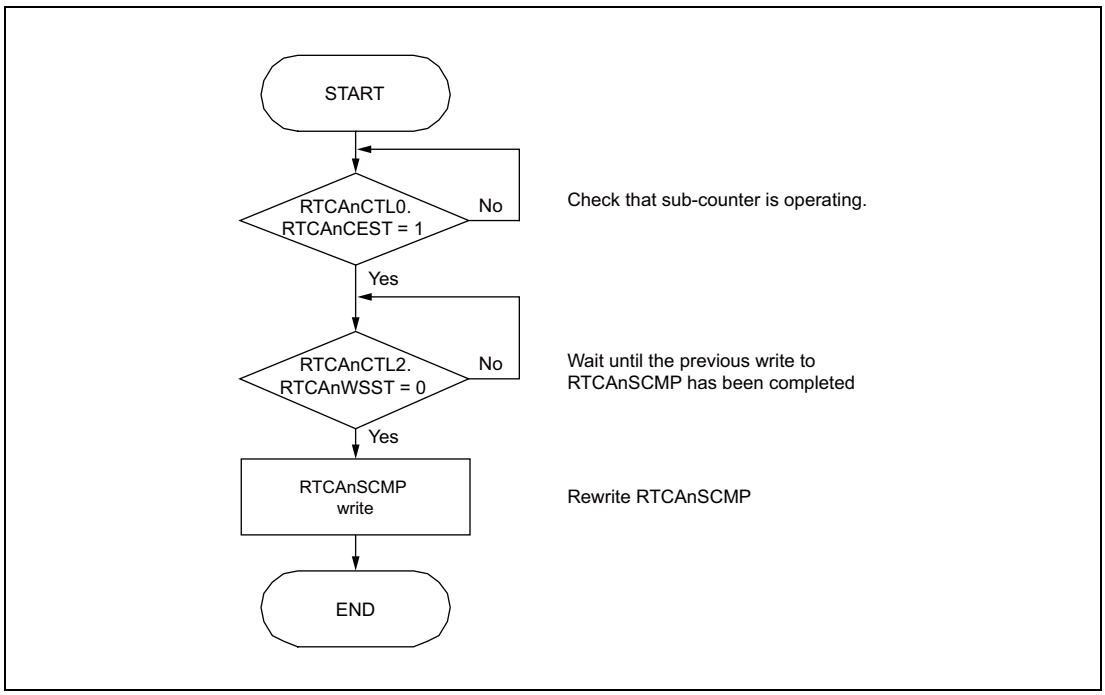

Figure 31.11 Writing the RTCAnSCMP Register

NOTE

While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), the status flag RTCAnCTL2.RTCAnWSST is set when RTCAnSCMP is written to. It is cleared when the write operation to RTCAnSCMP is completed. This is synchronous with the next RTCAnSUBC overflow.

RTCAnCTL2.RTCAnWSST can be set for up to one second. Be careful when performing polling (checking if RTCAnCTL2.RTCAnWSST = 1 at the beginning of this flow).

31.6 Timing Diagrams

31.6.1 Timing of Counter Start

The following diagram illustrates the counter start after setting the time in the buffer registers.

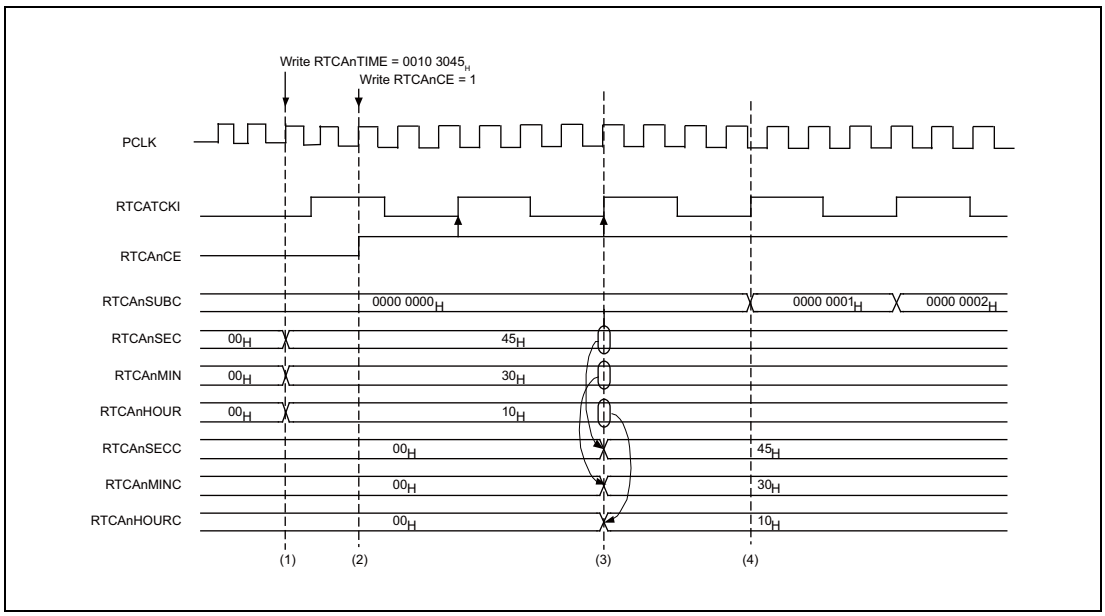

Figure 31.12 Counter Start Timing

The timing diagram above shows the following:

(1) The initial setting value of the time count buffer is set to 10:30:45 by setting RTCAnTIME = 0010 3045_H.
Count buffer registers RTCAnSEC, RTCAnMIN, and RTCAnHOUR are also automatically written.

(2) Sub-counter operation is started by setting RTCAnCTL0.RTCAnCE = 1.

(3) When the second rising edge of RTCATCKI occurs, the buffer register values are loaded to the corresponding count registers.

(4) When the next rising edge of RTCATCKI occurs, count up of the sub-counter starts.

31.6.2 Timing of Clock Counter Update while Counter Is Enabled

The following diagram illustrates the counter restart after setting the time in the buffer registers.

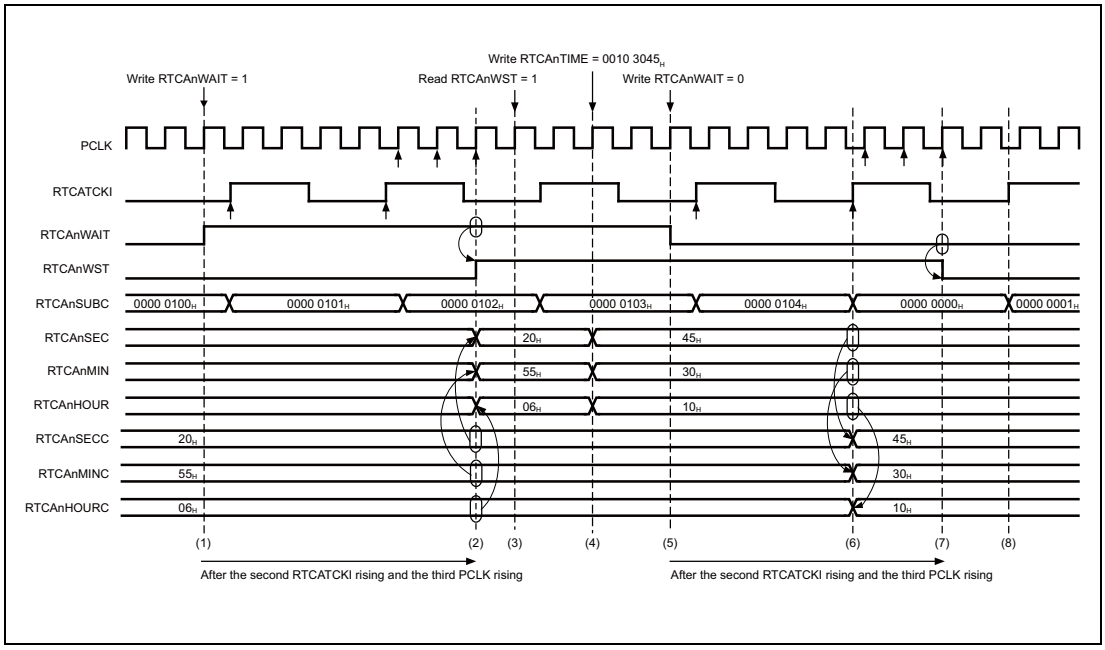

Figure 31.13 Clock Counter Update Timing

The timing diagram above shows the following:

(1) Trigger the clock counters stop (RTCAnCTL2.RTCAnWAIT = 1).

(2) RTCAnCTL2.RTCAnWST is set to 1 after the second rising edge of RTCATCKI and the third rising edge of PCLK, and the counter clock stops. The sub-counter continues counting.

(3) RTCAnCTL2.RTCAnWST = 1 can be readable.

(4) The initial setting value of the time count buffer is set to 10:30:45 by setting RTCAnTIME to 0010 3045_H.
Count buffer registers RTCAnSEC, RTCAnMIN, and RTCAnHOUR are also automatically written.

(5) Trigger the clock counters restart (RTCAnCTL2.RTCAnWAIT = 0).

(6) When the second rising edge of RTCATCKI occurs, the values of the buffer registers are loaded to the corresponding count registers. Write operation to RTCAnSECC is performed and RTCAnSUBC is cleared.

(7) When the third rising edge of PCLK occurs, RTCAnCTL2.RTCAnWST is set to 0.

(8) Clock counter operation is resumed.

31.6.3 Timing of Sub-Counter Read Buffer Reading while Counter is Enabled

The following diagram illustrates the timing when reading the sub-counter read buffer RTCAnSRBU.

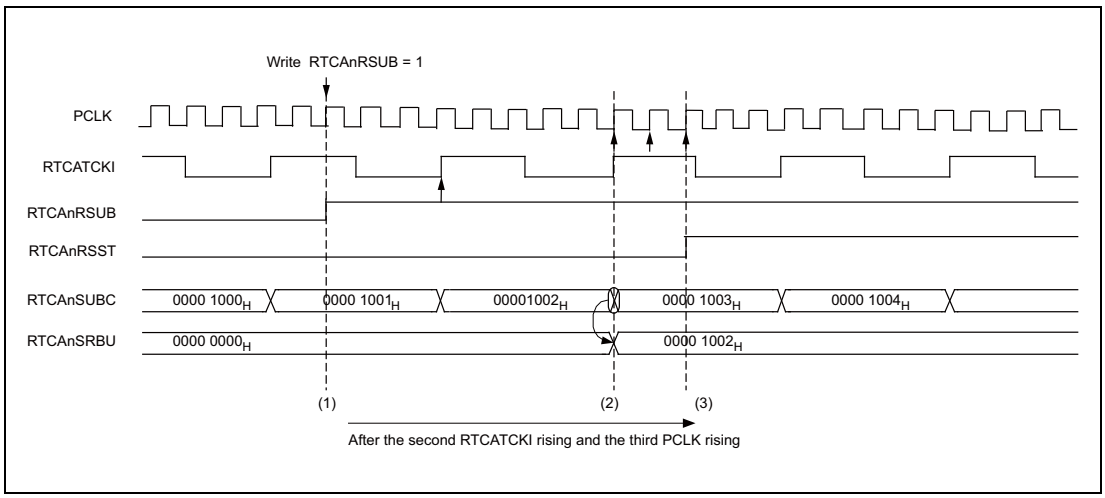

Figure 31.14 Timing when Reading the Sub-Counter Read Buffer Register Value

The timing diagram above shows the following:

(1) Setting RTCAnRSUB = 1 triggers loading of the sub-counter value to RTCAnSRBU.

(2) When the second rising edge of RTCATCKI occurs, the value of RTCAnSUBC is loaded to RTCAnSRBU.

(3) When the third rising edge of PCLK occurs, RTCAnCTL2.RTCAnRSST is set to 1 and RTCAnSRBU can be read.

Section 32 PWM Generators and Diagnostic (PWM-Diag)

This section contains a generic description of the PWM output/diagnostic function (PWM-Diag).

The first part of this section describes all RH850/D1L/D1M specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the units constituting PWM-Diag.

32.1 Features of RH850/D1L/D1M PWM-Diag

32.1.1 Number of Units and Channels

The PWM-Diag unit consists of a PWBA block for generating clock signals, PWGA blocks that generate PWM signals, and a PWSA block for generating triggers for A/D conversion. The numbers of individual units are listed below.

Each PWGA unit has one PWM channel interface. “Number of channels” is used with the same meaning as “number of units” in this section.

Table 32.1 Number of Units

Product Name	D1L1	D1L2(H)	D1M1(H) D1M1-V2 D1M1A	D1M2	D1M2H
PWBA					
Number of Units			1		
Name			PWBAn (n = 0)		
PWGA					
Number of Units			24		
Name			PWGAn (n = 0 to 23)		
PWSA					
Number of Units			1		
Name			PWSAn (n = 0)		

Table 32.2 Index

Index	Meaning
n	Throughout this section, individual units constituting the PWM-Diag function are identified by the index “n”; for example, PWBAnTE indicates the PWBAn status register.
m	The PWBA generation clock is identified by the index “m” (m = 0 to 3); for example, PWBAnBRSm indicates the PWMCLKm clock cycle configuration register.
x, y	An A/D converter configuration register number corresponding to a PWM-Diag channel is identified by the index “x, y”; for example, PWSAnPVCRx_y (x_y = 00_01, 02_03, ..., 10_11).
j	Registers storing trigger channel numbers (encoded value) from PWGAn are identified by the index “j”; for example, the PWSAnQUEj register (j = 0 to 7).
k	Sets of registers where each has the same function are identified by the index “k”; for example, the SLPWGAk register (k = 0).

The following table shows values indicated by the indexes of each product.

Table 32.3 Indexes of Products

Indexes of each product				
D1L1	D1L2(H)	D1M1(H) D1M1A	D1M2	D1M2H
x = 00, 02, ,,, 10 y = 01, 03, ,,, 11	x = 00, 02, ,,, 10 y = 01, 03, ,,, 11	x = 00, 02, ,,, 10 y = 01, 03, ,,, 11	x = 00, 02, ,,, 10 y = 01, 03, ,,, 11	x = 00, 02, ,,, 10 y = 01, 03, ,,, 11
j = 0 to 7	j = 0 to 7	j = 0 to 7	j = 0 to 7	j = 0 to 7
k = 0	k = 0	k = 0	k = 0	k = 0

32.1.2 Register Base Address

PWM-Diag base addresses are listed in the following table.

PWM-Diag register addresses are given as offsets from the base addresses in general.

Table 32.4 Register Base Addresses

Base Address Name	Base Address
<PWBA0_base>	FFE4 5800_H
<PWGAn_base>	FFE4 4000_H + 100_H x n
<PWSA0_base>	FFE4 $5A00_H$

32.1.3 Clock supply

Clock supply by and to PWM-Diag is listed in the following table.

Table 32.5 Clock Supply

Unit Name	Unit Clock Name	Internal Clock Signal
PWBA0	PCLK	Clock Controller CLKJIT
PWGAn	PCLK	Clock Controller CLKJIT
PWSA0	PCLK	Clock Controller CLKJIT

32.1.4 Interrupt Requests

PWM-Diag interrupt requests are listed in the following table.

Table 32.6 TAUJn interrupt requests

PWM-Diag signals	Function	Connected to
PWGA_INT0 to PWGA_INT23	Channel 0 to 23 interrupt	Interrupt Controller INTPWGA0 to INTPWGA23
PWSA_INT_QFULL	PWSA queue full interrupt	Interrupt Controller INTQFULL

32.1.5 Hardware Reset

PWM-Diag reset sources are listed in the following table. The individual PWM-Diag units are initialized by these reset sources.

The PWM-Diag and its registers are initialized by the following reset signals

Table 32.7 Reset Sources

Unit Name	Reset Source
PWBA0 PWGAn PWSA0	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

32.1.6 External Input/Output Signals

The external input/output signals of the PWM-Diag are listed below.

Table 32.8 External Input/Output Signals

Unit Signal Name	Outline	Connected to
PWGA_TOUTn (Unit: PWGA)	PWGA unit n output	Port PWGAnO

32.1.7 Internal signals

The signals for connecting two PWM-Diag channels or a PWM-Diag and another function are listed below.

Table 32.9 Internal Input/Output Signals

Unit Signal Name	Outline	Signal
PWBA0		
PWMCLK0	PWGA count clock 0	PWGAn
PWMCLK1	PWGA count clock 1	PWGAn
PWMCLK2	PWGA count clock 2	PWGAn
PWMCLK3	PWGA count clock 3	PWGAn
PWGAn		
PWGA_TRGOUT[11:0]	PWGAn trigger	PWSA0
PWSA0		
PWSA_ADTRG[1:0]	A/D converter unit select signal	ADCE0
PWSA_PVCR_VALUE[11:0] (PWSA0)	A/D converter control signal	ADCE0
ADCE0		
ADC_CONV_END0	A/D conversion completion signal	PWSA0

32.1.8 Outline of Functions

This function is comprised of four types of units: clock divider (PWBA), PWM generator (PWGA), A/D conversion trigger select function (PWSA), and A/D converter (ADCE).

PWBA

- Clock divider
  PWBA generates a PWMCLKm count clock signal by frequency division of PCLK and supplies it to the PWM generator PWGA.
  The cycle of the PWMCLKm count clock signal can be calculated from the setting of the PWBAnBRSm register by the equation below.

  PWMCLKm count clock cycle = (PWBAnBRSm value × 2) × PCLK cycle

  In addition, PWBA can control operation when the on-chip debugger is in use by using the PWBAnEMU register.

PWGA

PWGA outputs PWM waveforms and A/D conversion trigger to PWSA by using the input clock PWMCLKm from PWBA.

- PWM waveform output PWGA_TOUTn
  This generator outputs PWM waveforms from the PWGA_TOUTn pin. The PWM cycle is the full count cycle of the PWGAnCNT register (12-bit free-running counter). Set the high-level period of PWM output in the PWGAnCSDR and PWGAnCRDR registers.

  The PWM waveform cycle and duty can be calculated by the equations below.

  PWM waveform cycle = PWGAnCNT (12-bit full count: FFF_H + 1)
  × Count clock cycle
  = 4096 × PWMCLKm count clock cycle

  When PWGAnCRDR[11:0] > PWGAnCSDR[11:0],

  High-level period of PWM waveform =
  (PWGAnCRDR register value – PWGAnCSDR register value)
  × PWMCLKm count clock cycle

  PWM waveform duty (%) = High-level period of PWM waveform/PWM waveform cycle × 100 = (PWGAnCRDR register value – PWGAnCSDR register value)/4096 × 100

  Note that the PWM output is fixed to the low level when the PWGAnCRDR register value is equal to the PWGAnCSDR register value.

  When $1xxx_H$ is set in the PWGAnCRDR register (i.e. bit 12 is set to 1), the PWM output is fixed to the high level.

- A/D conversion trigger output PWGA_TRGOUTn
  The A/D conversion trigger signal PWGA_TRGOUTn for PWSA is generated when the PWGAnCTDR register value and the PWGAnCNT register value match while the PWM output PWGA_TOUTn is at the high level.
  The timing can be calculated by the equation below.

  A/D conversion trigger signal generation timing = PWGAnCTDR register value
  × PWMCLKm count clock cycle

- PWGA interrupt request signal PWGA_INTn
  PWGA generates the interrupt request signal PWGA_INTn at the falling edge of the PWM output PWGA_TOUTn.
  When the PWM output is fixed to the low level, PWGA_INTn is generated when the PWGAnCRDR register value and the PWGAnCNT register value (free-running counter value) match; when the PWM output is fixed to the high level, PWGA_INTn is generated at the timing of overflow of the PWGAnCNT register.

NOTE

Only the PWM Generators PWGA0 to PWGA11 can trigger the A/D Converter for diagnosis of their PWM output signals PWGA_TOUT0 to PWGA_TOUT11.

PWSA

PWSA transmits the required settings information to the A/D converter and outputs the A/D conversion start trigger, based on the A/D conversion trigger signal PWGA_TRGOUTn from the PWM generator (PWGA).

- A/D conversion control by PWSA
  PWSA outputs the information required for the A/D conversion, which is set in the corresponding PWSAnPVCRx_y register for the channel number of the trigger input from PWGAn, (i.e., information on ADC physical channel, external MPX control, and error detection level selection) is output to the A/D converter.
  At the same timing, A/D conversion trigger (PWSA_ADTRG) is output to ADCE0. (A maximum of eight input trigger signal PWGA_TRGOUTn information received during A/D conversion are stored and kept in PWSAnQUE.)
  The setting information to be output to the A/D converter is kept until the next trigger is generated.
  When the A/D conversion triggered by the PWM-Diag function is completed in the A/D converter, PWSA triggers the next A/D conversion based on the data stored in the PWSAnQUE register.
- Queuing of A/D conversion trigger from PWGA
  The A/D conversion trigger signal (PWGA_TRGOUTn) input from PWGAn is stored in the PWSAnQUEj register as a channel number. The PWSAnQUEj register stores a maximum of eight channel numbers of the A/D conversion trigger signal PWGA_TRGOUTn received during A/D conversion in a queue structure.
  A PWSA queue full interrupt occurs in the following states, when the queue of the PWSAnQUEj register becomes full:
  - A trigger number is written to PWSAnQUE7
  - A trigger number has already been written to PWSAnQUE7 and cannot be written when PWGA_TRGOUTn is input.

ADCE

A/D conversion is executed upon receipt of information required for A/D conversion and A/D conversion trigger from PWSA.

A/D conversion is executed using the PWM-Diag-dedicated scan group; on completion of the A/D conversion, it is reported to the PWSA.

For the basic operation of the A/D converter, see section **A/D Converter (ADCE)**.

For the A/D converter operation with the PWM-Diag function, see subsection **A/D Conversion with PWM-Diag Enabled**.

32.1.9 Block Diagram

The following figure shows an example of connecting the LED control circuit combining the PWM-Diag and the A/D converter.

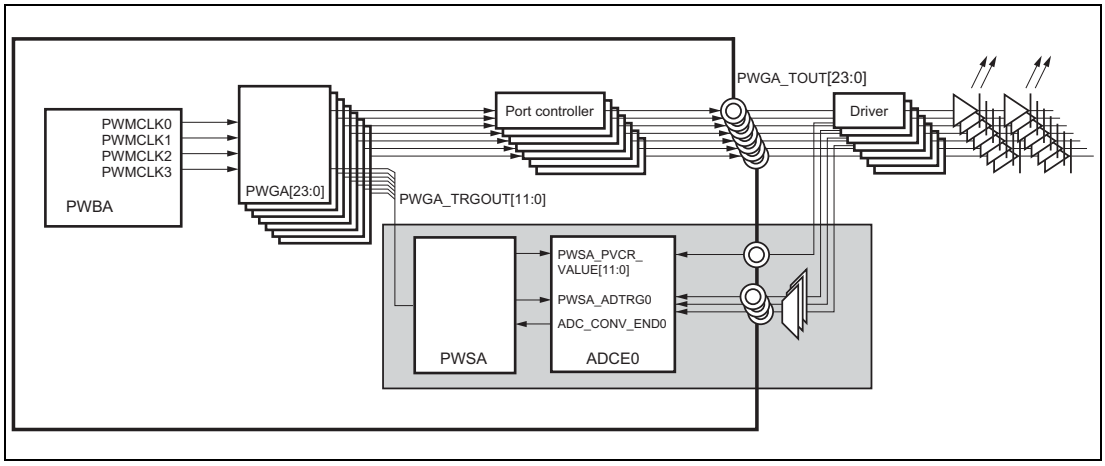

Figure 32.1 Example of Connecting the LED Control Circuit using the PWM-Diag and the A/D Converter

32.2 Registers

32.2.1 List of Registers

PWM-Diag registers are listed in the following table.

Table 32.10 List of PMW-Diag Registers

Module name	Register name	Symbol	Address
PWBAn	PWMCLKm cycle configuration register	PWBAnBRSm	<PWBAn_base> + 0004_H × m
	PWMCLKm enable status register	PWBAnTE	<PWBAn_base> + 0010_H
	PWMCLKm start trigger register	PWBAnTS	<PWBAn_base> + 0014_H
	PWMCLKm stop trigger register	PWBAnTT	<PWBAn_base> + 0018_H
	PWBA emulation register	PWBAnEMU	<PWBAn_base> + $001C_H$
PWGAn	PWM output set condition register	PWGAnCSDR	<PWGAn_base> + 0000_H
	PWM output reset condition register	PWGAnCRDR	<PWGAn_base> + 0004_H
	PWGA_TRGOUTn generation condition register	PWGAnCTDR	<PWGAn_base> + 0008_H
	Buffer register reload trigger register	PWGAnRDT	<PWGAn_base> + $000C_H$
	Buffer register reload status register	PWGAnRSF	<PWGAn_base> + 0010_H
	PWM cycle count register	PWGAnCNT	<PWGAn_base> + 0014_H
	PWGA control register	PWGAnCTL	<PWGAn_base> + 0020_H
	PWGAnCSDR buffer register	PWGAnCSBR	<PWGAn_base> + 0024_H
	PWGAnCRDR buffer register	PWGAnCRBR	<PWGAn_base> + 0028_H
	PWGAnCTDR buffer register	PWGAnCTBR	<PWGAn_base> + $002C_H$
SELB	PWGA synchronous trigger register	SLPWGAk	FFE4 5900_H + k × 4_H
PWSAn	PWSA control register	PWSAnCTL	<PWSAn_base> + 0000_H
	Trigger queue status register	PWSAnSTR	<PWSAn_base> + 0004_H
	Trigger queue status clear register	PWSAnSTC	<PWSAn_base> + 0008_H
	Trigger queue register	PWSAnQUEj	<PWSAn_base> + 0020_H + j × 4_H
	PWM-Diag mode A/D setting register	PWSAnPVCRx_y	<PWSAn_base> + 0040_H + x × 2_H
	PWSA emulation control register	PWSAnEMU	<PWSAn_base> + $000C_H$

The base addresses <PWBAn_base>, <PWGAn_base> and <PWSAn_base> are defined in the first subsection of this section under the key word “Register base addresses”.

32.2.1.1 PWBAnBRSm Register

This register sets the clock cycle of PWMCLKm.

Access: This register can be read/written in 16-bit units.

Address: <PWBAn_base> + 0004_H × m

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	PWBAnBRSm[10:0]										
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.11 PWBAnBRSm Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
10 to 0	PWBAnBRSm [10:0]	Register for setting the clock cycle of PWMCLKm. – PWBAnBRSm = 0: PWMCLKm stop – PWBAnBRSm = 1: PWMCLKm = PCLK / 2 × 1 – PWBAnBRSm = 2: PWMCLKm = PCLK / 2 × 2 ... – PWBAnBRSm = n: PWMCLKm = PCLK / 2 × n (n = 1 to 2047) These bits can only be rewritten when all counters using PWMCLKm are stopped (PWBAnTE.PWBATEm = 0).

32.2.1.2 PWBAnTE Register

This is a status register that indicates the output status of PWMCLKm (m = 0 to 3).

Access: This register can be read in 8-bit units.

Address: <PWBAn_base> + 0010_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	PWBAnTE3	PWBAnTE2	PWBAnTE1	PWBAnTE0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 32.12 PWBAnTE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned.
3	PWBAnTE3	A status flag indicating the operation status of PWMCLK3 0: Not operating 1: Operating
2	PWBAnTE2	A status flag indicating the operation status of PWMCLK2 0: Not operating 1: Operating
1	PWBAnTE1	A status flag indicating the operation status of PWMCLK1 0: Not operating 1: Operating
0	PWBAnTE0	A status flag indicating the operation status of PWMCLK0 0: Not operating 1: Operating

32.2.1.3 PWBAnTS Register

This register is a start trigger register for PWMCLKm (m = 0 to 3).

Access: This register can be written in 8-bit units.

Address: <PWBAn_base> + 0014_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	PWBAnTS3	PWBAnTS2	PWBAnTS1	PWBAnTS0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 32.13 PWBAnTS Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing to these bits, write the value after reset.
3	PWBAnTS3	Start trigger bit for PWMCLK3 0: Writing 0 does not work as a function. 1: Starts the output of PWMCLK3.
2	PWBAnTS2	Start trigger bit for PWMCLK2 0: Writing 0 does not work as a function. 1: Starts the output of PWMCLK2.
1	PWBAnTS1	Start trigger bit for PWMCLK1 0: Writing 0 does not work as a function. 1: Starts the output of PWMCLK1.
0	PWBAnTS0	Start trigger bit for PWMCLK0 0: Writing 0 does not work as a function. 1: Starts the output of PWMCLK0.

32.2.1.4 PWBAnTT Register

This register is a stop trigger register for PWMCLKm (m = 0 to 3).

Access: This register can be written in 8-bit units.

Address: <PWBAn_base> + 0018_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	PWBAnTT3	PWBAnTT2	PWBAnTT1	PWBAnTT0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 32.14 PWBAnTT Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing to these bits, write the value after reset.
3	PWBAnTT3	Stop trigger bit for PWMCLK3 0: Writing 0 does not work as a function. 1: Stops the output of PWMCLK3.
2	PWBAnTT2	Stop trigger bit for PWMCLK2 0: Writing 0 does not work as a function. 1: Stops the output of PWMCLK2.
1	PWBAnTT1	Stop trigger bit for PWMCLK1 0: Writing 0 does not work as a function. 1: Stops the output of PWMCLK1.
0	PWBAnTT0	Stop trigger bit for PWMCLK0 0: Writing 0 does not work as a function. 1: Stops the output of PWMCLK0.

32.2.1.5 PWBAnEMU Register

This register sets the operation during emulation.

Access: This register can be read/written in 8-bit units.

Address: <PWBAn_base> + $001C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PWBAnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 32.15 PWBAnEMU Register Contents

Bit Position	Bit Name	Function
7	PWBAnSVSDIS	(When the EPC.SVSTOP bit = 0) The count clock is provided continuously when the debugger has control of the microcontroller (by break points, etc.), regardless of the value of this bit (1 or 0). (When the EPC.SVSTOP bit = 1) 0: The count clock is stopped when the debugger has control of the microcontroller (by break points, etc.). 1: The count clock is provided continuously when the debugger has control of the microcontroller (by break points, etc.). This bit can only be rewritten when all counters using PWMCLKm are stopped (PWBAnTE.PWBATEm = 0).
6 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

32.2.1.6 PWGAnCTL — PWGA Control Register

PWGAnCTL is used to select the count clock from PWBA.

Access: This register can be read/written in 8-bit units.

Address: <PWGAn_base> + 0020_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PWGAnCKS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 32.16 PWGAnCTL Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	PWGAnCKS [1:0]	Count Clock Enable Input PWMCLK3 to PWMCLK0 Select 00: Uses PWMCLK0 as count clock 01: Uses PWMCLK1 as count clock 10: Uses PWMCLK2 as count clock 11: Uses PWMCLK3 as count clock These bits can only be rewritten when the PWGAn operation is stopped (SLPWGAk.SLPWGA[31:0] = 0).

32.2.1.7 PWGAnCNT — PWM Cycle Count Register

This is a count register.

Access: This register can be read in 16-bit units.

Address: <PWGAn_base> + 0014_H

Value after reset: $0FFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PWGAnCNT[11:0]											
Value after reset	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.17 PWGAnCNT Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned.
11 to 0	PWGAnCNT [11:0]	12-bit counter value

32.2.1.8 PWGAnCSDR — PWM Output Set Condition Register

This register sets the setting condition for PWGA_TOUTn output.

Access: This register can be read/written in 16-bit units.

Address: <PWGAn_base> + 0000_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PWGAnCSDR[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.18 PWGAnCSDR Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
11 to 0	PWGAnCSDR [11:0]	These bits set the setting condition for PWM output. The set value is reflected to the PWGAnCSBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1).

32.2.1.9 PWGAnCRDR — PWM Output Reset Condition Register

This register sets the reset condition for PWGA_TOUTn output.

Access: This register can be read/written in 16-bit units.

Address: <PWGAn_base> + 0004_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	PWGAnCRDR[12:0]												
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.19 PWGAnCRDR Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
12 to 0	PWGAnCRDR [12:0]	These bits set the reset condition for PWM output. The set value is reflected to the PWGAnCRBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1).

32.2.1.10 PWGAnCTDR — PWGA_TRGOUTn Generation Condition Register

This register sets the generation condition for PWGA_TRGOUTn.

Access: This register can be read/written in 16-bit units.

Address: <PWGAn_base> + 0008_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PWGAnCTDR[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.20 PWGAnCTDR Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
11 to 0	PWGAnCTDR [11:0]	These bits set the A/D conversion trigger generation condition for PWSAn. The set value is reflected to the PWGAnCTBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1).

32.2.1.11 PWGAnCSBR — PWGAnCSDR Buffer Register

This is a buffer register for the PWGAnCSDR register.

Access: This register can be read in 16-bit units.

Address: <PWGAn_base> + 0024_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PWGAnCSBR[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.21 PWGAnCSBR Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned.
11 to 0	PWGAnCSBR [11:0]	The set value is reflected to the PWGAnCSDR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). When the value matches the PWGAnCNT register value, the pin output is driven high.

32.2.1.12 PWGAnCRBR — PWGAnCRDR Buffer Register

This is a buffer register for the PWGA_TOUTn reset condition.

Access: This register can be read in 16-bit units.

Address: <PWGAn_base> + 0028_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	PWGAnCRBR[12:0]												
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.22 PWGAnCRBR Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned.
12 to 0	PWGAnCRBR [12:0]	The set value is reflected to the PWGAnCRDR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). When the value matches the PWGAnCNT register value, the pin output is driven low.

32.2.1.13 PWGAnCTBR — PWGAnCTDR Buffer Register

This is a buffer register for the PWGA_TRGOUTn generation condition.

Access: This register can be read in 16-bit units.

Address: <PWGAn_base> + $002C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PWGAnCTBR[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.23 PWGAnCTBR Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned.
11 to 0	PWGAnCTBR [11:0]	The set value is reflected to the PWGAnCTDR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). When the value matches the PWGAnCNT register value, a trigger is transmitted to PWSAn.

32.2.1.14 PWGAnRSF — Buffer Register Reload Status Register

This register is a status register for simultaneous rewrite control.

Access: This register can be read in 8-bit units.

Address: <PWGAn_base> + 0010_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWGAnRSF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 32.24 PWGAnRSF Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	PWGAnRSF	Simultaneous Rewrite Control Status 0: Simultaneous rewrite is enabled. This value indicates the completion of simultaneous rewrite after the generation of a simultaneous rewrite trigger signal. 1: Simultaneous rewrite is in progress. This value indicates the waiting state for completion.

32.2.1.15 PWGAnRDT — Buffer Register Reload Trigger Register

This is a simultaneous rewrite request trigger register.

Access: This register can be written in 8-bit units.

Address: <PWGAn_base> + $000C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWGAnRDT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 32.25 PWGAnRDT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing to these bits, write the value after reset.
0	PWGAnRDT	Simultaneous Rewrite Request Trigger 0: Writing 0 does not work as a function. 1: Triggers the simultaneous rewrite request for the compare registers (PWGAnCSDR, PWGAnCRDR, and PWGAnCTDR), and sets PWGAnRSF.PWGAnRSF to 1.

32.2.1.16 SLPWGAk — PWGA Simultaneous Trigger Register (k = 0)

This register triggers start and stop for respective channels simultaneously.

Access: This register can be read/written in 32-bit units.

Address: FFE4 5900_H + k × 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	SLPWGA[23:16]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SLPWGA[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.26 SLPWGAk Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When writing to these bits, write the value after reset.
23 to 0	SLPWGA [23:0]	Trigger start and stop to multiple channels simultaneously. 0: Stops the corresponding channels. 1: Starts the corresponding channels. The bits correspond to the following channels. SLPWGA0.SLPWGA[23:0]: PWGA23 - PWGA0

32.2.1.17 PWSAnCTL Register

This register is used to control operations of PWSA.

Access: This register can be read/written in 8-bit units.

Address: <PWSAn_base> + 0000_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWSAnENBL
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 32.27 PWSAnCTL Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	PWSAnENBL	Operation Permission Control 0: Operation is prohibited (initial state). Writing 0 initializes PWSAnSTR and PWSAnQUEj. 1: Operation is enabled.

32.2.1.18 PWSAnSTR Register

This is a status register that indicates whether the number of a channel for which an A/D conversion trigger has been generated is stored in a PWSAnQUEj register.

Access: This register can be read in 8-bit units.

Address: <PWSAn_base> + 0004_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PWSAnQFL	PWSAnQNE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 32.28 PWSAnSTR Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	PWSAnQFL	Indicates the queuing state of the A/D conversion trigger. 0: Some PWSAnQUEj registers do not store the channel number. 1: All of the PWSAnQUEj registers store the channel number.
0	PWSAnQNE	Bit indicating that there is a trigger in the trigger queue 0: The channel number is not stored in the PWSAnQUEj register, or the A/D conversion is in process while only PWSAnQUE0 stores the channel number. 1: The number of the channel waiting for conversion is stored in j = 1 and subsequent PWSAnQUEj registers.

32.2.1.19 PWSAnSTC Register

This register clears the status of the PWSAnSTR register.

Access: This register can be written in 8-bit units.

Address: <PWSAn_base> + 0008_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PWSAnCLFL	PWSAnCLNE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 32.29 PWSAnSTC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When writing to these bits, write the value after reset.
1	PWSAnCLFL	PWSAnQFL Clear 0: PWSAnQFL retains the status (Writing 0 does not work as a function). 1: PWSAnQFL is cleared to 0.
0	PWSAnCLNE	PWSAnQNE Clear 0: PWSAnQNE retains the status (Writing 0 does not work as a function). 1: PWSAnQNE is cleared to 0.

32.2.1.20 PWSAnQUEj (j = 0 to 7) Register

This register stores the channel number that received the trigger from PWGAn.

Access: This register can be read in 8-bit units.

Address: <PWSAn_base> + $0020_H + j \times 4_H$

Value after reset: $3F_H$

Bit	7	6	5	4	3	2	1	0
	—	—	PWSAnQUEj[5:0]					
Value after reset	0	0	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R

Table 32.30 PWSAnQUEj Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned.
5 to 0	PWSAnQUEj [5:0]	Stores the channel number (0 to 23) of the trigger-generated PWGA in order from PWSAnQUE0 to PWSAnQUE7. After the A/D conversion of PWSAnQUE0 is completed, the values in PWSAnQUE1 to PWSAnQUE07 shift to PWSAnQUE0 to PWSAnQUE6.

NOTE

If a trigger occurs simultaneously in multiple channels, the trigger with the smaller channel number has priority.

32.2.1.21 PWSAnPVCRx_y (x = 00, 02, 04 ... 10, y = 01, 03, 05 ... 11) Register

This register is used to set the corresponding A/D converter for each channel.

Consecutive two channels are set such as PWSA0PVCR02_03, and the 16 higher-order bits of each register correspond to an odd-numbered channel while the 16 lower-order bits correspond to an even-numbered channel.

At the generation of a trigger, the setting value is transmitted to the ADCEnPWDVCR register of the A/D converter.

For the ADCEnPWDVCR register, see. Section 45, A/D Converter (ADCE).

Access: This register can be read/written in 32-bit units.

Address: <PWSAn_base> + 0040_H + x × 2_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	PWSAnVRDTy [7:6]		PWSAnVRDTy[5:0]

Table 32.31 PWSAnPVCRx_y Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
23, 22	PWSAnVRDTy [7:6]	This bit indicates the setting value of the ADCEnPWDVCR.ULS[1:0] bits (odd-numbered channel).
21 to 16	PWSAnVRDTy [5:0]	This bit indicates the setting value of the ADCEnPWDVCR.GCTRL[5:0] bits (odd-numbered channel).
15 to 8	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
7, 6	PWSAnVRDTx [7:6]	These bits indicate the setting value of the ADCEnPWDVCR.ULS[1:0] bits. (even-numbered channel)
5 to 0	PWSAnVRDTx [5:0]	These bits indicate the setting value of the ADCEnPWDVCR.GCTRL[5:0] bits. (even-numbered channel)

32.2.1.22 PWSAnEMU — Emulation Control Register

This register is used to set the operation for emulation.

Access: This register can be read/written in 8-bit units.

Address: <PWSAn_base> + $000C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWSAnSVSDIS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 32.32 PWSAnEMU Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	PWSAnSVSDIS	(When the EPC.SVSTOP bit = 0) The operation continues when the debugger has control of the microcontroller (by break points, etc.), regardless of the value of this bit (1 or 0). (When the EPC.SVSTOP bit = 1) 0: When the debugger has control of the microcontroller (by break points, etc.); – The output state to A/D is retained, the ADC_CONV_ENDn input at a break point is internally retained, and PWSAnQUEj is updated after break release. – The PWGA_TRGOUT input is accepted even at a break, and PWSA_INT_QFULL is even output. – Reading and writing to the register is possible. 1: The operation continues when the debugger has control of the microcontroller (by break points, etc.). The above bit can only be rewritten when all counters using PWMCLKm are stopped (PWBAnTE.PWBATEm = 0), the operation of all channels PWGAn has stopped (SLPWGAk.SLPWGA), and no trigger has been generated from any of the channels PWGAn (PWSAnQUE0 is the value after reset).

32.3 Operating Procedure

Procedures for setting when starting and stopping operation of PWM-Diag are illustrated below.

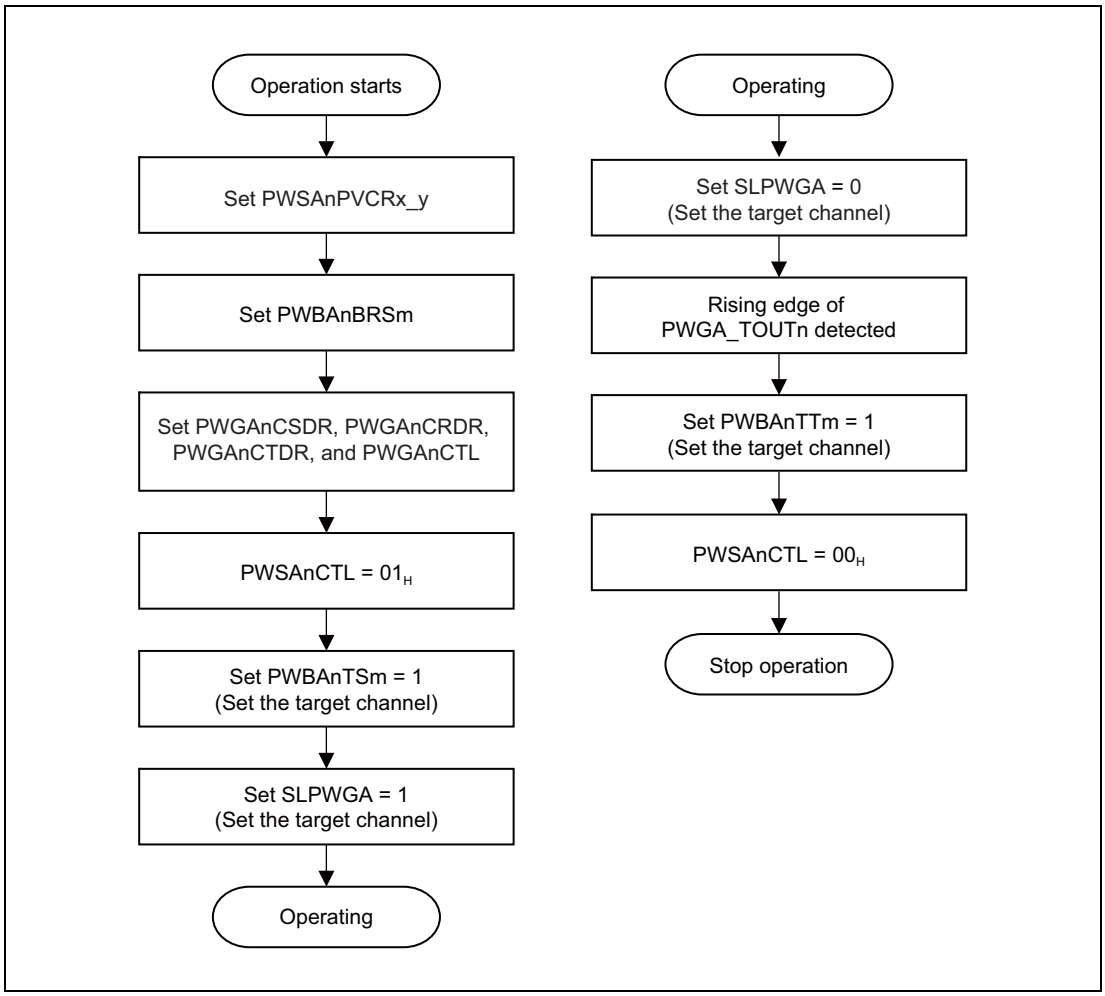

Figure 32.2 PWM-Diag Operating Procedure

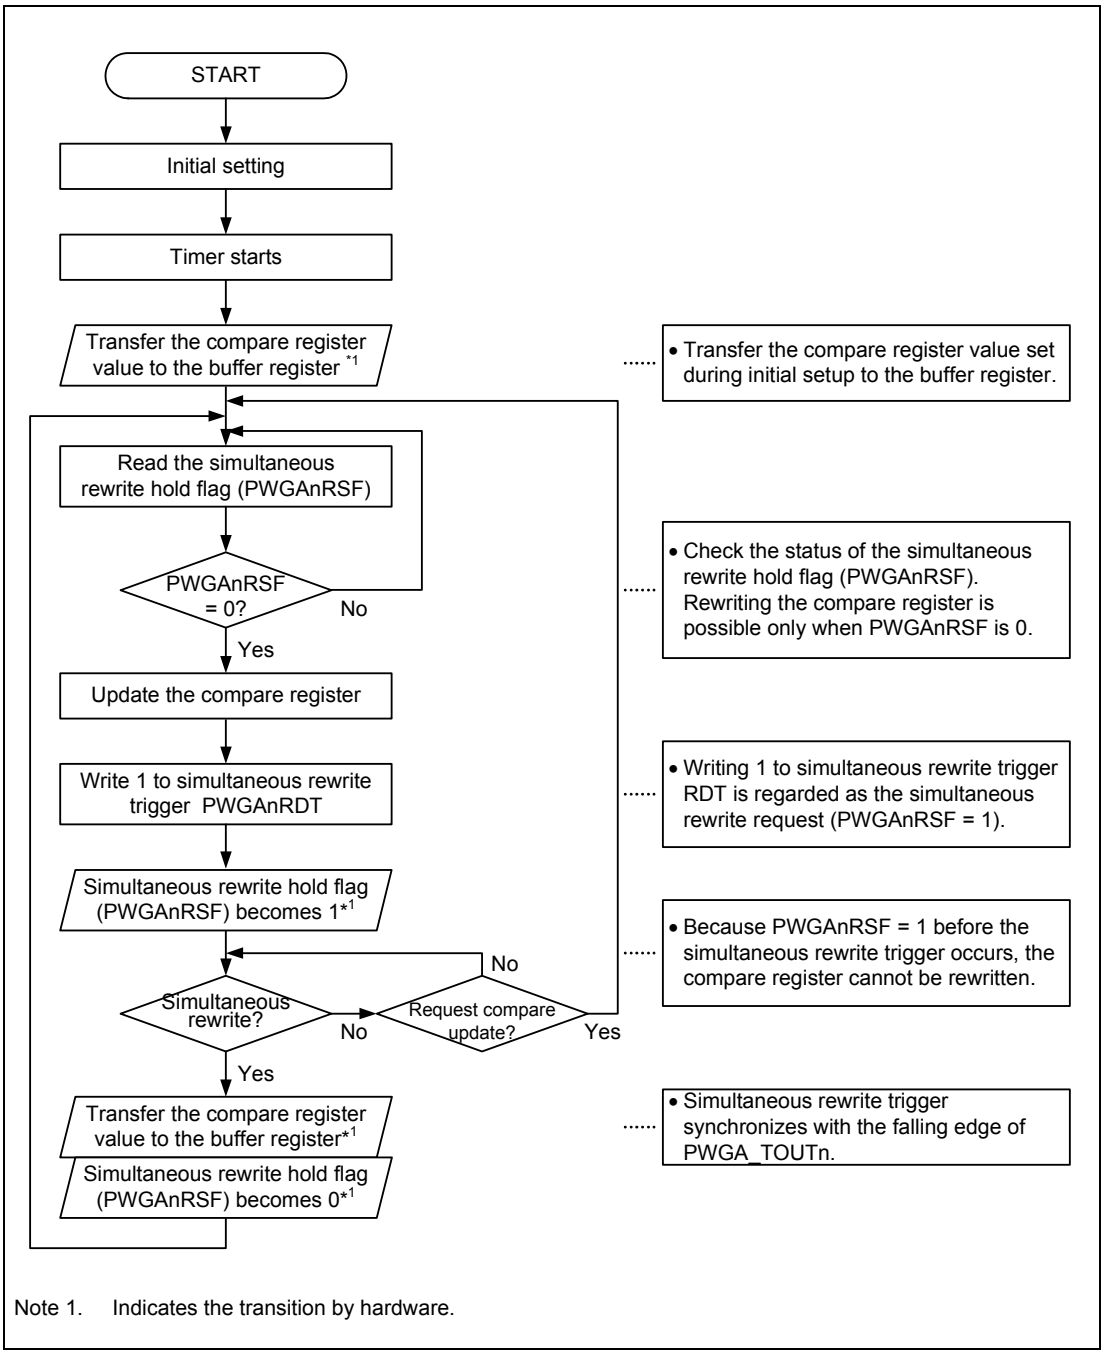
Procedures for simultaneous rewrite of PWGA are illustrated below.

The described term “compare register” indicates PWGAnCSDR, PWGAnCRDR, or PWGAnCTDR.

In addition, the described term “buffer register” indicates PWGAnCSBR, PWGAnCRBR, or PWGAnCTBR.



Note 1. Indicates the transition by hardware.

Figure 32.3 Simultaneous Rewrite Procedure

32.4 Operation Waveform of PWM-Diag

32.4.1 PWM Waveform Output by PWGA and Operation Waveform for A/D Conversion Trigger Output

32.4.1.1 Basic Operation Waveform of PWGA

The basic operation waveforms of PWGA are illustrated below.

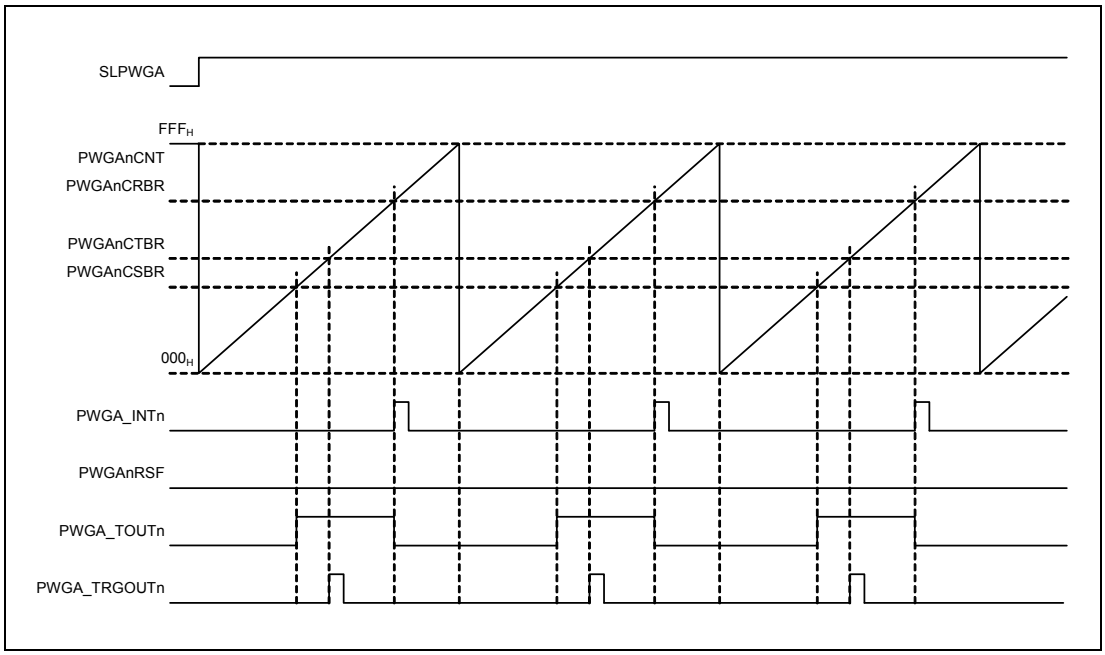


Figure 32.4 Basic Waveform

32.4.1.2 Operation Waveform when Simultaneous Rewrite for PWGA is Executed

The following figure illustrates the operation waveforms when simultaneous rewrite for PWGA is executed.

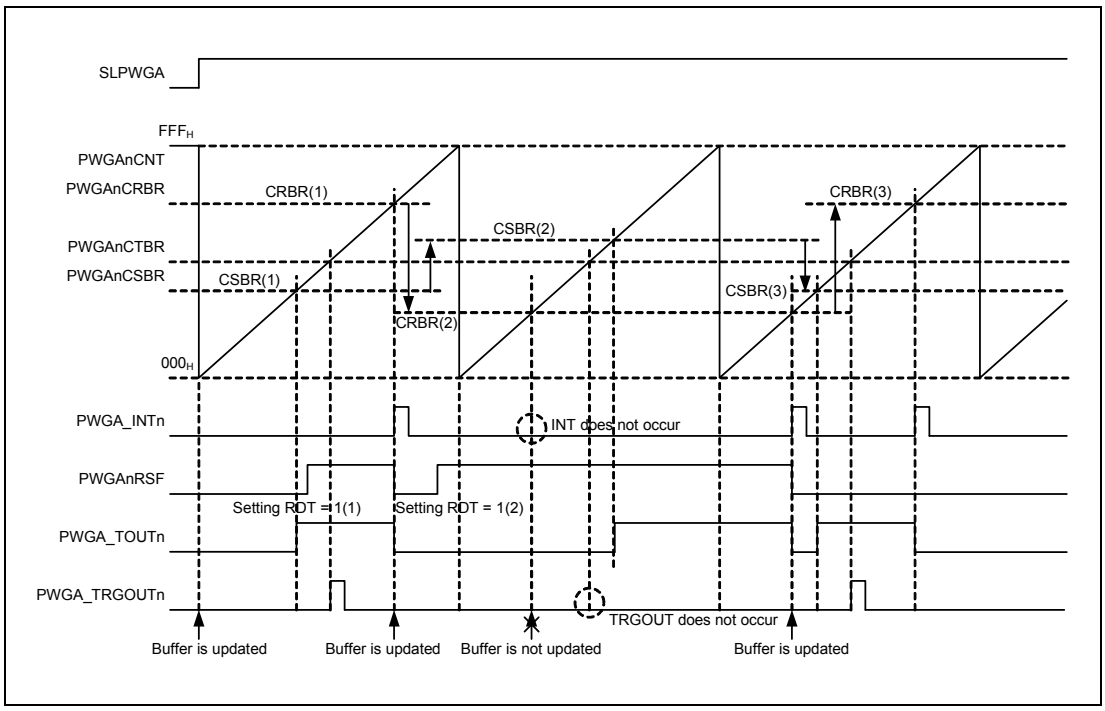

Figure 32.5 Waveform when Simultaneous Rewrite is Executed

Simultaneous rewrite is executed by re-setting the PWGAnCSDR and PWGAnCRDR registers, then setting either the PWGAnRDT or SLPWGAk register.

Moreover, if the relationship between set values in one interval is PWGAnCSDR > PWGAnCRDR, a falling edge in that interval is meaningless, and the falling edge in the next interval is valid.

Moreover, PWGA_TRGOUTn does not become valid unless PWGA_TOUTn is at the high level.

32.4.1.3 Operation Waveform when Stopping and Restarting PWGA Operation

The following figure illustrates the operation waveforms when stopping and restarting PWGA operation.

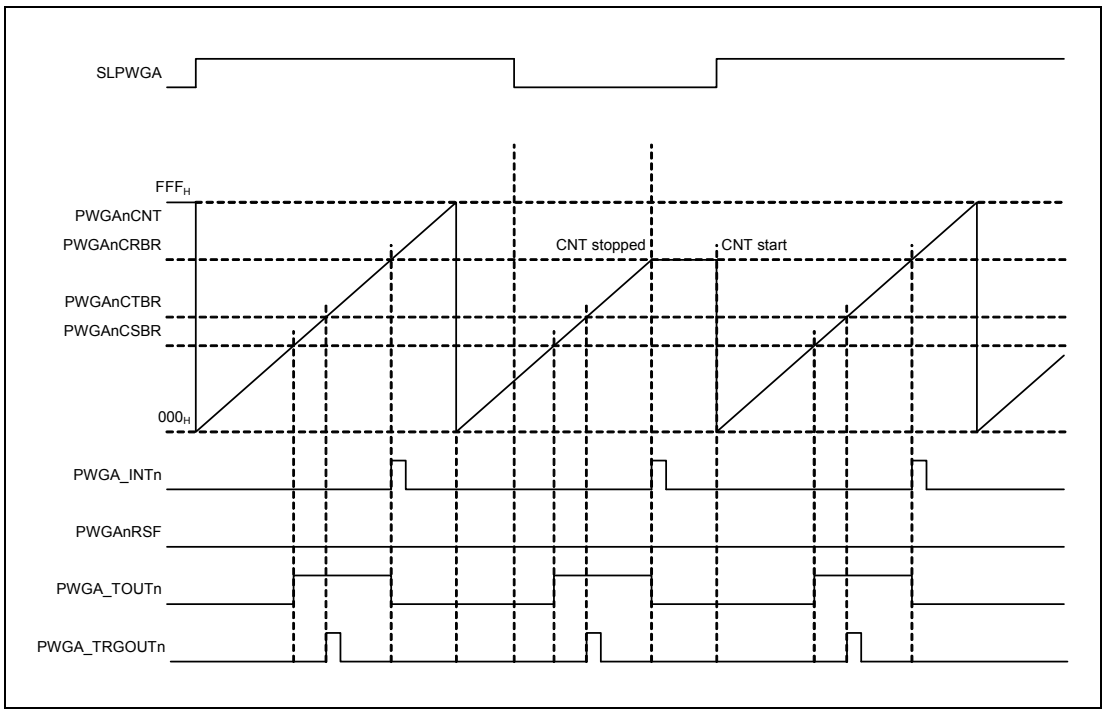

Figure 32.6 Stopping and Resuming Operation (1)

After the setting of SLPWGA has been changed from 1 to 0, PWGAnCNT stops operation because PWGA_INTn is generated.

After PWGA_INTn has been generated, by changing the setting of SLPWGA from 0 to 1, PWGAnCNT resumes counting from 000_H.

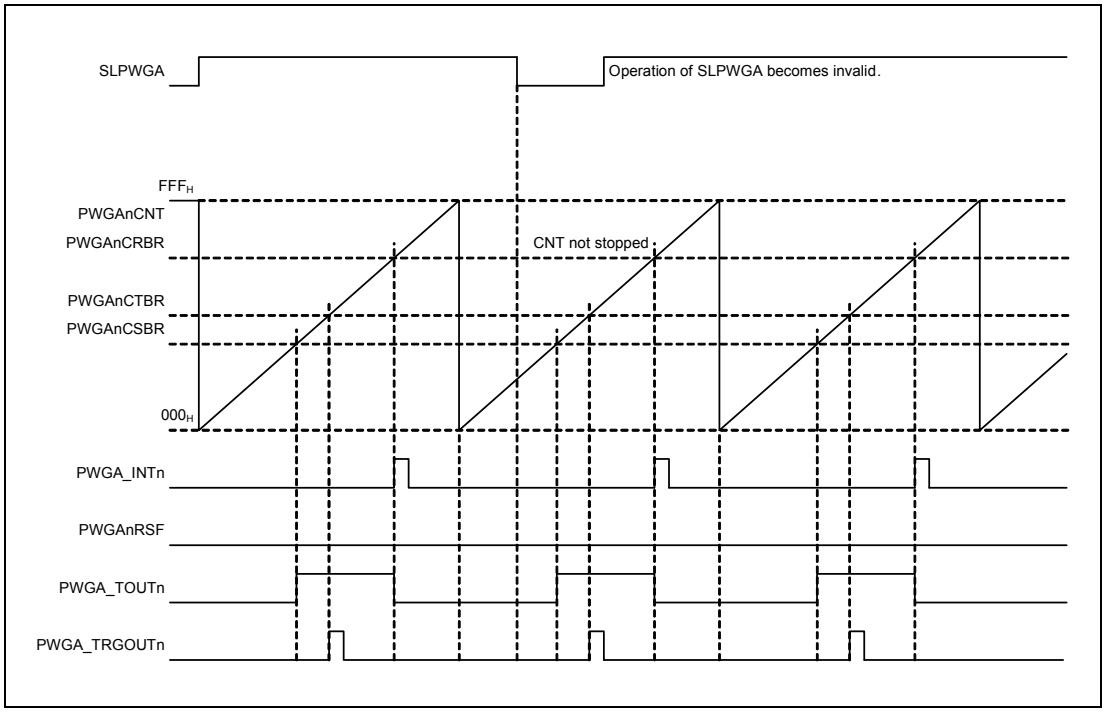

Figure 32.7 Stopping and Resuming Operation (2)

After the setting of SLPWGA has been changed from 1 to 0, if the setting of SLPWGA is changed from 0 to 1 before PWGA_INTn is generated, operations of SLPWGA become invalid, and PWGAnCNT continues counting.

32.4.1.4 Waveforms of PWGA Operation with Specific Settings

The following figures illustrate the waveforms of PWGA operation with specific settings.

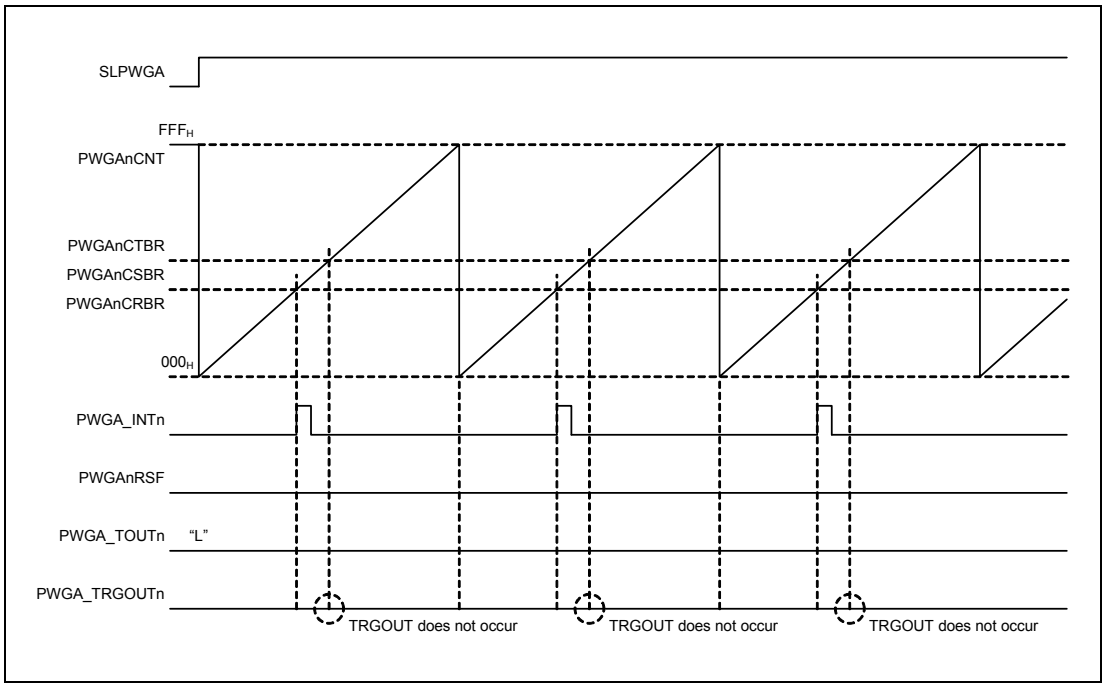

Figure 32.8 PWGA_TOUTn = 0% Output Waveform

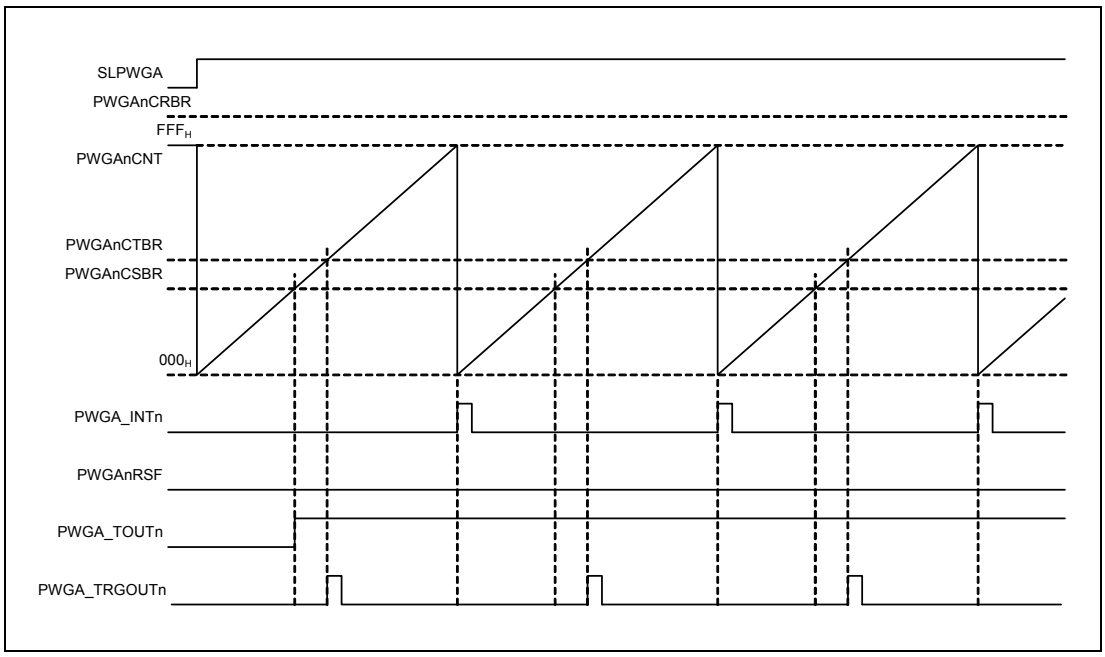

Figure 32.9 PWGA_TOUTn = 100% Output Waveform

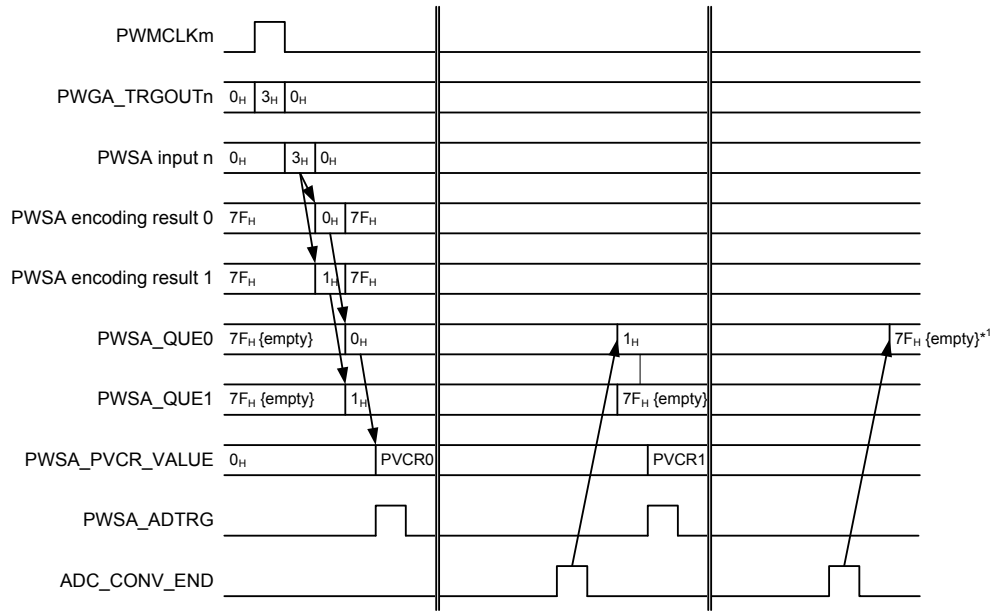
32.4.2 Operation Waveform when A/D Conversion Trigger Occurs in PWSA

An example of the PWSA operation is shown below.



Note 1. QUE0[5:0] indicates the PWGA_TRG number while the A/D conversion is executed. The initial value (while the A/D conversion is not executed) is $7F_H$.

Figure 32.10 Example of PWSA Operation

(1) Triggers occur simultaneously in channels 0 and 1 of PWGA. Channel 0 with the smaller channel number is stored in PWSAnQUE0, and channel 1 with the larger channel number is stored in PWSAnQUE1. The lower 16 bits information of PWSAnPVCR00_01 corresponding the value stored in PWSAnQUE0 is transmitted to the A/D converter and a trigger is output to the A/D converter.
At this time, as the A/D conversion for channel 1 is in the waiting state, the PWSAnSTR.PWSAnQNE bit is set.

(2) On completion of A/D conversion executed in step (1), the channel number of PWSAnQUE1 shifts to PWSAnQUE0 and PWSAnQUE1 enters the empty state.
After that, as similar to step (1), the upper 16-bit information of PWSAnPVCR00_01 corresponding to the value stored in PWSAnQUE0 is transmitted to the A/D converter and a trigger is output to the A/D converter.

(3) On completion of A/D conversion executed in step (2), PWSAnQUE0 enters the empty state.

32.5 PWM-Diag Related Function in A/D Converter (ADCE)

This section describes the A/D converter used in the PWM-Diag function.

32.5.1 ADCE registers when the PWM-Diag function is used

- Before starting PWSA operation, the A/D converter must be set using the following register.
  - PWM-Diag scan group control register (ADCEnPWDSGCR)
- When the PWM-Diag is running, the PWSAnPVCRx_y setting value corresponding to the channel under conversion is set in the following registers of the A/D converter.
  - PWM-Diag virtual channel register (ADCEnPWDVCR)
- After completion of A/D conversion, the conversion result can be checked by reading the following registers.
  - PWM-Diag data register (ADCEnPWDTSNDR)
  - PWM-Diag data supplementary information register (ADCEnPWDDIR)
- When A/D conversion result is outside the expected range, it can be confirmed using the upper/lower limit error detection function. The upper/lower limit error detection function is set by the following register.
  - Upper limit/lower limit error register (ADCEnULER)
- The scan end flag of the PWM-Diag scan group can be cleared using the following register.
  - PWM-Diag scan end flag clear register (ADCEnPWDSGSEFCR)

Section 33 Sound Generator (SG)

This section contains a generic description of the Sound Generator.

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.
The subsequent sections describe the features that apply to all implementations.

33.1 Overview of the RH850/D1L/D1M Sound Generators

33.1.1 Units

This microcontroller has the following number of units of the Sound Generator.

Table 33.1 Units

Sound Generator	
Units	5
Names	SG0 to SG4

Unit index n

Throughout this section, the individual units of the Sound Generators are identified by the index “n” (n = 0 to 4), for example SGnCTL for the SGn control register.

33.1.2 Register addresses

All Sound Generator register addresses are given as address offsets from the individual base addresses <SGn_base>.
The <SGn_base> addresses of each SGn are listed in the following table:

Table 33.2 Register base addresses <SGn_base>

SGn unit	<SGn_base> address
SG0	FFF1 1000_H
SG1	FFF1 1100_H
SG2	FFF1 1200_H
SG3	FFF1 1300_H
SG4	FFF1 1400_H

33.1.3 Clock supply

All Sound Generators provide one clock input.

Table 33.3 Clock supply

SGn unit	SGn clock	Connected to
SG0	PCLK	Clock Controller CLKFIX
SG1	PCLK	Clock Controller CLKFIX
SG2	PCLK	Clock Controller CLKFIX
SG3	PCLK	Clock Controller CLKFIX
SG4	PCLK	Clock Controller CLKFIX

33.1.4 Interrupts and DMA

The Sound Generators can generate the following interrupt and DMA requests:

Table 33.4 SGn interrupt and DMA requests

SGn signals	Function	Connected to
INTSG0TI	Threshold interrupt	Interrupt Controller INTSG0TI DMA Controller trigger ID 118
INTSG1TI	Threshold interrupt	Interrupt Controller INTSG1TI DMA Controller trigger ID 119
INTSG2TI	Threshold interrupt	Interrupt Controller INTSG2TI DMA Controller trigger ID 120
INTSG3TI	Threshold interrupt	Interrupt Controller INTSG3TI DMA Controller trigger ID 121
INTSG4TI	Threshold interrupt	Interrupt Controller INTSG4TI DMA Controller trigger ID 122

33.1.5 Reset sources

The Sound Generators and their registers are initialized by the following reset signal:

Table 33.5 Reset sources

SGn unit	Reset signal
SG0	• Reset Controller SYSRES • Reset Controller SG0RES • reset upon wake-up from DEEPSTOP mode
SG1	• Reset Controller SYSRES • Reset Controller SG1RES • reset upon wake-up from DEEPSTOP mode
SG2	• Reset Controller SYSRES • Reset Controller SG2RES • reset upon wake-up from DEEPSTOP mode
SG3	• Reset Controller SYSRES • Reset Controller SG3RES • reset upon wake-up from DEEPSTOP mode
SG4	• Reset Controller SYSRES • Reset Controller SG4RES • reset upon wake-up from DEEPSTOP mode

CAUTION

By default the SGnRES resets are active.
Thus before accessing an SGn module this reset must be released via the MRSTC register of the Reset Controller. Refer to Section 9, Reset Controller for details.

33.1.6 I/O signals

The following table shows the I/O signals of the Sound Generators.

Table 33.6 I/O signals connections

SGn signal	Function	Connected to
SG0:		
SGTFAO	Tone frequency or composite output	Port SG0FAO
SGTFAOL	Inverted composite output	Port SG0FAOL
SGTAO	PWM volume output	Port SG0AO
SG1:		
SGTFAO	Tone frequency or composite output	Port SG1FAO
SGTFAOL	Inverted composite output	Port SG1FAOL
SGTAO	PWM volume output	Port SG1AO
SG2:		
SGTFAO	Tone frequency or composite output	Port SG2FAO
SGTFAOL	Inverted composite output	Port SG2FAOL
SGTAO	PWM volume output	Port SG2AO
SG3:		
SGTFAO	Tone frequency or composite output	Port SG3FAO
SGTFAOL	Inverted composite output	Port SG3FAOL
SGTAO	PWM volume output	Port SG3AO
SG4:		
SGTFAO	Tone frequency or composite output	Port SG4FAO
SGTFAOL	Inverted composite output	Port SG4FAOL
SGTAO	PWM volume output	Port SG4AO

XOR Compare Unit check of SG output signals

The following SGn output signals can be checked by the XOR Compare Unit:

- SG0: SG0FAO, SG0FAOL at port P3_7, SG0AO at port P3_7.

33.2 Functional Overview

The Sound Generator (SG) consists of a programmable square wave tone generator and a programmable pulse-width modulator (PWM).

It generates an audio-frequency tone signal and a high-frequency pulse-width modulated signal. The duty cycle of the PWM signal defines the volume.

By default, the two signal components are routed to separate outputs. But both signals can also be combined to generate a composite signal that can be used to drive a loudspeaker circuit.

The PWM includes an internal automatic logarithmic decrement unit (ALD). The ALD can be used to reduce the tone volume over time without CPU intervention.

Features summary

Special features of the Sound Generator are:

- Programmable tone frequency (100 Hz to 6 kHz with a minimum step size of 20 Hz)
- Programmable volume level (9 bit resolution)
- Automatic logarithmic volume decrement function (ALD):
  - Volume reduction without CPU interaction
  - Programmable sound duration (256 steps)
  - Sound duration associated with tone frequency (gong effect)
  - Interrupt generation when programmable volume level is reached
- Automatic duration control (ADC)
- Automatic decrement/increment of volume (ADI)
- Wide range of PWM base frequencies (32 kHz to 64 kHz)
- Sound can be stopped or re-triggered (even if the ALD/ADC function is switched on)
- Composite or separated frequency/volume output for external circuitry variation
- Hardware-optimized update of frequency and volume to avoid audible artefacts

33.2.1 Description

The following figure provides a functional block diagram of the Sound Generator.

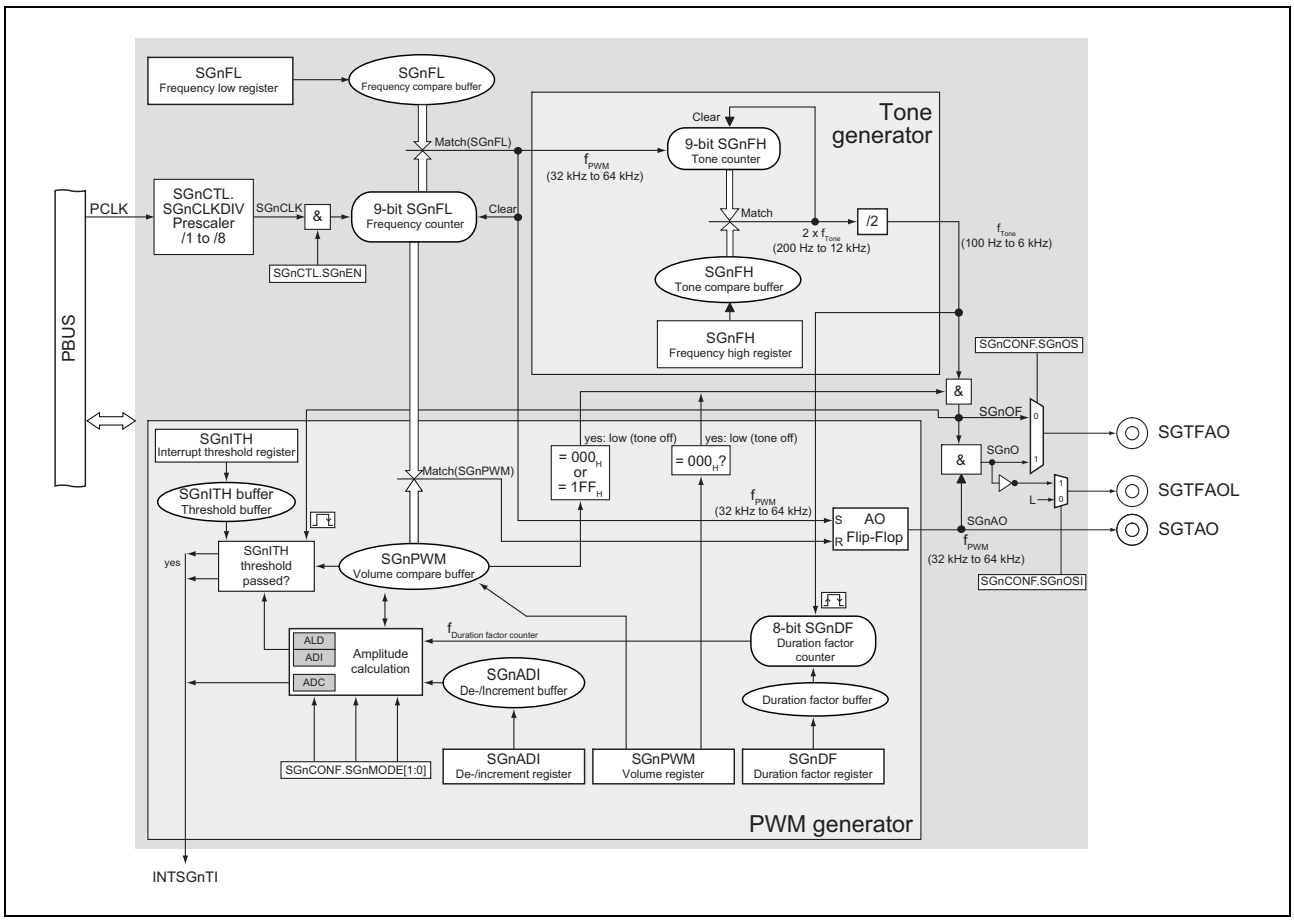


Figure 33.1 Sound Generator block diagram

PCLK

The Sound Generator's clock input PCLK is specified in the first section of this chapter under the key word “Clock supply”.

Tone generator

The tone generator consists of two up-counters with compare registers. The values written to the frequency registers are automatically copied to compare buffers. The counters are reset to zero when their values match the contents of the associated compare buffers.

The 9-bit frequency counter SGnFL generates a clock with a frequency between 32 kHz and 64 kHz. This clock constitutes the PWM base frequency f_{PWM}.

It is also the input of the second 9-bit tone counter SGnFH and a divider by two. The resulting tone frequency signal SGnOF has a frequency between 100 Hz and 6 kHz and a 50 % duty cycle.

PWM generator

The PWM generator generates the PWM volume signal SGnAO with the PWM base frequency f_{PWM}. The composite signal SGnO consists of the tone frequency signal SGnOF that is modulated with the PWM volume signal SGnAO (logical AND combination).
Thus the duty cycle of SGnAO determines the volume of the final audio signal.

The duty cycle of SGnAO is controlled by the volume register SGnPWM. The value written to this register is automatically copied to the associated volume compare buffer.

The PWM continually compares the value of the counter SGnFL with the contents of its volume compare buffer.

The AO Flip-Flop of the PWM generator is set by the pulses generated by the counter SGnFL (PWM base frequency f_{PWM}). It is reset when the SGnFL counter value matches the contents of the volume compare buffer SGnPWM. Thus, the PWM volume signal can have a duty cycle between 0 % (null volume) and 100 % (maximum volume).

The PWM base frequency is above 32 kHz and hence outside the audible range.

Outputs

The Sound Generator outputs following signals:

- SGTAO outputs the PWM volume signal SGnAO that holds the volume information ("amplitude").
- SGTFAO outputs by default the tone frequency signal SGnOF.
  If the SGnCONF.SGnOS bit is set, SGTFAO outputs the composite signal SGnO that can directly control a speaker circuit.
- SGTFAOL outputs by default a low level.
  If the SGnCONF.SGnOSI bit is set, SGTFAOL outputs the inverted composite signal SGnO.

33.2.2 Principle of operation

The software-controlled registers SGnFL, SGnFH, and SGnPWM are equipped with hardware buffers. The Sound Generator operates on these buffers.

This approach eliminates audible artefacts, because the buffers are only updated in synchronization with the generated tone frequency signal.

NOTE

This section provides an overview. For details please refer to Section 33.3, Functional Description.

33.2.2.1 Generation of the tone frequency

The tone frequency is determined by the tone frequency signal SGnOF, a rectangular signal with 50 % duty cycle.

The tone frequency f_{TONE} is generated by two counters and their associated compare register values. Two counters are necessary to keep the pulses of the tone frequency signal and the PWM volume signal synchronized.

The first counter (SGnFL) provides the input to the second (SGnFH) and also to the PWM. It is used to keep the working frequency of connected modules (PWM and tone generation) within the limits of 32 kHz and 64 kHz. Its match value defines also the 100 % volume level.

The second counter (SGnFH) generates the tone frequency (100 Hz to 6 kHz).

NOTE

If the SGnFL counter value is changed to generate a different tone frequency, the volume register SGnPWM has to be adjusted accordingly to keep the same volume.

33.2.2.2 Generation of the volume information (amplitude)

The volume information (the “amplitude” of the audible signal) is provided as the high-frequency PWM volume signal SGnAO. The duty cycle of SGnAO determines the amplitude of the final audio signal.

The composite signal SGnO is a logical AND combination of the PWM volume signal SGnAO and the tone frequency signal SGnOF.

After low-pass filtering, the analog signal amplitude corresponds to the duty cycle of the PWM volume signal. Low-pass filtering (averaging) is an inherent characteristic of a loudspeaker system.

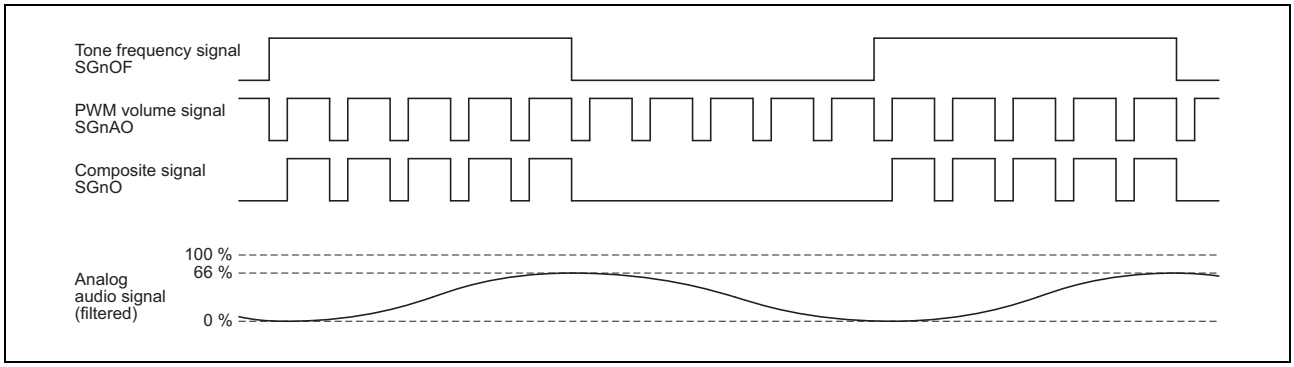

Figure 33.2 Generation of the composite output signal

The duty cycle can vary between 0 % and 100 %. Its generation is controlled by the frequency low register SGnFL and the volume register SGnPWM.

For details on SGnPWM updates, refer to Section 33.3.3, Updating the buffer values.

33.2.2.3 Automatic logarithmic fading (ALD)

The automatic logarithmic decrement function (ALD) provides an automatic volume reduction without CPU interaction.

In regular intervals (related to the tone frequency, selectable via the SGnDF register), the present contents of the volume compare buffer is divided by an automatically calculated division factor. The result is subtracted from the buffer value. The logarithmic reduction creates the impression of a linear volume reduction in the human ear.

The initial volume that is defined by the content of the volume register SGnPWM remains unchanged.

For a detailed description refer to Section 33.3.4, Automatic logarithmic fading (ALD).

33.2.2.4 Automatic decrement/increment of volume (ADI)

The automatic decrement/increment function (ADI) provides fading in and out of the volume without CPU interaction.

Depending on the value of the duration factor SGnDF, the volume is increased or decreased.

The sound is stopped when the volume compare buffer is 000_H or $1FF_H$.

For a detailed description refer to Section 33.3.5, Automatic decrement/increment (ADI) of the volume.

33.2.2.5 Automatic duration control (ADC)

The automatic duration control (ADC) stops the tone after a configurable number of periods of the tone frequency.

For a detailed description refer to Section 33.3.6, Automatic duration control (ADC).

33.2.2.6 Interrupt generation

In ALD, ADI and ADC mode the interrupt INTSGnTI can be generated:

- In ALD mode, the interrupt signals that the tone volume has decreased to a certain level (set in register SGnITH). Because the sound duration depends on the tone frequency and the contents of the sound duration register SGnDF, INTSGnTI can be used to indicate “sound is low” or “sound has ended”. Refer to Section 33.3.4.3, Interrupt in ALD mode for details.
- In ADI mode, the interrupt signals that the tone volume has decreased or increased to a certain level (set in register SGnITH). Refer to Section 33.3.5.3, Interrupt in ADI mode for details.
- In ADC mode, the interrupt signals that the sound has stopped. Refer to **Section 33.3.6.2, Interrupt in ADC mode** for details.

The interrupt is generated only once after the volume level has passed the value written to the SGnITH register.

33.3 Functional Description

This section explains the details of the Sound Generator.

33.3.1 Generating the tone

The tone frequency signal SGnOF is generated by the compare match signal of the tone counter SGnFH value with the value of the tone compare buffer SGnFH, followed by a by-two-divider. At each compare match, the counter is reset to zero.

The tone counter SGnFH is clocked by the output of the frequency counter SGnFL.

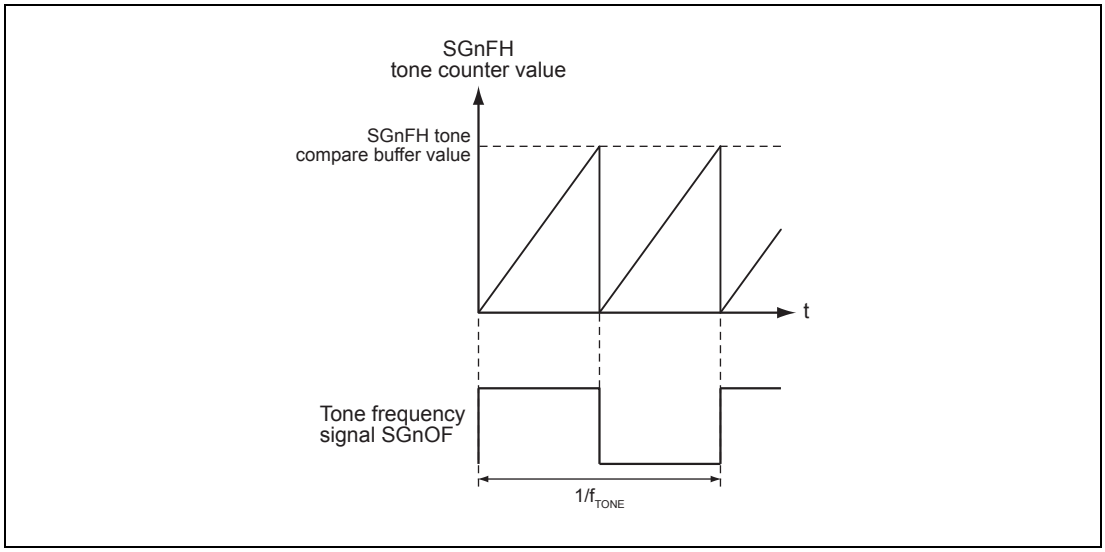

Figure 33.3 Generation of tone frequency

33.3.1.1 Updating the frequency and tone buffer values

The values of the frequency compare buffer and the tone compare buffer can be changed by writing to the associated frequency registers SGnFL and SGnFH.

Changing the value of the SGnFL register would also yield a change of the PWM base frequency, i.e. the tone volume. Therefore it is obligatory to write the correct PWM value to the SGnPWM register after a new SGnFL value is copied to the frequency compare buffer.

For a detailed description, refer to Section 33.3.3, Updating the buffer values.

33.3.1.2 Tone frequency calculation

The tone frequency can be calculated as:

$$f_{TONE} = \frac{f_{SGnCLK}}{2 \bullet (SGnFL + 1) \bullet (SGnFH + 1)}$$

with

$$_{SGnCLK} = \frac{f_{PCLK}}{SGnCLKDIV + 1}$$

where:

f_{PCLK}:	frequency of the Sound Generator input clock PCLK
f_{SGnCLK}:	frequency of the prescaler output clock SGnCLK
SGnFL:	contents of the SGnFL buffer
SGnFH:	contents of the SGnFH buffer
SGnCLKDIV:	register bits SGnCTL.SGnCLKDIV[2:0]

Example

With

- f_{SGnCLK} = 16 MHz
- SGnFL buffer = 255 ($00FF_H$) (this yields a PWM base frequency of 62.5 kHz)
- SGnFH buffer = 32 (0020_H)

a tone frequency f_{TONE} = 947 Hz is generated.

NOTE

The buffer contents can differ from the contents of the associated register until the next compare match.

33.3.2 Generating the volume information

The tone volume information, i.e. the frequency and duty cycle of the PWM volume signal SGnAO, is generated by comparing the SGnFL frequency counter value with the contents of the SGnFL frequency compare buffer and the SGnPWM volume compare buffer.

A Reset-Set Flip-Flop (AO-FF) is

- set if the SGnFL frequency counter value matches the SGnFL frequency compare buffer value (PWM base frequency f_{PWM})
- reset if the SGnFL frequency counter value matches the SGnPWM volume compare buffer value (duty cycle).

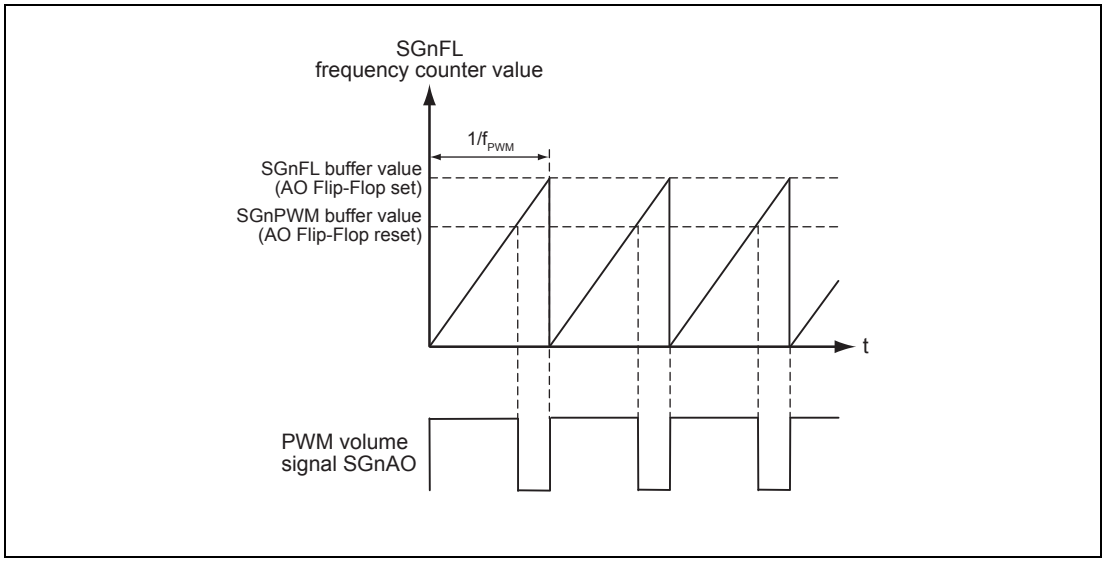

Figure 33.4 PWM signal generation

The duty cycle of the PWM volume signal is determined by the difference between the contents of the SGnFL counter buffer and the content of the SGnPWM volume buffer. A smaller difference (SGnFL - SGnPWM) yields a smaller duty cycle.

NOTES

1. The PWM volume signal SGnAO is continually high (100 % duty cycle) when the value of the SGnPWM volume buffer is higher than the value of the SGnFL frequency compare buffer.
2. The PWM volume signal SGnAO is continually low (0 % duty cycle) when the value of the SGnPWM volume buffer is zero, i.e. tone output has stopped.
3. The frequency low register SGnFL must not be set to a value above $1FE_H$.

33.3.2.1 PWM calculations

PWM base frequency

The PWM base frequency is determined by the frequency compare buffer SGnFL. It can be calculated as:

$$f_{PWM} = \frac{f_{SGnCLK}}{SGnFL + 1}$$

where:

f_{SGnCLK}: frequency of the prescaler output clock SGnCLK

SGnFL: contents of the SGnFL buffer

Duty cycle

The duty cycle of the PWM volume signal is calculated as follows:

- If [SGnPWM buffer] > [SGnFL buffer]:
  Duty cycle = 100 %
- If 0 ≤ [SGnPWM buffer] ≤ [SGnFL buffer]:
  Duty cycle = [SGnPWM buffer] / ([SGnFL buffer] + 1)

where:

[SGnPWM buffer] = contents of SGnPWM buffer

[SGnFL buffer] = contents of SGnFL buffer

Example

If register SGnFL is set to 240 ($00F0_H$), the following table applies:

Table 33.7 Duty cycle calculation example

[SGnPWM]	Calculation	Duty cycle [%]
$01FF_H$		100
...		100
$00F1_H$	241 / 241	100
$00F0_H$	240 / 241	99.6
$00EF_H$	239 / 241	99.2
...	...	...
0001_H	1 / 241	0.41
0000_H	0 / 241	0

The table shows, how the contents of register SGnFL affects the achievable volume resolution.

33.3.3 Updating the buffer values

The Sound Generator operates internally not directly with registers, which can be written by the application program, but with buffers of these registers.
The content of the registers are copied to their buffers (i.e. the buffer update) under specific conditions. This way the register content can be changed by the application program at any time without interfering with an ongoing tone generation.

Following registers have associated buffer registers: SGnPWM, SGnCONF, SGnDF, SGnADI, SGnITH, SGnFL, SGnFH.

33.3.3.1 Start of a new tone

Two events can basically enable an update of all buffers, e.g. for starting generation of a new tone.

It can be selected by the SGnCONF.SGnBE bit which of both is used:

- SGnCONF.SGnBE = 0:
  - buffer update by write to the volume register SGnPWM enabled
  - buffer update by INTSGnTI disabled
- SGnCONF.SGnBE = 1:
  - buffer update by INTSGnTI enabled
  - buffer update by write to the volume register SGnPWM disabled

In both above cases the generation of a new tone is started. Therefore all buffers are updated to specify the parameters of the new tone.

(a) SGnCONF.SGnBE = 0: SGnPWM write synchronization

The figure below shows a buffer update process by writing to SGnPWM.

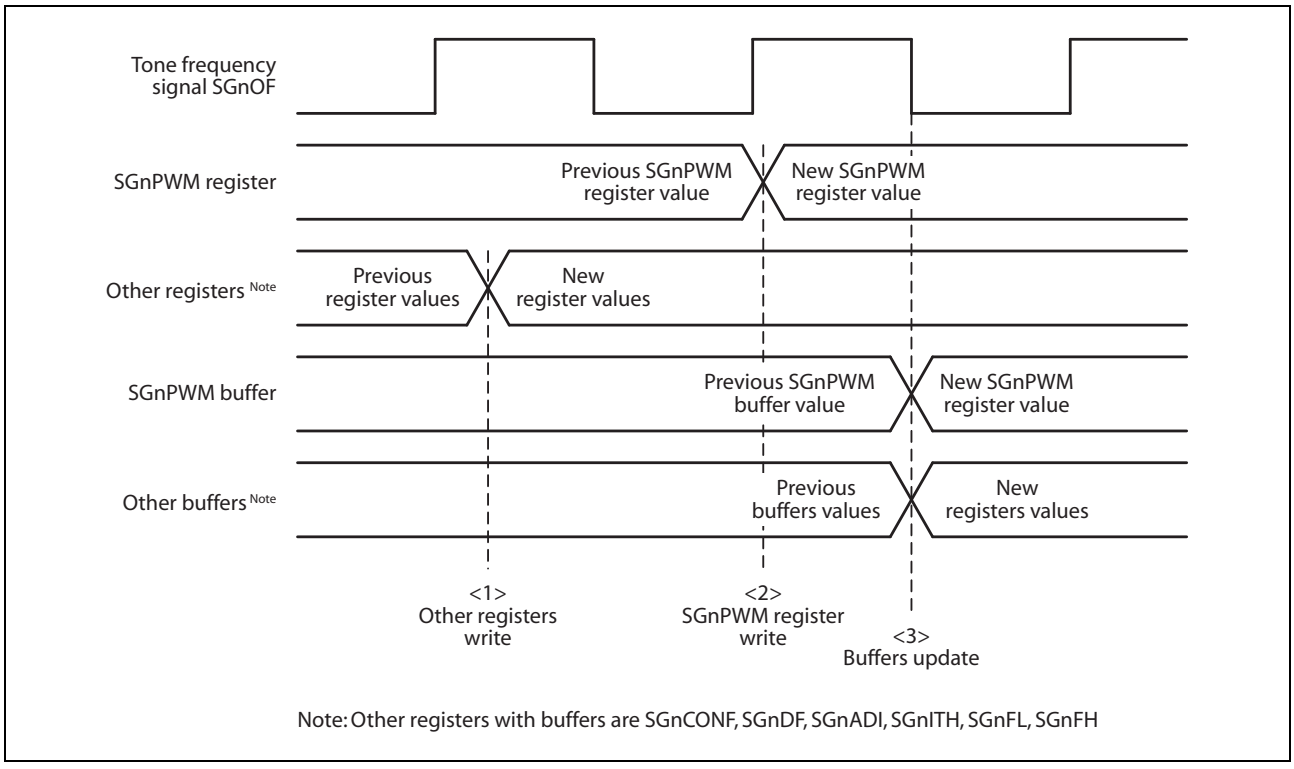

Figure 33.5 Update of buffer values by write to SGnPWM (SGnCONF.SGnBE = 0)

Before writing a new value to SGnPWM, all other buffered registers have to contain their desired values (<1>). Write to SGnPWM (<2>) enables the update of all buffers - including the SGnPWM buffer - with the falling next edge of the tone frequency signal SGnOF (<3>).

(b) SGnCONF.SGnBE = 1: INTSGnTI synchronization

The figure below shows a buffer update process by the INTSGnTI interrupt.
The interrupt is set up to be asserted at volume level D, i.e. the interrupt threshold register SGnITH is set to volume D.

The SGnPWM buffer is updated automatically by the ALD or ADI function each tone frequency signal falling edge.

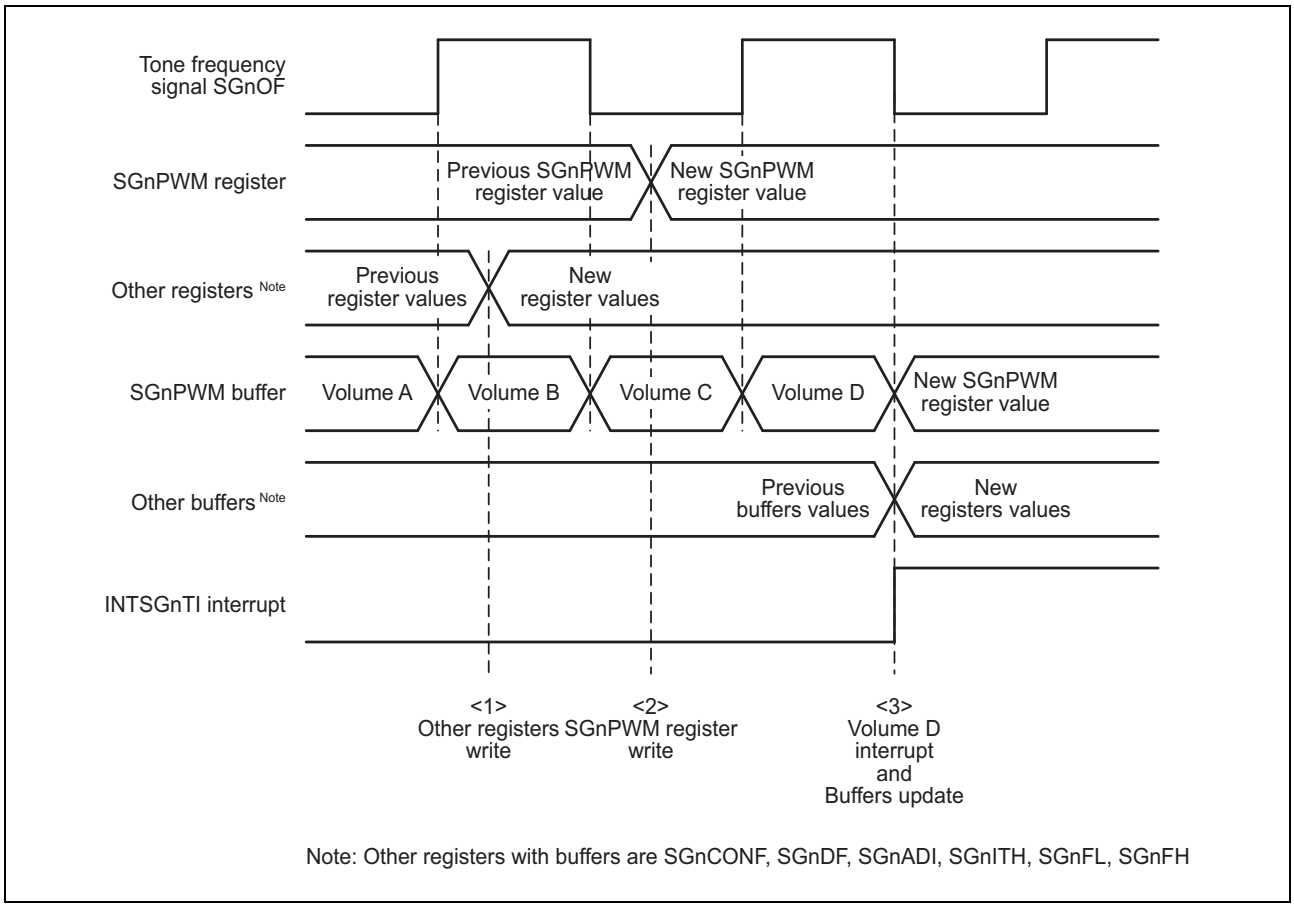

Figure 33.6 Update of buffer values by INTSGnTI (SGnCONF.SGnBE = 1)

Before the SGnPWM buffer reaches the volume D level all buffered registers have to contain their desired values (<1>) - including the SGnPWM buffer (<2>).
The INTSGnTI is asserted at volume D (<3>) and all buffers - including the SGnPWM buffer - are updated.

ADC mode

In automatic duration control mode (ADC) mode, the interrupt INTSGnTI is asserted, when the tone generation stops. However the buffer update is performed also in that case upon occurrence of INTSGnTI.

33.3.3.2 Volume compare buffer SGnPWM in ALD and ADI mode

In automatic volume adjustment modes (logarithmic volume fading (ALD) and volume decrement/increment (ADI)) the SGnPWM volume buffer is updated automatically during the tone generation process for changing the volume.

33.3.3.3 Buffer update conditions overview

The table below shows a summary of the buffers update conditions:

Table 33.8 Buffers update conditions

Buffers update conditions					
Register settings					
SGnCTL	SGnCONF		SGnPWM register write	Description	Updated Buffers
SGnEN	SGnBE	SGnMODE[1:0]			
1	0	X	yes	Tone generation is ongoing. Buffers update at next tone frequency signal (SGnOF) to continue with new tone.	SGnPWM, SGnCONF, SGnDF, SGnADI, SGnITH, SGnFL, SGnFH
	1	• 01_B (ADC) • 10_B (ADI) • 11_B (ALD)	X*[1]	Tone generation is ongoing. Buffers update at generation of INTSGnTI interrupt to continue with new tone.	SGnPWM, SGnCONF, SGnDF, SGnADI, SGnITH, SGnFL, SGnFH
	X	• 10_B (ADI) • 11_B (ALD)	no	Tone generation with automatic volume control is ongoing. Next calculated volume value stored in SGnPWM buffer at specified edge (SGnDF) of the tone frequency signal SGnOF.	SGnPWM
0	X	X	yes	Tone generation is stopped. Buffers are updated immediately.	SGnPWM, SGnCONF, SGnDF, SGnADI, SGnITH, SGnFL, SGnFH

Note 1. A write to the SGnPWM register does *not* enable the buffer update. See Section 33.4.6, Register buffers updating at interrupt generation for details.

33.3.4 Automatic logarithmic fading (ALD)

The automatic logarithmic decrement function (ALD) can be used to reduce the volume gradually to zero without CPU intervention.
The logarithmic decrease matches the sensitivity of the human ear and creates the impression of a linearly decaying tone.

A tone, started in ALD mode (SGnCONF.SGnMODE[1:0] = 11_B), will automatically fade away.

The fading is stopped if

- the volume has decreased to 0, i.e. the volume compare buffer SGnPWM value becomes 0,
- 000_H is written to the SGnPWM register.

The speed of the volume reduction is controlled by the sound duration factor register SGnDF.

A new volume value is calculated at every (SGnDF + 1) rising or falling edge of the tone frequency signal SGnOF.

The sound duration factor SGnDF can be set in the range 0 to 255.

33.3.4.1 Volume reduction

The calculation of the volume reduction uses an approximation of the logarithmic function by reducing the volume by 1/32 of the previous volume at each reduction step m.

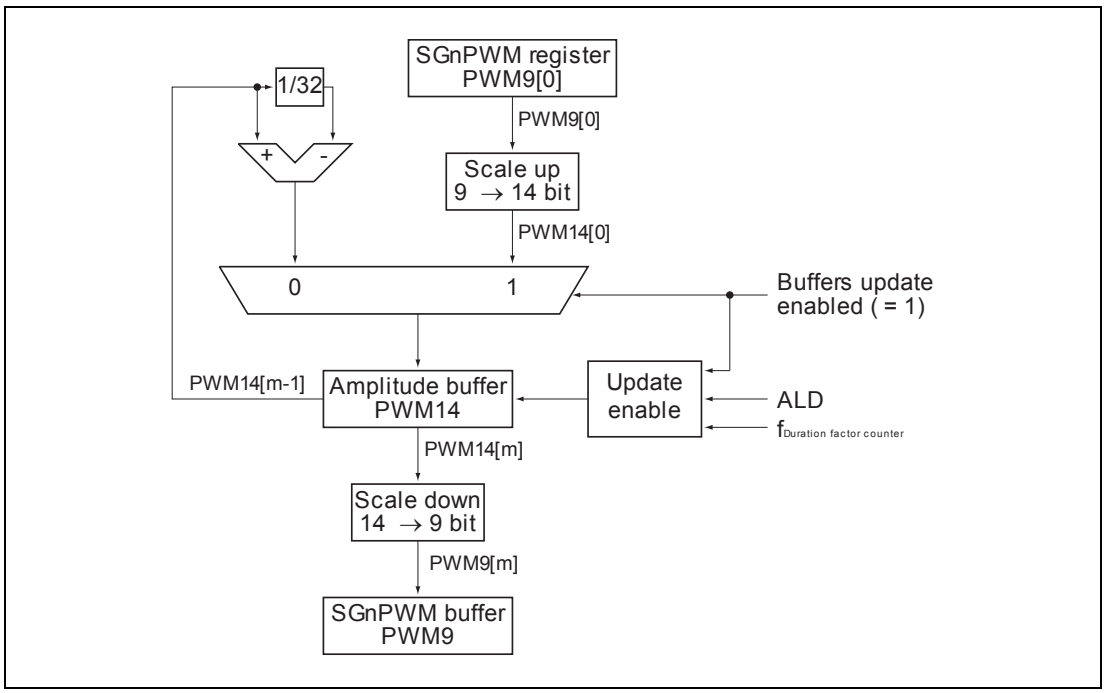

Figure 33.7 Volume calculation in ALD mode

The calculation uses 14-bit arithmetic and follows the procedure:

```
PWM9[0] = SGnPWM;                                  // initial volume
PWM14[0] = PWM9[0] << 5 + 31;                      // scale up to 14 bit
for (m=1, m<M+1; m++){
     PWM14[m] = PWM14[m-1]-(PWM14[m-1]>>5);        // decrement by 1/32
     PWM9[m] = PWM14[m] >> 5;                      // scale down to 9 bit
}
```

where:

PWM9[0]:	initial 9-bit PWM value
PWM14[0]:	initial 14-bit PWM value
PWM9[m]:	new 9-bit PWM value
PWM14[m]:	new 14-bit PWM value
PWM9[m-1]:	previous 9-bit PWM value
PWM14[m-1]:	previous 14-bit PWM value
M:	Number of volume reduction steps until tone stops, i.e. PWM9[M] = 0
m:	volume reduction step number, m = 1 to M

The maximum number of reduction steps M depends on the initial volume PWM9[0].

33.3.4.2 Tone duration

The volume reduction is conducted at the tone frequency signal SGnOF rising or falling edge number m x (SGnDF + 1).

The sound stops when the volume compare buffer SGnPWM value becomes zero.

The maximum number of volume reduction steps M depends on the start volume PWM9[0], i.e. the value set to SGnPWM register. To avoid an initial delay with apparently no effect, the start value shall not exceed the value of register SGnFL by more than 1.

The total duration T_D depends on

- the start volume PWM9[0], i.e. value of the SGnPWM register,
- the sound duration factor set in register SGnDF,
- the tone frequency f_{TONE}.

The diagram shows an example of ALD volume reduction with SGnDF = 2, i.e. every 3rd rising or falling SGnOF edge the tone volume is reduced.

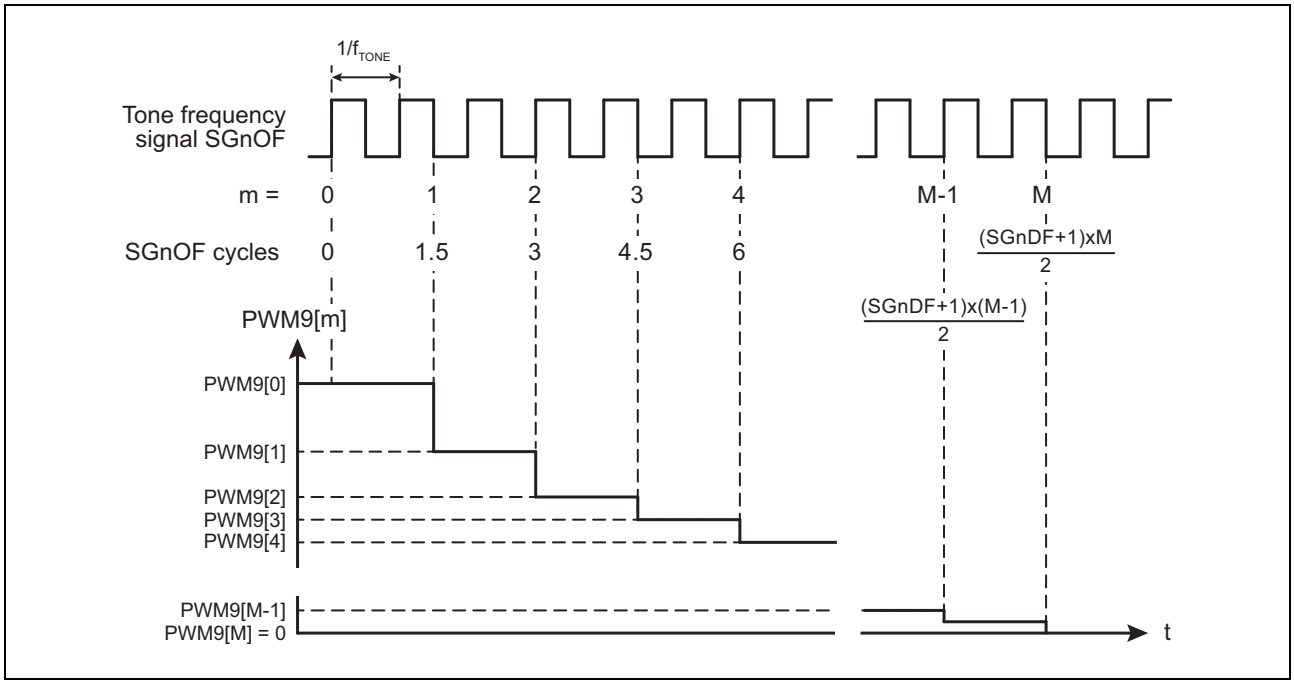

Figure 33.8 ALD mode timing

The tone duration T_D can be calculated as follows:

$$T_D = \frac{1}{2 \bullet f_{TONE}} \bullet (SGnDF + 1) \bullet M$$

where:

T_D:	duration of the tone, i.e. time until tone stops at PWM9[M] = 0
f_{TONE}:	frequency of the tone frequency signal SGnOF
SGnDF:	tone duration factor, i.e. contents of the SGnDF register
M:	Number of volume reduction steps until tone stops, i.e. PWM9[M] = 0

Example

The table below shows two examples of the sound duration for minimum and maximum tone frequency.

The following settings are assumed:

- f_{SGnCLK} = 16 MHz
- SGnFL = 332 (this yields a PWM base frequency of 48.048 kHz)
- SGnPWM = 333 (100 % volume)
- The tone frequency is changed via the SGnFH register:
  - SGnFH = 3 (this yields a tone frequency of 6.006 kHz)
  - SGnFH = 240 (this yields a tone frequency of 99.68 Hz)

With the initial 100 % volume (SGnPWM = 333) it takes M = 202 reduction steps to stop the sound, i.e. M = 202 and PWM9[M] = 0).

Table 33.9 ALD tone duration examples

	Tone duration T_D [sec]			
Tone frequency	SGnDF = 0	SGnDF = 1	...	SGnDF = 255
6006 Hz	0.017	0.034	...	4.305
99.68 Hz	1.013	2.026	...	259.390

NOTE

The present volume value of the SGnPWM buffer can not be read via the SGnPWM register.

33.3.4.3 Interrupt in ALD mode

The interrupt INTSGnTI is generated when the SGnPWM volume buffer reaches or passes below the value of the interrupt threshold register SGnITH at the next falling edge of the tone frequency signal SGnOF.

NOTE

The interrupt will not be generated if the SGnITH buffer value is 000_H.

If buffer update by INTSGnTI is enabled (SGnCONF.SGnBE = 1) the buffers are updated at the generation of the interrupt. See Section 33.3.3, Updating the buffer values for more information about buffer updating.

33.3.5 Automatic decrement/increment (ADI) of the volume

The automatic decrement/increment function (ADI) can be used to reduce or increase the volume without CPU intervention.

A tone, started in ADI mode (SGnCONF.SGnMODE[1:0] = 10_B) will be output with a linear decrementing or incrementing volume.

The volume increment or decrement is stopped if

- the volume has decreased to 0, i.e. the volume compare buffer SGnPWM value becomes 0,

- the volume has increased to the maximum, i.e. the volume compare buffer SGnPWM value becomes $1FF_H$,
- 000_H is written to the SGnPWM register.

The speed of the volume increment or decrement is controlled by the sound duration factor register SGnDF.

A new volume value is calculated at every (SGnDF + 1) rising or falling edge of the tone frequency signal SGnOF.

The sound duration factor SGnDF can be set in the range 0 to 255.

33.3.5.1 Volume reduction

The value to increment respectively decrement the volume buffer is defined by SGnADI.SGnADIL[8:0].
SGnADIL[8:0] can hold positive (increment) and negative (decrement) values. The MSB SGnADIL[8] is the sign bit (1 for negative values) and SGnADIL[7:0] is the absolute value. Thus a increment/decrement value range from -255 ($1FF_H$) to +255 ($0FF_H$) can be specified.

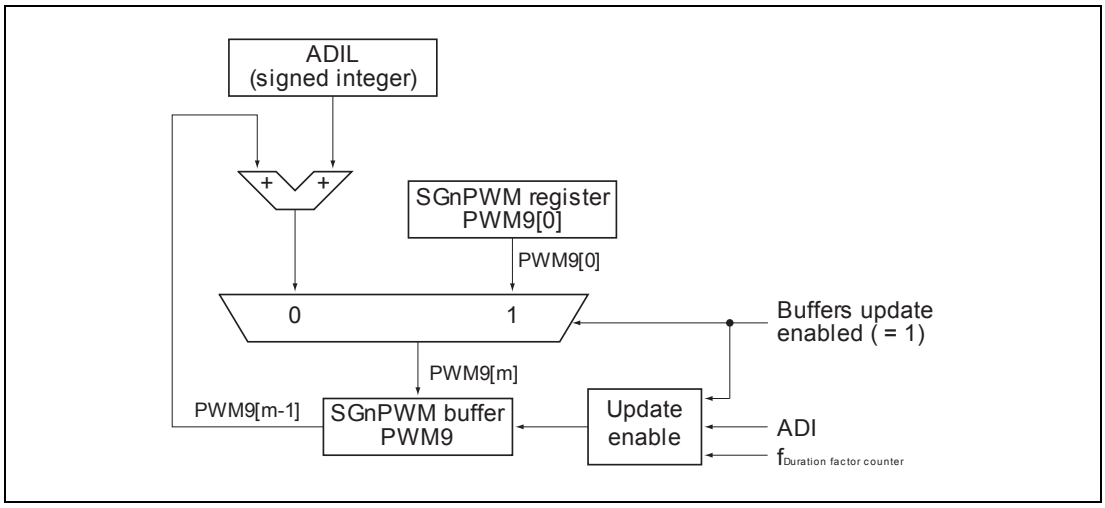

Figure 33.9 Volume calculation in ADI mode

The calculation uses 9-bit arithmetic and follows the procedure:

```
PWM9[0] = SGnPWM;                                   // initial volume
for (m=1, m<M+1; m++){
     PWM9[m] = PWM9[m-1]+ADIL                       // increment/decrement
}
```

where:

PWM9[0]:	initial 9-bit PWM value
PWM9[m]:	new 9-bit PWM value
PWM9[m-1]:	previous 9-bit PWM value
ADIL:	signed integer increment/decrement value SGnADI.SGnADIL[8:0]
M:	Number of volume increment/decrement steps until tone stops, i.e. PWM9[M] = 0 or $1FF_H$
m:	volume reduction step number, m = 1 to M

The maximum number of volume increment/decrement steps M depends on the initial volume PWM9[0]. [M = initial volume(SGnPWM) / decrement values(SGnADI.SGnADIL[8:0])]

33.3.5.2 Tone duration

The volume increment/decrement is conducted at the tone frequency signal SGnOF rising or falling edge number m x (SGnDF + 1).

The sound stops when the volume compare buffer SGnPWM value becomes 000_H or $1FF_H$.

The maximum number of volume increment/decrement steps M depends on the start volume PWM9[0], i.e. the value set to SGnPWM register. To avoid an initial delay with apparently no effect, the start value shall not exceed the value of register SGnFL by more than 1.

The total duration T_D depends on

- the start volume PWM9[0], i.e. value of the SGnPWM register,
- the sound duration factor set in register SGnDF,
- the tone frequency f_{TONE}.

The diagram shows an example of ADI volume reduction with SGnDF = 2, i.e. every 3rd rising or falling SGnOF edge the volume buffer SGnPWM is reduced.

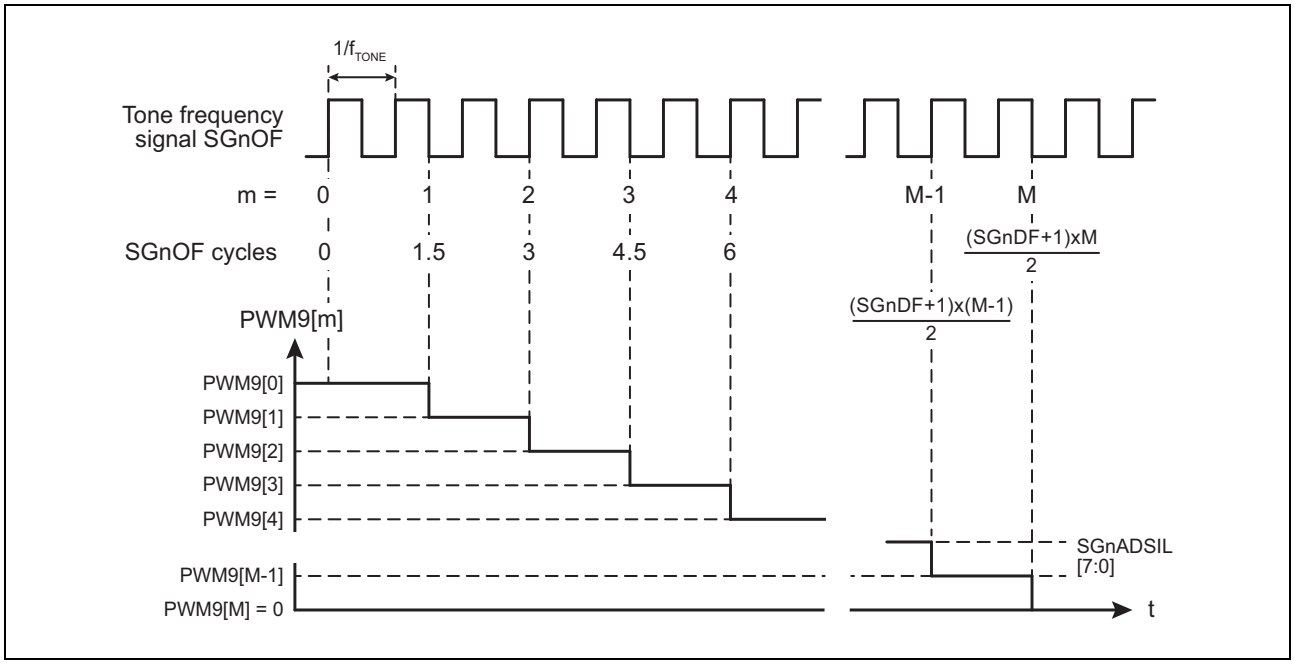

Figure 33.10 ADI mode timing

The tone duration T_D can be calculated as follows:

$$T_D = \frac{1}{2 \bullet f_{TONE}} \bullet (SGnDF + 1) \bullet M$$

where:

T_D:	duration of the tone, i.e. time until tone stops at PWM9[M] = 0
f_{TONE}:	frequency of the tone frequency signal SGnOF
SGnDF:	tone duration factor, i.e. contents of the SGnDF register
M:	Number of volume increment/decrement steps until tone stops, i.e. PWM9[M] = 0

Example

The table below shows two examples of the sound duration for minimum and maximum tone frequency.

The following settings are assumed:

- f_{SGnCLK} = 16 MHz
- SGnFL = 332 (this yields a PWM base frequency of 48.048 kHz)
- SGnPWM = 333 (100 % volume)
- The tone frequency is changed via the SGnFH register:
  - SGnFH = 3 (this yields a tone frequency of 6.006 kHz)
  - SGnFH = 240 (this yields a tone frequency of 99.68 Hz)
- SGnADI.SGnADIL[8:0] = 103_H (decrement by 3)

With the initial 100 % volume (SGnPWM = 333) it takes M = 111 reduction steps to stop the sound, i.e. M = 111 and PWM9[M] = 0). Please refer to the equations in **Section 33.3.5.1** to calculate the "M" value.

Table 33.10 ADI tone duration examples

	Tone duration T_D [sec]			
Tone frequency	SGnDF = 0	SGnDF = 1	...	SGnDF = 255
6006 Hz	0.009	0.018	...	2.366
99.68 Hz	0.557	1.114	...	142.529

NOTE

The present volume value of the SGnPWM buffer can not be read via the SGnPWM register.

33.3.5.3 Interrupt in ADI mode

The interrupt INTSGnTI is generated at the next falling edge of the tone frequency signal SGnOF in the following cases:

- In case of automatic volume increment (positive SGnADI.SGnADIL[8:0] value, i.e. SGnADIL[8] = 0):
  When the SGnPWM volume buffer reaches or goes above the value of the buffer of the interrupt threshold register SGnITH.
- In case of automatic volume decrement (negative SGnADI.SGnADIL[8:0] value, i.e. SGnADIL[8] = 1):
  When the SGnPWM volume buffer reaches or goes below the value of the buffer of the interrupt threshold register SGnITH.

NOTE

The interrupt will not be generated under any of the following conditions:

- if (SGnITH buffer value) = 000_H
- in case of automatic decrement (negative SGnADIL value):
  if ((SGnITH buffer value) + 1) < |(SGnADI buffer value)|
- in case of automatic increment (positive SGnADIL value):
  if ((SGnITH buffer value) - 1) > |(SGnADI buffer value)|
- in case of automatic increment (positive SGnADIL value):
  if (SGnITH buffer value) = $1FF_H$

If buffer update by INTSGnTI is enabled (SGnCONF.SGnBE = 1) the buffers are updated at the generation of the interrupt. See Section 33.3.3, Updating the buffer values for more information about buffer updating.

33.3.5.4 Fade-in with following continuous tone

The maximum volume is defined by the value of the SGnFL register, since SGnPWM ≥ SGnFL yields 100 % duty cycle of the PWM volume signal SGnAO.

If the volume shall increment in ADI mode the tone does not stop until the SGnPWM buffer value reaches its maximum value $1FF_H$, despite of the value of SGnFL. Thus the tone does not stop at maximum volume, defined by SGnFL, but at the maximal SGnPWM register value.

The implementation of a fade-in tone, that keeps a final volume after fade-in completion, can be done by using the INTSGnTI interrupt and the buffer update function, according to the following procedure:

1. Select the ADI mode (SGnCONF.SGnMODE[1:0] = 10_B).
2. Enable register's buffers update by INTSGnTI interrupt (SGnCONF.SGnBE = 1).
3. Set the interrupt trigger level (SGnITH) to the desired final volume level.
   The desired final volume level must not exceed the value of SGnFL.
4. Set the SGnADI and SGnDF registers to define the speed on the volume increment.
5. Start tone by writing start volume to SGnPWM.
6. Set SGnPWM to the desired final volume, i.e. to the same value as in SGnITH. This volume becomes valid after the interrupt INTSGnTI.
7. After the tone fade-in has started set SGnCONF.SGnMODE[1:0] = 00_B in order to change to continuous mode at the next buffers update, i.e. upon occurrence of the first INTSGnTI.
8. If the desired final volume is reached, the interrupt INTSGnTI is asserted, and the SGnPWM volume buffer is updated with the desired volume value from the SGnPWM register.

33.3.6 Automatic duration control (ADC)

The automatic duration control function (ADC) can be used to limit the duration of a constant volume tone.

The ADC mode is selected by SGnCONF.SGnMODE[1:0] = 01_B.

The tone is stopped if

- the specified time has passed,
- 000_H is written to the SGnPWM register.

33.3.6.1 Tone duration

The duration of the tone is determined by

- the initial value of the duration counter value SGnADI.SGnADIL[8:0]
- the duration factor SGnDF.SGnDF[7:0]

The duration counter buffer SGnADI.SGnADIL[8:0] is decrement by 1 at every (SGnDF + 1) rising or falling edge of the tone frequency signal SGnFO.

When the duration counter buffer SGnADI.SGnADIL[8:0] becomes 0, the tone is stopped.

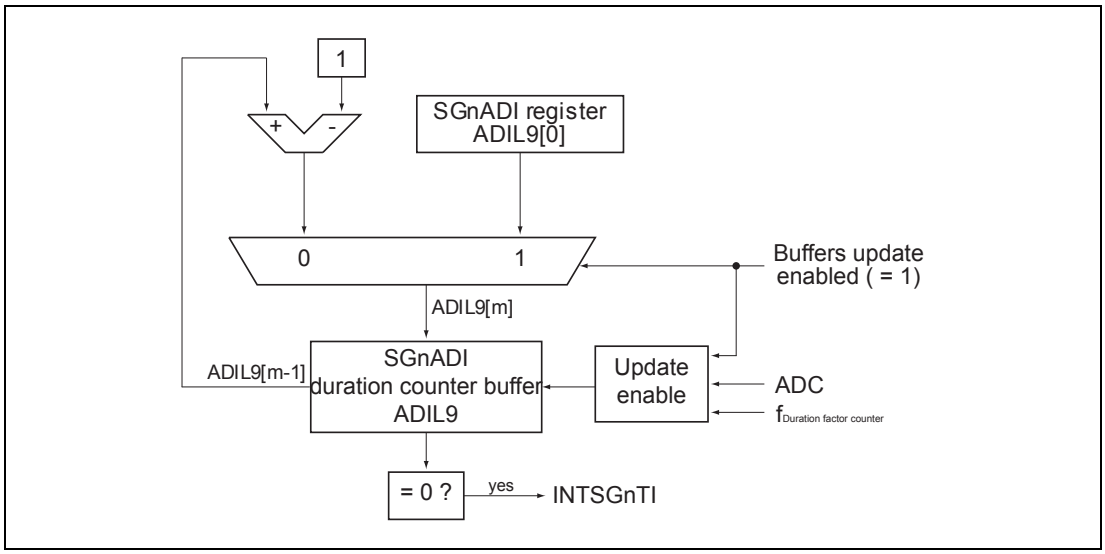

Figure 33.11 Time calculation in ADC mode

The calculation uses 9-bit arithmetic and follows the procedure:

```
ADIL9[0] = SGnADI;                              // initial counter = M
for (m=1, m<M+1; m++){
     ADIL9[m] = ADIL9[m-1]-1                    // decrement by 1
}
```

where:

ADIL9[0]:	initial duration counter value in the SGnADI.SGnADIL[8:0] register
ADIL9[m]:	new duration counter value in the SGnADI.SGnADIL[8:0] buffer
M:	Number of duration counter decrement steps until tone stops, i.e. M = ADIL9[0]
m:	duration counter decrement step number, m = 1 to M

The diagram shows an example of a tone duration control with SGnDF= 2, i.e. every 3rd rising or falling SGnOF edge the duration counter SGnADI.SGnADIL[8:0] is reduced by 1.
ADIL denotes the initial value of the SGnADI buffer, i.e. the SGnADI register contents.

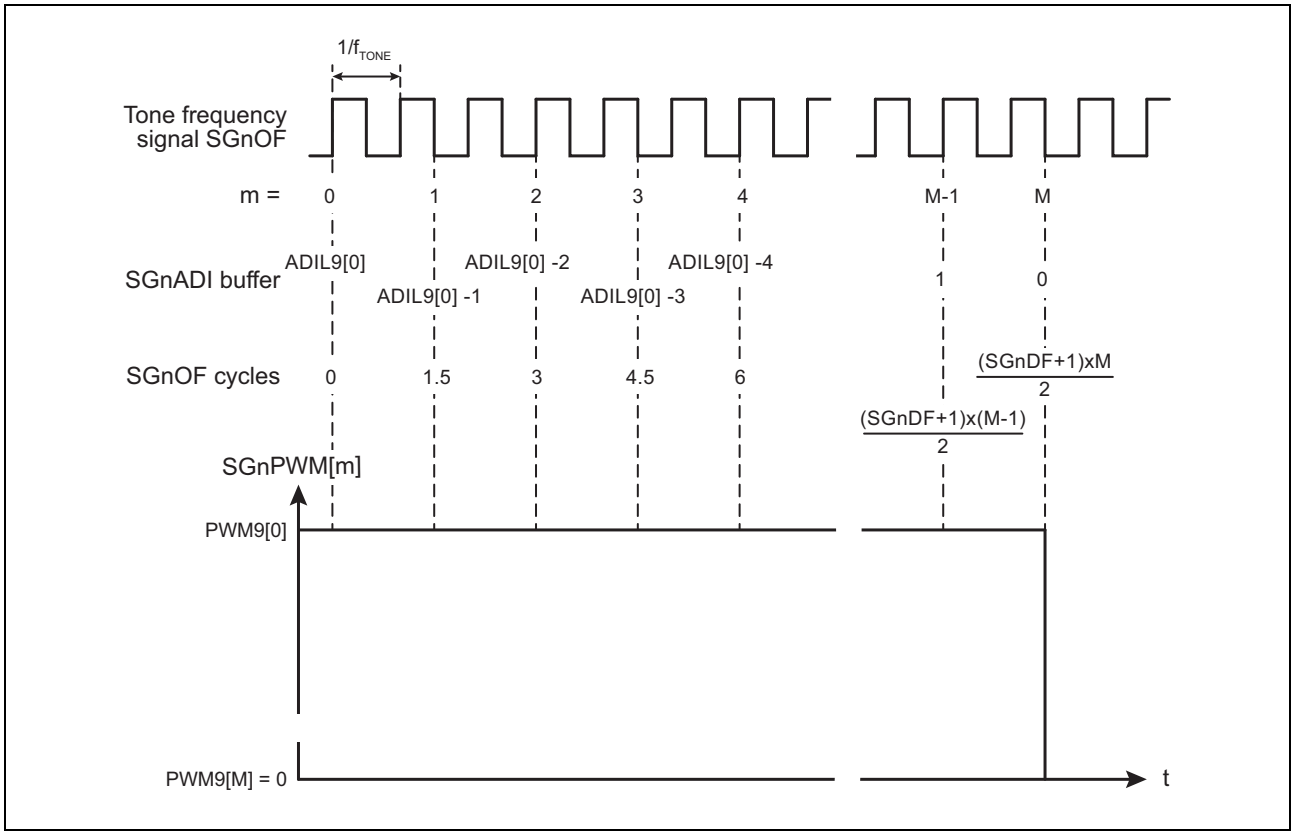

Figure 33.12 ADC mode timing

The tone duration T_D can be calculated as follows:

$$T_D = \frac{1}{2 \bullet f_{TONE}} \bullet (SGnDF + 1) \bullet SGnADIL$$

where:

T_D:	duration of the tone, i.e. time until tone stops at SGnADIL = 0
f_{TONE}:	frequency of the tone frequency signal SGnOF
SGnDF:	tone duration factor, i.e. contents of the SGnDF register
SGnADIL:	initial tone duration counter value SGnADI.SGnADIL[8:0]

Example

The table below shows two examples of the sound duration for minimum and maximum tone frequency.

The following settings are assumed:

- f_{SGnCLK} = 16 MHz
- SGnFL = 332 (this yields a PWM base frequency of 48.048 kHz)
- The tone frequency is changed via the SGnFH register:

  - SGnFH = 3 (this yields a tone frequency of 6.006 kHz)
  - SGnFH = 240 (this yields a tone frequency of 99.68 Hz)
- SGnADI.SGnADIL[8:0] = 64_H = 100 (initial duration counter value)

Table 33.11 ADC tone duration examples

	Tone duration T_D [sec]			
Tone frequency	SGnDF = 0	SGnDF = 1	...	SGnDF = 255
6006 Hz	0.008	0.017	...	2.131
99.68 Hz	0.502	1.003	...	128.405

NOTE

The present tone duration counter value of the SGnADI buffer can not be read via the SGnADI register.

33.3.6.2 Interrupt in ADC mode

The interrupt INTSGnTI is generated when the tone is stopped.

If buffer update by INTSGnTI is enabled (SGnCONF.SGnBE = 1) the buffers are updated at the generation of the interrupt. See Section 33.3.3, Updating the buffer values for more information about buffer updating.

33.3.7 INTSGnTI interrupt

In ALD, ADI and ADC mode the interrupt INTSGnTI can be generated:

- In ALD mode the interrupt INTSGnTI is generated when the SGnPWM volume buffer reaches or passes below the value of the interrupt threshold register SGnITH at next falling edge of the tone frequency signal SGnOF.
- In ADI mode, the interrupt generation depends on the sign of the volume offset:
  - If the volume offset is *positive* (positive value in the SGnADI buffer), the interrupt INTSGnTI is generated when the SGnPWM buffer value is *equal or above* the value of the SGnITH buffer.
  - If the volume offset is *negative* (negative value in SGnADI buffer), the interrupt INTSGnTI is generated when the SGnPWM buffer value is *equal or below* the value of the SGnITH buffer.
- In ADC mode the interrupt INTSGnTI is generated when the sound stops.

The following figure illustrates the interrupt generation in all three modes.

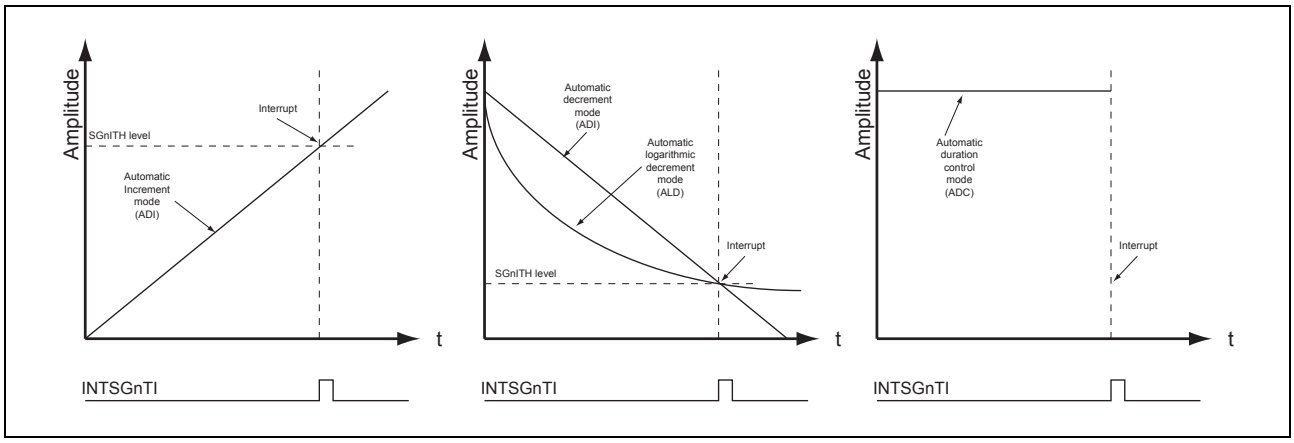

Figure 33.13 Interrupt generation

33.4 Sound Generator Application Hints

This section provides supplementary programming information.

33.4.1 Initialization

- To enable the Sound Generator, set SGnCTL.SGnEN = 1.
  This applies the clock SGnCLK to the Sound Generator.
- Select the desired mode:
  - SGnCONF.SGnMODE[1:0] = 00_B: continuous sound is output.
  - SGnCONF.SGnMODE[1:0] = 01_B: ADC mode is selected.
    The duration of sound output is limited as specified by the sound duration factor register SGnDF.
  - SGnCONF.SGnMODE[1:0] = 10_B: ADI mode is selected.
    The volume is faded in or out. The speed of decrease/increase of the volume is controlled by the register SGnDF.
  - SGnCONF.SGnMODE[1:0] = 11_B: ALD mode is selected.
    The volume is faded out logarithmically. This is detected by the human ear as a linearly fading sound.
- Enable or disable buffer update by interrupt INTSGnTI:
  - SGnCONF.SGnBE = 0: buffers updating is enabled by writing to the SGnPWM register.
  - SGnCONF.SGnBE = 1: buffers updating is performed with the next INTSGnTI interrupt.
- Specify the interrupt threshold level SGnITH.SGnITH[8:0].
- Select the output signal for SGTFAO:
  - SGnCONF.SGnOS = 0: SGTFAO outputs the tone frequency signal SGnOF
  - SGnCONF.SGnOS = 1: SGTFAO outputs the composite signal SGnO
- Select the output signal for SGTFAOL:

  - SGnCONF.SGnOSI = 0: SGTFAOL outputs fixed low level.
  - SGnCONF.SGnOSI = 1: SGTFAOL outputs the inverted composite signal SGnO
- Specify the tone to be generated:
  - Tone frequency: SGnFL and SGnFH
  - Volume: SGnFL and SGnPWM

  Writing the volume value to SGnPWM starts output of the tone.

33.4.2 Start sound

The sound is started by writing a non-zero value to the volume register SGnPWM.

NOTE

If sound was stopped before by writing SGnPWM = 0, the SGnPWM value to restart the sound must be greater than 1.

- If SGnCTL.SGnEN = 1 the sound generation will start immediately when writing to the SGnPWM register.
- If SGnCTL.SGnEN = 0 the sound starts after setting the SGnCTL.SGnEN = 1.
  Refer to Section 33.4.4.1, Avoidance of sound artefacts for details about pause termination.

NOTE

Before starting the sound, all other register settings must be made. See **Section 33.4.1, Initialization**.

33.4.3 Stop sound

33.4.3.1 Stop sound by the application program

The sound is stopped when 000_H is written to volume register SGnPWM, regardless of the setting of the SGnCONF.SGnBE bit.

33.4.3.2 Stop sound by automatic logarithmic decrement function

In ALD mode (SGnCONF.SGnMODE[1:0] = 11_B), the sound is stopped when the SGnPWM volume buffer reaches the value 000_H.

33.4.3.3 Stop sound by automatic decrement/increment function

In ADI mode (SGnCONF.SGnMODE[1:0] = 10_B), the sound is stopped when the SGnPWM volume buffer

- reaches or underruns the value 000_H (with decrement).
- reaches or overruns the value $1FF_H$ (with increment).

33.4.3.4 Stop sound by automatic duration control function

In ADC mode (SGnCONF.SGnMODE[1:0] = 01_B), the sound is stopped when the value stored in the SGnADI buffer register is decremented to 0.

33.4.4 Pause Sound

While sound generation is ongoing the sound can be paused by setting SGnCTL.SGnEN = 0. The sound will be paused with the next edge of the PCLK clock and all output signals remain at their current state.

Note that no synchronization with the tone frequency signal SGnOF is taking place, thus audible noise may be generated.

Sound generation continues after setting SGnCTL.SGnEN = 1.

33.4.4.1 Avoidance of sound artefacts

For avoiding sound artefacts, when the pause mode is terminated, it has to be prevented that the PWM signals will affect the output pins in this case.

Therefore it is recommended to perform following sequence:

1. Activate pause mode by SGnCTL.SGnEN = 0.
2. Read the current PWM buffer value via the volume register SGnPWM and store as a variable.
3. Set SGnPWM = 0.
4. Change the ports, that are used for the Sound Generator output signals, to port mode (PMCn_m = 0) and set the port output to low level (Pn_m = 0).
5. Terminate pause mode by SGnCTL.SGnEN = 1.
6. Wait at least for half of the sound frequency period.
7. Change the ports back to alternative function (PMCn_m = 0), i.e. the ports act again as Sound Generator outputs.
8. Restart the sound by writing the previously stored variable back to the volume register SGnPWM. Note that the SGnPWM value has to be greater than 1.
   The sound will start without sound artefacts.

33.4.5 Change tone volume

The tone volume is changed by writing a new volume value to SGnPWM register.

The new volume becomes effective upon the next buffers update:

If buffers update by INTSGnTI interrupt is enabled (SGnCONF.SGnBE = 1), the new volume becomes effective with the next INTSGnTI interrupt.

If buffers update by INTSGnTI interrupt is disabled (SGnCONF.SGnBE = 0), the new volume becomes effective with the next edge of the tone frequency signal SGnOF.

In either case the new volume becomes effective with a falling edge of the tone frequency signal SGnOF.

33.4.6 Register buffers updating at interrupt generation

If SGnCONF.SGnBE = 1 the buffers will be loaded with the values stored in their related registers at the generation of the INTSGnTI interrupt, that is generated according to the interrupt threshold register (SGnITH) value.

Furthermore the update process of the buffers due to a SGnPWM register write is disabled.

Therefore, when SGnCONF.SGnBE = 1 it is possible to load the next tone parameters into the registers while tone generation is ongoing. The next tone is started automatically when the INTSGnTI interrupts occurs.

For more details on register buffering see Section 33.3.3, Updating the buffer values.

CAUTION

Even if SGnCONF.SGnBE = 1 writing SGnPWM = 00_H stops the sound immediately, i.e. not at the generation of the next INTSGnTI interrupt. See Section 33.4.3, Stop sound for details about stopping of the sound.

33.4.7 Constant sound volume

A sound started in continuous output mode (SGnCONF.SGnMODE[1:0] = 00_B) is output with the volume value written to SGnPWM. The sound is output continually and does not stop automatically. It has to be stopped by writing 000_H to SGnPWM.

33.4.8 Generate special sounds

To generate special sounds (like blinker clicks etc.), frequency and volume can be changed simultaneously.

To change the frequency of a sound that has already started:

1. Write to frequency register SGnFL and/or SGnFH.
2. Write to volume register SGnPWM.

33.4.9 Output signal control

Table 33.12 Sound Generator output signals control

Register settings			Output signals		
SGnCONF.SGnOS	SGnCONF.SGnOSI	SGnPWM	SGTFAO	SGTFAOL	SGTAO
0	0	0	L	L	L

33.5 Sound Generator Registers

This section contains a description of all registers of the Sound Generator.

33.5.1 SG registers overview

The SG is controlled and operated by the following registers:

Table 33.13 SG register overview

Register name	Shortcut	Address
SGn control register	SGnCTL	<SGn_base> + 00_H
SGn status register	SGnSTAT	<SGn_base> + 04_H
SGn configuration register	SGnCONF	<SGn_base> + 08_H
SGn duration factor register	SGnDF	<SGn_base> + $0C_H$
SGn automatic decrement/increment register	SGnADI	<SGn_base> + 10_H
SGn interrupt threshold register	SGnITH	<SGn_base> + 14_H
SGn frequency low register	SGnFL	<SGn_base> + 18_H
SGn frequency high register	SGnFH	<SGn_base> + $1C_H$
SGn volume register	SGnPWM	<SGn_base> + 20_H
SGn emulation register	SGnEMU	<SGn_base> + 24_H

<SGn_base>

The base addresses <SGn_base> of the SGn is defined in the first section of this chapter under the key word “Register addresses”.

33.5.2 Sound Generator registers details

33.5.2.1 SGnCTL – Control register

This register controls the Sound Generator clock supply.

Access: This register can be read/written in 32-bit units.

Address: <SGn_base> + 00_H

Initial Value: 0000 0000_H

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	SGnCLKDIV[2:0]			SGnEN
R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 33.14 SGnCTL register contents

Bit position	Bit name	Function
31 to 4	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
3 to 1	SGn CLKDIV[2:0]	PCLK clock divisor for generation of the SGnCLK clock
0	SGnEN	Sound Generator clock enable / disable 0: Sound Generator clock is disabled and does not operate. Access to all registers is still possible. 1: Sound Generator clock is enabled and ready to use.

SGnCLKDIV[2:0]	f_{SGnCLK}
000_B	f_{PCLK}
001_B	f_{PCLK} / 2
010_B	f_{PCLK} / 3
011_B	f_{PCLK} / 4
100_B	f_{PCLK} / 5
101_B	f_{PCLK} / 6
110_B	f_{PCLK} / 7
111_B	f_{PCLK} / 8

Note: The SGnCLKDIV[2:0] bits shall only be changed when SGnEN = 0.

If SGnCTL.SGnEN is set to ’0’ while sound generation is ongoing, the sound will be stopped immediately. No synchronization to the sound signal takes place.

NOTE

Change the contents of this register only when the sound is stopped (register SGnPWM cleared).

33.5.2.2 SGnSTAT – Status register

This register indicates the status of the sound generation.

Access: This register can be read in 32-bit units.

Address: <SGn_base> + 04_H

Initial Value: 0000 0000_H

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	SGn RUN
R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 33.15 SGnSTAT register contents

Bit position	Bit name	Function
31 to 1	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
0	SGnRUN	Sound generation status 0: No sound is generated 1: Sound generation is ongoing SGnRUN is 0 in the following cases • SGnEN = 0 (Sound Generator clock is switched off) • SGnPWM buffer = 000_H • SGnPWM buffer = $1FF_H$ in ADI mode (positive saturation)

33.5.2.3 SGnFH – Frequency high register

This register is used to specify the final tone frequency. It holds the target value for the 9-bit counter SGnFH.

Tone compare buffer

The value of this register becomes effective only when it is copied to the SGnFH tone compare buffer. For details on register buffering refer to Section 33.3.3, Updating the buffer values.

Access: This register can be read/written in 32-bit units.

Address: <SGn_base> + $1C_H$

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	Counter SGnFH target value								
R	R	R	R	R	R	R	R/W								

Table 33.16 SGnFH register contents

Bit position	Bit name	Function
31 to 9	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
8 to 0	SGnFH[8:0]	Higher part of the frequency value

For the calculation of the resulting tone frequency refer to Section 33.3.1.2, Tone frequency calculation.

NOTES

1. Legal values depend on the contents of register SGnFL.
   SGnFL defines the frequency of the PWM base frequency, which is the input clock to the tone generator.
2. The value read from this register does not necessarily reflect the current tone frequency, because this frequency is determined by the frequency compare buffer value. The buffer might not be updated yet.
   For details see Section 33.3.1.1, Updating the frequency and tone buffer values.

33.5.2.4 SGnFL – Frequency low register

This register is used to specify the target value for the PWM frequency. It holds the target value for the 9-bit counter SGnFL.

Frequency compare buffer

The value of this register becomes effective only when it is copied to the SGnFL frequency compare buffer. For details on register buffering refer to Section 33.3.3, Updating the buffer values.

Access: This register can be read/written in 32-bit units.

Address: <SGn_base> + 18_H

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	Counter SGnFL target value								
R	R	R	R	R	R	R	R/W								

Table 33.17 SGnFL register contents

Bit position	Bit name	Function
31 to 9	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
8 to 0	SGnFL[8:0]	Lower part of the frequency value

For the calculation of the resulting PWM frequency refer to Section 33.3.2.1, PWM calculations.

The value written to SGnFL defines also the reference value for the maximum sound amplitude (100 % PWM duty cycle).
A 100 % duty cycle (continually high) will be generated if the SGnPWM value is higher than the SGnFL value.
For details see Section 33.3.2.1, PWM calculations).

NOTES

1. The maximum value to be written is 510 ($01FE_H$). This yields a PWM frequency of 31.3 kHz (with PCLK = 16 MHz).
   The minimum value to be written depends on the capability of the external circuit. A value of 255 ($00FF_H$) would yield a PWM frequency of 62.5 kHz (with PCLK = 16 MHz).
2. The value read from this register does not necessarily reflect the current PWM frequency, because this frequency is determined by the frequency compare buffer value. The buffer might not be updated yet.
   For details see Section 33.3.1.1, Updating the frequency and tone buffer values.

33.5.2.5 SGnPWM – Volume register

This register is used to specify the tone volume. It holds the target value for the sound amplitude that is given by the duty cycle of the PWM signal.
In ALD or ADI mode, the SGnPWM register holds the start value.

Volume compare buffer

The value of this register becomes effective only when it is copied to the SGnPWM volume compare buffer. For details on register buffering refer to Section 33.3.3, Updating the buffer values.

Access: This register can be read/written in 32-bit units.
When SGnCTL.SGnEN = 0 not the SGnPWM register value will be read but the current value of the SGnPWM buffer.

Address: <SGn_base> + 20_H

Initial Value: 0000 0000_H

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	Volume target value								
R	R	R	R	R	R	R	R/W								

Table 33.18 SGnPWM register contents

Bit position	Bit name	Function
31 to 9	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
8 to 0	SGnPWM[8:0]	Volume target value

The value written to this register must be considered in conjunction with the contents of register SGnFL. The register SGnFL specifies the maximum value of the counter SGnFL. For the calculation of the resulting duty cycle refer to Section 33.3.2.1, PWM calculations.

NOTES

1. The value read from this register does not necessarily reflect the current volume, because the value of counter SGnFL is compared with the contents of the volume buffer. The buffer might not be updated yet or changed by the ALD or ADI function.
2. The value of this register remains unchanged when the ALD or ADI is switched on.
3. The sound stops immediately when this register is cleared.

33.5.2.6 SGnDF – Duration factor register

This register is used to specify the duration of the sound.

- In ALD mode, it contains the value of the step size of volume recalculation.
- In ADC/ADI mode, it contains the value of the step size of counter decrement/increment.

Duration factor counter buffer

The value of this register becomes effective only when it is copied to the SGnDF duration factor counter buffer. For details on register buffering refer to Section 33.3.3, Updating the buffer values.

Access: This register can be read/written in 32-bit units.

Address: <SGn_base> + $0C_H$

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 33.19 SGnDF register contents

Bit position	Bit name	Function
31 to 8	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
7 to 0	SGnDF[7:0]	Duration factor for the ALD, ADI, and ADC mode • In ALD and ADI modes, a new volume value is calculated at every (SGnDF + 1) rising or falling edge of the tone frequency signal SGnOF. See Section 33.3.4, Automatic logarithmic fading (ALD) and Section 33.3.5, Automatic decrement/increment (ADI) of the volume for details. • In ADC mode the value of the tone duration buffer SGnADI is decreased at every (SGnDF + 1) rising or falling edge of the tone frequency signal SGnOF. See Section 33.3.6, Automatic duration control (ADC) for details.

NOTE

Change the contents of this register only when the sound is stopped (register SGnPWM cleared).

33.5.2.7 SGnCONF – Configuration register

This register is used to select output signals, buffer update method and the operation mode.

Configuration buffer

The value of this register becomes effective only when it is copied to the SGnCONF configuration buffer. For details on register buffering refer to Section 33.3.3, Updating the buffer values.

Access: This register can be read/written in 32-bit units.
Nevertheless the value of the register becomes effective only when the register value is buffered. For details on register buffering refer to Section 33.3.3, Updating the buffer values.

Address: <SGn_base> + 08_H

Initial Value: 0000 0000_H

2	SGnOS	SGTFAO output selection 0: Tone frequency signal SGnOF output at SGTFAO 1: Composite signal SGnO output at SGTFAO
1 to 0	SGnMODE[1:0]	Mode selection: 00_B: Continuous sound output selected 01_B: ADC mode selected 10_B: ADI mode selected 11_B: ALD mode selected

NOTE

Change the contents of this register only when the sound is stopped (register SGnPWM cleared).

33.5.2.8 SGnADI – Automatic decrement/increment register

The function of this register depends on the mode:

- ADI mode: linear volume increment or decrement.
- ADC mode: initial value of the decrement/increment buffer.

Decrement/increment buffer

The value of this register becomes effective only when it is copied to the SGnADI decrement/increment buffer. For details on register buffering refer to Section 33.3.3, Updating the buffer values.

Access: This register can be read/written in 32-bit units.

Address: <SGn_base> + 10_H

Initial Value: 0000 0000_H

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	R	R	R	R	R	R	R/W								

Table 33.21 SGnADI register contents

Bit position	Bit name	Function
31 to 9	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
8 to 0	SGnADIL[8:0]	In ADI mode: Volume increment/decrement value (signed integer) In ADC mode: Duration counter value

- In ADI mode the amplitude value stored in the SGnPWM compare buffer is decremented/incremented by the value stored in the SDnADI buffer. SGnADIL[8] is the sign bit and SGnADIL[7:0] the absolute value.
- In ADC mode the duration of the sound is controlled by the value stored in the SDnADI buffer.

See Section 33.3.6, Automatic duration control (ADC) and Section 33.3.5, Automatic decrement/increment (ADI) of the volume for details.

NOTE

Change the contents of this register only when the sound is stopped (register SGnPWM cleared).

33.5.2.9 SGnITH – Interrupt threshold register

In ALD and ADI modes, the volume is compared against the value of SGnITH. A *single* interrupt is generated at the next falling edge of the tone frequency signal SGnOF in the following cases:

- In ALD mode when the volume is less or equal to the SGnITH value.
- In ADI mode, depending on volume increment or decrement:
  - volume increment:
    When the volume is equal to or above the SGnITH value.
  - volume decrement:
    When the volume is equal to or below the SGnITH value.

Threshold buffer

The value of this register becomes effective only when it is copied to the SGnITH threshold buffer. For details on register buffering refer to Section 33.3.3, Updating the buffer values.

Access: This register can be read/written in 32-bit units.

Address: <SGn_base> + 14_H

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 33.22 SGnITH register contents

Bit position	Bit name	Function
31 to 9	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
8 to 0	SGnITH[8:0]	Interrupt threshold value This is the amplitude threshold that causes an interrupt when it is compared against amplitude values in ALD and ADI modes.

NOTE

Change the contents of this register only when the sound is stopped (register SGnPWM cleared).

Refer details on INTSGnTI interrupt generation, refer to Section 33.3.7, INTSGnTI interrupt.

33.5.2.10 SGnEMU - Emulation register

This register controls whether the Sound Generator can be stopped during emulation, for instance upon a breakpoint hit.

Access: This register can be read/written in 32-bit units.

Address: <SGn_base> + 24_H

Initial Value: 0000_0000_H

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Section 34 PCM-PWM Converter (PCMP)

This section contains a generic description of the PCM-PWM Converter.

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.
The subsequent sections describe the features that apply to all implementations.

34.1 Overview of the RH850/D1L/D1M PCM-PWM Converters

34.1.1 Units

This microcontroller has the following number of units of the PCM-PWM Converter.

Table 34.1 Units

PCM-PWM Converter	
Units	1
Names	PCMP0

Unit index n

Throughout this section, the individual units of the PCM-PWM Converters are identified by the index “n” (n = 0), for example PCMPnCTL for the PCMPn control register.

Channel index x

The two output channels for stereo data are identified by index “x”:

- x = 0 indicates the right channel
- x = 1 indicates the left channel

34.1.2 Register addresses

All PCM-PWM Converter register addresses are given as address offsets from the individual base addresses <PCMPn_base>.
The <PCMPn_base> addresses of each PCMPn are listed in the following table:

Table 34.2 Register base addresses <PCMPn_base>

PCMPn unit	<PCMPn_base> address
PCMP0	FFF1 0000_H

34.1.3 Clock supply

All PCM-PWM Converters provide one clock input.

Table 34.3 Clock supply

PCMPn unit	PCMPn clock	Connected to
PCMP0	PCLK	Clock Controller CLKFIX

34.1.4 Interrupts and DMA

The PCM-PWM Converters can generate the following interrupt and DMA requests:

Table 34.4 PCMPn interrupt and DMA requests

PCMPn signals	Function	Connected to
PCMPTIFFIL	FIFO buffer fill interrupt	Interrupt Controller INTPCMP0FFIL DMA Controller trigger ID 117
PCMPTIFERR	Error interrupt	Interrupt Controller INTPCMP0FERR

34.1.5 Reset sources

The PCM-PWM Converters and their registers are initialized by the following reset signal:

Table 34.5 Reset sources

PCMPn unit	Reset signal
PCMP0	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

34.1.6 I/O signals

The following table shows the I/O signals of the PCM-PWM Converters.

Table 34.6 I/O signals connections

PCMPn signal	Function	Connected to
PCMP0:		
PCMPTPWMAP0	Pulse-width modulated output AP channel 0	Port PCMP0AP0
PCMPTPWMAN0	Pulse-width modulated output AN channel 0	Port PCMP0AN0
PCMPTPWMBP0	Pulse-width modulated output BP channel 0	Port PCMP0BP0
PCMPTPWMBN0	Pulse-width modulated output BN channel 0	Port PCMP0BN0
PCMPTPWMAP1	Pulse-width modulated output AP channel 1	Port PCMP0AP1
PCMPTPWMAN1	Pulse-width modulated output AN channel 1	Port PCMP0AN1
PCMPTPWMBP1	Pulse-width modulated output BP channel 1	Port PCMP0BP1
PCMPTPWMBN1	Pulse-width modulated output BN channel 1	Port PCMP0BN1

XOR Compare Unit check of PCMP output signals

All PCMP output signals can be checked by the XOR Compare Unit.

34.2 Functional Overview

Features summary

The PCM-PWM module has the following features:

- Converts pulse-code modulated (PCM) audio samples to pulse-width modulated (PWM) signals
- Carrier frequency up to 40 MHz
- Two separate output channels for stereo data
- Programmable output sample frequency in the range 10 kHz to 60 kHz
- Output sample resolution up to 16 bits
- Two output modes to drive both half H-bridges and full H-bridges
- Static signal output function
- Double output mode

The following block diagram shows the main components of the PCM-PWM module. Note that the module has two output channels identified by the index “x” (x = 0, 1).

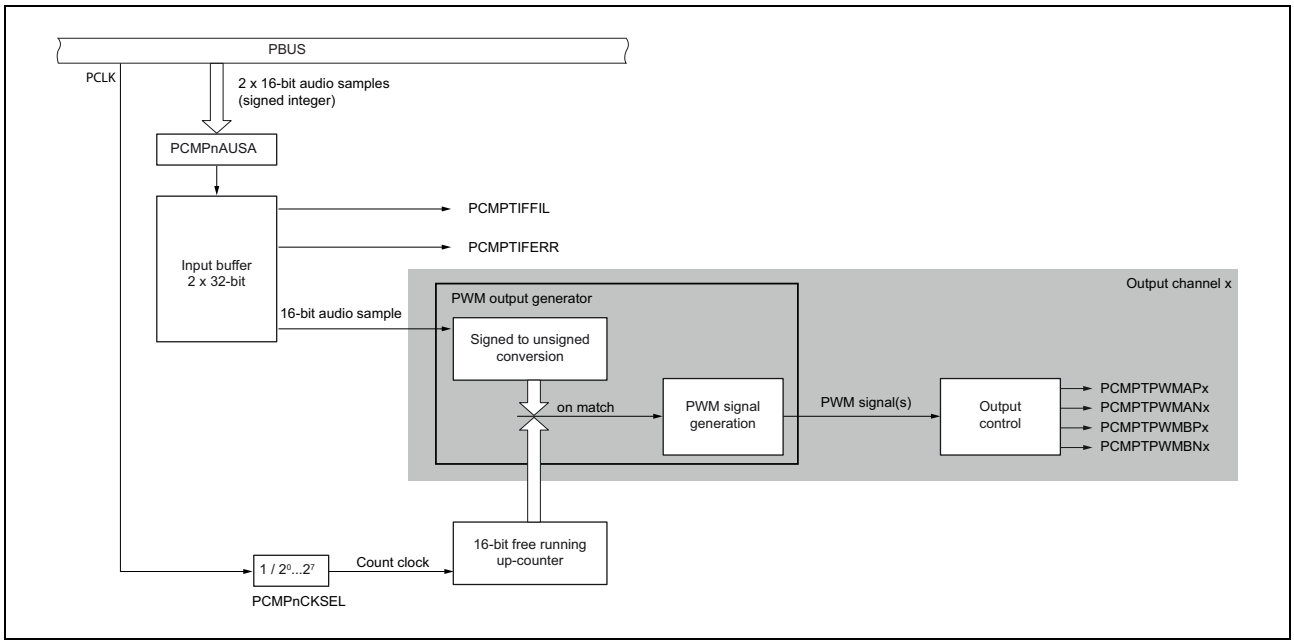

Figure 34.1 Functional blocks of the PCM-PWM module

34.3 Functional Description

The PCM-PWM module converts pulse-code modulated audio samples to pulse-width modulated signals. Two output modes are supported: either for driving a half H-bridge or for driving a full H-bridge. Refer to Section 34.3.4, Output modes.

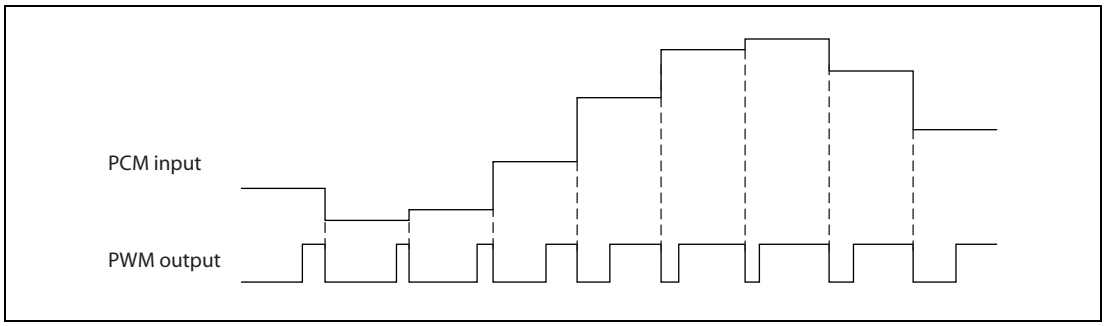

Figure 34.2 Converting PCM audio signals to PWM signals

Writing audio samples to the module

Audio samples are written to the audio sample input register PCMPnAUSA. Contents of the input register are transferred to the FIFO buffer.

For details on the FIFO buffer, refer to Section 34.3.1, PCM-coded data input.

Processing audio samples

The FIFO buffer sends the audio sample to be processed to the output channel. In mono mode, the same audio sample is sent to both output channels; in stereo mode, separate audio samples are sent. In double output mode, each audio sample is sent twice. Refer to Section 34.3.2, Mono mode / stereo mode and Section 34.3.3, Output sampling frequency for details.

Generating PWM output

The output channels first convert the PCM-coded data to an unsigned integer. A PWM signal with the corresponding duty cycle is then generated according to this value. For details refer to Section 34.3.5, PCM-PWM output generators and Section 34.3.3, Output sampling frequency.

The output control block generates the corresponding output signals. For details refer to Section 34.3.6, Output control.

34.3.1 PCM-coded data input

34.3.1.1 Audio sample format

The PCM-PWM module takes as input 16-bit signed integers. The PCM-coded data must be two's complement.

NOTES

1. If audio samples with less than 16 bits are used, they have to be sign-extended to 16 bits by the application to ensure correct interpretation of negative values.
2. Sample resolution and sample frequency is in a tradeoff. The application writing the audio signals to the PCM-PWM must scale values by sample resolution.

34.3.1.2 FIFO buffer

The PCM-PWM module has a FIFO buffer for incoming PCM-coded data. The FIFO buffer has two 32-bit blocks. Each 32-bit block stores two 16-bit audio samples.

In stereo mode (PCMPnCTL.PCMPnSTEREO = 1), the FIFO buffer stores one 32-bit stereo sample in each block: 16 bits for the left audio channel and 16 bits for the right audio channel.

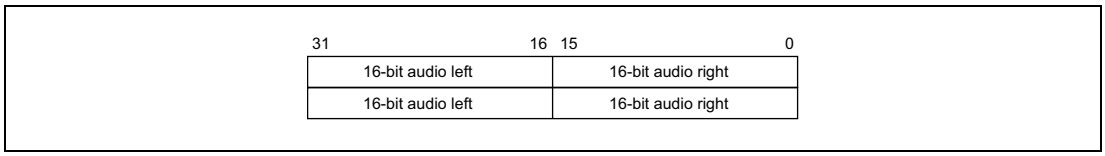

Figure 34.3 FIFO buffer in stereo mode

In mono mode (PCMPnCTL.PCMPnSTEREO = 0), the FIFO buffer stores two 16-bit audio samples in each block. The audio sample in the lower bit range is processed first.

See Section 34.3.2, Mono mode / stereo mode.

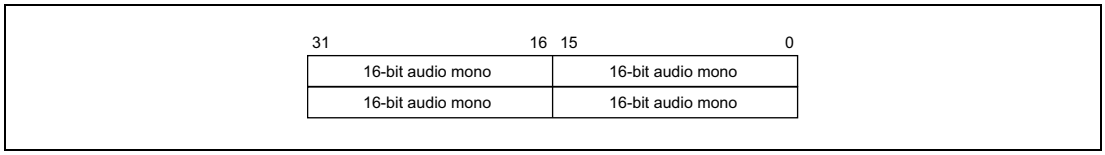

Figure 34.4 FIFO buffer in mono mode

FIFO fill request

The FIFO buffer fill state is indicated by bits PCMPnSTR.PCMPnFIFO[1:0].

When one of the blocks is empty (after processing of one stereo sample or two mono samples), the FIFO buffer fill state changes from full (PCMPnSTR.PCMPnFIFO[1:0] = 2) to not full (PCMPnSTR.PCMPnFIFO[1:0] = 1), which generates the FIFO fill request interrupt PCMPTIFFIL.

Data overflow and underrun

An overflow occurs if the FIFO buffer is full and a new audio sample is written to PCMPnAUSA. In this case, the FIFO buffer sets the bit PCMPnSTR.PCMPnOV = 1.

An underrun occurs if the FIFO buffer tries to get the next audio sample and PCMPnAUSA is empty. In this case, the FIFO buffer sets the bit PCMPnSTR.PCMPnUR = 1. The PCM-PWM will process the last audio sample again.

In both cases, the error interrupt PCMPTIFERR will be generated. Note that if the overflow or underrun condition is still pending (PCMPnSTR.PCMPnOV = 1 or PCMPnSTR.PCMPnUR = 1), no additional error interrupt request is generated.

34.3.2 Mono mode / stereo mode

The PCM-PWM module can generate either mono or stereo output. The bit PCMPnCTL.PCMPnSTEREO defines whether stereo mode is enabled.

34.3.2.1 Mono mode

In mono mode (PCMPnCTL.PCMPnSTEREO = 0), the PCM-PWM module processes the same audio sample simultaneously in both output channels:

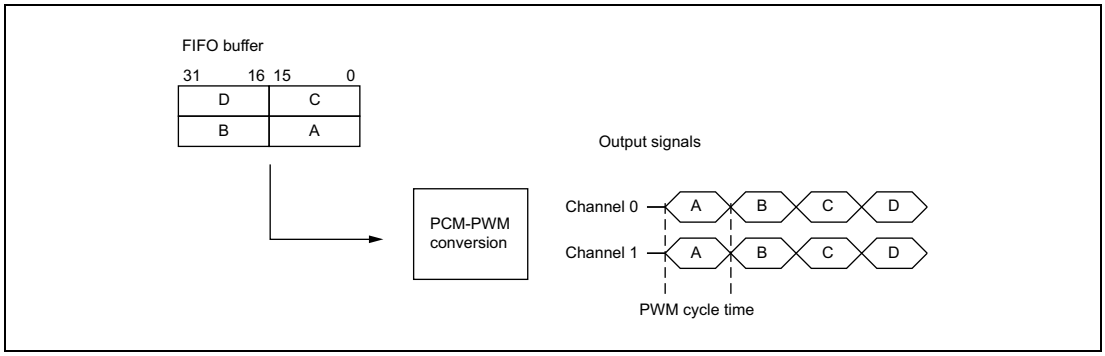

Figure 34.5 PCM-PWM in mono mode

34.3.2.2 Stereo mode

In stereo mode (PCMPnCTL.PCMPnSTEREO = 1), the PCM-PWM module processes a separate audio sample in each output channel.

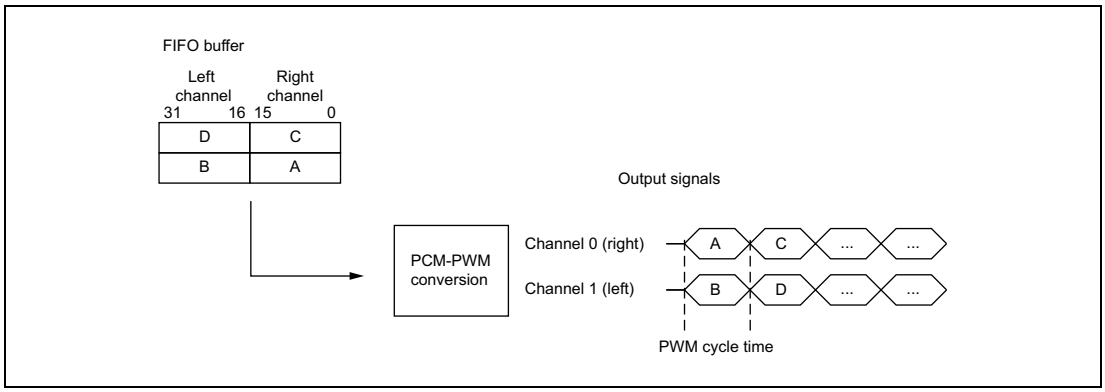

Figure 34.6 PCM-PWM in stereo mode

34.3.3 Output sampling frequency

The output sampling frequency depends on the settings in the control registers PCMPnTPWM (counter period) and PCMPnCKSEL (clock selection).

- The PCM-PWM module uses a 16-bit free running up-counter to determine the PWM duty cycle. The counter reset value is specified by PCMPnTPWM.
- The count clock frequency is determined by PCMPnCKSEL.

After conversion start (PCMPnCTL.PCMPnENAB = 1), the counter is started when the FIFO buffer is full (PCMPnSTR.PCMPnFIFO[1:0] = 2). This mechanism prevents the PCM-PWM module from trying to process audio samples until data is actually available.

The output sampling frequency and PWM cycle time are calculated as follows:

- Output sampling frequency = PCLK / (PCMPnTPWM x $2^{PCMPnCKSEL}$)
- PWM cycle time = (PCMPnTPWM x $2^{PCMPnCKSEL}$) / PCLK

34.3.3.1 Double output mode

The PCM-PWM module has a double output mode. When double output mode is enabled, every audio sample is processed twice. This doubles the output frequency with respect to the input frequency. The double output mode is enabled/disabled by the bit PCMPnCTL.PCMPnDOM.

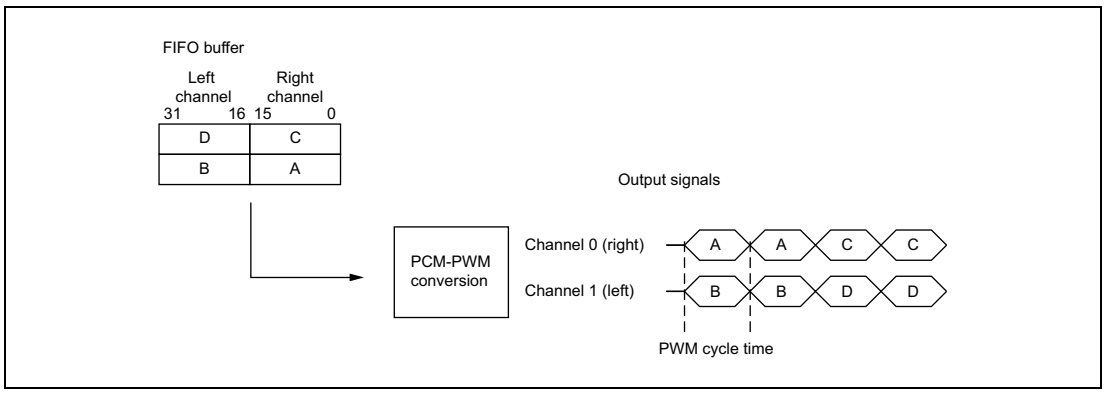

Figure 34.7 Double output mode (in stereo mode)

34.3.4 Output modes

34.3.4.1 Half H-bridge mode

In half H-bridge mode (PCMPnCTL.PCMPnMODE = 0), two pulse-width modulated signals (PCMPTPWMANx, PCMPTPWMAPx) are generated per output channel. The output signals can be used to drive a half H-bridge. Note that in this mode, the signals PCMPTPWMBPx and PCMPTPWMBNx are not used.

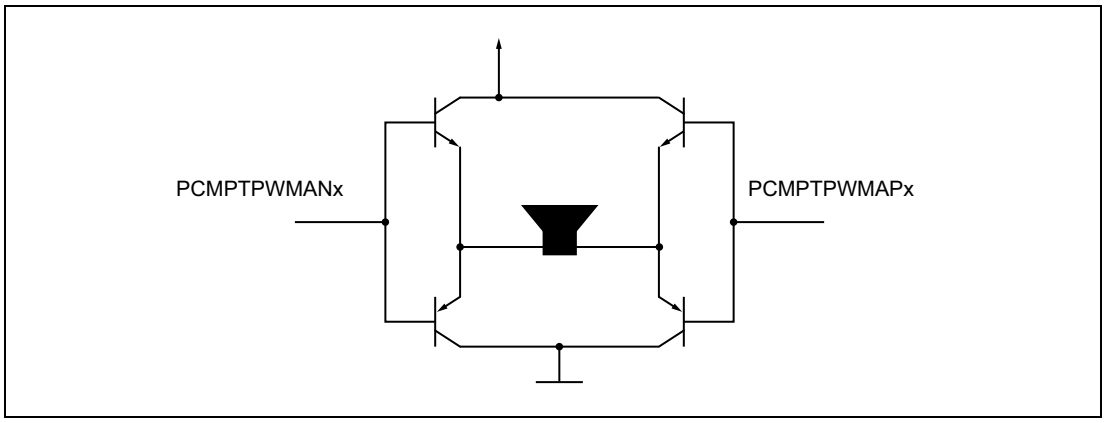

Figure 34.8 Driving a half H-bridge (here: emitter follower bridge)

The duty cycle of the PCMPTPWMAPx and PCMPTPWMANx signal reflects the sign of the PCM audio sample value. For example, if the duty cycle is above 50%, the audio sample has a positive value and if the duty cycle is below 50%, the audio sample has a negative value. Note that the active level can be set by control register PCMPnINV.

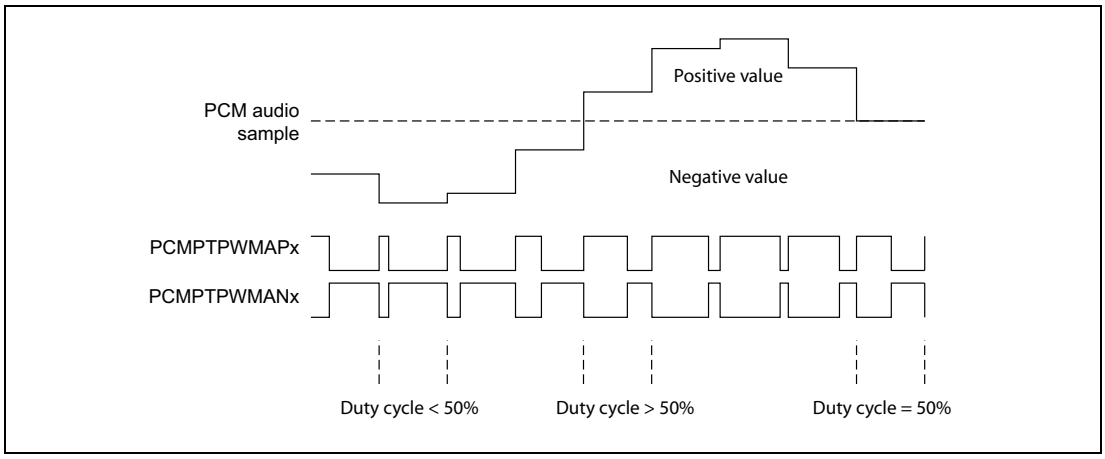

Figure 34.9 Example pulse-width modulated output in half H-bridge mode

NOTE

This mode can be used, for example, to drive a speaker that is driven by a single NPN transistor.

34.3.4.2 Full H-bridge mode

In full H-bridge mode, four pulse-width modulated signals are generated on each output channel (PCMPTPWMAPx, PCMPTPWMANx, PCMPTPWMBPx, PCMPTPWMBNx). These signals are used to drive a full H-bridge.

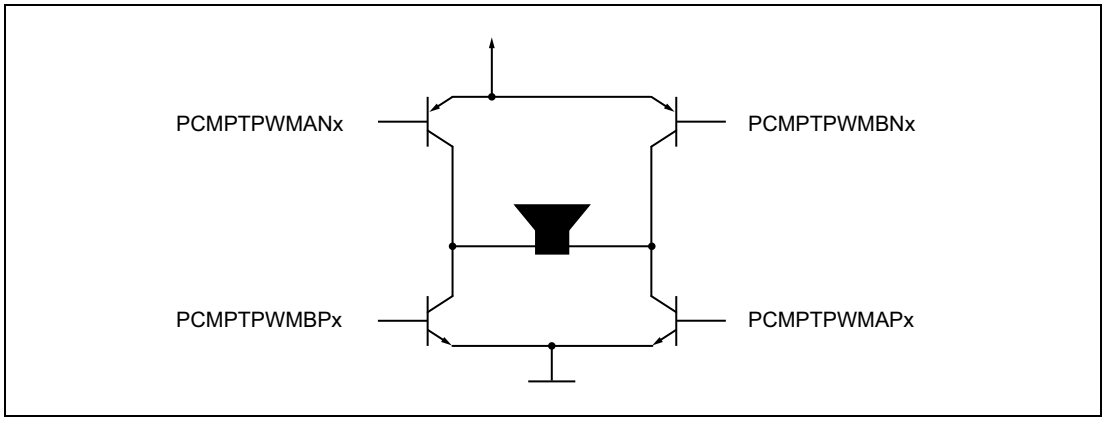

Figure 34.10 Driving a full H-bridge

In full H-bridge mode, the positive audio sample values are handled by the PCMPTPWMAPx / PCMPTPWMANx signals; the negative PCM audio sample values are handled by the PCMPTPWMBPx / PCMPTPWMBNx signals. Note that the active level can be set by control register PCMPnINV.

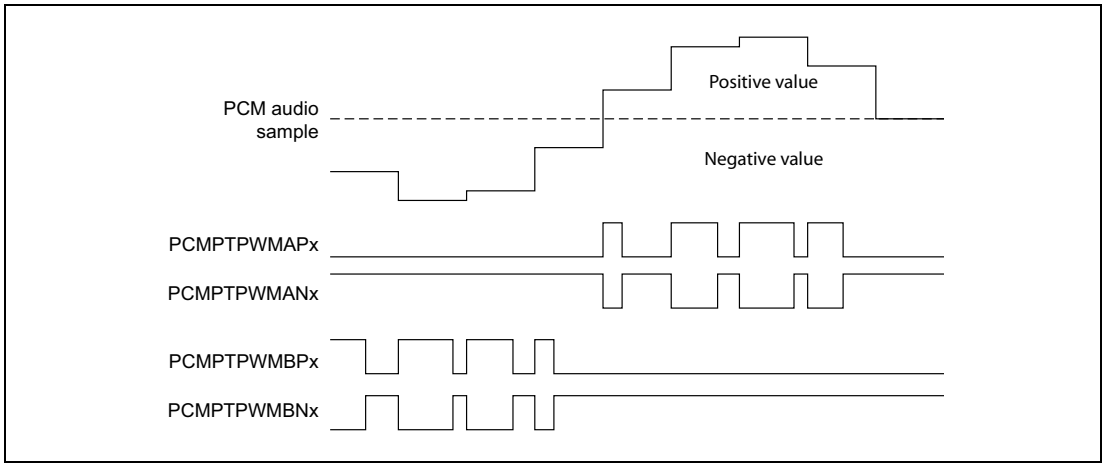

Figure 34.11 Example pulse-width modulated output in full H-bridge mode

NOTE

This output mode is used to drive a speaker with DC power-free operation during silence.

34.3.5 PCM-PWM output generators

The PCM-PWM output generators convert the PCM-coded audio samples to pulse-width modulated audio data as follows:

- Convert the signed integer value from the FIFO buffer to an unsigned integer value.
- Generate the corresponding PWM signals by comparing the resulting value with the current value of the internal counter.

The exact conversion algorithm depends on whether the module is in half H-bridge or full H-bridge mode.

34.3.5.1 PWM generation in half H-bridge mode

In half H-bridge mode, the PWM output generators add the value in the control register PCMPnOFFS to the signed integer value from the FIFO buffer. The resulting value is an unsigned integer.

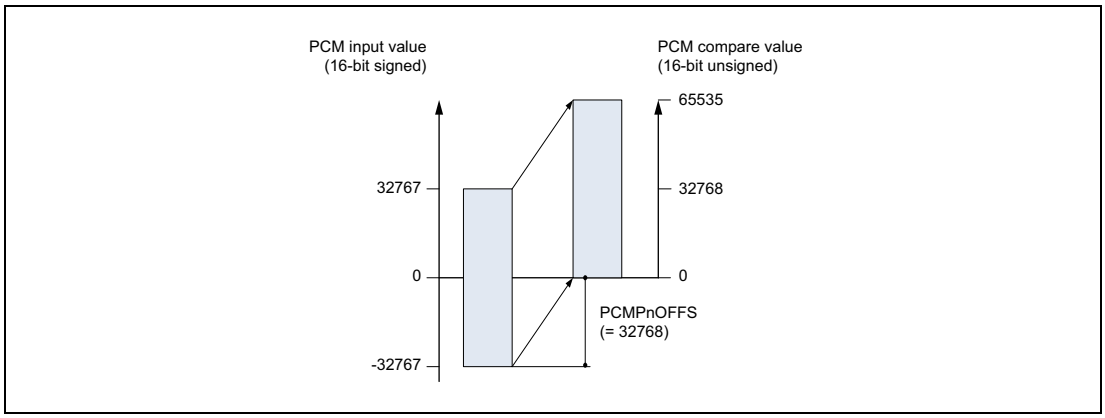

Figure 34.12 Converting the audio input in half H-bridge mode (PCMPnCTL.MODE = 0)

The following table shows the same mapping.

PCM input value	PCM compare value
-32768 (8000_H)	0
-1 ($FFFF_H$)	32767 ($7FFF_H$)
0	32768 (8000_H)
32767 ($7FFF_H$)	65535 ($FFFF_H$)

The resulting PCM compare values are then compared to the value of the counter. When the PCM compare value is greater than the value of the counter, the resulting PWM signal is high.

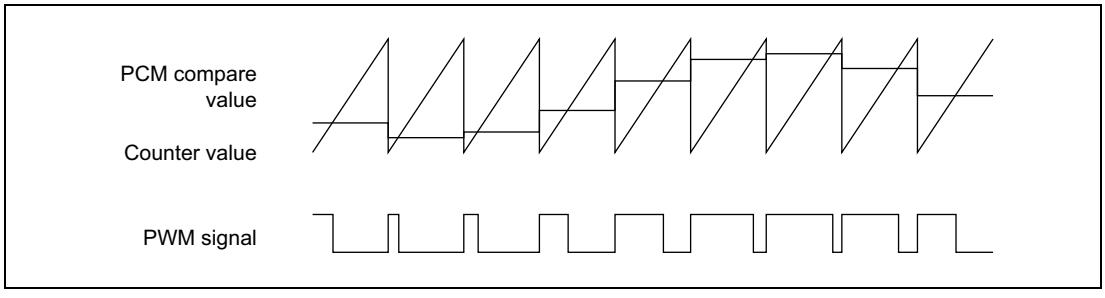

Figure 34.13 Converting the audio input in half H-bridge mode (PCMPnCTL.MODE = 0)

NOTES

1. The offset in PCMPnOFFS must be defined so that the lowest valid (negative) PCM value is converted to the unsigned integer value “0”.
2. The highest PCM input value must not exceed the maximum counter value specified in PCMPnTPWM.
3. The application writing the audio signals to the PCM-PWM must scale the values accordingly.

34.3.5.2 PWM generation in full H-bridge mode

In full H-bridge mode, two PWM signals are generated from the PCM input signals: one for the positive audio sample values (Ax) and one for the negative audio sample values (Bx). This is determined by the value of the most significant bit (MSB) in the PCM input value.

- If the MSB = 0, the PCM compare value equals the PCM input value. These values are used to generate the high level PWM signal.
- If the MSB = 1, the PCM compare value is calculated by subtracting 1 and inverting all bits. These values are used to generate the low level PWM signal.

PCM compare value = ~[(PCM input value) - 1]

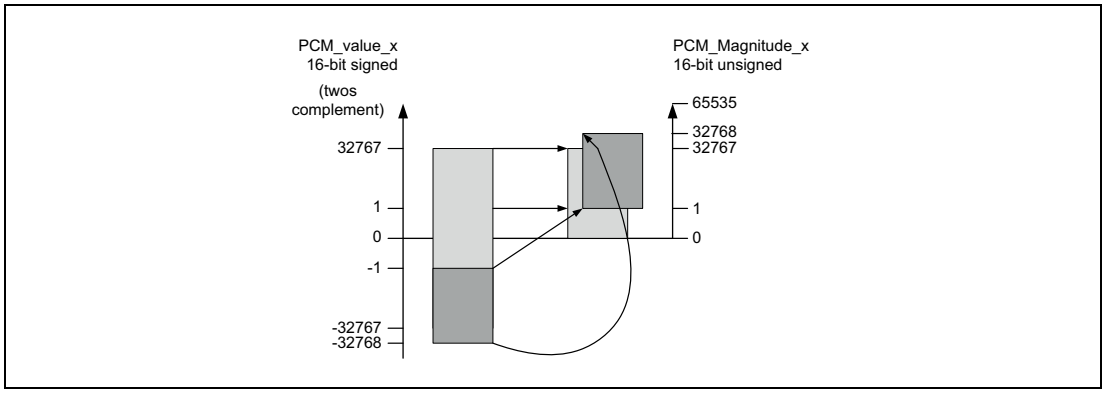

Figure 34.14 Converting the audio input in full H-bridge mode (PCMPnCTL.MODE = 1)

The following table shows the same mapping.

PCM input value	PCM compare value
-32768 (8000_H)	32768 (8000_H)
-1 ($FFFF_H$)	1 (0001_H)
0	0
1	1 (0001_H)
32767 ($7FFF_H$)	32767 ($7FFF_H$)

The resulting PCM compare values are then compared to the value of the counter. When the PCM compare value is greater than the value of the counter, the resulting PWM signal is high.

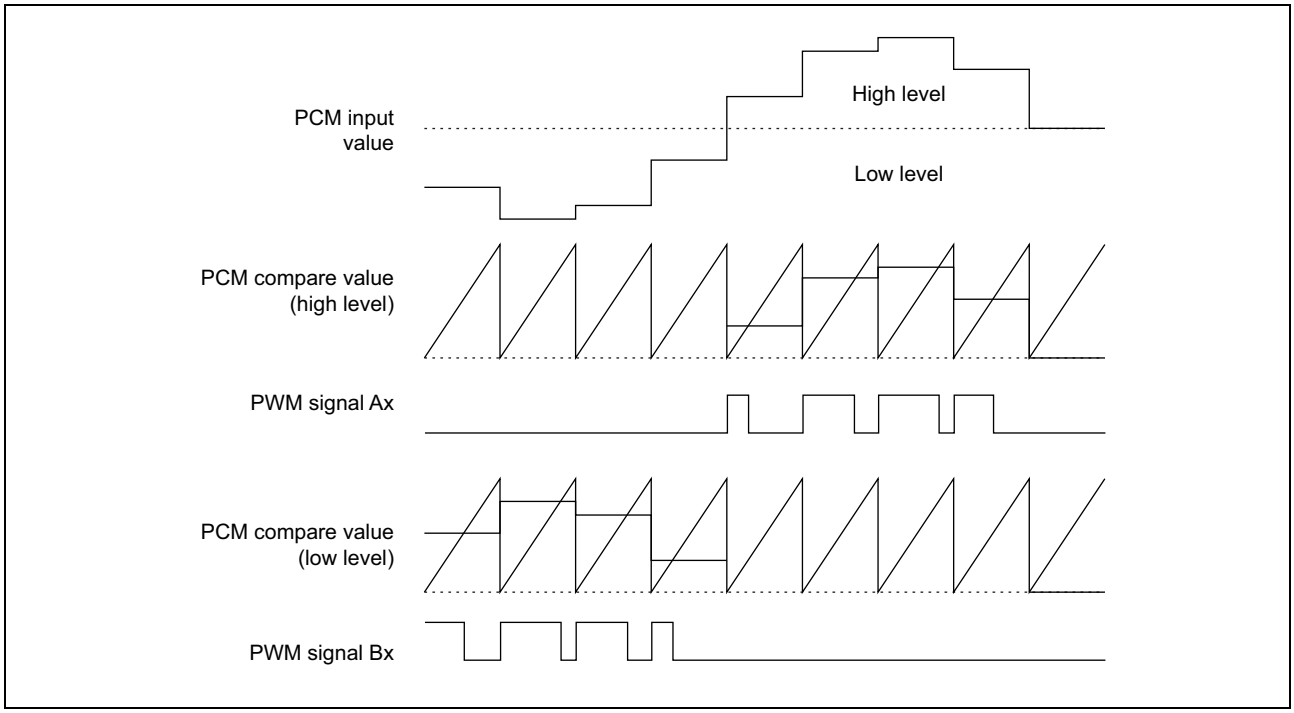

Figure 34.15 Calculating the PWM signals (full H-bridge mode)

34.3.6 Output control

The output control blocks receive the PWM signals from the PWM output generators and generate the PCMPTPWMAPx / PCMPTPWMANx and PCMPTPWMBPn / PCMPTPWMBNx output signals according to the following settings:

- Active level selection in the control register PCMPnINV
- Static signal output selection in the control registers PCMPnSTEN and PCMPnSTLV

Each of these registers allows individual settings for each of the output signals.

Active level selection

PCMPnINV defines whether the output signals are output non-inverted (active high) or inverted (active low). By default, the signals PCMPTPWMAPx and PCMPTPWMBPx are non-inverted, the signals PCMPTPWMANx and PCMPTPWMBNx are inverted.

Static signal output

PCMPnSTEN defines whether the PWM signal or a static signal is output. It is possible to change the selection during operation.

PCMPnSTLV and PCMPnINV define the level of the static signal. For details refer to **Table 34.7, Output control (registers interaction)**.

The following table provides an overview of how control registers PCMPnSTEN, PCMPnSTLV, and PCMPnINV interact.

Table 34.7 Output control (registers interaction)

PCMPnSTEN	PCMPnSTLV	PCMPnINV	Output	Description
0	X*1	0	PWM signal	PWM signal is output without changes.
		1	$\overline{\text{PWM signal}}$	PWM signal is inverted.
1	0	0	Low level	Static signal output Active: high, inactive: low Static level: inactive
		1	High level	Static signal output Active: low, inactive: high Static level: inactive
	1	0	High level	Static signal output Active: high, inactive: low Static level: active
		1	Low level	Static signal output Active: low, inactive: high Static level: active

Note 1. Control register PCMPnSTLV has no effect when control register PCMPnSTEN is 0.

NOTE

PCMPnSTEN and PCMPnSTLV can be used to perform a ramp up/down in half H-bridge mode, where one of the output pins is driven with the PWM signal and one is fixed. This avoids a crackling sound upon activation or deactivation of the PCM-PWM module.

34.3.7 Starting and stopping the PCM-PWM conversion

Start

To start PCM-PWM conversion, set PCMPnCTL.PCMPnENAB = 1. Audio samples can now be written to the control register PCMPnAUSA. The FIFO buffer picks up these samples.

When the FIFO buffer is full (PCMPnSTR.PCMPnFIFO[1:0] = 10_B), the PCM-PWM module starts converting the PCM data.

Stop

To stop PCM-PWM conversion, set PCMPnCTL.PCMPnENAB = 0. The conversion continues until the FIFO buffer is empty. After that, conversion is stopped. All output signals are set to active low level.

CAUTION

Since the PCM-PWM conversion continues until the FIFO buffer is empty, a final error interrupt PCMPTIFERR is generated to indicate a FIFO underrun, although PCMPnCTL.PCMPnENAB = 0.

34.3.8 Example setup

Example:

- Input data: 13 bit PCM audio samples
- Output mode: half H-bridge mode (emitter follower)
- Desired sample frequency: 11.025 kHz
- PCLK: 80 MHz
- Count clock: 80 MHz

Required settings:

- Count clock = PCLK / 2^0

  PCMPnCKSEL[2:0] = 000_B
- Maximum counter value = 80 MHz / 11.025 kHz = 7,256.24

  PCMPnTPWM[15:0] = 7,256 = $1C58_H$

This results in the following:

- Effective sample frequency f_{Seff}

  f_{Seff} = 80 MHz / 7,256 = 11.0254 kHz
- Effective output resolution R

  $7{,}256 = 2^R \Rightarrow R = \ln(7{,}256) / \ln(2) = 12.8$ bit
- Sample frequency error is < 0.05 %

34.4 PCM-PWM Registers

This section contains a description of all registers of the PCM-PWM module.

34.4.1 PCM-PWM registers overview

Table 34.8 PCM-PWM register overview

Register name	Shortcut	Address
Control register	PCMPnCTL	<PCMPn_base>
Counter period register	PCMPnTPWM	<PCMPn_base> + 04_H
Inverter control register	PCMPnINV	<PCMPn_base> + 08_H
Static level selection register	PCMPnSTLV	<PCMPn_base> + $0C_H$
Static level enable register	PCMPnSTEN	<PCMPn_base> + 10_H
Conversion offset register	PCMPnOFFS	<PCMPn_base> + 14_H
Audio sample input register	PCMPnAUSA	<PCMPn_base> + 18_H
Status register	PCMPnSTR	<PCMPn_base> + $1C_H$
Status clear register	PCMPnSTC	<PCMPn_base> + 20_H
Clock selection register	PCMPnCKSEL	<PCMPn_base> + 24_H
Emulation register	PCMPnEMU	<PCMPn_base> + 28_H

<PCMPn_base>

The base addresses <PCMPn_base> of the PCMPn is defined in the first section of this chapter under the key word “Register addresses”.

34.4.2 PCM-PWM registers details

34.4.2.1 PCMPnCTL - PCM-PWM control register

This register controls the operating mode and operating status of the PCM-PWM module.

Access: This register can be read/written in 32-bit units.

Address: <PCMPn_base>

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	PCMPnDOM	PCMPnSTEREO	PCMPnMODE	PCMPnENAB
R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 34.9 PCMPnCTL register contents

Bit position	Bit name	Function
31 to 4	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
3	PCMPn DOM	Enables/disables double output mode: 0: Disabled (every audio sample is output once) 1: Enabled (every audio sample is output twice)
2	PCMPn STEREO	Enables/disables stereo mode: 0: Disabled (mono mode) 1: Enabled (stereo mode)
1	PCMPn MODE	Specifies the output mode 0: Half H-bridge mode 1: Full H-bridge mode See Section 34.3.4, Output modes for additional information.
0	PCMPn ENAB	Enables/disables the PCM-PWM conversion: 0: Conversion disabled 1: Conversion enabled See Section 34.3.7, Starting and stopping the PCM-PWM conversion for details.

34.4.2.2 PCMPnTPWM - PCM-PWM counter period register

This register defines the period value of the counter. It influences the PWM cycle time and the output sample frequency as described in Section 34.3.3, Output sampling frequency.

Access: This register can be read/written in 32-bit units.
The PCM-PWM module must be disabled (PCMPnCTL.PCMPnENAB = 0) before writing to this register.

Address: <PCMPn_base> + 04_H

Initial Value: 0000 $FFFF_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15 to 0	PCMPn TPWM[15:0]	Maximum counter value

34.4.2.3 PCMPnINV - PCM-PWM inverter control register

This register defines the active level of the eight PWM output signals.

Access: This register can be read/written in 32-bit units.
The PCM-PWM module must be disabled (PCMPnCTL.PCMPnENAB = 0) before writing to this register.

Address: <PCMPn_base> + 08_H

Initial Value: 0000 $0A0A_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 34.11 PCMPnINV register contents

Bit position	Bit name	Function
31 to 12	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
11	PCMPn INVBN1	Sets the active level of the PCMPTPWMBN1 output signal: 0: Active high 1: Active low
10	PCMPn INVBP1	Sets the active level of the PCMPTPWMBP1 output signal: 0: Active high 1: Active low
9	PCMPn INVAN1	Sets the active level of the PCMPTPWMAN1 output signal: 0: Active high 1: Active low
8	PCMPn INVAP1	Sets the active level of the PCMPTPWMAP1 output signal: 0: Active high 1: Active low
7 to 4	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
3	PCMPn INVBN0	Sets the active level of the PCMPTPWMBN0 output signal: 0: Active high 1: Active low
2	PCMPn INVBP0	Sets the active level of the PCMPTPWMBP0 output signal: 0: Active high 1: Active low
1	PCMPn INVAN0	Sets the active level of the PCMPTPWMAN0 output signal: 0: Active high 1: Active low
0	PCMPn INVAP0	Sets the active level of the PCMPTPWMAP0 output signal: 0: Active high 1: Active low

34.4.2.4 PCMPnSTLV - PCM-PWM static level selection register

This register defines the static output level for every output pin if the static signal output function is enabled (corresponding bit in PCMPnSTEN is set). The static output level is also influenced by the setting of PCMPnINV. For details refer to Section 34.3.6, Output control.

Access: This register can be read/written in 32-bit units.
The PCM-PWM module must be disabled (PCMPnCTL.PCMPnENAB = 0) before writing to this register.

Address: <PCMPn_base> + $0C_H$

Initial Value: $0000\ 0000_H$

Bit position	Bit name	Function
31 to 12	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
11	PCMPn STLVBN1	Sets the static level of the PCMPTPWMBN1 output signal: 0: Static inactive 1: Static active
10	PCMPn STLVBP1	Sets the static level of the PCMPTPWMBP1 output signal: 0: Static inactive 1: Static active
9	PCMPn STLVAN1	Sets the static level of the PCMPTPWMAN1 output signal: 0: Static inactive 1: Static active
8	PCMPn STLVAP1	Sets the static level of the PCMPTPWMAP1 output signal: 0: Static inactive 1: Static active
7 to 4	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
3	PCMPn STLVBN0	Sets the static level of the PCMPTPWMBN0 output signal: 0: Static inactive 1: Static active
2	PCMPn STLVBP0	Sets the static level of the PCMPTPWMBP0 output signal: 0: Static inactive 1: Static active
1	PCMPn STLVAN0	Sets the static level of the PCMPTPWMAN0 output signal: 0: Static inactive 1: Static active
0	PCMPn STLVAP0	Sets the static level of the PCMPTPWMAP0 output signal: 0: Static inactive 1: Static active

34.4.2.5 PCMPnSTEN - PCM-PWM static level enable register

This register enables/disables the static signal output function for every output signal. Refer to Section 34.3.6, Output control for additional information.

Access: This register can be read/written in 32-bit units.

Address: <PCMPn_base> + 10_H

Initial Value: 0000 0000_H

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	PCMPn STENAP0	Enables/disables static output for the PCMPTPWMAP0 output signal: 0: PWM signal output enabled 1: Static output enabled

34.4.2.6 PCMPnOFFS - PCM-PWM conversion offset register

This register stores the offset that is used for the signed-unsigned conversion in half H-bridge mode (see Section 34.3.5.1, PWM generation in half H-bridge mode).

Access: This register can be read/written in 32-bit units.
The PCM-PWM module must be disabled (PCMPnCTL.PCMPnENAB = 0) before writing to this register.

Address: <PCMPn_base> + 14_H

Initial Value: $0000\ 8000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

34.4.2.7 PCMPnAUSA - PCM-PWM audio sample input register

This register is used to write a 32-bit pattern (as part of a sample) to the FIFO buffer. This 32-bit pattern has two 16-bit patterns. These patterns will either be used as left/right audio samples in stereo mode or as two consecutive mono samples in mono mode. The format of the sample is as a 16-bit signed integer in two's complement representation.

Access: This register can be written in 32-bit units.

Address: <PCMPn_base> + 18_H

Initial Value: $0000\ 0000_H$

W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 34.15 PCMPnAUSA register contents

Bit position	Bit name	Function
31 to 16	PCMPn AUSL[15:0]	16-bit sample left
15 to 0	PCMPn AUSR[15:0]	16-bit sample right

NOTES

1. The PCM-encoded data must be scaled to this value by the software sending audio data. If, for example, PCMPnTPWM is set to 255, the maximum compare value derived from the PCM-encoded input data has to be 255. The PCM-PWM module does not scale the data. All compare values that exceed the maximum counter value result in a 100% duty cycle. For details on the generation of compare values, refer to **Section 34.3.5, PCM-PWM output generators**.
2. If audio samples with less than 16 bits are used, they have to be sign-extended to 16 bits by the application to ensure correct interpretation of negative values.

34.4.2.8 PCMPnSTR - PCM-PWM status register

This register is used to monitor the fill state of the FIFO buffer (if the FIFO buffer has data to be converted), occurrences of a FIFO buffer overflow and a FIFO buffer underrun.

Access: This register can be read in 32-bit units.

Address: <PCMPn_base> + $1C_H$

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 34.16 PCMPnSTR register contents

Bit position	Bit name	Function
31 to 16	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
15 to 14	PCMPn FIFO[1:0]	Indicates the FIFO buffer fill state:

PCMPn FIFO[1:0]	Function
00_B	FIFO buffer empty.
01_B	FIFO buffer has one entry.
10_B	FIFO buffer has two entries.
11_B	Not used.

Bit position	Bit name	Function
13 to 2	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
1	PCMPn OV	FIFO buffer overflow flag: 0: No overflow occurred 1: Overflow occurred
0	PCMPn UR	FIFO buffer underrun flag: 0: No underrun occurred 1: Underrun occurred

34.4.2.9 PCMPnSTC - PCM-PWM status clear register

This register is used to reset the FIFO buffer status flags.

Access: This register can be written in 32-bit units.

Address: <PCMPn_base> + 20_H

Initial Value: 0000 0000_H

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 34.17 PCMPnSTC register contents

Bit position	Bit name	Function
31 to 2	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
1	PCMPn OVC	Clear FIFO buffer overflow flag: 0: No action 1: Clear PCMPnSTR.PCMPnOV
0	PCMPn URC	Clear FIFO buffer underrun flag: 0: No action 1: Clear PCMPnSTR.PCMPnUR

34.4.2.10 PCMPnCKSEL - PCM-PWM clock selection register

This register specifies the count clock.

Access: This register can be read/written in 32-bit units.
The PCM-PWM module must be disabled (PCMPnCTL.PCMPnENAB = 0) before writing to this register.

Address: <PCMPn_base> + 24_H

Initial Value: 0000 0000_H

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 34.18 PCMPnCKSEL register contents

Bit position	Bit name	Function
31 to 3	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
2 to 0	PCMPn CKSEL[2:0]	Specifies the count clock:

PCMPn CKSEL[2:0]	Function
000_B	PCLK / 2^0
001_B	PCLK / 2^1
010_B	PCLK / 2^2
...	...
111_B	PCLK / 2^7

34.4.2.11 PCMPnEMU - PCM-PWM emulation register

This register controls whether the PCM-PWM can be stopped during emulation, for instance upon a breakpoint hit.

Access: This register can be read/written in 32-bit units.

Address: <PCMPn_base> + 28_H

Initial Value: 00_H

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R

Table 34.19 PCMPnEMU register contents

Bit position	Bit name	Function
31 to 8	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.
7	PCMPn SVSDIS	Emulation control: 0: PCM-PWM can be stopped during emulation 1: PCM-PWM operates continuously during emulation
6 to 0	Reserved	When read, the value after reset is returned. When written to these bits, write the value after reset.

Section 35 Serial Sound Interface (SSIF)

This section contains a generic description of the Serial Sound Interface.

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.
The subsequent sections describe the features that apply to all implementations.

35.1 Overview of the RH850/D1L/D1M Serial Sound Interfaces

35.1.1 Units

This microcontroller has the following number of units of the Serial Sound Interface.

Table 35.1 Number of Units

Product Name	All products
Units	2
Names	SSIFn (n = 0, 1)

Table 35.2 Index

Index	Meaning
n	Throughout this section, the individual SSIF units are identified by the index “n” (n = 0, 1).

35.1.2 Register addresses

All Serial Sound Interface register addresses are given as address offsets from the individual base addresses <SSIFn_base>.
The <SSIFn_base> addresses of each SSIFn are listed in the following table:

Table 35.3 Register base addresses <SSIFn_base>

SSIFn unit	<SSIFn_base> address
SSIF0	FFF1 3000_H
SSIF1	FFF1 4000_H

35.1.3 Clock supply

All Serial Sound Interfaces provide following clock inputs.

Table 35.4 Clock supply

SSIFn unit	SSIFn clock	Connected to
SSIF0 SSIF1	PCLK	Clock Controller C_ISO_PCLK
	SSIACKINT	Clock Controller C_ISO_SSIF

35.1.4 Interrupt and DMA requests

The Serial Sound Interfaces can generate the following interrupt and DMA requests:

Table 35.5 SSIFn interrupt and DMA requests

SSIFn signals	Function	Connected to
SSIF0:		
TXI	Transmission data empty	Interrupt Controller INTSSIF0TX DMA trigger ID 113
RXI	Reception data full	Interrupt Controller INTSSIF0RX DMA trigger ID 114
IRQ	Multi-purpose interrupt	INTSSIF0
SSIF1:		
TXI	Transmission data empty	Interrupt Controller INTSSIF1TX DMA trigger ID 115
RXI	Reception data full	Interrupt Controller INTSSIF1RX DMA trigger ID 116
IRQ	Multi-purpose interrupt	INTSSIF1

35.1.5 Reset sources

The Serial Sound Interfaces and their registers are initialized by the following reset signal:

Table 35.6 Reset sources

SSIFn unit	Reset signal
SSIFn	• Reset Controller SYSRES • Reset Controller SG3RES for SSIF1 • Reset Controller SG2RES for SSIF0 • Reset upon wake-up from DEEPSTOP mode

CAUTION

By default the SGnRES resets are active.

Thus before accessing an SGn module this reset must be released via the MRSTC register of the Reset Controller. Refer to Section 9, Reset Controller for details.

35.1.6 I/O signals

The following table shows the I/O signals of the Serial Sound Interfaces.

Table 35.7 I/O signals connections

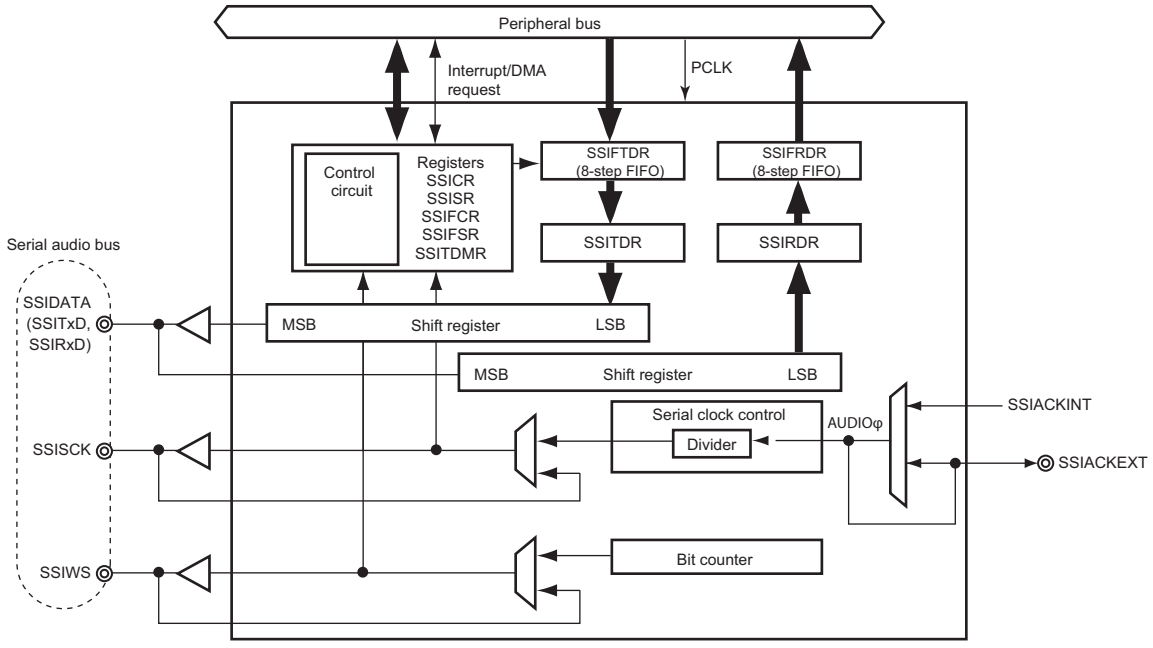
SSIFn signal	Function	Connected to
SSIACKEXT	Common audio clock input/output	Port SSIFACK
SSIF0:		
SSIDATA	Serial data input	Port SSIF0RXD
	Serial data output	Port SSIF0TXD
SSISCK	Serial bit clock input/output	Port SSIF0SCK
SSIWS	Word select input/output	Port SSIF0WS
SSIF1:		
SSIDATA	Serial data input	Port SSIF1RXD
	Serial data output	Port SSIF1TXD
SSISCK	Serial bit clock input/output	Port SSIF1SCK
SSIWS	Word select input/output	Port SSIF1WS

35.2 Features

The Serial Sound Interface is a module designed to exchange audio data with various devices offering I^2S bus compatibility. It also provides additional modes for other common formats, as well as support for multi-channel mode.

- Number of channels: Two channels
- Operating mode: Non-compressed mode
  The non-compressed mode supports serial audio streams divided by channels.
- Serves as both a transmitter and a receiver
- Capable of using serial bus format
- Asynchronous transfer takes place between the data buffer and the shift register.
- It is possible to select a dividing ratio for the clock used by the serial bus interface.
- It is possible to control data transmission or reception with DMA transfer and interrupt requests.
- Selects the oversampling clock input from among the following pins:
  - internal SSIACKINT
  - external SSIACKEXT
- Includes 8-stage FIFO buffers in transmitter and receiver
- Supports multi-channel mode (TDM mode) in which the SSIWS signal is high only for system word 1 period.
- Supports WS continue mode in which the SSIWS signal is not stopped.

The figure below shows a block diagram of this module.



[Legend]

SSICR:	Control register	SSIFCR:	FIFO control register
SSISR:	Status register	SSIFSR:	FIFO status register
SSITDR:	Transmit data register	SSIFTDR:	Transmit FIFO data register
SSIRDR:	Receive data register	SSIFRDR:	Receive FIFO data register
SSITDMR:	TDM mode register		

Note:
The selectable oversampling clocks SSIACKINT and SSIACKEXT are commonly used by both channels. All signals of the serial audio bus (SSIDATA (SSITxD, SSIRxD), SSISCK, SSIWS) are separated for each channel.

Figure 35.1 Block Diagram of the Serial Sound Interface

35.3 Register Description

The table below lists the register configuration. Note that explanations in the text omit the channel numbers.

Table 35.8 Register Configuration

Module Name	Channel	Register Name	Symbol	R/W	Initial Value	Address	Access Size
SSIF	0	Control register 0	SSICR_0	R/W	H'00000000	<SSIF0_base> + 00_H	32
SSIF		Status register 0	SSISR_0	R/W*1	H'02000013	<SSIF0_base> + 04_H	32
SSIF		FIFO control register 0	SSIFCR_0	R/W	H'00000000	<SSIF0_base> + 10_H	32
SSIF		FIFO status register 0	SSIFSR_0	R/(W)*2	H'00010000	<SSIF0_base> + 14_H	32
SSIF		Transmit FIFO data register 0	SSIFTDR_0	W	Undefined	<SSIF0_base> + 18_H	32
SSIF		Receive FIFO data register 0	SSIFRDR_0	R	Undefined	<SSIF0_base> + $1C_H$	32
SSIF		TDM mode register 0	SSITDMR_0	R/W	H'00000000	<SSIF0_base> + 20_H	32
SSIF	1	Control register 1	SSICR_1	R/W	H'00000000	<SSIF1_base> + 00_H	32
SSIF		Status register 1	SSISR_1	R/W*1	H'02000013	<SSIF1_base> + 04_H	32
SSIF		FIFO control register 1	SSIFCR_1	R/W	H'00000000	<SSIF1_base> + 10_H	32
SSIF		FIFO status register 1	SSIFSR_1	R/(W)*2	H'00010000	<SSIF1_base> + 14_H	32
SSIF		Transmit FIFO data register 1	SSIFTDR_1	W	Undefined	<SSIF1_base> + 18_H	32
SSIF		Receive FIFO data register 1	SSIFRDR_1	R	Undefined	<SSIF1_base> + $1C_H$	32
SSIF		TDM mode register 1	SSITDMR_1	R/W	H'00000000	<SSIF1_base> + 20_H	32
SELB	0 and 1	SSIF clock setting register	SSIFCLKCFG	R/W	H'00000000	FFC0 $602C_H$	32

Note 1. Although bits 29 to 26 in these registers can be read from or written to, bits other than these are read-only. For details, refer to Section 35.3.2, Status Register (SSISR).

Note 2. To bits 16 and 0 in these registers, only 0 can be written to clear the flags. Other bits are read-only. For details, refer to Section 35.3.6, FIFO Status Register (SSIFSR).

NOTES

1. In the header files the names of the above registers are defined in the following format:
   <ModuleName> + <Symbol>.
   <ModuleName> and <Symbol> are defined in the above table.
2. SSIF channel number is placed after "SSIF", and also needs "_0" "_1" at the end (i.e. SSIF0SSICR_0, SSIF1SSICR_1).
   Only SSIFCLKCFG has no channel number. (i.e. SELBSSIFCLKCFG).

35.3.1 Control Register (SSICR)

SSICR is a 32-bit readable/writable register that controls the IRQ, selects the polarity status, and sets operating mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	TUIEN	TOIEN	RUIEN	ROIEN	IIEN	-	CHNL[1:0]		DWL[2:0]			SWL[2:0]

	SCKD	SWSD	SCKP	SWSP	SPDP	SDTA	PDTA	DEL	CKDV[3:0]				MUEN	-	TEN	REN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	0	R	Reserved The read value is undefined. The write value should always be 0.
29	TUIEN	0	R/W	Transmit Underflow Interrupt Enable 0: Disables an underflow interrupt. 1: Enables an underflow interrupt.
28	TOIEN	0	R/W	Transmit Overflow Interrupt Enable 0: Disables an overflow interrupt. 1: Enables an overflow interrupt.
27	RUIEN	0	R/W	Receive Underflow Interrupt Enable 0: Disables an underflow interrupt. 1: Enables an underflow interrupt.
26	ROIEN	0	R/W	Receive Overflow Interrupt Enable 0: Disables an overflow interrupt. 1: Enables an overflow interrupt.
25	IIEN	0	R/W	Idle Mode Interrupt Enable 0: Disables an idle mode interrupt. 1: Enables an idle mode interrupt.
24	—	0	R	Reserved The read value is undefined. The write value should always be 0.
23, 22	CHNL[1:0]	00	R/W	Channels [When TDM = 0] These bits show the number of channels in each system word. 00: Having one channel per system word 01: Having two channels per system word 10: Having three channels per system word 11: Having four channels per system word [When TDM = 1] These bits show the number of system words in each TDM frame. 00: Setting prohibited 01: Having four system words per TDM frame 10: Having six system words per TDM frame 11: Having eight system words per TDM frame
21 to 19	DWL[2:0]	000	R/W	Data Word Length These bits indicate the number of bits in a data word. 000: 8 bits 001: 16 bits 010: 18 bits 011: 20 bits 100: 22 bits 101: 24 bits 110: 32 bits 111: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
18 to 16	SWL[2:0]	000	R/W	System Word Length These bits indicate the number of bits in a system word. 000: 8 bits 001: 16 bits 010: 24 bits 011: 32 bits 100: 48 bits 101: 64 bits 110: 128 bits 111: 256 bits
15	SCKD	0	R/W	Serial Bit Clock Direction 0: Serial bit clock is input, slave mode. 1: Serial bit clock is output, master mode. Note: Only the following settings are allowed: (SCKD, SWSD) = (0, 0) or (1, 1). Other settings are prohibited.
14	SWSD	0	R/W	Serial WS Direction 0: Serial word select is input, slave mode. 1: Serial word select is output, master mode. Note: Only the following settings are allowed: (SCKD, SWSD) = (0,0) or (1,1). Other settings are prohibited.
13	SCKP	0	R/W	Serial Bit Clock Polarity 0: SSIWS and SSIDATA change at the SSISCK falling edge (sampled at the SSISCK rising edge). 1: SSIWS and SSIDATA change at the SSISCK rising edge (sampled at the SSISCK falling edge).
12	SWSP	0	R/W	Serial WS Polarity [When TDM = 0] 0: SSIWS is low for the 1st channel, high for the 2nd channel. 1: SSIWS is high for the 1st channel, low for the 2nd channel. [When TDM = 1] 0: SSIWS is high only for system word 1 period, low for other periods. 1: Setting prohibited
11	SPDP	0	R/W	Serial Padding Polarity This bit is used to specify the active level of padding bits. 0: Padding bits are low. 1: Padding bits are high.
10	SDTA	0	R/W	Serial Data Alignment 0: Transmitting and receiving in the order of serial data and padding bits 1: Transmitting and receiving in the order of padding bits and serial data

	SCKP =0	SCKP = 1
SSIDATA input sampling timing at the time of reception	SSISCK rising edge	SSISCK falling edge
SSIDATA output change timing at the time of transmission	SSISCK falling edge	SSISCK rising edge
SSIWS input sampling timing at the time of slave mode (SWSD = 0)	SSISCK rising edge	SSISCK falling edge
SSIWS output change timing at the time of master mode (SWSD = 1)	SSISCK falling edge	SSISCK rising edge

Bit	Bit Name	Initial Value	R/W	Description
9	PDTA	0	R/W	Parallel Data Alignment When the data word length is 32 bits, this configuration field has no meaning. This bit applies to SSIRDR in receive mode and SSITDR in transmit mode. When data word length is 8 or 16 bits: 0: The lower bits of parallel data (SSITDR, SSIRDR) are transferred prior to the upper bits. 1: The upper bits of parallel data (SSITDR, SSIRDR) are transferred prior to the lower bits. When data word length is 18, 20, 22, or 24 bits: 0: Parallel data (SSITDR, SSIRDR) is left-aligned. 1: Parallel data (SSITDR, SSIRDR) is right-aligned. PDTA = 0  PDTA = 1 8	DEL	0	R/W	Serial Data Delay 0: 1 clock cycle delay between SSIWS and SSIDATA 1: No delay between SSIWS and SSIDATA

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	CKDV[3:0]	0000	R/W	Serial Oversampling Clock Division Ratio Sets the ratio between the oversampling clock (AUDIOφ) and the serial bit clock. When the SCKD bit is 0, the setting of these bits is ignored. The serial bit clock is used in the shift register and is supplied from the SSISCK pin. 0000: AUDIOφ*1 0001: AUDIOφ/2 0010: AUDIOφ/4 0011: AUDIOφ/8 0100: AUDIOφ/16 0101: AUDIOφ/32 0110: AUDIOφ/64 0111: AUDIOφ/128 1000: AUDIOφ/6 1001: AUDIOφ/12 1010: AUDIOφ/24 1011: AUDIOφ/48 1100: AUDIOφ/96 1101: Setting prohibited 1110: Setting prohibited 1111: Setting prohibited
3	MUEN	0	R/W	Mute Enable This bit is used to specify muting of the signals from this module during transmission. 0: This module is not muted. 1: This module is muted. Note: When this module is muted, serial data to be output is rewritten to 0 but data transmission in the module is not stopped. Write dummy data to the SSIFTDR not to generate a transmit underflow because the number of data in the transmit FIFO is decreasing.
2	–	0	R	Reserved The read value is undefined. The write value should always be 0.
1	TEN	0	R/W	Transmit Enable 0: Disables the transmit operation. 1: Enables the transmit operation. **Note:** Note: When TEN is set to 0 during transmission, SSIF must be reset for restart by SW reset (SG2RES or SG3RES).
0	REN	0	R/W	Receive Enable 0: Disables the receive operation. 1: Enables the receive operation.

Note 1. If CKDV[3:0] = 0000 (AUDIOφ) is selected, please make sure the I^2S clock duty requirement (< 5 %, i.e. duty cycle from 45 % to 55 %) is kept for external clocks . Also check the influence of activated digital noise filter.

35.3.2 Status Register (SSISR)

SSISR consists of status flags indicating the operational status of this module and bits indicating the current channel numbers and word numbers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	TUIRQ	TOIRQ	RUIRQ	ROIRQ	IIRQ	-	-	-	-	-	-	-	-	-
Initial value:	Undefined	Undefined	0	0	0	0	1	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W:	R	R	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	TCHNO[1:0]		TSWNO	RCHNO[1:0]		RSWNO	IDST
Initial value:	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	0	0	1	0	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: * The bit can be read or written to. Writing 0 initializes the bit, but writing 1 is ignored.

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
29	TUIRQ	0	R/(W)*	Transmit Underflow Error Interrupt Status Flag This status flag indicates that transmit data was supplied at a lower rate than was required. This bit is set to 1 regardless of the value of the TUIEN bit and can be cleared by writing 0 to this bit. If TUIRQ = 1 and TUIEN = 1, an IRQ interrupt occurs. If TUIRQ = 1, SSITDR did not have data written to it before it was required for transmission. This will lead to the same data being transmitted once more and a potential corruption of multi-channel data. As a result, this module will output erroneous data. Note: When an underflow error occurs, the current data in the data buffer of this module is transmitted until the next data is written.
28	TOIRQ	0	R/(W)*	Transmit Overflow Error Interrupt Status Flag This status flag indicates that transmit data was supplied at a higher rate than was required. This bit is set to 1 regardless of the value of the TOIEN bit and can be cleared by writing 0 to this bit. If TOIRQ = 1 and TOIEN = 1, an SSIF interrupt occurs. If TOIRQ = 1, SSIFTDR had data written to it while the transmit FIFO is full (TDC[3:0] = H'8). This will lead to the loss of data and a potential corruption of multi-channel data.
27	RUIRQ	0	R/(W)*	Receive Underflow Error Interrupt Status Flag This status flag indicates that receive data was supplied at a lower rate than was required. This bit is set to 1 regardless of the value of the RUIEN bit and can be cleared by writing 0 to this bit. If RUIRQ = 1 and RUIEN = 1, an SSIF interrupt occurs. If RUIRQ = 1, SSIFRDR was read while the receive FIFO is empty (RDC[3:0] = H'0).This can cause invalid receive data to be stored, which may lead to corruption of multi-channel data.
26	ROIRQ	0	R/(W)*	Receive Overflow Error Interrupt Status Flag This status flag indicates that receive data was supplied at a higher rate than was required. This bit is set to 1 regardless of the value of the ROIEN bit and can be cleared by writing 0 to this bit. If ROIRQ = 1 and ROIEN = 1, an SSIF interrupt occurs. If ROIRQ = 1, SSIRDR was not read before there was new unread data written to it. This will lead to the loss of data and a potential corruption of multi-channel data. Note: When an overflow error occurs, the current data in the data buffer of this module is overwritten by the next incoming data from the SSIF interface.

Bit	Bit Name	Initial Value	R/W	Description
25	IIRQ	1	R	Idle Mode Interrupt Status Flag This status flag indicates whether this module is in the idle state. This bit is set to 1 regardless of the value of the IIEN bit to allow polling. The interrupt can be masked by clearing IIEN to 0, but cannot be cleared by writing 0 to this bit. If IIRQ = 1 and IIEN = 1, an SSIF interrupt occurs. 0: This module is not in idle state. 1: This module is in idle state.
24 to 7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6, 5	TCHNO [1:0]	00	R	Transmit Channel Number These bits show the current channel number. These bits indicate the number of a channel whose data is required to be written to SSITDR. This value will change as the data is copied to the shift register, regardless of whether the data is written to SSITDR. When TDM or CONT is 1, these bits cannot be used.
4	TSWNO	1	R	Transmit Serial Word Number This status bit indicates the current word number. This bit indicates which system word is required to be written to SSITDR. This value will change as the data is copied to the shift register, regardless of whether the data is written to SSITDR. When TDM or CONT is 1, this bit cannot be used.
3, 2	RCHNO [1:0]	00	R	Receive Channel Number These bits show the current channel number. These bits indicate which channel the data in SSIRDR currently represents. This value will change as the data in SSIRDR is updated from the shift register. When TDM or CONT is 1, these bits cannot be used.
1	RSWNO	1	R	Receive Serial Word Number This status bit indicates the current word number. This bit indicates which system word the data in SSIRDR currently represents. This value will change as the data in SSIRDR is updated from the shift register, regardless of whether SSIRDR has been read. When TDM or CONT is 1, this bit cannot be used.
0	IDST	1	R	Idle Mode Status Flag This status flag indicates that the serial bus activity has stopped. This bit is cleared to 0 if the serial bus is currently active while TEN = 1 or REN = 1. This bit is automatically set to 1 if both TEN and REN are cleared to 0 and the current system word communication is completed. Note: If the external device stops the serial bus clock before the current system word is completed, this bit is not set.

Note: *The bit can be read or written to. Writing 0 initializes the bit, but writing 1 is ignored.

35.3.3 Transmit Data Register (SSITDR)

SSITDR is a 32-bit register that stores data to be transmitted. The data for transmission in the transmit FIFO data register (SSIFTDR) is automatically transferred to SSITDR.

Data written to this register is transferred to the shift register upon transmission request. If the data word length is less than 32 bits, the alignment is determined by the setting of the PDTA control bit in SSICR.

The CPU cannot read or write data from/to SSITDR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

35.3.4 Receive Data Register (SSIRDR)

SSIRDR is a 32-bit register that stores received data. The received data stored in SSIRDR is automatically transferred to the receive FIFO data register (SSIFRDR).

Data in this register is transferred from the shift register each time data word is received. If the data word length is less than 32 bits, the alignment is determined by the setting of the PDTA control bit in SSICR.

The CPU cannot read or write data from/to SSIRDR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

35.3.5 FIFO Control Register (SSIFCR)

SSIFCR is a 32-bit readable/writable register that specifies the data trigger numbers for the transmit and receive FIFO data registers, and enables or disables FIFO data resets and interrupt requests.

SSIFCR can always be read or written by the CPU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	TTRG[1:0]		RTRG[1:0]		TIE	RIE	TFRST	RFRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7, 6	TTRG[1:0]	00	R/W	Transmit Data Trigger Number When the FIFO is operating for transmission, these bits specify the number of bytes for transmission in the FIFO (trigger number for transmission) at which the TDE flag in the FIFO status register (SSIFSR) will be set. The TDE flag is set to 1 when the number of bytes for transmission in the transmit FIFO data register (SSIFTDR) has fallen to or below the trigger number corresponding to the setting as shown below. 00: 7 (1)* 01: 6 (2)* 10: 4 (4)* 11: 2 (6)* Note: * The values in parentheses are the number of empty stages in SSIFTDR at which the TDE flag is set.
5, 4	RTRG[1:0]	00	R/W	Receive Data Trigger Number When the FIFO is operating for reception, these bits specify the number of received bytes in the FIFO (trigger number for reception) at which the RDF flag in the FIFO status register (SSIFSR) will be set. The RDF flag is set to 1 when the number of received bytes in the receive FIFO data register (SSIFRDR) has risen to or above the trigger number corresponding to the setting as shown below. 00: 1 01: 2 10: 4 11: 6
3	TIE	0	R/W	Transmit Interrupt Enable This bit enables or disables generation of transmit data empty interrupt (TXI) requests in the following situation: when the FIFO is operating for transmission, the data for transmission in the transmit FIFO data register (SSIFTDR) are transferred to the transmit data register (SSITDR) and the number of data bytes in the transmit FIFO data register has become less than the set transmit trigger number, so that the TDE flag in the FIFO status register (SSIFSR) is set to 1. 0: Transmit data empty interrupt (TXI) request is disabled. 1: Transmit data empty interrupt (TXI) request is enabled.* Note: * TXI can be cleared by clearing either the TDE flag (see the description of the TDE bit for details) or TIE bit to 0.

Bit	Bit Name	Initial Value	R/W	Description
2	RIE	0	R/W	Receive Interrupt Enable Enables or disables generation of receive data full interrupt (RXI) requests when the RDF flag in the FIFO status register (SSIFSR) is set to 1 while the FIFO is operating for reception. 0: Receive data full interrupt (RXI) request is disabled. 1: Receive data full interrupt (RXI) request is enabled.* Note: * RXI can be cleared by clearing either the RDF flag (see the description of the RDF bit for details) or RIE bit to 0.
1	TFRST	0	R/W	Transmit FIFO Data Register Reset Invalidates the data in the transmit FIFO data register (SSIFTDR) to reset the FIFO to an empty state. 0: Reset is disabled.* 1: Reset is enabled. Note: * FIFO is reset at a power-on reset. **Note:** Note2: When TFRST is set to 0 during transmission, SSIF must be reset for restart by SW reset (SG2RES or SG3RES) .
0	RFRST	0	R/W	Receive FIFO Data Register Reset Invalidates the data in the receive FIFO data register (SSIFRDR) to reset the FIFO to an empty state. 0: Reset is disabled.* 1: Reset is enabled. Note: * FIFO is reset at a power-on reset.

35.3.6 FIFO Status Register (SSIFSR)

SSIFSR contains status flags that indicate the state of operation of the transmit and receive FIFO data registers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	TDC[3:0]				-	-	-	-	-	-	-	TDE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/(W)*

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	RDC[3:0]				-	-	-	-	-	-	-	RDF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/(W)*

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 24	TDC[3:0]	0000	R	Number of Data Bytes Stored in SSIFTDR TDC[3:0] = H'0 indicates no data for transmission. TDC[3:0] = H'8 indicates that 32 bytes of data for transmission is stored in SSIFTDR.
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	TDE	1	R/(W)*	Transmit Data Empty Indicates that, when the FIFO is operating for transmission, the data for transmission in the transmit FIFO data register (SSIFTDR) is transferred to the transmit data register (SSITDR), the number of data bytes in SSIFTDR has become less than the transmit trigger number specified by TTRG[1:0] in the FIFO control register (SSIFCR), and thus writing of transmit data to SSIFTDR has been enabled. 0: Number of data bytes for transmission in SSIFTDR is greater than the set transmit trigger number. [Clearing conditions] 0 is written to TDE after data of the number of bytes larger than the set transmit trigger number is written to SSIFTDR. The direct memory access controller is activated by transmit data empty (TXI) interrupt, and data of the number of bytes larger than the set transmit trigger number is written to SSIFTDR. 1: Number of data bytes for transmission in SSIFTDR is equal to or less than the set transmit trigger number.*1 [Setting conditions] Power-on reset Number of transmission data bytes stored in SSIFTDR has become equal to or less than the set transmit trigger number. Note: *1Since SSIFTDR is an 8-stage FIFO register, the amount of data that can be written to it while TDE = 1 is "8 – transmit trigger number to be specified" bytes at maximum. Writing more data will be ignored. The number of data bytes in SSIFTDR is indicated in the TDC[3:0] bits in SSIFSR.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
11 to 8	RDC[3:0]	0000	R	Number of Data Bytes Stored in SSIFRDR RDC[3:0] = H'0 indicates no received data. RDC[3:0] = H'8 indicates that 32 bytes of received data is stored in SSIFRDR.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RDF	0	R/(W)*	Receive Data Full Indicates that, when the FIFO is operating for reception, the received data is transferred to the receive FIFO data register (SSIFRDR) and the number of data bytes in SSIFRDR has become greater than the receive trigger number specified by RTRG[1:0] in the FIFO control register (SSIFCR). 0: Number of received data bytes in SSIFRDR is less than the set receive trigger number. [Clearing conditions] Power-on reset 0 is written to RDF after the receive FIFO is emptied with writing 1 to RFRST. 0 is written to RDF after data is read from SSIFRDR until the number of data bytes in SSIFRDR becomes less than the set receive trigger number. The direct memory access controller is activated by receive data full (RXI) interrupt, and data is read from SSIFRDR until the number of data bytes in SSIFRDR becomes less than the set receive trigger number. 1: Number of received data bytes in SSIFRDR is equal to or greater than the set receive trigger number. [Setting condition] Data of the number of bytes that is equal to or greater than the set receive trigger number is stored in SSIFRDR.*1 Note: *1Since SSIFRDR is an 8-stage FIFO register, the amount of data that can be read from it while RDF = 1 is the set receive trigger number of bytes at maximum. Continuing to read data from SSIFRDR after reading all the data will result in undefined data to be read. The number of data bytes in SSIFRDR is indicated in the RDC[3:0] bits in SSIFSR.

Note: * The bit can be read or written to. Writing 0 initializes the bit, but writing 1 is ignored.

35.3.7 Transmit FIFO Data Register (SSIFTDR)

SSIFTDR is a FIFO register consisting of eight stages of 32-bit registers for storing data to be serially transmitted. On detecting that the transmit data register (SSITDR) is empty, this module transfers the data for transmission written to SSIFTDR to SSITDR to start serial transmission, which can continue until SSIFTDR becomes empty. SSIFTDR can be written to by the CPU at any time.

Note that when SSIFTDR is full of transmit data (32 bytes), the next data cannot be written to it. If writing is attempted, it will be ignored and an overflow occurs.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Note: * Not writable while FIFO is receiving data.

35.3.8 Receive FIFO Data Register (SSIFRDR)

SSIFRDR is a FIFO register consisting of eight stages of 32-bit registers for storing serially received data. When four bytes of data have been received, this module transfers the received data in the receive data register (SSIRDR) to SSIFRDR to complete reception operation. Reception can continue until 32 bytes of data have been stored to SSIFRDR. SSIFRDR can be read but cannot be written to by the CPU. Note that when SSIFRDR is read while it does not hold received data, the value read is undefined and a reception underflow will occur.

After SSIFRDR becomes full of received data, the data received thereafter will be lost and a receive overflow occurs.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

35.3.9 TDM Mode Register (SSITDMR)

SSITDMR is a 32-bit readable/writable register that enables or disables muting of receive data in direct transfer, TDM mode, and WS continue mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	CONT	-	-	-	-	-	-	-	TDM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	—	0	R/W	Reserved Always write 0 to this bit.
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	CONT	0	R/W	WS Continue Mode 0: Disables WS continue mode. 1: Enables WS continue mode. Note: This bit can be set only in master mode (SCKD = 1 and SWSD = 1)
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TDM	0	R/W	TDM Mode 0: Disables TDM mode. 1: Enables TDM mode.

35.3.10 SSIF Clock Setting Register (SSIFCLKCFG)

SSIFCLKCFG is a 32-bit readable/writable register that selects the AUDIOφ clock and controls the SSIF clocks behaviour during debug break.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	PRMR0ISSA	PRMR0ISMA	PRMR0ISMS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	0	R	Reserved The read value is undefined. The write value should always be 0.
2	PRMR0ISSA	0	R/W	AUDIOφ clock selection 0: SSIACKINT input 1: SSIACKEXT input
1	PRMR0ISMA	0	R/W	Selects to continue or stop AUDIOφ clock during debugging. • When the EPC.SVSTOP bit is set to 0: Continues AUDIOφ clock regardless of the setting of this bit. • When the EPC.SVSTOP bit is set to 1: 0: Continues AUDIOφ clock. 1: Stops AUDIOφ clock.
0	PRMR0ISMS	0	R/W	Selects to continue or stop SSISCK clock during debugging. • When the EPC.SVSTOP bit is set to 0: Continues SSISCK clock regardless of the setting of this bit. • When the EPC.SVSTOP bit is set to 1: 0: Continues SSISCK clock. 1: Stops SSISCK clock.

35.4 Operation Description

35.4.1 Bus Format

This module can operate as a transmitter or a receiver and can be configured into many serial bus formats in either mode.

The bus format can be selected from one of the twelve major modes shown in the table below.

Table 35.9 Bus Format for SSIF Module

	TEN	REN	SCKD	SWSD	TDM	MUEN	IIEN	TOIEN	TUIEN	ROIEN	RUIEN	CONT	SWSP	DEL	PDTA	SDTA	SPDP	SCKP	SWL[2:0]	DWL[2:0]	CHNL[1:0]
Non-Compression Slave Receiver	0	1	0	0	0	Control Bits							Configuration Bits								
Non-Compression Slave Transmitter	1	0	0	0	0																
Non-Compression Slave Transceiver*1	1	1	0	0	0																
Non-Compression Master Receiver	0	1	1	1	0																
Non-Compression Master Transmitter	1	0	1	1	0																
Non-Compression Master Transceiver*1	1	1	1	1	0																
TDM Slave Receiver	0	1	0	0	1								0	Configuration Bits							
TDM Slave Transmitter	1	0	0	0	1								0								
TDM Slave Transceiver*1	1	1	0	0	1								0								
TDM Master Receiver	0	1	1	1	1								0								
TDM Master Transmitter	1	0	1	1	1								0								
TDM Master Transceiver*1	1	1	1	1	1								0								

Note 1. Set the TEN and REN bits to 1 at the same time when using transceiver mode.

35.4.2 Non-Compressed Modes

The non-compressed modes support all serial audio streams split into channels. It supports the I^2S compatible format as well as many more variants on these modes.

(1) Slave Receiver

This mode allows the module to receive serial data from another device. The clock and word select signal used for the serial data stream is also supplied from an external device. If these signals do not conform to the format specified in the configuration fields of this module, operation is not guaranteed.

(2) Slave Transmitter

This mode allows the module to transmit serial data to another device. The clock and word select signal used for the serial data stream is also supplied from an external device. If these signals do not conform to the format specified in the configuration fields of this module, operation is not guaranteed.

(3) Slave Transceiver

This mode allows serial data transmission and reception between this module and another device. The clock and word select signal used for the serial data stream is also supplied from an external device. If these signals do not conform to the format specified in the configuration fields of this module, operation is not guaranteed.

(4) Master Receiver

This mode allows the module to receive serial data from another device. The clock and word select signals are internally derived from the oversampling clock. The format of these signals is defined in the configuration fields of this module. If the incoming data from another device does not follow the configured format, operation is not guaranteed.

(5) Master Transmitter

This mode allows the module to transmit serial data to another device. The clock and word select signals are internally derived from the oversampling clock. The format of these signals is defined in the configuration fields of this module.

(6) Master Transceiver

This mode allows serial data transmission and reception between this module and another device. The clock and word select signals are internally derived from the oversampling clock. The format of these signals is defined in the configuration fields of this module.

(7) Operation Setting Related to Word Length

All bits related to the SSICR's word length are valid in non-compressed modes. There are many configurations this module supports, but some of the combinations are shown below for the I^2S compatible format, MSB-first and left-aligned format, and MSB-first and right-aligned format.

- I^2S Compatible Format

Figure 35.2 and **Figure 35.3** show the I^2S compatible formats without and with padding, respectively. Padding occurs when the data word length is smaller than the system word length.

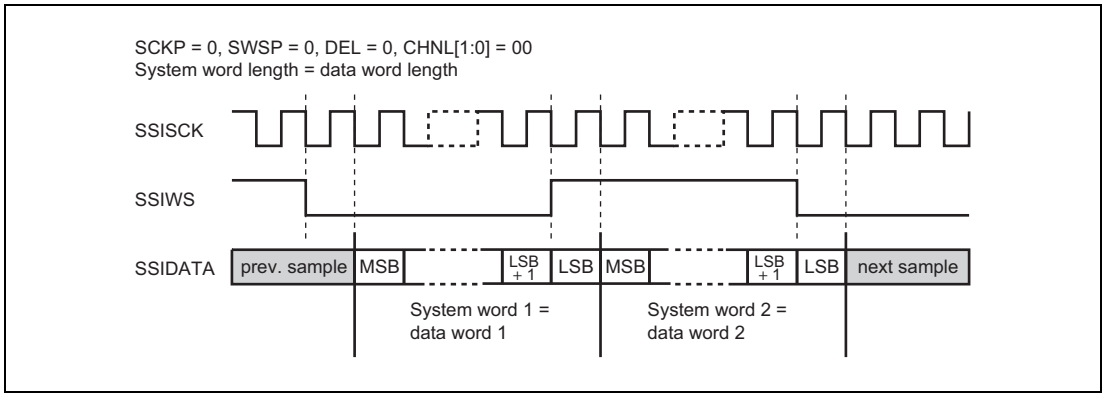

Figure 35.2 I^2S Compatible Format (without Padding)

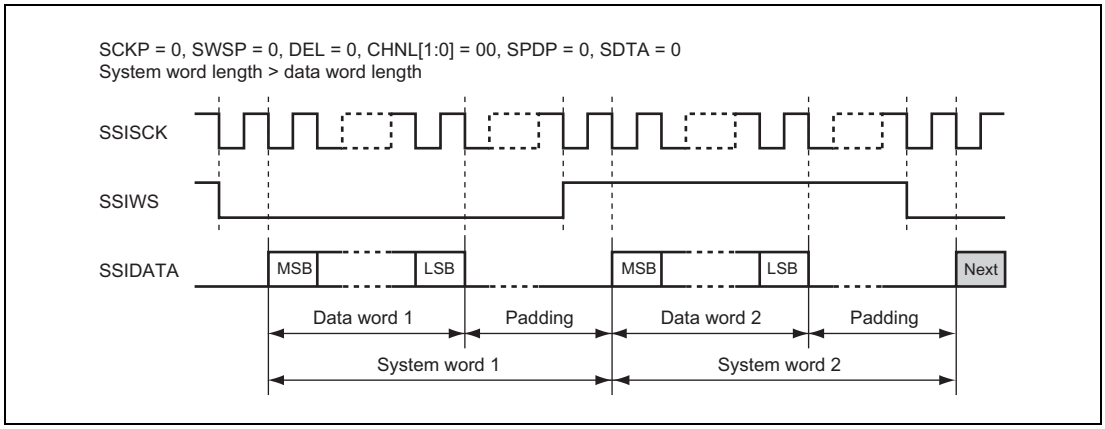

Figure 35.3 I2S Compatible Format (with Padding)

Figure 35.4 shows the MSB-first and left-aligned format and **Figure 35.5** shows the MSB-first and right-aligned format.

- MSB-first and Left-aligned Format

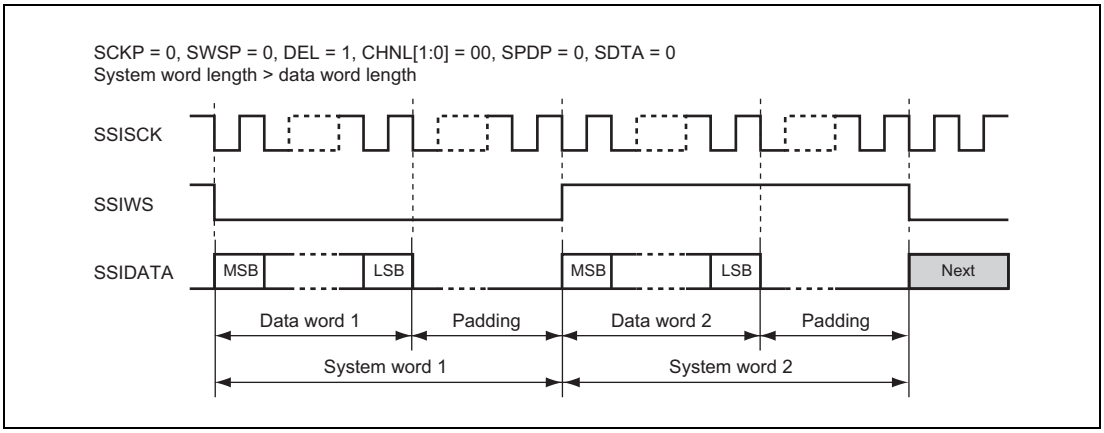

Figure 35.4 MSB-first and Left-aligned Format (Transmitted and Received in the Order of Serial Data and Padding Bits)

- MSB-first and Right-aligned Format

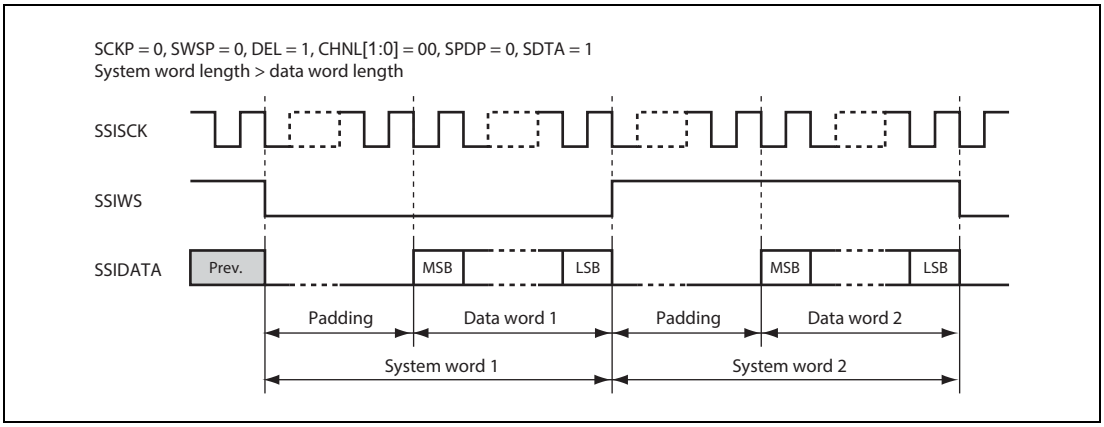

Figure 35.5 MSB-first and Right-aligned Format (Transmitted and Received in the Order of Padding Bits and Serial Data)

(8) Multi-channel Formats

Some devices extend the definition of the I^2S bus specification and allow more than 2 channels to be transferred within two system words.

This module supports the transfer of 4, 6, and 8 channels by using the CHNL[1:0], SWL[2:0] and DWL[2:0] bits only when the system word length (SWL[2:0]) is greater than or equal to the data word length (DWL[2:0]) multiplied by channels (CHNL[1:0]).

Table 35.10 shows the number of padding bits for each of the valid setting. If setting is not valid, "—" is indicated instead of a number.

Table 35.10 The Number of Padding Bits for Each Valid Setting

Padding Bits per System Word			DWL[2:0]	000	001	010	011	100	101	110
CHNL [1:0]	Decoded Channels per System Word	SWL [2:0]	Decoded Word Length	8	16	18	20	22	24	32
00	1	000	8	0	—	—	—	—	—	—
		001	16	8	0	—	—	—	—	—
		010	24	16	8	6	4	2	0	—
		011	32	24	16	14	12	10	8	0
		100	48	40	32	30	28	26	24	16
		101	64	56	48	46	44	42	40	32
		110	128	120	112	110	108	106	104	96
		111	256	248	240	238	236	234	232	224

When this module acts as a transmitter, each word written to SSITDR is transmitted to the serial audio bus in the order they are written. When this module acts as a receiver, each word received by the serial audio bus is read from the SSIRDR register in the order they are received.

The figures below show how the data on 4, 6, and 8 channels are transferred to the serial audio bus. Note that there are no padding bits in the first example (**Figure 35.6**), the second example (**Figure 35.7**) is left-aligned and the third (**Figure 35.8**) is right-aligned. The other conditions in these examples have been selected arbitrarily.

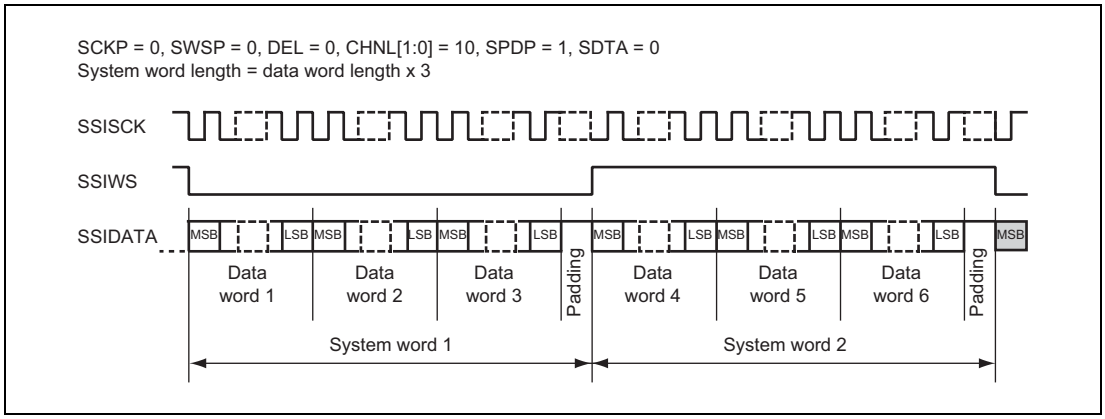

Figure 35.7 Multi-Channel Format (6 Channels with High Padding)

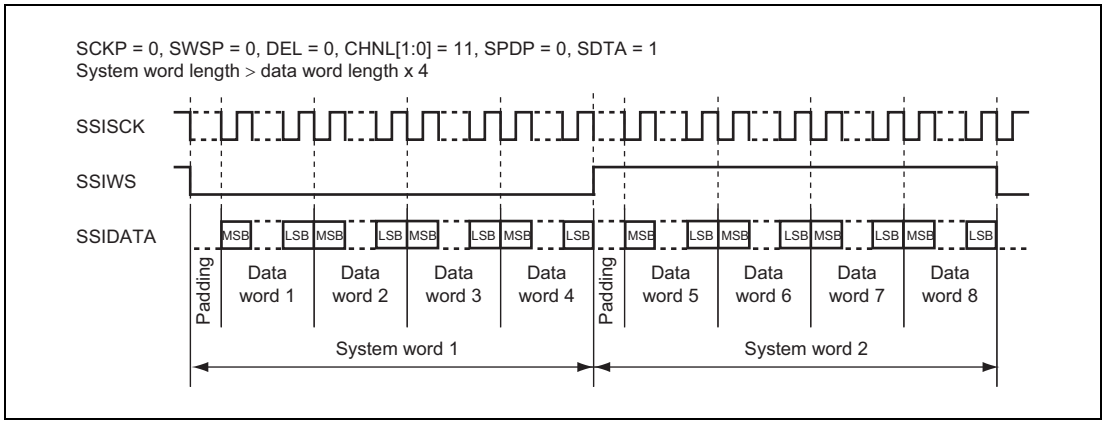

Figure 35.8 Multi-Channel Format (8 Channels; Transmitting and Receiving in the Order of Padding Bits and Serial Data ; with Padding)

(9) Operation Format Configuration Bits

Several more configuration bits in non-compressed mode are shown below. These bits are not mutually exclusive, but some combinations may not be useful.

These configuration bits are described below with reference to the basic sample format in the figure below.

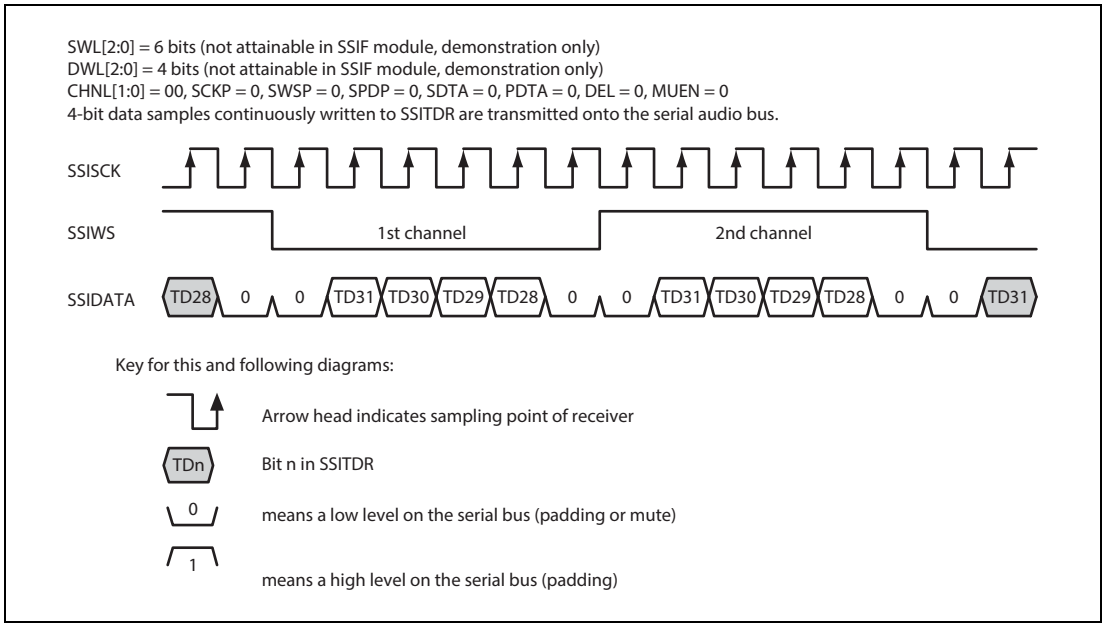

Figure 35.9 Basic Sample Format (Transmit Mode with Example System/Data Word Length)

The figure above uses a system word length of 6 bits and a data word length of 4 bits. These settings are not possible with this module but are used as an example only for clarification of the other configuration bits.

35.4.3 TDM Mode

TDM mode is provided to enable connection to multi-channel devices for TDM. This mode can be set using the TDM bit in the TDM mode register (SSITDMR). In this mode, the SSIWS signal is high only for system word 1 period and low for the other periods. The pulse produced on the SSIWS signal is defined as SYNC pulse. Note that the SYNC pulse always has the positive polarity (high only for system word 1 period).

The figures below show the TDM formats without and with padding, respectively.

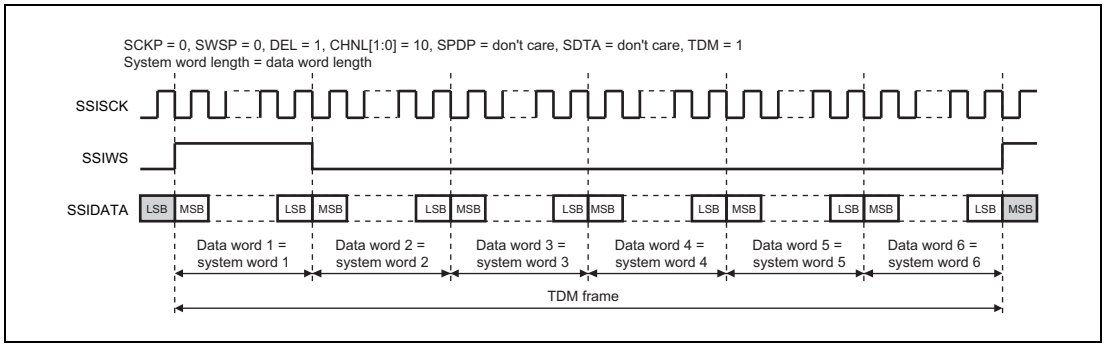

Figure 35.18 TDM Format (6 system words, no padding)

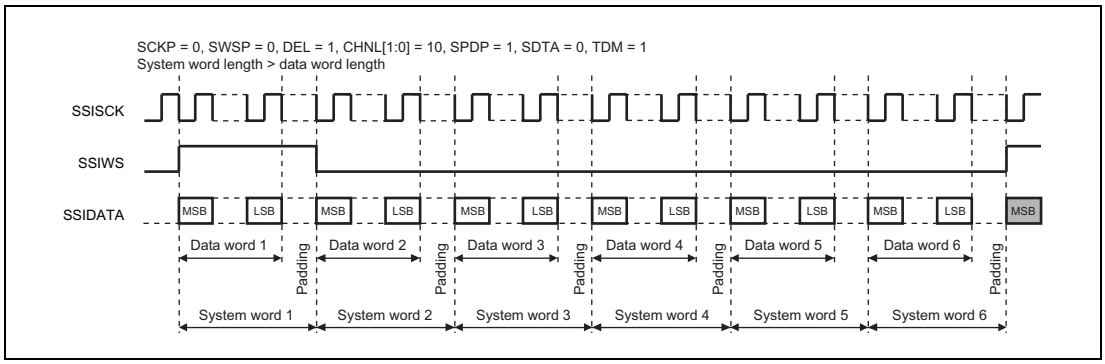

Figure 35.19 TDM Format (6 system words, with padding)

35.4.4 WS Continue Mode

In WS continue mode, the SSIWS signal continues to be output irrespective whether data transfer is enabled or disabled. This mode can be set using the CONT bit in the TDM mode register (SSITDMR). With this mode enabled, the SSIWS signal does not stop but continues operating even if TEN and REN bits in the control register (SSICR) are both set to 0 (transfer disabled). In case transfer is disabled while the MUEN bit in SSICR is set to 0, the SSITxD output keeps its last output data value until transfer is allowed again. With this mode disabled, the SSIWS signal stops if TEN and REN bits are both set to 0.

The figures below show the operations with WS continue mode enabled and disabled, respectively.

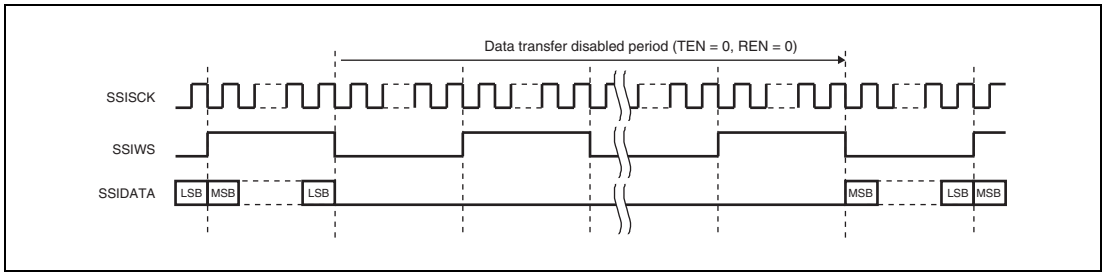

Figure 35.20 WS Continue Mode Enabled

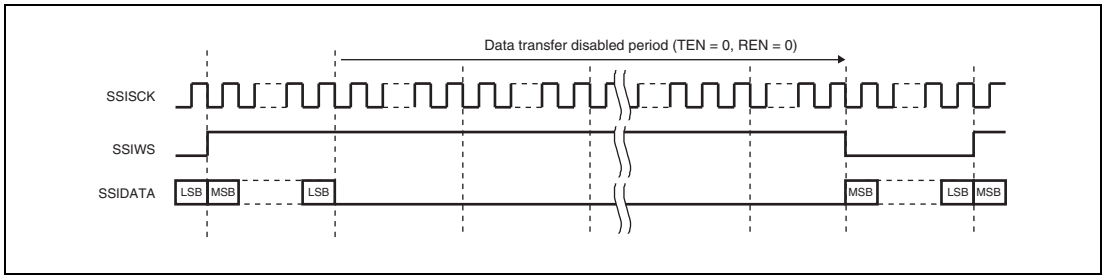

Figure 35.21 WS Continue Mode Disabled

35.4.5 Operation Modes

There are three modes of operation: configuration, enabled and disabled. The figure below shows how the module enters each of these modes.

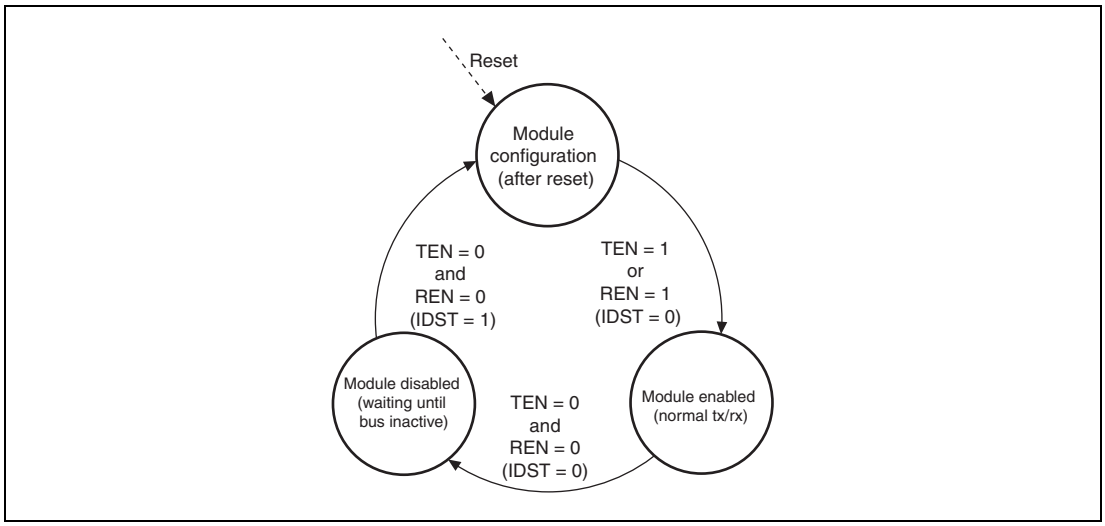

Figure 35.22 Operation Modes

(1) Configuration Mode

This mode is entered after the module is released from reset. All required configuration fields in the control register should be defined in this mode, before this module is enabled by setting the TEN and REN bits.

Setting the TEN and REN bits causes the module to enter the module enabled mode.

(2) Module Enabled Mode

Operation of the module in this mode is dependent on the operation mode selected. For details, refer to Section 35.4.6, Transmit Operation, and Section 35.4.7, Receive Operation, below.

35.4.6 Transmit Operation

Transmission can be controlled either by DMA transfer or interrupt.

DMA control is preferred to reduce the processor load. In DMA control mode, the processor will only receive interrupts if there is an underflow or overflow of data or if the DMA transfer has been completed.

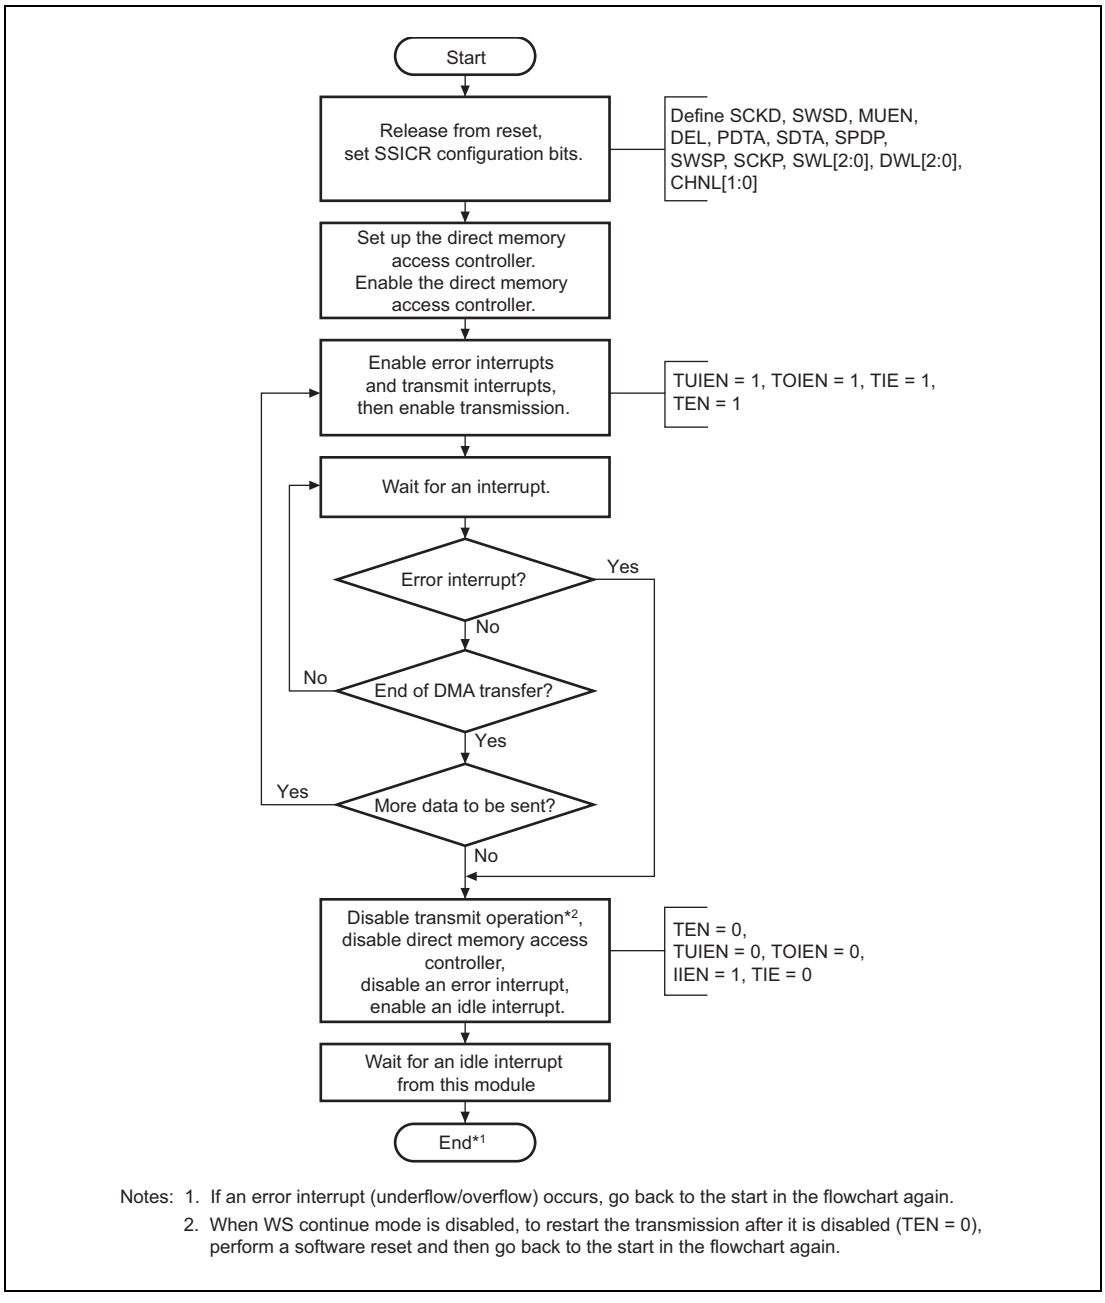
The alternative method is using the interrupts that this module generates to supply data as required.

When disabling this module, the clock* must be kept supplied to this module until the IIRQ bit indicates that the module is in the idle state.

Figure 35.23 shows the transmit operation in DMA control mode, and **Figure 35.24** shows the transmit operation in interrupt control mode.

Note: * Input clock from the SSISCK pin when SCKD = 0.
Oversampling clock when SCKD = 1.

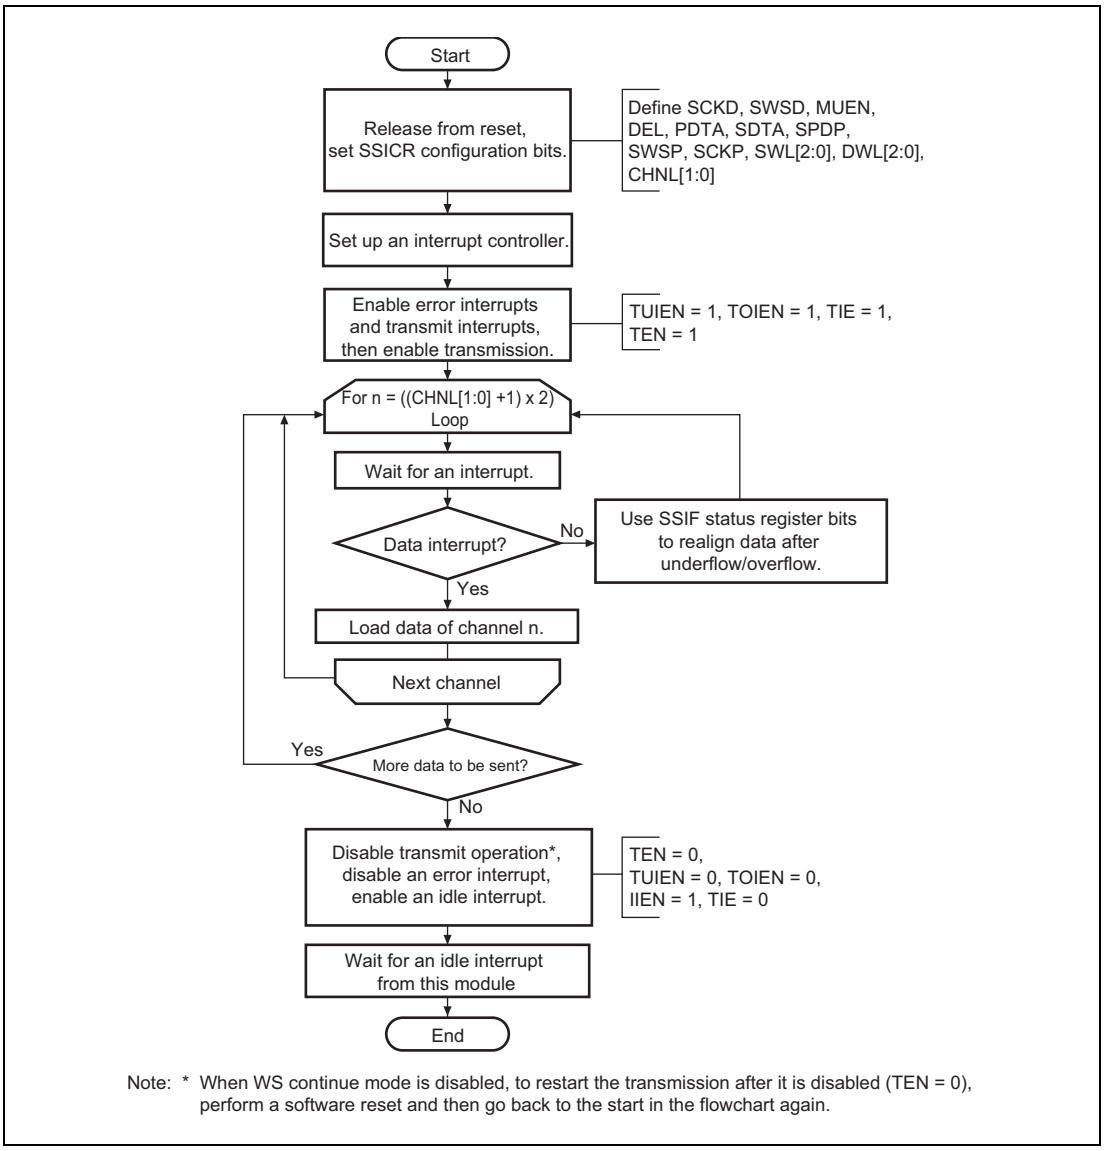
(1) Transmission Using Direct Memory Access Controller



Notes: 1. If an error interrupt (underflow/overflow) occurs, go back to the start in the flowchart again.
2. When WS continue mode is disabled, to restart the transmission after it is disabled (TEN = 0), perform a software reset and then go back to the start in the flowchart again.

Figure 35.23 Transmission Using Direct Memory Access Controller

(2) Transmission Using Interrupt-Driven Data Flow Control



Note: * When WS continue mode is disabled, to restart the transmission after it is disabled (TEN = 0), perform a software reset and then go back to the start in the flowchart again.

Figure 35.24 Transmission Using Interrupt-Driven Data Flow Control

35.4.7 Receive Operation

Like transmission, reception can be controlled either by DMA transfer or interrupt.

The figures below show the flow of operation.

When disabling this module, the clock* must be kept supplied to this module until the IIRQ bit indicates that the module is in the idle state.

Note: * Input clock from the SSISCK pin when SCKD = 0.
Oversampling clock when SCKD = 1.

(1) Reception Using Direct Memory Access Controller

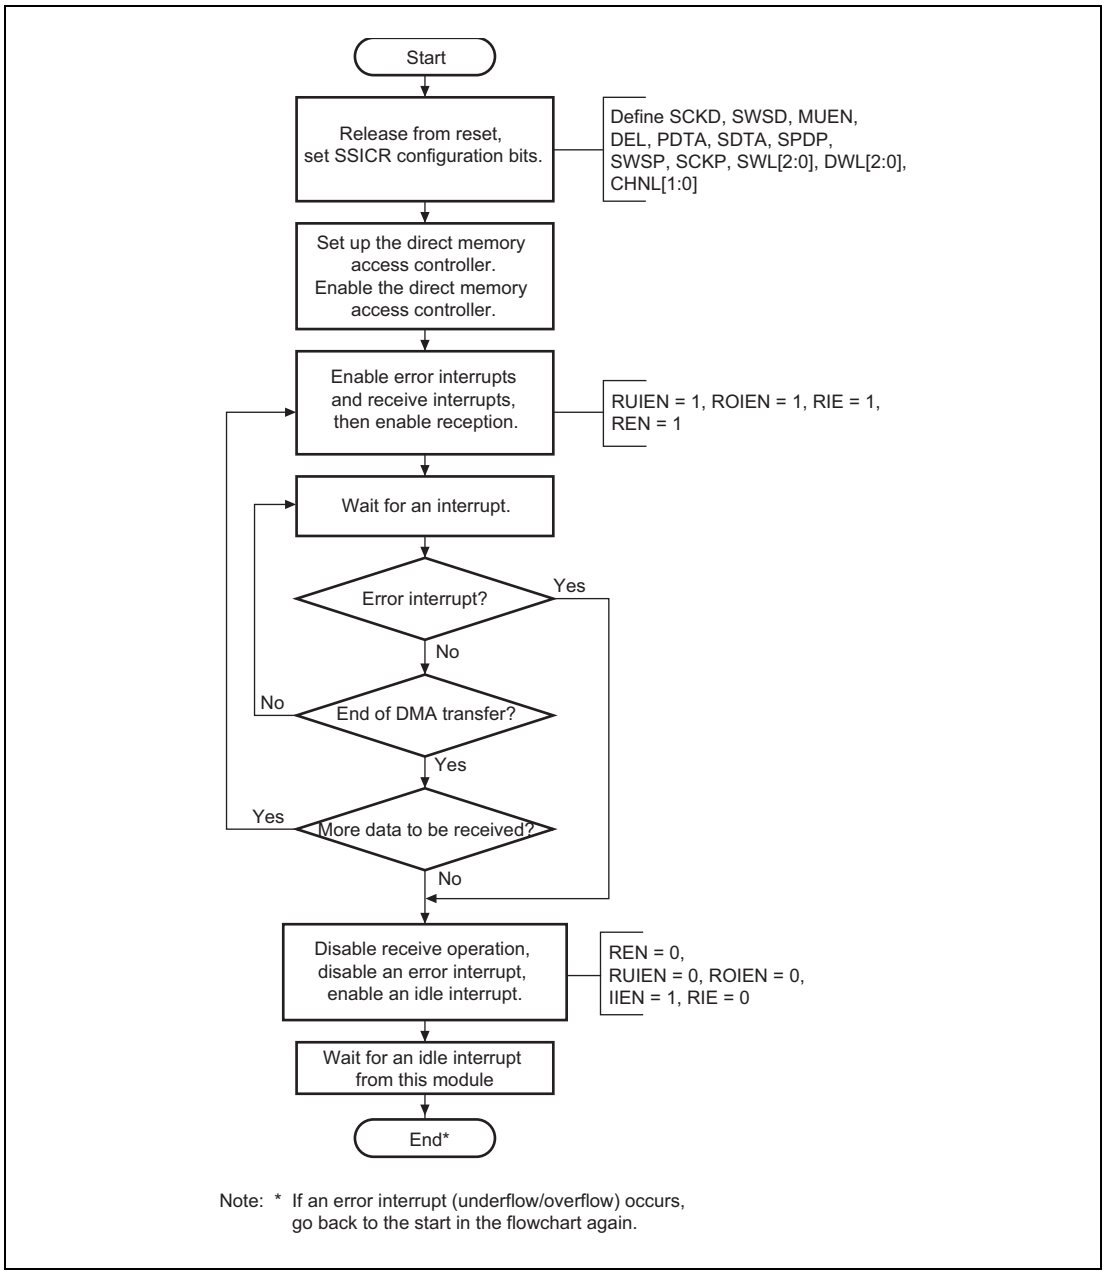


Figure 35.25 Reception Using Direct Memory Access Controller

(2) Reception Using Interrupt-Driven Data Flow Control

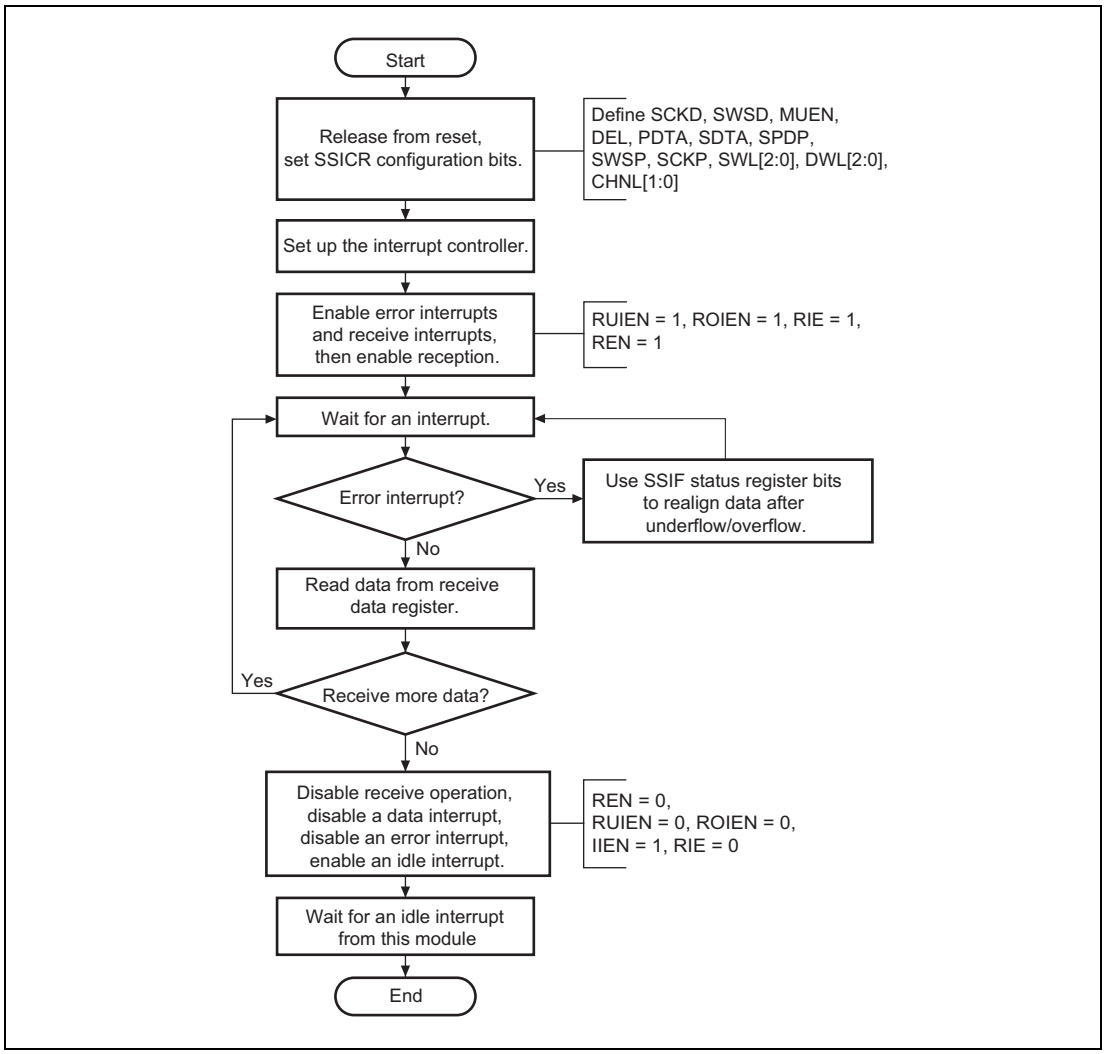

Figure 35.26 Reception Using Interrupt-Driven Data Flow Control

When an underflow or overflow error condition has matched, this module can be recovered to the status before underflow or overflow condition match by using the TCHNO[1:0] and TSWNO bits in transmission and the RCHNO[1:0] and RSWNO bits in reception. When an underflow or overflow occurs, the CPU can read the channel number and system word number to determine what point the serial audio stream has reached. In the transmitter case, the CPU can skip the data transmission until the SSIF module finds the data to transmit next, and so resynchronize with the audio data stream. In the receiver case the host CPU can store null data to make the number of receive data items consistent until it is ready to store the sample data that this module is indicating will be received next, and so resynchronize with the audio data stream.

35.4.8 Serial Bit Clock Control

This function is used to control and select the clock that is used for the serial bus interface.

If the serial bit clock direction is set to input (SCKD = 0), this module is in clock slave mode and the shift register uses the bit clock that was input to the SSISCK pin.

If the serial bit clock direction is set to output (SCKD = 1), this module is in clock master mode, and the shift register uses the oversampling clock or a divided oversampling clock as the bit clock. The oversampling clock is divided by the ratio specified by the serial oversampling clock division ratio bits (CKDV[3:0]) in SSICR for use as the bit clock by the shift register.

In either case above, the output of the SSISCK pin is the same as the bit clock.

35.5 Usage Notes

35.5.1 Limitations from Underflow or Overflow during DMA Operation

If an underflow or overflow occurs while the DMA is in operation, the SSIF module should be restarted. The transmit and receive buffers in the SSIF consists of 32-bit registers that share the L and R channels. Therefore, data to be transmitted and received at the L channel may sometimes be transmitted and received at the R channel if an underflow or overflow occurs, for example, under the following condition: the control register (SSICR) has a 32-bit setting for both data word length (DWL2 to DWL0) and system word length (SWL2 to SWL0).

If an error occurrence is confirmed with four types of error interrupts (transmit underflow, transmit overflow, receive underflow, and receive overflow) or the corresponding error status flags (the bits TUIRQ, TOIRQ, RUIRQ, and ROIRQ in SSISR), write 0 to the TEN or REN bit in SSICR to disable DMA transfer requests in this module, thus stopping the operation. (In this case, the direct memory access controller setting should also be stopped.) After this, write 0 to the error status flag bit to clear the error status, set the direct memory access controller again and restart the transfer.

35.5.2 Note on Changing Mode from Master Transceiver to Master Receiver

If a transmit underflow occurs in master transceiver mode while WS continue mode is disabled (SSITDMR.CONT = 0) and the TEN bit in SSICR is set to 0 in order to disable transmit operation, SSIWS output stops. In order to receive seamlessly after changing mode to master receiver mode, write dummy data to SSIFTDR to suppress transmit underflow.

35.5.3 Limits on TDM mode and WS Continue Mode

If TDM mode or WS continue mode setting is changed, the operation of the SSISCK and SSIWS signals immediately after switching are not guaranteed. If it affects the device to be connected, do not change the setting dynamically.

Section 36 LCD Bus Interface (LCBI)

This section contains a generic description of the LCD Bus Interface.

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.
The subsequent sections describe the features that apply to all implementations.

36.1 Overview of the RH850/D1L/D1M LCD Bus Interfaces

36.1.1 Units

This microcontroller has the following number of units of the LCD Bus Interface.

Table 36.1 Units

LCD Bus I/F (LCBI)	D1L1	D1L2(H) D1M1 D1M1-V2	D1M1H D1M1A	D1M2(H)
Units	1	1	0	0
Names	LCBI0	LCBI0	–	–

Unit index n

Throughout this section, the individual units of the LCD Bus Interfaces are identified by the index “n” (n = 0), for example LCBInOPMODE for the LCD Bus Interface n operation mode control register.

36.1.2 Register addresses

All LCD Bus Interface register addresses are given as address offsets from the individual base addresses <LCBIn_base>.
The <LCBIn_base> addresses of each LCBIn are listed in the following table:

Table 36.2 Register base addresses <LCBIn_base>

LCBIn unit	<LCBIn_base> address
LCBI0	FFFB 0000_H

36.1.3 Clock supply

All LCD Bus Interfaces provide one clock input.

Table 36.3 Clock supply

LCBIn unit	LCBIn clock	Connected to
LCBI0	PCLK	Clock Controller C_ISO_LCBI

36.1.4 Interrupts and DMA

The LCD Bus Interfaces can generate the following interrupt and DMA requests:

Table 36.4 LCBIn interrupt and DMA requests
