36.1.5 Reset sources

The LCD Bus Interfaces and their registers are initialized by the following reset signal:

Table 36.5 Reset sources

LCBIn unit	Reset signal
LCBI0	• Reset Controller SYSRES • Reset Controller LCBI0RES • reset upon wake-up from DEEPSTOP mode

CAUTION

By default the LCBI0RES reset is active.
Thus before accessing this module this reset must be released via the MRSTC register of the Reset Controller. Refer to Section 9, Reset Controller for details.

36.1.6 I/O signals

The following table shows the I/O signals of the LCD Bus Interfaces.

Table 36.6 I/O signals connections

LCBIn signal	Function	Connected to
LCBI0:		
LCDDATA[17:0]	Data I/O	Port LCBI0D[17:0]
$\overline{RD}$/E/PixelCLK	• Non-TFT operation mode: – RAM mode: Read strobe $\overline{RD}$ – E-Type mode: E strobe E • TFT operation mode: Pixel clock	Port $\overline{LCBI0RDE}$
$\overline{WR}$/RW	• RAM mode: Write strobe $\overline{WR}$ • E-Type mode: Read/Write strobe RW	Port $\overline{LCBI0WRRW}$
A0/DE	• Non-TFT operation mode: Data/control selection A0 • TFT operation mode: Data enable DE	Port LCBI0A0DE
$\overline{CS}$	Chip select	Port $\overline{LCBI0CS}$
$\overline{HSYNC}$	TFT horizontal synchronization	Port $\overline{LCBI0HSYNC}$
$\overline{VSYNC}$	TFT vertical synchronization	Port $\overline{LCBI0VSYNC}$

36.2 Functional Overview

Features summary

The LCD Bus Interface has the following features:

- Support of TFT and non-TFT LCDs
- Support of color LCDs using a color lookup table (CLUT)
  - CLUT RAM size: 256 x 18 bits
  - 16 color and 256 color palette
- Byte/halfword/word read and write operations
- DMA support for read and write operations
- 8 / 9 / 16 / 18 bit LCD bus width
  Data can be shifted so that it is accessed using different bits of the LCD bus (e.g. 8 bits can be written to bit position [7:0], [8:1], [9:2], or [17:10])
- Buffering of write data to avoid wait states on CPU/DMA access
  Interrupts indicate buffer fill state.
- Interrupt generation when LCD bus reading transfer is complete (read data ready interrupt)
- Flags that indicate the bus cycle state

The LCD Bus Interface has the following additional features for non-TFT LCDs:

- Support of two different control signal modes:
  - RAM mode with separate read and write strobe
  - E-Type mode with read/write signal and data strobe “E”
- Programmable transfer speed (100 kHz … 10 MHz) through
  - Selectable prescaler for operation clock
  - Programmable transfer time
  - Programmable wait states
  - Selectable fast bus cycle mode
- LCD bus timing is generated by hardware using A0 and $\overline{CS}$ control lines

The LCD Bus Interface has the following additional features for TFT LCDs:

- $\overline{HSYNC}$ and $\overline{VSYNC}$ signal generation
- Programmable pixel clock
- Programmable video synchronization timing

The following block diagram shows the main components of the LCD Bus Interface.

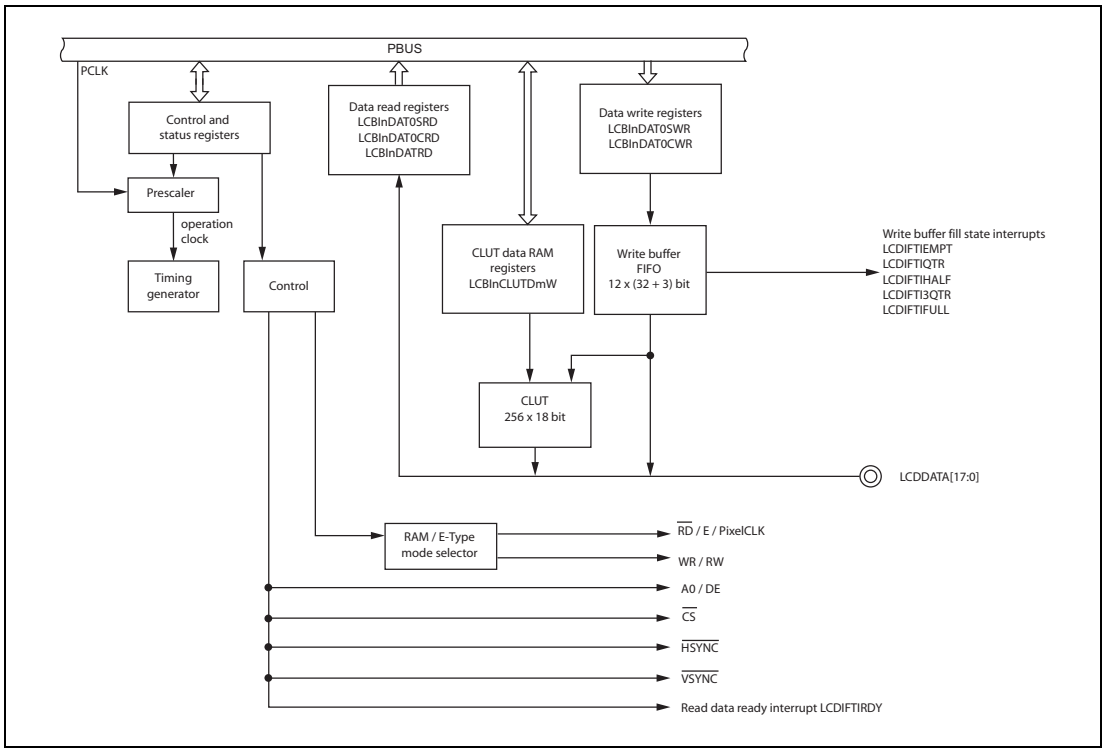

Figure 36.1 Block diagram of the LCD Bus Interface

36.3 Functional Description

The LCD Bus Interface connects the microcontroller to an external LCD controller. It provides an asynchronous 18-bit parallel data bus to send data to, and query data from, the LCD controller. Control lines specify the read/write timing and the transfer direction.

Non-TFT and TFT displays

The LCD Bus Interface supports both TFT and non-TFT LCDs using the corresponding operation mode, control registers, and control lines. The LCD bus has two operation modes that are selected by bits LCBInOPMODE.LCBInOPMODE[1:0].

For details on the operation modes, refer to

- Section 36.3.1, Non-TFT operation mode
- Section 36.3.2, TFT operation mode

Color display

To support color displays, the LCD Bus Interface supports the conversion of write data using a Color Lookup Table (CLUT). CLUT usage is possible in both operation modes.

For details on CLUT usage, refer to Section 36.3.3, Color usage.

CPU or DMA

Data can be read from, and written to, the LCD Bus Interface using the DMA Controller or by directly accessing the interface from the CPU.

Timing configuration

The timing of the LCD bus signals is determined by register settings.

Bus width

The LCD Bus Interface is 18 bits wide. It supports LCD controllers requiring 8-bit, 9-bit, 16-bit, or 18-bit data. In order to improve performance, the interface is equipped with 32-bit registers that allow the CPU or DMA to write and read data of 8-bit, 16-bit or 32-bit of payload size. The interface automatically generates an appropriate number of consecutive 8-bit, 9-bit, 16-bit, or 18-bit accesses on the LCD bus.

Write buffer

The LCD Bus Interface has an internal bit write buffer (FIFO) that allows the next data to be written to the data write registers while a transfer on the LCD bus is in progress.

The result of a read operation is directly available in the data read registers.

Operation clock

The operation clock of the LCD Bus Interface is derived from PCLK by a prescaler specified in the LCBInCKSEL register.

For TFT displays, the pixel clock is derived from the operation clock.

36.3.1 Non-TFT operation mode

Access modes and control signals

In non-TFT operation mode (LCBInOPMODE.LCBInOPMODE[1:0] = 01_B), the LCD Bus Interface can access an external LCD controller in two different access modes. The mode is selected by bit LCBInBCYCT.LCBInBCYTYPE.

- RAM mode (LCBInBCYCT.LCBInBCYTYPE = 0)

  The control signals $\overline{WR}$ and $\overline{RD}$ are used to control the external component.

- E-Type mode (LCBInBCYCT.LCBInBCYTYPE = 1)

  The control signals RW and E are used to control the external component.

36.3.1.1 Access types

The following access types are possible:

- Read or write access
- Display data or control data
- Byte, halfword, or word access

For every access type, a dedicated data register is provided. The name of the data register specifies the access type. For details on the data registers, refer to Section 36.4.5, LCD Bus Interface data registers details.

Write operation

Write access to the LCD bus is performed by writing data to one of the data write registers. The data is transferred to the write buffer (FIFO). If there is a transfer in progress, the new data is held in the write buffer. As soon as the current transfer has completed, the new data is fetched from the write buffer and transferred to the LCD controller.

Display data or control data can be written. Different data write registers and the A0 control line are used to distinguish the two data types.

- Data written to LCBInDAT0SWR registers is display data.

  It is converted by the CLUT, if enabled (LCBInTCONTROL.LCBInDTCC = 1), and written to the LCD bus.
  While writing display data, the A0 control line is active according to the settings in the output level register LCBInOUTLEV.

- Data written to LCBInDAT0CWR registers is control data.

  It is directly written to the LCD bus. The CLUT is not considered. The setting of control bit LCBInTCONTROL.LCBInDTCC is ignored.
  While writing control data, the A0 control line is inactive according to the settings in the output level register LCBInOUTLEV.

Depending on the LCD bus width, a single write access can result in one or more write accesses on the LCD bus.

For example, writing the data register LCBInDAT0SWRH writes 16 bits of display data to the LCD bus. If the LCD bus width is 8 bit, 2 consecutive write accesses are performed.

Read operation

When new data is available to read, the read data ready interrupt request LCDIFTIRDY is generated.

When the CPU or the DMA reads one of the data read registers, the read operation on the LCD Bus Interface is started.

The value read from the register is the data from the *previous* transfer. Therefore, an initial dummy read operation is required to update the register.

As soon as the data of the current transfer is available in the data read registers, the read data ready interrupt request LCDIFTIRDY is generated. The data can be retrieved with the next read operation:

- If control data shall be read, read the LCBInDAT0CRD register of the desired size.
- If display data shall be read, read the LCBInDAT0SRD register of the desired size.

Depending on the LCD bus width, a single read access can result in one or more read accesses on the LCD bus.

For example, reading the display data register LCBInDAT0SRDW reads 32 bits of new display data from the LCD bus. If the LCD bus width is 8 bit, 4 consecutive read accesses are performed.

When reading, the CLUT is not considered. The setting of control bit LCBInTCONTROL.LCBInDTCC is ignored.

During the read operation, similarly to the write operation, the A0 control line indicates whether the requested read data is display data or control data.

Read operation without initiating a bus transfer

Data can be read from the LCBInDATRDW data read register without initiating a new read transfer via the LCD Bus Interface.

The read access to the LCBInDATRDW data read register is useful when previous read accesses to any of the data read registers have been performed and only the most-recently transferred data should be read without starting a new LCD bus transfer.

CAUTION

When a read access is triggered (data read register is read), the old data of the data read register is overwritten. To avoid loss of data, the application must handle read accesses properly.

Priorities and pending data

Only one read access can be pending. There is no read buffer.

Up to 12 write accesses can be pending in the write buffer.

If a read transfer is initiated while another read transfer is already pending, the new read transfer is ignored. The status flag LCBInSTATUS.LCBInTCRPG indicates whether a read transfer is pending or not.

If both read and write transfers are pending, the write transfers have higher priority: write transfer is performed before read transfer.

36.3.1.2 Transfer speed

The LCD Bus Interface provides programmable transfer speeds from approximately 100 kHz to 10 MHz with a minimum of 20 steps. The value is specified using the following control registers:

- LCBInCKSEL
  This register sets the operation clock from PCLK, PCLK/2, PCLK/4, ..., PCLK/64.
- LCBInBCYC
  This register defines the number of operation clock cycles for one bus cycle. Wait states for different states within one bus cycle can be specified separately. For example, the number of operation clock cycles for activating the control signals.
  Note that the number of clock cycles equals the LCBInBCYC register bits value +1.
- LCBInOPMODE
  To improve performance, fast bus cycle mode can be activated by bit LCBInOPMODE.LCBInOPMFAST.
  In fast bus cycle mode the LCBInBCYC register timing settings LCBInTIAD[3:0], LCBInTIDW[3:0], LCBInTMAD[3:0] and LCBInTMDW[3:0] are taken as 0.

After reset, the slowest clock is selected as default.

The transfer speed depends on RAM or E-Type, slow or fast bus cycle mode and the timing settings in the LCBInBCYC register:

(1) RAM mode (LCBInBCYCT.LCBInBCYTYPE = 0)

- Slow bus cycle RAM *read* mode (LCBInOPMODE.LCBInOPMFAST = 0)

  Transfer speed = TIAD + TIDW + TIRD + TIDZ
  = (LCBInTIAD[3:0] + 1) + (LCBInTIDW[3:0] + 1) + (LCBInTIRD[7:0] + 1) + (LCBInTIDZ[3:0] + 1)

- Slow bus cycle RAM *write* mode (LCBInOPMODE.LCBInOPMFAST = 0)

  Transfer speed = TIAD + TIDW + TIWR + TIDZ
  = (LCBInTIAD[3:0] + 1) + (LCBInTIDW[3:0] + 1) + (LCBInTIWR[7:0] + 1) + (LCBInTIDZ[3:0] + 1)

- Fast bus cycle RAM *read* mode (LCBInOPMODE.LCBInOPMFAST = 1)

  Transfer speed = TIRD + TIDZ
  = (LCBInTIRD[7:0] + 1) + (LCBInTIDZ[3:0] + 1)

- Fast bus cycle RAM *write* mode (LCBInOPMODE.LCBInOPMFAST = 1)

  Transfer speed = TIWR + TIDZ
  = (LCBInTIWR[7:0] + 1) + (LCBInTIDZ[3:0] + 1)

(2) E-Type mode (LCBInBCYCT.LCBInBCYTYPE = 1)

- Slow bus cycle E-Type mode (LCBInOPMODE.LCBInOPMFAST = 0)

$$\begin{aligned}\text{Transfer speed} &= \text{TMAD} + \text{TMDW} + \text{TMED} + \text{TMDZ}\\ &= (\text{LCBInTMAD}[3:0] + 1) + (\text{LCBInTMDW}[3:0] + 1) + (\text{LCBInTMED}[7:0] + 1) + (\text{LCBInTMDZ}[3:0] + 1)\end{aligned}$$

- Fast bus cycle E-Type mode (LCBInOPMODE.LCBInOPMFAST = 1)

$$\begin{aligned}\text{Transfer speed} &= \text{TMED} + \text{TMDZ}\\ &= (\text{LCBInTMED}[7:0] + 1) + (\text{LCBInTMDZ}[3:0] + 1)\end{aligned}$$

36.3.1.3 General timing

Every bus cycle is split into bus cycle states. The bus cycle states that are valid for a bus cycle depend on the selected access mode (RAM or E-Type) and the transfer direction (read or write). The duration of every bus cycle state can be configured separately.

The following timing diagrams show the general timing of a bus cycle in RAM and E-Type mode for both read and write operation.

CAUTION

If the FIFO of LCBI runs empty, the $\overline{\text{CS}}$ signal returns to its inactive state after the current bus cycle. Especially after feeding the first data into the LCBI, this may happen already after the first LCD bus cycle.

(1) General timing in RAM mode

The data transmission in RAM mode is split into the following states:

Table 36.7 Data transmission states in RAM mode

State	Control bit	State number*1
No activity between two transmissions	–	0
Waiting for address	LCBInTIAD[3:0]	1
Activating read/write strobe	LCBInTIDW[3:0]	2
Width of the read strobe	LCBInTIRD[7:0]	3
End of the bus cycle	LCBInTIDZ[3:0]	4
Width of the write strobe	LCBInTIWR[7:0]	5

Note 1. The state number refers to the state line in the following RAM mode diagrams.

The following figure shows the general timing of a *read* operation in RAM mode.

Control signals level

The following figures assume following settings of the control signals levels:

- LCBInOUTLEV.LCBInTLCS = 0: $\overline{\text{CS}}$ is active-low
- LCBInOUTLEV.LCBInTLRDE = 0: $\overline{\text{RD}}$ is active-low
- LCBInOUTLEV.LCBInTLWR = 0: $\overline{\text{WR}}$ is active-low
- LCBInOUTLEV.LCBInTLA0 is set as required to indicate transmission of control or data information

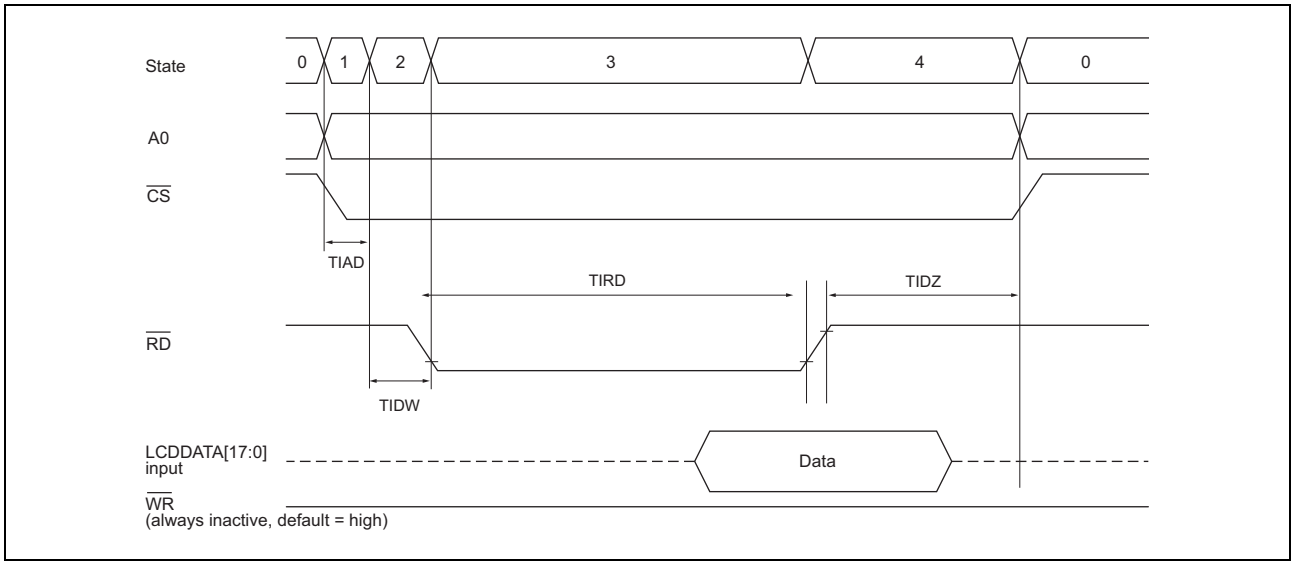

Figure 36.2 Timing diagram of a read operation in RAM mode

$\overline{CS}$ is active while the LCD Bus Interface is active. When the read strobe $\overline{RD}$ is active, data is read from the LCD bus. The write strobe $\overline{WR}$ is inactive.

The following figure shows the general timing of a *write* operation in RAM mode.

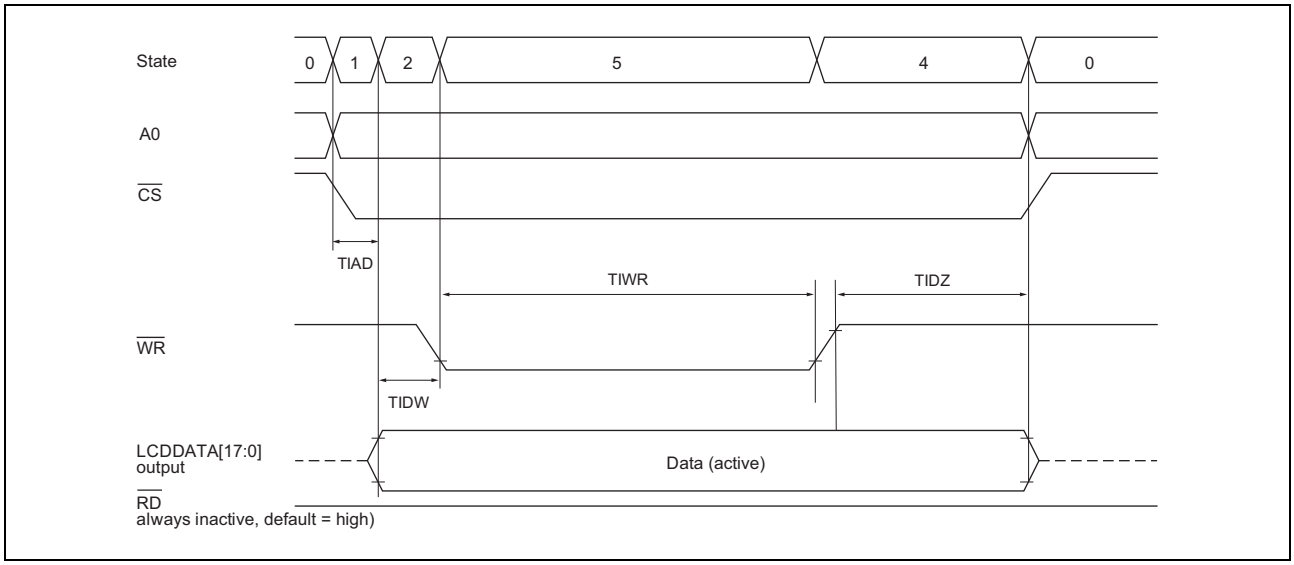

Figure 36.3 Timing diagram of a write operation in RAM access mode

$\overline{CS}$ is active while the LCD Bus Interface is active. When the write strobe $\overline{WR}$ is active, data is written to the LCD bus. The read strobe $\overline{RD}$ is inactive.

(2) General timing in E-Type mode

The data transmission in E-Type mode is split into the following states:

Table 36.8 Data transmission states in E-Type mode

State	Control bit	State number*1
No activity between two transmissions	–	0
Waiting for address	LCBInTMAD	1
Activating read/write direction	LCBInTMDW	2
Width of the read/write strobe	LCBInTMED	3
End of the bus cycle	LCBInTMDZ	4

Note 1. The state number refers to the state line in the following E-Type mode diagrams.

Control signals level

The following figures assume following settings of the control signals levels:

- LCBInOUTLEV.LCBInTLCS = 0: $\overline{CS}$ is active-low
- LCBInOUTLEV.LCBInTLRDE = 0: $\overline{E}$ is active-low
- LCBInOUTLEV.LCBInTLWR = 0: RW is
  - active-high for read
  - active-low for write
- LCBInOUTLEV.LCBInTLA0 is set as required to indicate transmission of control or data information

The following figure shows the general timing of a *read* operation in E-Type mode.

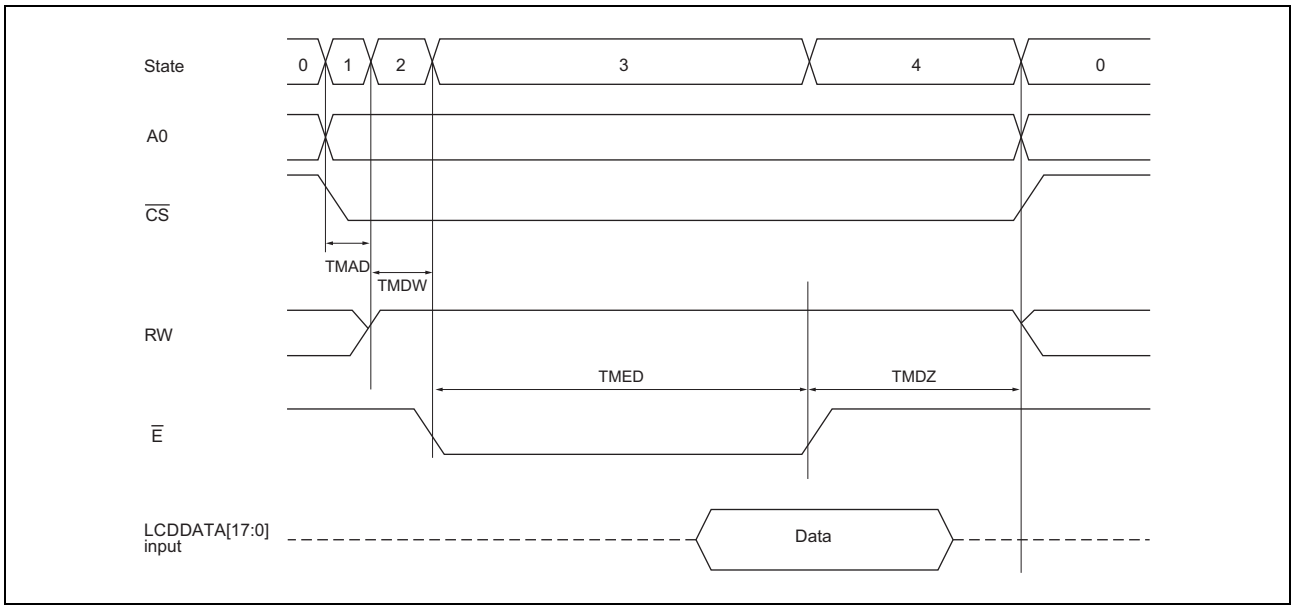

Figure 36.4 Timing diagram of a read operation in E-Type mode

$\overline{CS}$ is active while the LCD Bus Interface is active. When the read/write signal RW has high level and the $\overline{E}$ strobe is active, data is read from the LCD bus.

The following figure shows the general timing of a *write* operation in E-Type mode.

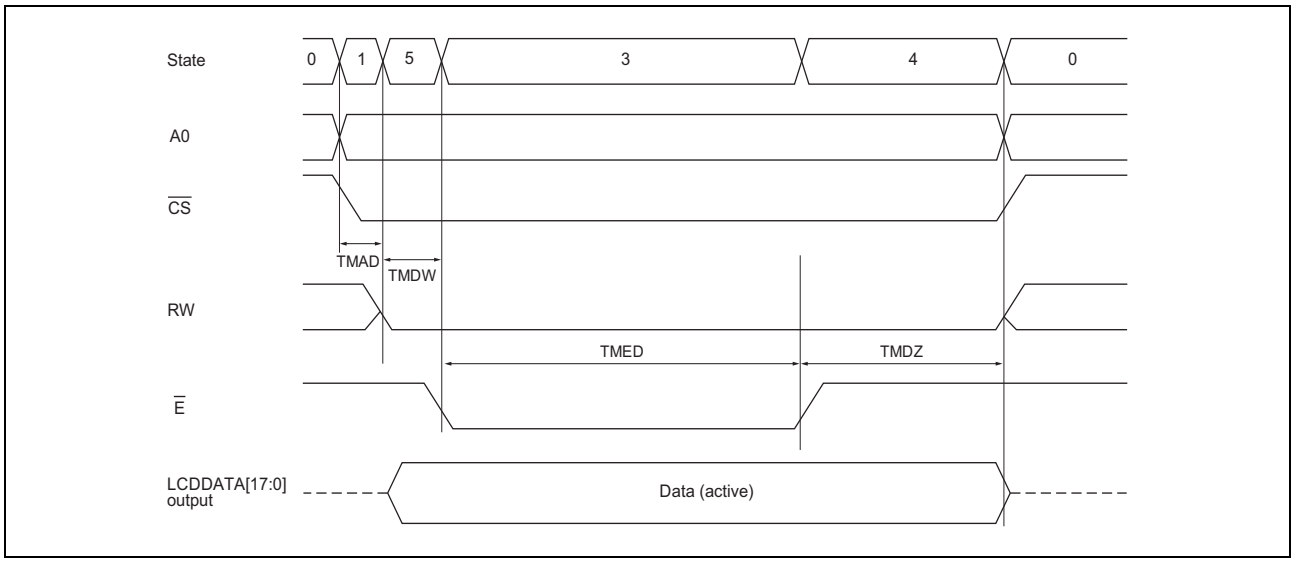

Figure 36.5 Timing diagram of a write operation in E-Type mode

$\overline{CS}$ is active while the LCD Bus Interface is active. When the read/write signal RW has low level and the $\overline{E}$ strobe is active, data is written to the LCD bus.

36.3.1.4 Status flags

The following status information is provided:

- Data transfer active (LCBInSTATUS.LCBInTCIDLE)
- Change of control registers possible (LCBInSTATUS.LCBInTCLOCK)

  Control registers can only be changed while no data transfer is active.
- Reading transfer pending (LCBInSTATUS.LCBInTCRPG)

36.3.2 TFT operation mode

In TFT operation mode, video data is sent to the LCD bus. One bus cycle contains the data of one pixel (e.g. RGB value of a pixel). One picture frame comprises pixels in a configurable number of lines and pixels per line.

Control signals are generated to indicate the start of a new pixel line ($\overline{HSYNC}$) or the start of a new picture frame ($\overline{VSYNC}$).

The pixel clock specifies the transfer speed of single pixels within a line.

Wait states can be specified, for example at the end of a line or a picture frame.

Write buffer

To sustain a constant frame rate on the TFT LCD, the CPU or DMA has to provide enough data for the write buffer. The write buffer generates interrupts to warn if specified states are reached. For details see Section 36.3.4, Write buffer details.

The TFT operation mode is automatically stopped (LCBInOPMODE.LCBInOPMODE[1:0] = 00_B), if there is a write buffer underrun.

36.3.2.1 Access types

The following access types are possible:

- Write access

  Read access is not possible in TFT operation mode.
- Display data (pixel data)
- Byte, halfword, or word access

Write access to the LCD bus is performed by writing data to one of the data write registers LCBInDAT0CWR or LCBInDAT0SWR. The data is transferred to the write buffer, which operates using a first-in first-out (FIFO) principle. It is converted by the CLUT, if enabled (LCBInTCONTROL.LCBInDTCC = 1), and written to the LCD bus.

Data is continuously fetched from the write buffer. If the write buffer runs empty (LCDIFTIEMPT), the LCD Bus Interface stops. When new data is written to the write buffer, the LCD Bus Interface can be restarted with a new picture frame.

Depending on the LCD bus width, a single write operation can contain one or more pixel data values on the LCD bus.

For example, writing the data register LCBInDAT0SWRH writes 16 bits of display data to the LCD bus. If the LCD bus width is 8 bits, data for two pixels is output.

The DE control line is active while display data is transmitted.

NOTE

Reading of data read registers LCBInDAT0CRD, LCBInDAT0SRD, or LCBInDATRDW is not allowed in TFT operation mode.

36.3.2.2 Transfer speed

The transfer speed depends on the pixel clock, the operation clock and the selected wait states. The following control registers are available:

- LCBInCKSEL

  This register sets the operation clock from PCLK, PCLK/2, PCLK/4, ..., PCLK/64.
- LCBInTFTPRS

  This register is used to specify a prescaler to derive the pixel clock from the operation clock.
- LCBInTFTCYC0, LCBInTFTCYC1, and LCBInTFTCYC2

  These registers define the number of pixel clock or operation clock cycles for one bus cycle. Wait states for different states within one bus cycle can be specified. For example, the back porch time.

After reset, the slowest clock is selected as default.

Pixel clock

The pixel clock can be calculated as follows:

Pixel clock = operation clock / (LCBInTFTPCPRS[15:0] + 1)

36.3.2.3 General timing

The timing depends on the number of lines per picture frame (LCBInTFTCYC1.LCBInTFNVC[9:0]) and the number of pixels per line (LCBInTFTCYC2.LCBInTFNHC[9:0]).

The transmission of a picture frame is split into the following states:

Table 36.9 States in transmission of a picture frame

State				Control bit*1	State number*2
Wait state between picture frames				LCBInTFDHV[7:0]	7
Vertical frame	VSYNC pulse width (new picture frame start)			LCBInTFNHVS[7:0]	1
	Vertical back porch time			LCBInTFNVB[7:0]	2
	Horizontal frame	Wait state between lines		LCBInTFDCH[7:0]	
		HSYNC pulse width (new line start)		LCBInTFNCHS[7:0]	3
		Horizontal back porch time		LCBInTFNHB[7:0]	4
		Pixel	Wait for pixel clock to become active	LCBInTFDCD[6:0]	5
			Pixel clock active time (transfer of one pixel)	LCBInTFDCW[7:0]	
		Horizontal front porch time		LCBInTFNHE[5:0]	6
	Vertical front porch time			LCBInTFNVE[5:0]	7

Note 1. Control bits starting with “LCBInTFD” give the wait states based on operation clock cycles. Control bits starting with “LCBInTFN” give the wait states based on pixel clock cycles.

Note 2. The state number refers to the state line in the following diagrams.

Control signals level

The following figures assume following settings of the control signals levels:

- LCBInOUTLEV.LCBInTLVS = 0: $\overline{\text{VSYNC}}$ is active-low
- LCBInOUTLEV.LCBInTLHS = 0: $\overline{\text{HSYNC}}$ is active-low
- LCBInOUTLEV.LCBInTLDE = 1: DE is active-high

The following figure shows the general timing in TFT operation mode.

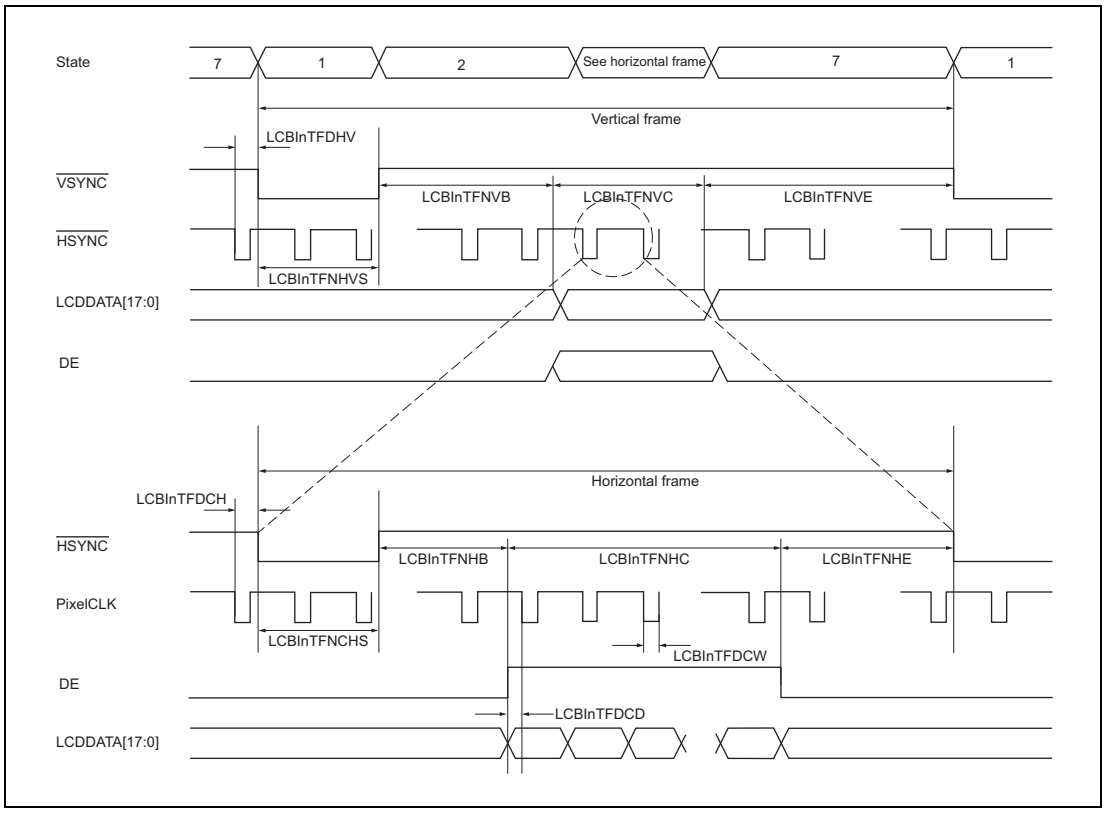

Figure 36.6 TFT operation mode general timing

The timing diagram above shows the following:

- One vertical frame (corresponding to a full image) consists of several horizontal frames (corresponding to a pixel line each)
- The signal DE is active when pixel data is transferred

36.3.2.4 Status flags

The following status information is provided:

- Change of control registers possible (LCBInSTATUS.LCBInTCLOCK)
- Control registers can only be changed during back porch time of vertical synchronization.

36.3.3 Color usage

To support color displays, the LCD Bus Interface can convert write data to RGB values using a Color Lookup Table (CLUT). The data from the write buffer is used as an address to index and select a RGB value. CLUT usage is enabled by control bit LCBInTCONTROL.LCBInDTCC.

The colors are defined in the CLUT data RAM. The CLUT data RAM has a size of 256 x 18 bits. This size is suitable for 18-bit and 9-bit LCD bus widths:

- LCD bus width = 18 bits: One 18-bit color definition per CLUT address
- LCD bus width = 9 bits: Two consecutive 9-bit bus accesses for the 18-bit color definition per CLUT address

A dedicated mode is provided for writing the CLUT data RAM.

CLUT palette modes

There are two CLUT palette modes:

- 8-bit palette mode

  1 color palette with 256 colors.
  For each color, an 8-bit data value is required.

- 4-bit palette mode

  16 color palettes each with 16 colors.
  The currently active palette is selected by the offset address in register LCBInCLUTOFFS.
  For each color, a 4-bit data value is required.

The CLUT palette mode is selected by bit LCBInTCONTROL.LCBInDTCP.

The following figure illustrates the difference between the two CLUT palette modes. For details refer to Section 36.3.5, Data transfer types.

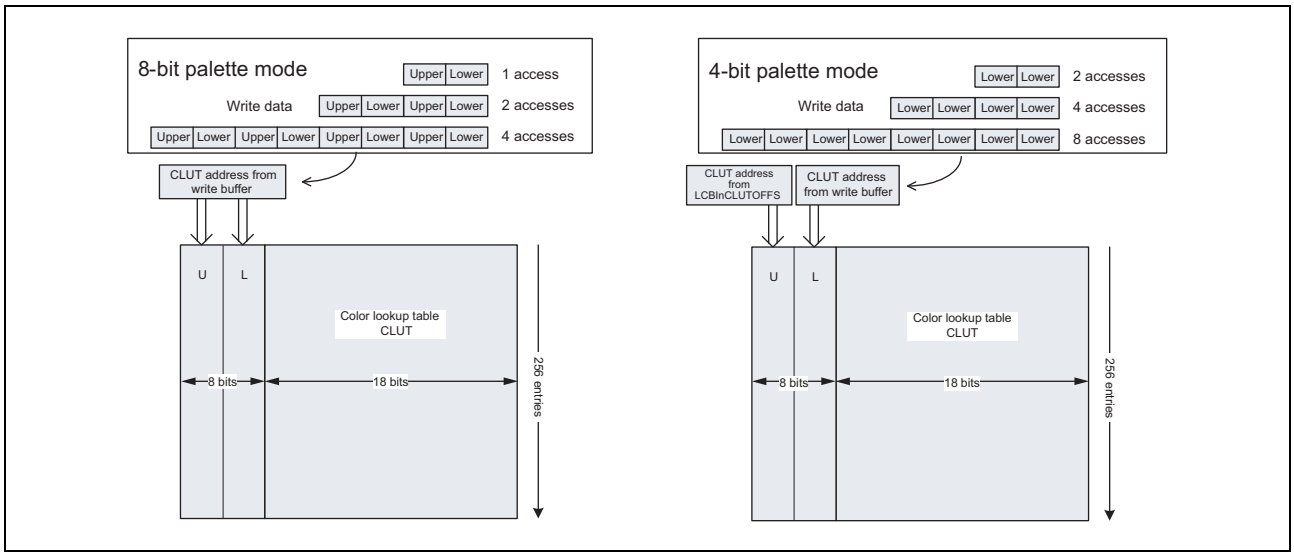

Figure 36.7 CLUT addressing

NOTE

When CLUT usage is enabled in non-TFT operation mode, the CLUT is nevertheless ignored in the following cases:

- When control data is written (writing to registers LCBInDAT0SWR)
- When data is read

CLUT definition mode

The CLUT color values are defined in CLUT definition mode. When this mode is selected (LCBInOPMODE.LCBInOPMODE[1:0] = 11_B), CLUT data values can be read and written via the CLUT data RAM registers LCBInCLUTDmW (m = 0 to 255).

During CLUT definition mode

- no data can be written to the write buffer
- no data is transferred via the LCD Bus Interface
- no TFT control signals ($\overline{\text{HSYNC}}$, $\overline{\text{VSYNC}}$, DE, PixelCLK) are generated.

36.3.4 Write buffer details

The write buffer is a FIFO buffer to store data that is to be written to the LCD bus. It optimizes the data transfer on the LCD bus. This means, that data is fetched from the write buffer while a transfer is still active on the LCD bus.

36.3.4.1 Size and content

The write buffer has a size of 12 x (32 + 3) bits. It can hold the following data for up to 12 write accesses:

- 32 data bits
- 2 bits for access size specification (8 bit, 16 bit, or 32 bit)
- 1 bit to hold the A0 setting

Example

When data is written to register LCBInDAT0SWRH, the write buffer holds the data plus a 2-bit code for 16-bit access and a 1-bit code for “A0 is set”.

36.3.4.2 Write buffer fill state interrupts

For every write buffer fill state, except overflow and underrun, an interrupt request is generated. All fill states are reflected in the LCBInIRQPEN register. This is important in TFT operation mode, because there have to be enough values in the FIFO to provide a constant frame rate.

Table 36.10 Write buffer fill states (1/2)

Fill state	Number of data in write buffer	Comments	Interrupt status flag
Empty	1→ 0	-	LCDIFTIEMPT LCBInIRQPEN.LCBInRWIRQE
Half full	5 → 6 7 → 6	-	LCDIFTIHALF LCBInIRQPEN.LCBInRWIRQH
Quarter full	4 → 3	-	LCDIFTIQTR LCBInIRQPEN.LCBInRWIRQQ
Three quarters full	8 → 9	-	LCDIFTI3QTR LCBInIRQPEN.LCBInRWIRQT

Table 36.10 Write buffer fill states (2/2)

Fill state	Number of data in write buffer	Comments	Interrupt status flag
Full	11→ 12	-	LCDIFTIFULL LCBInIRQPEN.LCBInRWIRQF
Overflow	12	A value is written to the write buffer while it is full. The new value is discarded.	LCBInIRQPEN.LCBInRWOVF
Underrun*1	0	• Non-TFT operation mode: No underrun can occur. LCD Bus Interface is stopped when write buffer is empty. • TFT operation mode: Data is fetched from the write buffer while it is empty. LCD Bus Interface is stopped. Video output is stopped.	LCBInIRQPEN.LCBInRWUNR

Note 1. Refer also to “Write buffer prefetch” below.

CAUTION

After the first data has been written to an empty buffer a write buffer empty interrupt LCDIFTIEMPT is generated, since this first data is immediately transferred to the interface.

Write buffer prefetch

While data is output via the LCD bus I/F the next data word is already fetched from the write buffer. This means in particular during output of the last data an underrun occurs because of the prefetch attempt of the next - but not existing - data.
Consequently the LCD bus I/F operation is stopped.

CAUTION

For continues data output via the LCD bus I/F make sure to have at least one data word in the write buffer to avoid an LCD bus I/F stop because of an underrun.

36.3.5 Data transfer types

Depending on the access type and the LCD bus width, bit shifts, and CLUT usage, one or more transfers are performed on the LCD Bus Interface:

- Access type

  Access to the data registers can be performed as:
  - Byte access (8 bit)
  - Halfword access (16 bit)
  - Word access (32 bit)

- CLUT usage

  When data is converted by the CLUT, the number of bits to address a color value in the CLUT is specified by the CLUT palette mode:

  – In 4 bit palette mode, 4 address bits are required.

  – In 8 bit palette mode, 8 address bits are required.

  18 or 2 x 9 data bits are transferred on the LCD bus.

- LCD bus width

  – Without CLUT usage, 8-bit, 9-bit, 16-bit, and 18-bit bus widths are supported.

  – With CLUT usage, 9-bit and 18-bit bus widths are supported.

  The desired LCD bus width is selected by control bits LCBInTCONTROL.LCBInDTCM[1:0].

- Bit shifts

  On the LCD bus, data can be shifted.
  For example, 8 bits can be written to bit positions [7:0], [8:1], [9:2], or [17:10]. The bit shift is specified by control bits LCBInTCONTROL.LCBInDTCS[1:0].

NOTES

1. Every access must address the base address of the data registers. Access to the individual bytes within the registers is prohibited.
2. Data transfers with CLUT usage are only allowed for 9 bit and 18 bit LCD busses.

The following sections show the different data transfer types, depending on the above mentioned settings.

36.3.5.1 Transfers without CLUT usage on any LCD bus width

The following table summarizes the number of transfers on the LCD bus, depending on the LCD bus width and the access type for data transfers without CLUT usage (LCBInTCONTROL.LCBInDTCC = 0).

Table 36.11 Number of data transfers without CLUT usage

LCD bus width (LCBInDTCM[1:0])	Number of data transfers on LCD bus		
	Byte access	Halfword access	Word access
8 bit	1	2	4
9 bit	-	1	2
16 bit	-	1	2
18 bit	-	-	1

The following figure illustrates the data transfer types.

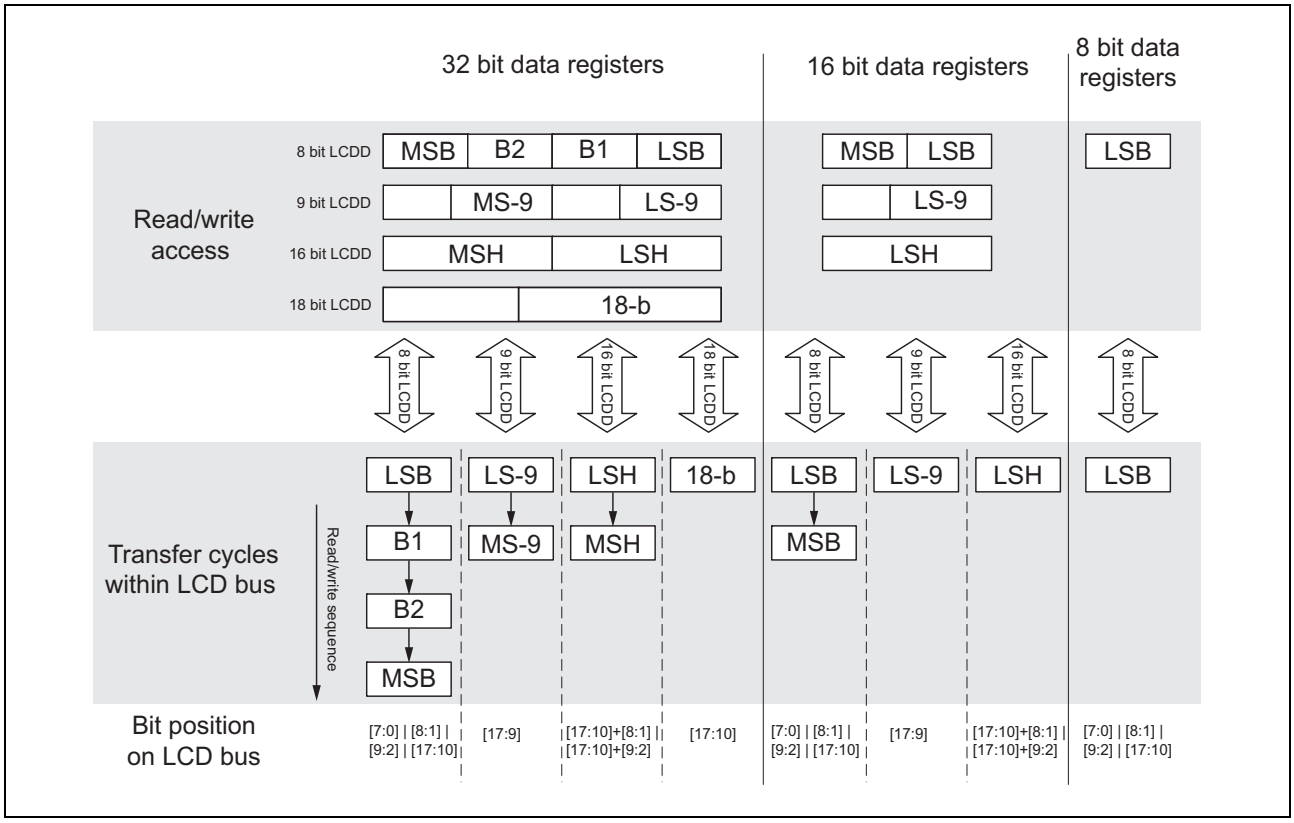

Figure 36.8 Data transfer types without CLUT usage

36.3.5.2 Data transfers with CLUT usage on 18-bit LCD bus

When CLUT usage is enabled (LCBInTCONTROL.LCBInDTCC = 1), every data access is converted to one or more 18-bit color values.

The following table summarizes the number of transfers with CLUT usage on an 18-bit LCD bus, depending on the CLUT palette mode and the access type for data transfers.

NOTE

When CLUT usage is enabled in non-TFT operation mode, control data write operations and read operations are performed without CLUT conversion.

Table 36.12 Number of data transfers with CLUT usage on 18-bit LCD bus

CLUT palette mode (LCBInDTCP)	Number of data transfers on LCD bus		
	Byte access	Halfword access	Word access
8 bit	1	2	4
4 bit	2	4	8

Example

In 4 bit palette mode, 4 color values can be addressed with a halfword access. Every color value requires one 18 bit data transfer on the LCD bus, so that a total of 4 data transfers is performed.

The following figure illustrates the data transfer types.

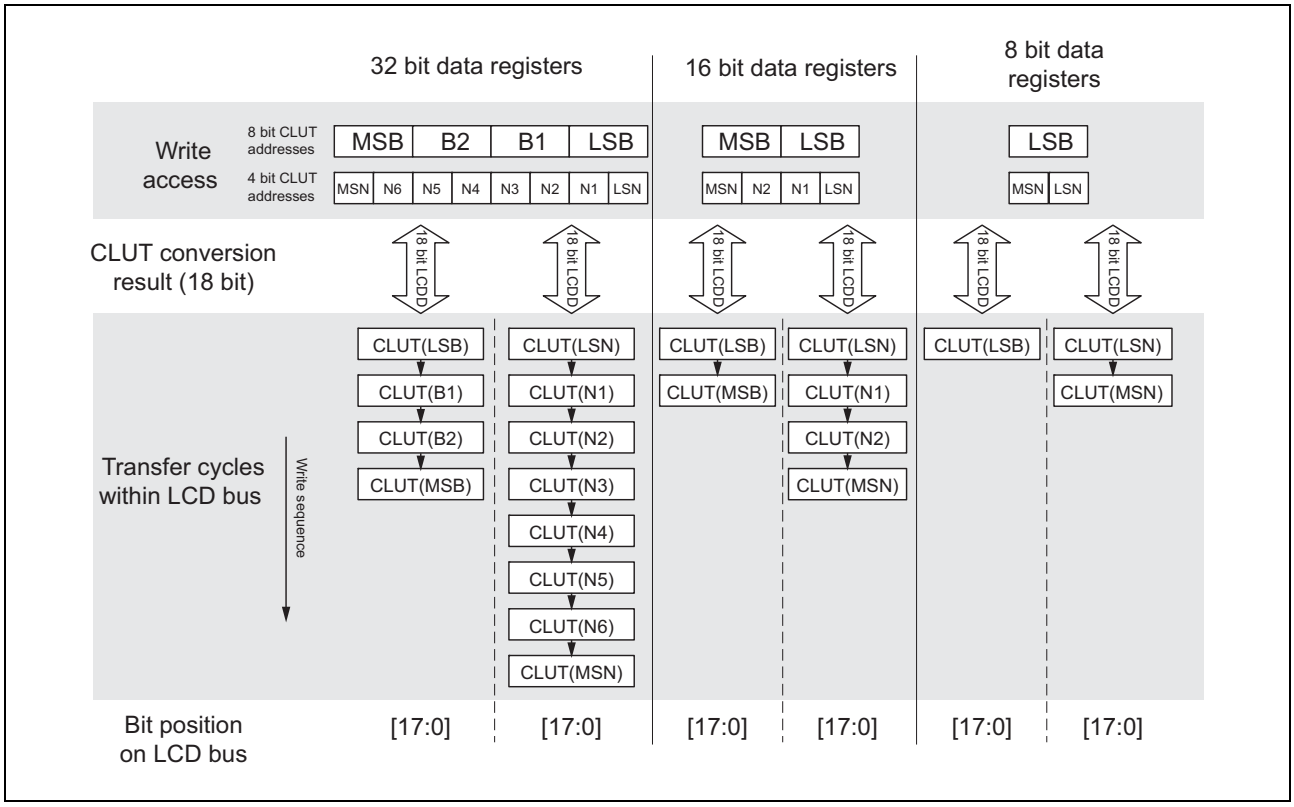

Figure 36.9 Data transfer types with CLUT usage on 18-bit LCD bus

CLUT conversion starts with the LSB and ends with the MSB.

LSB is output first.

36.3.5.3 Data transfers with CLUT usage on 9-bit LCD bus

When CLUT usage is enabled (LCBInTCONTROL.LCBInDTCC = 1), every data access is converted to one or more 18-bit color values.

The following table summarizes the number of transfers with CLUT usage on a 9-bit LCD bus, depending on the CLUT palette mode and the access type for data transfers.

NOTE

When CLUT usage is enabled in non-TFT operation mode, control data write operations and read operations are performed without CLUT conversion.

Table 36.13 Number of data transfers with CLUT usage on 9-bit LCD bus

CLUT palette mode (LCBInDTCP)	Number of data transfers on LCD bus		
	Byte access	Halfword access	Word access
8 bit	2	4	8
4 bit	4	8	16

Example

In 4 bit palette mode, 4 color values can be addressed with a halfword access. Every color value requires two 9 bit data transfer on the LCD bus, so that a total of 8 data transfers is required.

The following figure illustrates the data transfer types.

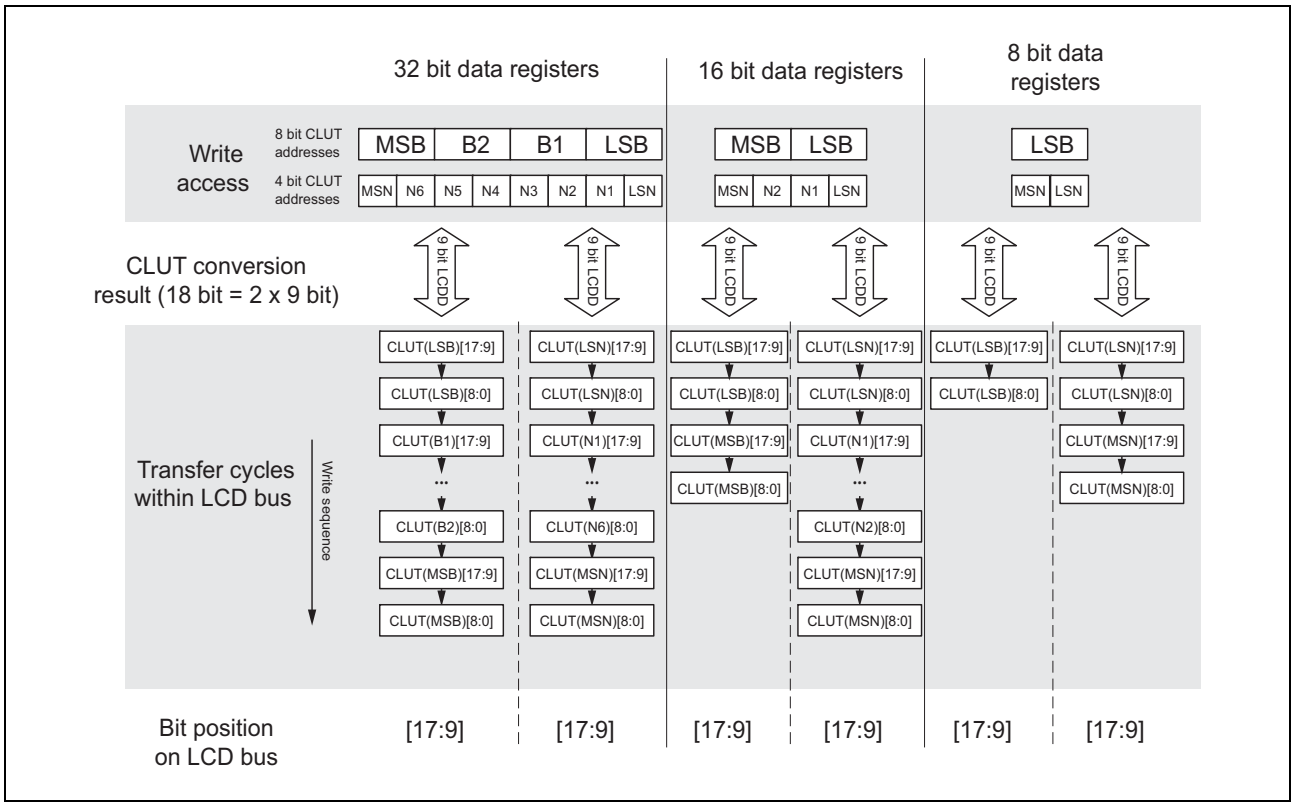

Figure 36.10 Data transfer types with CLUT usage on 9-bit LCD bus

CLUT conversion starts with the LSB and ends with the MSB.

LSB of the data is output first, but the upper 9 bits of the CLUT output are transmitted first on the bus.

36.3.6 Soft reset

The LCD Bus Interface can be reset by a soft reset (LCBInSRESET.LCBInSRST).

When the LCD Bus Interface is reset by software, all active transfers are stopped, pending transfers are deleted and the write buffer is cleared.

Note that not all control registers are reset by a soft reset.

36.3.7 Change control registers settings

To change the control register settings, the following procedure must be considered:

1. Stop the LCD Bus Interface (LCBInOPMODE.LCBInOPMODE[1:0] = 00_B).
   The write buffer is cleared.
2. Read the LCBInOPMODE register to ensure that the LCD Bus Interface is stopped (LCBInOPMODE.LCBInOPMODE[1:0] = 00_B). If unsuccessful, repeat writing to the LCBInOPMODE register.
3. Change any of the following control register settings.
   – LCBInCKSEL (operation clock setting)
   – LCBInTCONTROL (specification of CLUT usage, CLUT palette mode, LCD bus width, and bit shifting on LCD bus)
   – LCBInBCYCT and LCBInBCYC (Bus cycle timing settings for non-TFT operation

mode)
- LCBInTFTPRS (pixel clock setting for TFT operation mode)
- LCBInTFTCYC0, LCBInTFTCYC1, LCBInTFTCYC2 (Bus cycle timing settings for TFT operation mode)
- LCBInOUTLEV (output level specification of control signals)

4. Set the desired operation mode to restart the LCD Bus Interface (LCBInOPMODE.LCBInOPMODE[1:0]).

36.4 Registers

This section contains a description of all registers of the LCD Bus Interface.

36.4.1 LCD Bus Interface registers overview

The LCD Bus Interface is controlled and operated by the following registers:

Table 36.14 Control registers overview

Register name	Shortcut	Address
General control registers		
Clock selection control register	LCBInCKSEL	<LCBIn_base> + 440_H
Operation mode control register	LCBInOPMODE	<LCBIn_base> + $44C_H$
Data transfer control register	LCBInTCONTROL	<LCBIn_base> + 454_H
CLUT offset control register	LCBInCLUTOFFS	<LCBIn_base> + 450_H
Output level control register	LCBInOUTLEV	<LCBIn_base> + 470_H
Status indication register	LCBInSTATUS	<LCBIn_base> + 474_H
Pending interrupt and FIFO error register	LCBInIRQPEN	<LCBIn_base> + $47C_H$
Pending interrupt clear register	LCBInIRQCLR	<LCBIn_base> + 480_H
Soft reset control register	LCBInSRESET	<LCBIn_base> + 448_H
Emulation register	LCBInEMU	<LCBIn_base> + 444_H
Non-TFT mode control registers		
Bus cycle type non-TFT control register	LCBInBCYCT	<LCBIn_base> + 458_H
Non-TFT modes bus cycle specification control register	LCBInBCYC	<LCBIn_base> + $45C_H$
TFT mode control registers		
TFT cycle prescaler control register	LCBInTFTPRS	<LCBIn_base> + 460_H
TFT cycle timing specification control register 0	LCBInTFTCYC0	<LCBIn_base> + 464_H
TFT cycle timing specification control register 1	LCBInTFTCYC1	<LCBIn_base> + 468_H
TFT cycle timing specification control register 2	LCBInTFTCYC2	<LCBIn_base> + $46C_H$

Table 36.15 Data registers overview

Register name	Shortcut	Address
Data write registers	LCBInDAT0SWR	<LCBIn_base> + 400_H
	LCBInDAT0SWRH	<LCBIn_base> + 404_H
	LCBInDAT0SWRW	<LCBIn_base> + 408_H
	LCBInDAT0CWR	<LCBIn_base> + $40C_H$
	LCBInDAT0CWRH	<LCBIn_base> + 410_H
	LCBInDAT0CWRW	<LCBIn_base> + 414_H
Data read registers	LCBInDAT0SRD	<LCBIn_base> + 418_H
	LCBInDAT0SRDH	<LCBIn_base> + $41C_H$
	LCBInDAT0SRDW	<LCBIn_base> + 420_H
	LCBInDAT0CRD	<LCBIn_base> + 424_H
	LCBInDAT0CRDH	<LCBIn_base> + 428_H
	LCBInDAT0CRDW	<LCBIn_base> + $42C_H$
	LCBInDATRDW	<LCBIn_base> + 430_H

Table 36.16 CLUT data RAM registers overview

Register name	CLUT data area	Address
CLUT data RAM registers	LCBInCLUTD0W	<LCBIn_base>
	LCBInCLUTD1W	<LCBIn_base> + 4_H
	LCBInCLUTD2W	<LCBIn_base> + 8_H
	...	...
	LCBInCLUTD254W	<LCBIn_base> + $3F8_H$
	LCBInCLUTD255W	<LCBIn_base> + $3FC_H$

<LCBIn_base>

The base addresses <LCBIn_base> of the LCBIn is defined in the first section of this chapter under the key word “Register addresses”.

36.4.2 LCD Bus Interface general control registers details

36.4.2.1 LCBInCKSEL - Clock selection control register

This register selects the prescaler for the LCD Bus Interface operation clock.

Access: This register can be accessed in 32-bit units.
The LCD Bus Interface must be stopped (LCBInOPMODE.LCBInOPMODE[1:0] = 00_B) before writing to this register. For details refer to Section 36.3.7, Change control registers settings.

Address: <LCBIn_base> + 440_H

Initial Value: 0000 0006_H

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 36.17 LCBInCKSEL register contents

Bit position	Bit name	Function
31 to 3	Reserved	When read, the value after reset is returned. When written, write the value after reset.
2 to 0	LCBIn CKS[2:0]	Selects the prescaler for the operation clock.

CKS2	CKS1	CKS0	Operation clock
0	0	0	PCLK/1
0	0	1	PCLK/2
0	1	0	PCLK/4
0	1	1	PCLK/8
1	0	0	PCLK/16
1	0	1	PCLK/32
1	1	0	PCLK/64
1	1	1	Not allowed

36.4.2.2 LCBInOPMODE - Operation mode control register

This register selects the operation mode for the LCD Bus Interface.

Access: This register can be accessed in 32-bit units.
If a new value is written to this register while control registers are locked (LCBInSTATUS.LCBInTCLOCK = 1) the new value does not take effect until the control registers are unlocked (LCBInSTATUS.LCBInTCLOCK = 0).

Address: <LCBIn_base> + $44C_H$

Initial Value: $0000\ 0000_H$. This register is initialized by a LCBI H/W reset and by soft reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 36.18 LCBInOPMODE register contents

Bit position	Bit name	Function
31 to 5	Reserved	When read, the value after reset is returned. When written, write the value after reset.
4	LCBIn OPMFAST	Enables fast bus cycle mode: 0: Fast bus cycle mode disabled (slow bus cycle mode enabled) 1: Fast bus cycle mode enabled (slow bus cycle mode disabled) This bit only applies in non-TFT operation mode.
3 to 2	Reserved	When read, the value after reset is returned. When written, write the value after reset.
1 to 0	LCBIn OPMODE[1:0]	Specifies the operation mode.

LCBIn OPMODE1	LCBIn OPMODE0	Description
0	0	LCD Bus Interface is stopped The write buffer is cleared
0	1	Non-TFT operation mode
1	0	TFT operation mode
1	1	CLUT definition mode

36.4.2.3 LCBInTCONTROL - Data transfer control register

This register specifies the LCD bus width, the bit shifts on the LCD bus, CLUT usage, and CLUT palette mode.

Access: This register can be accessed in 32-bit units.
The LCD Bus Interface must be stopped (LCBInOPMODE.LCBInOPMODE[1:0] = 00_B) before writing to this register. For details refer to Section 36.3.7, Change control registers settings.

Address: <LCBIn_base> + 454_H

Initial Value: $0000\ 0000_H$. This register is initialized by a LCBI H/W reset and by soft reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R/W	R/W

Table 36.19 LCBInTCONTROL register contents

Bit position	Bit name	Function
31 to 8	Reserved	When read, the value after reset is returned. When written, write the value after reset.
7 to 6	LCBIn DTCS[1:0]	Specifies the bit shifts of data on the LCD bus. These bits only apply for 8-bit and 16-bit bus width. Refer to Table 36.20, Bit shifts on the LCD bus.
5 to 4	LCBIn DTCM[1:0]	Selects the LCD bus width. **LCBIn DTCM1 / LCBIn DTCM0 / LCD bus width** 0 / 0 / 8 bit 0 / 1 / 16 bit 1 / 0 / 9 bit 1 / 1 / 18 bit This setting is only supported with 32-bit accesses. When CLUT usage is enabled (LCBInTCONTROL.LCBInDTCC = 1), only 9-bit or 18-bit bus widths are allowed. Refer to Section 36.3.5, Data transfer types.
3 to 2	Reserved	When read, the value after reset is returned. When written, write the value after reset.
1	LCBInDTCP	Specifies the CLUT palette mode: 0: 8-bit palette mode 1: 4-bit palette mode This bit only applies when LCBInTCONTROL.LCBInDTCC = 1.
0	LCBInDTCC	Enables/disables CLUT usage: 0: CLUT usage disabled 1: CLUT usage enabled For details refer to Section 36.3.3, Color usage.

Table 36.20 Bit shifts on the LCD bus

LCBInDTCM[1:0]	LCBInDTCS[1:0]	LCD bus width	Bit position of data on the LCD bus
00	00	8 bit	[7:0]
	01		[8:1]
	10		[9:2]
	11		[17:10]
01	00	16 bit	Setting prohibited
	01		[17:10] and [8:1]
	10		[17:10] and [9:2]
	11		Setting prohibited
10	X	9 bit	[17:9]
11		18 bit	[17:0]

36.4.2.4 LCBInCLUTOFFS - CLUT offset control register

This register selects one of the 16 alternative color palettes each with 16 colors. It specifies the 4 bit offset address of the color palette.

This register only applies when CLUT usage is selected (LCBInTCONTROL.LCBInDTCC = 1) and 4 bit palette mode is selected (LCBInTCONTROL.LCBInDTCP = 1).

Access: This register can be accessed in 32-bit units.

Address: <LCBIn_base> + 450_H

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R

Table 36.21 LCBInCLUTOFFS register contents

Bit position	Bit name	Function
31 to 8	Reserved	When read, the value after reset is returned. When written, write the value after reset.
7 to 4	LCBIn CLTOFFS[7:4]	Specifies the offset address of color palette in 4-bit palette mode
3 to 0	Reserved	When read, the value after reset is returned. When written, write the value after reset.

36.4.2.5 LCBInOUTLEV - Output level control register

This register selects the output level of the LCD bus control signals. The default level is active-low.

Access: This register can be accessed in 32-bit units.
The LCD Bus Interface must be stopped (LCBInOPMODE.LCBInOPMODE[1:0] = 00_B) before writing to this register. For details refer to Section 36.3.7, Change control registers settings.

Address: <LCBIn_base> + 470_H

Initial Value: 0000 0000_H. This register is initialized by a LCBI H/W reset and by soft reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 36.22 LCBInOUTLEV register contents (1/2)

Bit position	Bit name	Function
31 to 11	Reserved	When read, the value after reset is returned. When written, write the value after reset.
10	LCBInTLDE	Specifies the active level of the data enable signal DE in TFT mode, that indicates valid data: 0: DE is active-low 1: DE is active-high **Note:** In non-TFT mode, LCBInTLDE has no meaning.
9	LCBInTLVS	Specifies the active level of the vertical synchronization signal $\overline{\text{VSYNC}}$ in TFT mode, that indicates new frame: 0: VSYNC is active-low 1: VSYNC is active-high **Note:** In non-TFT mode, LCBInTLVS has no meaning.
8	LCBInTLHS	Specifies the active level of the horizontal synchronization signal $\overline{\text{HSYNC}}$ in TFT mode, that indicates new line: 0: $\overline{\text{HSYNC}}$ is active-low 1: HSYNC is active-high **Note:** In non-TFT mode, LCBInTLHS has no meaning.
7 to 4	Reserved	When read, the value after reset is returned. When written, write the value after reset.
3	LCBInTLRDE	Specifies the active level of the read strobe $\overline{\text{RD}}$ or the E strobe in non-TFT mode: • $\overline{\text{RD}}$ strobe in RAM mode: 0: $\overline{\text{RD}}$ strobe active-low 1: RD strobe active-high • E strobe in E-Type mode: 0: $\overline{\text{E}}$ strobe active-low 1: E strobe active-high **Note:** In TFT mode, LCBInTLRDE has no meaning.

Table 36.22 LCBInOUTLEV register contents (2/2)

Bit position	Bit name	Function
2	LCBInTLWR	Specifies the active level of the write strobe $\overline{WR}$ or the RW signal in non-TFT mode: • $\overline{WR}$ strobe in RAM mode: 0: $\overline{WR}$ strobe active-low 1: WR strobe active-high • RW signal in E-Type mode: 0: RW is – active-high for read – active-low for write 1: RW is – active-low for read – active-high for write **Note:** In TFT mode, LCBInTLWR has no meaning.
1	LCBInTLCS	Specifies the active level of the chip select signal $\overline{CS}$ in non-TFT mode, that indicates transfer enabled: 0: $\overline{CS}$ is active-low 1: CS is active-high **Note:** In TFT mode, LCBInTLCS has no meaning.
0	LCBInTLA0	Specifies the active level of the A0 control signal in non-TFT mode: 0: A0 – = 0 indicates control data – = 1 indicates display data 1: A0 – = 0 indicates display data – = 1 indicates control data **Note:** In TFT mode, LCBInTLA0 has no meaning.

36.4.2.6 LCBInSTATUS - Status indication register

This register indicates the status of pending read transfers, of the control register lock state, and of the idle state.

In TFT operation mode, only the register lock state is applied.

Access: This register can be accessed in 32-bit units.

Address: <LCBIn_base> + 474_H

Initial Value: $0000\ 0001_H$. This register is initialized by a LCBI H/W reset and by soft reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 36.23 LCBInSTATUS register contents

Bit position	Bit name	Function
31 to 3	Reserved	When read, the value after reset is returned. When written, write the value after reset.
2	LCBIn TCRPG	Indicates whether a read transfer is pending. 0: No read transfer is pending 1: Read transfer is pending This bit is only valid in non-TFT operation mode.
1	LCBIn TCLOCK	Indicates the status of the control register locking: 0: Control registers are *not* locked and *can* be changed 1: Control registers are locked and *cannot* be changed
0	LCBIn TCIDLE	Indicates the idle state in non-TFT operation mode: 0: Not idle Data transfer is currently active and/or pending. 1: Idle No data transfer is currently active and the write buffer empty. This bit is only applied in non-TFT operation mode. In TFT operation mode, this bit is always cleared.

36.4.2.7 LCBInIRQPEN - Pending interrupt and FIFO error register

This register indicates the pending interrupt requests due to certain write buffer fill states and when read data is available on the LCD bus.

The flags can be cleared by writing to register LCBInIRQCLR.

NOTE

The status of the bits of this register has no impact on the generation of an interrupt request. Thus even if a bit is not cleared, a new interrupt request will be generated, provided its condition is fulfilled.
If the interrupt requests are checked by polling of this register, the concerned bit must be cleared by writing to LCBInIRQCLR.

Access: This register can be accessed in 32-bit units.

Address: <LCBIn_base> + $47C_H$

Initial Value: $0000\ 0000_H$. This register is initialized by a LCBI H/W reset and by soft reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 36.24 LCBInIRQPEN register contents (1/2)

Bit position	Bit name	Function
31 to 10	Reserved	When read, the value after reset is returned. When written, write the value after reset.
9	LCBIn RWUNR	Indicates the write buffer underrun state: 0: No underrun 1: Underrun occurred The LCD Bus Interface is stopped. This bit is only set in TFT operation mode.
8	LCBIn RWOVF	Indicates the write buffer overflow state: 0: No overflow 1: Overflow occurred The last value written to the write buffer is lost.
7 to 6	Reserved	When read, the value after reset is returned. When written, write the value after reset.
5	LCBIn RWIRQT	Indicates a three quarters filled write buffer (LCDIFTI3QTR interrupt request): 0: No interrupt request pending 1: Interrupt request pending
4	LCBIn RWIRQQ	Indicates a quarter filled write buffer (LCDIFTIQTR interrupt request): 0: No interrupt request pending 1: Interrupt request pending
3	LCBIn RWIRQF	Indicates a completely filled write buffer (LCDIFTIFULL interrupt request): 0: No interrupt request pending 1: Interrupt request pending

Table 36.24 LCBInIRQPEN register contents (2/2)

Bit position	Bit name	Function
2	LCBIn RWIRQH	Indicates a half filled write buffer (LCDIFTIHALF interrupt request): 0: No interrupt request pending 1: Interrupt request pending
1	LCBIn RWIRQE	Indicates an empty write buffer (LCDIFTIEMPT interrupt request): 0: No interrupt request pending 1: Interrupt request pending
0	LCBIn TCIRQ	Indicates that read data is available (LCDIFTIRDY interrupt request): 0: No interrupt request pending (no read data is available) 1: Interrupt request pending (read data is available)

36.4.2.8 LCBInIRQCLR - Pending interrupt and FIFO error clear register

This register clears the interrupt pending and FIFO error flags of register LCBInIRQPEN.

Access: This register can be accessed in 32-bit units.

Address: <LCBIn_base> + 480_H

Initial Value: $0000\ 0000_H$. This register is initialized by a LCBI H/W reset and by soft reset.

36.4.2.9 LCBInSRESET - Soft reset control register

This register forces the stop of all active transfers, pending transfers are deleted, the write buffer is cleared, and the idle state is set (LCBInSTATUS.LCBInTCIDLE = 1).

Access: This register can be accessed in 32-bit units.
This register always reads as 0000 0000_H.

Address: <LCBIn_base> + 448_H

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	LCBInSRST	Triggers soft reset: 0: Soft reset is not triggered 1: Soft reset is triggered

36.4.2.10 LCBInEMU - Emulation register

This register controls whether the LCD Bus I/F can be stopped during emulation, for instance upon a breakpoint hit.

Access: This register can be accessed in 32-bit units.

Address: <LCBIn_base> + 444_H

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

36.4.3 LCD Bus Interface non-TFT mode control registers details

36.4.3.1 LCBInBCYCT - Bus cycle type non-TFT control register

This register selects the access mode in non-TFT operation mode.

Access: This register can be accessed in 32-bit units.
The LCD Bus Interface must be stopped (LCBInOPMODE.LCBInOPMODE[1:0] = 00_B) before writing to this register. For details refer to Section 36.3.7, Change control registers settings.

Address: <LCBIn_base> + 458_H

Initial Value: 0000 0000_H. This register is initialized by a LCBI H/W reset and by soft reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 1	Reserved	When read, the value after reset is returned. When written, write the value after reset.
0	LCBIn BCYTYPE	Selects the access mode: 0: RAM 1: E-Type

36.4.3.2 LCBInBCYC - Non-TFT modes bus cycle specification control register

This register specifies the duration of bus cycle states in non-TFT operation mode. The duration is based on operation clock cycles.

The names and functions of the bits differ in RAM access mode (LCBInBCYCT.LCBInBCYTYPE = 0) and E-Type access mode (LCBInBCYCT.LCBInBCYTYPE = 1).

Access: This register can be accessed in 32-bit units.
The LCD Bus Interface must be stopped (LCBInOPMODE.LCBInOPMODE[1:0] = 00_B) before writing to this register. For details refer to Section 36.3.7, Change control registers settings.

Address: <LCBIn_base> + $45C_H$

Initial Value: FFFF $0FFF_H$. This register is initialized by a LCBI H/W reset and by soft reset.

Table 36.30 LCBInBCYC register contents in E-Type access mode (2/2)

Bit position	Bit name	Function
3 to 0	LCBIn TMAD[3:0]	Waiting for address TMAD = LCBInTMAD[3:0] + 1 **Note:** not effective in fast bus cycle mode (LCBInOPMODE.LCBInOPMFAST = 1)

36.4.4 LCD Bus Interface TFT mode control registers details

36.4.4.1 LCBInTFTPRS - TFT cycle prescaler control register

This register specifies the prescaler for the pixel clock in TFT operation mode.

The duration of most bus cycle states in TFT operation mode is based on pixel clock cycles. The exceptions are LCBInTFDCH, LCBInTFDCW and LCBInTFDCD; they are based on operation clock cycles.

Access: This register can be accessed in 32-bit units.
The LCD Bus Interface must be stopped (LCBInOPMODE.LCBInOPMODE[1:0] = 00_B) before writing to this register. For details refer to Section 36.3.7, Change control registers settings.

Address: <LCBIn_base> + 460_H

Initial Value: 0000 $FFFF_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 36.31 LCBInTFTPRS register contents

Bit position	Bit name	Function
31 to 16	Reserved	When read, the value after reset is returned. When written, write the value after reset.
15 to 0	LCBInTFTPCPRS[15:0]	Specifies the pixel clock prescaler.

LCBInTFTPCPRS[15:0]	Pixel clock
0000_H	Setting prohibited
0001_H	Operation clock / 2
0002_H	Operation clock / 3
...	...
$FFFE_H$	Operation clock / 65535
$FFFF_H$	Operation clock / 65536

CAUTION

When the prescaler for the operation is 1 (LCBInCKSEL.LCBInCKS[2:0] = 000_B), the prescaler for the operation clock must not be set to one (LCBInTFTPRS.LCBInTFTPCPRS[15:0] = 0000_H).

36.4.4.2 LCBInTFTCYC0 - TFT cycle timing specification control register 0

This register specifies the duration of bus cycle states in TFT operation mode. The duration is based on pixel clock cycles or on operation clock cycles.

Access: This register can be accessed in 32-bit units.
The LCD Bus Interface must be stopped (LCBInOPMODE.LCBInOPMODE[1:0] = 00_B) before writing to this register. For details refer to Section 36.3.7, Change control registers settings.

Address: <LCBIn_base> + 464_H

Initial Value: $FF7F\ FFFF_H$. This register is initialized by a LCBI H/W reset and by soft reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LCBInTFDCH[7:0]								LCBInTFDHV[7:0]							
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 36.32 LCBInTFTCYC0 register contents

Bit position	Bit name	Function
31 to 24	LCBIn TFDCW[7:0]	Pixel clock active time 00_H: 1 operation clock cycle ... FF_H: 256 operation clock cycles
23	Reserved	When read, the value after reset is returned. When written, write the value after reset.
22 to 16	LCBIn TFDCD[6:0]	Wait state between data becoming active and pixel clock becoming active 00_H: 1 operation clock cycle ... $7F_H$: 128 operation clock cycles
15 to 8	LCBIn TFDCH[7:0]	Wait state between lines 00_H: 1 operation clock cycle ... FF_H: 256 operation clock cycles
7 to 0	LCBIn TFDHV[7:0]	Wait state between picture frames 00_H: 1 pixel clock cycle ... FF_H: 256 pixel clock cycles

CAUTION

Every pixel clock cycle comprises (pixel clock prescaler value) / (operation clock prescaler) operation clock cycles.

- **The values of LCBInTFDCW[7:0] and LCBInTFDCD[6:0] must be less than or equal to LCBInTFTPCPRS[15:0] / LCBInCKS[2:0].**

Example

- Pixel clock prescaler value = 80 (LCBInTFTPRS.LCBInTFTPCPRS[15:0] = $4F_H$)
- Operation clock prescaler value = 4 (LCBInCKSEL.LCBInCKS[2:0] = 010_B)

The values of LCBInTFDCW[7:0] and LCBInTFDCD[6:0] must be less than or equal to $20 = 14_H$. This means, the wait states must be set to 13_H or less.

36.4.4.3 LCBInTFTCYC1 - TFT cycle timing specification control register 1

This register specifies the duration of bus cycle states in TFT operation mode and the number of lines per picture frame. The duration of bus cycle states is based on the number of lines per picture frame.

Access: This register can be accessed in 32-bit units.
The LCD Bus Interface must be stopped (LCBInOPMODE.LCBInOPMODE[1:0] = 00_B) before writing to this register. For details refer to Section 36.3.7, Change control registers settings.

Address: <LCBIn_base> + 468_H

Initial Value: FFFF $FFFF_H$. This register is initialized by a LCBI H/W reset and by soft reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LCBInTFNVE[5:0]						LCBInTFNVC[9:0]									
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LCBInTFNVB[7:0]								LCBInTFNHVS[7:0]							
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 36.33 LCBInTFTCYC1 register contents

Bit position	Bit name	Function
31 to 26	LCBIn TFNVE[5:0]	Vertical front porch time*1 00_H: 1 x $\overline{\text{HSYNC}}$ pulse ... $3F_H$: 64 x $\overline{\text{HSYNC}}$ pulse
25 to 16	LCBIn TFNVC[9:0]	Number of lines per picture frame 000_H: 1 x $\overline{\text{HSYNC}}$ pulse ... $3FF_H$: 1024 x $\overline{\text{HSYNC}}$ pulse
15 to 8	LCBIn TFNVB[7:0]	Vertical back porch time*1 00_H: 1 x $\overline{\text{HSYNC}}$ pulse ... FF_H: 256 x $\overline{\text{HSYNC}}$ pulse
7 to 0	LCBIn TFNHVS[7:0]	$\overline{\text{VSYNC}}$ pulse width*1 00_H: 1 x $\overline{\text{HSYNC}}$ pulse ... FF_H: 256 x $\overline{\text{HSYNC}}$ pulse

Note 1. The front porch time, back porch time and $\overline{\text{VSYNC}}$ pulse width is determined by counting the active edges of $\overline{\text{HSYNC}}$ pulses up to the respective number given in this register.
Since the $\overline{\text{HSYNC}}$ edges are only counted, while the data enable signal DE is inactive, the real time length is also dependent on LCBInTFTCYC0.LCBInTFDHV[7:0].

36.4.4.4 LCBInTFTCYC2 - TFT cycle timing specification control register 2

This register specifies the duration of bus cycle states in TFT operation mode. The duration is based on pixel clock cycles.

Access: This register can be accessed in 32-bit units.
The LCD Bus Interface must be stopped (LCBInOPMODE.LCBInOPMODE[1:0] = 00_B) before writing to this register. For details refer to Section 36.3.7, Change control registers settings.

Address: <LCBIn_base> + $46C_H$

Initial Value: FFFF $FFFF_H$. This register is initialized by a LCBI H/W reset and by soft reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 36.34 LCBInTFTCYC2 register contents

Bit position	Bit name	Function
31 to 26	LCBIn TFNHE[5:0]	Horizontal front porch time*1 00_H: 1 pixel clock cycle ... $3F_H$: 64 pixel clock cycles
25 to 16	LCBIn TFNHC[9:0]	Number of pixels per line 000_H: 1 pixel clock cycle ... $3FF_H$: 1024 pixel clock cycles
15 to 8	LCBIn TFNHB[7:0]	Horizontal back porch time*1 00_H: 1 pixel clock cycle ... FF_H: 256 pixel clock cycles
7 to 0	LCBIn TFNCHS[7:0]	HSYNC pulse width*1 00_H: 1 pixel clock cycle ... FF_H: 256 pixel clock cycles

Note 1. The front porch time, back porch time and $\overline{\text{HSYNC}}$ pulse width is determined by counting the active edges of pixel clock pulses up to the respective number given in this register.
Since the pixel clock edges are only counted, while the data enable signal DE is inactive, the real time length is also dependent on LCBInTFTCYC0.LCBInTFDCD[6:0].

36.4.5 LCD Bus Interface data registers details

36.4.5.1 LCBInDAT0SWR, LCBInDAT0CWR - LCD Bus Interface data write registers

These data registers contain the data that is to be written.

Writing to a data write register initiates a write access on the LCD bus. All data write registers are 32-bit registers. Depending on the access type, only 8 bits, 16 bits, or 32 bits are used.

For details, refer to Section 36.3.5, Data transfer types.

Access:
- Byte access registers LCBInDAT0SWR/LCBInDAT0CWR:
  These registers can be written in 32-bit units.
- Halfword access registers LCBInDAT0SWRH/LCBInDAT0CWRH:
  These registers can be written in 32-bit units.
- Word access registers LCBInDAT0SWRW/LCBInDAT0CWRW:
  These registers can be written in 32-bit units.

Address: Refer to Table 36.35, Data write registers overview

Initial Value: 0000 0000_H.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 36.35 Data write registers overview

Data write register	Used bits	Access type	Function	Address
LCBInDAT0SWR	LCBInDATSWR[7:0]	Byte	Write 8-bit display data with A0 active. If CLUT is enabled, the data is converted to RGB values.	<LCBIn_base> + 400_H
LCBInDAT0SWRH	LCBInDATSWR[15:0]	Halfword	Write 16-bit display data with A0 active. If CLUT is enabled, the data is converted to RGB values.	<LCBIn_base> + 404_H
LCBInDAT0SWRW	LCBInDATSWR[31:0]	Word	Write 32-bit display data with A0 active. If CLUT is enabled, the data is converted to RGB values.	<LCBIn_base> + 408_H
LCBInDAT0CWR	LCBInDATCWR[7:0]	Byte	Write 8-bit control data with A0 inactive.	<LCBIn_base> + $40C_H$
LCBInDAT0CWRH	LCBInDATCWR[15:0]	Halfword	Write 16-bit control data with A0 inactive.	<LCBIn_base> + 410_H
LCBInDAT0CWRW	LCBInDATCWR[31:0]	Word	Write 32-bit control data with A0 inactive.	<LCBIn_base> + 414_H

NOTE

The active and inactive level of A0 is determined by LCBInOUTLEV.LCBInTLA0.

Depending on the operation mode, the LCD bus width and the access type (byte, halfword, or word access) certain data write register accesses are forbidden:

Table 36.36 Allowed (OK) and forbidden (X) access to data write registers

LCD Bus Interface operation mode	LCD bus width	LCBInDAT0SWR	LCBInDAT0SWRH	LCBInDAT0SWRW	LCBInDAT0CWR	LCBInDAT0CWRH	LCBInDAT0CWRW
Non-TFT (without CLUT usage)	8	OK	OK	OK	OK	OK	OK

	9	X	OK	OK	X	OK	OK
	16	X	OK	OK	X	OK	OK
	18	X	X	OK	X	X	OK
TFT (with CLUT usage)	9 or 18	OK	OK	OK	OK	OK	OK

36.4.5.2 LCBInDAT0SRD, LCBInDAT0CRD - LCD Bus Interface data read registers

In non-TFT operation mode, a data read register contains the data that is to be read.

When read data is available from the LCD bus, this data is accessed by reading a data read register. All data read registers are 32-bit registers. Depending on the access type, only 8 bits, 16 bits, or 32 bits are used for data.

For details, refer to Section 36.3.5, Data transfer types.

Access:
- Byte access registers LCBInDAT0SRD/LCBInDAT0CRD: These registers can be read in 32-bit units.
- Halfword access registers LCBInDAT0SRDH/LCBInDAT0CRDH: These registers can be read in 32-bit units.
- Word access registers LCBInDAT0SRDW/LCBInDAT0CRDW: These registers can be read in 32-bit units.

Address: Refer to Table 36.37, Data read registers overview

Initial Value: 0000 0000_H.

R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 36.37 Data read registers overview

Data read register	Used bits	Access type	Function	Address
LCBInDAT0SRD	LCBInDATSRD[7:0]	Byte	Read 8-bit display data with A0 active.*1	<LCBIn_base> + 418_H
LCBInDAT0SRDH	LCBInDATSRD[15:0]	Halfword	Read 16-bit display data with A0 active.*1	<LCBIn_base> + $41C_H$
LCBInDAT0SRDW	LCBInDATSRD[31:0]	Word	Read 32-bit display data with A0 active.*1	<LCBIn_base> + 420_H
LCBInDAT0CRD	LCBInDATCRD[7:0]	Byte	Read 8-bit control data with A0 inactive.*1	<LCBIn_base> + 424_H
LCBInDAT0CRDH	LCBInDATCRD[15:0]	Halfword	Read 16-bit control data with A0 inactive.*1	<LCBIn_base> + 428_H
LCBInDAT0CRDW	LCBInDATCRD[31:0]	Word	Read 32-bit control data with A0 inactive.*1	<LCBIn_base> + $42C_H$
LCBInDATRDW	LCBInDATRD[31:0]	Word	Read LCD data (32-bit access only).*2	<LCBIn_base> + 430_H

Note 1. If the LCD Bus Interface has been stopped due to a debug break (with LCBInEMU.LCBInSVSDIS = 0), it is not allowed to read these registers.
The LCBInDATRDW register can be used instead to obtain the last read data.

Note 2. When reading register LCBInDATRDW, no read access is triggered on the LCD bus but previously fetched data is reread. Refer to Section 36.3.1, Non-TFT operation mode operation mode for details.

NOTE

The active and inactive level of A0 is determined by LCBInOUTLEV.LCBInTLA0.

Depending on the operation mode, the LCD bus width and the access type (byte, halfword, or word access) certain data read register accesses are forbidden:

Table 36.38 Allowed (OK) and forbidden (X) access to data read registers

LCD Bus Interface operation mode	LCD bus width	LCBInDAT0SRD	LCBInDAT0SRDH	LCBInDAT0SRDW	LCBInDAT0CRD	LCBInDAT0CRDH	LCBInDAT0CRDW	LCBInDATRDW
Non-TFT*1	8	OK	OK	OK	OK	OK	OK	OK
	9	X	OK	OK	X	OK	OK	X
	16	X	OK	OK	X	OK	OK	X
	18	X	X	OK	X	X	OK	X
TFT		X						

Note 1. Reading of data registers in non-TFT operation mode *with* CLUT usage results in reading of data registers in non-TFT operation mode *without* CLUT usage.

36.4.6 CLUT Data RAM registers

36.4.6.1 LCBInCLUTDmW - CLUT data RAM registers (m = 0 to 255)

These registers are used to read and write the data of the color lookup table CLUT. Each LCBInCLUTDmW register is used for the definition of 18-bit color values, for example RGB values.

For details refer to Section 36.3.3, Color usage.

Access: This register can be accessed in 32-bit units.
It can only be read/written in CLUT definition mode (LCBInOPMODE.LCBInOPMODE[1:0] = 11_B).

Address: <LCBIn_base> + m x 4_H (m = 0 to 255)

Initial Value: This register is not initialized.

Section 37 Video and Graphics Functions

37.1 Architecture of the Graphics Subsystem

The Graphics Subsystems comprise following modules:

- Video channels with the Video Input and Output interfaces, the Image Synthesizers and the Video Output Warping Engine.
- Sprite Engine with RLE Units for de-compressing RLE encoded colour data and Sprite Units for sprite layers.

The Graphics Subsystem is connected to the XC0 cross-connect for transfer of video and graphics data to and from the various memories.

The Video Input Interfaces and the Distortion Correction with the Video Output Warping Engine have directly access to the XC0 cross-connect - and thus to the memories.

All memory read accesses of the Image Synthesizers are routed via the XC2 cross-connect to the Sprite Engine, which acquires the colour data from the memories via the cross-connect XC0.

Likewise the other cross-connect systems XC0 and XC1 the XC2 is also a multilayer transaction based bus system.
Refer to Section 14, Bus Architecture for details about the bus architecture.

Refer to the following sections for detailed descriptions about the various functional components:

- Video Input Interface: **Input Controller** in Section 38, Video Data Controller E (VDCE)
- Scaler: **Scaler** in Section 38, Video Data Controller E (VDCE)
- Format Converter: **Image Quality Improver** in Section 38, Video Data Controller E (VDCE)
- Image Synthesizer: **Image Synthesizer** in Section 38, Video Data Controller E (VDCE)
- Distortion Correction: **Output Image Generator** in Section 38, Video Data Controller E (VDCE) and Section 39, Video Output Warping Engine (VOWE)
- Video Output Interface: **Output Controller** in Section 38, Video Data Controller E (VDCE)
- General control functions: **System Controller** in Section 38, Video Data Controller E (VDCE)

CAUTION

Correct operation of the video and graphics functions is not guaranteed if CPU runs operated by the EMCLK.

However, the registers of the video and graphics modules can be accessed.

37.2 Graphics Subsystem Block Diagrams

The Graphics Subsystems of the various devices are different and shown in the following sections.

NOTES

1. The XC0 cross-connect in the following diagrams are not part of the Graphics Subsystem, but are included better understanding of the entire colour data transfers.
2. The arrows in the following diagrams indicate the direction of the colour data flow. For information about the master and slave ports at the cross-connects refer to Section 14, Bus Architecture.

37.2.1 D1L2(H) Graphics Subsystem

The D1L2(H) device features one video output channel and supports four graphic layers.

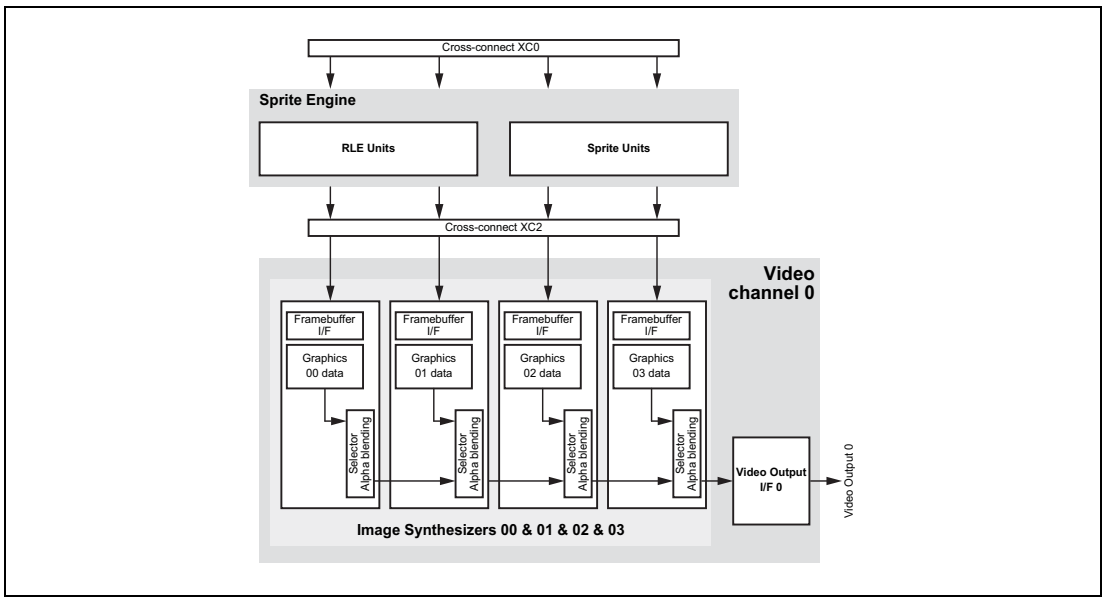

Figure 37.1 D1L2(H) Graphics Subsystem

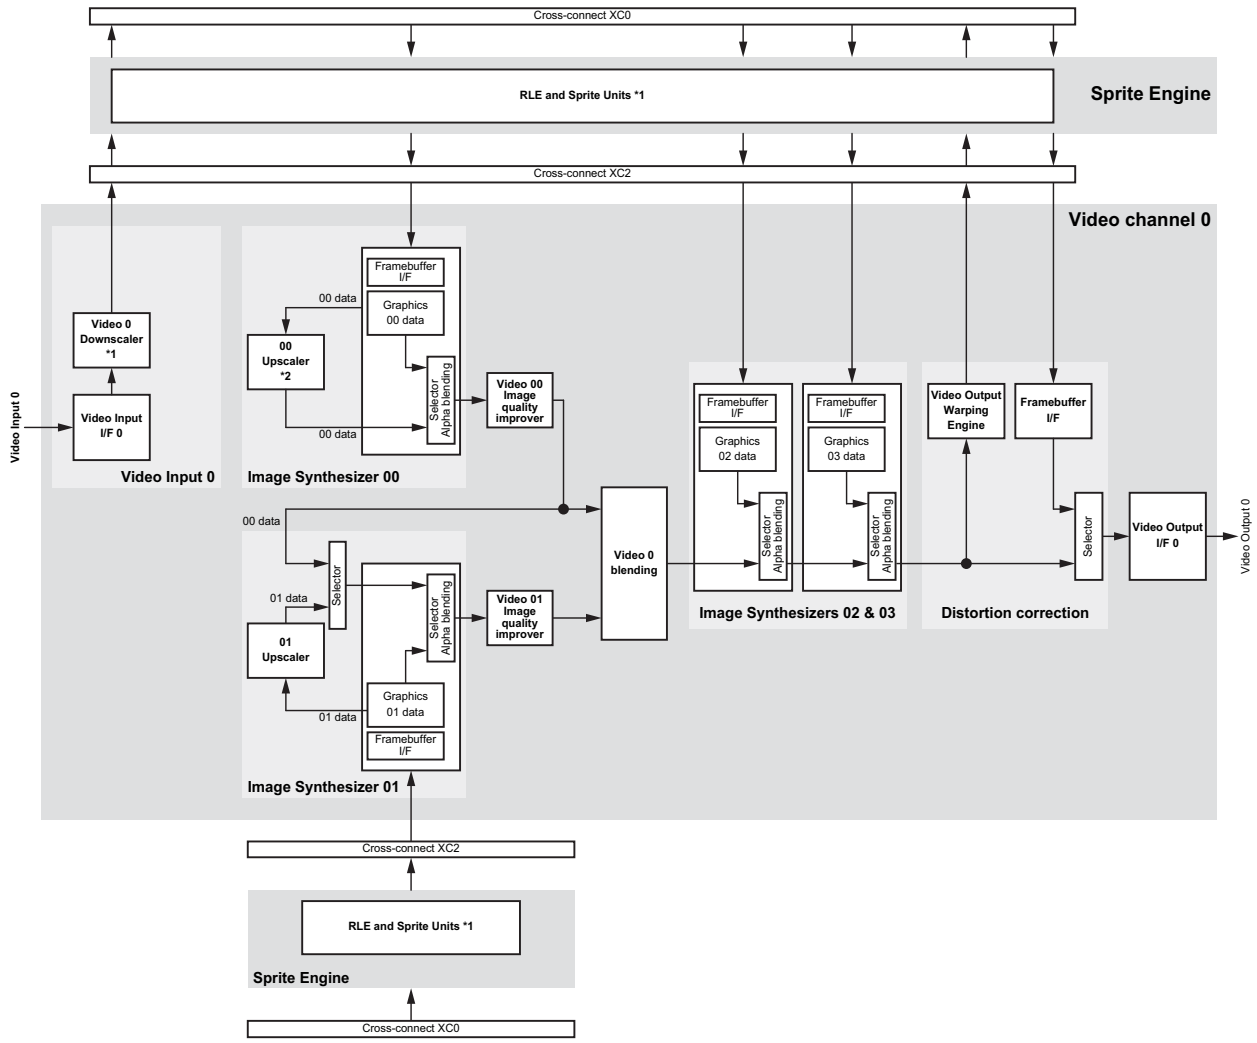
37.2.2 D1M1(H), D1M1-V2, D1M2(H) and D1M1A Graphics Subsystem

The D1M1(H), D1M1-V2devices features one video input and output channel, while the D1M2(H) device provides two video input and two video output channels.

Following layer combinations are possible:

- D1M1(H), D1M1-V2:
  - 4 graphics layers
  - 1 video layer + 3 graphics layers
- D1M2(H) for each of channel 0 and channel 1:
  - 4 graphics layers
  - 1 video layer + 3 graphics layers
  - 2 video layers + 2 graphics layers
- D1M1A:
  - 4 graphics layers (channel 0 and channel 1)
  - 1 video layer + 3 graphics layers (only channel 0)

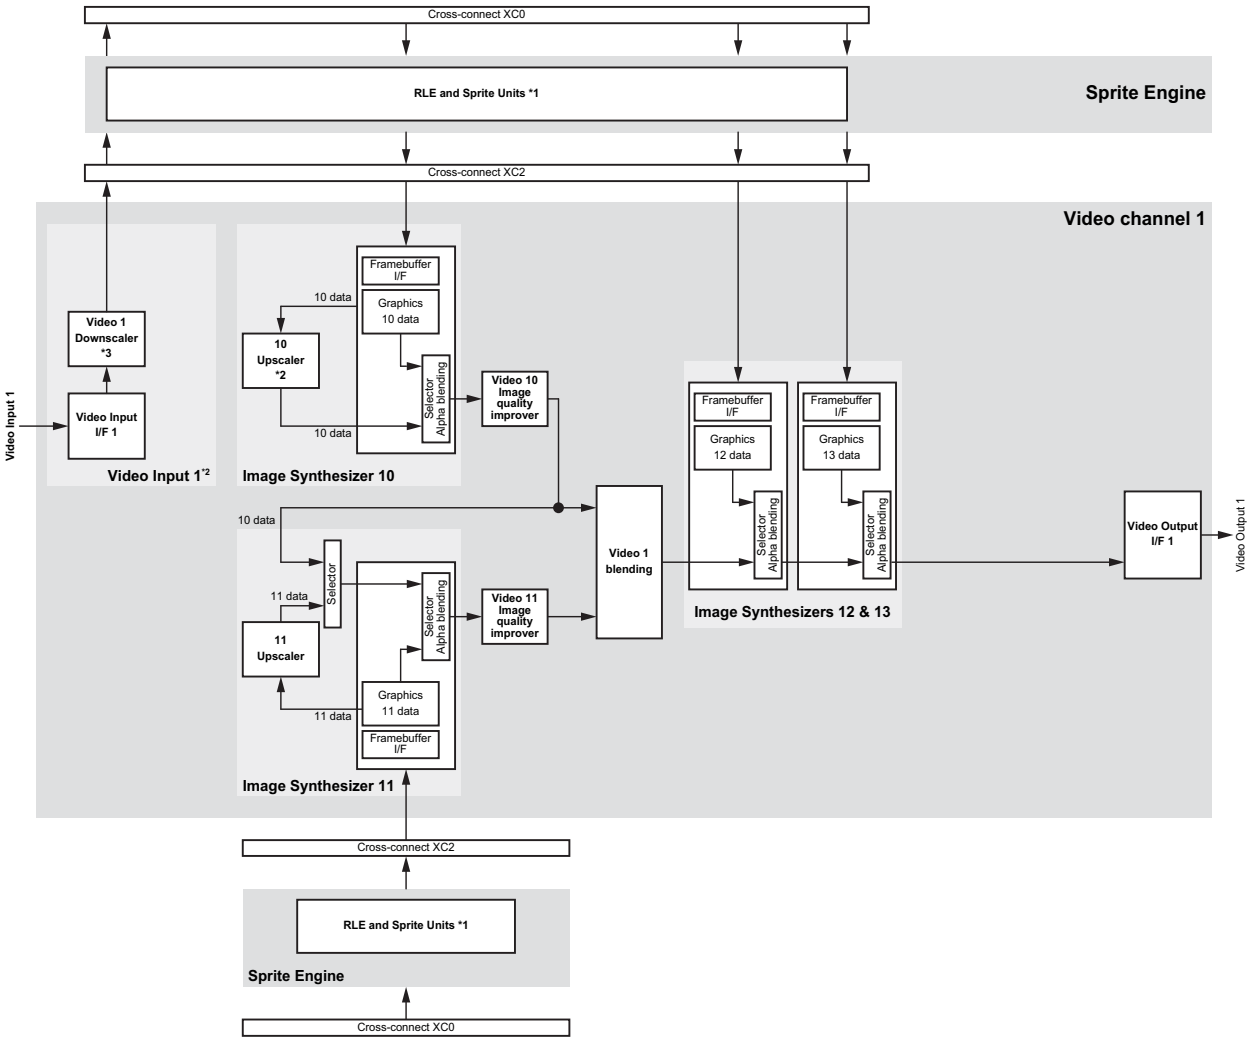
The Video Output channel 0 of the D1M1(H), D1M1-V2, D1M2(H) and D1M1A devices have a Video Output Warping Engine for predistortion of video images.



Note 1. – D1M1(H), D1M2(H): RLE unit can be used for background layer.
– D1M1-V2, D1M1A: RLE units can be used for all layers.

Note 2. The Video 0 Downscaler and 00 Upscaler can not be used concurrently. Either the Downscaler or the Upscaler can be used at the same time.

Figure 37.2 D1M1(H), D1M1-V2, D1M2(H) and D1M1A Graphics Subsystem video channel 0 data flow



Note 1. – D1M2(H): RLE unit can be used for background layer.
– D1M1A: RLE units can be used for all layers.

Note 2. The Video 1 Downscaler and 10 Upscaler can not be used concurrently. Either the Downscaler or the Upscaler can be used at the same time.

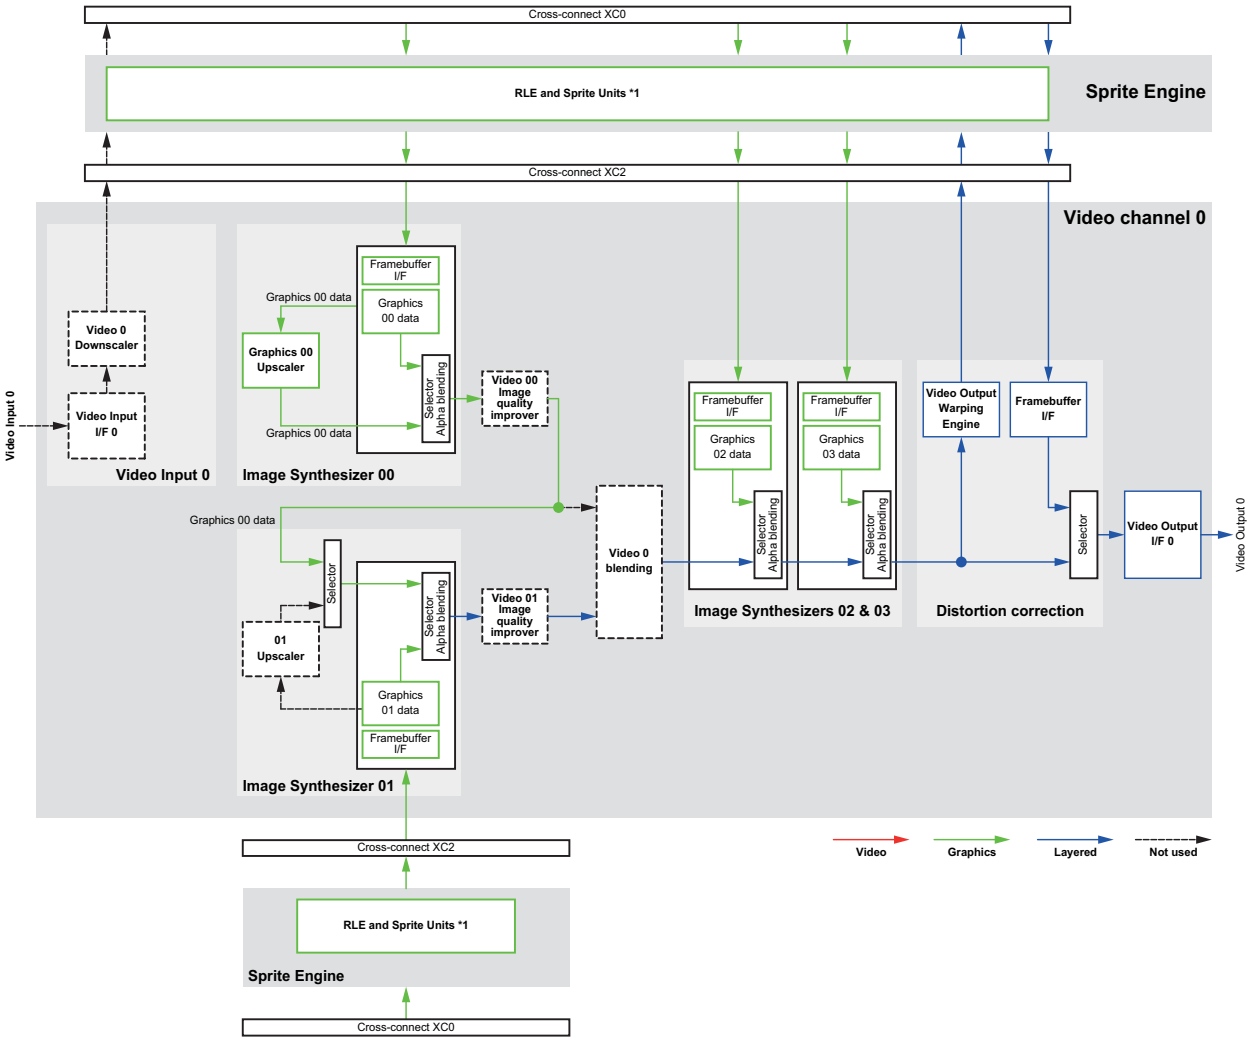
Note 3. The Video Input I/F 1 is not available for D1M1A devices.

Figure 37.3 D1M2(H) and D1M1A Graphics Subsystem video channel 1 data flow

37.3 Video input and output data flow

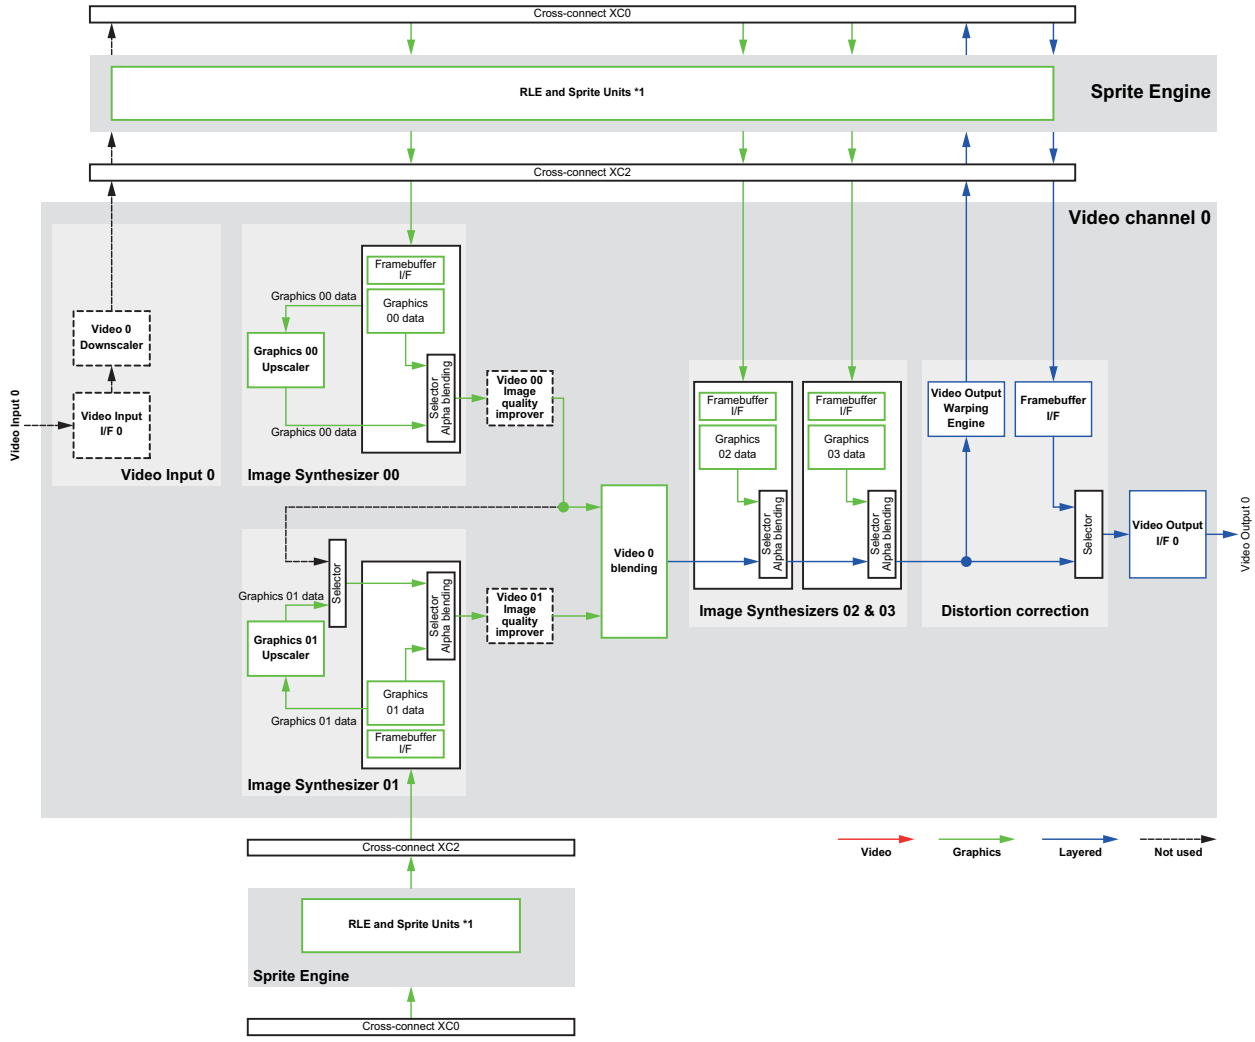
37.3.1 No video layers

If no video layers are used, each of the four Image Synthesizers can generate one graphic layer. The first Image Synthesizer (00 for channel 0, 10 for channel 1 of D1M2(H)) can utilize the upscaler for enlarging the graphics data, which constitutes the lowest layer 0, i.e. the background layer.



Note 1. – D1M1(H), D1M2(H): RLE unit can be used for background layer.
– D1M1-V2, D1M1A: RLE units can be used for all layers.

Figure 37.4 D1M1(H), D1M1-V2, D1M2(H) and D1M1A video channel 0 data flow: four graphics layers - configuration 1

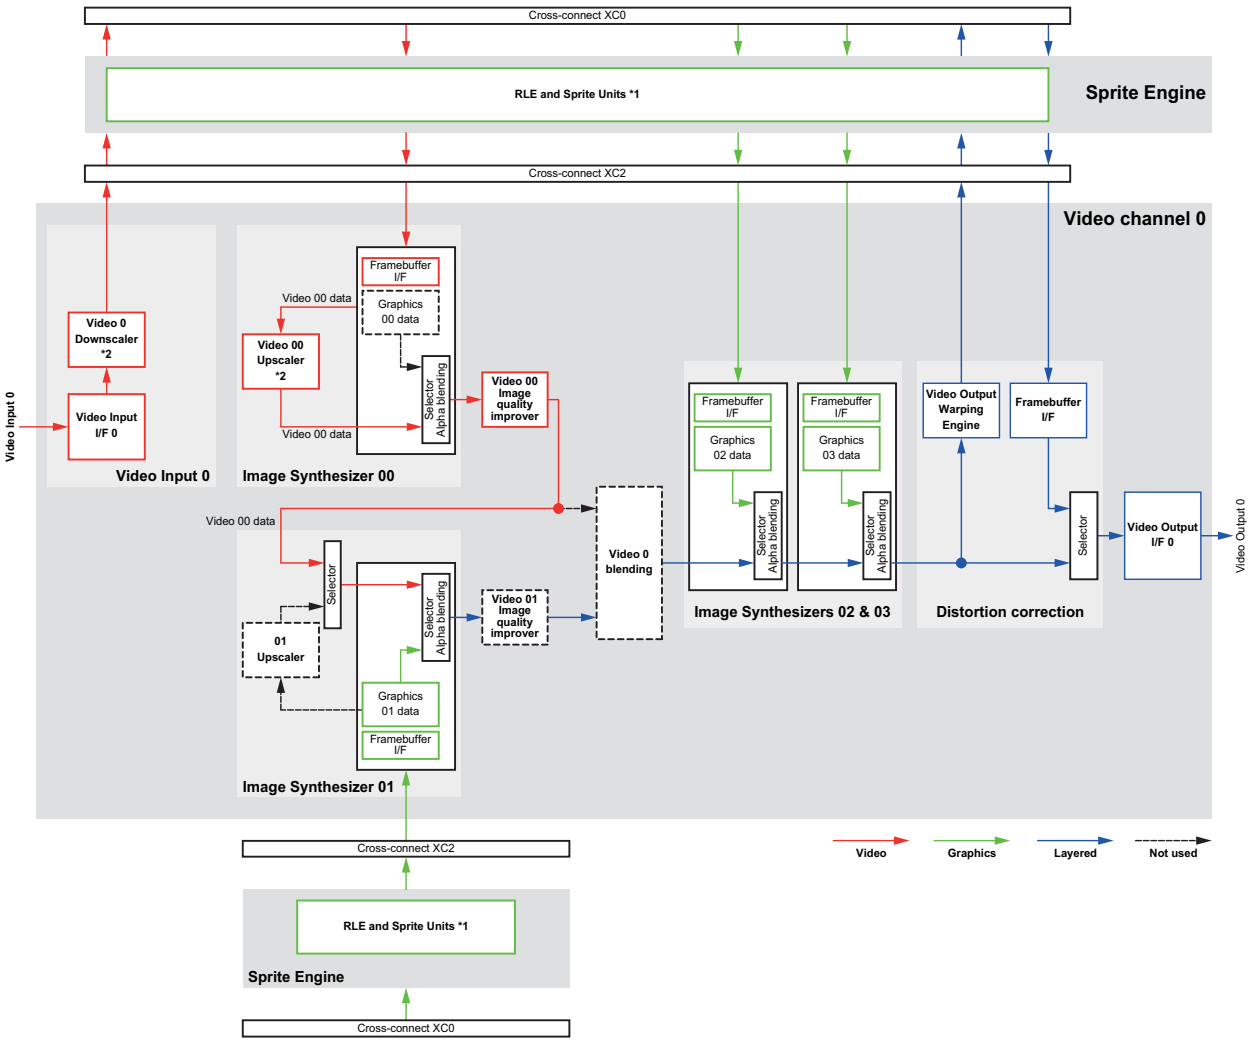


Note 1. – D1M1(H), D1M2(H): RLE unit can be used for background layer.
– D1M1-V2, D1M1A: RLE units can be used for all layers.

Figure 37.5 D1M1(H), D1M1-V2, D1M2(H) and D1M1A video channel 0 data flow: four graphics layers - configuration 2

37.3.2 One video layer

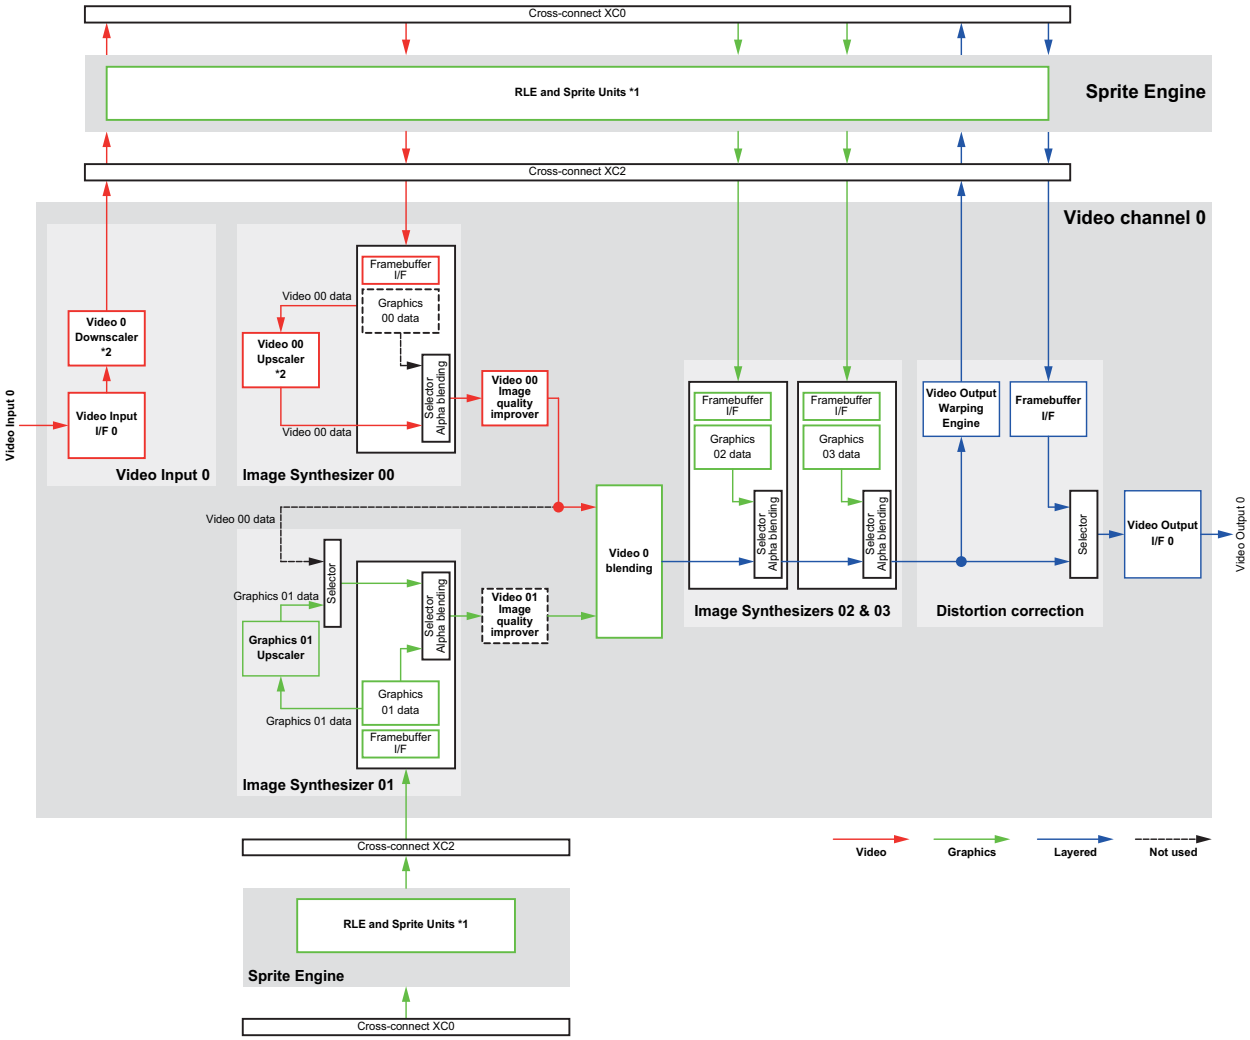
If one video layer is used, the first Image Synthesizer (00 for channel 0, 10 for channel 1 of D1M2(H) and D1M1A) can utilize the upscaler for enlarging the video data, which constitutes the lowest layer 0, i.e. the background layer.
All other Image Synthesizers can add up to three graphics layers.



Note 1. – D1M1(H), D1M2(H): RLE unit can be used for background layer.
– D1M1-V2, D1M1A: RLE units can be used for all layers.
However since captured video data from the Video Input interface is to be used on the background layer in this example, the RLE engines in the RLE units are bypassed anyway.

Note 2. The Video 0 Downscaler and Video 00 Upscaler can not be used concurrently. Either the Downscaler or the Upscaler can be used at the same time.

Figure 37.6 D1M1(H), D1M1-V2, D1M2(H) and D1M1A video channel 0 data flow: one video + up to three graphics layers - configuration 1



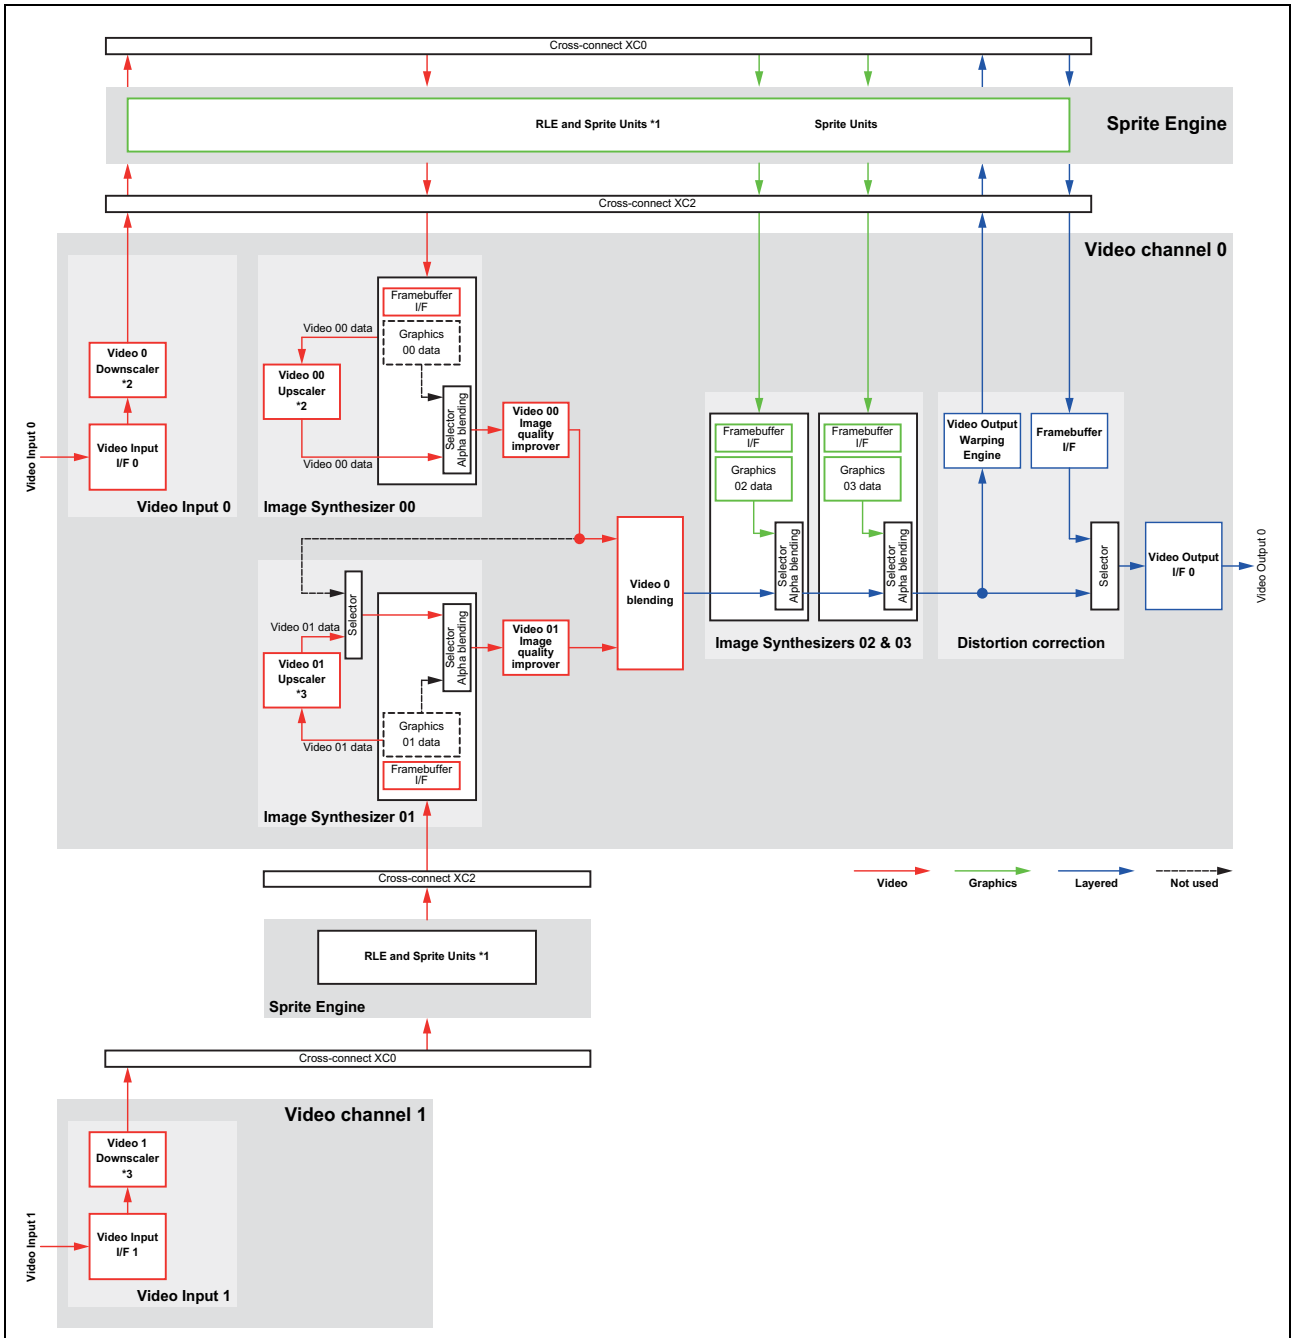
Note 1. – D1M1(H), D1M2(H): RLE unit can be used for background layer.
– D1M1-V2, D1M1A: RLE units can be used for all layers.
However since captured video data from the Video Input interface is to be used on the background layer in this example, the RLE engines in the RLE units are bypassed anyway.

Note 1. The Video 0 Downscaler and Video 00 Upscaler can not be used concurrently. Either the Downscaler or the Upscaler can be used at the same time.

Figure 37.7 D1M1(H), D1M1-V2, D1M2(H) and D1M1A video channel 0 data flow: one video + up to three graphics layers - configuration 2

37.3.3 Two video layers with D1M2H

If the captured data of both D1M2H Video Inputs are used, the Video Input data are scaled up by Image Synthesizer 00 and 01 (10 and 11 for channel 1) and combined by a separate video data blending unit. Blending is performed with a definable constant α value.
The remaining Image Synthesizers can add up to two graphics layers.



Note 1. RLE unit can be used for background layers.
However since captured video data from the Video Input interfaces are to be used on the background layer in this example, the RLE engines in the RLE units are bypassed anyway.

Note 2. The Video 0 Downscaler and Video 00 Upscaler can not be used concurrently. Either the Downscaler or the Upscaler can be used at the same time.

Note 3. The Video 1 Downscaler and Video 01 Upscaler can not be used concurrently. Either the Downscaler or the Upscaler can be used at the same time.

Figure 37.8 D1M2H video channel 0 data flow: two video + up to two graphics layers

37.4 D1M1(H), D1M1-V2, D1M2(H) and D1M1A video input/output synchronization

The D1M1(H), D1M1-V2, D1M2(H) and D1M1A devices provide basically two modes for selecting screen synchronization signals:

- Video output - video input synchronized mode
  In this mode the Video Input and Output is operating frame-synchronous, i.e. the external Video Input vertical synchronization signal is used throughout the entire input - output path.
- Separate mode
  In this mode a separate vertical synchronization signal is generated for the output path, independently from the Video Input.

In either case the horizontal synchronization signals are generated independently from the Video Input. The VSYNC signals are checked and erroneous VSYNC pulses are suppressed and missing VSYNC pulses are substituted in order to ensure stable continuous frame synchronization.

Interrupts

Three interrupts are generated related to the synchronization:

- Video input VSYNC interrupt, marks occurrence of the external VSYNC signal
- Video output VSYNC interrupt, marks occurrence of the VSYNC signals, used in the video output path
- VSYNC substitution interrupts, marks occurrence of a VSYNC substitution

NOTE

For more details refer to “Synchronization Control” in the “Scaler” section of “Video Data Controller (VDCE)”.

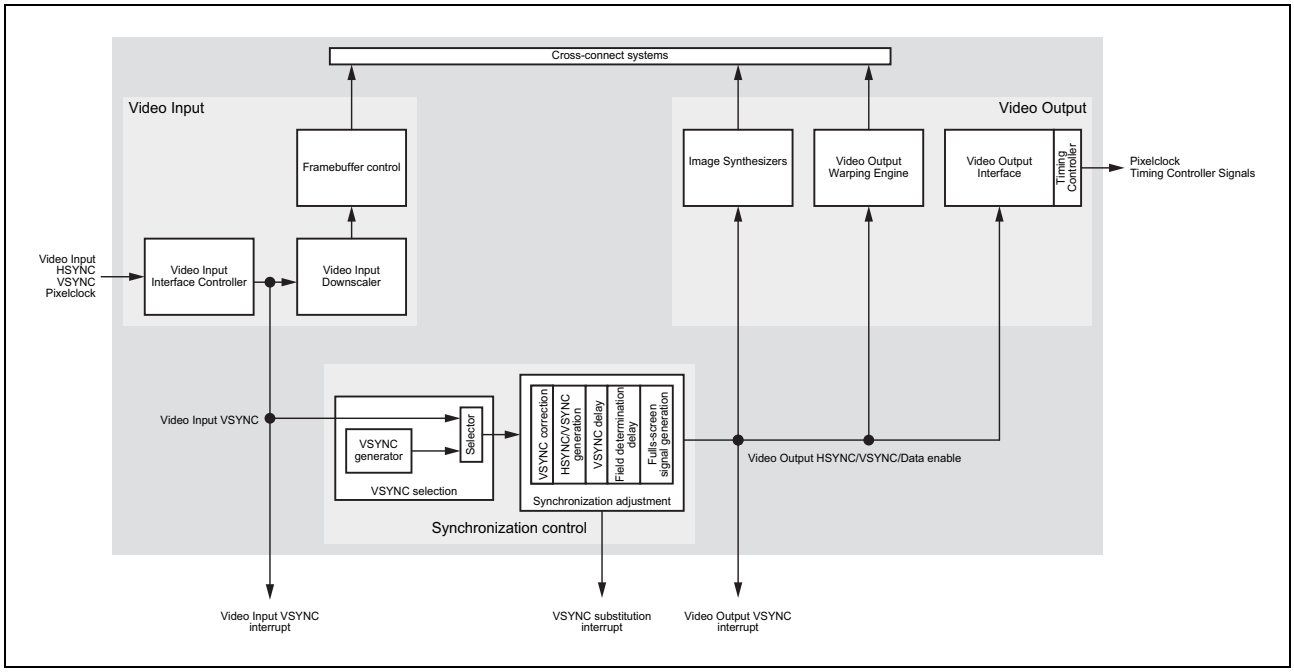


Figure 37.9 D1M1(H), D1M1-V2, D1M2(H) and D1M1A video input/output synchronization

37.5 Video channels clock generation

The clocks for the video channels can be derived from the Spread-Spectrum clock generator PLL0 or from a non-jittered clock of another PLL circuit, in case the connected display does not allow a jittered pixel clock.

The maximum video output pixel clock frequencies C_ISO_VDCEnCLK are:

- D1L2(H): 10 MHz
- D1M1(H), D1M1-V2: 30 MHz
- D1M2(H), D1M1A: 48 MHz

37.5.1 D1L2(H) pixel clock generator

The pixel clock C_ISO_VDCE0CLK of the video output interface is generated by a divider 2..255 from one of the clocks from the clock generators (PLLs).

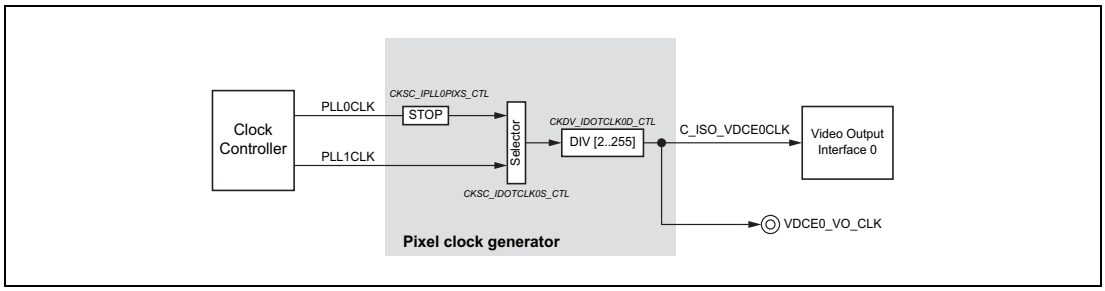

Figure 37.10 D1L2(H) video output pixel clock generation

37.5.2 D1M1(H)pixel clock generator

The pixel clock DOTCLK is generated by a divider 2..255 from one of the clocks from the clock generators (PLLs).

Several options are provided for C_ISO_VI0PIXCLK and C_ISO_VDCE0CLK, depending on the application scenario.

Video input interface used

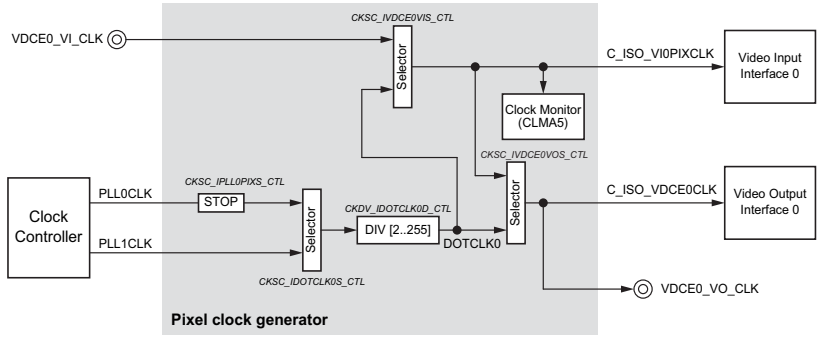
I.e. external video input clock VDCE0_VI_CLK is available.

- C_ISO_VI0PIXCLK = VDCE0_VI_CLK
- C_ISO_VDCE0CLK =
  - DOTCLK: in case video input and output operating with different pixel clocks
  - C_ISO_VI0PIXCLK: in case video input and output operating with same pixel clock

Video input interface not used

I.e. external video input clock VDCE0_VI_CLK is not available.

- C_ISO_VI0PIXCLK = DOTCLK
- C_ISO_VDCE0CLK = DOTCLK



Note 1. The name of the clock control and selection registers are shown in *italics*.

Figure 37.11 D1M1(H) video output pixel clock generation

37.5.3 D1M2(H) video channels clock generator

Video output pixel clock

To generate a video output pixel clock with sufficient granularity the D1M2(H) devices feature an additional dedicated PLL2 circuit, which can generate a jittered (via PLL0) or non-jittered (directly via MainOsc) pixel clock.
However the two Video Output Interfaces share the dedicated PLL2 for pixel clock generation.

Generally the pixel clock C_ISO_VDCEnCLK of the video output interface n is generated by a divider [2..255] from one of the clocks from the clock generators (PLLs).

Additionally each video channel can also select the external video input clock as output pixel clock.

The video output pixel clock generation differs in case a LVTTL/RGB output interface or a RSDS output interface is used.

For operating the RSDS output interface of the D1M2(H) devices a clock with 4 x pixel clock frequency is required by the RSDS logic. The pixel clock of the Video Output Interfaces needs to select a DIV4 of this clock as pixel clock.

If only a LVTTL output interface is used the pixel clock can be derived directly from the DIB [2:255] divider output.

Video input pixel clock

In normal use case the video input pixel clock is taken from the corresponding external signal.

In case of MIPI interface usage the video input clock in generated from the MIPI controller clock (by dividing by 3, 6, 12).

1. MIPI interface used (VDCE0)

   I.e.

   – C_ISO_VI0PIXCLK = C_ISO_MIPIPIXCLK

2. Video input interface used (VDCE0)

   I.e. external video input clock VDCE0_VI_CLK is available:

– C_ISO_VI0PIXCLK = VDCE0_VI_CLK

3. Video input interface not used (VDCE0)

I.e. external video input clock VDCE0_VI_CLK is not available:

– C_ISO_VI0PIXCLK = C_ISO_MIPIPIXCLK

4. Video input interface used (VDCE1)

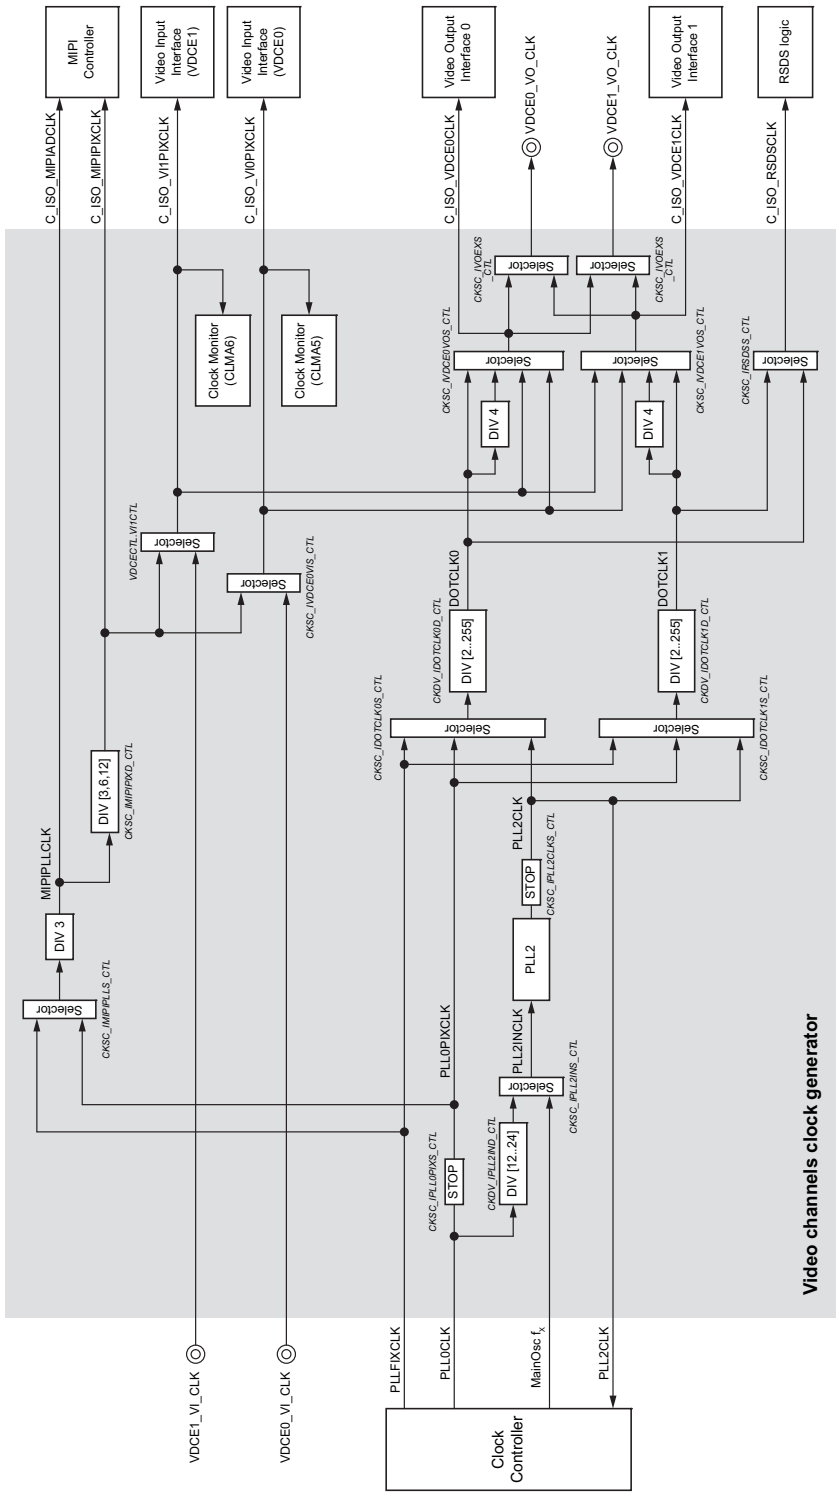
I.e. external video input clock VDCE1_VI_CLK is available:

– C_ISO_VI1PIXCLK = VDCE1_VI_CLK

5. Video input interface not used (VDCE1)

I.e. external video input clock VDCE1_VI_CLK is not available:

– C_ISO_VI1PIXCLK = C_ISO_MIPIPIXCLK



Note 1. The name of the clock control and selection registers are shown in *italics*.

Figure 37.12 D1M2(H) video channels clock generator

37.5.4 D1M1A video channels clock generator

The pixel clock DOTCLKn (n = 0, 1) is generated by a divider [1..255] from one of the clocks from the clock generators (PLLs).

In addition, D1M1A has options for VODDR, Serial RGB and Open LDI output. The video clocks have to be set by following options.

Video input interface used

I.e. external video input clock VDCE0_VI_CLK is available:

- C_ISO_VI0PIXCLK = VDCE0_VI_CLK

Video input interface not used

I.e. external video input clock VDCE0_VI_CLK is not available:

- C_ISO_VI0PIXCLK = DOTCLK

Video output interface clocks selections

The video output clock must be properly selected for the respective output mode.

Regarding the video ouput mode selection, refer to Section 37.9.3.2, D1M1A Video output selection.

(1) Video Output Interface n (VDCEn, n = 0, 1) input clocks selections

Table 37.1 Video Output Interface n input clocks selections

Output mode	C_ISO_VDCEnCLK	C_ISO_VDCEnCLK_OUT
Parallel RGB	CKSC_IVDCEnVOS_CTL*1	
Serial RGB*2	CKSC_IVDCE1VOS_CTL /[3 or 4]*1	CKSC_IVDCE1VOS_CTL*1
VODDR	VOn_PCLK	
Open LDI	DOTCLKn /7	

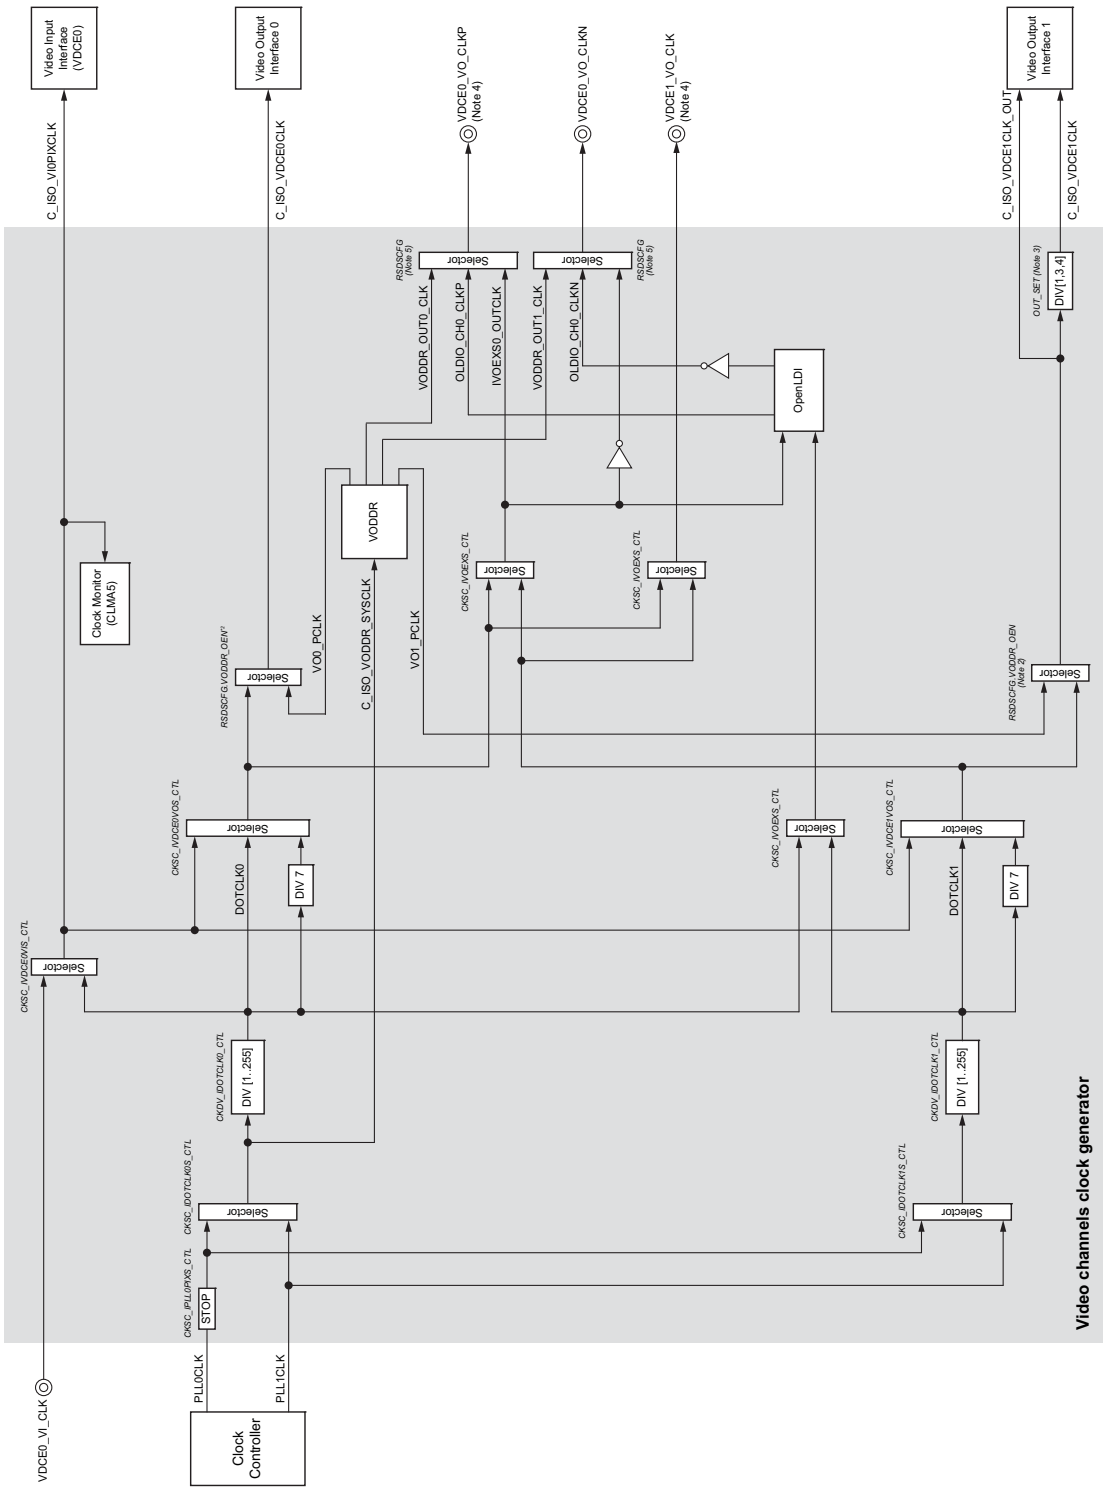
Note 1. The name of a selector register denotes the selected clock.
Note 2. Serial RGB is only available from VDCE1.

(2) External video output clocks selections

Table 37.2 External video output clocks selections

Output mode	VDCE0_VO_CLKP	VDCE1_VO_CLK
Parallel RGB	CKSC_IVDCE0VOS_CTL, (CKSC_IVDCE1VOS_CTL*2)*1	
Serial RGB	CKSC_IVDCE0VOS_CTL, (CKSC_IVDCE1VOS_CTL*2)*1	
VODDR	VODDR_OUT0_CLK	VODDR_OUT1_CLK
Open LDI	OpenLDIO_OUTCLK	–

Note 1. The name of a selector register denotes the selected clock.
Note 2. In case of CKSC_IVDCE0VOS_CTL = 1.



Note 1. The name of the clock control and selection registers are shown in *italics*.

Note 2. Refer to Section 37.10.1.2, RSDSCFG — RSDS and other video output control register.

Note 3. This selector is controlled by OUT_SET.OUT_FRQ_SEL bits of the respective Video Data Controller (VDCE). For details, refer to the OUT_SET register description in Section 38, Video Data Controller E (VDCE).

Note 4. Refer to Table 37.2, External video output clocks selections.

Note 5. Refer to Section 37.9.3, D1M1A Video output configuration.

Figure 37.13 D1M1A video channels clock generator

37.5.5 D1M1-V2 video channels clock generator

The pixel clock DOTCLK0 is generated by a divider [2..255] from one of the clocks from the clock generators (PLLs).

Several options are provided for C_ISO_VI0PIXCLK and C_ISO_VDCE0CLK, depending on the application scenario.

In addition, D1M1-V2 has options for Serial RGB output. The video clocks have to be set by following options.

Video input interface used

I.e. external video input clock VDCE0_VI_CLK is available:

- C_ISO_VI0PIXCLK = VDCE0_VI_CLK
- C_ISO_VDCE0CLK_OUT =
  - DOTCLK0: in case video input and output operating with different pixel clocks
  - C_ISO_VI0PIXCLK: in case video input and output operating with same pixel clock

Video input interface not used

I.e. external video input clock VDCE0_VI_CLK is not available:

- C_ISO_VI0PIXCLK = DOTCLK0
- C_ISO_VDCE0CLK_OUT = DOTCLK0

Video output interface clocks selections

The video output clock must be properly selected for the respective output mode.

Regarding the video output mode selection, refer to Section 37.9.4.1, D1M1-V2 video output mode selection.

(1) Video Output Interface 0 (VDCE0) input clock selections

Table 37.3 Video Output Interface n input clock selections

Output mode	C_ISO_VDCE0CLK	C_ISO_VDCE0CLK_OUT
Parallel RGB	CKSC_IVDCE0VOS_CTL*1	
Serial RGB	CKSC_IVDCE0VOS_CTL /[3 or 4]*1	CKSC_IVDCE0VOS_CTL*1

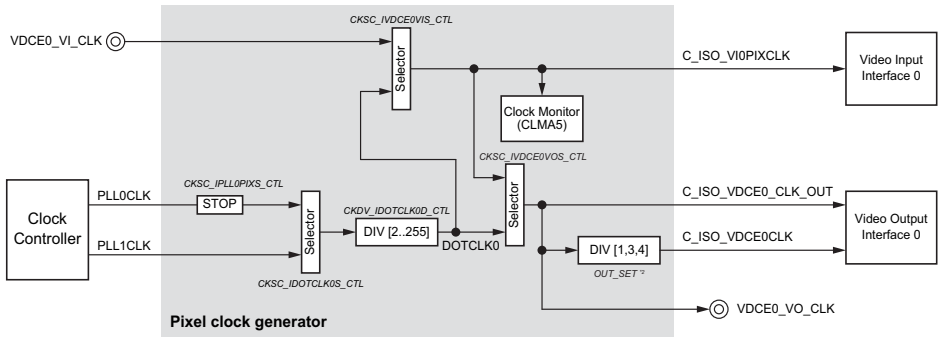
Note 1. The name of a selector register denotes the selected clock.

(2) External video output clock selections

Table 37.4 External video output clock selections

Output mode	VDCE0_VO_CLKP	VDCE0_VO_CLKN
Parallel RGB	CKSC_IVDCE0VOS_CTL*1	
Serial RGB	CKSC_IVDCE0VOS_CTL*1	

Note 1. The name of a selector register denotes the selected clock.



Note 1. The name of the clock control and selection registers are shown in *italics*.

Note 2. This selector is controlled by OUT_SET.OUT_FRQ_SEL bits of the respective Video Data Controller (VDCE).
For details, refer to the OUT_SET register description in Section 38, Video Data Controller E (VDCE).

Figure 37.14 D1M1-V2 video output pixel clock generation

37.5.6 D1M2(H) clock selections for different layer configurations

Depending on the types of layers, the data flow configuration and the usage of scalers certain settings need to be applied in order to supply all engaged modules with appropriate clocks.

The Section 37.3, Video input and output data flow shows diagrams for the various data flow configurations, which are referred to in the following table.

Table 37.5 Clock selections for different layer configurations

Layers		Clock supply for used scalers			
Types	**Configuration*4**	**Video input 0 downscaler**	**Image synthesizer 00 upscaler**	**Video input 1 downscaler**	**Image synthesizer 01 upscaler**
4 graphics	1	–	C_ISO_MIPIPIXCLK	–	–
	2				C_ISO_MIPIPIXCLK*2
1 video input + 3 graphics	1	C_ISO_MIPIPIXCLK or VDCE0_VI_CLK*1*3		–	–
	2				C_ISO_MIPIPIXCLK*2
2 video inputs + 2 graphics	–	C_ISO_MIPIPIXCLK or VDCE0_VI_CLK*1*3		VDCE1_VI_CLK*2*3	

Note 1. Selection by
CKSC_IVDCE0_VIS_CTL = 01_B: port VDCE0_VI_CLK
CKSC_IVDCE0_VIS_CTL = 10_B: C_ISO_MIPIPIXCLK

Note 2. Selection by
VDCECTL.VI1CTL = 0: port VDCE1_VI_CLK
VDCECTL.VI1CTL = 1: C_ISO_MIPIPIXCLK
The VDCECTL register is described in Section 37.10.1.1, VDCECTL — VDCE control register.

Note 3. The video input 0 or 1 downscaler and the image synthesizer 00 or 01 upscaler can not be used concurrently. Either the Downscaler or the Upscaler can be used at the same time.

Note 4. Refer to Section 37.3, Video input and output data flow for diagrams of the different configurations.

37.5.7 Video channels clock generators registers

The video channels clock generators are controlled and operated by the following registers:

Table 37.6 List of video channels clock generators registers

Register name	Shortcut	Address
PLL0PIXCLK clock control register	CKSC_IPLL0PIXS_CTL	FFF8 5640$_H$
PLL0PIXCLK clock active register	CKSC_IPLL0PIXS_ACT	FFF8 5648$_H$

C_ISO_MIPIPIXCLK clock divider register	CKSC_IMIPIPIXD_CTL	FFF8 56C0$_H$
C_ISO_MIPIPIXCLK clock divider active register	CKSC_IMIPIPIXD_ACT	FFF8 56C8$_H$

NOTE

The function of the PLL2 and its control registers are described in Section 12, Clock Controller.

NOTE

In the header files the module name of the above register is defined as:

SYS.

37.5.7.1 CKSC_IPLL0PIXS_CTL — PLL0PIXCLK clock control register (D1L2(H), D1M1(H), D1M1-V2, D1M2(H) and D1M1A only)

Writing to this register is protected by a special sequence of instructions by using the protection command register PROTCMDD1.
For details, refer to **Section 4, Write-Protected Registers**.

Access: This register can be read/written in 32-bit units.
Address: FFF8 5640$_H$
Initial value: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 37.22 CKDV_IDOTCLK1D_STAT register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When written, write the initial value.
1	DOTCLK1 ACT	DOTCLK1 clock output active state 0: clock is inactive 1: clock is active
0	DOTCLK1 SYNC	DOTCLK1 clock divider state 0: output clock does not correspond to the current DOTCLK1D clock divider 1: output clock corresponds to the current DOTCLK1D clock divider

37.5.7.17 CKSC_IVDCE0VOS_CTL — C_ISO_VDCE0CLK source clock selection register (D1M1(H), D1M1-V2, D1M2(H) and D1M1A only)

Writing to this register is protected by a special sequence of instructions by using the protection command register PROTCMDD1.
For details, refer to **Section 4, Write-Protected Registers**.

Access: This register can be read/written in 32-bit units.
Address: FFF8 5880$_H$
Initial value: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

NOTE

As long as the clock, selected by the source clock selection register, is not active, this source clock active register remains 0.
Its shows the correct value, when the selected clock becomes active.

37.5.7.29 CKSC_IMIPIPIXD_CTL — C_ISO_MIPIPIXCLK clock divider register (D1M2(H) only)

Writing to this register is protected by a special sequence of instructions by using the protection command register PROTCMDD1.
For details, refer to **Section 4, Write-Protected Registers**.

Access: This register can be read/written in 32-bit units.
Address: FFF8 56C0$_H$
Initial value: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 37.35 CKSC_IMIPIPIXD_CTL register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When written, write the initial value.
1 to 0	MIPIPIXD CSID[1:0]	Clock divider setting for C_ISO_MIPIPIXCLK 00_B: Disabled 01_B: MIPIPLLCLK /3 (default) 10_B: MIPIPLLCLK /6 11_B: MIPIPLLCLK /12

37.5.7.30 CKSC_IMIPIPIXD_ACT — C_ISO_MIPIPIXCLK clock divider active register (D1M2(H) only)

Access: This register can be read in 32-bit units.

Address: FFF8 56C8$_H$

Initial value: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MIPIPIXD ACT[1:0]	
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.36 CKSC_IMIPIPIXD_ACT register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When written, write the initial value.
1 to 0	MIPIPIXD ACT[1:0]	Current active IMIPIPIXD clock divider 0: selected clock inactive All others: selected and active clock

NOTE

As long as the clock, selected by the source clock selection register, is not active, this source clock active register remains 0.
Its shows the correct value, when the selected clock becomes active.

37.5.8 Video Input Pixel Clock Monitoring

The video input pixel clocks are supervised by the Clock Monitors CLMA5 and CLMA6.

Table 37.37 Video Input pixel Clock Monitors

Module	Clock	Connected to
CLMA5:		
CLMATSMP	CLMA5 sampling clock	Low Speed IntOsc f_{RL} (240 kHz)
CLMATMON	CLMA5 monitored clock	C_ISO_VI0PIXCLK (Video Input Interface 0 pixel clock)
CLMA6 (D1M2(H) only):		
CLMATSMP	CLMA6 sampling clock	Low Speed IntOsc f_{RL} (240 kHz)
CLMATMON	CLMA6 monitored clock	C_ISO_VI1PIXCLK (Video Input Interface 1 pixel clock)

In case of a pixel clock fail the clock monitor generates an error signal, that is input to the Error Control Module.

For the functional description of the Clock Monitors CLMA5 and CLMA6 refer to **Section 12.7, Clock Monitor A (CLMA)**.

37.6 Sprite Engine registers update control

The sprite definition registers of the Sprite Engine are updated, i.e. new sprite definition values become effective, with internal vertical enable from VDCE and software control, depending which signal the update for a certain sprite is assigned to.
Refer to “Sprite definition registers modification” in Section 43, Sprite Engine (SPEA) for details.

The following diagram shows how the Sprite Engine VUPDATEn (n=0,1) inputs are generated.

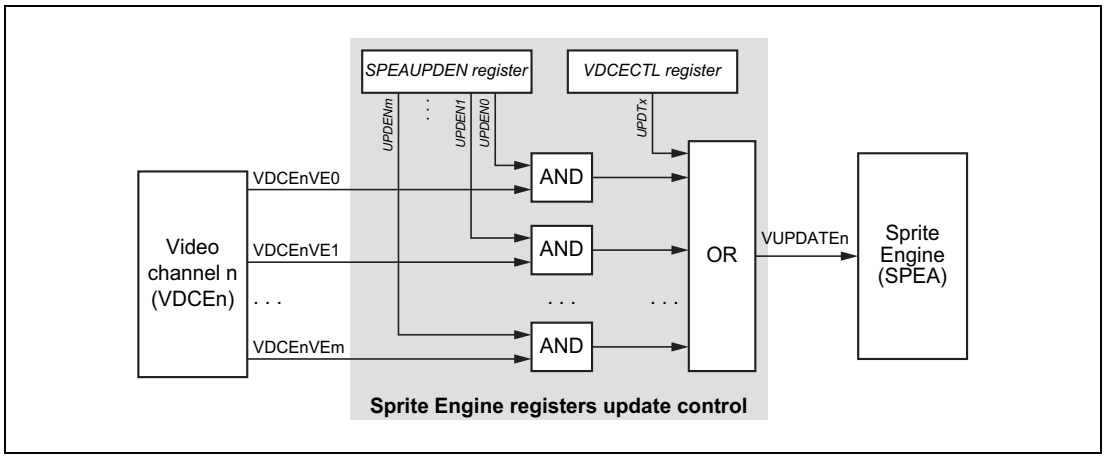

Figure 37.15 Sprite Engine registers update control for video channel n

Each stage of a video channel n issues vertical enable signals VDCEnVEm, which indicate active data processing of an image synthesizer stage.

These signals turn active with the first visible line of image data displayed by a layer and turns inactive after the last visible line has been displayed by that layer.

The Sprite Engine’s VUPDATEn input changes to low level when all VDCEnVEm signals turned to inactive (low level). This triggers the update of the sprite registers.

Each VDCEnVEm signal can be masked, i.e. disregarded, via mask bits in the Sprite Engine update timing control register SPEAUPDEN:

- UPDENm = 0: VDCEnVEm does not impact VUPDATEn signal generation
- UPDENm = 1: VDCEnVEm impacts VUPDATEn signal generation

The following table lists all available VDCEnVEm signals.

Table 37.38 VDCEnVEm signals (1/2)

VDCEn	VDCEnVEm signal		Mask bit
VDCE0	VDCE0VE0	VE of Image Synthesizer 00	SPEAUPDEN.UPDEN0
	VDCE0VE1	VE of Image Synthesizer 01	SPEAUPDEN.UPDEN1
	VDCE0VE2	VE of Image Synthesizer 02	SPEAUPDEN.UPDEN2
	VDCE0VE3	VE of Image Synthesizer 03	SPEAUPDEN.UPDEN3
	VDCE0VE4	VE of Output Image Generator	SPEAUPDEN.UPDEN4
	VDCE0VE5	VE after alpha blending of Image Synthesizer 02 and Image Synthesizer 03	SPEAUPDEN.UPDEN5

Table 37.38 VDCEnVEm signals (2/2)

VDCEn	VDCEnVEm signal		Mask bit
VDCE1 (D1M1A, D1M2(H) only)	VDCE1VE0	VE of Image Synthesizer 10	SPEAUPDEN.UPDEN8
	VDCE1VE1	VE of Image Synthesizer 11	SPEAUPDEN.UPDEN9
	VDCE1VE2	VE of Image Synthesizer 12	SPEAUPDEN.UPDEN10
	VDCE1VE3	VE of Image Synthesizer 13	SPEAUPDEN.UPDEN11
	VDCE1VE4	VE after alpha blending of Image Synthesizer 12 and Image Synthesizer 13	SPEAUPDEN.UPDEN12

Hardware and software update

By use of the VDCECTL.UPDTn bit and the mask bits SPEAUPDEN.UPDENm it can be selected whether the Sprite Engine registers are update by hardware, i.e. by the VDCEnVEm signals, or by the application program.

- Hardware update: VDCECTL.UPDTn = 0

  SPEAUPDEN.UPDENm = 1 selects the VDCEnVEm signals to generate VUPDATEn

- Software update: all SPEAUPDEN.UPDENm = 0

  The VSYNCn signal is directly controlled by the VDCECTL.UPDTn bit.
  Following procedure triggers the Sprite Engine registers update:

  – Set UPDTn = 1: VUPDATEn → high
  – Set UPDTn = 0: VUPDATEn → low: triggers Sprite Engine registers update.

37.7 Video Input selection

Depending on the data format of the video input signals and the ports, which are used to connect these, several control registers have to be set:

- correct alternative port function by use of the port control registers PFCn and PFCEn
- VDCE0: video input selection via VDCECTL.PXSL and VDCECTL.VISL0
- VDCE1: video input selection via VDCECTL.VISL1

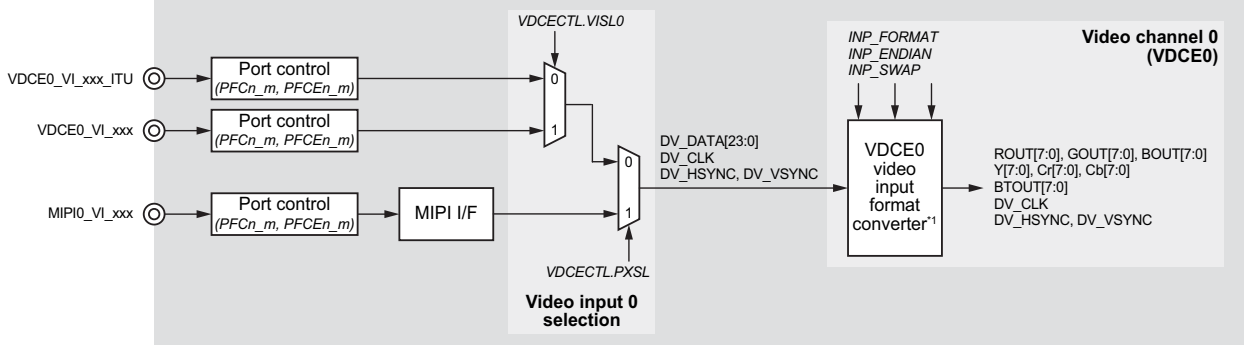
Refer to Section 2, Pins for detailed information about alternative port functions.

The tables in the following sections summarize the correct selection of the video input data format.

37.7.1 Video input channel 0 selection

Table 37.39 Video input channel 0 selection

Alternative port function	2nd alternative input (PFCn_m = 1, PFCEn_m = 0)	3rd alternative input (PFCn_m = 0, PFCEn_m = 1)		MIPI
Input ports	VDCE0_VI_xxx_ITU	VDCE0_VI_xxx_ITU	VDCE0_VI_xxx	MIPI0_VI_xxx
Data format	BT656, BT601	BT656, BT601	RGB666, RGB565, YCbCr422, BT656, BT601	RGB888, RGB565, YCbCr422
VISL0	0		1	–
PXSL	0			1



Note 1. The Video Data Controllers VDCEn include facilities to change the mapping of the color input data DV_DATA[23:0] to the VDCEn input data ROUT[7:0], GOUT[7:0], BOUT[7:0], BTOUT[7:0], Y[7:0], Cr[7:0] and Cb[7:0]. Refer to Section 38, Video Data Controller E (VDCE) for details about the INP_FORMAT, INP_ENDIAN and INP_SWAP settings.

Figure 37.16 Video channel 0 video input selections

The following table shows the assignment between the various video input signals for following settings:

- VDCEn video input format converter settings:
  - INP_EXT_SYNC_CNT.INP_ENDIAN_ON = 0
  - INP_EXT_SYNC_CNT.INP_SWAP_ON = 0

  For other bit allocations of DV_DATA[23:0] to ROUT[7:0], GOUT[7:0], BOUT[7:0], Y[7:0], Cr[7:0], Cb[7:0] and BTOUT[7:0] refer to Section 38, Video Data Controller E (VDCE).
- Video input selection:

– VDCECTL.PXSL = 0: input via VDCE0_VI signals (no MIPI)

Table 37.40 Video channel 0 input format selection examples

	VDCE0 video input format converter output			
	INP_FORMAT[2:0] = 001_B	INP_FORMAT[2:0] = 010_B	INP_FORMAT[2:0] = 011_B, 100_B	INP_FORMAT[2:0] = 101_B
Port signal name	**RGB666**	**RGB565**	**ITU formats**	**YCrCb422**
Color data signals				
VDCE0_VI_DATA17	ROUT[7]	–	–	–
VDCE0_VI_DATA16	ROUT[6]	–	–	–
VDCE0_VI_DATA15	ROUT[5]	ROUT[7]	–	Y[7]
VDCE0_VI_DATA14	ROUT[4]	ROUT[6]	–	Y[6]
VDCE0_VI_DATA13	ROUT[3]	ROUT[5]	–	Y[5]
VDCE0_VI_DATA12	ROUT[2]	ROUT[4]	–	Y[4]
VDCE0_VI_DATA11	GOUT[7]	ROUT[3]	–	Y[3]
VDCE0_VI_DATA10	GOUT[6]	GOUT[7]	–	Y[2]
VDCE0_VI_DATA9	GOUT[5]	GOUT[6]	–	Y[1]
VDCE0_VI_DATA8	GOUT[4]	GOUT[5]	–	Y[0]
VDCE0_VI_DATA7	GOUT[3]	GOUT[4]	BTOUT[7]	Cb[7] / Cr[7]
VDCE0_VI_DATA6	GOUT[2]	GOUT[3]	BTOUT[6]	Cb[6] / Cr[6]
VDCE0_VI_DATA5	BOUT[7]	GOUT[2]	BTOUT[5]	Cb[5] / Cr[5]

37.8 D1M2(H) MIPI Video Input Interface (MIPI)

37.8.1 Overview of the RH850/D1L/D1M MIPI Video Input Interface

37.8.1.1 Number of Units

This microcontroller has the following number of units of the MIPI.

Each MIPI unit has one channel interface. “Number of channels” is used with the same meaning as “number of units” in this section.

Table 37.43 Number of Units

Product Name	D1L1	D1L2(H)	D1M1(H) D1M1-V2 D1M1A	D1M2(H)
Units	–	–	–	1
Names	–	–	–	MIPIn (n = 0)

Table 37.44 Index

Index	Meaning
n	Throughout this section, the individual MIPI units are identified by the index “n” (n = 0): for example, MIPInMODE is the MIPIn mode register.

37.8.1.2 Register Base Addresses

MIPI base addresses are listed in the following table.

MIPI register addresses are given as offsets from the base addresses in general.

Table 37.45 Register Base Address

Base Address Name	Base Address
<MIPI0_base>	FFFD 3400_H

37.8.1.3 Clock supply

The MIPI clock supply is shown in the following table.

Table 37.46 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
MIPI0	MIPIPCLK	Clock Controller C_ISO_PCLK
	MIPIADCLK	Clock Controller C_ISO_MIPIADCLK
	MIPIPIXCLK	Clock Controller C_ISO_MIPIPIXCLK

37.8.1.4 Interrupts

MIPI interrupt requests are listed in the following table.

Table 37.47 MIPIn interrupt requests

MIPIn signals	Function	Connected to
MIPI0:		
	MIPI buffer overflow interrupt	Interrupt Controller INTMIPI0OVF
	MIPI controller interrupt	Interrupt Controller INTMIPI0CTL

37.8.1.5 Reset sources

MIPI reset sources are listed in the following table. MIPI is initialized by these reset sources.

Table 37.48 Reset sources

Unit Name	Reset Source
MIPI0	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

37.8.1.6 External Input/Output Signals

External input/output signals of MIPI are listed below.

Table 37.49 I/O signals connections

Unit Signal Name	Outline	Alternative Port Pin Signal
MIPI0:		
MIPI0_VI_DATA0P	Data lane 0 signals	Port MIPI0_VI_DATA0P
MIPI0_VI_DATA0N		Port MIPI0_VI_DATA0N
MIPI0_VI_DATA1P	Data lane 1 signals	Port MIPI0_VI_DATA1P
MIPI0_VI_DATA1N		Port MIPI0_VI_DATA1N
MIPI0_VI_CLKP	Clock lane signals	Port MIPI0_VI_CLKP
MIPI0_VI_CLKN		Port MIPI0_VI_CLKN

37.8.2 Functional Overview

The MIPI Video Input Interface captures video data from a MIPI CSI-2 compliant Camera Serial Interface and passes the video data on to the Video Input Interface of the Video Data Controller.

Features summary

- Input and output color formats: 16-bit YUV422, 24-bit RGB888, 16-bit RGB565
- Maximum frame size: 1024 x 1024 pixels (24-bit color)
- Maximum frame rate: 60 frames/s
- MIPI CSI-2 receiver
- Lane module type:

  - MIPI CSI-2 receiver
  - The external MIPI CSI-2 master can send trigger events over the MIPI interface, which can issue interrupts.
- Data lane number: up to two lanes
- Data transfer bandwidth
  - Maximum data clock: max. 240 MHz in DDR mode
  - Transfer speed: max. 480 Mbit/s per lane, max. 960 Mbit/s in total
- Data consistency checks
  - ECC check on MIPI packet header (single bit errors correction, double bit errors detection)
  - CRC check on data packets
- Video output signal to the Video Data Controller
  - Regular video timing with HSYNC and VSYNC
  - Horizontal blank period: fixed to 16 pixel clock cycles
  - Burst output via two 4 KB output buffers
- Following MIPI CSI-2 features are not supported by this implementation of the MIPI Video Input Interface:
  - Virtual channel: This feature is not supported.
  - Embedded data: Transmitting embedded data to the Video Data Controller VDCE0 is not supported.
  - Low power data transfer (LPDT): This feature is not supported.

37.8.3 Functional Description

The following figure provides a functional block diagram of the MIPI Video Input Interface.

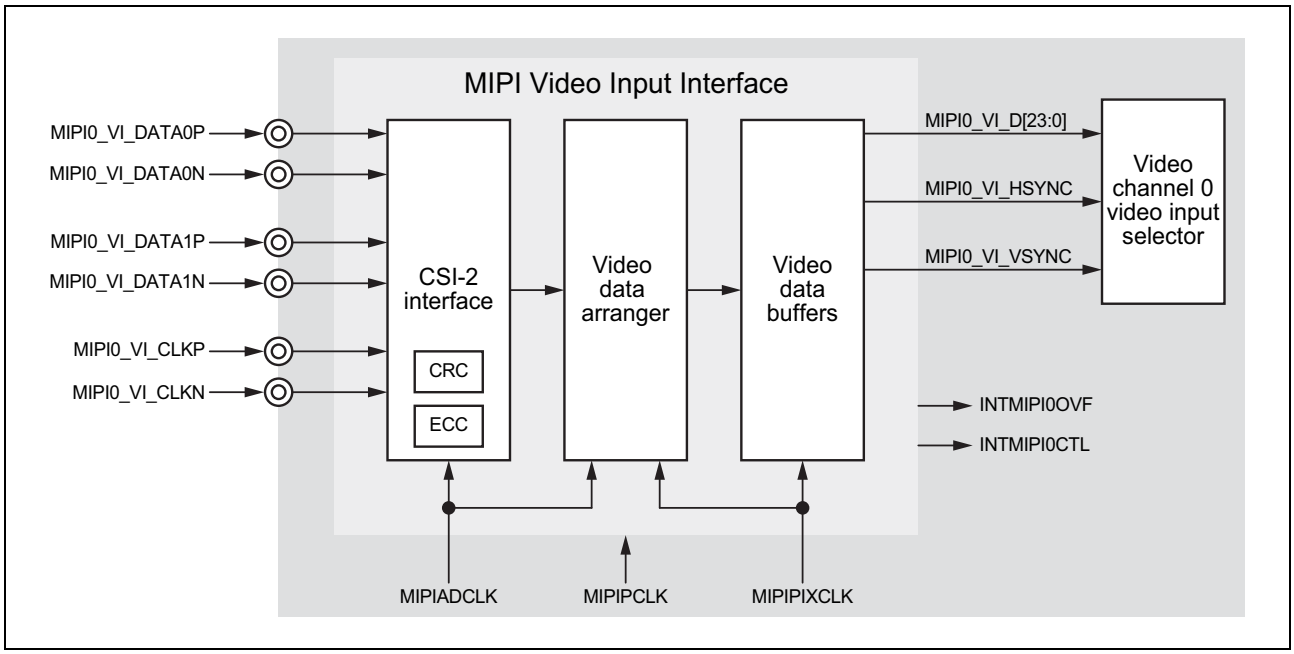

Figure 37.18 MIPI Video Input Interface block diagram

The video data, acquired via the CSI-2 interface, is arranged to be forwarded to the video input selector for the video channel 0 of the Video Data Controller.

The color format of the video data is passed through to the video channel 0, i.e. the color format is not changed.

The video signals (MIPI0_VI_D[23:0], MIPI0_VI_HSYNC and MIPI0_VI_VSYNC) are passed to the video input selector for the video channel 0 of the Video Data Controller via video data buffers.

The clock for the video channel 0 signals (MIPI0_VI_D[23:0], MIPI0_VI_HSYNC and MIPI0_VI_VSYNC) is the MIPIPIXCLK..
Refer to Section 37.7, Video Input selection for details about the video input selector.

37.8.4 MIPI Video Input Interface registers

The MIPI Video Input Interface is controlled and operated by the following registers:

For details on <MIPIn_base>, see Section 37.8.1.2, Register Base Addresses.

Table 37.50 MIPI register overview

Register name	Shortcut	Address
Operation control register	MIPInON	<MIPIn_base> + 00_H
Mode register	MIPInMODE	<MIPIn_base> + 04_H
Data delay register	MIPInDATA_DLY_CTL	<MIPIn_base> + 08_H
Reset register	MIPInRST_CTL	<MIPIn_base> + $0C_H$
SubLVDS buffer control	MIPInBUF_CTL	<MIPIn_base> + 10_H
$T_{CLK-SETTLE}$ and $T_{HS-SETTLE}$ register	MIPInSOT_COUNT	<MIPIn_base> + 14_H
PHY layer status register	MIPInRX_STATE	<MIPIn_base> + 18_H
Long packet word count definition register	MIPInWORD_COUNT	<MIPIn_base> + $1C_H$
LP buffer and noise removal timing register	MIPInLP_EN_ON_WC	<MIPIn_base> + 20_H
Line blanking period register	MIPInLINE_BLANK	<MIPIn_base> + 28_H
LP11 reset delay adjustment register	MIPInRESET_DLY_CTL0	<MIPIn_base> + $2C_H$
Interrupt status register	MIPInINTSTATUS	<MIPIn_base> + 40_H
Interrupt enable set register	MIPInINTENSET	<MIPIn_base> + 48_H
Interrupt enable clear register	MIPInINTENCLR	<MIPIn_base> + $4c_H$
Interrupt factor clear register	MIPInINTFFCLR	<MIPIn_base> + 50_H
T_{EOT} setting	MIPInEOT_COUNT	<MIPIn_base> + 74_H
Video input color format register	MIPInVIN_MODE	<MIPIn_base> + $9C_H$

37.8.4.1 MIPInON – Operation control register

This register controls start and stop of the MIPI interface.

Access: This register can be read/written in 32-bit units.

Address: <MIPIn_base> + 00_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit position	Bit name	Function
31 to 1	Reserved	These bits are always read as 0. When written, write the initial value.
0	MIPI_ON	MIPI interface start/stop control 0: Stop the MIPI interface immediately 1: Start the MIPI interface immediately

37.8.4.2 MIPInMODE – Mode register

This register controls the mode of the MIPI interface.

Access: This register can be read/written in 32-bit units.

Address: <MIPIn_base> + 04_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	DEL_LP11_NOISE	LANE_NUM[1:0]		0	SEL_PLIF	RSTN_CLK_ON	RSTN_DATA_ON	SOT_CLKSEL	0	0	0	0	DATA_TYPE[1:0]	
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 37.52 MIPInMODE register contents (1/2)

Bit position	Bit name	Function
31 to 30	Reserved	These bits are always read as 0. When written, write the initial value.
29	DEL_LP11_NOISE	Noise filter for clock line. If this is switched on, noise occurring during transition from HS state to LP11 state is removed. 0: Noise removal disabled 1: Noise removal enabled
28 to 27	LANE_NUM[1:0]	Number of lanes. 00_B: 1 lane 01_B: 2 lanes All others: Setting prohibited
26	Reserved	These bits are always read as 0. When written, write the initial value.
25	SEL_PLIF	Select PHY layer interface synchronization method 0: Select FIFO method 1: Setting prohibited
24	RSTN_CLK_ON	Reset enable for clock lane for $T_{CLK\text{-}SETTLE}$ and T_{EOT} When this bit is 1(enable), the reset of clock lane is controlled after $T_{CLK\text{-}SETTLE}$ and T_{EOT}. This reset is available for noise removal from HS buffer during LP mode. This bit must be set to 1 before the MIPI transmission is enabled by MIPInON.MIPI_ON = 1. 0: Disable (prohibited when MIPInON.MIPI_ON = 1) Clock lane is not controlled after $T_{CLK\text{-}SETTLE}$ and T_{EOT}. Also, clock lane is not reset during LP mode. 1: Enable The reset of clock lane is released after $T_{CLK\text{-}SETTLE}$. $T_{CLK\text{-}SETTLE}$ is defined in MIPInSOT_COUNT.CLK_COUNT[7:0]. The reset of clock lane is activated after T_{EOT}. T_{EOT} is defined in MIPInEOT_COUNT.EOT_COUNT[7:0].

Table 37.52 MIPInMODE register contents (2/2)

Bit position	Bit name	Function
23	RSTN_ DATA_ON	Reset enable for data lane for $T_{HS-SETTLE}$ and T_{EOT} When this bit is 1(enable), the reset of data lane is controlled after $T_{HS-SETTLE}$ and T_{EOT}. This reset is available for noise removal from HS buffer during LP mode. This bit must be set to 1 before the MIPI transmission is enabled by MIPInON.MIPI_ON = 1. 0: Disable (prohibited when MIPInON.MIPI_ON = 1) Data lane is not controlled after $T_{HS-SETTLE}$ and T_{EOT}. Also, data lane is not reset during LP mode. 1: Enable The reset of data lane is released after $T_{HS-SETTLE}$. $T_{HS-SETTLE}$ is defined in MIPInSOT_COUNT.DATA_COUNT[7:0]. The reset of data lane is activated after T_{EOT}. T_{EOT} is defined in MIPInEOT_COUNT.EOT_COUNT[7:0].
22	SOT_CLKSEL	Select the clock that counts $T_{HS-SETTLE}$ 0: MIPIADCLK 1: External clock divided by 4
21 to 18	Reserved	These bits are always read as 0. When written, write the initial value.
17 to 16	DATA_ TYPE[1:0]	Input format specification 10_B: RAW8 All others: Setting prohibited
15 to 5	Reserved	These bits are always read as 0. When written, write the initial value.
4	VTIM	Timing of MIPI0_VI_VSYNC changes for using VDCE vertical position shifting 0: Enabled 1: Disabled
3 to 2	Reserved	This bit is always read as 0. When written, write the initial value.
1	ECC_EN	ECC check and correction of single bit errors of the header 0: Disabled 1: Enabled
0	CRC_EN	CRC check of the packet data 0: Disabled 1: Enabled

37.8.4.3 MIPInDATA_DLY_CTL – Data delay register

The register is for input data delay setting.

Access: This register can be read/written in 32-bit units.

Address: <MIPIn_base> + 08_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	0	0	0	DLY_LANE1[2:0]			DLY_LANE0[2:0]		
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.53 MIPInDATA_DLY_CTL register contents

Bit position	Bit name	Function
31 to 6	Reserved	These bits are always read as 0. When written, write the initial value.
5 to 3	DLY_ LANE1[2:0]	Delay adjustment for data lane 1 Delay time = DLY_LANE1[2:0] x 100 ps
2 to 0	DLY_ LANE0[2:0]	Delay adjustment for data lane 0 Delay time = DLY_LANE0[2:0] x 100 ps

37.8.4.4 MIPInRST_CTL – Reset register

This register is used to reset the MIPI interface.

The reset must be released only if MIPI receiver is in STOP state.
So, please set the MIPI transceiver to STOP state (LP11) before releasing MIPI reset.
Thus follow the procedure below to reset the MIPI interface:

- Write MIPInRST_CTL = 0000 0003_H
- Set MIPI transceiver to STOP state (LP11)
- Write MIPInRST_CTL = 0000 0000_H

NOTE

In order to reduce power consumption it is recommended to set the MIPI interface into reset if it is not used.

Access: This register can be read/written in 32-bit units.

Address: <MIPIn_base> + $0C_H$

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	OTHER_RST	PHY_RST
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 37.54 MIPInRST_CTL register contents

Bit position	Bit name	Function
31 to 2	Reserved	These bits are always read as 0. When written, write the initial value.
1	OTHER_RST	Reset MIPI interface, except PHY layer and PHY layer interface 0: Release reset 1: Reset
0	PHY_RST	Reset PHY layer and PHY layer interface 0: Release reset 1: Reset

CAUTION

All parts of the MIPI Interface must be reset or released from reset at the same time.

Thus set

- **MIPInRST_CTL = 0000 0003_H to set the MIPI Interface in reset**
- **MIPInRST_CTL = 0000 0000_H to release the MIPI Interface from reset**

37.8.4.5 MIPInBUF_CTL – SubLVDS buffer control

This register is used to control the lane buffers.

Access: This register can be read/written in 32-bit units.

Address: <MIPIn_base> + 10_H

Initial value: 0000 $7FFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MIPInBUF_CTL[31:16]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MIPInBUF_CTL[15:0]															
Initial value	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.55 MIPInBUF_CTL register contents

Bit position	Bit name	Function
31 to 0	MIPInBUF _CTL[31:0]	Lane buffer control • Set this register to 0000 0000_H if the MIPI interface is used. • Set this register to its initial value 0000 $7FFF_H$ if the MIPI interface is not used.

37.8.4.6 MIPInSOT_COUNT – $T_{CLK\text{-}SETTLE}$ and $T_{HS\text{-}SETTLE}$ register

This register determines the duration of $T_{CLK\text{-}SETTLE}$ and $T_{HS\text{-}SETTLE}$.

At the beginning of the HS transmission the LP receive buffers are switched off and the HS receive buffers and the line termination is switched on.

To mask possible analog effects that could occur during the switching a time is defined where the output from the HS receiver is ignored. Thus the time bridges the time until the switch from LP to HS has been settled.

For the data lane this time is $T_{HS\text{-}SETTLE}$ and is defined by MIPInSOT_COUNT.DATA_COUNT[7:0]. For the clock lane this time is $T_{CLK\text{-}SETTLE}$ and is defined by MIPInSOT_COUNT.CLK_COUNT[7:0].

(1) CLK_COUNT[7:0]

CLK_COUNT[7:0] must satisfy the following condition:

$$(95\ ns / T_{MIPIADCLK}) - 2 \leq CLK\_COUNT[7:0] \leq (300\ ns / T_{MIPIADCLK}) - 3$$

with

$T_{MIPIADCLK}$ $= 1/f_{MIPIADCLK}$ = cycle duration of the MIPIADCLK in ns

Example

for $f_{MIPIADCLK}$ = 160 MHz, i.e. $T_{MIPIADCLK}$ = 6.25 ns

$$(95\ ns / 6.25\ ns) - 2 \leq CLK\_COUNT[7:0] \leq (300\ ns / 6.25\ ns) - 3$$

$$13.2 \leq CLK\_COUNT[7:0] \leq 45$$

Thus CLK_COUNT[7:0] must be set between 14 and 45.

(2) DATA_COUNT[7:0]

DATA_COUNT[7:0] must satisfy the following condition

$$[(85\ ns + 6\ UI) / T_{HS\_SET\_CLK}] - 2 \leq DATA\_COUNT[7:0] \leq [(145\ ns + 10\ UI) / T_{HS\_SET\_CLK}] - 3$$

with

$T_{HS\_SET\_CLK}$ Count clock for T_{HS_SETTLE}, which is selected by MIPInMODE.SOT_CLKSEL:

- SOT_CLKSEL = 0: count clock is MIPIADCLK
  $T_{HS\_SET\_CLK} = T_{MIPIADCLK} = 1/f_{MIPI\_VI\_CLK}$
  = cycle duration of the MIPIADCLK in ns
- SOT_CLKSEL = 1: count clock is the MIPI interface input clock MIPI_VI_CLK/4
  $T_{HS\_SET\_CLK} = 4 \times T_{MIPI\_VI\_CLK} = 4/f_{MIPIADCLK}$
  = cycle duration of the MIPI_VI_CLK/4 in ns

UI Unit Interval, equal to the duration of any HS state on the clock lane, which is 1/2 clock cycle duration of the MIPI interface input clock MIPI_VI_CLK.

- $UI = T_{MIPI\_VI\_CLK}/2 = 2 \times f_{MIPI\_VI\_CLK}$
  = cycle duration of the 2 × MIPI_VI_CLK in ns

Example 1

for

- SOT_CLKSEL = 0
- $f_{MIPIADCLK}$ = 160 MHz → $T_{HS\_SET\_CLK}$ = 6.25 ns
- MIPI_VI_CLK = 240 MHz → UI = $T_{MIPI\_VI\_CLK}/2$ = 2.08 ns)

$$[(85\ ns + 6 \times 2.08\ ns) / 6.25\ ns] - 2 \leq DATA\_COUNT[7:0] \leq [(145\ ns + 10 \times 2.08\ ns) / 6.25] - 3$$

$$13.6 \leq DATA\_COUNT[7:0] \leq 23.5$$

Thus DATA_COUNT[7:0] must be set between 14 and 23.

Example 2

for

- SOT_CLKSEL = 1
- MIPI_VI_CLK = 240 MHz → $T_{HS\_SET\_CLK} = 4 \times T_{MIPI\_VI\_CLK}$ = 16.67 ns
- MIPI_VI_CLK = 240 MHz → UI = $T_{MIPI\_VI\_CLK}/2$ = 2.08 ns)

$$[(85\ ns + 6 \times 2.08\ ns) / 16.67\ ns] - 2 \leq DATA\_COUNT[7:0] \leq [(145\ ns + 10 \times 2.08\ ns) / 6.25] - 3$$

$$3.85 \leq DATA\_COUNT[7:0] \leq 6.95$$

Thus DATA_COUNT[7:0] must be set between 4 and 6.

Access: This register can be read/written in 32-bit units.

Address: <MIPIn_base> + 14_H

Initial value: 0000 0000_H

23 to 16	DATA_ COUNT[7:0]	$T_{HS-SETTLE}$ setting of data lane
15 to 8	Reserved	These bits are always read as 0. When written, write the initial value.
7 to 0	CLK_ COUNT[7:0]	$T_{CLK-SETTLE}$ setting of clock lane

37.8.4.7 MIPInRX_STATE – PHY layer status register

This register indicates the STOP state of the PHY.

PHY STOP state is indicated by

RX_STOP_STATE_0 = RX_STOP_STATE_1 = RX_STOP_STATE_C = 1.

Verification of the STOP state is used to check release timing for MIPInRST_CTL.
Refer to Section 37.8.4.4, MIPInRST_CTL – Reset register for details.

Access: This register can be read in 32-bit units.

Address: <MIPIn_base> + 18_H

Initial value: 0000 0492_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 37.57 MIPInRX_STATE register contents

Bit position	Bit name	Function
31 to 18	Reserved	These bits are always read as 0.
17	Bit17	The read value of this bit is undefined.
16	RX_STOP_STATE_C	This bit indicates the clock lane status of PHY layer. 0: Not STOP 1: STOP **Note:** This status can not be confirmed when MIPInBUF_CTL = 0000 $7FFF_H$ or MIPInRST_CTL = 0000 0003_H.
15 to 12	Reserved	These bits are always read as 0.
11, 10	Bit11, Bit10	The read values of these bits are undefined.
9	Reserved	These bits are always read as 0.
8, 7	Bit8, Bit7	The read values of these bits are undefined.
6	Reserved	This bit is always read as 0.
5	Bit5	The read value of this bit is undefined.
4	RX_STOP_STATE_1	This bit indicates the data lane 1 status of PHY layer. 0: Not STOP 1: STOP
3	Reserved	This bit is always read as 0.
2	Bit2	The read value of this bit is undefined.
1	RX_STOP_STATE_0	This bit indicates the data lane 0 status of PHY layer. 0: Not STOP 1: STOP
0	Reserved	This bit is always read as 0. When written, write the initial value.

37.8.4.8 MIPInWORD_COUNT – Long packet word count definition register

This register allows to define the maximum size of long packets to be transferred to the Video Data Controller.

If enabled (FORCE_WC_EN = 1) the maximum packet word count of Long Packet will be fixed to FORCE_WC_NUM[15:0].
If packet word count is larger than FORCE_WC_NUM[15:0], FORCE_WC_NUM[15:0] size will be sent to Video Data Controller VDCE0.
In such case a CRC error will be generated. Therefore CRC check should be disabled (MIPInMODE.CRC_EN = 0), when FORCE_WC_EN = 1.

NOTE

By shortening Long Packets, while the image is sent to the Video Data Controller, the right side of the image can be cut.
Alternatively the image can also be cut by the Video Data Controller.

Access: This register can be read/written in 32-bit units.

Address: <MIPIn_base> + $1C_H$

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 37.58 MIPInWORD_COUNT register contents

Bit position	Bit name	Function
31 to 17	Reserved	These bits are always read as 0. When written, write the initial value.
16	FORCE_ WC_EN	Enable Long Packet size limitation 0: Disable 1: Enable
15 to 0	FORCE_ WC_NUM[15:0]	Word count value of Long Packet, if enabled by FORCE_WC_EN = 1. One word has 8 bit.

37.8.4.9 MIPInLP_EN_ON_WC – LP buffer and noise removal timing register

This register adjusts the timing and the width of noise removal when LP buffer is turned on.

LP buffer is turned on again after high speed transmission has ended.
Each high speed packet contains a word count value that indicates the length of the packet.

Switching on of LP buffer can be adjusted absolute to the beginning of the packet (LP_EN_ON_MODE = 1) or relative to the end of the packet (LP_EN_ON_MODE = 0). The adjustment value is given by LP_EN_ON_WC[15:0].

Noise reduction is then defined in an interval centered around this switching point. The width of the interval is given by 2* LP_DEL_NOISE_TIM[6:0].

Access: This register can be read/written in 32-bit units.

Address: <MIPIn_base> + 20_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	0	0	0	0	0	LP_DEL_NOISE_MODE	LP_DEL_NOISE_TIM[6:0]							LP_EN_ON_MODE
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LP_EN_ON_WC[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.59 MIPInLP_EN_ON_WC register contents

Bit position	Bit name	Function
31 to 25	Reserved	These bits are always read as 0. When written, write the initial value.
24	LP_DEL_ NOISE_MODE	Enable noise removal mode. 1: Noise removal enabled 0: Noise removal disabled
23 to 17	LP_DEL_ NOISE_ TIM[6:0]	The count value for noise removal when LP_DEL_NOISE_MODE = 1. The recommended value of LP_DEL_NOISE_TIM[6:0] is 05_H.
16	LP_EN_ON_ MODE	Setting LP buffer on timing 0: LP buffer turns on when word count reached the calculated value (Word count in packet header) -LP_EN_ON_WC[15:0]. 1: LP buffer turns on after LP_EN_ON_WC[15:0] read words.
15 to 0	LP_EN_ON_ WC[15:0]	Set the word count (WC) when to (IO_MIPI_LP_EN_ * _OUT == 1) switch the LP BUFFER on. The recommended value of LP_EN_ON_WC[15:0] is 0020_H.

The noise reduction interval must not leave the data interval of the packet.
Thus LP_EN_ON_WC[15:0] and LP_DEL_NOISE_TIM[6:0] must comply to the following conditions:

- If noise removal enabled (LP_EN_ON_MODE = 1):

  - LP_EN_ON_WC[15:0] + LP_DEL_NOISE_TIM[6:0] + 16 < (wordcount in packet header)
  - LP_EN_ON_WC[15:0] – LP_DEL_NOISE_TIM[6:0] > 0
- If noise removal disabled (LP_EN_ON_MODE = 0):
  - LP_EN_ON_WC[15:0] – LP_DEL_NOISE_TIM[6:0] - 16 > 0
  - LP_EN_ON_WC[15:0] + LP_DEL_NOISE_TIM[6:0] < (wordcount in packet header)

NOTE

The word count in packet header is changed to MIPInWORD_COUNT.FORCE_WC_NUM[15:0], if Long Packet size limitation is enabled (MIPInWORD_COUNT.FORCE_WC_EN = 1).

37.8.4.10 MIPInLINE_BLANK – Line blanking period register

This register generates EOT (End of Transmission) timing.

MIPInLINE_BLANK controls the duration between the current line data (current Long Packet) and the next line data (next Long Packet).
This control is not related to MIPInWORD_COUNT control.

EOT timing is used in the following cases

- Initialization timing after a line data is transmitted.
- When MIPI mode moves from HS to LP under the condition that the number of words is less than WORD COUNT, EOT timing can be used to adjust the timing LP buffer turn on.

Access: This register can be read/written in 32-bit units.

Address: <MIPIn_base> + 28_H

Initial value: 0000 0004_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.60 MIPInLINE_BLANK register contents

Bit position	Bit name	Function
31 to 8	Reserved	These bits are always read as 0. When written, write the initial value.
7 to 0	LINE_ BLANK[7:0]	Interval until EOT in MIPIADCLK cycles

LINE_BLANK[7:0] must stay smaller than the minimum time until next HS transfer.
Thus it must satisfy the following condition:

- 12 * UI < MIPIADCLK cycles * (LINE_BLANK[7:0] + 2) < $T_{HS-EXIT}$ + T_{LPX} + $T_{HS-PREPARE}$ + $T_{HS-ZERO}$ − 12 * MIPIADCLK cycles
  UI means clock cycle / 2 in the HS mode (1 Data Bit Time).
- The setting of MIPInLINE_BLANK = 0 is prohibit.

37.8.4.11 MIPInRESET_DLY_CTL0 – LP11 reset delay adjustment register

This register selects the LP11 reset delay.

Access: This register can be read/written in 32-bit units.

Address: <MIPIn_base> + $2C_H$

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	0	0	RESET_DLY_LANE1[11:0]

Table 37.61 MIPInRESET_DLY_CTL0 register contents

Bit position	Bit name	Function
31 to 28	Reserved	These bits are always read as 0. When written, write the initial value.
27 to 16	RESET_DLY_LANE1[11:0]	Control reset delay for data lane 1. **CAUTION** The initial value of RESET_DLY_LANE1[11:0] must be changed to $03F_H$ during the MIPI I/F initialization.
15 to 12	Reserved	These bits are always read as 0. When written, write the initial value.
11 to 0	RESET_DLY_LANE0[11:0]	Control reset delay for data lane 0. **CAUTION** The initial value of RESET_DLY_LANE0[11:0] must be changed to $03F_H$ during the MIPI I/F initialization.

37.8.4.12 MIPInINTSTATUS – Interrupt status register

This register shows the status of interrupt.

For each interrupt a dedicated status bit is provided with the following meaning:

- interrupt status bit = 0: interrupt has not occurred
- interrupt status bit = 1: interrupt has occurred

De-assertion of an interrupt and clearing of its status bit can be executed via the MIPInINTFFCLR register.

NOTE

If an interrupt is disabled (by writing 1 to its corresponding mask bit in the MIPInINTENCLR register), its status bit in MIPInSTATUS remains 0, even if the respective interrupt condition is fulfilled.

Access: This register can be read in 32-bit units.

Address: <MIPIn_base> + 40_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 37.62 MIPInINTSTATUS register contents (1/2)

Bit position	Bit name	Function
31 to 28	Reserved	These bits are always read as 0. When written, write the initial value.
27	ESC_TRIG_UK5	Unknown-5 trigger
26	ESC_TRIG_UK4	Unknown-4 trigger
25	ESC_TRIG_UK3	Unknown-3 trigger
24	ESC_TRIG_RESET	Detect reset-trigger (remote application)
23 to 18	Reserved	These bits are always read as 0. When written, write the initial value.
17	PHWC_ERR	Detect packet header WORDCOUNT error
16	CTL_ERR_1	False Control Error for data lane 1
15	ESC_ERR_1_3	Escape mode entry command error for data lane 1
14	SOT_SYNC_ERR_1	Start-of-Transmission (SoT) synchronization error for data lane 1
13	SOT_ERR_1	Start-of-Transmission (SoT) error for data lane 1

Table 37.62 MIPInINTSTATUS register contents (2/2)

Bit position	Bit name	Function
12	CTL_ERR_0	False Control Error for data lane 0
11	ESC_ERR_0	Escape mode entry command error for data lane 0
10	SOT_SYNC_ ERR_0	Start-of-Transmission (SoT) synchronization error for data lane 0
9	SOT_ERR_0	Start-of-Transmission (SoT) error for data lane 0
8	BUF_OR_ERR	BUFFER overrun error
7 to 6	Reserved	These bits are always read as 0. When written, write the initial value.
5	FRAMESYNC_ ERR	FRAME SYNC error
4	Reserved	These bits are always read as 0. When written, write the initial value.
3	CRC_ERR	CRC error detection
2	ECC_SINGLE_ ERR	Single bit ECC error detection
1	ECC_MULTI_ ERR	Multi bit ECC error detection
0	Reserved	These bits are always read as 0. When written, write the initial value.

Interrupt details

- Unknown-5,4,3 trigger (bit[27:25])
  - If Unknown-5,4,3 trigger commands are received, these interrupts are asserted.
  - Entry Command Patterns are 10100000, 00100001 and 01011101.
- Reset-trigger (Remote Application, bit[24])
  - If Reset-trigger commands are received, this interrupt are asserted.
  - Entry Command Pattern is 01100010.
- Packet Header word count error (bit[17])
  - Asserted when word count is lager than
    Actual Data Size + ((Ths-trail + Ths-exit) / (UI * 8)) * Number of Lane
    and receive next packet with the LP buffer tuerned on status. (LP buffer turn on timing is controllable by MIPInLP_EN_ON_WC register).
- False Control Error (bit[16], [12])
  - If a LP-Rqst (LP-10) is not followed by the remainder of a valid Escape or Turnaround sequence, a False Control Error is indicated. This error is also indicated if a HS-Rqst (LP-01) is not correctly followed by a Bridge State (LP-00).
- Escape Mode Entry Command Error (bit[15], [11])
  - If the receiving Lane Module does not recognize the received Entry Command for Escape mode an Escape mode Entry Command Error is indicated.
- SoT Sync Error (bit[14], [10])

  - If the SoT Leader sequence is corrupted in a way that proper synchronization cannot be expected, a SoT Sync Error is indicated.

  When SOT_SYNC_ERR is detected the MIPI module must be reset by using the MIPInRST_CTL register. See Section 37.8.4.4, MIPInRST_CTL – Reset register for details.

- SoT Error (bit[13], [9])
  - The Leader sequence for Start of High-Speed Transmission is fault tolerant for any single-bit error and some multi bit errors. Therefore, the synchronization may be usable, but confidence in the payload data is lower. If this situation occurs an SoT Error is indicated.
- BUFFER overrun error(bit[8])
  - Asserted when the overrun is occurred in the internal data FIFO of MIPI module.
- FRAMESYNC_ERR (bit[5])
  - Asserted when a Frame End (FE) is not paired with a Frame Start (FS) on the same virtual channel.
- CRC_ERR (bit[3])
  - Asserted when the computed CRC code is different than the received CRC code.
- ECC_SINGLE_ERR (bit[2])
  - Asserted when an ECC syndrome was computed and a single bit-error in the packet header was detected and corrected.
- ECC_MULTI_ERR (bit[1])
  - Asserted when an ECC syndrome was computed and two bit-errors are detected in the received packet header.

37.8.4.13 MIPInINTENSET – Interrupt enable set register

This register is used to enable the interrupts.

For each interrupt a dedicated interrupt enable bit is provided with the following function:

- at write:
  - interrupt enable bit = 0: no function
  - interrupt enable bit = 1: enable interrupt
- at read:
  - interrupt enable bit = 0: interrupt disabled
  - interrupt enable bit = 1: interrupt enabled

Disabling an interrupt can be executed via the MIPInINTENCLR register.

Enabling the interrupts

- Unknown-5,4,3 trigger (ESC_TRIG_UK5_EN, ESC_TRIG_UK4_EN, ESC_TRIG_UK3_EN = 1)
- Reset-trigger (ESC_TRIG_RESET_EN = 1)
- False Control Error (CTL_ERR_1_EN = 1, CTL_ERR_0_EN = 1)
- Escape Mode Entry Command Error (ESC_ERR_1_3_EN = 1, ESC_ERR_0_EN = 1)

should be used with the noise removal of clock line enabled (MIPInMODE.DEL_LP11_NOISE = 1).

Access: This register can be read/written in 32-bit units.

Address: <MIPIn_base> + 48_H

Initial value: 0000 0000_H

11	ESC_ERR_0_EN	Escape mode entry command error for data lane 0 enable
10	SOT_SYNC_ERR_0_EN	Start-of-Transmission (SoT) synchronization error for data lane 0 enable
9	SOT_ERR_0_EN	Start-of-Transmission (SoT) error for data lane 0 enable
8	BUF_OR_ERR_EN	BUFFER overrun error enable
7 to 6	Reserved	These bits are always read as 0. When written, write the initial value.
5	FRAMESYNC_ERR_EN	FRAME SYNC error enable
4	Reserved	These bits are always read as 0. When written, write the initial value.
3	CRC_ERR_EN	CRC error detection enable
2	ECC_SINGLE_ERR_EN	Single bit ECC error detection enable
1	ECC_MULTI_ERR_EN	Multi bit ECC error detection enable
0	Reserved	These bits are always read as 0. When written, write the initial value.

37.8.4.14 MIPInINTENCLR – Interrupt enable clear register

This register is used to mask the interrupts.

For each interrupt a dedicated interrupt mask bit is provided with the following function:

- at write:
  - interrupt mask bit = 0: no function
  - interrupt mask bit = 1: disable (mask) interrupt
- at read: always 0

Enabling an interrupt can be executed via the MIPInINTENSET register.

Access: This register can be written in 32-bit units.

Address: <MIPIn_base> + $4C_H$

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

2	ECC_SINGLE_ ERR_MASK	Single bit ECC error detection mask
1	ECC_MULTI_ ERR_MASK	Multi bit ECC error detection mask
0	Reserved	These bits are always read as 0. When written, write the initial value.

37.8.4.15 MIPInINTFFCLR – Interrupt factor clear register

This register is used to de-assert an interrupt and clear its status flag in the MIPInINTSTATUS register..

For each interrupt a dedicated interrupt bit is provided with the following function:

- at write:
  - interrupt factor clear bit = 0: no function
  - interrupt factor clear bit = 1: de-assert interrupt and clear its status bit in MIPInINTSTATUS
- at read: always 0

Access: This register can be written in 32-bit units.

Address: <MIPIn_base> + 50_H

Initial value: 0000 0000_H

26	ESC_TRIG_UK4_CLR	Unknown-4 trigger clear
25	ESC_TRIG_UK3_CLR	Unknown-3 trigger clear
24	ESC_TRIG_RESET_CLR	Detect reset-trigger (remote application) clear
23 to 18	Reserved	These bits are always read as 0. When written, write the initial value.
17	PHWC_ERR_CLR	Detect packet header WORDCOUNT error clear
16	CTL_ERR_1_CLR	False Control Error for data lane 1 enable clear
15	ESC_ERR_1_3_CLR	Escape mode entry command error for data lane 1 enable clear
14	SOT_SYNC_ERR_1_CLR	Start-of-Transmission (SoT) synchronization error for data lane 1 enable clear
13	SOT_ERR_1_CLR	Start-of-Transmission (SoT) error for data lane 1 enable clear
12	CTL_ERR_0_CLR	False Control Error for data lane 0 enable clear

Table 37.65 MIPInINTFFCLR register contents (2/2)

Bit position	Bit name	Function
11	ESC_ERR_0_CLR	Escape mode entry command error for data lane 0 enable clear
10	SOT_SYNC_ERR_0_CLR	Start-of-Transmission (SoT) synchronization error for data lane 0 enable clear
9	SOT_ERR_0_CLR	Start-of-Transmission (SoT) error for data lane 0 enable clear
8	BUF_OR_ERR_CLR	BUFFER overrun error enable clear
7 to 6	Reserved	These bits are always read as 0. When written, write the initial value.
5	FRAMESYNC_ERR_CLR	FRAME SYNC error clear
4	Reserved	These bits are always read as 0. When written, write the initial value.
3	CRC_ERR_CLR	CRC error detection clear
2	ECC_SINGLE_ERR_CLR	Single bit ECC error detection clear
1	ECC_MULTI_ERR_CLR	Multi bit ECC error detection clear
0	Reserved	These bits are always read as 0. When written, write the initial value.

37.8.4.16 MIPInEOT_COUNT – T_{EOT} setting

This register sets the reset timing of DES according T_{EOT}.

EOT_COUNT[7:0] refers to the number of MIPIADCLK cycles. It is the period from changing LP11 to beginning reset.

In the case that the data rate is more than 266 Mbps per one lane, this register should be set 0.

Otherwise, it is necessary to satisfy the following condition.

- MIPInMODE.SOT_CLKSEL = 0 (MIPIADCLK is $T_{HS\text{-}SETTLE}$ count clock):
  16 UI < $T_{MIPIADCLK}$ x EOT_COUNT[7:0]
  ($T_{MIPIADCLK}$ = MIPIADCLK cycle duration)
- MIPInMODE.SOT_CLKSEL = 1(external clock divided by 4 is $T_{HS\text{-}SETTLE}$ count clock):
  EOT_COUNT[7:0] = 3

Access: This register can be read/written in 32-bit units.

Address: <MIPIn_base> + 74_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 37.67 MIPInVIN_MODE register contents

Bit position	Bit name	Function
31 to 2	Reserved	These bits are always read as 0. When written, write the initial value.
1 to 0	VIN_ MODE[1:0]	Selection of the video data color format 00_B: YUV422 01_B: RGB888 10_B: RGB565 11_B: Setting prohibited

37.8.5 MIPI Operation

37.8.5.1 Start and stop sequence

MIPI port setup

(1) Select alternative port function: i.e. PMC40.PMC40_[5:0] = 11 1111_B for two data lanes

(2) Set ports as input: i.e. PM40.PM40_[5:0] = 11 1111_B for two data lanes

(3) Wait 20 µsec buffer stabilization time

(4) MIPI video source and clock setup

- Select video input channel 0 for MIPI CSI-2: VDCECTL.PXSL = 1
- Setup clocks
  – C_ISO_MIPIADCLK
  – C_ISO_MIPIPIXCLK

Start sequence

1. Reset by MIPInRST_CTL = 0000 0003_H
2. Set up following registers:
   - MIPInMODE
   - MIPInDATA_DLY_CTL
   - MIPInBUF_CTL
   - MIPInSOT_COUNT
   - MIPInWORD_COUNT
   - MIPInLP_EN_ON_WC
   - MIPInLINE_BLANK
   - MIPInRESET_DLY_CTL0
   - MIPInEOT_COUNT
   - MIPInVIN_MODE
3. Release reset by MIPInRST_CTL = 0000 0000_H
4. Enable MIPI interrupts by set up to the following registers:
   – MIPInINTENCLR
   – MIPInINTFFCLR
   – MIPInINTENSET
   Activate the following interrupts by the Interrupt Controller:
   – INTMIPI0OVF
   – INTMIPI0CTL
5. Enable MIPI transmission by MIPInON.MIPI_ON = 1.

Example start sequence

In the following a register set-up example is given for a MIPI CSI-2 video data stream with following parameters:

- 640 x 480 pixel size (VGA with VESA timing)
- 24 bpp (RGB888)

- using 2 data lanes of MIPI CSI-2
- using clock C_ISO_MIPIPIXCLK = 26.67 MHz
  (from C_ISO_MIPIADCLK = MIPIPLLCLK = PLL0 / 3 = 160 MHz;
  C_ISO_MIPIPIXCLK = MIPIPLLCLK / 6 = 26.67 MHz)

Register settings:

1. MIPInMODE = 2982 0003_H
2. MIPInDATA_DLY_CTL = 0000 0000_H
3. MIPInBUF_CTL = 0000 0000_H
4. MIPInSOT_COUNT = 0014 0014_H
5. MIPInWORD_COUNT = 0000 0000_H
6. MIPInLP_EN_ON_WC = 010A 0020_H
7. MIPInLINE_BLANK = 0000 0004_H
8. MIPInRESET_DLY_CTL0 = 003F $003F_H$
9. MIPInEOT_COUNT = 0000 0000_H
10. MIPInVIN_MODE = 0000 0001_H

CAUTION

Do not change the registers MIPInMODE, MIPInDATA_DLY_CTL, MIPInBUF_CTL, MIPInSOT_COUNT, MIPInWORD_COUNT, MIPInLP_EN_ON_WC, MIPInLINE_BLANK, MIPInRESET_DLY_CTL0, MIPInEOT_COUNT while the MIPI interface is active.

These registers may only be changed after the stop sequence.

Stop sequence

1. Disable MIPI Interrupts by the Interrupt Controller:
   – INTMIPI0OVF
   – INTMIPI0CTL
2. Disable the MIPI interface by MIPInON.MIPI_ON = 0.

37.8.5.2 Interrupt handling sequence

- INTMIPI0OVF interrupt handling:
  When MIPI buffer overflow is detected the MIPI module must be reset by using the MIPInRST_CTL register. See Section 37.8.4.4, MIPInRST_CTL – Reset register for details.
- INTMIPI0CTL interrupt handling:
  Evaluate interrupt cause by MIPInINTSTATUS interrupt status register and handle cause as described in Section 37.8.4.12, MIPInINTSTATUS – Interrupt status register.

37.8.5.3 Video Input Setup for MIPI

The MIPI Video Input Interface provides the video data to the Video Input channel 0 with the following attributes:

1. sync and data capture point
   - horizontal- and vertical- sync is to be captured on rising clock edge
   - data is to be captured on riding clock edge
2. horizontal blanking:
   - sync width fixed to 1 pixel clock
   - back porch fixed to 16 pixel clocks
   - active high horizontal sync
3. vertical blanking:
   - sync width fixed to 1 line
   - back porch fixed to 3 lines
   - active high vertical sync
   - first data line is the line with active sync

That means the following register settings have to be performed for the VDCE Video Input channel 0:

- DEMODE0.DE_4HS_EN = 1 when MIPInMODE.VTIM is 0.
- INP_SEL_CNT.INP_PXD_EDGE = 0 (rising edge)
- INP_SEL_CNT.INP_VS_EDGE = 0 (rising edge)
- INP_SEL_CNT.INP_HS_EDGE = 0 (rising edge)
- SC0_SCL0_DS2.SC0_RES_VS = 4 (refer to note below)
  (1 line vsync + 3 line backporch = 4 lines)
- SC0_SCL0_DS2.SC0_RES_VW = 484 (refer to note below)
  (height of video signal + 4 = 484 lines at VGA)
- SC0_SCL0_DS3.SC0_RES_HS = 17 (1 pixel hsync + 16 pixel backporch = 17 pixel)
- SC0_SCL0_DS3.SC0_RES_HW = 640 (width of video signal = 640 pixels at VGA)

NOTE

The frame sync (vertical sync and horizontal sync) information is contained in the actual data packets (long packets) of the MIPI CSI-2 data stream.

By this fact the vertical sync is provided to the VDCE video input channel 0 together with the first line of video data. As the VDCE video input requires 4 lines from the reception of VSYNC to the capture of the first line (min. value of SC0_SCL0_DS2.SC0_RES_VS register is 4) the first 4 lines can't be captured.

However, this issue can be avoided by setting DEMODE0.DE_4HS_EN to 1 in VDCE0 and MIPInMODE.VTIM to 0. By this setting, VDC automatically shift 4 lines after VSYNC detection between VSYNC and the first HSYNC from MIPI.

Also, when DEMODE0.DE_4HS_EN is set to 1, the detection of the end of line is available by setting DEMODE0.DE_VLAST_EN. For the detail, please refer DEMODE0 and DEMODE1 in VDCE chapter.

When MIPInMODE.VTIM is 1, the MIPI CSI-2 video data stream needs to contain 4 lines of dummy data as first active data lines.

I.e. when a 640 x 480 pixels size video input source (VGA) shall be captured by the VDCE video input via MIPI CSI-2, provide a 640 x 484 pixels size video source with lines 1 to 4 containing dummy data and lines 5 to 484 containing the actual video data.

Application hint: This can be done by providing a data enable signal to the MIPI CSI-2 generating video converter, that starts 4 lines earlier than the actual video data.

37.8.5.4 Conditions for MIPI video clock selection

The MIPI Video Input Interface can select the pixel clock to the Video Input channel 0 (C_ISO_MIPIPIXCLK) generated from the clock source C_ISO_MIPIADCLK by division.

The selection of this divider (CKSC_IMIPIPIXD_CTL) needs to fulfill the following two conditions.

(1) Condition 1: VIN pixel clock (restriction of MIPI Video data buffers)

- C_ISO_MIPIPIXCLK > VIN pixel clock
- (C_ISO_MIPIADCLK / DIV) > VIN pixel clock

with DIV is 3, 6 or 12. (Refer to Section 37.5.7.29, CKSC_IMIPIPIXD_CTL — C_ISO_MIPIPIXCLK clock divider register (D1M2(H) only))

Example:

- C_ISO_MIPIADCLK = 160 MHz
- QVGA 240 x 320 (native video data timing of data embedded into MIPI CSI-2 video stream)

⇒ VIN pixel clock = 5 MHz
(160 MHz / 12) = 13.34 MHz > 5 MHz

⇒ Select DIV = 12

(2) Condition 2: max. HSYNC width (restriction of VDCE)

- (C_ISO_MIPIPIXCLK × VIN total width) / VIN pixel clock ≤ 2015 pixels
- ((C_ISO_MIPIADCLK / DIV) × VIN total width) / VIN pixel clock ≤ 2015 pixels

with DIV is 3, 6 or 12. (Refer to Section 37.5.7.29, CKSC_IMIPIPIXD_CTL — C_ISO_MIPIPIXCLK clock divider register (D1M2(H) only))

Example:

- C_ISO_MIPIADCLK = 160 MHz
- QVGA 240 x 320 (native video data timing of data embedded into MIPI CSI-2 video stream)

⇒ VIN total width = 320 + 84 = 404 pixel

⇒ VIN pixel clock = 5 MHz
((160MHz / 12) * 404 pixel) / 5MHz = 1078 <= 2015 pixels

⇒ Select DIV = 12

37.8.5.5 VSYNC Timing from MIPI to VDCE

The following figure show the difference of VSYNC output timing by MIPInMODE.VTIM.

When MIPInMODE.VTIM is 0, VSYNC is asserted before almost 1 line from the first line output. Also, VSYNC is asserted until next data come to data buffer.

When MIPInMODE.VTIM is 1, VSYNC is output at the same timing as HSYNC to VDCE.

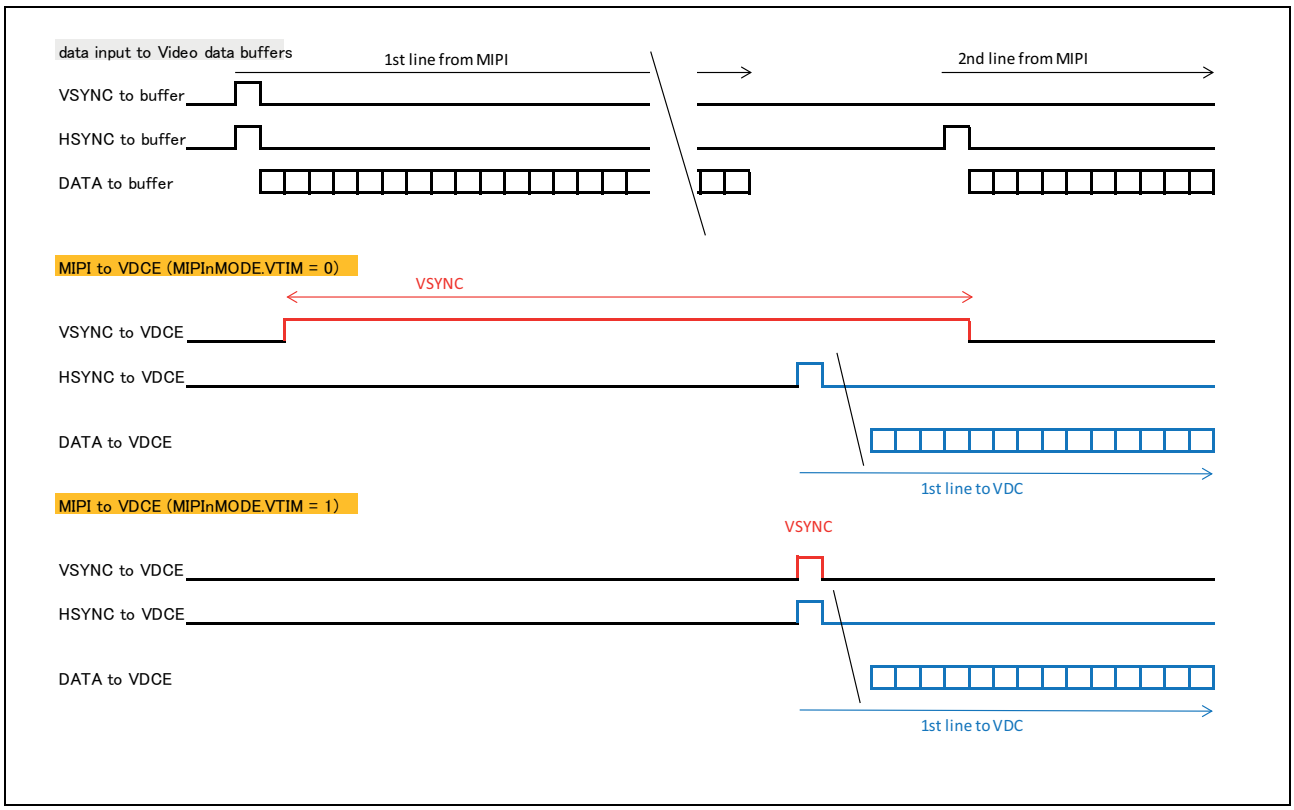

Figure 37.19 VSYNC Timing from MIPI to VDCE

NOTE

- MIPInMODE.VTIM is 1, DEMODE0 and 1 in VDCE0 register can be available.
- VDCE setting except DEMODE0 and 1 for MIPI is the same regardless MIPInMODE.VTIM setting.

MIPI setting

1. Fix the capturing position
   - SC_SCL0_DS2.SC_RES_VS = 4
   - SC_SCL0_DS3.SC_RES_HS = 17
2. DEMODE setting

   [No line detection]
   - DEMODE0=0x00000010

   [line detection after the last line finished]

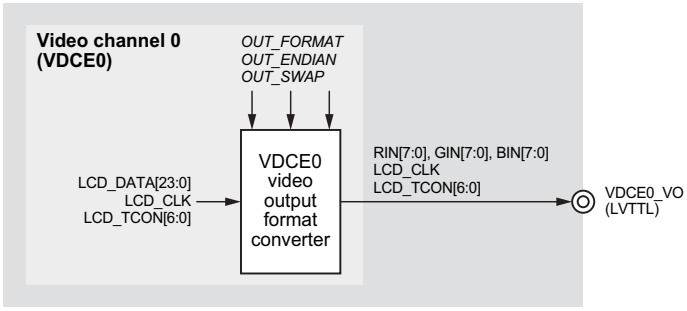
- DEMODE0=0x00000014
- DEMODE1= active line number
  e.g) when active vertical width is 480, DEMODE1 is 480.
- SC_SCL0_INT.SC_RES_LINE = active line number + 4
  e.g) when active vertical width is 480, SC_RES_LINE is 484.

3. Other VDCE setting is the same as video input setting with HSYNC

37.9 Video Output selection and RSDS control

37.9.1 D1L2(H) and D1M1(H) Video output selection

The diagram below illustrates the video output signal connections.



Note: The Video Data Controllers VDCEn include facilities to change the mapping of the color output data LCD_DATA[23:0] to the VDCEn output data RIN[7:0], GIN[7:0] and BIN[7:0]. Refer to Section 38, Video Data Controller E (VDCE) for details about the OUT_FORMAT, OUT_ENDIAN and OUT_SWAP settings.

Figure 37.20 D1L2(H) and D1M1(H) video output signals

The following table shows the assignment between the various video output signals for following settings:

- VDCEn video output format converter settings:
  - OUT_SET.OUT_FORMAT[1:0] = 00_B
  - OUT_SET.OUT_ENDIAN_ON = 0
  - OUT_SET.OUT_SWAP_ON = 0

  For other bit allocations of LCD_DATA[23:0] to RIN[7:0], GIN[7:0] and BIN[7:0] refer to Section 38, Video Data Controller E (VDCE).

Table 37.68 D1L2(H) and D1M1(H) Video output format selection example (1/2)

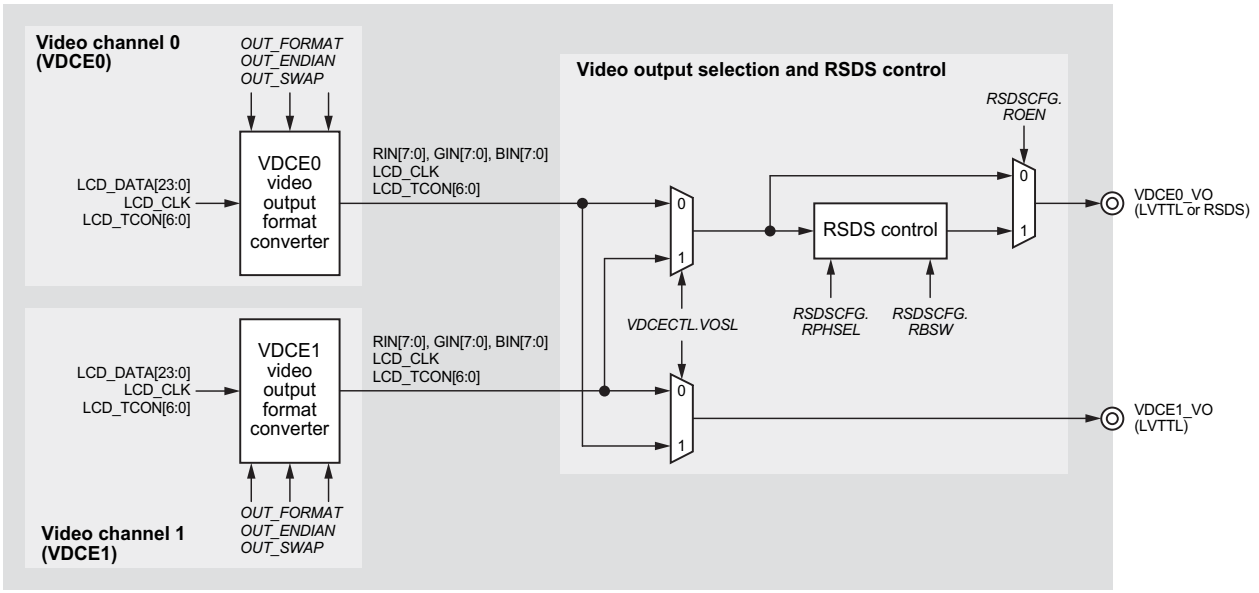
37.9.2 D1M2(H) Video output selection

The diagram below illustrates the video output selection options.



Note: The Video Data Controllers VDCEn include facilities to change the mapping of the color output data LCD_DATA[23:0] to the VDCEn output data RIN[7:0], GIN[7:0] and BIN[7:0]. Refer to Section 38, Video Data Controller E (VDCE) for details about the OUT_FORMAT, OUT_ENDIAN and OUT_SWAP settings.

Figure 37.21 D1M2(H) video output selections

By use of the VDCECTL.VOSL selector the output signals from the video channels 0 and 1 can be swapped, so that any of both can be used for the RSDS output. The other video output is output as LVTTL signals.

Table 37.69 D1M2(H) Video output selections

VDCECTL.VOSL	RSDSCFG.ROEN	Ports VDCE0_VO	Ports VDCE1_VO
0	0	Video channel 0: LVTTL	Video channel 1: LVTTL
	1	Video channel 0: RSDS	
1	0	Video channel 1: LVTTL	Video channel 0: LVTTL
	1	Video channel 1: RSDS	

37.9.2.1 Video data and clock output settings

The following tables show the assignment between the video data and clock output signals for different settings endian and R – B swap (red channel – blue channel swapping).

Basic video output selection and RSDS:

- RSDSCFG.ROEN = 1: VDCE0_VO as RSDS
- VDCECTL.VOSL determines which video output channel is output as RSDS via VDCE0_VO (no impact on the tables)
- The tables show the assignment for RGB888 output format, selected by OUT_SET.OUT_FORMAT[1:0] = 00_B. For other formats refer to Section 38, Video Data Controller E (VDCE).

(a) VDCEn video output format converter settings (no R – B swap, little endian)

– OUT_SET.OUT_FORMAT[1:0] = 00_B (RGB888 output)

– OUT_SET.OUT_ENDIAN_ON = 0 (little endian)

– OUT_SET.OUT_SWAP_ON = 0 (no R – B swap)

Table 37.70 D1M2(H) Video output format selection (no R – B swap, little endian)

LCD_TCON5	LCD_TCON5	VDCEn_VO_TCON5
LCD_TCON6	LCD_TCON6	VDCEn_VO_TCON6

37.9.3 D1M1A Video output configuration

37.9.3.1 D1M1A video output mode selection

Parallel 16-/18-/24-bit RGB, VODDR, Open LDI and Serial 8-bit RGB are assigned to the same alternative ports.

Therefore, these output functions must be selected by RSDSCFG register.

NOTE

P42_[15:11] functions (VDCE0_VO_TCONx) are not changed by RSDSCFG register.

Table 37.75 Pin assignment of P43_0-1, P44_0-11, P45_0-13 (1/2)

		Use case			
		Parallel RGB*1	**VODDR**	**Open LDI*2**	**Serial RGB*2*4**
Configuration					
RSDSCFG register	VODDR_OEN	0	1	0	0
	OLDI0_OEN	0	0	1	–
	SRGB1_EN	0	0	–*3	1
	Pin name	**Pin functions**			
1st alternative assignment	P43_0	VDCE0_TCON2 (HS)	VODDR_TCON2 (HS)		VDCE1_VO_TCON2 (HS)

	P44_10	VDCE0_VO_DATA13	VODDR_LCDOUT13		
	P44_11	VDCE0_VO_DATA12	VODDR_LCDOUT12		
	P45_0	VDCE0_VO_CLKP	VODDR_OUT0_CLK	OLDI0_CH0_CLKP	
	P45_1	VDCE0_VO_CLKN	VODDR_OUT1_CLK	OLDI0_CH0_CLKN	
	P45_2	VDCE0_VO_DATA11	VODDR_LCDOUT11	OLDI0_CH1_P	
	P45_3	VDCE0_VO_DATA10	VODDR_LCDOUT10	OLDI0_CH1_N	
	P45_4	VDCE0_VO_DATA9	VODDR_LCDOUT9	OLDI0_CH2_P	
	P45_5	VDCE0_VO_DATA8	VODDR_LCDOUT8	OLDI0_CH2_N	
	P45_6	VDCE0_VO_DATA7	VODDR_LCDOUT7	OLDI0_CH3_P	
	P45_7	VDCE0_VO_DATA6	VODDR_LCDOUT6	OLDI0_CH3_N	
	P45_8	VDCE0_VO_DATA5	VODDR_LCDOUT5	OLDI0_CH4_P	
	P45_9	VDCE0_VO_DATA4	VODDR_LCDOUT4	OLDI0_CH4_N	
	P45_10	VDCE0_VO_DATA3	VODDR_LCDOUT3		
	P45_11	VDCE0_VO_DATA2	VODDR_LCDOUT2		
	P45_12	VDCE0_VO_DATA1	VODDR_LCDOUT1		
	P45_13	VDCE0_VO_DATA0	VODDR_LCDOUT0		

Table 37.75 Pin assignment of P43_0-1, P44_0-11, P45_0-13 (2/2)

		Use case			
		Parallel RGB*1	**VODDR**	**Open LDI*2**	**Serial RGB*2*4**
2nd alternative assignment	P43_0	VDCE0_VO_TCON3 (DE)	VODDR_VO_TCON3 (DE)*5		VDCE1_VO_TCON3 (DE)

Note 1. VDCE0 and VDCE1 output can be swapped by VDCECTL.VOSL.

Note 2. Pins not used for the selected video output mode can be used for other functions.

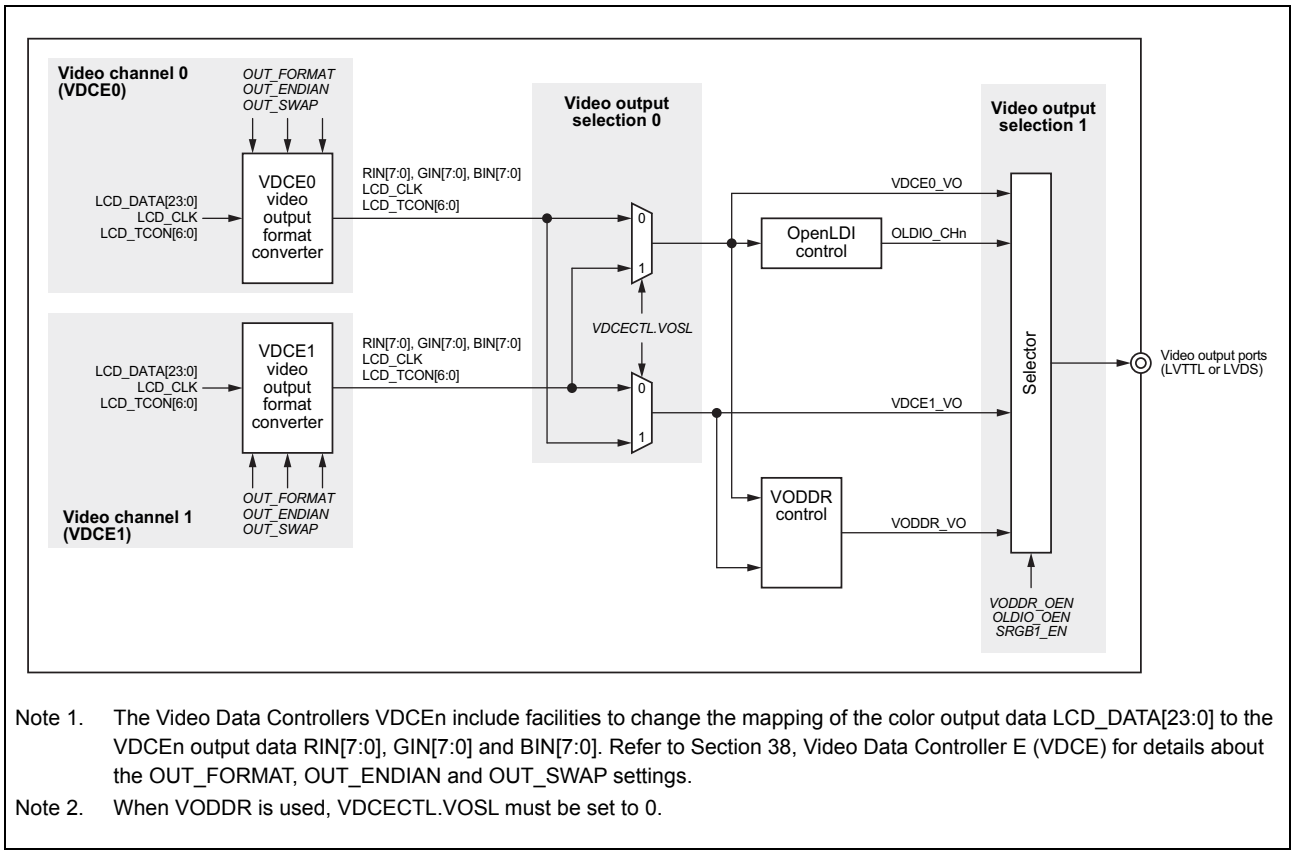
Note 3. When OpenLDI is not used, OLDI0_OEN must be set to 0.

Note 4. Serial RGB is only available for VDCE1.

Note 5. Another alternative, when all 3 sync signals (HS+VS and DE) are required for VODDR at the same time, is to use VDCE0_VO_TCON3 (DE) on P42_11 (AF1 Out). This port pin selection is not controlled by the RSDSCFG register.

37.9.3.2 D1M1A Video output selection

The diagram below illustrates the video output selection options.



Note 1. The Video Data Controllers VDCEn include facilities to change the mapping of the color output data LCD_DATA[23:0] to the VDCEn output data RIN[7:0], GIN[7:0] and BIN[7:0]. Refer to Section 38, Video Data Controller E (VDCE) for details about the OUT_FORMAT, OUT_ENDIAN and OUT_SWAP settings.

Note 2. When VODDR is used, VDCECTL.VOSL must be set to 0.

Figure 37.22 D1M1A video output selections

By use of the VDCECTL.VOSL selector the output signals from the video channels 0 and 1 can be swapped, so that any of both can be used for the OpenLDI output. The other video output is output as LVTTL signals.

Table 37.76 D1M1A video output selections

VDCECTL.	RSDSCFG.			
VOSL	VODDR_OEN	OLDIO_OEN	SRGB1_OEN	Video output ports
0	0	0	0	Video Channel 0: Parallel RGB
	1			VODDR: VODDR output
	0	1	– *1	OpenLDI (Video Channel 0): OpenLDI (LVDS) output
		– *1	1	Video Channel 1: Serial RGB
1	0	0	0	Video Channel 1: Parallel RGB
	1			VODDR: VODDR output
	0	1	– *1	OpenLDI (Video Channel 1): OpenLDI (LVDS) output

Note 1. OpenLDI output ports and Serial RGB ports from VDCE1_VO are not overlapping.

37.9.4 D1M1-V2 Video output configuration

37.9.4.1 D1M1-V2 video output mode selection

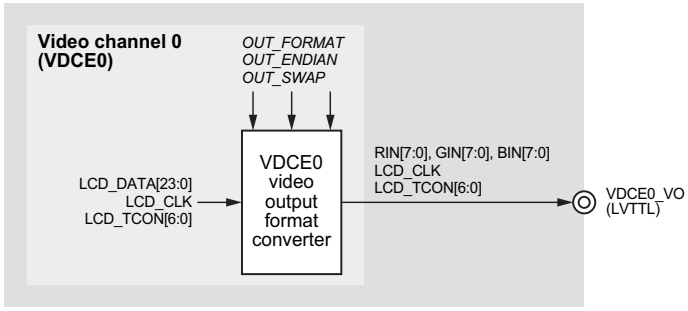
Parallel 16-/18-/24-bit RGB and Serial 8-bit RGB are assigned to the same alternative ports. These output function must be selected by the OUT_SET.OUT_FRQ_SEL[1:0] register.

Table 37.77 Pin assignment of P44_0-11, P45_0-13

		Use case	
		Parallel RGB	**Serial RGB**
Configuration			
OUT_SET register	OUT_FRQ_SEL[1:0]	0	1, 2
	Pin name	**Pin functions**	
1st alternative assignment	P44_0	VDCE0_VO_DATA23	
	P44_1	VDCE0_VO_DATA22	
	P44_2	VDCE0_VO_DATA21	
	P44_3	VDCE0_VO_DATA20	
	P44_4	VDCE0_VO_DATA19	
	P44_5	VDCE0_VO_DATA18	
	P44_6	VDCE0_VO_DATA17	
	P44_7	VDCE0_VO_DATA16	
	P44_8	VDCE0_VO_DATA15	
	P44_9	VDCE0_VO_DATA14	
	P44_10	VDCE0_VO_DATA13	
	P44_11	VDCE0_VO_DATA12	
	P45_0	VDCE0_VO_CLKP	VDCE0_VO_CLKP
	P45_1	VDCE0_VO_CLKN	VDCE0_VO_CLKN
	P45_2	VDCE0_VO_DATA11	
	P45_3	VDCE0_VO_DATA10	
	P45_4	VDCE0_VO_DATA9	
	P45_5	VDCE0_VO_DATA8	
	P45_6	VDCE0_VO_DATA7	VDCE0_VO_DATA7
	P45_7	VDCE0_VO_DATA6	VDCE0_VO_DATA6
	P45_8	VDCE0_VO_DATA5	VDCE0_VO_DATA5
	P45_9	VDCE0_VO_DATA4	VDCE0_VO_DATA4
	P45_10	VDCE0_VO_DATA3	VDCE0_VO_DATA3
	P45_11	VDCE0_VO_DATA2	VDCE0_VO_DATA2
	P45_12	VDCE0_VO_DATA1	VDCE0_VO_DATA1
	P45_13	VDCE0_VO_DATA0	VDCE0_VO_DATA0

37.9.4.2 D1M1-V2 Video output selection

The diagram below illustrates the video output selection options.



Note: The Video Data Controllers VDCEn include facilities to change the mapping of the color output data LCD_DATA[23:0] to the VDCEn output data RIN[7:0], GIN[7:0] and BIN[7:0]. Refer to Section 38, Video Data Controller E (VDCE) for details about the OUT_FORMAT, OUT_ENDIAN and OUT_SWAP settings.

Figure 37.23 D1M1-V2 video output signals

37.9.5 Video output clock inversion in LVTTL mode

If the video data VDCEn_VO_DATA[23:0] is output in LVTTL mode, the video data changes at the rising edge of the video output clock VDCEn_VO_CLK.

By use of the port output inversion function of the port control the video output clock can be inverted, thus the video data changes at the falling edge of the video output clock.

- VDCE0_VO_CLK
  - PINV45.PINV45_0 = 0: not inverted
    VDCE0_VO_DATA[23:0] changes at the rising edge of VDCE0_VO_CLK
  - PINV45.PINV45_0 = 1: inverted
    VDCE0_VO_DATA[23:0] changes at the falling edge of VDCE0_VO_CLK
- VDCE1_VO_CLK
  - PINV47.PINV47_8 = 0: not inverted
    VDCE1_VO_DATA[23:0] changes at the rising edge of VDCE1_VO_CLK
  - PINV47.PINV47_8 = 1: inverted
    VDCE1_VO_DATA[23:0] changes at the falling edge of VDCE1_VO_CLK

37.9.6 D1M2(H) RSDS control

37.9.6.1 Phase shift

RSDSCFG.RPHSL[1:0] selects a phase shift in 90 ° steps between the RSDS output clock VDCE0_VO_CLKP and the RSDS data output.

While RSDS data are output to terminal with 1 cycle delay from VDCE output, TCON signals are not delayed to terminal.
Therefore, when RSDS output is used, TCON signals should be delayed for 1 cycle. For this adjustment, please refer to Section 38.8.1.9, LCD TCON.

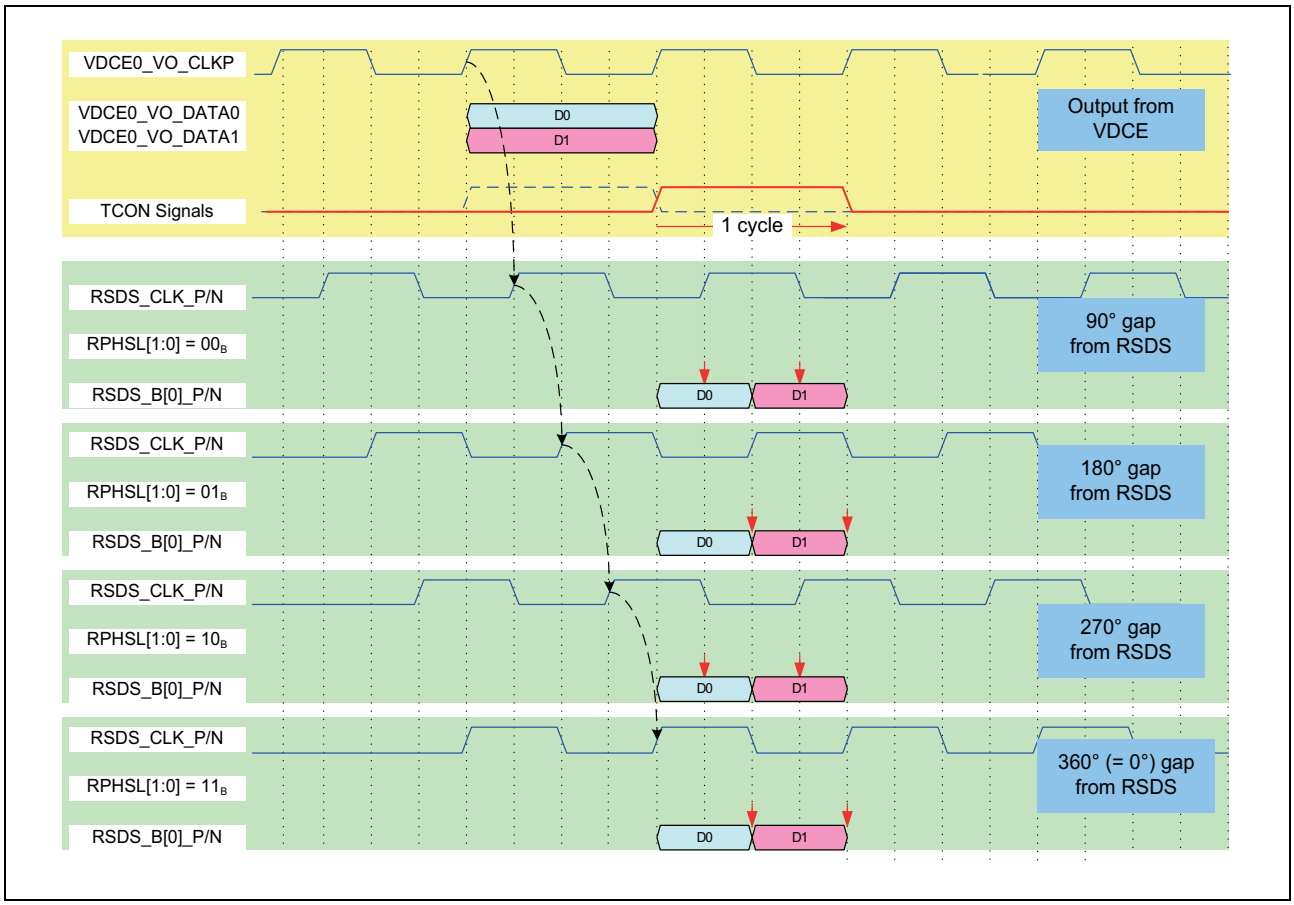


Figure 37.24 RSDS clock phase shift

37.9.6.2 RSDS data bit swap

RSDSCFG.RBSW selects a bit swap of the bits on a single RSDS data line:

- RBSW = 0: no swap, even number bit (i.e. data bits 0, 2, 4, 6) first
- RBSW = 1: swap, odd number bit (i.e. data bits 1, 3, 5, 7) first

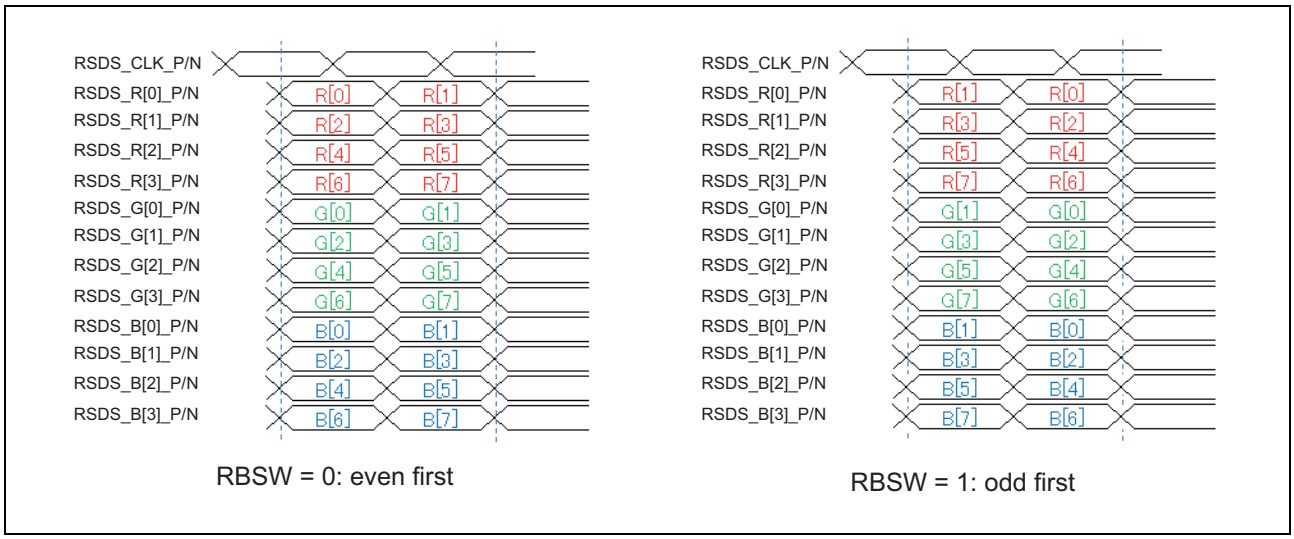

Figure 37.25 RSDS data bitswap

37.9.6.3 RSDS setup

1. Select alternative port function:
   - PMC44.PM44_[11:0] = FFF_H
   - PMC45.PM45_[13:0] = $3FFF_H$
2. Set ports as output:
   - PM44.PM44_[11:0] = FFF_H
   - PM45.PM45_[13:0] = $3FFF_H$
3. Set RSDSCFG.ROEN = 1 to select RSDS output
4. Set RSSCFG.RPHSL[1:0] and RSSCFG.RBSW as required.
5. Wait 10 µsec RSDS buffer stabilization time.

37.10 Video and graphics functions control registers

Table 37.78 List of video and graphics functions control registers

Module Name	Register Name	Symbol	Address
SELB	VDCE control registers	VDCECTL	FFC0 601C$_H$
SELB	RSDS configuration register	RSDSCFG	FFC0 6020$_H$
SELB	Sprite Engine update timing control register	SPEAUPDEN	FFC0 6048$_H$

NOTES

1. In the header files the names of the above registers are defined in the following format: <ModuleName> + <Symbol>.
   <ModuleName> and <Symbol> are defined in the above table.
2. Memory access right after register access has possibility to cause the racing between two accesses via different routes.
   Therefore, the last accessed register value must be confirmed at least before memory access. Refer to Section 3.4.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation for details.

37.10.1 Register details

37.10.1.1 VDCECTL — VDCE control register

Access: This register can be read/written in 32-bit units.

Address: FFC0 601C$_H$

Initial value: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0*1
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	0	0	VI1CTL	UPDT1	UPDT0	PXSL	VOSL	VISL1	VISL0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The initial value “0” of bit 16 must be changed to “1” and must not be changed afterwards.

Table 37.79 VDCECTL register contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When written, write the initial value.
16	–	**CAUTION** The initial value “0” of bit 16 must be changed to “1” and must not be changed afterwards.
15 to 7	Reserved	When written, write the initial value.
6	VI1CTL	Selection of C_ISO_VI1PIXCLK (for D1M2(H) devices only) 0: C_ISO_VI1PIXCLK = VDCE1_VI_CLK 1: C_ISO_VI1PIXCLK = C_ISO_MIPIPIXCLK
5	UPDT1	Sprite Engine software update control This bit is used to generate the VUPDATE1 signal towards the Sprite Engine in sprite definition registers in software mode.
4	UPDT0	Sprite Engine software update control This bit is used to generate the VUPDATE0 signal towards the Sprite Engine in sprite definition registers in software mode.
3	PXSL	Video Input selection for VDCE0 (D1M2(H) only) 0: LVTTL 1: MIPI
2	VOSL	Video Output swap (for D1M2(H) and D1M1A devices only) 0: VDCE0 -> VO0 (LVTTL/RSDS) VDCE1 -> VO1 (LVTTL) 1: VDCE0 -> VO1 (LVTTL) VDCE1 -> VO0 (LVTTL/RSDS)
1	VISL1	Video Input color format for video channel 1 (for D1M2(H) devices only) 0: 8-bit ITU656 1: 24-bit RGB888
0	VISL0	Video Input color format for video channel 0 0: 8-bit ITU656 1: 24-bit RGB888

37.10.1.2 RSDSCFG — RSDS and other video output control register

Access: This register can be read/written in 32-bit units.

Address: FFC0 6020$_H$

Initial value: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

37.11 Video Output Warping Engine (VOWE) Ring Buffer

The Video Output Warping Engine (VOWE) writes rendered data to the memory. The Output Image Renderer (OIR) reads this data and forwards it to the Video Output module.

Since both, writing to the memory by the Video Output Warping Engine and reading the data by the Output Image Renderer is performed on the same timebase, which is determined by the frame geometry, framerate and pixel clock, it is in most cases not necessary to reserve memory for a complete output frame, since the OIR reads the VOWE data already before a complete frame has been stored.

A Ring Buffer in the memory that holds enough VOWE data for the OIR is sufficient to ensure continuous video data output.

The VOWE Ring Buffer holds data for an integer number of lines. Thus its size is calculated by

Ring Buffer size = (number of lines) x (line stride)

The Ring Buffer size must be a power of 2, hence the number of lines and the line stride have to be a power of 2 as well.

The Ring Buffer location in the memory is defined by its base address and mask.

The Ring Buffer base address RB_BASE_ADDR is defined by VOWEMAC.RBBADR[31:10].
It must be aligned to 1 KB boundaries, thus the lower 9 bit of the base address have to be all 0.

The mask is defined by VOWEMMC.RBMASK[31:0] = RB_SIZE - 1.
RB_SIZE denotes the Ring Buffer size.

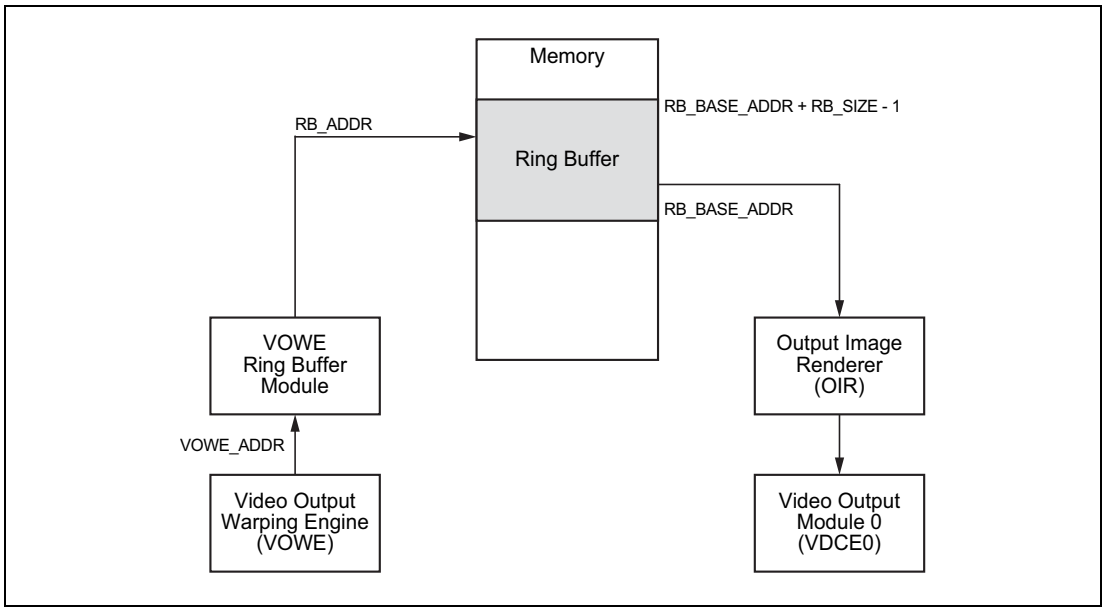

Figure 37.26 VOWE Ring Buffer module

The Ring Buffer address RB_ADDR, that is the address to write data the buffer in the memory, is calculated by

RB_ADDR = RB_BASE_ADDR + (VOWE_ADDR mod RB_SIZE)

VOWE_ADDR denotes the write address, issued by the VOWE.
“mod” denotes the modulo operator.

Example:

- horizontal size: 2048 32-bit pixel -> line stride = 2048 x 4 byte = 8 KB
- Ring Buffer shall hold 16 lines:
  -> RB_SIZE = 16 x 8 KB = 128 KB = 0002 0000_H
  -> VOWEMMC.RBMASK[31:0] = RB_SIZE - 1 = 0001 $FFFF_H$
- Ring Buffer base address RB_BASE_ADDR = VOWEMAC.RBBADR[31:0] = 4001 0000_H

If VOWE_ADDR = 1234 5670_H:

RB_ADDR = 4001 0000_H + (1234 5678_H mod 0002 0000_H)
= 4001 0000_H + 0000 5678_H = 4001 5678_H

Output Image Renderer loop addressing

The Output Image Renderer features a loop addressing function, that is to be used when reading the data from the Ring Buffer. Refer to Section 38.7, Output Image Generator for details.

37.11.1 VOWE Ring Buffer control registers

Table 37.82 List of the VOWE Ring Buffer control registers

Module Name	Register Name	Symbol	Address
SELB	VOWE Ring Buffer address offset register	VOWEMAC	FFC0 6040_H
SELB	VOWE Ring Buffer mask register	VOWEMMC	FFC0 6044_H

NOTES

1. In the header files the names of the above registers are defined in the following format:
   <ModuleName> + <Symbol>.
   <ModuleName> and <Symbol> are defined in the above table.
2. Memory access right after register access has possibility to cause the racing between two accesses via different routes.
   Therefore, the last accessed register value must be confirmed at least before memory access. Refer to Section 3.4.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation for details.

37.11.2 Register details

37.11.2.1 VOWEMAC — VOWE Ring Buffer base address register

Access: This register can be read/written in 32-bit units.

Address: FFC0 6040_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RBBADR[31:16]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RBBADR[15:10]						0	0	0	0	0	0	0	0	0	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R

Table 37.83 VOWEMAC register contents

Bit Position	Bit Name	Function
31 to 10	RBBADR[31:10]	Video Output Warping Engine Ring Buffer base address It must be aligned to 1 KB boundaries, thus the lower 10 bits of the base address are always 0.
9 to 0	Reserved	When written, write the initial value.

37.11.2.2 VOWEMMC — VOWE Ring Buffer mask register

Access: This register can be read/written in 32-bit units.

Address: FFC0 6044_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

37.12 Open LDI Interface (D1M1A only)

37.12.1 Overview of Open LDI Interface

37.12.1.1 Units

This microcontroller has the following number of units of the Open LDI Interface.

Table 37.85 Number of Units

Product Name	D1L1	D1L2(H)	D1M1(H) D1M1-V2	D1M1A	D1M2(H)
Number of Units	–	–	–	1	–
Name	–	–	–	OLDIn (n = 0)	–

37.12.1.2 Indices

Following indices are used in this section:

Table 37.86 Indices

Index	Meaning
n	The individual Open LDI Interface units are generically indicated by the index “n”.

37.12.1.3 Register addresses

All OLDIn register addresses are given as address offsets from the individual base addresses <OLDIn_base>.

These base addresses are listed in the following table.

Table 37.87 Register base addressed <OLDIn_base>

OLDIn unit	<OLDIn_base> address
OLDI0	F200 2000H

37.12.1.4 Clock supply

All Open LDI Interfaces provide following clock inputs.

Table 37.88 Clock supply

OLDIn unit	OLDIn clock	Connected to
OLDI0	APB bus clock PCLK	Clock Controller C_ISO_PCLK
	Operation clock OLDICLK	Clock Controller CKSC_IVOEXS_CTL

37.12.1.5 Interrupts

The Open LDI Interface units do not generate any interrupt requests.

37.12.1.6 Reset sources

The Open LDI and their registers are initialized by the following reset signal:

Table 37.89 Reset sources

OLDIn unit	Reset signal
OLDI0	Reset Controller SYSRES

37.12.1.7 External Input/Output Signals

The external input/output signals of Open LDI are listed below.

Table 37.90 Video output signals connection

OLDIn signal	Function	Connected to *1
OLDI0_CH0_CLKP	OLDI0 differential clock (pos)	Video output mode selection OLDI0_CH0_CLKP
OLDI0_CH0_CLKN	OLDI0 differential clock (neg)	Video output mode selection OLDI0_CH0_CLKN
OLDI0_CH1_P	OLDI0 differential Ch1 data (pos)	Video output mode selection OLDI0_CH1_P
OLDI0_CH1_N	OLDI0 differential Ch1 data (neg)	Video output mode selection OLDI0_CH1_N
OLDI0_CH2_P	OLDI0 differential Ch2 data (pos)	Video output mode selection OLDI0_CH2_P
OLDI0_CH2_N	OLDI0 differential Ch2 data (neg)	Video output mode selection OLDI0_CH2_N
OLDI0_CH3_P	OLDI0 differential Ch3 data (pos)	Video output mode selection OLDI0_CH3_P
OLDI0_CH3_N	OLDI0 differential Ch3 data (neg)	Video output mode selection OLDI0_CH3_N
OLDI0_CH4_P	OLDI0 differential Ch4 data (pos)	Video output mode selection OLDI0_CH4_P
OLDI0_CH4_N	OLDI0 differential Ch4 data (neg)	Video output mode selection OLDI0_CH4_N

Note 1. The video output signals can be selected from several kinds of mode. Refer to Section 37.9.3.1, D1M1A video output mode selection.

37.12.2 Open LDI Overview

The Open LDI module converts an RGB signal output by the Video Output Controller E Unit module to the Open LDI format and outputs those signals.

The Open LDI interface supports 8 output data formats with the conversion formats selected by register settings. The output control signals can also be selected freely.

37.12.2.1 Features

This module has the following features.

- Output pins:
  Five differential output pairs (4 data and 1 clock) that conform to the TIA/EIA-644 standard.
- Operating frequency: maximum operation clock (OLDICLK) frequency 240 MHz
- Maximum dot clock frequency of 34 MHz
- Supports eight output data formats

37.12.2.2 Block Diagram

The figure below shows the block diagram of the Open LDI module.

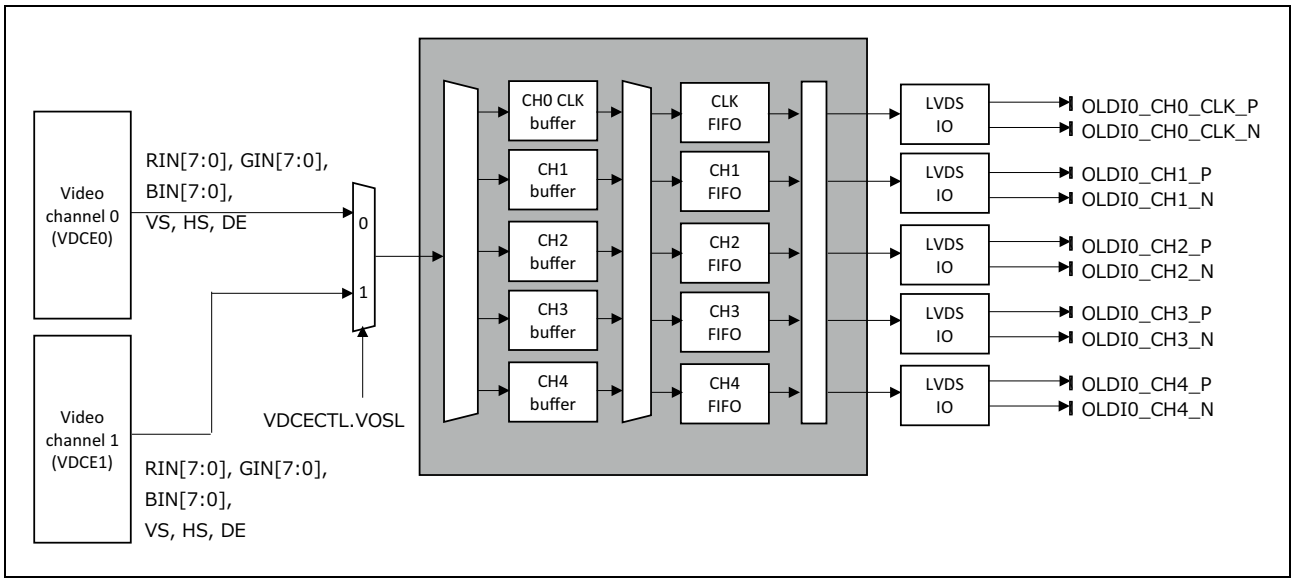

Figure 37.27 Open LDI Block Diagra

Table 37.91 Open LDI selections

OLDIn unit	VDCECTL.VOSL	Function
OLDI0	0	Video channel 0 (VDCE0)
	1	Video channel 1 (VDCE1)

37.12.2.3 Output signals

Table 37.92 Output signals

Pin Name	I/O	Connected to
OLDI0_CH0_CLKP	Output	OLDI0 differential clock (pos)
OLDI0_CH0_CLKN	Output	OLDI0 differential clock (neg)
OLDI0_CH1_P	Output	OLDI0 differential Ch1 data (pos)
OLDI0_CH1_N	Output	OLDI0 differential Ch1 data (neg)
OLDI0_CH2_P	Output	OLDI0 differential Ch2 data (pos)
OLDI0_CH2_N	Output	OLDI0 differential Ch2 data (neg)
OLDI0_CH3_P	Output	OLDI0 differential Ch3 data (pos)
OLDI0_CH3_N	Output	OLDI0 differential Ch3 data (neg)
OLDI0_CH4_P	Output	OLDI0 differential Ch4 data (pos)
OLDI0_CH4_N	Output	OLDI0 differential Ch4 data (neg)

The state of the Open LDI pin is determined by the OLDInCR register.

37.12.3 Register Description

The table below lists the register configuration.

Register Access Size

All registers can be accessed in 32-bit units.

Correct device operation is not guaranteed if any access size other than 32-bit is used to access these registers.

<OLDIn_base>

The base address <OLDIn_base> of the OLDIn is defined in section 37.12.1.3, Register addresses.

Table 37.93 Register Configuration

Register Name	Symbol	Address
OLDI control register 0	OLDInCR0	<OLDIn_base> + 00_H
OLDI control register 1	OLDInCR1	<OLDIn_base> + 04_H
OLDI CTR control register	OLDInCTRCR	<OLDIn_base> + $0C_H$
OLDI control register	OLDInCHCR	<OLDIn_base> + 10_H
OLDI skew control register	OLDInSKEWCTR	<OLDIn_base> + 70_H

37.12.3.1 OLDInCR0 – Open LDI control register 0

This register controls Open LDI function.

Access: This register can be read/written in 32-bit units.

Address: <OLDIn_base> + 00_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 11	–	These bits are always read as 0. When written, write the initial value.
10 to 8	CTR2SEL[2:0]	Ctrl2 Select Selects data to be output to Ctrl2 (see section 37.12.4.3, CH Selection). 000: DE 011: HSYNC 100: VSYNC Other settings are prohibited.
7	–	These bits are always read as 0. When written, write the initial value.
6 to 4	CTR1SEL[2:0]	Ctrl1 Select Selects data to be output to Ctrl1 (see section 37.12.4.3, CH Selection). 000: VSYNC 001: DE 100: HSYNC Other settings are prohibited.
3	–	These bits are always read as 0. When written, write the initial value.
2 to 0	CTR0SEL[2:0]	Ctrl0 Select Selects data to be output to Ctrl0 (see section 37.12.4.3, CH Selection). 000: HSYNC 001: VSYNC 010: DE Other settings are prohibited.

37.12.3.4 OLDInCHCR – Open LDI CH control register

This register controls Open LDI function.

Access: This register can be read/written in 32-bit units.

Address: <OLDIn_base> + 10_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

5 to 3	SKEW2[2:0]	Setting CH2 Skew.
2 to 0	SKEW1[2:0]	Setting CH1 Skew.

37.12.4 Operation

The Open LDI module converts the RGB signals output from a Video Data Controller E (VDCE) Unit to the Open LDI format and outputs those signals. Since the output data format can be selected by register settings, this module can convert to any of the Open LDI formats. The output data format is determined by (1) the mode selection, (2) the Ctrl signal selection, and (3) the CH selection.

The registers concerned with the output data format must be set before the Open LDI module is started and must not be changed during module operation.

37.12.4.1 Mode Selection

The mode is selected by the LVMD[3:0] bits in the Open LDI control register 0. **Figure 37.28** shows the output data format.

Here, R0 to R7, G0 to G7, and B0 to B7 are the RGB signals and Ctrl0 to Ctrl3 are control signals (such as HSYNC and VSYNC). The Ctrl signals can be set by the CTR control register. CH1, CH2, CH3, and CH4 are buffers that hold data temporarily. The default is for the CH1, CH2, CH3, and CH4 data to be output directly without change to OLDIn_CH1_P/N, OLDIn_CH2_P/N, OLDI0_CH3_P/N, and OLDIn_CH4_P/N. The CH assignment can be switched with the CH control register settings.

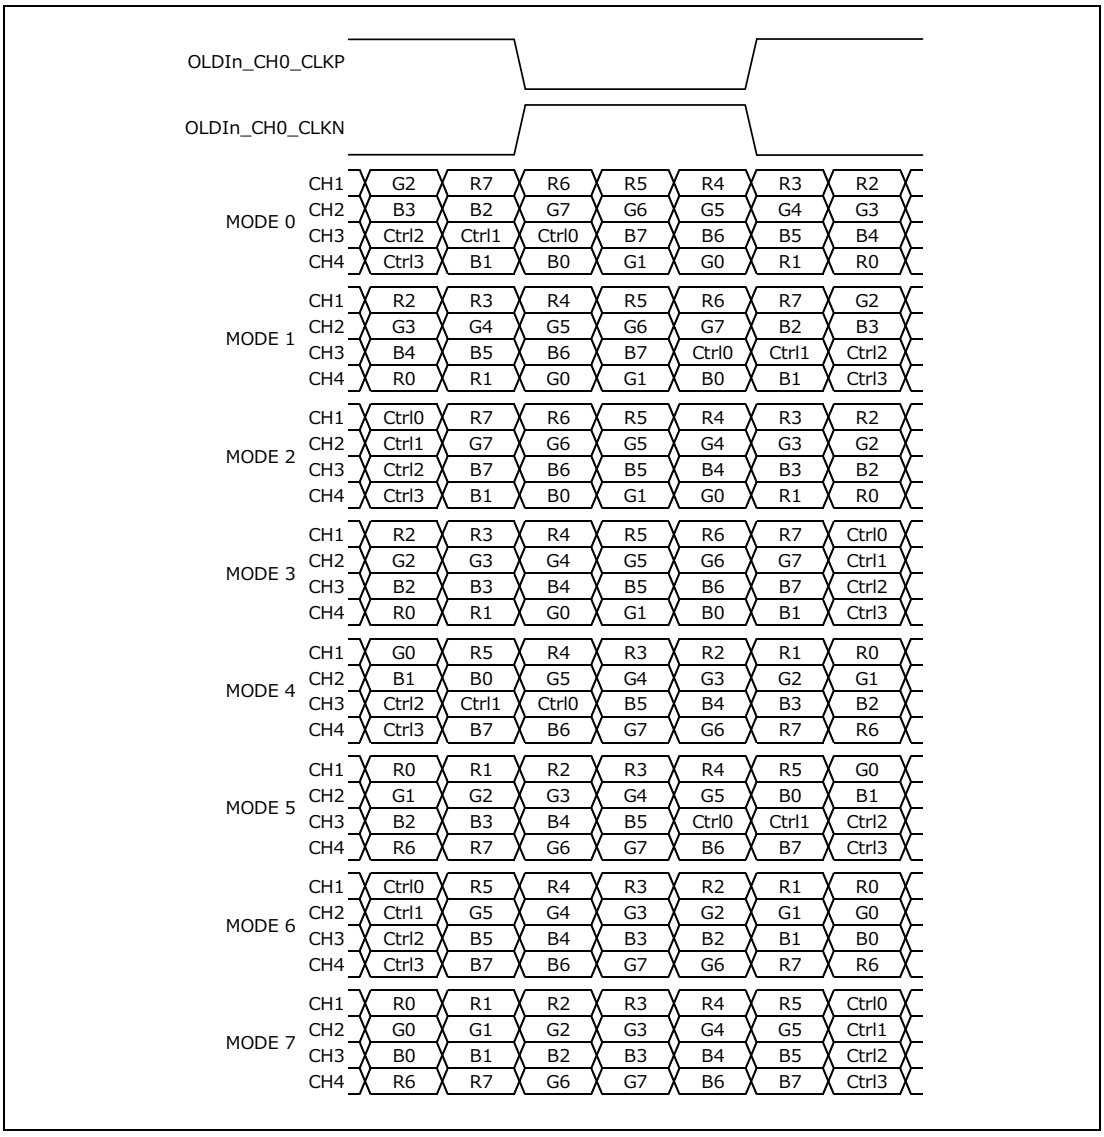

Figure 37.28 Output Data Format

37.12.4.2 Ctrl Signal Selection

The two stage settings shown below are required to select the Ctrl signals.

(1) Open LDI Port Selection

The Open LDI ports used to output the Ctrl signals are selected with the CTR control register (OLDInCTRCR). This results in the signals input to the Open LDI ports being output as Ctrl signals.

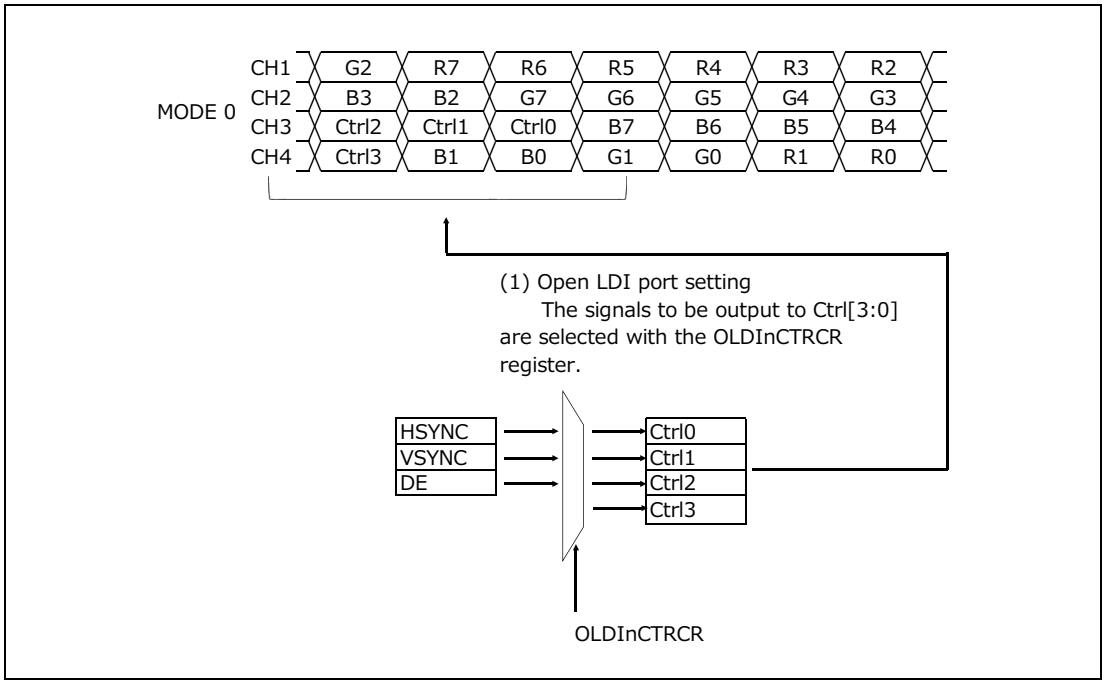

Figure 37.29 Ctrl Signal Selection

Set the desired Ctrl signal characteristics with the VDCE registers.

For example, to reverse the polarity of the HSYNC signal, the polarity must be set with VDCE register settings. (The Open LDI module only converts the signals output from VDCE to the Open LDI format.)

An example of Ctrl signal settings is shown below.

1. Ctrl0 = HSYNC, Ctrl1 = VSYNC, and Ctrl2 = DE

Set the VDCE registers so that HSYNC, VSYNC, and DE are output.

Then set the CTR control register (OLDInCTRCR) so that CTR0SEL[2:0] = 000, CTR1SEL[2:0] = 000, and CTR2SEL[2:0] = 000.

37.12.4.3 CH Selection

The Open LDI module stores the RGB signal data in CH1, CH2, CH3, and CH4 according to the mode selection and Ctrl signal selection registers.

The CH1, CH2, CH3, and CH4 data is then stored in the CH1, CH2, CH3, and CH4 FIFOs according to the CH selection register setting. The data stored in the CH1, CH2, CH3, and CH4 FIFOs is output from the external pins after passing through the LVDS buffers.

37.12.5 Usage Notes

The mode is selected by the LVMD[3:0] bits in the Open LDI control register 0. Figure 37.28, Output Data Format shows the output data format.

Here, R0 to R7, G0 to G7, and B0 to B7 are the RGB signals and Ctrl0 to Ctrl3 are control signals (such as HSYNC and VSYNC). The Ctrl signals can be set by the CTR control register. CH1, CH2, CH3, and CH4 are buffers that hold data temporarily. The default is for the CH1, CH2, CH3, and CH4 data to be output directly without change to OLDIn_CH1_P/N, OLDIn_CH2_P/N, OLDIn_CH3_P/N, and OLDIn_CH4_P/N. The CH assignment can be switched with the CH control register settings.

Sample Configuration flow of Open LDI

(1) Initialization

(1) Initialize Open LDI ports to port mode and input mode:
- PMCn_m = 0
- PMn_m = 1

(2) Set OLDInCR0 = 0:
- If OpenLDI was previously active, disable the output and stop the operation.

(3) Set RSDSCFG:
- VODDR output disable. (RSDSCFG.VODDR_OEN = 0)
- Open LDI output enable. (RSDSCFG.OLDI_OEN = 1)

(4) Set OLDInCR1:
- Select output off mode. (CLKSTBY/CH1STBY/CH2STBY/CH3STBY/CH4STBY[1:0] = 01)

(5) Set OLDInCTRCR:
- Configure the placement of synchronisation signals in data stream.

(6) Set OLDInCHCR:
- Select the data channel to be output on each of the data output pin pairs.

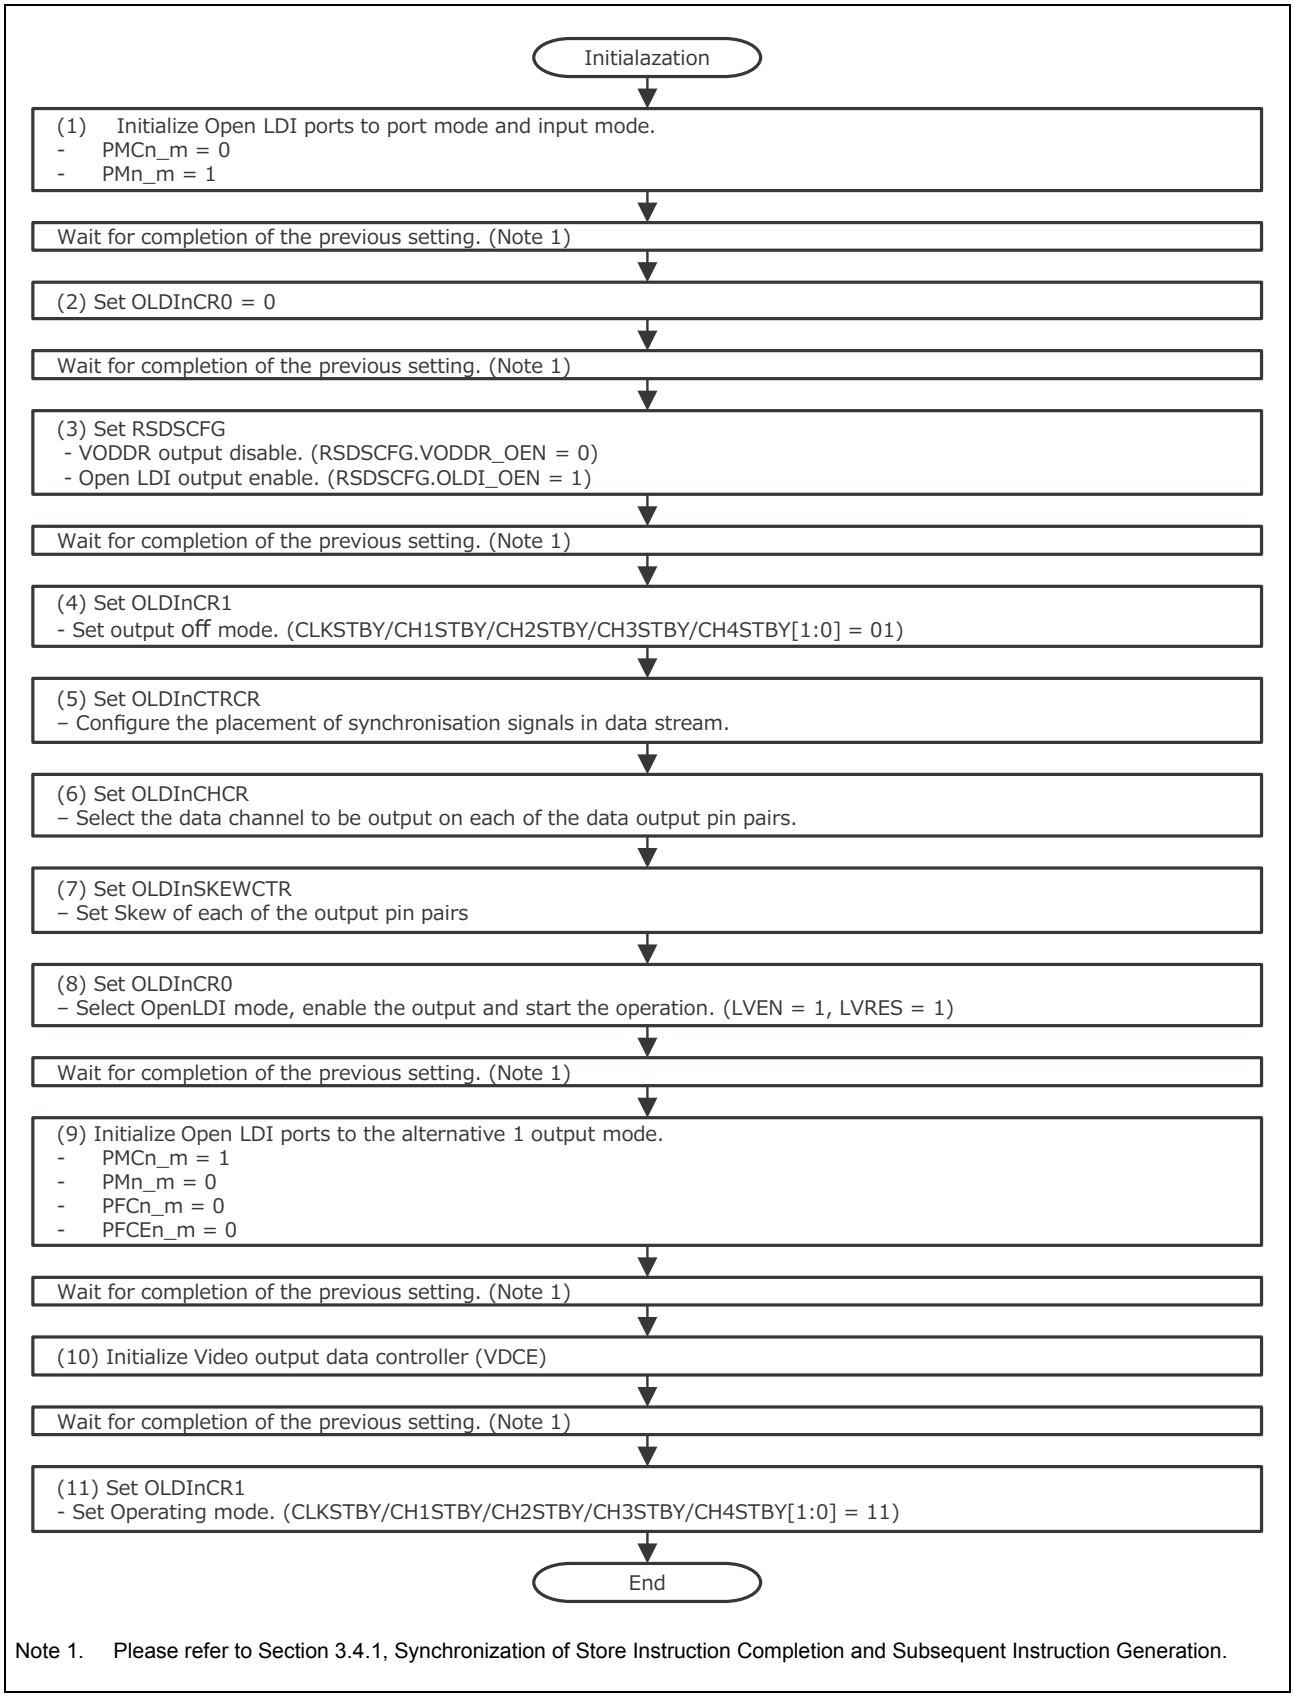
(7) Set OLDInSKEWCTR:
- Set Skew of each of the output pin pairs

(8) Set OLDInCR0:
- Select OpenLDI mode, enable the output and start the operation. (LVEN = 1, LVRES = 1)

(9) Initialize Open LDI ports to the alternative 1 output mode :
- PMCn_m = 1
- PMn_m = 0
- PFCn_m = 0
- PFCEn_m = 0

(10) Initialize Video data controller (VDCE)

(11) Set OLDI0CR1 :
- Select operating mode. (CLKSTBY/CH1STBY/CH2STBY/CH3STBY/CH4STBY[1:0] = 11)



Note 1. Please refer to Section 3.4.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation.

Figure 37.30 Open LDI initialization flow

(2) Shutdown

(12) Set OLDInCR1 :

– Select output off mode.
(CLKSTBY/CH1STBY/CH2STBY/CH3STBY/CH4STBY[1:0] = 01)

(13) De-initialize Open LDI ports to port mode :

– PMn_m = 1, PMCn_m = 0 or Pn_m = 0, PMn_m = 0, PMCn_m = 0 (Note 1)

NOTE

Ports get set to GPIO input (Hi-Z) with PMn_m = 1, PMCn_m = 0 or to GPIO output Low with Pn_m = 0, PMn_m = 0, PMCn_m = 0.

(3) 3. Recovery

(14) Re-initialize Open LDI ports to the alternative 1 output mode :

– PMCn_m = 1

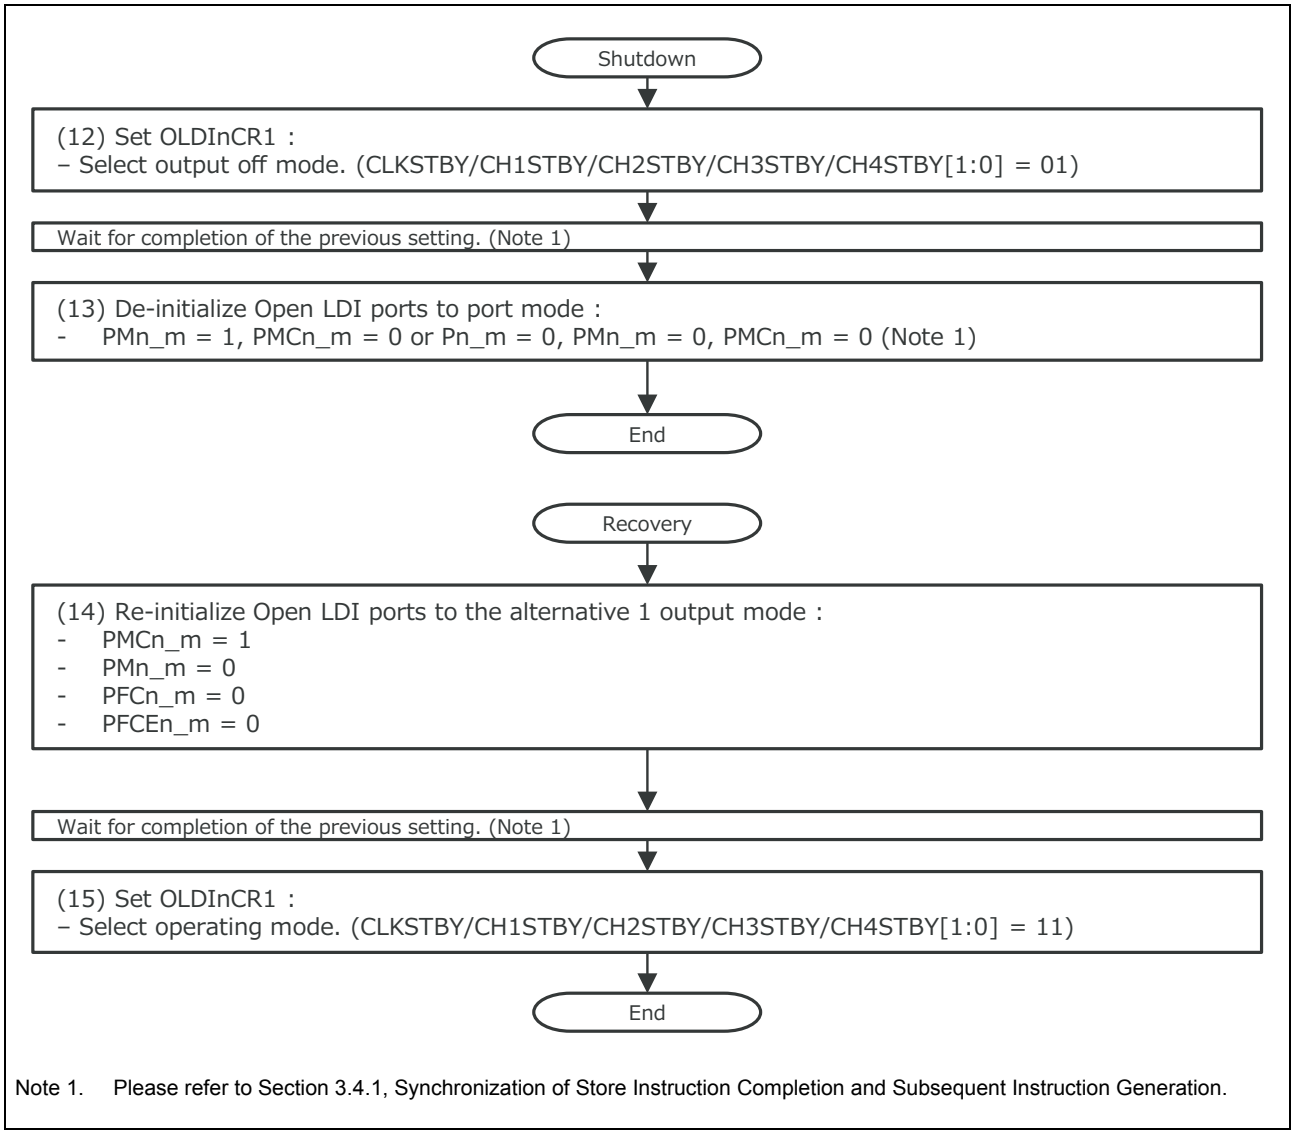
– PMn_m = 0

– PFCn_m = 0

– PFCEn_m = 0

(15) Set OLDInCR1:

– Select operating mode.
(CLKSTBY/CH1STBY/CH2STBY/CH3STBY/CH4STBY[1:0] = 11)



Note 1. Please refer to Section 3.4.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation.

Figure 37.31 Open LDI shutdown and recovery flow

NOTE

When OpenLDI is used (RSDSCFG.VODDR_OEN is set to 0 and RSDSCFG.OLDI_OEN is set to 1), P45_0 to P45_9 can not be used for other functions than Open LDI.

37.12.6 Limitation

1. Once Open LDI operation is started (OLDInCR0.LVRES = 1 and OLDInCR0.LVEN = 1), do not modify the Open LDI registers/bits as below.
   - OLDInCR0.LVRES = 0 (Stopped)
   - OLDInCR0.LVEN = 0 (Output off)
   - OLDInCR1.CLKSTBY/CH1STBY/CH2STBY/CH3STBY/CH4STBY[1:0] = 00 (Standby mode)
2. Do not disable C_ISO_VDCE0CLK or C_ISO_VDCE1CLK, while Open LDI operation clock (OLDICLK) is running.
   - CKSC_IVDCE0VOS_CTL.VDCE0VOSCSID[2:0] = 000B to disable C_ISO_VDCE0CLK (When using Open LDI Interface with video channel 0)
   - CKSC_IVDCE1VOS_CTL.VDCE1VOSCSID[2:0] = 000B to disable C_ISO_VDCE1CLK (When using Open LDI Interface with video channel 1)

When stopping the operation clock (OLDICLK), it is necessary to stop OLDICLK and IVOEXS0_OUTCLK at the same timing by using CKSC_IDOTCLK0S_CTL (When using Open LDI Interface with video channel 0) or CKSC_IDOTCLK1S_CTL (When using Open LDI Interface with video channel 1).

37.13 Video Output DDR format converter (VODDR) (D1M1A only)

37.13.1 Overview of VODDR

37.13.1.1 Units

This microcontroller has the following number of units of the VODDR.

Table 37.99 Number of Units

Product Name	D1L1	D1L2(H)	D1M1(H) D1M1-V2	D1M1A	D1M2(H)
Units	–	–	–	1	–
Names	–	–	–	VODDR0	–

37.13.1.2 Register addresses

The VODDR register addresses are given as address offsets from the individual base addresses <VODDR_base>.

These base addresses are listed in the following table.

Table 37.100 Register Base Address

Base Address Name	Base Address
<VODDR0_base>	F200 1000_H

37.13.1.3 Clock supply

All VODDR Interfaces provide following clock inputs.

Table 37.101 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
VODDR0	APB bus clock PCLK	Clock Controller C_ISO_PCLK
	Operation clock PLLCLK	Clock Controller C_ISO_VODDR_SYSCLK

37.13.1.4 Reset sources

The VODDR and their registers are initialized by the following reset signal:

Table 37.102 Reset sources

Unit Name	Reset Source
VODDR0	• Reset Controller SYSRES

37.13.1.5 External Input/Output Signals

The external input/output signals of VODDR are listed below.

Table 37.103 I/O signals connections

Unit Signal Name	Outline	Alternative Port Pin Signal*1
VODDR0:		
VODDR_LCDOUT[23:0]	Video output data	Video output mode selection VODDR_LCDOUT[23:0]
VODDR_TCON0(VS)	Video output synchronization signal (VSYNC)	Video output mode selection VODDR_TCON0(VS)
VODDR_TCON2(HS)	Video output synchronization signal (HSYNC)	Video output mode selection VODDR_TCON2(HS)
VODDR_TCON3(DE)	Video output synchronization signal (DE)	Video output mode selection VODDR_TCON3(DE)
VODDR_OUT0_CLK	Video output Ch0 pixel clock	Video output mode selection VODDR_OUT0_CLK
VODDR_OUT1_CLK	Video output Ch1 pixel clock	Video output mode selection VODDR_OUT1_CLK

Note 1. The video output signals can be selected from several kinds of format. Refer to Section 37.9.3, D1M1A Video output configuration.

37.13.2 Function Overview

The VODDR module converts two video output channels (VDCE0, VDCE1) to a signal set of one channel video output (LCDOUT[23:0], VSYNC, HSYNC, DE). Two video output pixel clocks are generated by dividing the PLLCLK.

This module has the following features.

- Video output format conversion
- Pixel clock generation
  - Maximum PLLCLK: max. 480MHz
  - Maximum pixel clock: max. 30 MHz. (VO0_PCLK, VO1_PCLK)
- Timing adjustment function of each channel
  - Data output timing adjustment
  - Clock phase adjustment

37.13.3 Function Description

The following figure provides a functional block diagram of the VODDR module.

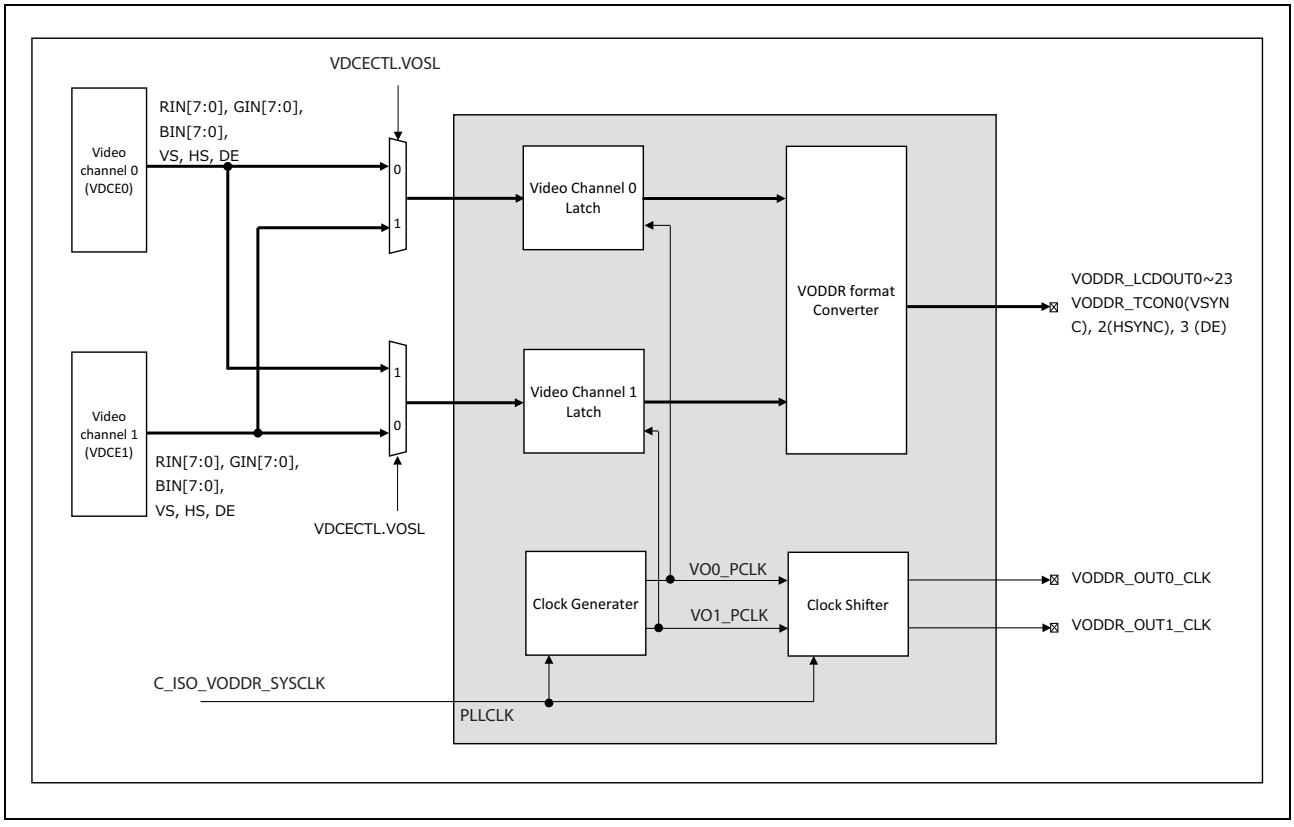


Figure 37.32 VODDR block diagram

37.13.3.1 Video output format conversion

The following figure shows examples of video output format conversion in VODDR module.

VODDR module mix two video output data streams to single video output signal set (LCDOUT23_0, TCON0:VS, TCON2:HS, TCON3:DE).

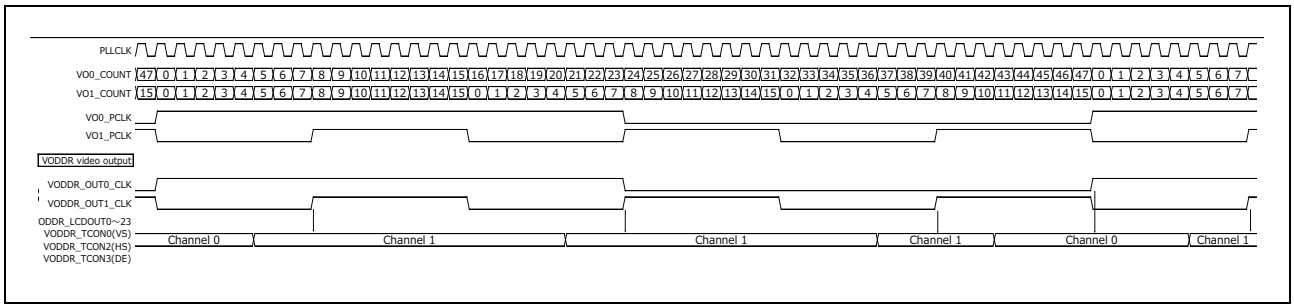

Figure 37.33 VODDR format conversion

37.13.3.2 Pixel clock generation

The following figure shows examples of pixel clock generation in VODDR module.

The frequency of the generated channel 0 pixel clock (VO0_PCLK) is defined by CLK_DIV0[7:0] and the frequency of PLLCLK as $f_{VO0\_PCLK} = f_{PLLCLK} / CLK\_DIV0[7:0]$. Also, the frequency of the generated channel 1 pixel clock (VO1_PCLK) is defined by CLK_DIV1[7:0] and the frequency of PLLCLK as $f_{VO1\_PCLK} = f_{PLLCLK} / CLK\_DIV1[7:0]$.

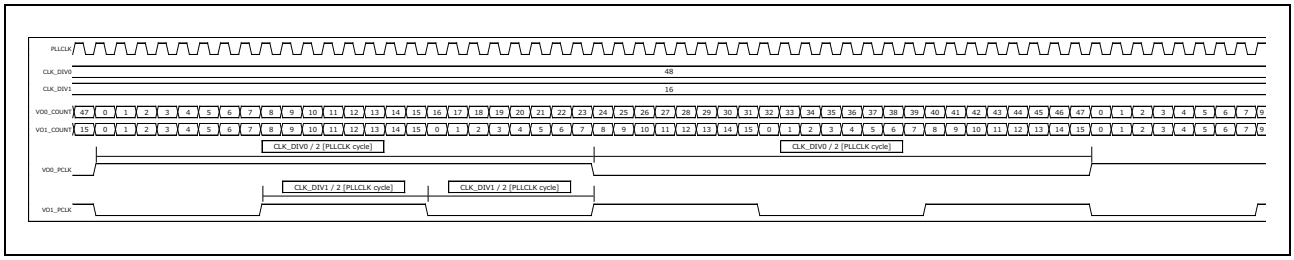

Figure 37.34 VODDR pixel clock generation

CLK_DIV0[7:0] and CLK_DIV1[7:0] must satisfy the followings.

1. The frequency of VO1_PCLK is larger than or equal to the frequency of VO0_PCLK
   - $f_{VO1\_PCLK} \geq f_{VO0\_PCLK}$
2. The frequency of VO0_PCLK and VO1_PCLK is less than or equal to maximum pixel clock frequency.
   - $CLK\_DIV0[7:0] \geq f_{PLLCLK} / f_{max.\ pixel\ clock}$: $30\ MHz \geq f_{VO0\_PCLK}$
   - $CLK\_DIV1[7:0] \geq f_{PLLCLK} / f_{max.\ pixel\ clock}$: $30\ MHz \geq f_{VO1\_PCLK}$
3. The values of CLK_DIV0[7:0] and CLK_DIV1[7:0] is even value.
   - CLK_DIV0[7:0] % 2 = 0
   - CLK_DIV1[7:0] % 2 = 0
4. VO1_PCLK frequency is an integer multiple of the VO0_PCLK frequency.
   - $f_{VO0\_PCLK} : f_{VO1\_PCLK} = 1 : 1, 1 : 2, 1 : 3, \ldots$

37.13.3.3 Timing adjustment function

(1) Data output timing adjustment

The following figure shows examples of video data output timing.

The video data output timing is defined by OUT_TIM0[2:0] and OUT_TIM1[2:0].

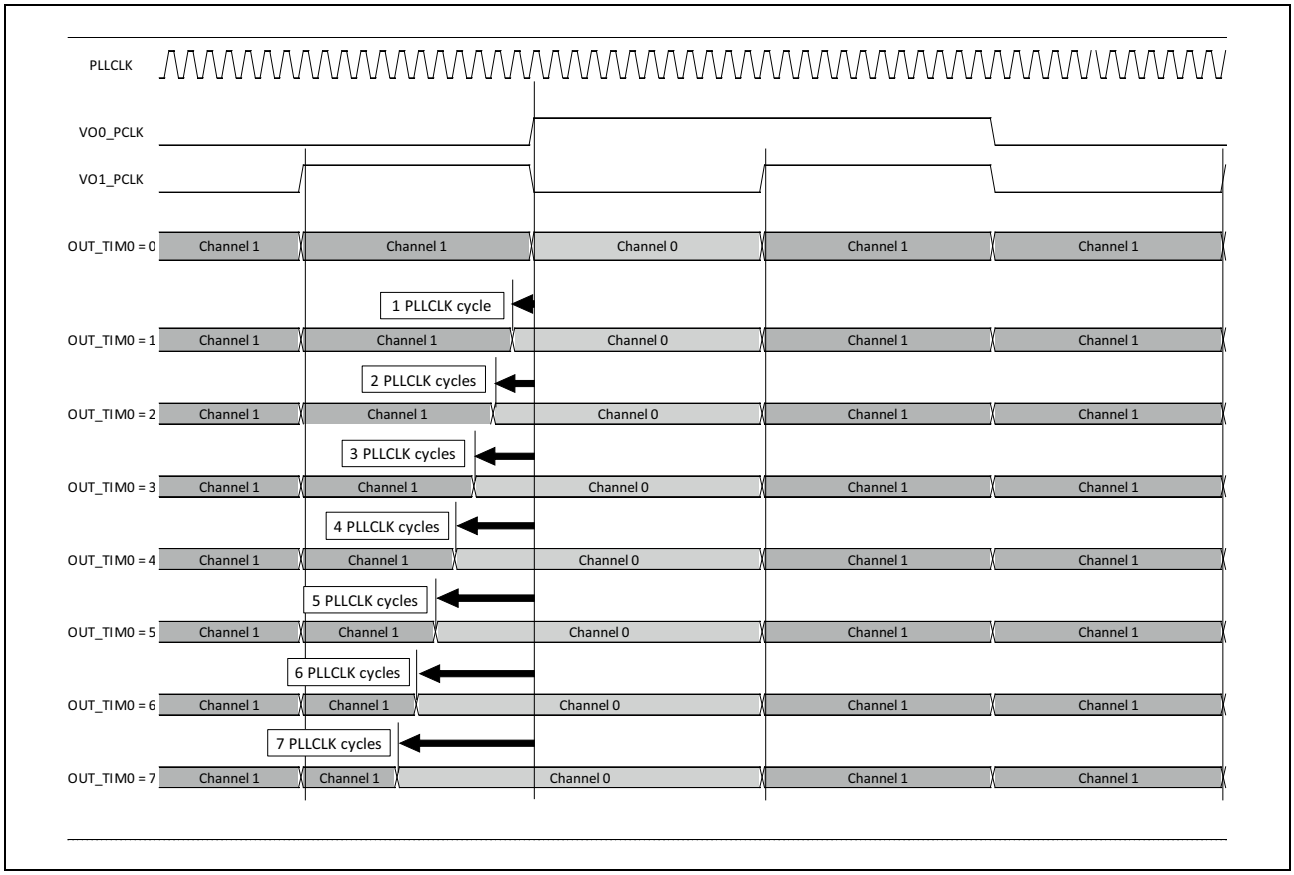

Figure 37.35 VODDR data output timing adjustment

(2) Clock phase adjustment

The following figure shows examples of pixel clock phase adjustment in VODDR module.

The VODDR_OUT0_CLK is shifted to CONFIG0[2:0] cycles behind. Also, the VODDR_OUT1_CLK is shifted to CONFIG1[2:0] cycles behind. The data output timing adjustment is performed the rise edge of VO0_PCLK or VO1_PCLK as a base point. Thus, the clock phase adjustment does not affect video data output timing.

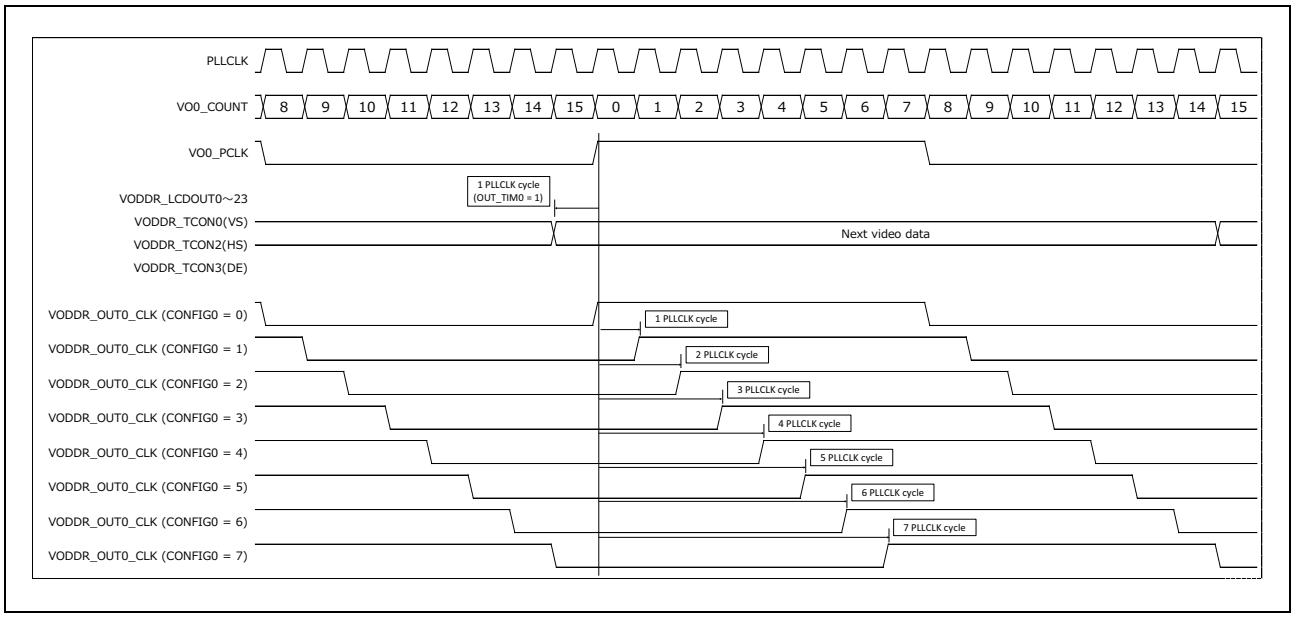

Figure 37.36 VODDR clock phase adjustment

37.13.4 Register Description

The table below lists the register configuration.

Register Access Size

All registers can be accessed in 32-bit units.

Correct device operation is not guaranteed if any access size other than 32-bit is used to access these registers.

<VODDR_base>

The base address <VODDR_base> of the VODDR is defined in Section 37.13.1.2, Register addresses.

Table 37.104 Register Configuration

Module Name	Register name	Shortcut	Address
VODDR0	System control register	VODDR0SYSCNT	<VODDR_base> + 00_H
	Clock divider control register	VODDR0CLKDIV	<VODDR_base> + 04_H
	Timing control 1 register	VODDR0TIMCNT1	<VODDR_base> + $0C_H$

37.13.4.1 VODDR0SYSCNT – VODDR System control register

This register controls VODDR function.

Access: This register can be read/written in 32-bit units.

Address: <VODDR_base> + 00_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VO1_ENABLE
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK_START
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 37.105 VODDR0SYSCNT register contents

Bit Position	Bit Name	Function
31 to 17	-	These bits are always read as 0. When written, write the initial value.
16	VO1_ENABLE	Video channel 1 enable When this bit is 1 (enable), video channel 1 is output. 0: Disable Video channel 1. (Only video channel 0 is output) 1: Enable Video channel 1. (Both of video channel 0 and video channel 1 is output)
15 to 1	-	These bits are always read as 0. When written, write the initial value.
0	CLK_START	Clock generation enable 0: Disable clock generation 1: Enable clock generation Before setting this bit to 1, it must be set to following registers. VODDR0CLKDIV, VODDR0TIMCNT1

37.13.4.2 VODDR0CLKDIV – VODDR Clock divider control register

This register controls VODDR function.

Access: This register can be read/written in 32-bit units.

Address: <VODDR_base> + 04_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CLK_DIV1[7:0]							
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CLK_DIV0[7:0]							
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.106 VODDR0CLKDIV register contents

Bit Position	Bit Name	Function
31 to 24	-	These bits are always read as 0. When written, write the initial value.
23 to 16	CLK_DIV1[7:0]	Clock divider setting for video channel 1 This register must be set even value. 0: Setting prohibited. 1: Setting prohibited. 2: $f_{(VO1\_PCLK)} = f_{(PLLCLK)} / 2$ 3: Setting prohibited. 4: $f_{(VO1\_PCLK)} = f_{(PLLCLK)} / 4$ ... 254: $f_{(VO1\_PCLK)} = f_{(PLLCLK)} / 254$ 255: Setting prohibited.
15 to 8	-	These bits are always read as 0. When written, write the initial value.
7 to 0	CLK_DIV0[7:0]	Clock divider setting for video channel 0 This register must be set even value. 0: Setting prohibited. 1: Setting prohibited. 2: $f_{(VO0\_PCLK)} = f_{(PLLCLK)} / 2$ 3: Setting prohibited. 4: $f_{(VO0\_PCLK)} = f_{(PLLCLK)} / 4$ ... 254: $f_{(VO0\_PCLK)} = f_{(PLLCLK)} / 254$ 255: Setting prohibited.

NOTES

1. CLK_DIV0[7:0] and CLK_DIV1[7:0] must satisfy the following condition:
   $f_{(VO0\_PCLK)} \leq f_{(VO1\_PCLK)}$
2. While VODDR0SYSCNT.CLK_START = 1, the setting of this register is prohibited.

37.13.4.3 VODDR0TIMCNT1 – VODDR timing control 1 register

This register controls VODDR function.

Access: This register can be read/written in 32-bit units.

Address: <VODDR_base> + $0C_H$

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OUT_TIM1[2:0]			—	—	—	—	—	OUT_TIM0[2:0]		
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Table 37.107 VODDR0TIMCNT1 register contents

Bit Position	Bit Name	Function
31 to 27	-	These bits are always read as 0. When written, write the initial value.
26 to 24	OUT_TIM1[2:0]	Setting data output timing adjustment for video channel 1 Video data of channel 1 are output OUT_TIM1[2:0] cycles prior to rising edge of VO1_PCLK. 0: 0 PLLCLK cycle 1: 1 PLLCLK cycles … 7: 7 PLLCLK cycles
23 to 19	-	These bits are always read as 0. When written, write the initial value.
18 to 16	OUT_TIM0[2:0]	Setting data output timing adjustment for video channel 0 Video data of channel 0 are output OUT_TIM0[2:0] cycles prior to rising edge of VO0_PCLK. 0: 0 PLLCLK cycle 1: 1 PLLCLK cycles … 7: 7 PLLCLK cycles
15 to 11	-	These bits are always read as 0. When written, write the initial value.
10 to 8	CONFIG1[2:0]	Setting clock phase adjustment for video channel 1 The VODDR_OUT1_CLK is output shifted to CONFIG1[2:0] cycles behind. 0: 0 PLLCLK cycle 1: 1 PLLCLK cycle 2: 2 PLLCLK cycles … 7: 7 PLLCLK cycles
7 to 3	-	These bits are always read as 0. When written, write the initial value.
2 to 0	CONFIG0[2:0]	Setting clock phase adjustment for video channel 0 The VODDR_OUT0_CLK is output shifted to CONFIG0[2:0] cycles behind. 0: 0 PLLCLK cycle 1: 1 PLLCLK cycle 2: 2 PLLCLK cycles … 7: 7 PLLCLK cycles

NOTE

While VODDR0SYSCNT.CLK_START = 1, the setting of this register is prohibited.

37.13.5 Operation

(1) Start sequence for VODDR.

The following sequence describes the start sequence for VODDR.

1. Select VODDR format by RSDSCFG.VODDR_OEN = 1B
2. Set C_ISO_VODDR_SYSCLK by configuration of CKSC_IDOTCLK0S_CTL
3. Set up following registers:
   - VODDR0CLKDIV.CLK_DIV0[7:0]
   - VODDR0CLKDIV.CLK_DIV1[7:0]
   - VODDR0TIMCNT1.CONFIG0[2:0]
   - VODDR0TIMCNT1.CONFIG1[2:0]
   - VODDR0TIMCNT1.OUT_TIM0[2:0]
   - VODDR0TIMCNT1.OUT_TIM1[2:0]
4. Enable clock generation by VODDR0SYSCNT = 0001 0001H
5. Setting Video Data Controller E (VDCE)

(2) Re-start sequence for VODDR

The following sequence describes the re-start sequence for VODDR.

1. Disable clock generation by VODDR0SYSCNT = 0000 0000H
2. Set up following registers:
   - VODDR0CLKDIV.CLK_DIV0[7:0]
   - VODDR0CLKDIV.CLK_DIV1[7:0]
   - VODDR0TIMCNT1.CONFIG0[2:0]
   - VODDR0TIMCNT1.CONFIG1[2:0]
   - VODDR0TIMCNT1.OUT_TIM0[2:0]
   - VODDR0TIMCNT1.OUT_TIM1[2:0]
3. Enable clock generation by VODDR0SYSCNT = 0001 0001_H

37.13.5.1 Setting Example for WVGA + WQVGA

Table 37.108 and **Table 37.109** are setting example for using WVGA (800 x 480 @ 60Hz) + WQVGA (480 x 272 @ 60Hz) displays.

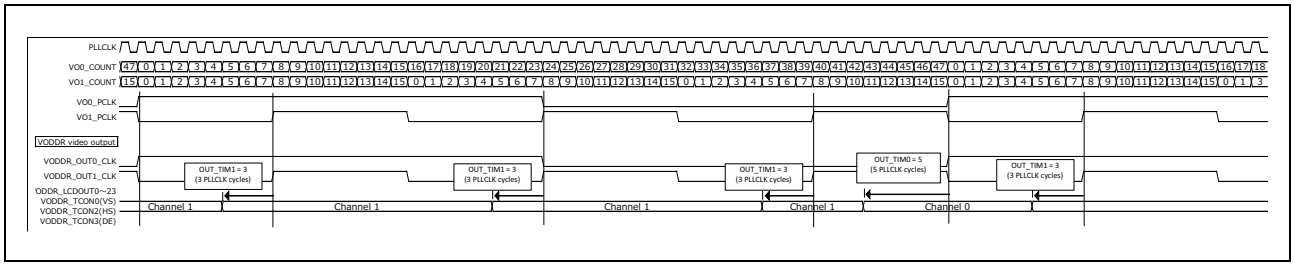

Figure 37.37 VODDR WVGA + WQVGA (60Hz) Video Output

Table 37.108 Video parameters for WVGA + WQVGA (60 Hz) display

Item		Settings
PLLCLK	PLLCLK frequency	480 MHz
Channel 0	Video image size	WQVGA
	Frame rate	60 Hz
	Vertical valid period	272 lines
	Horizontal valid period	480 pixels
	Pixel clock frequency	10 MHz
Channel 1	Video image size	WVGA
	Frame rate	60 Hz
	Vertical valid period	480 lines
	Horizontal valid period	800 pixels
	Pixel clock frequency	30 MHz

Table 37.109 VODDR Register Setting Example for WVGA + WQVGA (60 Hz) display

Register Name	Bit Name	Settings	Remarks
VODDR0CLKDIV	CLK_DIV0[7:0]	48	$f_{(VO0\_PCLK)} = f_{(PLLCLK)} / 48 = 10$ MHz
	CLK_DIV1[7:0]	16	$f_{(VO1\_PCLK)} = f_{(PLLCLK)} / 16 = 30$ MHz
VODDR0TIMCNT1	CONFIG0[2:0]	0	VODDR_OUT0_CLK is shifted 0 cycles for VO0_PCLK
	COMFIG1[2:0]	0	VODDR_OUT1_CLK is shifted 0 cycles for VO1_PCLK
	OUT_TIM0[2:0]	5	Video data of channel 0 are output before 5 cycles prior to rising edge of VO0_PCLK
	OUT_TIM1[2:0]	3	Video data of channel 1 are output before 3 cycles prior to rising edge of VO1_PCLK

Table 37.110 and **Table 37.111** are setting example for using WVGA (800 x 480 @ 60Hz) + WQVGA (480 x 272 @ 50Hz) displays.

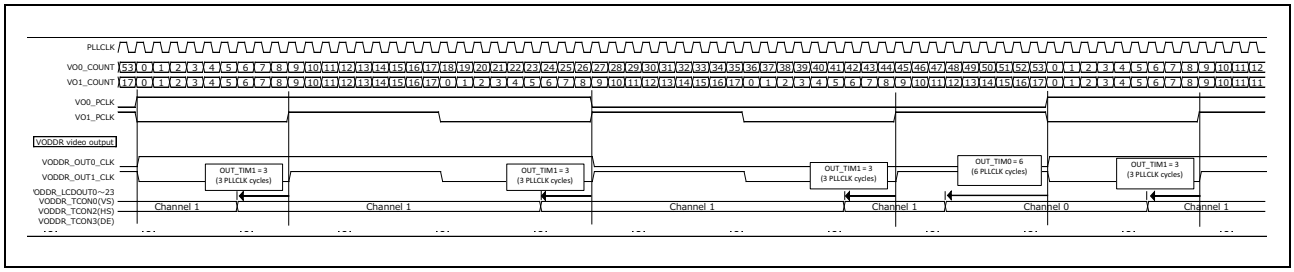

Figure 37.38 VODDR WVGA + WQVGA (50 Hz) Video Output

Table 37.110 Video parameters for WVGA + WQVGA (50 Hz) display

Item		Settings
PLLCLK	PLLCLK frequency	480MHz
Channel 0	Video image size	WQVGA
	Frame rate	50 Hz

Table 37.113 VODDR Register Setting Example for WQVGA + WQVGA display

Register Name	Bit Name	Settings	Remarks
VODDR0CLKDIV	CLK_DIV0[7:0]	48	$f_{(VO0\_PCLK)} = f_{(PLLCLK)} / 48 = 10$ MHz
	CLK_DIV1[7:0]	48	$f_{(VO1\_PCLK)} = f_{(PLLCLK)} / 48 = 10$ MHz
VODDR0TIMCNT1	CONFIG0[2:0]	6	VODDR_OUT0_CLK is shifted 6 cycles for VO0_PCLK
	CONFIG1[2:0]	6	VODDR_OUT1_CLK is shifted 6 cycles for VO1_PCLK
	OUT_TIM0[2:0]	6	Video data of channel 0 are output before 6 cycles prior to rising edge of VO0_PCLK
	OUT_TIM1[2:0]	6	Video data of channel 1 are output before 6 cycles prior to rising edge of VO1_PCLK

Section 38 Video Data Controller E (VDCE)

This section contains a generic description of the Video Data Controller E.

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.
The subsequent sections describe the features that apply to all implementations.

38.1 Overview of the RH850/D1L/D1M Video Data Controllers E

38.1.1 Units

This microcontroller has the following number of units of the Video Data Controller E.

Table 38.1 Units

Video Data Controller E (VDCE)	D1L1	D1L2(H)	D1M1(H) D1M1-V2	D1M1A D1M2(H)
Units	–	1	1	2
Names	–	VDCE0	VDCE0	VDCE0, VDCE1

Unit index n

Throughout this section, the individual units of the Video Data Controllers E are identified by the index “n” (n = 0, 1).

38.1.2 Register addresses

All Video Data Controller E register addresses are given as address offsets from the individual base addresses <VDCEn_base>.
The <VDCEn_base> addresses of each VDCEn are listed in the following table:

Table 38.2 Register base addresses <VDCEn_base>

VDCEn unit	<VDCEn_base> address
VDCE0	F200 4000_H
VDCE1	F200 6000_H

38.1.3 Clock supply

All Video Data Controllers E provide following clock inputs.

Table 38.3 Clock supply

VDCEn unit	VDCEn clock	Connected to
VDCE0	PCLK	Video channels clock generator C_ISO_XCCLK/2
	Cross-connect clock	Clock Controller C_ISO_XCCLK
	Video output pixel clock	Video channels clock generator C_ISO_VDCE0CLK
	Video input pixel clock	Video channels clock generator C_ISO_VI0PIXCLK
VDCE1	PCLK	Video channels clock generator C_ISO_XCCLK/2
	Cross-connect clock	Clock Controller C_ISO_XCCLK
	Video output pixel clock	Video channels clock generator C_ISO_VDCE1CLK
	Video input pixel clock	Video channels clock generator C_ISO_VI1PIXCLK

NOTE

For a detailed description of the video channels clock generator refer to Section 37.5, Video channels clock generation.

38.1.4 Interrupts

The Video Data Controllers E can generate the following interrupt requests:

Table 38.4 VDCEn interrupt requests (1/2)

VDCEn signals	Function	Connected to
VDCE0:		
S0_VSYNCERR	Missing Vsync signal for scaler 0	Interrupt Controller INTVDCE0ERR logical OR combination of all VDCE0 error interrupts
IV1_VBUFERR	Frame buffer write overflow signal for scaler 0	
IV3_VBUFERR	Frame buffer read underflow signal for graphics 0	
IV5_VBUFERR	Frame buffer read underflow signal for graphics 2	
IV6_VBUFERR	Frame buffer read underflow signal for graphics 3	
S1_VSYNCERR	Missing Vsync signal for scaler 1	
IV4_VBUFERR	Frame buffer read underflow signal for graphics 1	
V8_VBUFERR	Frame buffer read underflow signal for graphics (OIR)	
	VBLANK detection at Graphics 3	Interrupt Controller INTVDCE0GR3VBLANK
S0_VI_VSYNC	VSYNC input at Scaler 0 interrupt	Interrupt Controller INTVDCE0S0VIVSYNC
S0_LO_VSYNC	VSYNC output at Scaler 0 interrupt	Interrupt Controller INTVDCE0S0LOVSYNC
GR3_VLINE	Line detection of designated line at Graphics3 interrupt	Interrupt Controller INTVDCE0GR3VLINE

Table 38.4 VDCEn interrupt requests (2/2)

VDCEn signals	Function	Connected to
S0_VFIELD	End of field for record function at Scaler 0 interrupt	Interrupt Controller INTVDCE0S0VFIELD
S1_LO_VSYNC	VSYNC output at Scaler 1 interrupt	Interrupt Controller INTVDCE0S1LOVSYNC
OIR_VI_VSYNC	VSYNC input at Output Image Render interrupt	Interrupt Controller INTVDCE0OIRVIVSYNC
OIR_LO_VSYNC	VSYNC output at Output Image Render interrupt	Interrupt Controller INTVDCE0OIRLOVSYNC
OIR_VLINE	Line detection of designated line to panel output at Output Image Render interrupt	Interrupt Controller INTVDCE0OIRVLINE
VDCE1:		
S0_VSYNCERR	Missing Vsync signal for scaler 0	Interrupt Controller INTVDCE1ERR logical OR combination of all VDCE1 error interrupts
IV1_VBUFERR	Frame buffer write overflow signal for scaler 0	
IV3_VBUFERR	Frame buffer read underflow signal for graphics 0	
IV5_VBUFERR	Frame buffer read underflow signal for graphics 2	
IV6_VBUFERR	Frame buffer read underflow signal for graphics 3	
S1_VSYNCERR	Missing Vsync signal for scaler 1	
IV4_VBUFERR	Frame buffer read underflow signal for graphics 1	
	VBLANK detection at Graphics 3	Interrupt Controller INTVDCE1GR3VBLANK
S0_VI_VSYNC	VSYNC input at Scaler 0 interrupt	Interrupt Controller INTVDCE1S0VIVSYNC
S0_LO_VSYNC	VSYNC output at Scaler 0 interrupt	Interrupt Controller INTVDCE1S0LOVSYNC
GR3_VLINE	Line detection of designated line at Graphics3 interrupt	Interrupt Controller INTVDCE1GR3VLINE
S0_VFIELD	End of field for record function at Scaler 0 interrupt	Interrupt Controller INTVDCE1S0VFIELD
S1_LO_VSYNC	VSYNC output at Scaler 1 interrupt	Interrupt Controller INTVDCE1S1LOVSYNC

38.1.5 Reset sources

The Video Data Controllers E and their registers are initialized by the following reset signal:

Table 38.5 Reset sources

VDCEn unit	Reset signal
VDCE0	• Reset Controller SYSRES • Reset Controller VDCE0RES • reset upon wake-up from DEEPSTOP mode
VDCE1	• Reset Controller SYSRES • Reset Controller VDCE1RES • reset upon wake-up from DEEPSTOP mode

CAUTION

By default the VDCEnRES resets are active.
Thus before accessing a VDCEn module this reset must be released via the MRSTC register of the Reset Controller. Refer to Section 9, Reset Controller for details.

38.1.6 I/O signals

The following table shows the I/O signals of the Video Data Controllers E.

Table 38.6 I/O signals connections

VDCEn signal	Function	Connected to
VDCE0		
DV_DATA[23:0]	Video Input I/F 0 *1	Video input selection DV_DATA[23:0]
DV_CLK		Video input selection DVCLK
DV_HSYNC		Video input selection DV_HSYNC
DV_VSYNC		Video input selection DV_VSYNC
RIN[7:0]	Video Output I/F 0 data *2	Video output selection RIN[7:0]
GIN[7:0]		Video output selection GIN[7:0]
BIN[7:0]		Video output selection BIN[7:0]
LCD_CLK	Video Output I/F 0 clock *2	Video output selection LCD_CLK
LCD_TCON0	Video Output I/F 0 synchronization signals	Port VDCE0_VO_TCON0 *2
LCD_TCON1		Port VDCE0_VO_TCON1*3
LCD_TCON2		Port VDCE0_VO_TCON2 *2
LCD_TCON3		Port VDCE0_VO_TCON3 *2
LCD_TCON4		Port VDCE0_VO_TCON4*3
LCD_TCON5		Port VDCE0_VO_TCON5*3
LCD_TCON6		Port VDCE0_VO_TCON6*3
VDCE1		
DV_DATA[23:0]	Video Input I/F 1 *1	Video input selection DV_DATA[23:0]
DV_CLK		Video input selection DVCLK
DV_HSYNC		Video input selection DV_HSYNC
DV_VSYNC		Video input selection DV_VSYNC
RIN[7:0]	Video Output I/F 1 data *2	Video output selection RIN[7:0]
GIN[7:0]		Video output selection GIN[7:0]
BIN[7:0]		Video output selection BIN[7:0]
LCD_CLK	Video Output I/F 1 clock *2	Video output selection LCD_CLK
LCD_TCON0	Video Output I/F 1 synchronization signals	Port VDCE1_VO_TCON0 *2
LCD_TCON1		Port VDCE1_VO_TCON1
LCD_TCON2		Port VDCE1_VO_TCON2 *2
LCD_TCON3		Port VDCE1_VO_TCON3 *2
LCD_TCON4		Port VDCE1_VO_TCON4
LCD_TCON5		Port VDCE1_VO_TCON5
LCD_TCON6		Port VDCE1_VO_TCON6

Note 1. The video input signals can be selected from various ports. Refer to Section 37.7, Video Input selection for details about the video input signal selections.

Note 2. The output of the video output signals to the ports can be output to the display in various modes. Refer to Section 37.9, Video Output selection and RSDS control for details about the video output modes.

Note 3. For availability of these signals, refer to the Section 2.3.2, List of Alternative Function Pins.

38.1.7 Bus master IDs

The Video Data Controller master interfaces are connected to the XC2 cross-connect system, which forms an own master ID domain.

The following table summarizes the Video Data Controller master interfaces IDs, their connection to an XC2 layer and the Sprite Engine slave interface.

Since all Video Data Controller masters access the XC0 and XC1 cross-connects through the Sprite Engine master interfaces, the master ID of the respective Sprite Engine master interface appears on the XC0/XC1 cross-connects.

For detailed information about the cross-connection systems and the usage of the master IDs refer to Section 14.2, Cross-connect systems.

Table 38.7 Video channels master IDs

			XC2 cross-connect		Sprite Engine	
Master I/F		**Access**	**Master ID**	**XC2 layer**	**XC2 slave**	**XC0/XC1 master ID**
Video channel 0	Video Input 0	W	0	XC2_0	RLE Units	MSTID8
	Image Synthesizer 00	R	0	XC2_0	RLE Units	MSTID8
	Image Synthesizer 01	R	4	XC2_1	Sprite Unit 0	MSTID9
	Image Synthesizer 02	R	8	XC2_2	Sprite Unit 1	MSTID10
	Image Synthesizer 03	R	12	XC2_3	Sprite Unit 2	MSTID11
	Output Image Generator	R	10	XC2_1	Sprite Unit 0	MSTID9
	Video Output Warping Engine	W	6	XC2_2	Sprite Unit 1	MSTID10
		R				
Video channel 1	Video Input 1	W	13	XC2_3	Sprite Unit 2	MSTID11
	Image Synthesizer 10	R	1	XC2_0	RLE Units	MSTID8
	Image Synthesizer 11	R	13	XC2_3	Sprite Unit 2	MSTID11
	Image Synthesizer 12	R	9	XC2_2	Sprite Unit 1	MSTID10
	Image Synthesizer 13	R	5	XC2_1	Sprite Unit 0	MSTID9

38.2 Overview

38.2.1 Features

The Video Display Controller consists of the following seven blocks. For the image synthesis, two planes of video image + two graphics planes, one plane of video image + three graphics planes, or four graphics planes can be selected.

1. Input controller: Input video image selection, sync signal adjustment, and brightness adjustment, gain adjustment, and YCbCr ↔ GBR conversion using a color matrix
2. Scaler: Scale up and scale down
3. Image quality improver: YCbCr ↔ GBR conversion using a color matrix
4. Image synthesizer: Synthesis of two planes of video image + two graphics planes, one plane of video image + three graphics planes, or four graphics planes
5. Output image generator: Writing and reading of image data to and from the frame buffer after the image synthesis
6. Output controller: Brightness/contrast adjustment, gamma correction, dither processing, output format conversion, control signal output for TFT-LCD panel
7. System controller: Interrupt control, panel clock control, CLUT table select signal status flag output

The functions of Video Display Controller are listed in the following table.

Table 38.8 Features of Video Display Controller (1/2)

Item	Function
Input video image specification*3	• 8-bit input conforming to ITU-R BT.656 standard (27 MHz, interlace signal) • 8-bit input conforming to ITU-R BT.656 extended standard (27 MHz, progressive signal)*1 • 8-bit input conforming to ITU-R BT.601 extended standard (27 MHz, interlace signal)*1 • 16-bit input conforming to ITU-R BT.601 extended standard (13.5 MHz, interlace signal)*1 • Digital pin input: YCbCr422, YCbCr444, RGB888, RGB666, and RGB565 video image • Digital pin input size: Maximum input video image size to be set*2: 1024 pixels × 1024 lines (horizontal × vertical) • Examples of input video image size: XGA (1024 × 768), SVGA (800 × 600), WVGA (800 × 480), VGA (640 × 480), WQVGA (480 × 240), QVGA in landscape (320 × 240), QVGA in portrait (240 × 320)
Video image quality adjustment function	Contrast adjustment, brightness adjustment
Video image scaling processing*3	Vertical: ×1/8 to ×8, linear/hold interpolation Horizontal: ×1/8 to ×8, linear/hold interpolation IP conversion can be performed by adjusting the initial phase.
Video image rotation function	• Horizontal mirroring in the YCbCr422/YCbCr444/RGB565/RGB888 format

Table 38.8 Features of Video Display Controller (2/2)

Item	Function
Graphics	• Number of graphic planes: Four planes (graphics 0, graphics 1, graphics 2, and graphics 3) • Supported pixel formats: – RGB565 progressive format (α: none, R: 5 bits, G: 6 bits, B: 5 bits; 16 bits in total) – RGB888 progressive format (α: none, R: 8 bits, G: 8 bits, B: 8 bits; 24 bits in total) – α RGB1555 progressive format (α: 1 bit, R: 5 bits, G: 5 bits, B: 5 bits; 16 bits in total) – α RGB4444 progressive format (α: 4 bits, R: 4 bits, G: 4 bits, B: 4 bits; 16 bits in total) – α RGB8888 progressive format (α: 8 bits, R: 8 bits, G: 8 bits, B: 8 bits; 32 bits in total) – RGBα5551 progressive format (R: 5 bits, G: 5 bits, B: 5 bits, α: 1 bit; 16 bits in total) – RGBα8888 progressive format (R: 8 bits, G: 8 bits, B: 8 bits, α: 8 bits; 32 bits in total) – CLUT8 progressive format (CLUT: 8 bits) – CLUT4 progressive format (CLUT: 4 bits) – CLUT1 progressive format (CLUT: 1 bits) – YCbCr422 progressive format (Y: 8 bits, Cb/Cr: 8 bits; 16 bits in total) (only for graphics 0 and 1) – YCbCr444 progressive format (Y: 8 bits, Cb: 8 bits, Cr: 8 bits; 24 bits in total) (only for graphics 0 and 1)
Graphics function	• Alpha blending in rectangular area: Mixes images according to transparency rate α in the specified area. • Chroma-key: Mixes images using the specified RGB color and CLUT value according to transparency rate α. • Alpha blending in one pixel units: Mixes images according to transparency rate α when the target graphics image is in the αRGB1555, αRGB4444, αRGB8888, RGBα5551, RGBα8888, or CLUT8/4/1 format. Alpha blending rectangular and one pixel unit at the same time. Constant rectangular alpha value is multiplied with pixel alpha value.
	For each dot, the priority among the α values of the above functions is as follows: Alpha blending in rectangular area > Chroma-key > Alpha blending in one pixel units
	Note: Alpha blending and Chroma-Key features are not supported for Graphic Layer 0 (GR0).
Output video image size	Maximum output video image size to be set*: 1280 pixels × 1024 lines (horizontal × vertical) Note: * Depends on the AC characteristics of the display panel. Examples of output video image size: • WXGA(1280 x 768), XGA (1024 × 768) • SVGA (800 × 600), WVGA (800 × 480), • VGA (640 × 480), WQVGA (480 × 240), • QVGA size in landscape (320 × 240) • QVGA size in portrait (240 × 320)
Output video image format	• RGB888 progressive video output (24-bit parallel output) • RGB666 progressive video output (18-bit parallel output) • RGB565 progressive video output (16-bit parallel output) • Serial RGB progressive output (8-bit serial output) (D1M1A and D1M1-V2 only)
Panel output adjustment	Panel brightness/contrast adjustment, RGB gamma correction*3, dither processing, output format conversion
Sync signal output	Control signal output for the TFT-LCD panel
Interrupt output	• Vsync signal for video image input/output • Line interrupt output (can be output on a desired line.) • Erroneous Vsync cycle detection signal for video input • Field write completion signal • Overflow/underflow signal for the internal buffer

Note 1. The ITU-R BT.656 and BT.601 standard does not include the description regarding the progressive signal. The ITU-R BT.601 standard does not include the description regarding the connection interface.

Note 2. Depends on the AC characteristics of the connected device.

Note 3. Not available for D1L2(H) devices.

38.2.2 Block Diagram

Following figures show the entire block diagram of this module. This LSI incorporates two video display controllers (channels 0 and 1), to each of which the video signal is input from the corresponding video decoder. Each controller can also fetch output from the input control block of the other controller. For details, see the description of each block.

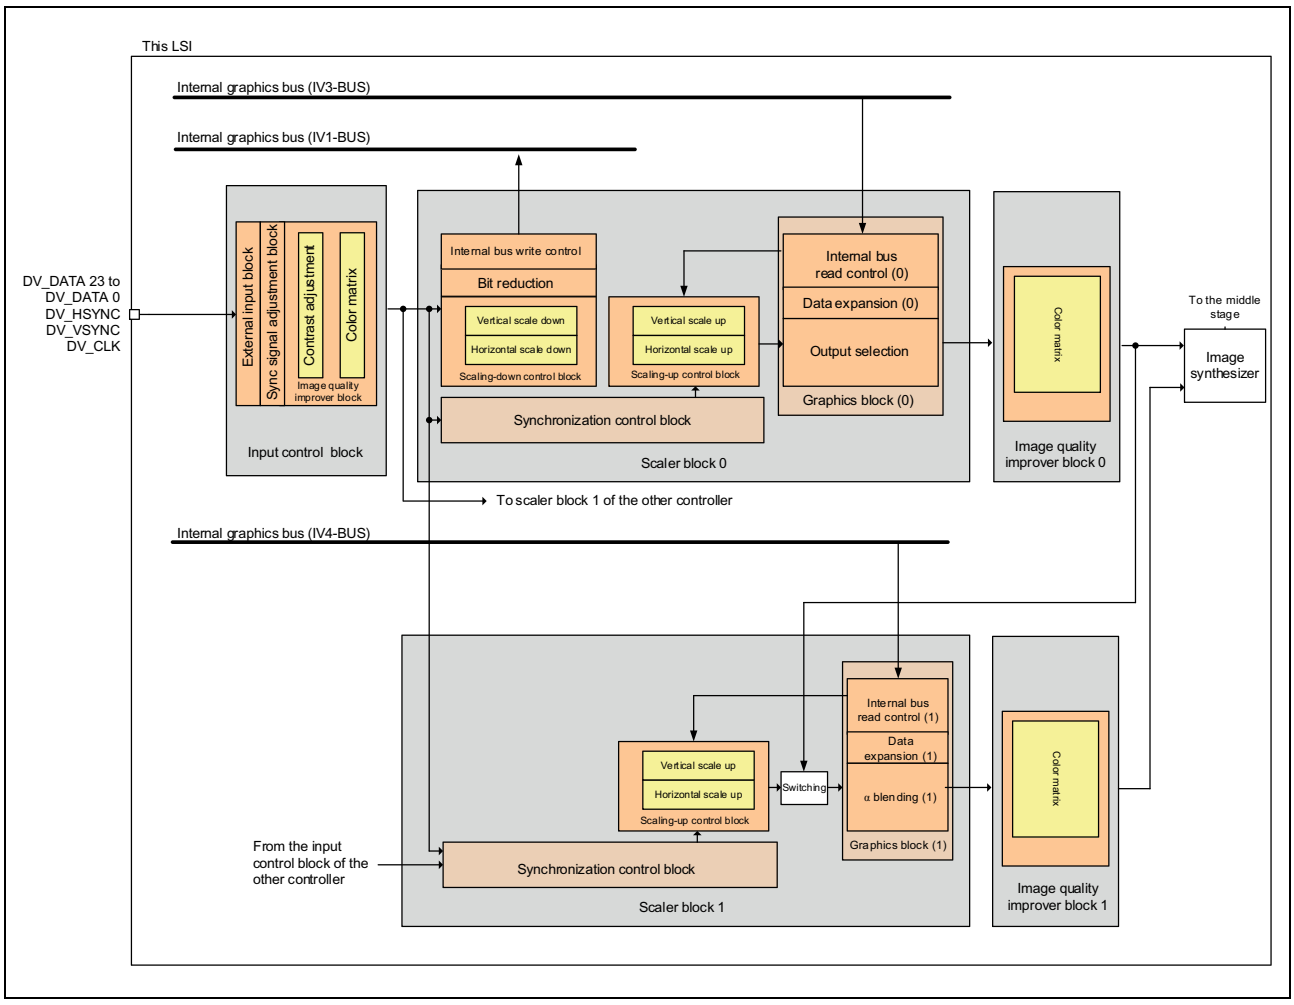

Figure 38.1 Video Display Controller Former Stage Block Diagram

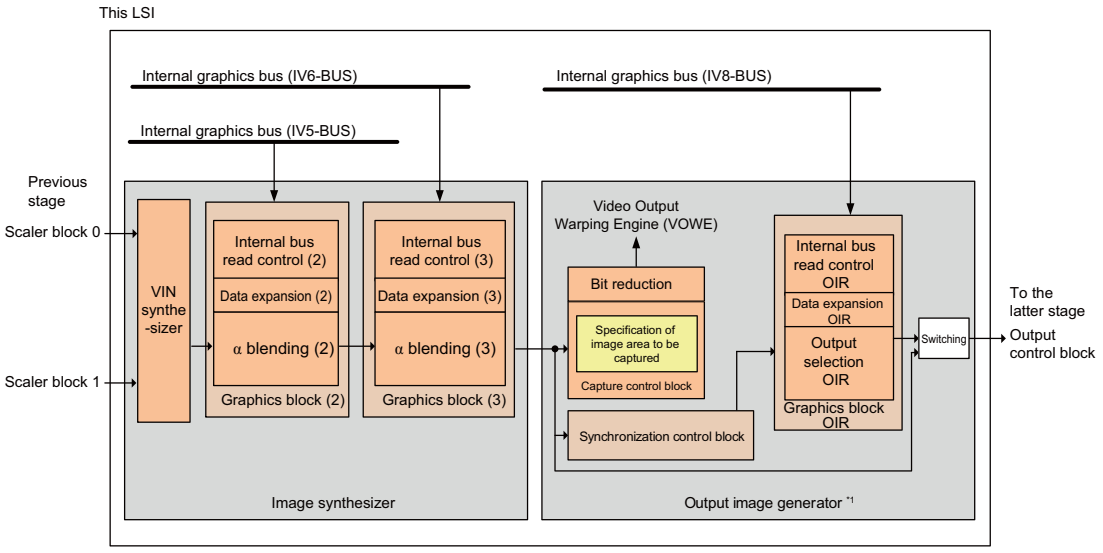

Note 1. The output image generator is bypassed in the D1L2(H) devices.

Figure 38.2 Video Display Controller Middle Stage Block Diagram

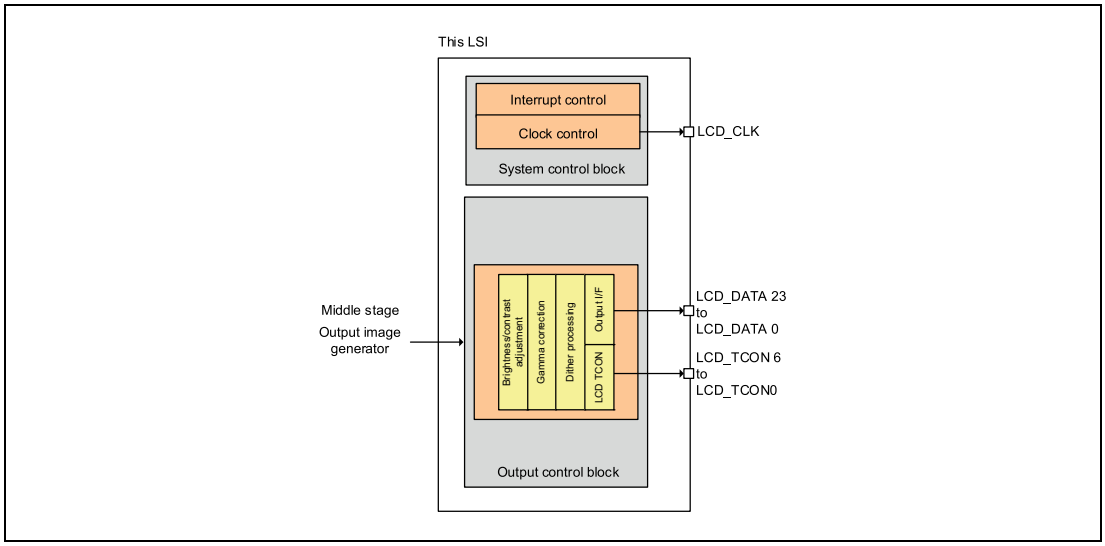

Figure 38.3 Video Display Controller Latter Stage Block Diagram

38.2.3 Input/Output Pins

The following tables show the pin configuration.

Table 38.9 Input/Output Pins (Channel 0)

Symbol	I/O	Pin Name	Function
DV0_CLK	Input	External input clock 0	External input 0 clock pin
DV0_VSYNC	Input	External input Vsync 0	External input 0 Vsync signal pin
DV0_HSYNC	Input	External input Hsync 0	External input 0 Hsync signal pin
DV0_DATA 17 to DV0_DATA 0	Input	External input video image data 0	External input 0 video image data pin
LCD0_CLK	Output	Panel clock 0	Panel output 0 clock pin
LCD0_DATA 23 to LCD0_DATA 0	Output	Video image data 0 for panel	Panel output 0 video image data pin
LCD0_TCON 6 to LCD0_TCON 0	Output	Control signal 0 for panel	Panel output 0 timing control pin

Table 38.10 Input/Output Pins (Channel 1)

Symbol	I/O	Pin Name	Function
DV1_CLK	Input	External input clock 1	External input 1 clock pin
DV1_VSYNC	Input	External input Vsync 1	External input 1 Vsync signal pin
DV1_HSYNC	Input	External input Hsync 1	External input 1 Hsync signal pin
DV1_DATA 23 to DV1_DATA 0	Input	External input video image data 1	External input 1 video image data pin
LCD1_CLK	Output	Panel clock 1	Panel output 1 clock pin
LCD1_DATA 23 to LCD1_DATA 0	Output	Video image data 1 for panel	Panel output 1 video image data pin
LCD1_TCON 6 to LCD1_TCON 0	Output	Control signal 1 for panel	Panel output 1 timing control pin

38.2.4 Clocks

There are two clocks to be mainly used by the Video Display Controller: the video image clock and pixel clock.

The video image clock is used while the video image is processed in the input controller, passed to the scale-down control block in the scaler, and then written to the buffer (internal bus write control).

The pixel clock is used in graphics read-out processing by the scaler (internal bus read controller) through output controller processing. For parallel RGB output, the frequencies of the pixel clock and panel clock (LCD_CLK) are the same.

When the serial RGB output is selected in the output controller, the pixel clock frequency is 1/3 or 1/4 of the panel clock (LCD_CLK) frequency.

38.2.5 Hsync and Vsync Signals

Hsync and Vsync signals to be used in the logic stage following the scale-up control block of the scaler are generated by the synchronization control block of the scaler. Since the Hsync and Vsync signals are used as the reference signals for the LCD TCON, which generates various LCD panel driving timings, they are also the reference signals for the control signals (LCD_TCON6 to LCD_TCON0 pins) passed to the LCD panel.

The output Hsync signal always operates at a free-running frequency, and the horizontal period is set with SC_SCL0_FRC4.SC_RES_FH[10:0]. On the other hand, the output Vsync signal is selected from the external input (digital pin input) and free-running Vsync signals with SC_SCL0_FRC3.SC_RES_VS_SEL of the scaler.

38.2.5.1 External Input Vsync

(1) Operation Outline

In this mode, the output Vsync signal is generated according to an external input Vsync signal. When displaying video image input from a digital pin on the panel, always use this mode. However, the output Hsync signal is free running even in this mode. The following figure shows the timing of external input Vsync signal.

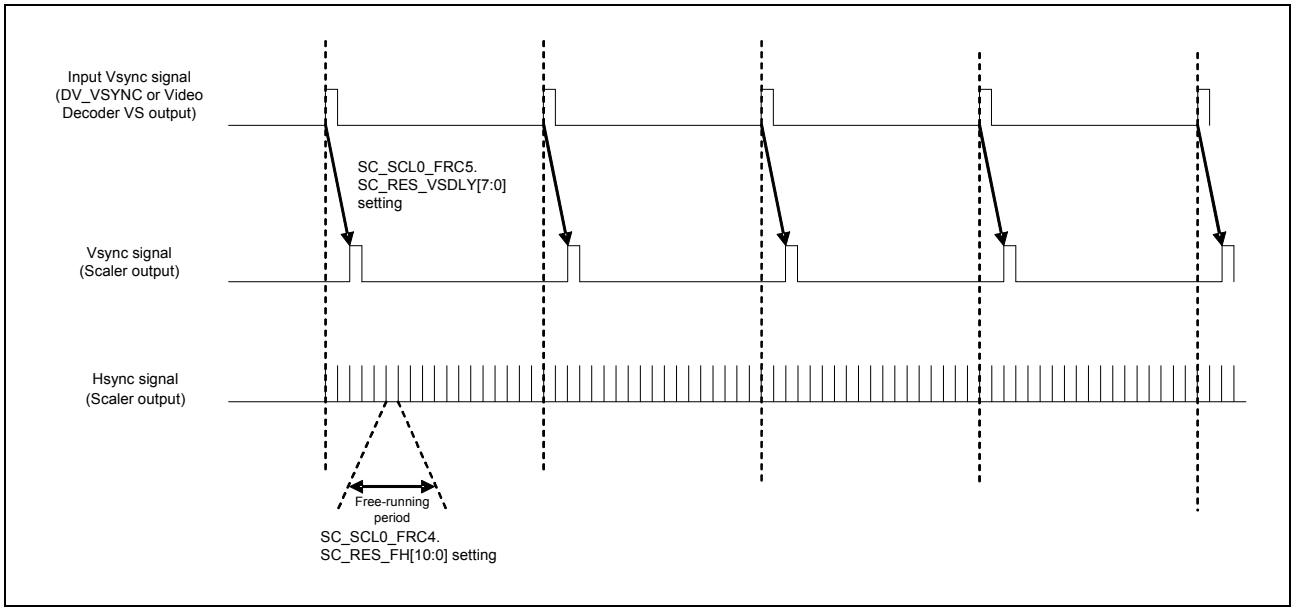

Figure 38.4 External Input Vsync Timing

(2) Notes

When Vsync is externally input, generation of the output Vsync signal is based on the external Vsync signal. That is, the output Vsync signal follows the input Vsync signal, so if an unstable Vsync signal is input, the output Vsync signal will also be unstable.

Since the output Hsync signal is generated according to the frequency generated by a free-running clock and the Vsync signal is generated from the video input as a base, the signals will not be in synchronization. This module adjusts the timing between these signals by adjusting the output Vsync signal so that it stays in time with the output Hsync signal. Therefore, even if the input Vsync signal is stable, the timing of the output Vsync signal may be increased or decreased by up to one line to stay in synchronization with the timing of the output Hsync signal.

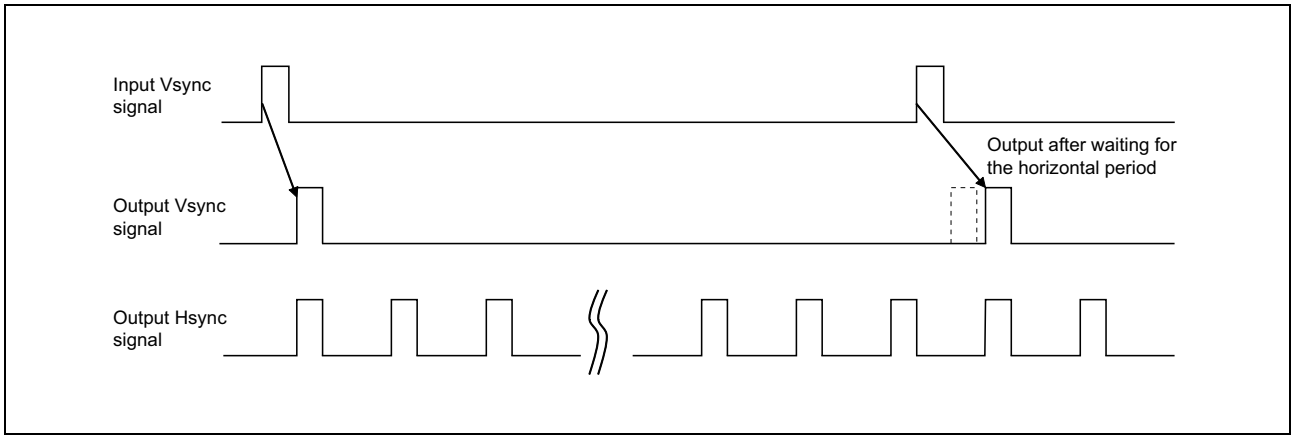

Figure 38.5 Detailed Timing Chart for Generation of the Output Vsync Signal

38.2.5.2 Free-Running Vsync

In this mode, the Vsync signal is generated according to the pixel clock (free running). The vertical period is selected with SC_SCL0_FRC4.SC_RES_FV[10:0]. The output Hsync signal is also free running. The following figure shows the timing.

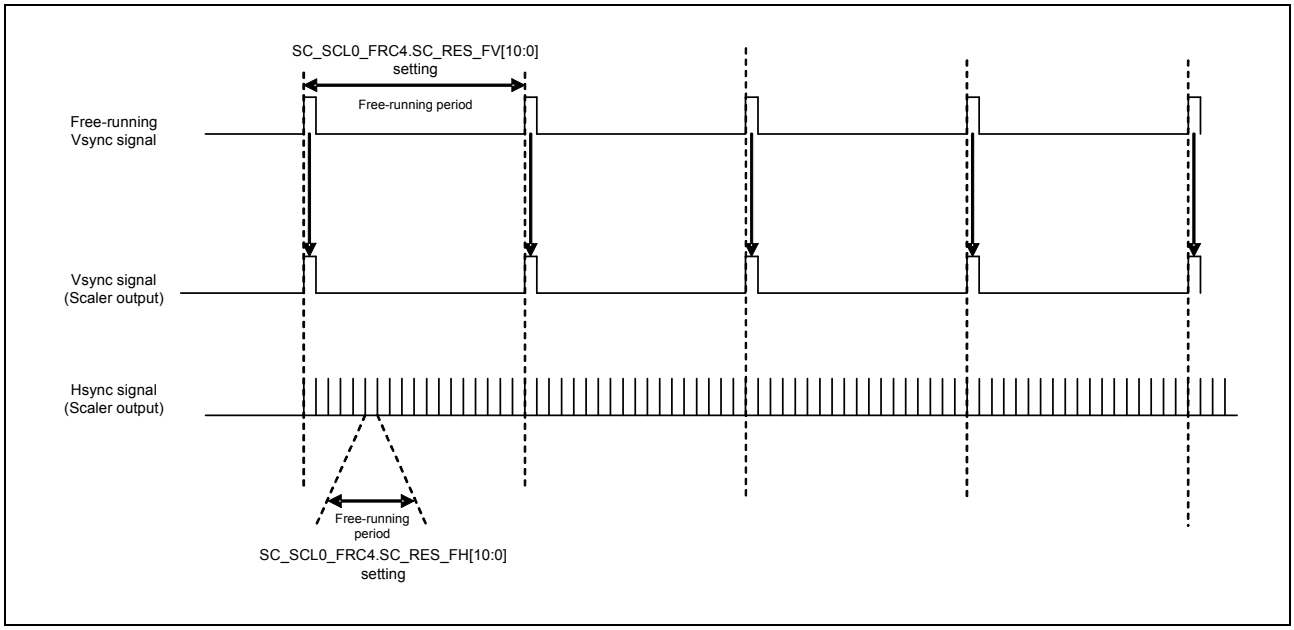

Figure 38.6 Free Running Vsync Timing

38.2.5.3 Sync Signal Selection

The following table shows examples of sync signal selection.

Table 38.11 Sync Signal Selection

External Video Input	Graphics	Vsync Signal Selected
Not displayed	Not displayed	Not used
Not displayed	Displayed	Free-running Vsync
Displayed	Not displayed	External input Vsync
Displayed	Displayed	External input Vsync

38.2.5.4 Usage Note on Changing Vsync Signal Selections

When the Vsync signal selection is changed, the output Vsync signal is discontinuous, resulting in disordered panel display. In this case, perform the mute processing according to the panel specification as necessary and change the Vsync signal selection.

38.3 Input Controller

NOTE

The Input Controller is not available for the D1L2(H) devices.

38.3.1 Input Controller Functions

38.3.1.1 Overview of Functions

The input controller receives signals supplied via the external input pins, and subjects the signals to synchronization adjustment, horizontal noise reduction, contrast correction (dynamic range compression), and brightness adjustment, gain adjustment, and YCbCr ↔ GBR conversion using a color matrix.

The functional block diagram of the input controller is shown below.

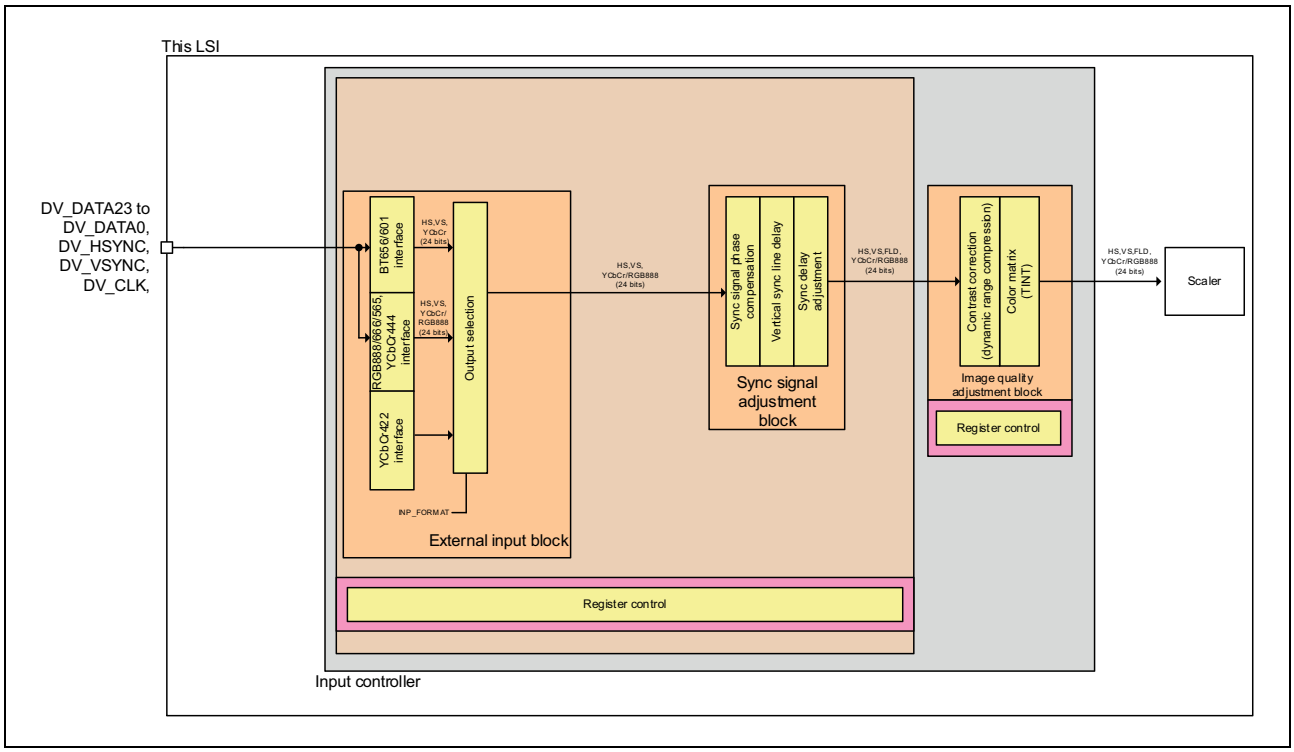

Figure 38.7 Functional Block Diagram of Input Controller

38.3.1.2 Updating Registers of External Signal Input Block and Sync Signal Adjustment Block

The control registers of the external input block and sync signal adjustment block are updated by setting the relevant update control bit to 1.

For the control registers other than the IMGCNT_DRC_REG register of the image quality adjustment block, the update timing is controlled using the Vsync signal.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 38.12 Register Update Control

Register Name	Bit Name	Initial Value	Description
INP_UPDATE	INP_EXT_UPDATE	0	External Input Block Register Update 0: Registers are not updated. 1: Registers are updated.
INP_UPDATE	INP_IMG_UPDATE	0	Sync Signal Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated.
IMGCNT_UPDATE	IMGCNT_VEN	0	Image Quality Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync signal.

38.3.1.3 Controlling External Input Video Signals

(1) The external input video image signals in the YCbCr444, RGB888, RGB666, RGB565, BT656 (extended), BT601 (extended), YCbCr422 (BT601 extended to 16 bits) formats can be handled.

(2) The BT656 signals can be used for the 525-line and 59.94-Hz (27.0-MHz) or the 625-line and 50.00-Hz (27.0-MHz) interlace signals and for the 525-line and 59.94-Hz (54.0-MHz) or the 625-line and 50.00-Hz (54.0-MHz) BT656-extended progressive signals.

(3) The BT601 signals can be used for the 8-bit data line 525-line and 59.94 Hz (27.0-MHz) or the 625-line and 50.00-Hz (27.0-MHz) interlace signals and for the 525-line and 59.94 Hz (54.0-MHz) or the 625-line and 50.00-Hz (54.0-MHz) progressive signals.

(4) The YCbCr422 signals can be used for the 16-bit data line 525-line and 59.94-Hz (13.5-MHz) or the 625-line and 50.00-Hz (13.5-MHz) BT601-extended interlace signals.

(5) The above signals can be selected by the INP_FORMAT[2:0] bits. Bit endian change and B/R signal swap are controlled by setting the INP_ENDIAN_ON and INP_SWAP_ON bits.

Table 38.13 External Input Video Signal Control

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_FORMAT[2:0]	000	External Input Format Select 0: YCbCr444, RGB888 1: RGB666 2: RGB565 3: BT656 4: BT601 5: YCbCr422 6, 7: Setting prohibited
INP_EXT_SYNC_CNT	INP_ENDIAN_ON	0	External Input Bit Endian Change On/Off Control 0: Off 1: On
INP_EXT_SYNC_CNT	INP_SWAP_ON	0	External Input B/R Signal Swap On/Off Control 0: Off 1: On

38.3.1.4 Selecting Clock Edge for External Input Signals

The clock edge for receiving the video image signals, Vsync signals, and Hsync signals is individually selected with the INP_PXD_EDGE, INP_VS_EDGE, INP_HS_EDGE bits.

Table 38.14 External Input Clock Edge Selection

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_PXD_EDGE	0	Clock Edge Select for Capturing External Input Video Image Signals DV_DATA23 to DV_DATA0 0: Rising edge 1: Falling edge
INP_SEL_CNT	INP_VS_EDGE	0	Clock Edge Select for Capturing External Input Vsync Signal DV_VSYNC 0: Rising edge 1: Falling edge
INP_SEL_CNT	INP_HS_EDGE	0	Clock Edge Select for Capturing External Input Hsync Signal DV_HSYNC 0: Rising edge 1: Falling edge

The figure below shows the typical input timing of external input signals.

The input signals can be received at the rising edge of the clock signal DV_CLK when the INP_PXD_EDGE, INP_VS_EDGE, and INP_HS_EDGE bits are 0.

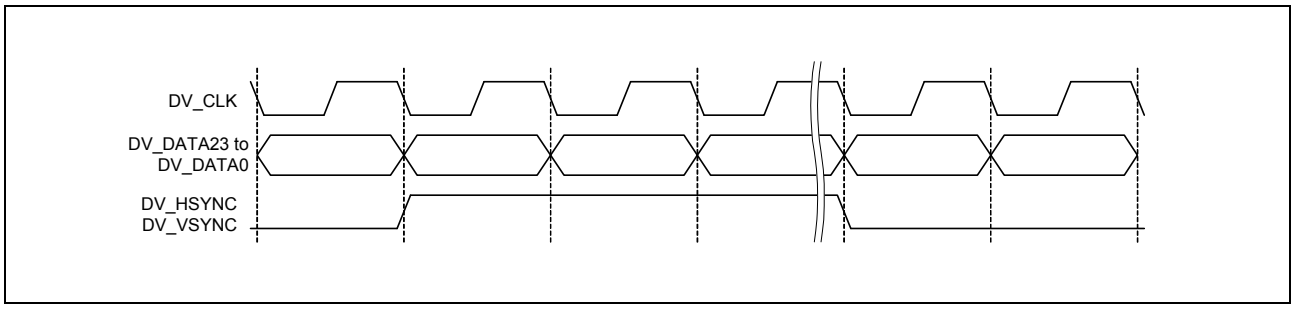

Figure 38.8 Typical Input Timing of external Input Signals (Clock Phase)

38.3.1.5 External Input Sync Signal Inversion Control

Inversion of polarity of the Vsync and Hsync signals can be controlled by the INP_VS_INV and INP_HS_INV bits.

Table 38.15 Sync Signal Inversion Control

Register Name	Bit Name	Initial Value	Description
INP_EXT_ SYNC_CNT	INP_VS_INV	0	External Input Vsync Signal DV_VSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
INP_EXT_ SYNC_CNT	INP_HS_INV	0	External Input Hsync Signal DV_HSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)

38.3.1.6 Bit Allocation of External Input Video Image Signals

Allocation of the external input video image signal pins DV_DATA to the signals in each format is described below.

(1) YCbCr444/RGB888 Input

When the external input is of YCbCr444/RGB888 format, the video image signal pins DV_DATA are allocated to the internal signals Y/GOUT, Cb/BOUT, Cr/ROUT, as shown in **Table 38.16**.

Table 38.16 Bit Allocation of DV_DATA Pin Inputs when the External Input is of YCbCr444/RGB888

INP_FORMAT[2:0]	**0**	**0**	**0**	**0**
INP_ENDIAN_ON	**0**	**0**	**1**	**1**
INP_SWAP_ON	**0**	**1**	**0**	**1**
DV_DATA23	Cr/ROUT[7]	Cb/BOUT[7]	Cr/ROUT[0]	Cb/BOUT[0]
DV_DATA22	Cr/ROUT[6]	Cb/BOUT[6]	Cr/ROUT[1]	Cb/BOUT[1]
DV_DATA21	Cr/ROUT[5]	Cb/BOUT[5]	Cr/ROUT[2]	Cb/BOUT[2]
DV_DATA20	Cr/ROUT[4]	Cb/BOUT[4]	Cr/ROUT[3]	Cb/BOUT[3]
DV_DATA19	Cr/ROUT[3]	Cb/BOUT[3]	Cr/ROUT[4]	Cb/BOUT[4]

(2) RGB666 Input

When the external input is of RGB666 format, the video image signal pins DV_DATA are allocated to the internal signals GOUT, BOUT, ROUT as shown in **Table 38.17**.

The internal signals GOUT, BOUT, ROUT to which the video image signal pins DV_DATA are allocated are output as a 24-bit video image from the RGB666 interface with the following formulae.

G[7:0] = GOUT[7:2] × 255 ÷ 63

B[7:0] = BOUT[7:2] × 255 ÷ 63

R[7:0] = ROUT[7:2] × 255 ÷ 63

(3) RGB565 Input

When the external input is of RGB565 format, the video image signal pins DV_DATA are allocated to the internal signals GOUT, BOUT, ROUT as shown in **Table 38.18**.

The internal signals GOUT, BOUT, ROUT to which the video image signal pins DV_DATA are allocated are output as a 24-bit video image from the RGB565 interface with the following formulae.

G[7:0] = GOUT[7:2] × 255 ÷ 63

B[7:0] = BOUT[7:3] × 255 ÷ 31

R[7:0] = ROUT[7:3] × 255 ÷ 31

(4) BT656/BT601 Input

When the external input is of BT656 or BT601 format, the video image signal pins DV_DATA are allocated to the internal signal BTOUT, as shown in **Table 38.19**.

The internal signal BTOUT to which the video image signal pins DV_DATA are allocated is expanded to the YCbCr signal.

For expansion to the YCbCr signal, see Section 38.3.1.11, BT656/BT601/YCbCr422 Format Setting.

38.3.1.10 BT656 Progressive Format

This product can be connected with devices which output data in the BT656 progressive format. Because the standard for the BT656 format does not include description of output in the progressive format, there is no guarantee that this product is connected with devices which output data in the progressive format. The following description shows how to generate a vertical/horizontal synchronization signal by decoding the SAV/EAV code input via the BT656 interface of this module. Confirm the connection with devises which output data in the BT656 progressive format in accordance with this section.

(1) SAV/EAV Code

The SAV/EAV code consists of four words. When the first word is set to FF and the second and third words are set to 00, timing signals are generated by decoding the value of the fourth word (XY). For bit information, see **Table 38.22** in **Section 38.3.1.9**. This product does not refer to the parity bits (P3 to P0).

(2) Vertical/Horizontal Synchronization Signal

Based on the SAV/EAV code, the vertical/horizontal synchronization signal is generated.

(a) Vertical Synchronization Signal

The vertical synchronization signal is output when the value of the V bit is changed from 0 to 1 in the BT656 format. The timing of the output varies with the setting of INP_EXT_SYNC_CNT.INP_F525_625 setting and the value of the F bit in the BT656 format.

The table below lists the timing.

Table 38.26 Timing of Delay for Output of Vertical Synchronization Signal

INP_EXT_SYNC_CNT. INP_F525_625	F Bit in BT656 Format	Output Timing	Remark
0: 525 lines	0 (Field 1)	2.5 lines after setting of V bit to 1 is detected	525 lines, vertical synchronization signal for field 2
	0 (Field 2)	3 lines after setting of V bit to 1 is detected	525 lines, vertical synchronization signal for field 1
1: 625 lines	0 (Field 1)	2.5 lines after setting of V bit to 1 is detected	625 lines, vertical synchronization signal for field 2
	0 (Field 2)	2 lines after setting of V bit to 1 is detected	625 lines, vertical synchronization signal for field 1

(b) Horizontal Synchronization Signal

Based on the setting of the INP_EXT_SYNC_CNT.INP_H_EDGE_SEL bit, the horizontal synchronization signal is output.

(3) Example of Timing for Progressive Input in BT656 Format

Table 38.27 shows an example of the SAV/EAV code in 525-line progressive input in the BT656 format. **Figure 38.17** shows the vertical/horizontal synchronization signal extracted from 525-line progressive input in the BT656 format. The field is detected as field 1 in this example, because the value of the F bit is set to 0 when that of the V bit is changed from 0 to 1. The field is regarded as the bottom field. The vertical synchronization signal is output 2.5 lines after the detection of the SAV code.

Table 38.27 SAV/EAV Code in BT656 Progressive Format (525 Lines/59.94 Hz)

		One Horizontal Period																
		EAV				H blank	SAV				Valid area							
		1	2	3	4		273	274	275	276	277	278	279	280	...	1713	1714	1715	1716

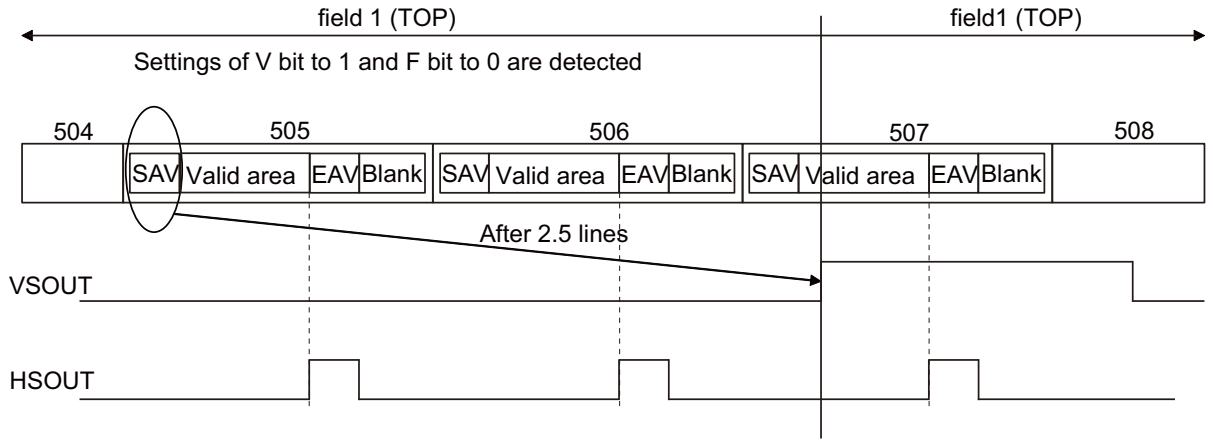
	525	FF	00	00	BX		FF	00	00	AX									

X: Not referred



Note: In the case of BT601/656, because 2 pixel (YCbCr: Yn,Cbn,Crn,Yn+1) is captured at 4 cycle, horizontal size is doubled internally.
Therefore, in this case, horizontal size must be scale down to be half by using down-scaler in order to keep original input size.

The registers related to horizontal down-scaling is the below.
* SC_SCL0_DS1.SC_RES_DS_H_ON
* SC_SCL0_DS4.SC_RES_DS_H_RATIO
* SC_SCL0_DS7.SC_RES_OUT_HW

Figure 38.17 Vertical/Horizontal Synchronization Signal in BT656 Format (525 Lines, Progressive)

38.3.1.11 BT656/BT601/YCbCr422 Format Setting

The BT656 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format and progressive signal format (extended).

The BT601 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format and progressive signal format.

The YCbCr422 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format in the 16-bit extended data-bus format of the BT601 standard.

The Vsync signal timing for the 525-line BT656 format and 625-line BT656 format are different.

The operating mode is set by the INP_F525_625 bit.

Table 38.28 Operating Mode Setting for BT656 Format

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_F525_625	0	Number of Lines for BT656 Input of External Input System 0: 525 lines 1: 625 lines

When the interlace signals are to be input in BT656/BT601/YCbCr422 format, half of 2fH phase timings of the Vsync signal and the Hsync signal are set with the INP_FH50[9:0] bits.

The INP_FH50[9:0] bits are also used for the vertical synchronous phase adjustment block. Therefore, for bit description, see **Table 38.33**.

When the external input is of BT656 format, the reference point of the Hsync signal is set with the INP_H_EDGE_SEL bit.

Table 38.29 Hsync Signal Reference Selection for BT656 Format

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	0	Hsync Signal Reference Select for BT656 Format of External Input System 0: EAV 1: SAV

When the external input is of BT656/BT601 format, the internal signal BTOUT[7:0], which is input from the DV_DATA pins and allocated, is expanded to the 24-bit YCbCr signal.

Expansion timing with respect to the Hsync signal reference is set with the INP_H_POS[1:0] bits.

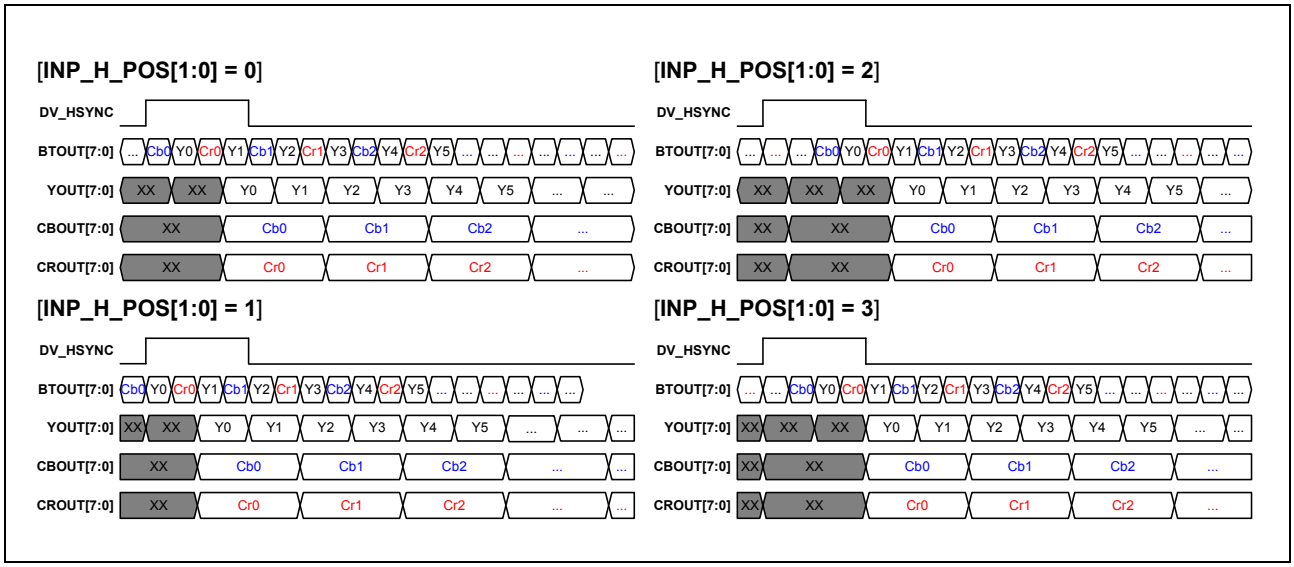


Figure 38.18 YCbCr Data Expansion for BT656/BT601 Input

NOTE

In the case of BT601/656, because 2 pixel (YCbCr:Yn,Cbn,Crn,Yn+1) is captured at 4 cycle, horizontal size is doubled internally.

Therefore, in this case, horizontal size must be scale down to be half by using down-scaler in order to keep original input size.

The registers related to horizontal down-scaling is the below.

- SC_SCL0_DS1.SC_RES_DS_H_ON
- SC_SCL0_DS4.SC_RES_DS_H_RATIO
- SC_SCL0_DS7.SC_RES_OUT_HW

Table 38.30 Data String Start Timing Selection for BT656/BT601 Input

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	0	Y/Cb/Y/Cr Data String Start Timing with respect to Hsync Reference 0: Cb/Y/Cr/Y 1: Y/Cr/Y/Cb 2: Cr/Y/Cb/Y 3: Y/Cb/Y/Cr

When the external input is in YCbCr422 format, the input from the DV_DATA pins is allocated to the internal Y[7:0] and CbCr[7:0] signals, and the CbCr[7:0] are expanded to a 16-bit signal.

Expansion timing with respect to the Hsync signal reference is set with the INP_H_POS[1:0] bits.

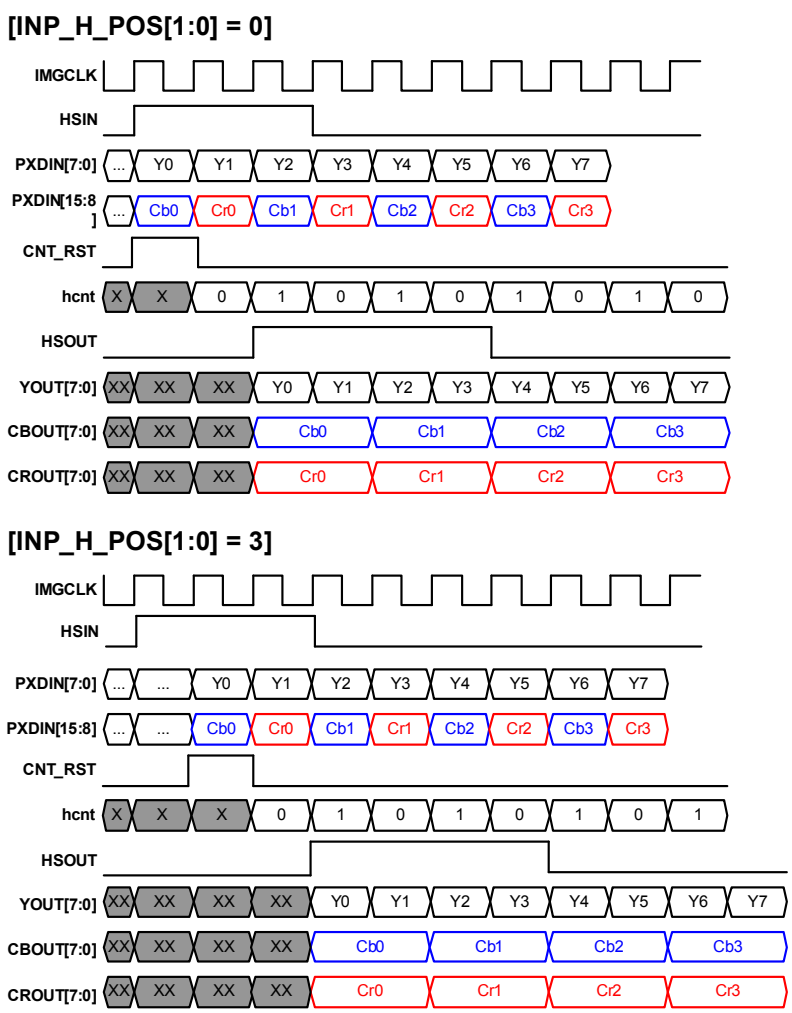

Figure 38.19 YCbCr Data Expansion for YCbCr422 Input

Table 38.31 Data String Start Timing Selection for YCbCr422 Input

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	0	Cb/Cr Data String Start Timing with respect to Hsync Reference 0: Cb/Cr 3: Cr/Cb 1, 2: Setting prohibited

38.3.1.12 YCbCr444/RBG888/666/565 Input Timing

The YCbCr444/RGB888/666/565 format can be used for the progressive YCbCr/RGB signal.

The sync signal width (H_SYNC, V_SYNC), sync signal polarity (H_POL, V_POL), valid period start position (H_BP, V_BP), valid period end position (H_FP, V_FP), and valid period video width (H_ACTIVE, V_ACTIVE) are shown in **Table 38.32**.

Table 38.32 YCbCr/RGB Signal Reception Timing

Item	Description
External input clock	Maximum external input clock frequency: up to 48.00 MHz
Vsync signal width (V_SYNC)	Minimum Vsync signal width: 1 CLK
Vsync signal polarity (V_POL)	Positive or negative polarity is selected by the relevant registers.
Vertical valid period start position (V_BP)	From Vsync reference to the head of the video image: 4 lines or more
Vertical valid period video width (V_ACTIVE)	Maximum vertical valid period: 1024 lines
Vertical valid period end position (V_FP)	From the end of the video image to the Vsync reference: 4 lines or more
Hsync signal width (H_SYNC)	Minimum Hsync signal width: 1 CLK
Hsync signal polarity (H_POL)	Positive or negative polarity is selected by the relevant registers.
Horizontal valid period start position (H_BP)	From Hsync reference to the head of the video image: 16 CLK or more
Horizontal valid period video width (H_ACTIVE)	Maximum horizontal valid period: up to 1024 pixels
Horizontal valid period end position (H_FP)	From the end of the video image to the Hsync reference: 16 CLK or more

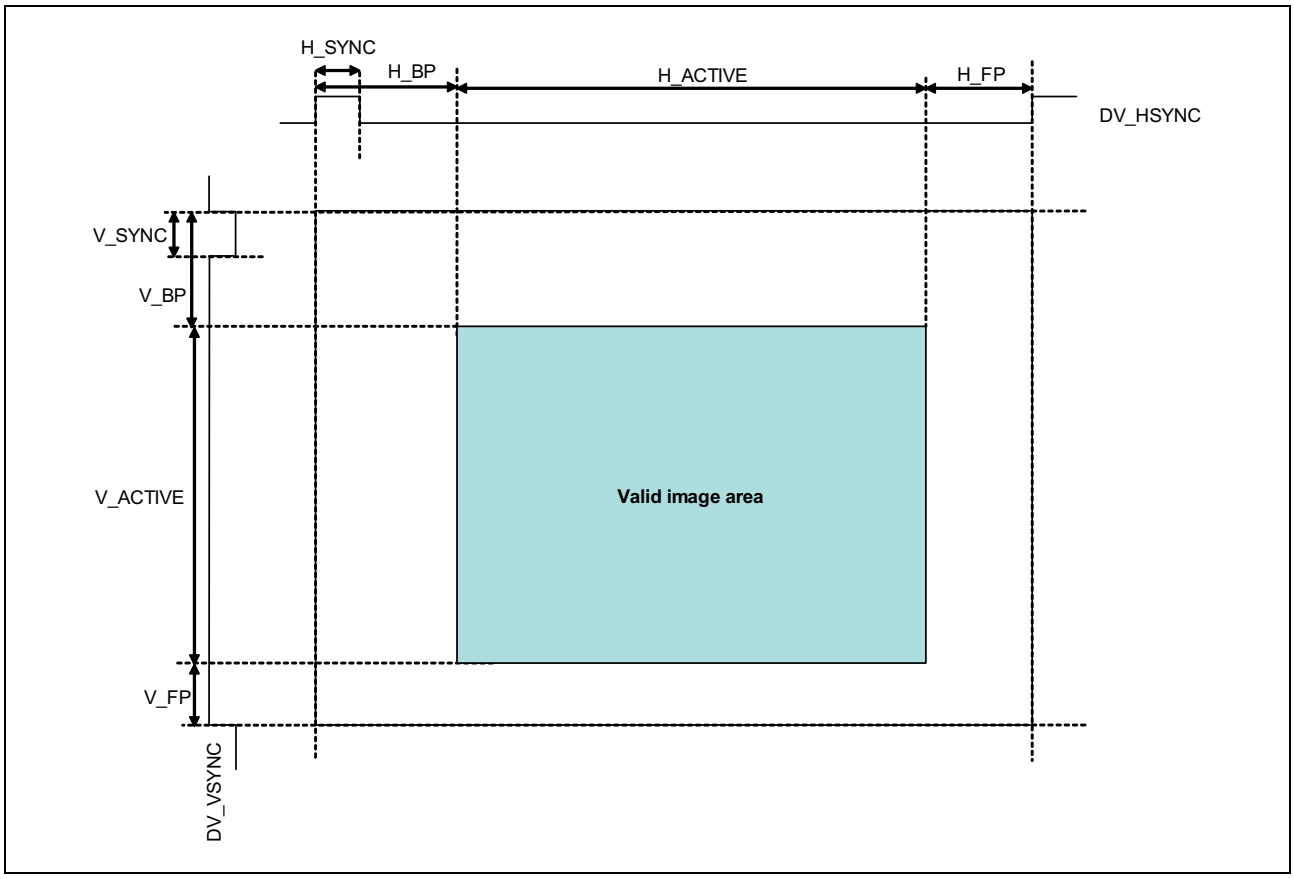

Figure 38.20 YCbCr/RGB Signal Reception Timing

38.3.1.13 Field Differentiation and Vsync Signal Phase Adjustment

The phase of the input Vsync signal and Hsync signal is detected and the field of the interlace signal is determined. When the reference point of the Vsync signal is detected within ±0.5 horizontal period with respect to the Hsync signal, it is determined as the interlace top field. When the reference point of the Vsync signal is detected outside ±0.5 horizontal period with respect to the Hsync signal, it is determined as the interlace bottom field.

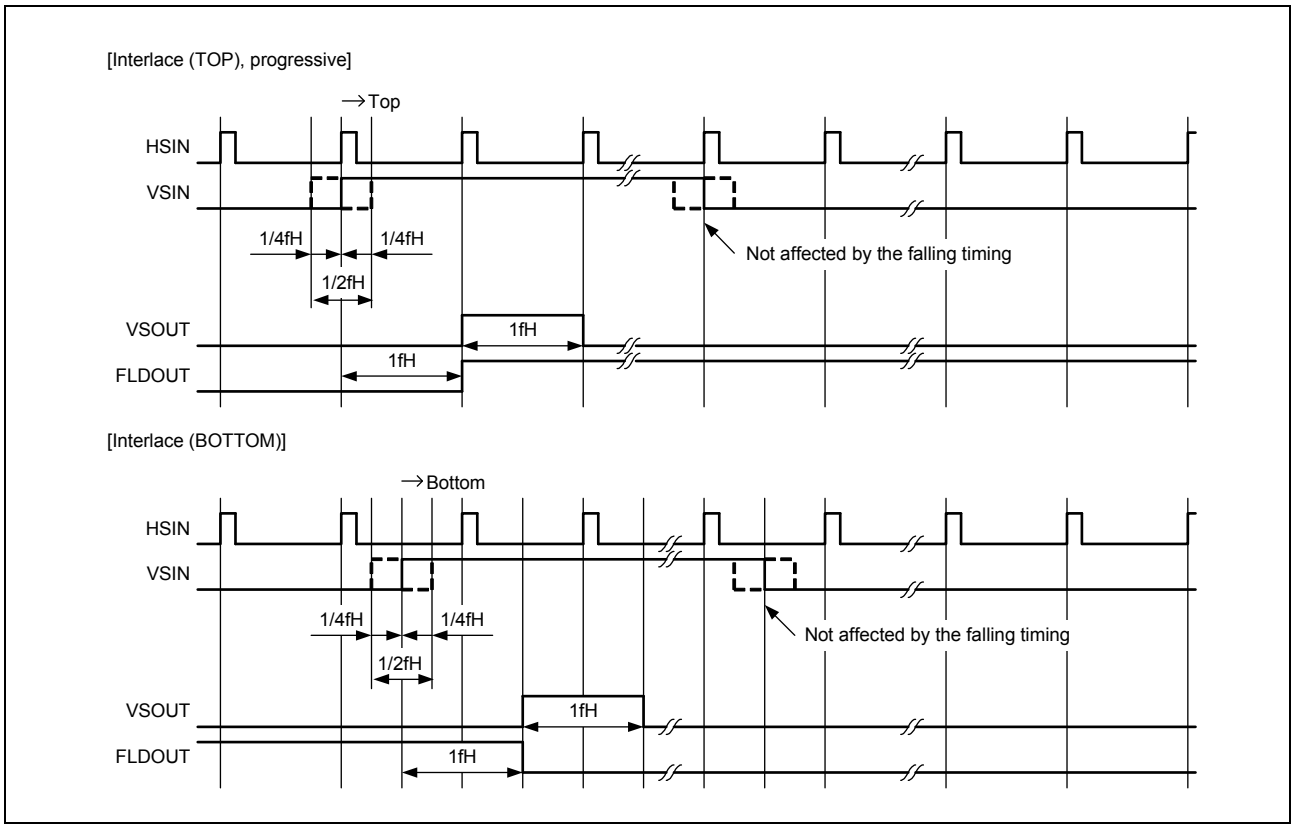

Figure 38.21 Vsync Signal Phase Adjustment

The timings of 1/2fH Vsync signal phase and 1/4fH Vsync signal phase are set with INP_FH50[9:0] and INP_FH25[9:0], respectively.

Table 38.33 Vsync Signal Phase Timing Setting

Register Name	Bit Name	Initial Value	Description
INP_VSYNC_PH_ADJ	INP_FH50[9:0]	858	Vsync Signal 1/2fH Phase Timing Should be 1/2 the horizontal cycle.
INP_VSYNC_PH_ADJ	INP_FH25[9:0]	429	Vsync Signal 1/4fH Phase Timing Should be 1/4 the horizontal cycle.

38.3.1.14 Vsync Signal Delay Adjustment in Line Units

The Vsync signal line delay adjust block can delay the Vsync signal and the field differentiation signal in line units.

When a video signal with a short vertical front porch is input, the vertical front porch is adjusted.

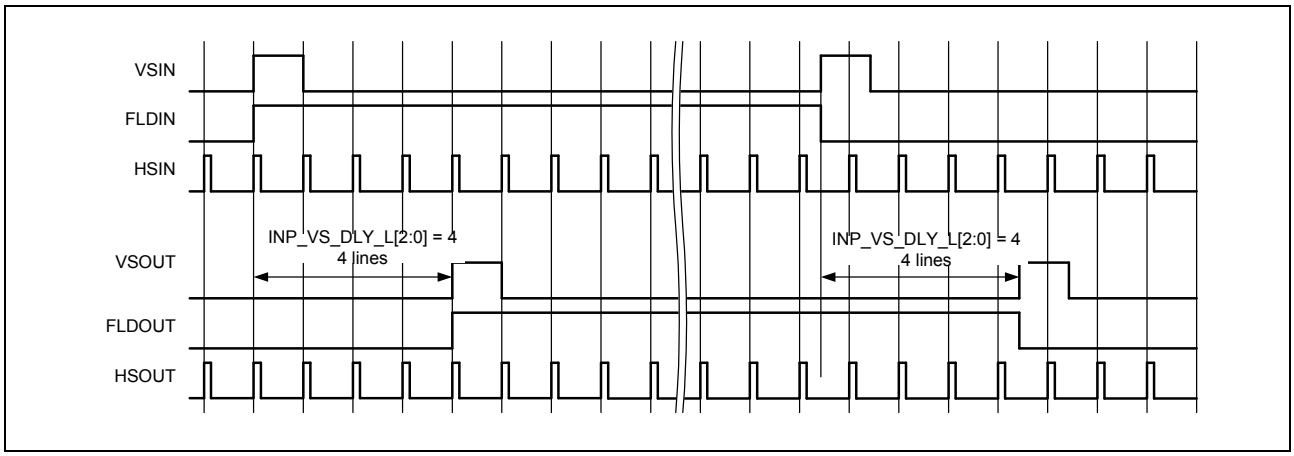

Figure 38.22 Timing of Vsync Signal Delay in Line Units

Table 38.34 Adjustment of Vsync Signal Delay in Line Units

Register Name	Bit Name	Initial Value	Description
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	0	Number of Lines for Delaying Vsync Signal and Field Differentiation Signal Delay amount: 0 to 7 (lines)

38.3.1.15 Sync Signal Delay Adjustment

Delay can be adjusted independently for the Vsync signal, Hsync signal, and field differentiation signal in the units of clock.

Lacking margin of the horizontal front porch is adjusted according to the input synchronization disturbance.

Table 38.35 Sync Signal Delay Adjustment

Register Name	Bit Name	Initial Value	Description
INP_DLY_ADJ	INP_VS_DLY[7:0]	0	Vsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
INP_DLY_ADJ	INP_HS_DLY[7:0]	0	Hsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
INP_DLY_ADJ	INP_FLD_DLY[7:0]	0	Field Differentiation Signal Delay Amount Delay amount: 0 to 254 (clock cycles)

38.3.1.16 Color Matrix

By using a color matrix, input signal offsets and nine-axis gain can be adjusted. This enables brightness adjustment, gain adjustment, and YCbCr and GBR mutual conversion.

(1) GBR to GBR Conversion

YGIN_A = YGIN + IMGCNT_MTX_YG – 128

CBBIN_A = CBBIN + IMGCNT_MTX_B – 128

CRRIN_A = CRRIN + IMGCNT_MTX_R – 128

YGOUT = (IMGCNT_MTX_GG×YGIN_A + IMGCNT_MTX_GB×CBBIN_A + IMGCNT_MTX_GR×CRRIN_A) ÷ 256

CBBOUT = (IMGCNT_MTX_BG×YGIN_A + IMGCNT_MTX_BB×CBBIN_A + IMGCNT_MTX_BR×CRRIN_A) ÷ 256

CRROUT = (IMGCNT_MTX_RG×YGIN_A + IMGCNT_MTX_RB×CBBIN_A + IMGCNT_MTX_RR×CRRIN_A) ÷ 256

(2) GBR to YCbCr Conversion

YGIN_A = YGIN + IMGCNT_MTX_YG – 128

CBBIN_A = CBBIN + IMGCNT_MTX_B – 128

CRRIN_A = CRRIN + IMGCNT_MTX_R – 128

YGOUT = (IMGCNT_MTX_GG×YGIN_A + IMGCNT_MTX_GB×CBBIN_A + IMGCNT_MTX_GR×CRRIN_A) ÷ 256

CBBOUT = (IMGCNT_MTX_BG×YGIN_A + IMGCNT_MTX_BB×CBBIN_A + IMGCNT_MTX_BR×CRRIN_A) ÷ 256 + 128

CRROUT = (IMGCNT_MTX_RG×YGIN_A + IMGCNT_MTX_RB×CBBIN_A + IMGCNT_MTX_RR×CRRIN_A) ÷ 256 + 128

Table 38.36 Matrix Coefficient (Typical Value) for SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	Set Value	Coefficient	Set Value	Coefficient	Set Value
YGOUT	0.587	IMGCNT_MTX_GG = 150	0.114	IMGCNT_MTX_GB = 29	0.299	IMGCNT_MTX_GR = 77
CBBOUT	–0.331	IMGCNT_MTX_BG = 1963	0.500	IMGCNT_MTX_BB = 128	–0.169	IMGCNT_MTX_BR = 2005
CRROUT	–0.419	IMGCNT_MTX_RG = 1941	–0.081	IMGCNT_MTX_RB = 2027	0.500	IMGCNT_MTX_RR = 128

(3) YCbCr to GBR Conversion

YGIN_A = YGIN + IMGCNT_MTX_YG – 128

CBBIN_A = CBBIN – 128

CRRIN_A = CRRIN – 128

YGOUT = (IMGCNT_MTX_GG×YGIN_A + IMGCNT_MTX_GB×CBBIN_A + IMGCNT_MTX_GR×CRRIN_A) ÷ 256

CBBOUT = (IMGCNT_MTX_BG×YGIN_A + IMGCNT_MTX_BB×CBBIN_A + IMGCNT_MTX_BR×CRRIN_A) ÷ 256

CRROUT = (IMGCNT_MTX_RG×YGIN_A + IMGCNT_MTX_RB×CBBIN_A + IMGCNT_MTX_RR×CRRIN_A) ÷ 256

Table 38.37 Matrix Coefficient (Typical Value) for SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	Set Value	Coefficient	Set Value	Coefficient	Set Value
YGOUT	1.000	IMGCNT_MTX_GG = 256	–0.344	IMGCNT_MTX_GB = 1960	–0.714	IMGCNT_MTX_GR = 1865
CBBOUT	1.000	IMGCNT_MTX_BG = 256	1.772	IMGCNT_MTX_BB = 454	0.000	IMGCNT_MTX_BR = 0
CRROUT	1.000	IMGCNT_MTX_RG = 256	0.000	IMGCNT_MTX_RB = 0	1.402	IMGCNT_MTX_RR = 359

(4) YCbCr to YCbCr Conversion

YGIN_A = YGIN + IMGCNT_MTX_YG – 128

CBBIN_A = CBBIN – 128

CRRIN_A = CRRIN – 128

YGOUT = (IMGCNT_MTX_GG×YGIN_A + IMGCNT_MTX_GB×CBBIN_A + IMGCNT_MTX_GR×CRRIN_A) ÷ 256

CBBOUT = (IMGCNT_MTX_BG×YGIN_A + IMGCNT_MTX_BB×CBBIN_A + IMGCNT_MTX_BR×CRRIN_A) ÷ 256 + 128

CRROUT = (IMGCNT_MTX_RG×YGIN_A + IMGCNT_MTX_RB×CBBIN_A + IMGCNT_MTX_RR×CRRIN_A) ÷ 256 + 128

Table 38.38 YCbCr to GBR Conversion (1/2)

Register Name	Bit Name	Initial Value	Description
IMGCNT_MTX_MODE	IMGCNT_MTX_MD [1:0]	3	Operating Mode 0: GBR → GBR 1: GBR → YCbCr 2: YCbCr → GBR 3: YCbCr → YCbCr
IMGCNT_MTX_YG_ADJ0	IMGCNT_MTX_YG [7:0]	128	Offset (DC) Adjustment of Y/G Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB], 512 [LSB])
IMGCNT_MTX_CBB_ADJ0	IMGCNT_MTX_B [7:0]	128	Offset (DC) Adjustment of B Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
IMGCNT_MTX_CRR_ADJ0	IMGCNT_MTX_R [7:0]	128	Offset (DC) Adjustment of R Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
IMGCNT_MTX_YG_ADJ0	IMGCNT_MTX_GG [10:0]	256	Y/G Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
IMGCNT_MTX_YG_ADJ1	IMGCNT_MTX_GB [10:0]	0	Cb/B Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
IMGCNT_MTX_YG_ADJ1	IMGCNT_MTX_GR [10:0]	0	Cr/R Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Table 38.38 YCbCr to GBR Conversion (2/2)

Register Name	Bit Name	Initial Value	Description
IMGCNT_MTX_CBB_ ADJ0	IMGCNT_MTX_BG [10:0]	0	Y/G Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
IMGCNT_MTX_CBB_ ADJ1	IMGCNT_MTX_BB [10:0]	256	Cb/B Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
IMGCNT_MTX_CBB_ ADJ1	IMGCNT_MTX_BR [10:0]	0	Cr/R Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
IMGCNT_MTX_CRR_ ADJ0	IMGCNT_MTX_RG [10:0]	0	Y/G Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
IMGCNT_MTX_CRR_ ADJ1	IMGCNT_MTX_RB [10:0]	0	Cb/B Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
IMGCNT_MTX_CRR_ ADJ1	IMGCNT_MTX_RR [10:0]	256	Cr/R Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

38.3.1.17 Video input by data enable (D1M1A, D1M1-V2 and D1M2(H) only)

(1) Description

When video input synchronize with data enable (= DE) instead of HSYNC, it is available by special hardware setting.

Support format

Parallel video input is available with DE.

- RGB888, RGB565, YCbCr444, YCbCr422
- Interlace input can't be supported.

Restrictions

- When video input is used by HSYNC, DEMODE0 and DEMODE1 must be set to 0 before video clock input.
- When video input by data enable is used, delay adjustment of sync signal is not available. INP_DLY_ADJ must be set to 0.

(2) Input timing by data enable

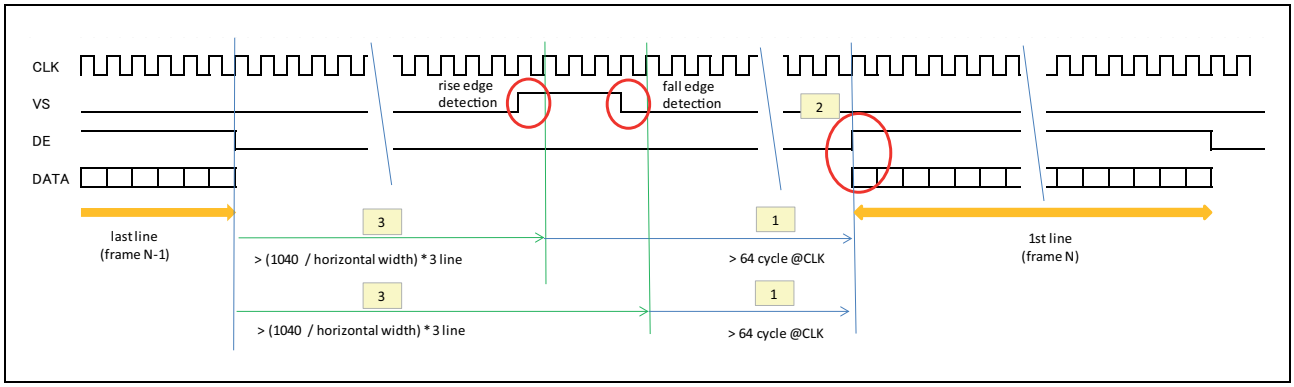

Figure 38.23 Input timing by data enable

1. VSYNC must be asserted before over 64 cycles which 1st line comes.
   In VDCE, internal 4 HSYNC pulses are generated between VS and the first DE.Therefore, vertical back porch (SC_SCL0_DS2.SC_RES_VS) must be fixed to 4.
2. The data is captured from the first active DE.
   For this setting, horizontal back porch (SC_SCL0_DS3.SC_RES_HS) must be setting to 1.Data is captured for cycles in SC_SCL0_DS3.SC_RES_HW.
3. VSYNC must not be asserted before the VDCE finished internal handling of the previous frame. [The period from the end of the last line to the next VSYNC detection]

– VSYNC rise edge detection case:
(vertical front porch) > (1040 / horizontal width) + 3
– VSYNC fall edge detection case:
(vertical front porch + vertical sync) > (1040 / horizontal width) + 3

Table 38.39 Video input by data enable

Register Name	Bit Name	Initial Value	Description
DEMODE0	DE_4HS_EN	0	Vertical position is shifted before 4 lines from the timing configured at other registers. 1: enable 0: disable For data enable input method, this bit must be set to 1. When this bit is 1, VDCE shift 4 lines internally after VSYNC detection. Therefore, SC_SCL0_DS2.SC_RES_VS must be fixed to 4.
	DE_HSBYPS_EN	0	Starting timing to capture video data by DV_HSYNC is shifted before 1 DV_CLK. 1: enable 0: disable For data enable input method, this bit must be set to 1. When this bit is 1 and SC_SCL0_DS3.SC_RES_HS is 1, VDCE can capture data from first cycle of data enable.
	DE_VLAST_EN	0	Interrupt timing changes to end of the final line by using setting of DEMODE1. 1: enable 0: disable This bit is available for the detection of the end of the last line by SC_SCL0_INT.SC_RES_LINE at data enable input. When this bit is 1, DE_VLAST[10:0] and SC_RES_LINE must be set. For the detail, please refer setting example. **Note:** This function can be only used for input vertical size is multiple of 16.
DEMODE1	DE_VLAST[10:0]	0	Active vertical line number at data enable input This register is available when DE_VLAST_EN is 1. Line number must be set by 16 line alignment, so Bit 4-0 of this register must be set to 0.

(3) How to set for data enable input

1. Fix the capturing position
   – SC_SCL0_DS2.SC_RES_VS = 4
   – SC_SCL0_DS3.SC_RES_HS = 1
2. DEMODE0 and DEMODE1 setting

   [No line detection]

   – DEMODE0=0x00000018
   (DE_4HS_EN=1, DE_HSBYPS_EN=1)

   [Line detection after the last line finished]

- DEMODE0=0x0000001C
  (DE_4HS_EN=1, DE_HSBYPS_EN=1, DE_VLAST_EN=1)
- DEMODE1= active line number
  e.g) when active vertical width is 480, DEMODE1 is 480.
- SC_SCL0_INT.SC_RES_LINE = active line number + 4
  e.g) when active vertical width is 480, SC_RES_LINE is 484.

3. Other setting
   - INP_DLY_ADJ = 0
   - Other VDCE settings are the same as video input setting with HSYNC.

38.3.2 Register Descriptions

Table 38.40 to **Table 38.45** show register Configuration.

- Symbols used in Register Description:

  Initial value: Register value after a power-on reset

  —: Undefined value

  R/W: Readable/writable. The written value can be read.

  R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

  R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

  R: Read-only. The write value should always be 0.

  —/W: Write-only. The read value is undefined.

Table 38.40 Register Configuration of Input Controller (Channel 0)

Module Name	Register Name	Symbol	R/W	Initial Value	Address	Access Size

Table 38.45 Register Configuration for data enable input (Channel 1)

Module Name	Register Name	Symbol	R/W	Initial Value	Address	Access Size
VDCE1	Video input with data enable control register 0	DEMODE0	R/W	H'0001 20A0	<VDCE1_base> + 1B3C	32
VDCE1	Video input with data enable control register 1	DEMODE1	R/W	H'0001 20A0	<VDCE1_base> + 1B40	32

NOTE

Register access sizes other than defined in the table above are not supported.

NOTE

In the header files the names of the above registers are defined in the following format:

<ModuleName> + <Symbol>.

<ModuleName> and <Symbol> are defined in the above table.

38.3.2.1 External Input Block Register Update Control Register (INP_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	INP_EXT_UPDATE	—	—	—	INP_IMG_UPDATE
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INP_EXT_UPDATE	0	R/WC1	External Input Block Register Update 0: Registers are not updated. 1: Registers are updated.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INP_IMG_UPDATE	0	R/WC1	Sync Signal Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated.

38.3.2.2 Input Select Control Register (INP_SEL_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	Caution *	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	INP_FORMAT[2:0]			—	—	—	INP_PXD_EDGE	—	—	—	INP_VS_EDGE	—	—	—	INP_HS_EDGE
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

CAUTION

The initial value “0” of bit 20 must be changed to “1”.

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	Bit20	0	R/W	**CAUTION** The initial value “0” of this bit must be changed to “1”.
19 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14 to 12	INP_FORMAT[2:0]	0	R/W	External Input Format Select 0: YcbCr444, RGB888 1: RGB666 2: RGB565 3: BT656 4: BT601 5: YCbCr422 6, 7: Setting prohibited
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INP_PXD_EDGE	0	R/W	Clock Edge Select for Capturing External Input Video Image Signals DV_DATA23 to DV_DATA0 0: Rising edge 1: Falling edge
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INP_VS_EDGE	0	R/W	Clock Edge Select for Capturing External Input Vsync Signals DV_VSYNC 0: Rising edge 1: Falling edge
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INP_HS_EDGE	0	R/W	Clock Edge Select for Capturing External Input Hsync Signals DV_HSYNC 0: Rising edge 1: Falling edge

Note: INP_FORMAT[2:0], INP_PXD_EDGE, INP_VS_EDGE, and INP_HS_EDGE are updated when the INP_EXT_UPDATE bit in INP_UPDATE is 1. INP_SEL is updated when set.

38.3.2.3 External Input Sync Signal Control Register (INP_EXT_SYNC_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INP_ENDIAN_ON	—	—	—	INP_SWAP_ON	—	—	—	INP_VS_INV	—	—	—	INP_HS_INV
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	INP_H_EDGE_SEL	—	—	—	INP_F525_625	—	—	INP_H_POS[1:0]	
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INP_ENDIAN_ON	0	R/W	External Input Bit Endian Change On/Off Control 0: Off 1: On
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INP_SWAP_ON	0	R/W	External Input B/R Signal Swap On/Off Control 0: Off 1: On
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INP_VS_INV	0	R/W	External Input Vsync Signal DV_VSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INP_HS_INV	0	R/W	External Input Hsync Signal DV_HSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INP_H_EDGE_SEL	0	R/W	Reference Select for External Input BT656 Hsync Signal 0: EAV 1: SAV
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INP_F525_625	0	R/W	Number of Lines for BT656 External Input 0: 525 lines 1: 625 lines
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	INP_H_POS[1:0]	0	R/W	Y/Cb/Y/Cr Data String Start Timing to Hsync Reference for BT656/601 or YCbCr422 External Input 0: Cb/Y/Cr/Y(BT656/601), Cb/Cr (YCbCr422) 1: Y/Cr/Y/Cb(BT656/601), setting prohibited (YCbCr422) 2: Cr/Y/Cb/Y(BT656/601), setting prohibited (YCbCr422) 3: Y/Cb/Y/Cr(BT656/601), Cr/Cb (YCbCr422)

Note: This register is updated when the INP_EXT_UPDATE bit in INP_UPDATE is 1.

38.3.2.4 Vsync Signal Phase Adjustment Register (INP_VSYNC_PH_ADJ)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	INP_FH50[9:0]									
Initial Value:	0	0	0	0	0	0	1	1	0	1	0	1	1	0	1	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	INP_FH25[9:0]									
Initial Value:	0	0	0	0	0	0	0	1	1	0	1	0	1	1	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	INP_FH50 [9:0]	858	R/W	Vsync Signal 1/2fH Phase Timing 1/2 clock cycle of the horizontal cycle should be set.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	INP_FH25 [9:0]	429	R/W	Vsync Signal 1/4fH Phase Timing 1/4 clock cycle of the horizontal cycle should be set.

Note: The INP_FH50[9:0] bits are updated when the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE are 1. The IMP_FH25[9:0] bits are updated when the INP_IMG_UPDATE bit is 1.

38.3.2.5 Sync Signal Delay Adjustment Register (INP_DLY_ADJ)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	INP_VS_DLY_L[2:0]			INP_FLD_DLY[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INP_VS_DLY[7:0]								INP_HS_DLY[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 24	INP_VS_ DLY_L[2:0]	0	R/W	Number of lines for Delaying Vsync signal and Field Differentiation Signal Delay amount: 0 to 7 (lines)
23 to 16	INP_FLD_ DLY[7:0]	0	R/W	Field Differentiation Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
15 to 8	INP_VS_ DLY[7:0]	0	R/W	Vsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
7 to 0	INP_HS_ DLY[7:0]	0	R/W	Hsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)

Note: This register is updated when the INP_IMG_UPDATE bit in INP_UPDATE is 1.

38.3.2.6 Image Quality Adjustment Block Register Update Control Register (IMGCNT_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IMGCNT_VEN
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	IMGCNT_VEN	0	R/WC1	Image Quality Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync signal.

38.3.2.7 Image Quality Adjustment Block Matrix Mode Register (IMGCNT_MTX_MODE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IMGCNT_MTX_MD[1:0]	
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	IMGCNT_MTX_MD[1:0]	3	R/W	Operating Mode 0: GBR → GBR 1: GBR → YCbCr 2: YCbCr → GBR 3: YCbCr → YCbCr

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

38.3.2.8 Image Quality Adjustment Block Matrix YG Adjustment Register 0 (IMGCNT_MTX_YG_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	IMGCNT_MTX_YG[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_GG[10:0]										
Initial Value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	IMGCNT_ MTX_YG[7:0]	128	R/W	Offset (DC) Adjustment of Y/G Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_ MTX_GG[10:0]	256	R/W	Y/G Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

38.3.2.9 Image Quality Adjustment Block Matrix YG Adjustment Register 1 (IMGCNT_MTX_YG_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	IMGCNT_MTX_GB[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_GR[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	IMGCNT_ MTX_GB [10:0]	0	R/W	Cb/B Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_ MTX_GR [10:0]	0	R/W	Cr/R Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

38.3.2.10 Image Quality Adjustment Block Matrix CBB Adjustment Register 0 (IMGCNT_MTX_CBB_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	IMGCNT_MTX_B[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_BG[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	IMGCNT_ MTX_B[7:0]	128	R/W	Offset (DC) Adjustment of Cb/B Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_ MTX_BG[10:0]	0	R/W	Y/G Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

38.3.2.11 Image Quality Adjustment Block Matrix CBB Adjustment Register 1 (IMGCNT_MTX_CBB_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	IMGCNT_MTX_BB[10:0]										
Initial Value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_BR[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	IMGCNT_ MTX_BB [10:0]	256	R/W	Cb/B Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_ MTX_BR [10:0]	0	R/W	Cr/R Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

38.3.2.12 Image Quality Adjustment Block Matrix CRR Adjustment Register 0 (IMGCNT_MTX_CRR_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	IMGCNT_MTX_R[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_RG[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	IMGCNT_ MTX_R[7:0]	128	R/W	Offset (DC) Adjustment of Cr/R Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_ MTX_RG[10:0]	0	R/W	Y/G Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

38.3.2.13 Image Quality Adjustment Block Matrix CRR Adjustment Register 1 (IMGCNT_MTX_CRR_ADJ1)

38.3.2.15 Video input with data enable control register 0 (DEMODE0)

Following functions are added for video input signal use-case expansion of the VDCE Video Input.

1. Vertical position can be shifted before 4 lines from the timing configured by other registers.
2. Starting timing to capture video data by DV_HSYNC can be shifted before 1 DV_CLK.
3. Interrupt timing can be changed to the end of the final line by additional line number comparator.

Additional functions on VDCE are controlled by the DEMODE0 and DEMODE1 registers.

CAUTION

Add setting of DEMODE0 to the initialization routine.

38.3.3 Usage Methods

38.3.3.1 Input Format Adjustment Method

Setting examples of each input format are shown below.

Table 38.46 External Input (BT656, 525i) Setting Example

Register Name	Bit Name	Description	Setting Value
INP_SEL_CNT	Bit20	Set this bit to “1”.	1
INP_SEL_CNT	INP_FORMAT[2:0]	Selects the external input format.	3
INP_SEL_CNT	INP_PXD_EDGE	Selects the clock edge for capturing the external input video signals.	0
INP_SEL_CNT	INP_VS_EDGE	Selects the clock edge for capturing the external input Vsync signals.	0
INP_SEL_CNT	INP_HS_EDGE	Selects the clock edge for capturing the external input Hsync signals.	0
INP_EXT_SYNC_CNT	INP_ENDIAN_ON	Changes the bit endian of the external input.	0
INP_EXT_SYNC_CNT	INP_SWAP_ON	Enables or disables the B/R signal swap of the external input.	0
INP_EXT_SYNC_CNT	INP_HS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_VS_INV	Enables or disables the Vsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	Selects the Hsync reference for BT656 input.	0
INP_EXT_SYNC_CNT	INP_F525_625	Sets the number of lines for BT656 input.	0
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	Sets the data start timing with respect to the Hsync in the BT656/601 format.	0
INP_VSYNC_PH_ADJ	INP_FH50[9:0]	Sets the 1/2fH phase in clock cycle units.	858
INP_VSYNC_PH_ADJ	INP_FH25[9:0]	Sets the 1/4fH phase in clock cycle units.	429
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	Sets the number of lines for delaying the Vsync signal and field differentiation signal.	0
INP_DLY_ADJ	INP_VS_DLY[7:0]	Sets the amount of delay of the Vsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_HS_DLY[7:0]	Sets the amount of delay of the Hsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_FLD_DLY[7:0]	Sets the amount of delay of the field differentiation signal in clock units.	0

Note: Some registers require, after they are set, that the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE should be set to 1.

Table 38.47 External Input (BT601, 525i) Setting Example

Register Name	Bit Name	Description	Setting Value
INP_SEL_CNT	Bit20	Set this bit to “1”.	1
INP_SEL_CNT	INP_FORMAT[2:0]	Selects the external input format.	4
INP_SEL_CNT	INP_PXD_EDGE	Selects the clock edge for capturing the external input video signals.	0
INP_SEL_CNT	INP_VS_EDGE	Selects the clock edge for capturing the external input Vsync signals.	0
INP_SEL_CNT	INP_HS_EDGE	Selects the clock edge for capturing the external input Hsync signals.	0
INP_EXT_SYNC_CNT	INP_ENDIAN_ON	Changes the bit endian of the external input.	0
INP_EXT_SYNC_CNT	INP_SWAP_ON	Enables or disables the B/R signal swap of the external input.	0
INP_EXT_SYNC_CNT	INP_HS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_VS_INV	Enables or disables the Vsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	Selects the Hsync reference for BT656 input.	0
INP_EXT_SYNC_CNT	INP_F525_625	Sets the number of lines for BT656 input.	0
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	Sets the data start timing with respect to the Hsync in the BT656/601 format.	0
INP_VSYNC_PH_ADJ	INP_FH50[9:0]	Sets the 1/2fH phase in clock cycle units.	858
INP_VSYNC_PH_ADJ	INP_FH25[9:0]	Sets the 1/4fH phase in clock cycle units.	429
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	Sets the number of lines for delaying the Vsync signal and field differentiation signal.	0
INP_DLY_ADJ	INP_VS_DLY[7:0]	Sets the amount of delay of the Vsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_HS_DLY[7:0]	Sets the amount of delay of the Hsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_FLD_DLY[7:0]	Sets the amount of delay of the field differentiation signal in clock units.	0

Note: Some registers require, after they are set, that the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE should be set to 1.

38.3.3.2 Usage Method of Conversion Color Matrix

Typical data conversion setting examples are shown below.

Table 38.48 Conversion Color Matrix

Register Name	Bit Name	GBR to GBR	GBR to YCbCr	YCbCr to GBR	YCbCr to YCbCr
IMGCNT_MTX_MODE	IMGCNT_MTX_MD[1:0]	0	1	2	3
IMGCNT_MTX_YG_ADJ0	IMGCNT_MTX_YG[7:0]	128	128	128	128
IMGCNT_MTX_YG_ADJ0	IMGCNT_MTX_GG[10:0]	256	150	256	256
IMGCNT_MTX_YG_ADJ1	IMGCNT_MTX_GB[10:0]	0	29	1960	0
IMGCNT_MTX_YG_ADJ1	IMGCNT_MTX_GR[10:0]	0	77	1865	0
IMGCNT_MTX_CBB_ADJ0	IMGCNT_MTX_B[7:0]	128	128	128	128
IMGCNT_MTX_CBB_ADJ0	IMGCNT_MTX_BG[10:0]	0	1963	256	0
IMGCNT_MTX_CBB_ADJ1	IMGCNT_MTX_BB[10:0]	256	128	454	256
IMGCNT_MTX_CBB_ADJ1	IMGCNT_MTX_BR[10:0]	0	2005	0	0
IMGCNT_MTX_CRR_ADJ0	IMGCNT_MTX_R[7:0]	128	128	128	128
IMGCNT_MTX_CRR_ADJ0	IMGCNT_MTX_RG[10:0]	0	1941	256	0
IMGCNT_MTX_CRR_ADJ1	IMGCNT_MTX_RB[10:0]	0	2027	0	0
IMGCNT_MTX_CRR_ADJ1	IMGCNT_MTX_RR[10:0]	256	128	359	256

Note: The registers require, after they are set, that the IMGCNT_VEN bit in IMGCNT_UPDATE should be set to 1.

38.4 Scaler

NOTE

The D1L2(H) devices do not feature the video input and down/up scaling functions. It can only read unscaled image data into Graphic Layers 0 and 1.

38.4.1 Scaler Functions

38.4.1.1 Overview of Functions

The scaler subjects the YCbCr and RGB signals output from the input controller, to sync signal generation; and reduction and enlargement of the images.

The scaler also records video image in the frame buffer.

The Video Display Controller has two scalers (scalers 0 and 1) in each channel. For image blending, either cascading the scalers or using the VIN synthesizer can be selected. When the scalers are cascaded for image blending, the image from scaler 0 is placed in the lower layer and that from scaler 1 is placed in the upper layer.

Scaler 0 receives a signal from the input controller in the channel where scaler 0 belongs.

For the VIN synthesizer, refer to Section 38.6, Image Synthesizer.

In scalers 0 and 1, either enlargement process or graphics 0 or 1 process can be used at a time.

The functional block diagrams of scalers 0 and 1 are shown below.

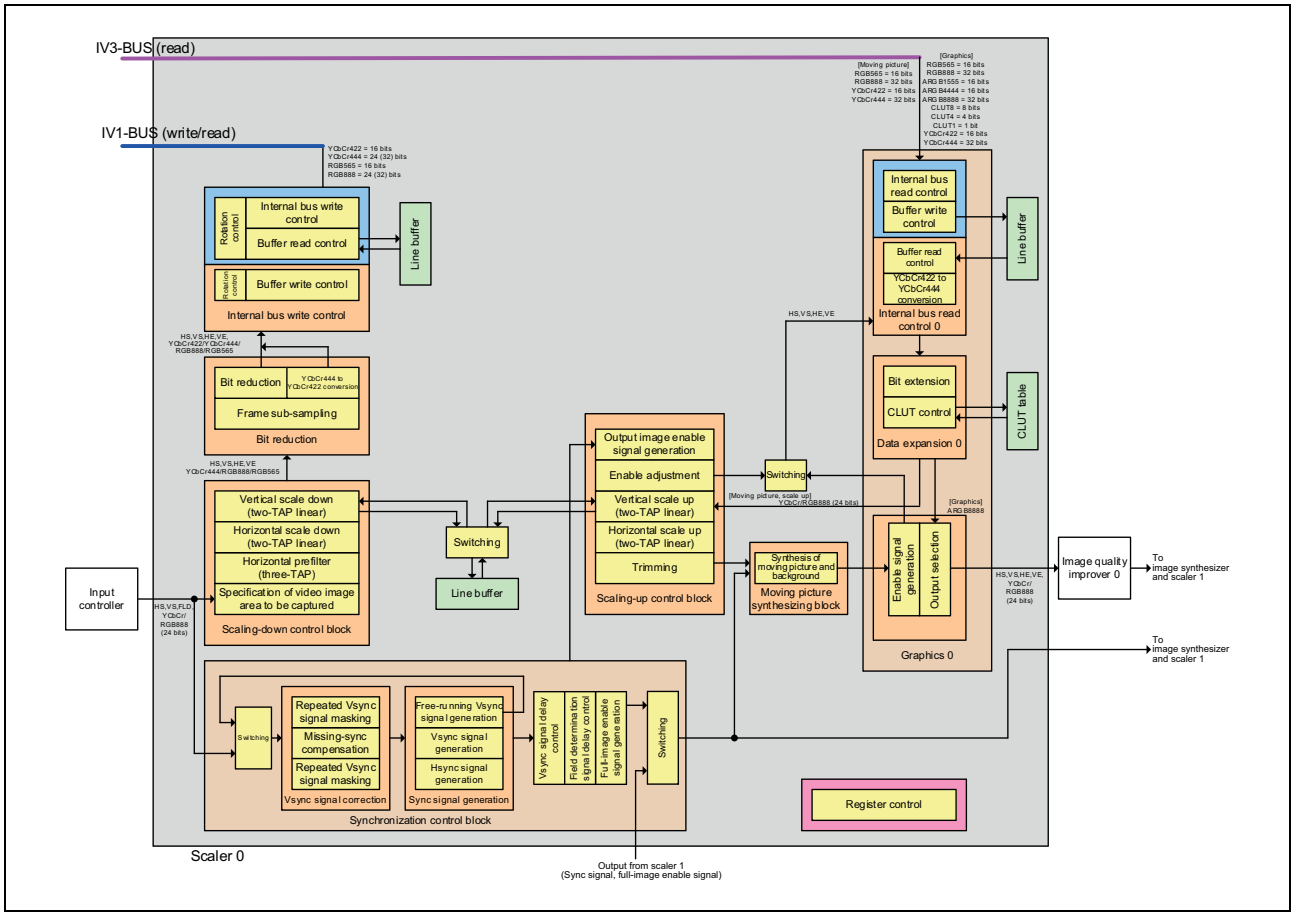

Figure 38.24 Functional Block Diagram of Scaler 0

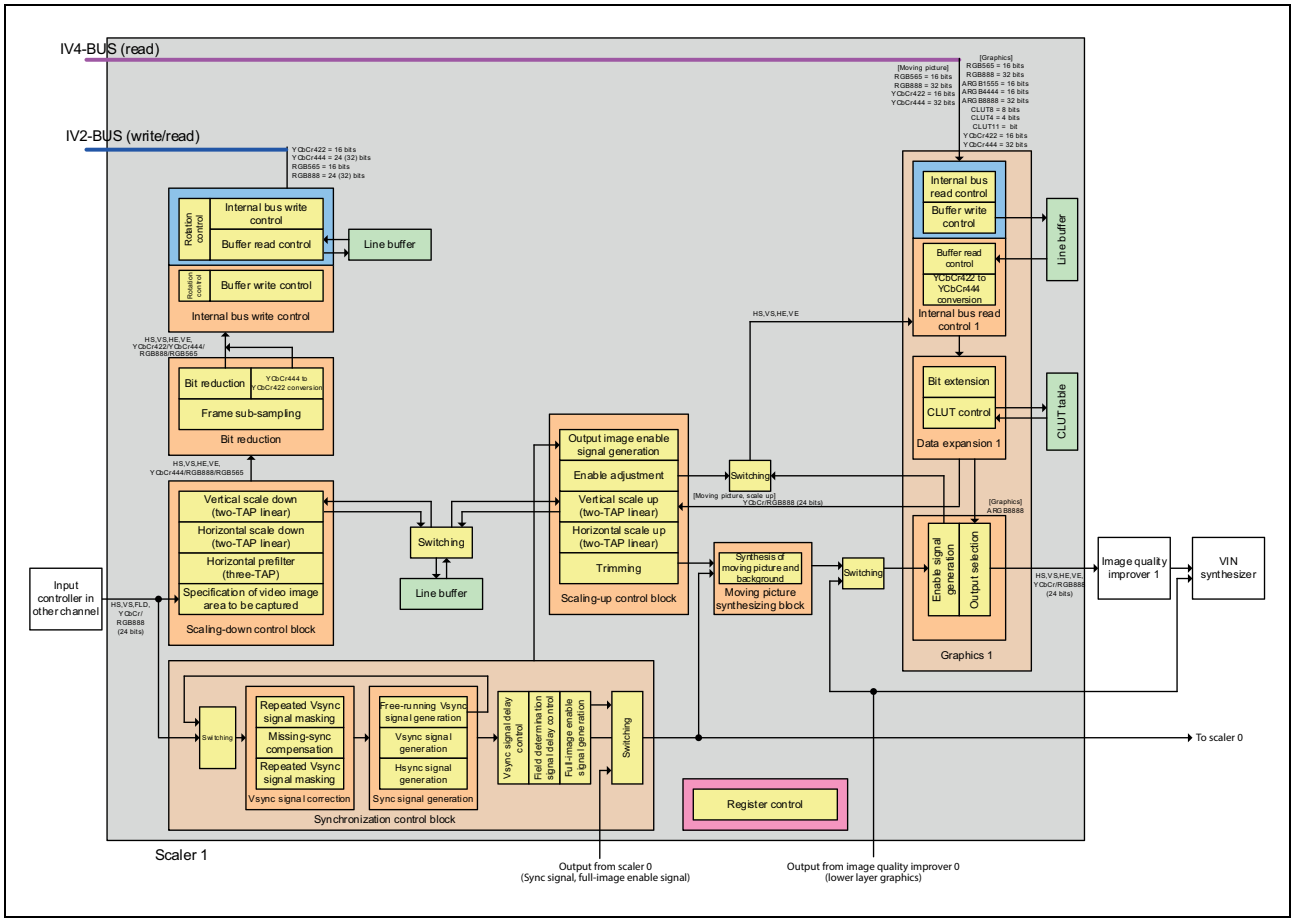

Figure 38.25 Functional Block Diagram of Scaler 1

The video display controller has two scalers and each scaler has a graphics block. The registers and bits in the scalers are named SC0_xxxx or SC1_xxxx and those in the graphics blocks are named GR0_xxxx or GR1_xxxx, but in this section, they are collectively called SC_xxxx or GR_xxxx.

38.4.1.2 Register Control

(1) Updating Registers

The Vsync signal is used to control the update timing of all the registers of the scaling and graphics blocks except some registers of the sync control block and some of the other blocks.

After 1 is set to the bits in the update control register, the contents of the relevant registers are modified at the rising edge of the Vsync signal. The update control register is automatically cleared to 0 after the modification.

Table 38.49 Register Update Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_UPDATE	SC_SCL0_UPDATE	0	SYNC Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL0_UPDATE	SC_SCL0_VEN_D	0	Scaling-Up Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_C	0	Scaling-Down Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_B	0	Synchronization Control and Scaling-up Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_A	0	Scaling-Down Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL1_UPDATE	SC_SCL1_UPDATE_B	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL1_UPDATE	SC_SCL1_UPDATE_A	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL1_UPDATE	SC_SCL1_VEN_B	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL1_UPDATE	SC_SCL1_VEN_A	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_UPDATE	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
GR_UPDATE	GR_P_VEN	0	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_IBUS_VEN	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

The registers controlled by SC_SCL0_VEN_A, SC_SCL0_VEN_C, SC_SCL1_VEN_A, and SC_SCL1_VEN_B are modified at the rising edge of the input Vsync signal.

The registers controlled by SC_SCL0_VEN_B, SC_SCL0_VEN_D, GR_P_VEN, and GR_IBUS_VEN are modified at the rising edge of the output Vsync signal.

38.4.1.3 Synchronization Control

(1) Selecting Vsync Signal

The Vsync signal to be output from the scaler can be selected.

When an external input signal is to be displayed, an external input Vsync signal should be selected to be output.

When an external input signal is not provided, a free-running Vsync signal should be selected to be output.

Table 38.50 Vsync Signal Selection Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Vsync Signal Output Select 0: External input Vsync signal 1: Internally generated free-running Vsync signal

(2) Masking Repeated Vsync Signals

It is possible to prevent receiving the Vsync signal with a period shorter than the standard period. This is achieved by setting the start timing to receive the next Vsync signal after receiving an input Vsync signal.

The Vsync signal reception masking period is set with the SC_RES_VMASK[15:0] bits.

Masking period [usec] = SC_RES_VMASK × 128 ÷ pixel clock frequency [MHz]

This function is enabled or disabled by the SC_RES_VMASK_ON bit.

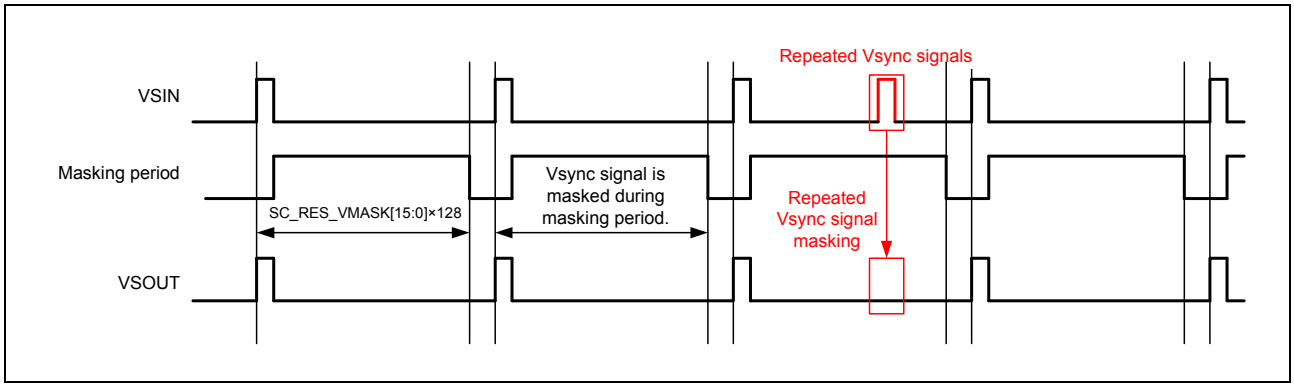

Figure 38.26 Timing for Masking Repeated Vsync Signals

Table 38.51 Repeated Vsync Signal Mask Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC1	SC_RES_VMASK_ON	1	Repeated Vsync Signal Masking Control 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled.
SC_SCL0_FRC1	SC_RES_VMASK[15:0]	2800	Repeated Vsync Signal Masking Period Sets the repeated Vsync signal masking period beginning at a Vsync signal in terms of 128 pixel-clock periods. Masking period [usec] = SC_RES_VMASK × 128 ÷ pixel clock frequency [MHz]

(3) Compensating for Missing Vsync Signals

It is possible to prevent output of the Vsync signal with a period longer than the standard period. This is achieved by setting the wait time after reception of an input Vsync signal until reception of the next Vsync signal.

If no Vsync signals are received during the wait time, an internally generated sync signal is inserted.

The wait time can be set using the SC_RES_VLACK[15:0] bits.

Wait time [usec] = SC_RES_VLACK × 128 ÷ pixel clock frequency [MHz]

This function is enabled or disabled by the SC_RES_VLACK_ON bit.

If no Vsync signals are input during the Vsync signal reception time, the SC_RES_QVLACK bit is set to the high level.

If Vsync signals are continuously detected four or more times during the Vsync signal reception time, the SC_RES_QVLOCK bit is set to the high level.

The SC_RES_QVLOCK bit is valid even when both the SC_RES_VMASK_ON and SC_RES_VLACK_ON bits are set to turn off the corresponding functions.

Note that, however, the SC_RES_VMASK and SC_RES_VLACK bits must be set correctly.

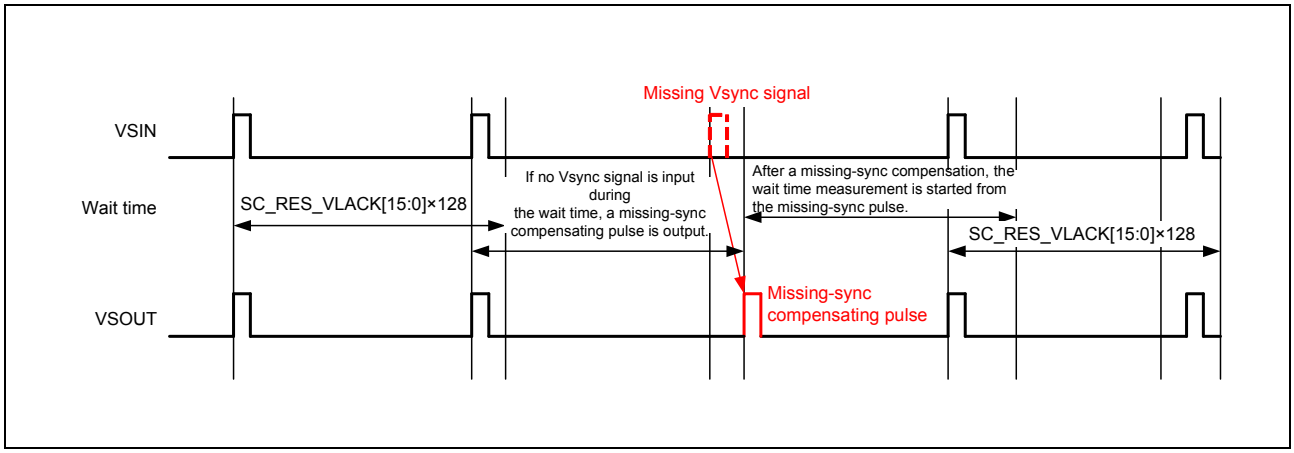

Figure 38.27 Compensation of Missing Vsync Signals

Table 38.52 Missing Vsync Compensation Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC2	SC_RES_VLACK_ON	1	Missing Vsync Signal Compensation 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.
SC_SCL0_FRC2	SC_RES_VLACK[15:0]	3600	Missing-Sync Compensating Pulse Output Wait Time Sets the wait time before outputting a missing-sync compensating pulse after a Vsync signal. Wait time [usec] = SC_RES_VLACK × 128 ÷ pixel clock frequency [MHz]
SC_SCL0_FRC9	SC_RES_QVLACK	—	Missing Vsync Signal Detection Flag 1: Missing Vsync signal input has been detected. 0: No missing Vsync signal input has been detected.
SC_SCL0_FRC9	SC_RES_QVLOCK	—	Locked Vsync Signal Detection Flag 1: Repeated and missing Vsync signal input has not been detected for four or more vertical periods. 0: Repeated or missing Vsync signal input has been detected.

For the Vsync signal, repeated-signal masking is first carried out and then missing-signal compensation is carried out, followed by another repeated-signal masking.

Repetition masking is inserted after missing-Vsync compensation to prevent output of the Vsync signal even in cases such as the input of a Vsync signal immediately after the input of a pulse to compensate for a missing Vsync signal.

On/off control of the missing-Vsync compensation also applies to the second repeated-Vsync masking; and masking period setting of the first repeated-Vsync masking also applies to the second repeated-Vsync masking.

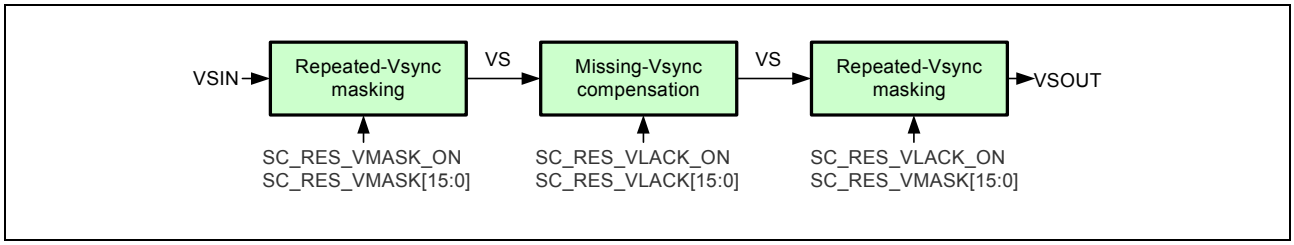

Figure 38.28 Repeated-Vsync Masking and Missing-Vsync Compensation

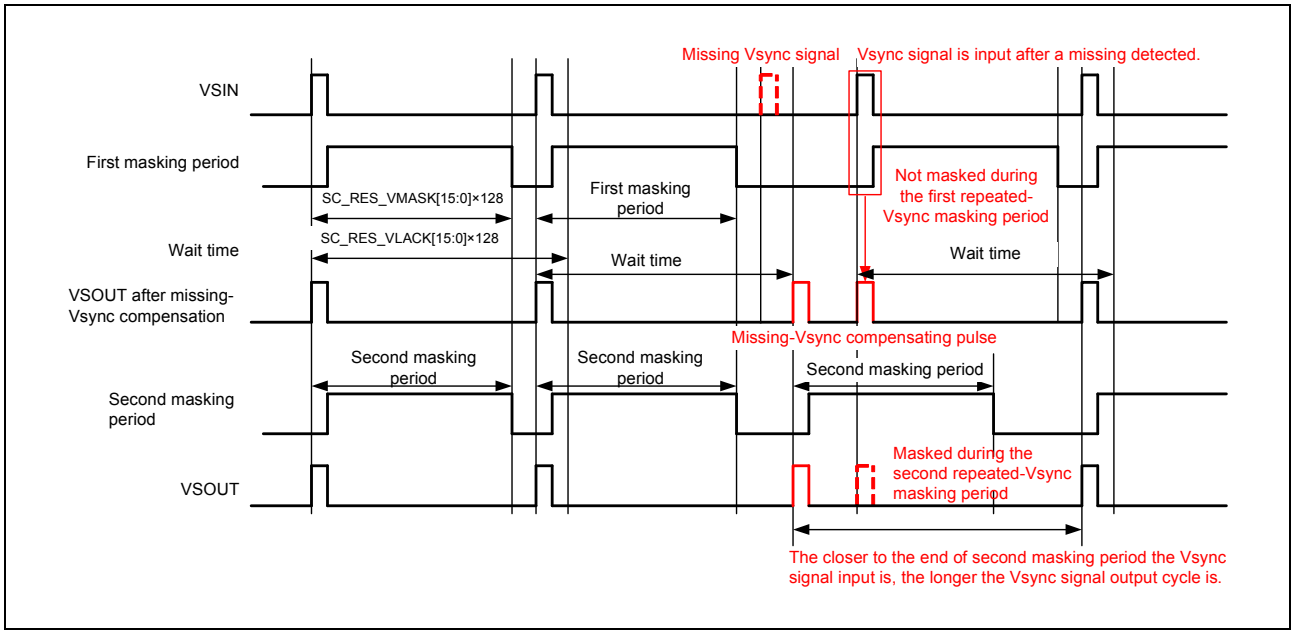

Figure 38.29 Timing for Masking Repeated Vsync Signals and Missing Vsync Signal Compensation

(4) Free-Running Period

Free-running Vsync and Hsync periods can be set.

Hsync period [usec] = (SC_RES_FH + 1) ÷ pixel clock frequency [MHz]

Vsync period [usec] = horizontal period [usec] × (SC_RES_FV + 1)

Table 38.53 Free-Running Period Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC4	SC_RES_FV[10:0]	524	Free-Running Vsync Period Setting Free-running Vsync period = (SC_RES_FV + 1) × horizontal period [usec]
SC_SCL0_FRC4	SC_RES_FH[10:0]	799	Hsync Period Setting Hsync period [usec] = (SC_RES_FH +1) ÷ pixel clock frequency [MHz]

When selecting an external input Vsync signal, set the SC_RES_VS_SEL bit to 0. At this time, the internally generated free-running Vsync signal is not output.

In the meantime, the Hsync signal is always generated according to the free-running signal setting and output from the scaler.

(5) Vsync Signal Delay Control

Delay of Vsync signal output from the scaler can be controlled.

The delay is used to adjust the frame buffer read timing.

Table 38.54 Vsync Output Delay Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC5	SC_RES_VSDLY[7:0]	1	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: SC_RES_VSDLY × output Hsync period [usec]

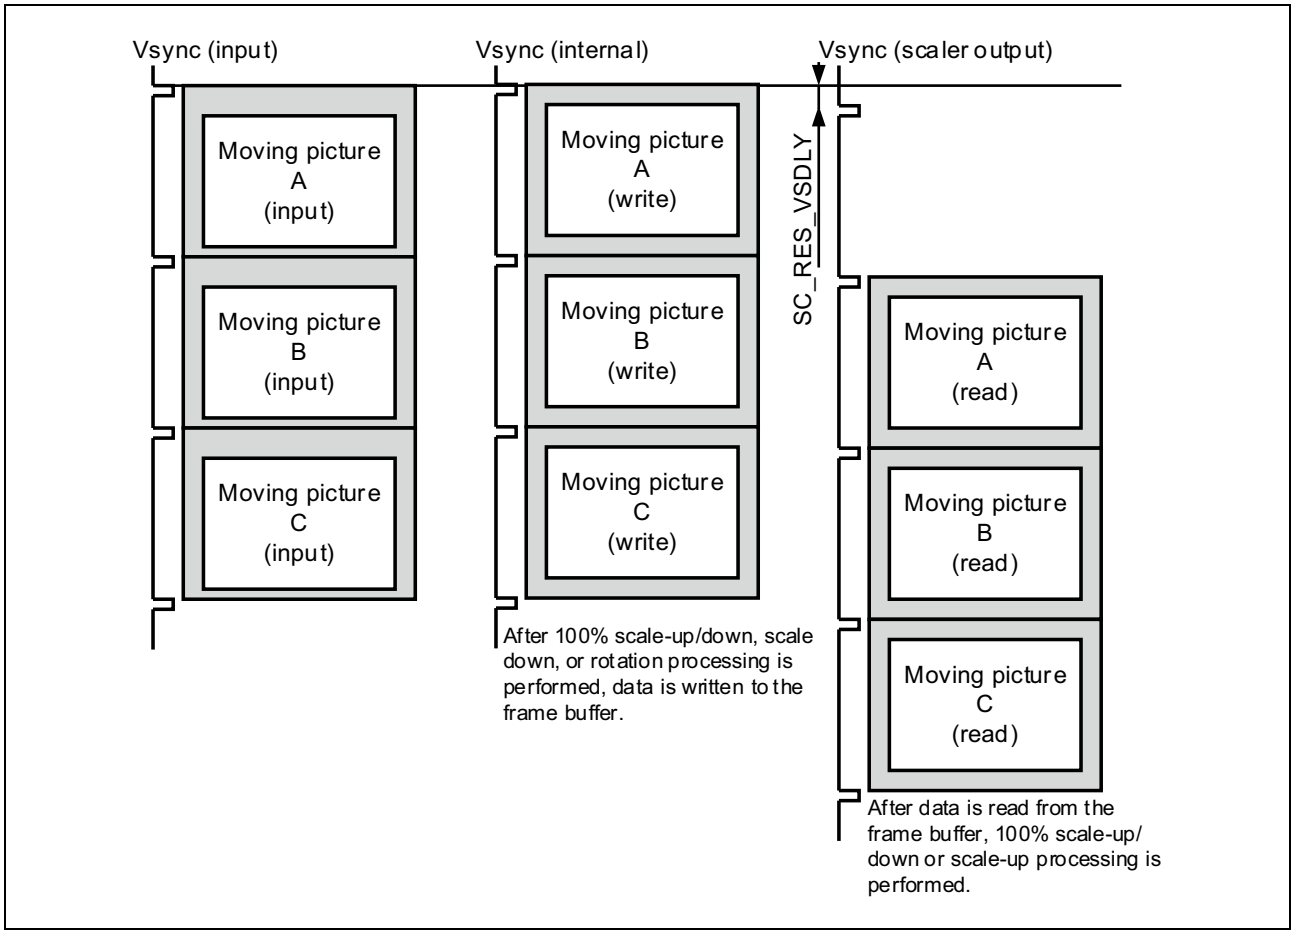

Figure 38.30 Vsync Signal Phases (Two Frame-Buffer Planes Used)

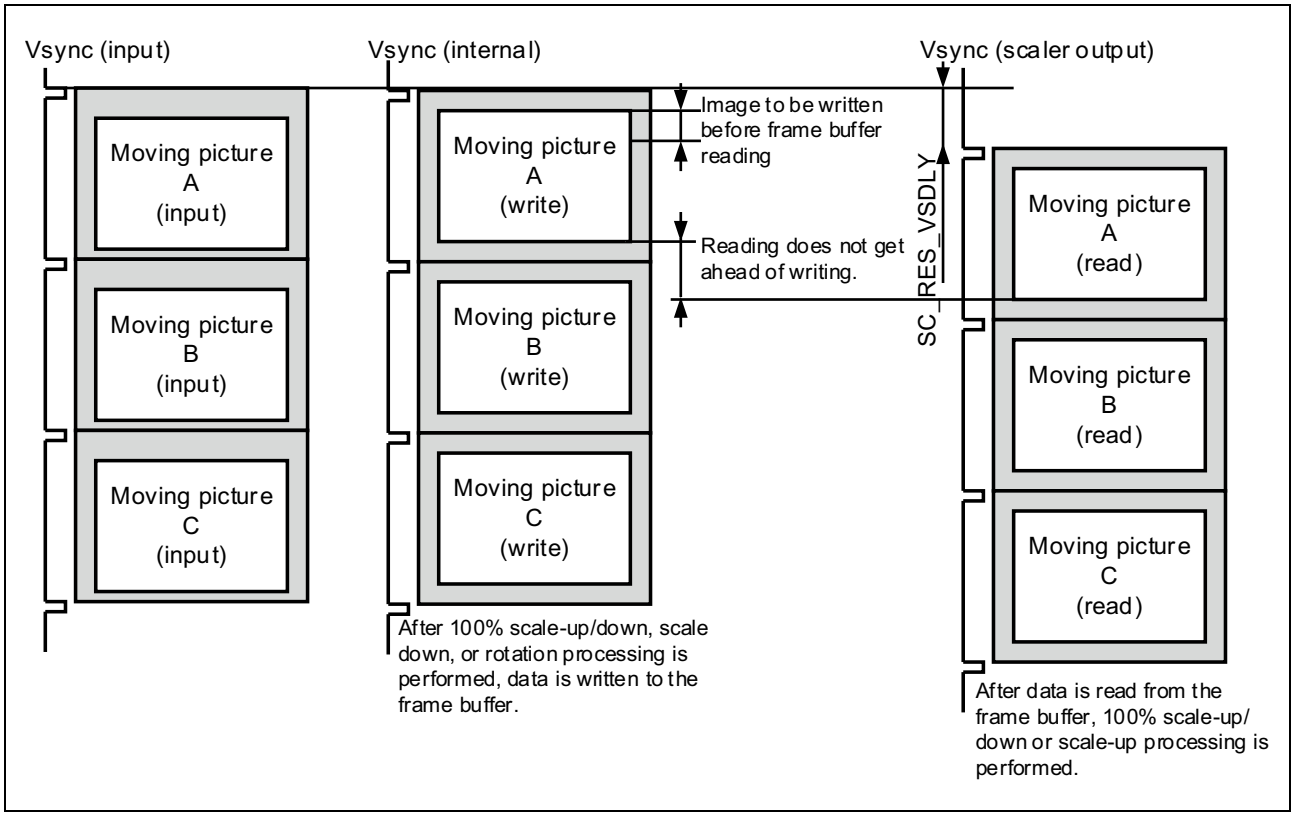

Figure 38.31 Vsync Signal Phases (One Frame-Buffer Plane Used)

38.4.2 Setting Video Input Size

(1) Setting Image Area to be Captured

The image area to be captured can be set for reduction or enlargement.

The area is defined by specifying its start position and width based on the input Hsync and Vsync signals.

Table 38.55 Control of Image Area to be Captured

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS2	SC_RES_VS[10:0]	18	Vertical Position Setting for Video Signal Capturing (VSYNC + (V backporch -1) lines) Note: The set value should be four or more (lines). SC_RES_VS + SC_RES_VW should be equal to or less than 2039 (lines).
SC_SCL0_DS2	SC_RES_VW[10:0]	240	Vertical Width of Video Signal to be Captured (lines) Note: SC_RES_VS + SC_RES_VW should be equal to or less than 2039 (lines).
SC_SCL0_DS3	SC_RES_HS[10:0]	244	Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_HS + SC_RES_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_DS3	SC_RES_HW[10:0]	1440	Horizontal Width of Video Signal to be Captured (video-image clock cycles) Note: SC_RES_HS + SC_RES_HW should be equal to or less than 2015 (clock cycles).

(2) Generating a Full-Screen Enable Signal

The valid period of the full screen to be output from the scaler can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the scaler.

Table 38.56 Full-Screen Enable Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	35	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC_RES_F_VS + SC_RES_F_VW should be equal to or less than 2039 (lines).
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	480	Vertical Enable Signal Width for Full Screen (lines) Note: SC_RES_F_VS + SC_RES_F_VW should be equal to or less than 2039 (lines).
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	144	Horizontal Enable Signal Start Position for Full Screen. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_F_HS + SC_RES_F_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	640	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note: SC_RES_F_HS + SC_RES_F_HW should be equal to or less than 2015 (clock cycles).

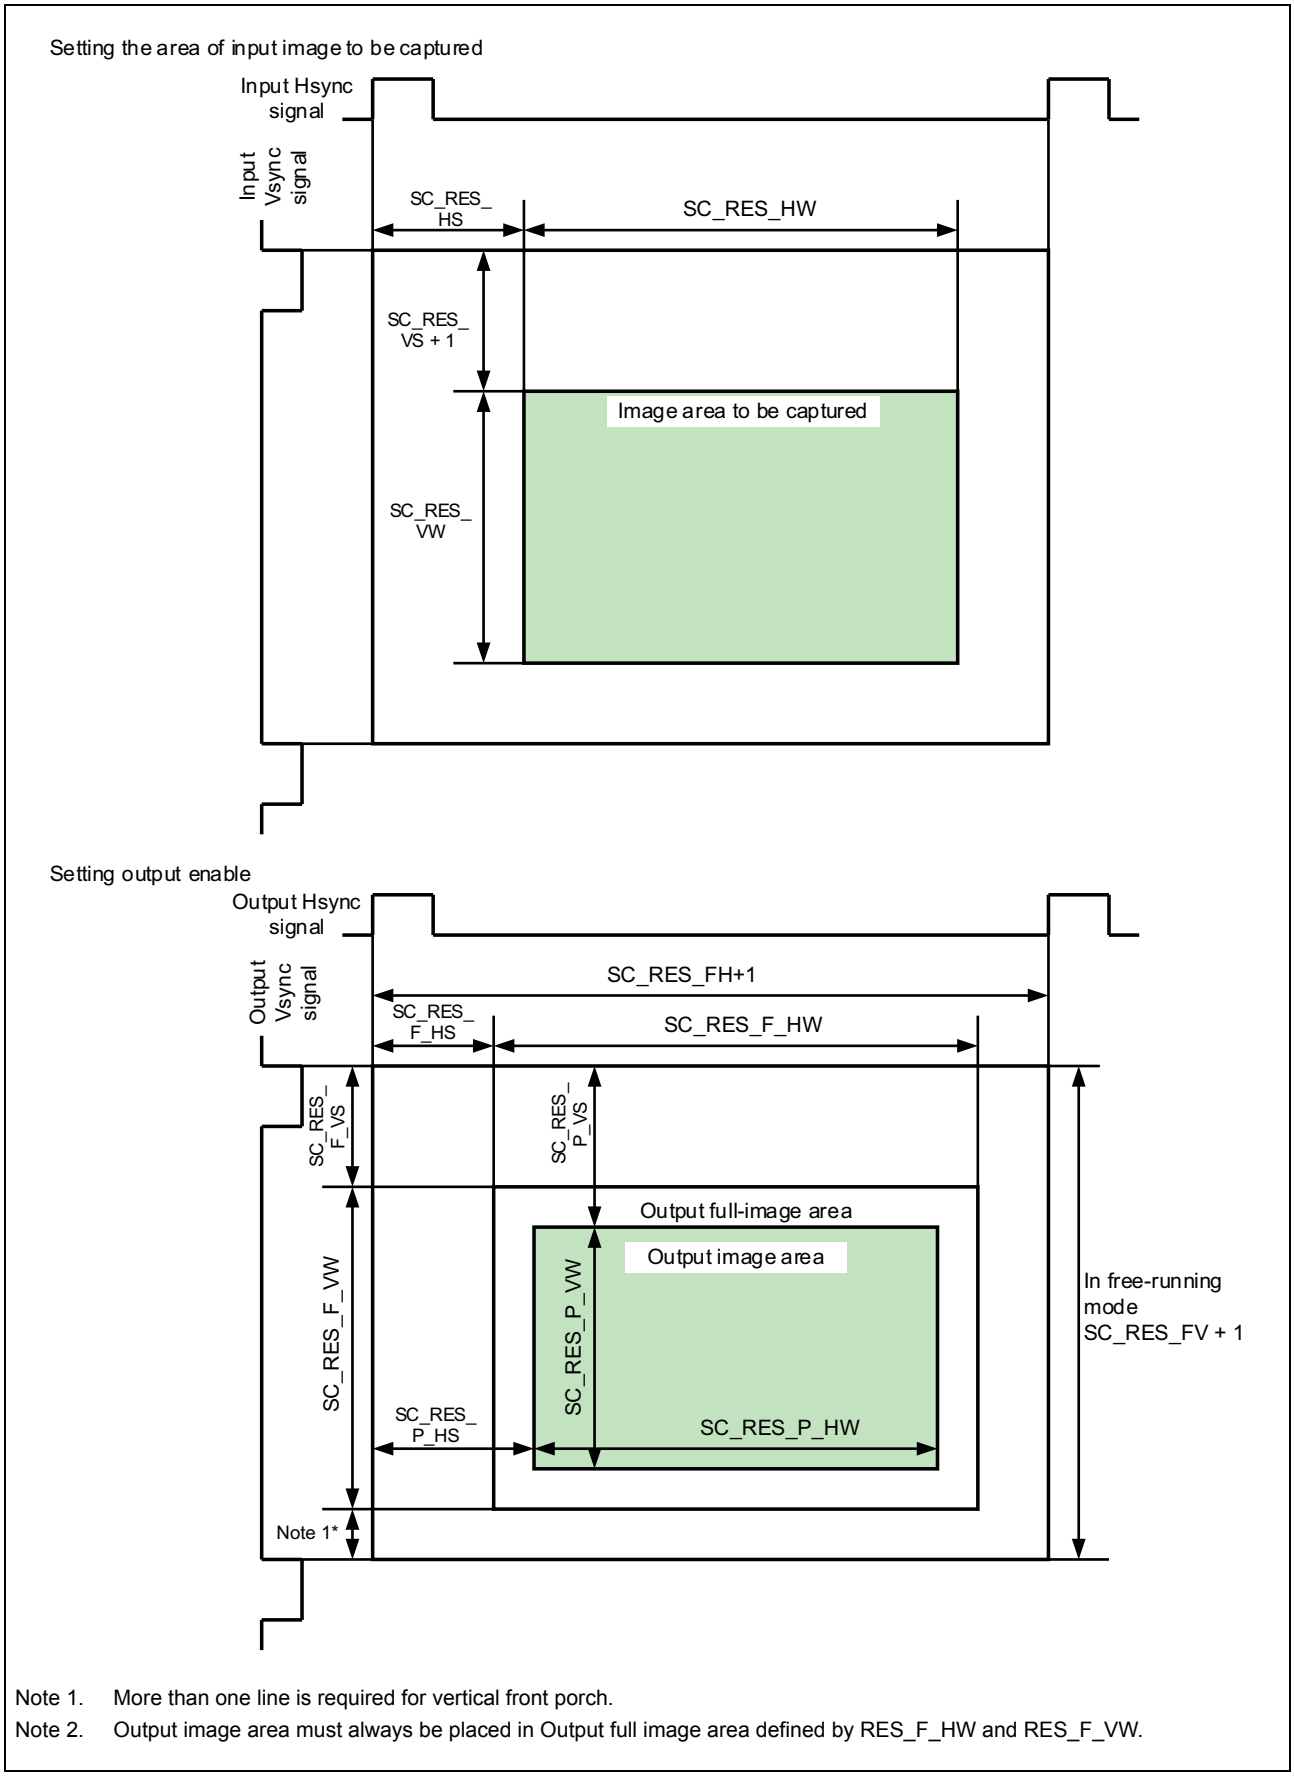
(3) Generating an Image Output Enable Signal

The valid period of the image to be output can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the scaler.

Table 38.57 Image Output Enable Controls

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US2	SC_RES_P_VS[10:0]	35	Vertical Enable Signal Start Position for Output Image. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC_RES_P_VS + SC_RES_P_VW should be equal to or less than 2039 (lines).
SC_SCL0_US2	SC_RES_P_VW[10:0]	480	Vertical Enable Signal Width for Output Image (lines) Note: SC_RES_P_VS + SC_RES_P_VW should be equal to or less than 2039 (lines).
SC_SCL0_US3	SC_RES_P_HS[10:0]	144	Horizontal Enable Signal Start Position for Output Image. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_P_HS + SC_RES_P_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_US3	SC_RES_P_HW[10:0]	640	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: SC_RES_P_HS + SC_RES_P_HW should be equal to or less than 2015 (clock cycles).



Note 1. More than one line is required for vertical front porch.
Note 2. Output image area must always be placed in Output full image area defined by RES_F_HW and RES_F_VW.

Figure 38.32 Enable Settings

38.4.2.1 Scaling Settings

(1) Scaling Processing Block

The scaling-down control block scales down the input image from the input controller.

Table 38.58 Scaling Process

Mirroring	Horizontal Scaling	Vertical Scaling	Scaling-Down Control Block	Scaling-Up Control Block
Normal	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
Horizontal mirroring	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale-up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up

It is impossible to use vertical reduction by the scaling-down control block and vertical enlargement by the scaling-up control block simultaneously because they are mutually exclusive.

38.4.2.2 Horizontal Prefilter

The horizontal prefilter can be turned on or off for brightness (Y) and RGB signals to suppress the frequency band of the signals during horizontal size reduction. The input format depends on the SC_RES_MD[1:0] bit setting in the writing mode register (SC_SCL1_WR1).

When the horizontal reduction ratio is high and there is too much folding frequency component to ignore, the horizontal prefilter should be turned on.

Table 38.59 Horizontal Prefilter Settings

Input Format	SC_RES_PFIL_SEL	Operation
YCbCr input	1	Turns on the horizontal prefilter for Y signal and turns off the horizontal prefilter for Cb/Cr signal.
	0	Turns off the horizontal prefilter.
RGB input	1	Turns on the horizontal prefilter for RGB signal.
	0	Turns off the horizontal prefilter.

Table 38.60 Horizontal Prefilter Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS4	SC_RES_PFIL_SEL	0	Prefilter Mode Select for Brightness Signals 0: The prefilter is turned off. 1: The prefilter is turned on. (1/4 + 1/2 + 1/4)

38.4.2.3 Horizontal Scale-Down

The number of horizontally arranged pixels can be decreased at a desired ratio in the range of 1/1 to 1/8 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input pixels X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input pixels X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - phase) + X_{n+1} \times phase) / 4096$$

(3) Calculation of Horizontal Scale Down Ratio

The value to be set to the horizontal scale-down ratio SC_RES_DS_H_RATIO can be obtained using the following equation based on the number of input pixels SC_RES_HW and number of output pixels SC_RES_OUT_HW, where the decimals are rounded off.

SC_RES_DS_H_RATIO = round (SC_RES_HW ÷ SC_RES_OUT_HW × 4096)

Note that, for 100% horizontal scale-up, the SC_RES_HW and SC_RES_OUT_HW values should be identical and the SC_RES_DS_H_RATIO bits should be set to 4096.

(4) Handling for Lack of Last-Input Pixel

Interpolation is carried out between the second-last-input and last-input pixels to produce the last-output pixel at the right end of a screen. The interpolation position of the last-output pixel may be close to the second-last-input pixel depending on the horizontal scale-down ratio; in this case, it may appear that the last-input pixel is lacking.

The undesirable influence by lack of last-input pixel can be decreased by appropriately adjusting the horizontal scale-down ratio using the following equations.

Pre-adjustment horizontal scale-down ratio RATIO_org should be calculated first to find adjustment value σ, and then scale-down ratio SC_RES_DS_H_RATIO should be determined.

RATIO_org = round (SC_RES_HW ÷ SC_RES_OUT_HW × 4096)

σ = (RATIO_org × (SC_RES_OUT_HW − 1) − (SC_RES_HW − 1) × 4096) ÷ (SC_RES_OUT_HW − 1)

SC_RES_DS_H_RATIO = roundup (RATIO_org − σ)

Table 38.61 Horizontal Scale Down Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS1	SC_RES_DS_H_ON	1	Horizontal Scale Down On/Off 0: Off 1: On
SC_SCL0_DS7	SC_RES_OUT_HW[10:0]	640	Number of Valid Horizontal Pixels Output by Scaling-down Control Block (Video-image clock cycles)
SC_SCL0_DS4	SC_RES_DS_H_INTERPOTYP	1	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS4	SC_RES_DS_H_RATIO[15:0]	9224	Horizontal Scale Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) round(SC_RES_HW ÷ SC_RES_OUT_HW × 4096) SC_RES_DS_H_RATIO < 4096: Setting prohibited SC_RES_DS_H_RATIO = 4096: 100% scale up SC_RES_DS_H_RATIO > 4096: Scale down

Note: The SC_RES_OUT_HW value should be aligned in 4-pixel units and equal to or smaller than the SC_RES_HW value.

38.4.2.4 Vertical Scale-Down

The number of lines can be decreased in the vertical direction at a desired ratio in the range of 1/1 to 1/8 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input lines X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input lines X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - \text{phase}) + X_{n+1} \times \text{phase}) / 4096$$

(3) Calculation of Vertical Scale Down Ratio

The value to be set to the vertical scale-down ratio SC_RES_V_RATIO can be obtained using the following equation based on the number of input lines SC_RES_VW and number of output lines SC_RES_OUT_VW, where the decimals are rounded off.

SC_RES_V_RATIO = round (SC_RES_VW ÷ SC_RES_OUT_VW × 4096)

Note that the SC_RES_VW and SC_RES_OUT_VW values should be identical for vertical enlargement or 100% vertical enlargement.

For 100% vertical enlargement, reduction is carried out assuming SC_RES_V_RATIO as 4096.

(4) Handling for Lack of Last-Input Line

Interpolation is carried out between the second-last-input and last-input lines to produce the last-output line at the lower end of a screen. The interpolation position of the last-output line may be close to the

second-last-input line depending on the vertical scale-down ratio; in this case, it may appear that the last-input line is lacking.

The undesirable influence by the lack of last-input line can be decreased by appropriately adjusting the vertical scale-down ratio using the following equations.

Pre-adjustment vertical scale-down ratio RATIO_org should be calculated first to find adjustment value σ, and then scale-down ratio SC_RES_V_RATIO should be determined.

RATIO_org = round (SC_RES_VW ÷ SC_RES_OUT_VW × 4096)

σ = (RATIO_org × (SC_RES_OUT_VW − 1) − (SC_RES_VW − 1) × 4096) ÷ (SC_RES_OUT_VW − 1)

SC_RES_V_RATIO = round (RATIO_org − σ)

Table 38.62 Vertical Scale Down Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS1	SC_RES_DS_V_ON	1	Vertical Scale Down On/Off 0: Off 1: On
SC_SCL0_DS7	SC_RES_OUT_VW [10:0]	240	Number of Valid Lines in Vertical Direction Output by Scaling-Down Control Block (lines) This bit setting is used for the number of lines to be written to the frame buffer. When SC_SCL1_WR1.SC_RES_LOOP is 0 (frame write mode), these bits specify the number of lines for one frame. When SC_SCL1_WR1.SC_RES_LOOP is 1 (line write mode), these bits specify the number of lines for writing in a ring configuration.
SC_SCL0_DS5	SC_RES_V_ INTERPOTYP	1	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS6	SC_RES_V_RATIO [15:0]	2044	Vertical Scale UP/Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: round(SC_RES_VW ÷ SC_RES_OUT_VW × 4096) For scale up: round(SC_RES_IN_VW ÷ SC_RES_P_VW × 4096) SC_RES_V_RATIO < 4096: Scale up SC_RES_V_RATIO = 4096: 100% scale up SC_RES_V_RATIO > 4096: Scale down

Note: SC_RES_V_RATIO and SC_RES_V_INTERPOTYP are both shared by vertical reduction and vertical enlargement.
It is impossible to use vertical reduction and vertical enlargement simultaneously because they are mutually exclusive.
The SC_RES_OUT_VW value should be aligned in 4-line units and equal to or smaller than the SC_RES_VW value.

38.4.2.5 Horizontal Scale Up

The number of horizontally arranged pixels can be increased at a desired ratio in the range of 1/1 to 8/1 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input pixels X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows.

$X_{interpo} = X_n$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input pixels X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - \text{phase}) + X_{n+1} \times \text{phase}) / 4096$$

(3) Calculation of Horizontal Scale Up Ratio

The value to be set to the horizontal scale-up ratio SC_RES_US_H_RATIO can be obtained using the following equation based on the number of input pixels SC_RES_IN_HW and number of output pixels SC_RES_P_HW, where the decimals are rounded off.

SC_RES_US_H_RATIO = round (SC_RES_IN_HW ÷ SC_RES_P_HW × 4096)

Note that, for 100% horizontal scale-up, the SC_RES_IN_HW and SC_RES_P_HW values should be identical and the SC_RES_US_H_RATIO bits should be set to 4096.

(4) Folding Handling

Since interpolation is carried out between the last-input pixel and second-last-input folding pixel to produce the last-output pixel at the right end of a screen, folding may undesirably stand out depending on the horizontal scale up ratio.

The undesirable influence by folding pixels can be decreased by appropriately adjusting the horizontal scale-up ratio using the following equations.

Pre-adjustment horizontal scale-up ratio RATIO_org should be calculated first to find adjustment value σ, and then scale-up ratio SC_RES_US_H_RATIO should be determined.

RATIO_org = round (SC_RES_IN_HW ÷ SC_RES_P_HW × 4096)

σ = (RATIO_org × (SC_RES_P_HW − 1) − (SC_RES_IN_HW − 1) × 4096 ÷ (SC_RES_P_HW − 1)

SC_RES_US_H_RATIO = round (RATIO_org − σ)

Table 38.63 Horizontal Scale Up Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US1	SC_RES_US_H_ON	1	Horizontal Scale Up On/Off 0: Off 1: On
SC_SCL0_US4	SC_RES_IN_HW[10:0]	640	Number of Valid Horizontal Pixels Input to Scaling-down Control Block (Pixel-clock cycles)
SC_SCL0_US6	SC_RES_US_H_ INTERPOTYP	1	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_US5	SC_RES_US_H_RATIO [15:0]	9224	Horizontal Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) round(SC_RES_IN_HW ÷ SC_RES_P_HW × 4096) SC_RES_US_H_RATIO < 4096: Scale up SC_RES_US_H_RATIO = 4096: 100% scale-up SC_RES_US_H_RATIO > 4096: Setting prohibited

38.4.2.6 Vertical Scale-Up

The number of lines can be increased in the vertical direction at a desired ratio in the range of 1/1 to 8/1 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input lines X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input lines X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - phase) + X_{n+1} \times phase) / 4096$$

(3) Calculation of Vertical Scale Up Ratio

The value to be set to the vertical scale-up ratio SC_RES_V_RATIO can be obtained using the following equation based on the number of input lines SC_RES_IN_VW and number of output lines SC_RES_P_VW, where the decimals are rounded off.

SC_RES_V_RATIO = round (SC_RES_IN_VW ÷ SC_RES_P_VW × 4096)

Note that, for 100% vertical enlargement or vertical reduction, the SC_RES_IN_VW and SC_RES_P_VW values should be identical.

(4) Folding Handling

The last line to be output at the bottom of the screen is produced by interpolation between the last line and line for folding (second-last line to be input). According to the vertical scale-up rate, this may cause folding to stand out.

The undesirable influence by folding lines can be decreased by appropriately adjusting the vertical scale-up ratio using the following equations.

Pre-adjustment vertical scale-up ratio RATIO_org should be calculated first to find adjustment value σ, and then scale-up ratio SC_RES_V_RATIO should be determined.

RATIO_org = round (SC_RES_IN_VW ÷ SC_RES_P_VW × 4096)

σ = (RATIO_org × (SC_RES_P_VW − 1) − (SC_RES_IN_VW − 1) × 4096) ÷ (SC_RES_P_VW − 1)

SC_RES_V_RATIO = round (RATIO_org − σ)

Table 38.64 Vertical Scale Up Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US1	SC_RES_US_V_ON	1	Vertical Scale Up On/Off 0: Off 1: On
SC_SCL0_US4	SC_RES_IN_VW[10:0]	240	Number of Valid Lines in Vertical Direction Input to Scaling-down Control Block (Lines)
SC_SCL0_DS5	SC_RES_V_INTERPOTYP	1	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS6	SC_RES_V_RATIO[15:0]	2044	Vertical Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: round(SC_RES_VW ÷ SC_RES_OUT_VW × 4096) For scale up: round(SC_RES_IN_VW ÷ SC_RES_P_VW × 4096) SC_RES_V_RATIO < 4096: Scale up SC_RES_V_RATIO = 4096: 100% scale up SC_RES_V_RATIO > 4096: Scale down

Note: SC_RES_V_RATIO and SC_RES_V_INTERPOTYP are both shared by vertical reduction and vertical enlargement.
It is impossible to use vertical reduction and vertical enlargement simultaneously because they are mutually exclusive.

38.4.2.7 IP Conversion

(1) Initial Phase Control

When interlaced signals are input, line flickering caused by the line offset between the top and bottom fields can be decreased before being displayed by independently adjusting the initial scaling phases of the fields.

For various operations, appropriate settings should be made referring to the relevant registers as listed in **Table 38.65**.

Table 38.65 Initial Scaling Phase Settings (Standard Values) for IP Conversion

Mirroring	Horizontal Scaling	Vertical Scaling	Reference Bit (Setting)
Normal	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
Horizontal mirroring	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_TOP_INIPHASE = 2048

Note: Set 0 to the initial phase control registers where the specific value is not shown in the table.
Set 0 to all the initial phase control registers when progressive signals are input.

Table 38.66 Initial Scaling Phase Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS5	SC_RES_BTM_INIPHASE [11:0]	0	Vertical Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_DS5	SC_RES_TOP_INIPHASE [11:0]	2048	Vertical Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_US6	SC_RES_US_HB_INIPHASE [11:0]	0	Horizontal Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_US6	SC_RES_US_HT_INIPHASE [11:0]	0	Horizontal Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)

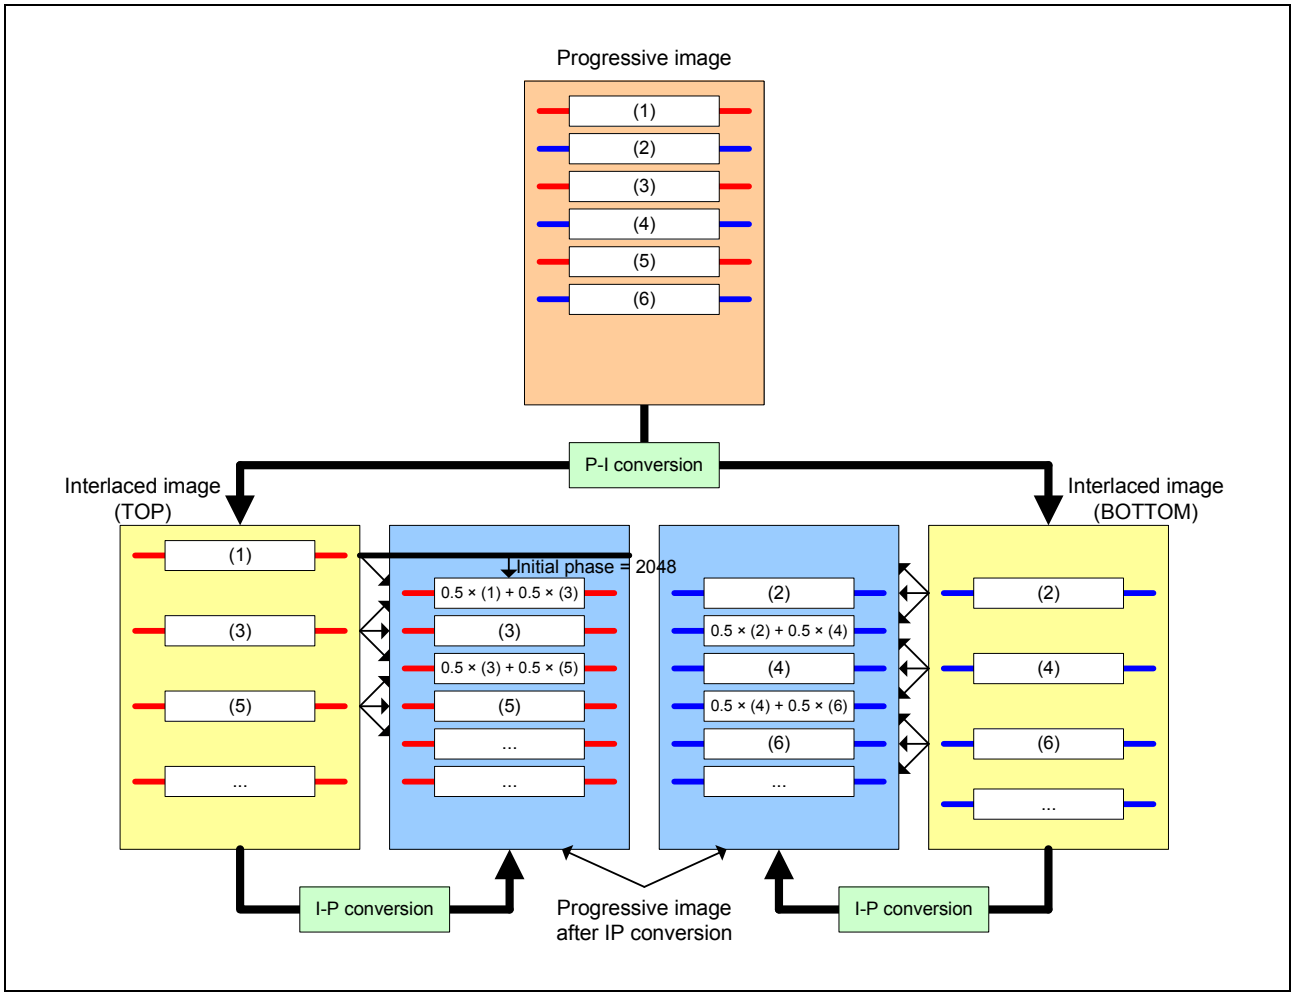


Figure 38.33 IP Conversion Processing Schematic Diagram

(2) Field Determination Signal Control

When interlaced signals are input, the field determination signal can be controlled, which is output to the scaling-up control block during vertical scaling.

When progressive signals are input or vertical scaling is carried out by the scaling-down control block, the field determination signal output to the scaling-up control block is fixed to the specific level, and thus either 0 or 1 can be set to the SC_RES_FLD_DLY_SEL bit.

Table 38.67 Settings for Field Determination Signal Control

Input Signal	Vertical Processing	Frame Buffer	SC_RES_FLD_DLY_SEL
Progressive	—	—	—
Interlace	Vertical scale down	—	—
	Vertical scale up	One plane or less	0
		Two planes or more	1

Table 38.68 Field Determination Signal Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC5	SC_RES_FLD_DLY_SEL	1	Field Determination Signal Delay Control 0: No delay 1: Delay of one vertical cycle

38.4.2.8 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image Line before Scaling-down

When the location of the image line input to the scaling-down control block matches the SC_SCL1_LINE setting, an interrupt processing is done. In addition, the current location of the line input to the scaling-down control block can be read from a register.

Table 38.69 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image line before Scaling-down

Register Name	Bit Name	Initial Value	Description
SC_SCL0_INT	SC_RES_LINE[10:0]	All 0	Setting of Interrupt on Image Line Input to Scaling-down Control Block When the location of the image line input to the scaling-down control block matches the SC_SCL0_LINE setting, an interrupt signal is output.
SC_SCL0_MON0	SC_RES_LIN_STAT[10:0]	All 0	Current Location of Image Line Input to Scaling-down Control Block

38.4.2.9 Trimming

The upper, lower, right, and left parts of a post-scaling image can be trimmed off as specified by the SC_RES_VCUT and SC_RES_HCUT bits before being output.

The frame lines of the post-scaling image can also be displayed by setting the SC_RES_DISP_ON bit to 1.

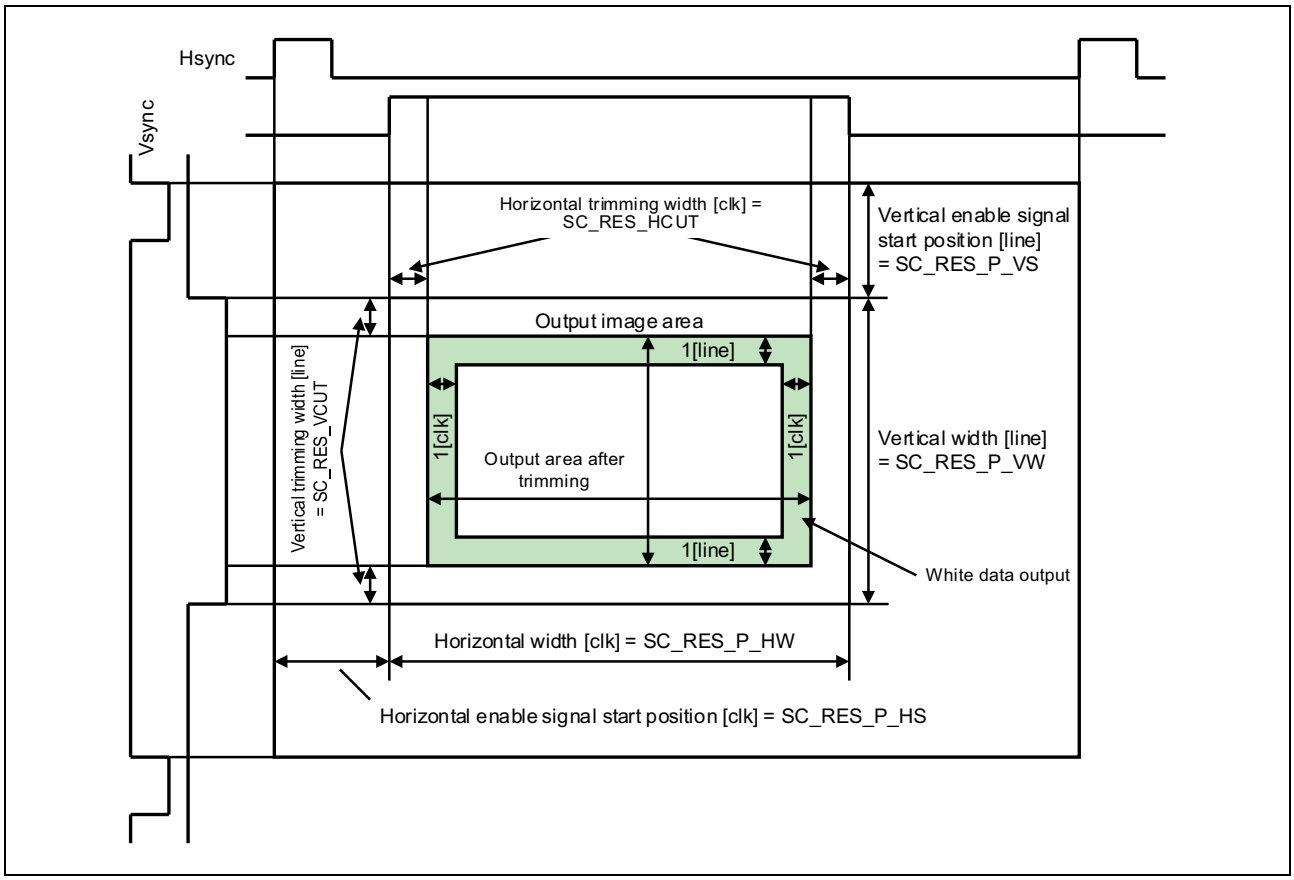

Figure 38.34 Area Relationship for Trimming (Frame Lines Displayed)

Table 38.70 Trimming Control

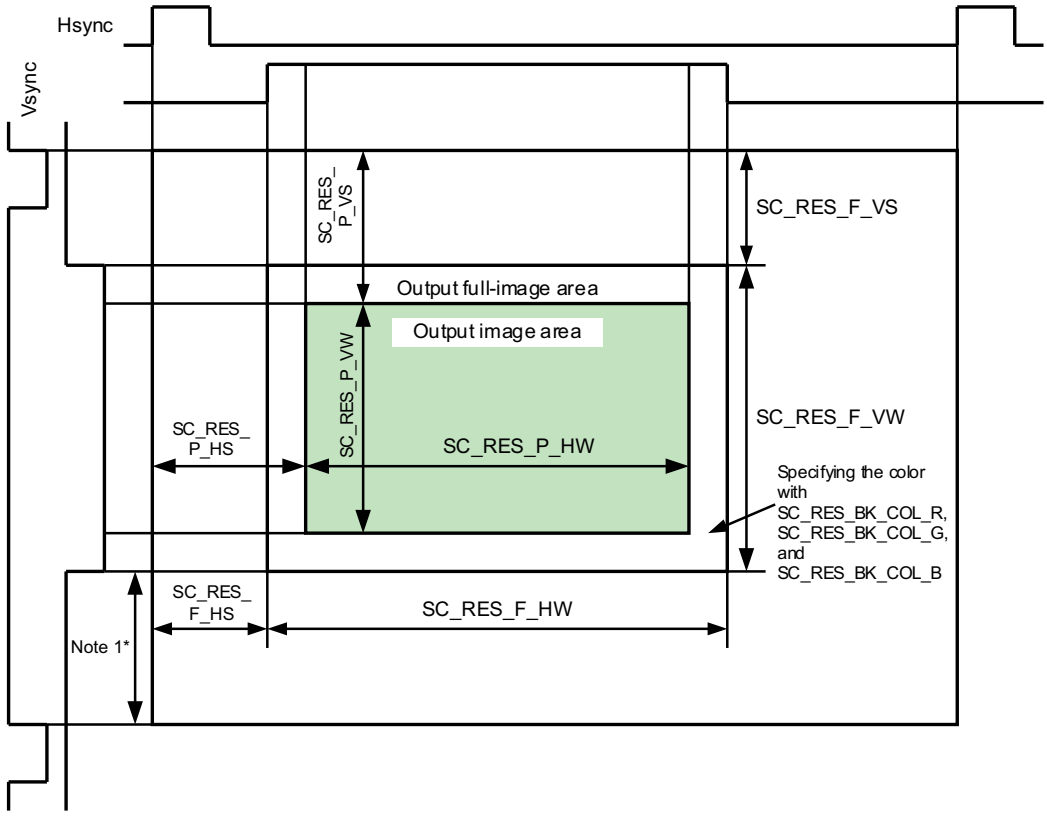
Register Name	Bit Name	Initial Value	Description
SC_SCL0_US7	SC_RES_HCUT[7:0]	0	Horizontal Amount of Cut-off Post-Scaling Image (Right and Left Parts) Sets the number of pixel-clock cycles.
SC_SCL0_US7	SC_RES_VCUT[7:0]	0	Vertical Amount of Cut-off Post-Scaling Image (Upper and Lower Parts) Sets the number of lines.
SC_SCL0_US8	SC_RES_DISP_ON	0	Post-Scaling Image Frame Display On/Off 0: Frame display on 1: Frame display off

38.4.2.10 Screen Synthesis

During the valid full-screen period, the image area can be overlaid before being output. If the image area to be output is smaller than a full-screen, the background color specified by the SC_RES_BK_COL_R, SC_RES_BK_COL_G, and SC_RES_BK_COL_B bits are displayed to fill the background.

Table 38.71 Screen Synthesis Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_OVR1	SC_RES_BK_COL_R [7:0]	128	Background Color Setting R/Cr Signal R:8 bits; unsigned (0 to 255 [LSB]) Cr:8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
SC_SCL0_OVR1	SC_RES_BK_COL_B [7:0]	128	Background Color Setting B/Cb Signal B:8 bits; unsigned (0 to 255 [LSB]) Cb:8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
SC_SCL0_OVR1	SC_RES_BK_COL_G [7:0]	0	Background Color Setting G/Y Signal G/Y:8 bits; unsigned (0 to 255 [LSB])



Note 1. More than one line is required for vertical front porch.
Note 2. Output image area must always be placed in Output full image area defined by RES_F_HW and RES_F_VW.

Figure 38.35 Area Relationship with Output Image Size Smaller than a Full Screen

38.4.2.11 Selecting Format for Writing Video Image Signals to Frame Buffer

A format can be selected for writing video image signals to the frame buffer.

Although 24-bit YCbCr signals or 24-bit RGB signals are input to the scaling control block, they are converted into 16-bit YCbCr422 signals, 16-bit RGB565 signals, 32-bit YCbCr444 signals, or 32-bit RGB888 signals before being written to the frame buffer.

As bit reduction processing of RGB565, rounding off or 2 × 2 pattern dither can be selected with the SC_RES_DTH_ON bit. For details on pattern dither, see **Section 38.8.1.7**.

Table 38.72 Frame Buffer Writing Mode Setting

RES_BITDEC_ON	SC_RES_MD[1:0]	Writing Mode
0	3	YCbCr444 (normal, horizontal mirroring)
0	2	RGB888 (normal, horizontal mirroring)
1	1	RGB565 (normal, horizontal mirroring)
0	0	YCbCr422 (normal, horizontal mirroring)

Note 1. Only scaler 0 can output signals to the image renderer.

Table 38.73 Video Signal Writing Format Selection Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_MD[1:0]	0	Frame Buffer Video-Signal Writing Format 0: YCbCr422 (16 bits) 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: YCbCr444 (24 (32) bits)
SC_SCL1_WR6	SC_RES_BITDEC_ON	0	Bit Reduction On/Off 0: Off 1: On
SC_SCL1_WR6	SC_RES_DTH_ON	0	Dither Correction On/Off 0: Off (rounded off) 1: On (2 × 2 pattern dither)

38.4.2.12 Horizontal Mirroring

Horizontal mirroring can be carried out for scaled-down images before being written to the frame buffer.

Table 38.74 and **Table 38.75** show the relationship between various writing modes for image processing and video signals.

Table 38.74 Relationship between Writing Modes and Video Signals

RES_DS_WR_MD[2:0]	Writing Modes	YCbCr444	YCbCr422	RGB565	RGB888
0	Normal writing	Enabled	Enabled	Enabled	Enabled
1	Horizontal mirroring	Enabled	Enabled	Enabled	Enabled
2 to 7	Setting prohibited	—	—	—	—

Table 38.75 Horizontal Mirroring Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_DS_WR_MD [2:0]	0	Frame Buffer Writing Mode for Image Processing 0: Normal 1: Horizontal mirroring 2 to 7: Setting prohibited

38.4.2.13 Writing to Frame Buffer

(1) Frame Buffer Write Control

Frame buffer writing is enabled or disabled.

Table 38.76 Frame Buffer Writing Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR5	SC_RES_WENB	0	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled.

(2) Frame Buffer Writing Rate Selection

A frame buffer writing rate can be selected from among 1/1, 1/2, 1/4, and 1/8 the vertical frequency of the input signal.

When 1/2, 1/4, or 1/8 is selected, either the top or bottom field can be selected for writing.

Table 38.77 Frame Buffer Write Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR5	SC_RES_FS_RATE [1:0]	0	Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The SC_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal
SC_SCL1_WR5	SC_RES_FLD_SEL	0	Write Field Select 0: Top field 1: Bottom field
SC_SCL1_WR5	SC_RES_INTER	1	Field Operating Mode Select 0: Progressive 1: Interlace

(3) Frame Buffer Write Addresses

Frame buffer addresses are specified using the base address, line offset address, frame offset address, data size of a line, and the number of lines in a frame. When an interlaced video image is input, the top and bottom field data can be separately stored in the frame buffer.

The SC_RES_BASE[31:0], SC_RES_LN_OFF[14:0], and SC_RES_FLM_OFF[22:0] bits should be set in 128-byte units (the lower seven bits should be fixed to 0).

For the data size of a line and the number of lines in a frame, the relevant register values set for the scaling-down control block are used.

Table 38.78 Frame Buffer Write Address Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_TB_ADD_MOD	0	Top and Bottom Data Write Address Specification Method 0: A write address is specified in common for top and bottom data. 1: Separate write addresses are specified for top and bottom data.
SC_SCL1_WR2	SC_RES_BASE [31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer to store the frame data for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0.
SC_SCL1_WR8	SC_RES_BASE_B [31:0]	0	Frame Buffer Base Address for Bottom Sets the start address of the frame buffer to store the frame data for the bottom field when SC_RES_TB_ADD_MOD = 1.
SC_SCL1_WR3	SC_RES_LN_OFF [14:0]	2048	Frame Buffer Line Offset Address Sets the line offset address for calculating the line start address for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. Line 0: SC_RES_BASE Line 1: SC_RES_BASE + SC_RES_LN_OFF × 1 : Line n: SC_RES_BASE + SC_RES_LN_OFF × n
SC_SCL1_WR9	SC_RES_LN_OFF_B [14:0]	2048	Frame Buffer Line Offset Address for Bottom Sets the line offset address for calculating the line start address for the bottom field when SC_RES_TB_ADD_MOD = 1. Line 0: SC_RES_BASE_B Line 1: SC_RES_BASE_B + SC_RES_LN_OFF_B × 1 : Line n: SC_RES_BASE_B+ SC_RES_LN_OFF_B × n
SC_SCL1_WR4	SC_RES_FLM_OFF [22:0]	524288	Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. Buffer 0: SC_RES_BASE Buffer 1: SC_RES_BASE + SC_RES_FLM_OFF × 1 : Buffer n: SC_RES_BASE + SC_RES_FLM_OFF × n
SC_SCL1_WR10	SC_RES_FLM_OFF_B [22:0]	524288	Frame Buffer Frame Offset Address for Bottom Sets the frame offset address for calculating the start address of each frame for the bottom field when SC_RES_TB_ADD_MOD = 1. Buffer 0: SC_RES_BASE_B Buffer 1: SC_RES_BASE_B + SC_RES_FLM_OFF_B × 1 : Buffer n: SC_RES_BASE_B + SC_RES_FLM_OFF_B × n

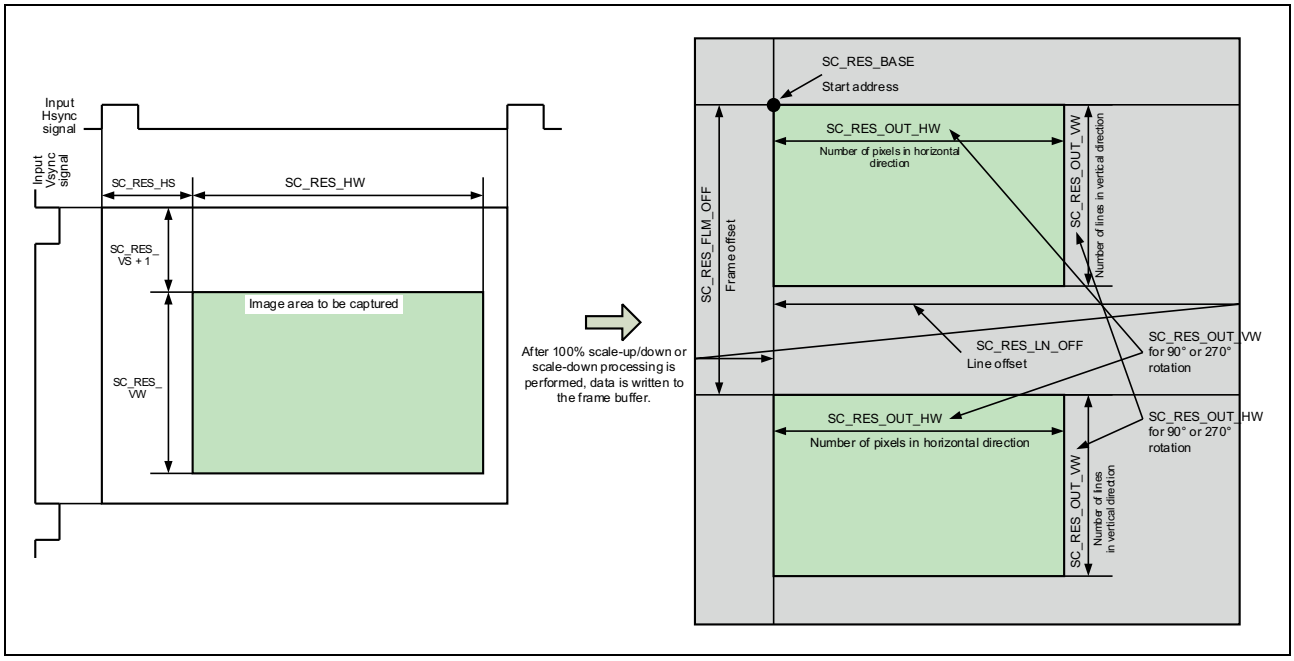


Figure 38.36 Data Arrangement in Frame Buffer

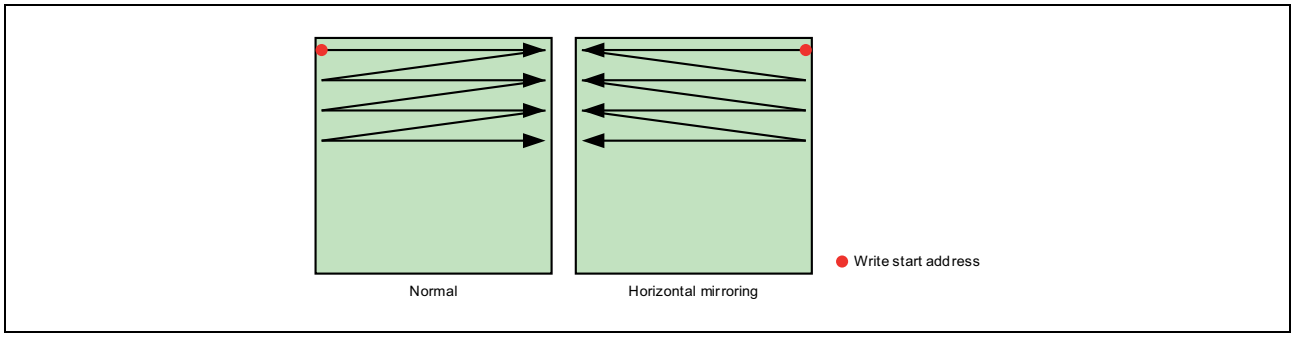

Figure 38.37 Data Arrangement in Frame Buffer in Various Writing Modes

(4) Frame Buffer Management

The scaling control block can handle multiple frames as the frame buffer.

Data is written to the buffer in cyclic mode according to the number of frames specified by the SC_RES_FLM_NUM bits.

To use the frame buffer as the ring buffer in line mode, the SC_RES_FLM_NUM bits should be set to 0 (1 frame) and the SC_RES_LOOP bit to 1.

Table 38.79 Frame Buffer Write Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR3	SC_RES_FLM_ NUM[9:0]	1	Number of Frames of Buffer to be Written to Sets the number of frames for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0 Number of frames defined by SC_RES_FLM_NUM + 1 are used.
SC_SCL1_WR9	SC_RES_FLM_ NUM_B[9:0]	1	Number of Frames of Buffer to be Written to for Bottom Field when SC_RES_TB_ADD_MOD = 1 Number of frames defined by SC_RES_FLM_NUM_B + 1 are used.
SC_SCL1_WR1	SC_RES_LOOP	0	Frame Buffer Write Mode Select 0: Frame mode 1: Line mode (read as ring buffer)
SC_SCL1_WR7	SC_RES_FLM_ CNT[9:0]	—	Frame Number Before Frame Being Accessed Frame number before the frame being accessed in the top field when SC_RES_TB_ADD_MOD = 1 or that in the top or bottom field when SC_RES_TB_ADD_MOD = 0.
SC_SCL1_WR11	SC_RES_FLM_ CNT_B[9:0]	—	Frame Number Before Frame Being Accessed in Bottom Field Frame number before the frame being accessed in the bottom field when SC_RES_TB_ADD_MOD = 1.

(5) Buffer Overflow Handling

If writing to the frame buffer cannot be completed due to bus-traffic related problems, an overflow interrupt can be output to the interrupt controller.

Table 38.80 Buffer Overflow Detection

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR7	SC_RES_OVERFLOW	—	Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed.

(6) Frame Buffer Write End Flag

When writing one frame of data to the frame buffer is completed, a frame buffer write end interrupt can be output to the interrupt controller.

38.4.2.14 Selecting a Scaling-up Process or Graphics 0 or 1 Process

Scaling-up process and graphics 0 or 1 process are mutually exclusive and thus frame buffer cannot be read out simultaneously for the processes.

When displaying input video image signals or displaying enlarged graphics, data is read from the frame buffer via the scaling-up control block.

However, graphics can be enlarged and displayed by the scaling-up control block only when the RGB565, RGB888, YCbCr422, or YCbCr444 format is used.

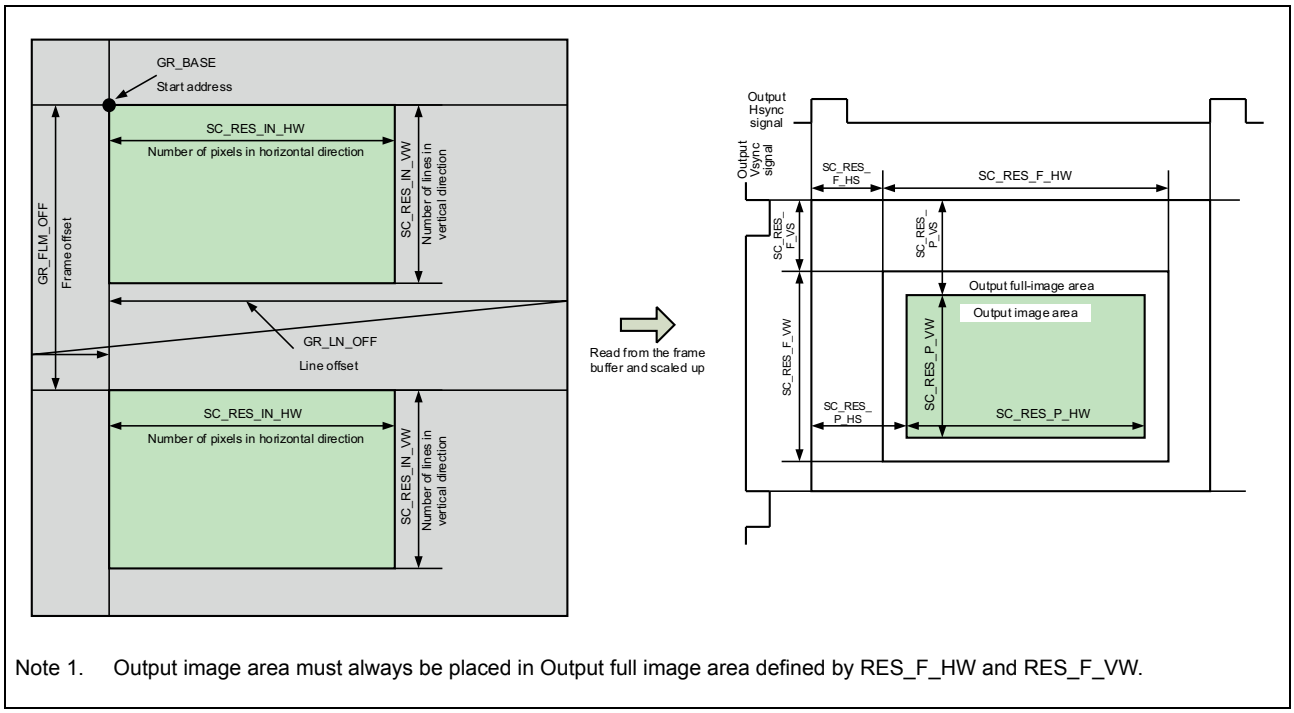
When displaying graphics without enlargement, the data is read from the frame buffer via the graphics 0 or 1 processing block.

With the SC_RES_IBUS_SYNC_SEL bit, sync signals for reading out the frame buffer and read size setting bits are selected.

Table 38.81 Selection of Scaling-Up Process and Graphics 0 or 1 Process

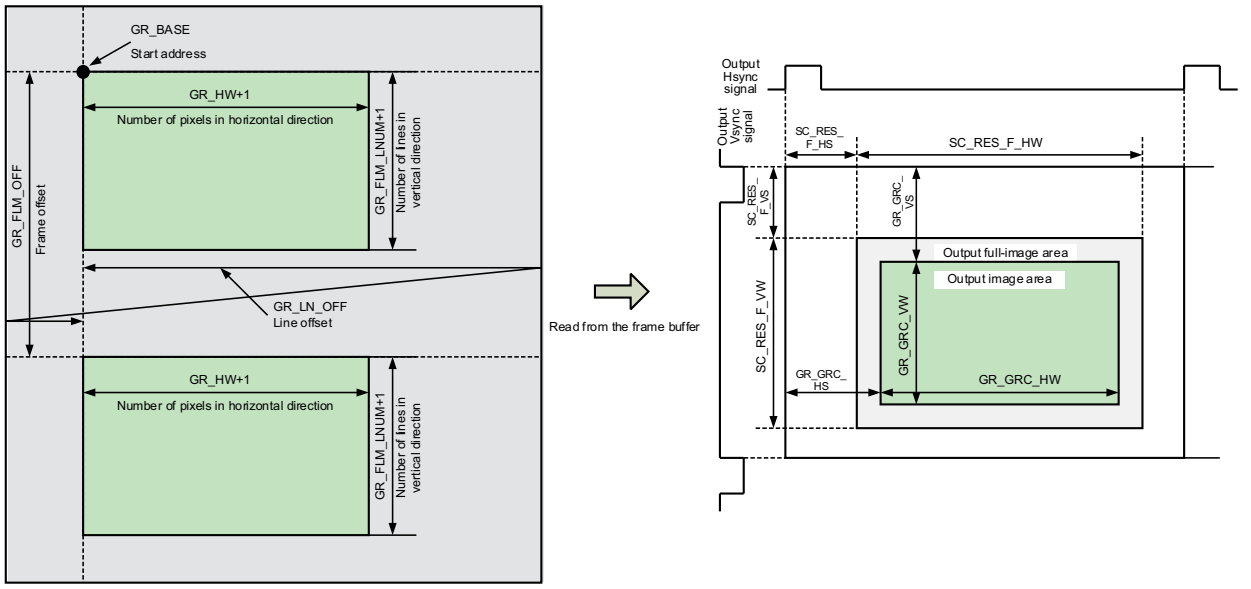
Type of Output Scaling Display	SC_RES_ IBUS_SYNC_SEL	Sync Signals for Frame Buffer Read	Frame Buffer Read Size Setting Bits	Display Enabling Bits
Input video signal display Enlarged graphics display	0	Output from scaling-up control block	SC_RES_IN_VW SC_RES_IN_HW	SC_RES_P_VS SC_RES_P_VW SC_RES_P_HS SC_RES_P_HW
Graphics display	1	Output from graphics 0 or 1 processing block	GR_FLM_LNUM*[1] GR_HW*	GR_GRC_VS GR_GRC_VW GR_GRC_HS GR_GRC_HW

Note 1. The value set to the register + 1 is the actual read size.



Note 1. Output image area must always be placed in Output full image area defined by RES_F_HW and RES_F_VW.

Figure 38.38 Area Setting for Input Video Image Signal Display and Enlarged Graphics Display



Note 1. Output image area must always be placed in Output full image area defined by RES_F_HW and RES_F_VW.

Figure 38.39 Area Setting for Graphics Display

Table 38.82 Scaling-Up Process or Graphics 0 or 1 Process Selection

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US8	SC_RES_IBUS_SYNC_SEL	0	Sync Signal Select for Frame Buffer Read Block 0: Sync signals from the scaling-up control block 1: Sync signals from the graphics processing block

The GR_DISP_SEL bits are used to select a display by the scaling-up control block (video image display or enlarged graphics display) or graphics display.

For details on the graphics processing, refer to the Section 38.6, Image Synthesizer.

38.4.2.15 Selecting Field for Frame Buffer Reading

For the next frame buffer to be read, the top or bottom field can be selected. This field selection is used in the scaling-up control block.

Table 38.83 Field Specification for Frame Buffer Reading

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_FLD_SEL	0	Enables or disables top or bottom field selection for the next frame buffer to be read. 0: Field selection is disabled. 1: Top or bottom field can be selected.
GR_FLM3	GR_FLD_NXT	0	Selects the top or bottom field for the next frame buffer. 0: Bottom 1: Top

38.4.2.16 Frame Buffer Reading Processing

(1) Write Pointer Control

The write pointer is incremented by one every time frame data writing is completed.

(2) Read Pointer Control

The read pointer is updated at the rising edge of the vertical sync signal on the reading side according to the difference between the read and write pointer values as follows.

(a) When (write pointer value) – (read pointer value) ≤ 1
The read pointer value is not updated (the same frame is displayed continuously).

(b) When (write pointer value) – (read pointer value) = 2
The read pointer is incremented by one with the next updating timing.

(c) When (write pointer value) – (read pointer value) ≥ 3
The read pointer is incremented by two with the next updating timing.
(One frame is skipped.)

(3) Frame Buffer Read Control

(a) When SC_RES_WENB = 0
Frame data is not written to the frame buffer, and the frame buffer is not read.

(b) When frame data writing is terminated with SC_RES_WENB = 1
As the pointer buffer value is determined, the frame buffer is read.

Table 38.84 Frame Buffer Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR5	SC_RES_WENB	0	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Writing is disabled. 1: Writing is enabled.
GR_FLM1	GR_FLM_SEL	0	Frame Buffer Address Setting Signal Selection 0: Links to scaling-down process. (This setting is prohibited when separate write addresses are specified for the top and bottom fields; that is, SC0_RES_TB_ADD_MOD = 1 in SC0_SCL1_WR1.) 1: Selects GR0_FLM_NUM[9:0].
GR_FLM2	GR_BASE	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. The lower seven bits should be fixed to 000 0000.

For other frame buffer read operation and graphics processing, refer to Section 38.6, Image Synthesizer.

38.4.2.17 Cascaded Connection

To display one video image plane + three graphics planes or to display four graphics planes, scaler 0 and graphics block 1 in scaler 1 are cascaded.

When cascaded connection is selected, the scaling-up processing in scaler 1 is not available.

Table 38.85 Cascaded Connection

Register Name	Bit Name	Initial Value	Description
GR1_AB1	GR1_CUS_CON_ON	0	Cascaded Connection Enable/Disable 0: Cascaded connection is disabled. 1: Cascaded connection is enabled.

38.4.3 Register Descriptions

Table 38.86 and **Table 38.87** show the register configuration.

Symbols used in Register Description:

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

Table 38.86 Register Configuration of the Scaler (Channel 0) (1/5)

Module Name	Register Name	Symbol	R/W	Initial Value	Address	Access Size

VDCE1	Alpha blending control register 8 (graphics 1)	GR1_AB8	R/W	H'0000 0000	<VDCE1_base> + 1D3C	32
VDCE1	Alpha blending control register 9 (graphics 1)	GR1_AB9	R/W	H'0000 0000	<VDCE1_base> + 1D40	32
VDCE1	Alpha blending control register 10 (graphics 1)	GR1_AB10	R/W	H'0000 0000	<VDCE1_base> + 1D44	32
VDCE1	Alpha blending control register 11 (graphics 1)	GR1_AB11	R/W	H'0000 0000	<VDCE1_base> + 1D48	32
VDCE1	Background color control register (graphics 1)	GR1_BASE	R/W	H'0000 8080	<VDCE1_base> + 1D4C	32
VDCE1	CLUT table control register (graphics 1)	GR1_CLUT	R/W	H'0000 0000	<VDCE1_base> + 1D50	32
VDCE1	Status monitor register (graphics 1)	GR1_MON	R	H'0000 0000	<VDCE1_base> + 1D54	32

NOTE

Register access sizes other than defined in the table above are not supported.

NOTE

In the header files the names of the above registers are defined in the following format:

<ModuleName> + <Symbol>.

<ModuleName> and <Symbol> are defined in the above table.

38.4.3.1 SCL0 Register Update Control Register (SC0_SCL0_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SC0_SCL0_VEN_D	SC0_SCL0_VEN_C	—	—	—	SC0_SCL0_UPDATE	—	—	—	SC0_SCL0_VEN_B	—	—	—	SC0_SCL0_VEN_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/WC1	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	SC0_SCL0_VEN_D	0	R/WC1	Scaling-Up Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
12	SC0_SCL0_VEN_C	0	R/WC1	Scaling-Down Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_SCL0_UPDATE	0	R/WC1	SYNC Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_SCL0_VEN_B	0	R/WC1	Synchronization Control and Scaling-up Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_SCL0_VEN_A	0	R/WC1	Scaling-Down Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

38.4.3.2 Mask Control Register (SC0_SCL0_FRC1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_VMASK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SC0_RES_VMASK [15:0]	2800	R/W	Repeated Vsync Signal Masking Period Sets the repeated Vsync signal masking period beginning at a Vsync signal in terms of 128 pixel-clock periods. Masking period [usec] = SC0_RES_VMASK[15:0] × 128 ÷ pixel clock frequency [MHz]
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_ VMASK_ON	1	R/W	Repeated Vsync Signal Masking Control 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled.

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.3 Missing Vsync Compensation Control Register (SC0_SCL0_FRC2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_VLACK[15:0]															
Initial value:	0	0	0	0	1	1	1	0	0	0	0	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_VLACK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SC0_RES_ VLACK [15:0]	3600	R/W	Missing-Sync Compensating Pulse Output Wait Time Sets the wait time before outputting a missing-sync compensating pulse after a Vsync signal. Wait time [usec] = SC0_RES_VLACK[15:0] × 128 ÷ pixel clock frequency [MHz]
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_ VLACK_ON	1	R/W	Missing Vsync Signal Compensation 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.

Note 1. This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

Note 2. The generation of a missing-sync signal is signalled by the interrupt S0_VSYNCERR, which is listed in Section 38.1.4, Interrupts.

38.4.3.4 Output Sync Select Register (SC0_SCL0_FRC3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC0_RES_VS_IN_SEL	—	—	—	—	—	—	—	SC0_RES_VS_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_RES_VS_IN_SEL	0	R/W	Horizontal and Vertical Sync Signal Output and Full-Screen Enable Signal Select Be sure to clear this bit to 0 when cascaded connection is enabled (GR1_AB1.GR1_CUS_CON_ON = 1). 0: Horizontal and vertical sync signal output and full-screen enable signal from scaler 0 1: Horizontal and vertical sync signal output and full-screen enable signal from scaler 1
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_VS_SEL	1	R/W	Vsync Signal Output Select 0: Externally input Vsync signal 1: Internally generated free-running Vsync signal

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.5 Free-Running Period Control Register (SC0_SCL0_FRC4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_FV[10:0]										
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	1	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_FH[10:0]										
Initial value:	0	0	0	0	0	0	1	1	0	0	0	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_FV [10:0]	524	R/W	Free-Running Vsync Period Setting Free-running Vsync period = (SC0_RES_FV[10:0] + 1) × horizontal period [usec]
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_FH [10:0]	799	R/W	Hsync Period Setting Hsync period [usec] = (SC0_RES_FH[10:0] +1) ÷ pixel clock frequency [MHz]

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.6 Output Delay Control Register (SC0_SCL0_FRC5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC0_RES_FLD_DLY_SEL	SC0_RES_VSDLY[7:0]							
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_RES_ FLD_DLY_SEL	1	R/W	Field Determination Signal Delay Control 0: No delay 1: Delay of one vertical cycle
7 to 0	SC0_RES_ VSDLY[7:0]	1	R/W	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: SC0_RES_VSDLY[7:0] × output Hsync period [usec]

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.7 Full-Screen Vertical Size Register (SC0_SCL0_FRC6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_F_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_F_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_F_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC0_RES_F_VS[10:0] + SC0_RES_F_VW[10:0] should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_F_VW[10:0]	480	R/W	Vertical Enable Signal Width for Full Screen (lines) Note: SC0_RES_F_VS[10:0] + SC0_RES_F_VW[10:0] should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.8 Full-Screen Horizontal Size Register (SC0_SCL0_FRC7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_F_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_F_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_F_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Full Screen. (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_F_HS[10:0] + SC0_RES_F_HW[10:0] should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_F_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) **Notes:** 1. SC0_RES_F_HS[10:0] + SC0_RES_F_HW[10:0] should be equal to or less than 2015 (clock cycles). 2. In the case of video output format is Serial RGB (OUT_SET.OUT_FORMAT[1:0] = 3), it is nessesary to add 2 to the value in SC0_RES_F_HW.

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.9 Vsync Detection Register (SC0_SCL0_FRC9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_QVLOCK	—	—	—	SC0_RES_QVLACK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_QVLOCK	0	R	Locked Vsync Signal Detection Flag 1: Repeated and missing Vsync signal input has not been detected for four or more vertical periods. 0: Repeated or missing Vsync signal input has been detected.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_QVLACK	0*1	R	Missing Vsync Signal Detection Flag 1: Missing Vsync signal input has been detected. 0: Missing Vsync signal input has not been detected.

Note 1. SC0_RES_QVLACK changes immediately from 0 to 1, if the video output clock is enabled. It changes back to 0 after detection of the first VSync. So interrupt on missing Vsync shall be enabled only from the second Vsync onwards.

38.4.3.10 Status Monitor 0 Register (SC0_SCL0_MON0)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_LIN_STAT[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_LIN_STAT[10:0]	All 0	R	Current location of the image line input to the scaling-down control block.

38.4.3.11 Interrupt Control Register (SC0_SCL0_INT)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_LINE[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_LINE[10:0]	All 0	R/W	Setting of Interrupt on Image Line Input to Scaling-down Control Block When the location of the image line input to the scaling-down control block matches the SC0_RES_LINE[10:0] setting, an interrupt signal is output.

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.12 Scaling-Down Control Register (SC0_SCL0_DS1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_DS_V_ON	—	—	—	SC0_RES_DS_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_DS_V_ON	1	R/W	Vertical Scale Down On/Off 0: Off 1: On **Note:** For D1L2(H) devices this bit must be set to 0.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_DS_H_ON	1	R/W	Horizontal Scale Down On/Off 0: Off 1: On **Note:** For D1L2(H) devices this bit must be set to 0.

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.13 Vertical Capture Size Register (SC0_SCL0_DS2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_VS [10:0]	18	R/W	Vertical Position Setting for Video Signal Capturing (VSYNC + (V backporch - 1) lines) Note: The set value should be four or more (lines). SC0_RES_VS[10:0] + SC0_RES_VW[10:0] should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_VW [10:0]	240	R/W	Vertical Width of Video Signal to be Captured (Lines) Note: SC0_RES_VS[10:0] + SC0_RES_VW[10:0] should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.14 Horizontal Capture Size Register (SC0_SCL0_DS3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_HW[10:0]										
Initial value:	0	0	0	0	0	1	0	1	1	0	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_HS [10:0]	244	R/W	Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_HS[10:0] + SC0_RES_HW[10:0] should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_HW [10:0]	1440	R/W	Horizontal Width of Video Signal to be Captured (Video-image clock cycles) Note: SC0_RES_HS[10:0] + SC0_RES_HW[10:0] should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.15 Horizontal Scale Down Register (SC0_SCL0_DS4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	SC0_RES_PFIL_SEL	SC0_RES_DS_H_INTERPOTYP	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_DS_H_RATIO[15:0]															
Initial value:	0	0	1	0	0	1	0	0	0	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	SC0_RES_PFIL_SEL	0	R/W	Prefilter Mode Select for Brightness Signals 0: The prefilter is turned off. 1: The prefilter is turned on. (1/4 + 1/2 + 1/4)
28	SC0_RES_DS_H_INTERPOTYP	1	R/W	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_DS_H_RATIO[15:0]	9224	R/W	Horizontal Scale Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) round(SC0_RES_HW[10:0] ÷ SC0_RES_OUT_HW[10:0] × 4096) SC0_RES_DS_H_RATIO[15:0] < 4096: Setting prohibited SC0_RES_DS_H_RATIO[15:0] = 4096: 100% scale up SC0_RES_DS_H_RATIO[15:0] > 4096: Scale down

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.16 Initial Vertical Phase Register (SC0_SCL0_DS5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SC0_RES_V_INTERPOTYP	SC0_RES_TOP_INIPHASE[11:0]											
Initial value:	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SC0_RES_BTM_INIPHASE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SC0_RES_V_INTERPOTYP	1	R/W	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	SC0_RES_TOP_INIPHASE [11:0]	2048	R/W	Vertical Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SC0_RES_BTM_INIPHASE [11:0]	0	R/W	Vertical Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)

Note: This register is updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_B bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

38.4.3.17 Vertical Scaling Register (SC0_SCL0_DS6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_V_RATIO[15:0]															
Initial value:	0	0	0	0	0	1	1	1	1	1	1	1	1	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_V_RATIO [15:0]	2044	R/W	Vertical Scale Up/Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: round (SC0_RES_VW[10:0] ÷ SC0_RES_OUT_VW[10:0] × 4096) For scale up: round (SC0_RES_IN_VW[10:0] ÷ SC0_RES_P_VW[10:0] × 4096) SC0_RES_V_RATIO[15:0] < 4096: Scale up SC0_RES_V_RATIO[15:0] = 4096: 100% scale up SC0_RES_V_RATIO[15:0] > 4096: Scale down

Note: These bits updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_B bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1. Accordingly, even a scaled-up graphics display requires both an input Vsync signal and output Vsync signal.

38.4.3.18 Scaling-Down Control Block Output Size Register (SC0_SCL0_DS7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_OUT_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_OUT_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_OUT_VW[10:0]	240	R/W	Number of Valid Lines in Vertical Direction Output by Scaling-down Control Block (lines) This bit setting is used for the number of lines to be written to the frame buffer. When SC0_SCL1_WR1.SC0_RES_LOOP is 0 (frame write mode), specify the number of lines for one frame. When SC0_SCL1_WR1.SC0_RES_LOOP is 1 (line write mode), specify the number of lines for repeated write. Note: The SC0_RES_OUT_VW[10:0] value should be aligned in 4-line units and equal to or smaller than the SC0_RES_VW[10:0] value.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_OUT_HW[10:0]	640	R/W	Number of Valid Horizontal Pixels Output by Scaling-Down Control Block (video-image clock cycles) Note: The SC0_RES_OUT_HW[10:0] value should be aligned in 4-pixel units and equal to or smaller than the SC0_RES_HW[10:0] value.

Note: This register is updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_C bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

38.4.3.19 Scaling-Up Control Register (SC0_SCL0_US1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_US_V_ON	—	—	—	SC0_RES_US_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_US_V_ON	1	R/W	Vertical Scale Up On/Off 0: Off 1: On **Note:** For D1L2(H) devices this bit must be set to 0.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_US_H_ON	1	R/W	Horizontal Scale Up On/Off 0: Off 1: On **Note:** For D1L2(H) devices this bit must be set to 0.

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.20 Output Image Vertical Size Register (SC0_SCL0_US2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_P_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_P_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_P_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Output Image (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC0_RES_P_VS[10:0] + SC0_RES_P_VW[10:0] should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_P_VW[10:0]	480	R/W	Vertical Enable Signal Width for Output Image (lines) Note: SC0_RES_P_VS[10:0] + SC0_RES_P_VW[10:0] should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.21 Output Image Horizontal Size Register (SC0_SCL0_US3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_P_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_P_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_P_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Output Image (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_P_HS[10:0] + SC0_RES_P_HW[10:0] should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_P_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: SC0_RES_P_HS[10:0] + SC0_RES_P_HW[10:0] should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.22 Scaling-Up Control Block Input Size Register (SC0_SCL0_US4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_IN_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_IN_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_IN_VW[10:0]	240	R/W	Number of Valid Lines in Vertical Direction Input to Scaling-down Control Block (lines)
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_IN_HW[10:0]	640	R/W	Number of Valid Horizontal Pixels Input to Scaling-down Control Block (pixel-clock cycles)

Note: This register is updated when the SC0_SCL0_VEN_B and SC0_SCL0_VEN_D bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

38.4.3.23 Horizontal Scale Up Register (SC0_SCL0_US5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_US_H_RATIO[15:0]															
Initial value:	0	0	1	0	0	1	0	0	0	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_US_H_RATIO [15:0]	9224*1	R/W	Horizontal Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) round (SC0_RES_IN_HW[10:0] ÷ SC0_RES_P_HW[10:0] × 4096) SC0_RES_US_H_RATIO[15:0] < 4096: Scale up SC0_RES_US_H_RATIO[15:0] = 4096: 100% scale up SC0_RES_US_H_RATIO[15:0] > 4096: Setting prohibited

Note 1. Initial value is in invalid range. When up-scaling is used, this value must be changed to the proper value.

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.24 Horizontal Scale Up Initial Phase Register (SC0_SCL0_US6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SC0_RES_US_H_INTERPOTYP	SC0_RES_US_HT_INIPHASE[11:0]											
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SC0_RES_US_HB_INIPHASE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SC0_RES_US_H_INTERPOTYP	1	R/W	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	SC0_RES_US_HT_INIPHASE[11:0]	0	R/W	Horizontal Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SC0_RES_US_HB_INIPHASE[11:0]	0	R/W	Horizontal Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.25 Trimming Register (SC0_SCL0_US7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_HCUT[7:0]								SC0_RES_VCUT[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	SC0_RES_HCUT[7:0]	0	R/W	Horizontal Amount of Cut-off Post-Scaling Image (Right and Left Parts) Sets the number of pixel-clock cycles.
7 to 0	SC0_RES_VCUT[7:0]	0	R/W	Vertical Amount of Cut-off Post-Scaling Image (Upper and Lower Parts) Sets the number of lines.

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.26 Frame Buffer Read Select Register (SC0_SCL0_US8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_IBUS_SYNC_SEL	—	—	—	SC0_RES_DISP_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_IBUS_SYNC_SEL	0	R/W	Sync Signal Select for Frame Buffer Read Block 0: Sync signals from the scaling-up control block 1: Sync signals from the graphics processing block
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_DISP_ON	0	R/W	Post-Scaling Image Frame Display On/Off 0: Frame display off 1: Frame display on

Note: SC0_RES_IBUS_SYNC_SEL is updated when the SC0_SCL0_VEN_B and SC0_SCL0_VEN_D bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.
SC0_RES_DISP_ON is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.27 Background Color Register (SC0_SCL0_OVR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	SC0_RES_BK_COL_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BK_COL_G[7:0]								SC0_RES_BK_COL_B[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	SC0_RES_BK_COL_R[7:0]	128	R/W	Background Color Setting R/Cr Signal R: 8 bits; unsigned (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
15 to 8	SC0_RES_BK_COL_G[7:0]	0	R/W	Background Color Setting G/Y Signal G/Y: 8 bits; unsigned (0 to 255 [LSB])
7 to 0	SC0_RES_BK_COL_B[7:0]	128	R/W	Background Color Setting B/Cb Signal B: 8 bits; unsigned (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

38.4.3.28 SCL1 Register Update Control Register (SC0_SCL1_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	SC0_SCL1_UPDATE_B	—	—	—	SC0_SCL1_UPDATE_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_SCL1_VEN_B	—	—	—	SC0_SCL1_VEN_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	SC0_SCL1_UPDATE_B	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_SCL1_UPDATE_A	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_SCL1_VEN_B	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_SCL1_VEN_A	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

38.4.3.29 Writing Mode Register (SC0_SCL1_WR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_WRSWA [2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SC0_RES_TB_ADD_MOD	SC0_RES_DS_WR_MD[2:0]			SC0_RES_MD[1:0]		SC0_RES_LOOP	Caution *
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

CAUTION

The initial value “0” of bit 0 must be changed to “1”.

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	SC0_RES_WRSWA[2:0]	All 0	R/W	8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer writing as follows. Bit 0 0: Not swapped in 8-bit units. 1: Swapped in 8-bit units. Bit 1 0: Not swapped in 16-bit units. 1: Swapped in 16-bit units. Bit 2 0: Not swapped in 32-bit units. 1: Swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units]
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	SC0_RES_TB_ADD_MOD	0	R/W	Top and Bottom Data Write Address Specification Method 0: A write address is specified in common for top and bottom data. 1: Separate write addresses are specified for top and bottom data.
6 to 4	SC0_RES_DS_WR_MD[2:0]	0	R/W	Frame Buffer Writing Mode for Image Processing 0: Normal 1: Horizontal mirroring 2 to 7: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
3, 2	SC0_RES_MD [1:0]	0	R/W	Frame Buffer Video-Signal Writing Format 0: YCbCr422 (16 bits) 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: YCbCr444 (24 (32) bits)
1	SC0_RES_ LOOP	0	R/W	Frame Buffer Write Mode Select 0: Frame mode 1: Line mode (read as ring buffer)
0	Bit0	0	R/W	**CAUTION** The initial value “0” of this bit must be changed to “1”.

Note: SC0_RES_LOOP is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.
SC0_RES_TB_ADD_MOD, SC0_RES_DS_WR_MD[2:0], and SC0_RES_MD[1:0] are updated when the SC0_SCL1_VEN_A and SC0_SCL1_VEN_B bits in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) are 1.
SC0_RES_WRSWA[2:0] is updated when the SC0_SCL1_UPDATE_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

38.4.3.30 Write Address Register 1T (SC0_SCL1_WR2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_RES_ BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer to store the frame data for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. The address must be 128 byte aligned, so the lower 7 bits must be set to 0.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

38.4.3.31 Write Address Register 2T (SC0_SCL1_WR3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SC0_RES_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	SC0_RES_LN_OFF[14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the line start address for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. Line 0: SC0_RES_BASE[31:0] Line 1: SC0_RES_BASE[31:0] + SC0_RES_LN_OFF[14:0] × 1 : Line n: SC0_RES_BASE[31:0] + SC0_RES_LN_OFF[14:0] × n The address must be 128 byte aligned, so the lower 7 bits must be set to 0.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_NUM[9:0]	1	R/W	Number of Frames of Buffer to be Written to Sets the number of frames for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0 Number of frames defined by SC0_RES_FLM_NUM[9:0] + 1 are used.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

38.4.3.32 Write Address Register 3T (SC0_SCL1_WR4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	SC0_RES_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	SC0_RES_FLM_OFF[22:0]	524288	R/W	Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. Buffer 0: SC0_RES_BASE[31:0] Buffer 1: SC0_RES_BASE[31:0] + SC0_RES_FLM_OFF[22:0] × 1 : Buffer n: SC0_RES_BASE[31:0] + SC0_RES_FLM_OFF[22:0] × n The address must be 128 byte aligned, so the lower 7 bits must be set to 0.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

38.4.3.33 Frame Sub-Sampling Register (SC0_SCL1_WR5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SC0_RES_INTER	—	—	SC0_RES_FS_RATE[1:0]		—	—	—	SC0_RES_FLD_SEL	—	—	—	SC0_RES_WENB
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	SC0_RES_INTER	1	R/W	Field Operating Mode Select 0: Progressive 1: Interlace
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SC0_RES_FS_RATE[1:0]	0	R/W	Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The SC0_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_FLD_SEL	0	R/W	Write Field Select 0: Top field 1: Bottom field
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_WENB	0	R/W	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled.

Note: SC0_RES_INTER, SC0_RES_FS_RATE[1:0], and SC0_RES_FLD_SEL are updated when the SC0_SCL1_VEN_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1. SC0_RES_WENB is updated when the SC0_SCL1_VEN_A and SC0_SCL1_VEN_B bits in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) are 1.

38.4.3.34 Bit Reduction Register (SC0_SCL1_WR6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_DTH_ON	—	—	—	SC0_RES_BITDEC_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_DTH_ON	0	R/W	Dither Correction On/Off 0: Off (rounded off) 1: On (2 × 2 dither pattern)
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_BITDEC_ON	0	R/W	Bit Reduction On/Off 0: Off 1: On

Note: This register is updated when the SC0_SCL1_VEN_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

38.4.3.35 Write Detection Register (SC0_SCL1_WR7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_OVERFLOW
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_CNT[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_RES_OVERFLOW	0	R	Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_CNT[9:0]	0	R	Frame Number Before Frame Being Accessed Frame number before the frame being accessed in the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that in the top or bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0.

38.4.3.36 Write Address Register 1B (SC0_SCL1_WR8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_BASE_B[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BASE_B[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_RES_BASE_B [31:0]	0	R/W	Frame Buffer Base Address for Bottom Sets the start address of the frame buffer to store the frame data for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. The address must be 128 byte aligned, so the lower 7 bits must be set to 0.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

38.4.3.37 Write Address Register 2B (SC0_SCL1_WR9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SC0_RES_LN_OFF_B[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_NUM_B[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	SC0_RES_LN_OFF_B [14:0]	2048	R/W	Frame Buffer Line Offset Address for Bottom Sets the line offset address for calculating the line start address for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. Line 0: SC0_RES_BASE_B[31:0] Line 1: SC0_RES_BASE_B[31:0] + SC0_RES_LN_OFF_B[14:0] × 1 : Line n: SC0_RES_BASE_B[31:0] + SC0_RES_LN_OFF_B[14:0] × n The address must be 128 byte aligned, so the lower 7 bits must be set to 0.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_NUM_B [9:0]	1	R/W	Number of Frames of Buffer to be Written to for Bottom Field Number of frames defined by SC0_RES_FLM_NUM_B[9:0] + 1 are used when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

38.4.3.38 Write Address Register 3B (SC0_SCL1_WR10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	SC0_RES_FLM_OFF_B[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

38.4.3.42 Frame Buffer Control Register 1 (Graphics 0) (GR0_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FLD_SEL	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR0_FLM_SEL[1:0]		—	—	—	—	—	—	—	Caution *
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

CAUTION

The initial value “0” of bit 0 must be changed to “1”.

Bit	Bit Name	Initial Value	R/W	Description
31	GR0_FLD_SEL	0	R/W	Enables or disables top or bottom field selection for the next frame buffer to be read. 0: Field selection is disabled. 1: Top or bottom field can be selected.
30 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR0_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR0_FLM_SEL[1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Links to scaling-down process. (This setting is prohibited when separate write addresses are specified for the top and bottom fields; that is, SC0_RES_TB_ADD_MOD = 1 in SC0_SCL1_WR1.) 1: Selects GR0_FLM_NUM[9:0]. 2: prohibited 3: prohibited
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	Bit0	0	R/W	**CAUTION** The initial value “0” of this bit must be changed to “1”.

Note: GR0_FLD_SEL is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_LN_OFF_DIR is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_FLM_SEL[1:0] is updated when the GR0_P_VEN and GR0_IBUS_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

38.4.3.43 Frame Buffer Control Register 2 (Graphics 0) (GR0_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR0_BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. The address must be 128 byte aligned, so the lower 7 bits must be set to 0.

Note: This register is updated when the GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

38.4.3.44 Frame Buffer Control Register 3 (Graphics 0) (GR0_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FLD_NXT	GR0_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR0_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GR0_FLD_NXT	0	R/W	Top or Bottom Field Selection for Next Frame Buffer 0: Bottom 1: Top
30 to 16	GR0_LN_ OFF[14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR0_BASE[31:0] Line 1: GR0_BASE[31:0] + GR0_LN_OFF[14:0] × 1 : Line n: GR0_BASE[31:0] + GR0_LN_OFF[14:0] × n The address must be 128 byte aligned, so the lower 7 bits must be set to 0.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR0_FLM_ NUM[9:0]	1	R/W	Frame Number of Frame Buffer Manually set the frame number when GR0_FLM_SEL[1:0] = 1.

Note: GR0_FLD_NXT is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_LN_OFF[14:0] and GR0_FLM_NUM[9:0] are updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

38.4.3.45 Frame Buffer Control Register 4 (Graphics 0) (GR0_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR0_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR0_FLM_OFF[22:0]	524288	R/W	Frame Buffer Frame Offset Address Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR0_BASE[31:0] Buffer 1: GR0_BASE[31:0] + GR0_FLM_OFF[22:0] × 1 : Buffer n: GR0_BASE[31:0] + GR0_FLM_OFF[22:0] × n The address must be 128 byte aligned, so the lower 7 bits must be set to 0.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

38.4.3.46 Frame Buffer Control Register 5 (Graphics 0) (GR0_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR0_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR0_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR0_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame Number of lines is (GR0_FLM_LNUM[10:0] + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR0_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. (GR0_FLM_LOOP[10:0] + 1) lines are read.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

38.4.3.47 Frame Buffer Control Register 6 (Graphics 0) (GR0_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FORMAT[3:0]				—	GR0_HW[10:0]										
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_YCC_SWAP[2:0]			GR0_RDSWA[2:0]			—	GR0_CNV444_MD	—	—	GR0_STA_POS[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR0_FORMAT [3:0]	8	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: YCbCr422 9: YCbCr444 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR0_HW [10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR0_HW[10:0] + 1) pixels. Note: The set value should be equal to or more than two.
15 to 13	GR0_YCC_SWAP[2:0]	0	R/W	Controls swapping of data read from buffer in the YCbCr422 format. 0: Cb/Y0/Cr/Y1 1: Y0/Cb/Y1/Cr 2: Cr/Y0/Cb/Y1 3: Y0/Cr/Y1/Cb 4: Y1/Cr/Y0/Cb 5: Cr/Y1/Cb/Y0 6: Y1/Cb/Y0/Cr 7: Cb/Y1/Cr/Y0

Bit	Bit Name	Initial Value	R/W	Description
12 to 10	GR0_ RDSWA [2:0]	0	R/W	8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer reading as follows. Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units. Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units. Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units]
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	GR0_ CNV444_ MD	0	R/W	Sets the interpolation mode for YCbCr422 to YCbCr444 conversion. 0: Hold interpolation 1: Average interpolation
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	GR0_STA_ POS[5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR0_STA_POS[5:0] is skipped from the start of the line.

Note: GR0_YCC_SWAP[2:0], GR0_CNV444_MD, and GR0_STA_POS[5:0] are updated when GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_ RDSWA is updated when the GR0_UPDATE bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_FORMAT[3:0] and GR0_HW[10:0] are updated when GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

38.4.3.48 Alpha Blending Control Register 1 (Graphics 0) (GR0_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	GR0_GRC_DISP_ON	—	—	GR0_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR0_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR0_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display (GR0_BASE[31:0]) 1: Lower-layer graphics display When displaying video image or enlarged graphics, select this setting. 2: Current graphics display When displaying graphics, select this setting. 3: Blended display of lower-layer graphics and current graphics* Note:* Select this setting whenever chroma-key processing is to proceed. Since only current graphics are to be displayed by chroma-key processing, set the α values for both pixels to be subject to chroma-keying and pixels not to be subject to chroma-keying to 255.

Note: This register is updated when GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

NOTE

Alpha blending and Chroma-Key features are not supported for Graphic Layer 0 (GR0).

38.4.3.49 Alpha Blending Control Register 2 (Graphics 0) (GR0_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR0_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR0_GRC_VS[10:0]	0	R/W	Vertical Start Position of Graphics Image Area. **NOTE** The set value should be four or more (lines). GR0_GRC_VS[10:0] + GR0_GRC_VW[10:0] should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR0_GRC_VW[10:0]	0	R/W	Vertical Width of Graphics Image Area. **NOTE** GR0_GRC_VS[10:0] + GR0_GRC_VW[10:0] should be equal to or less than 2039 (lines).

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

38.4.3.50 Alpha Blending Control Register 3 (Graphics 0) (GR0_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR0_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR0_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR0_GRC_HS[10:0]	0	R/W	Horizontal Start Position of Graphics Image Area. Note: The set value should be 16 or more (clock cycles). GR0_GRC_HS[10:0] + GR0_GRC_HW[10:0] should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR0_GRC_HW[10:0]	0	R/W	Horizontal Width of Graphics Image Area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR0_HW[10:0] to 2 and GR0_GRC_HW[10:0] to 1 (1 pixel) or 2 (2 pixels). **NOTE** GR0_GRC_HS[10:0] + GR0_GRC_HW[10:0] should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

38.4.3.51 Alpha Blending Control Register 7 (Graphics 0) (GR0_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_CK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_CK_ON	0	R/W	CLUT-Index/RGB-Index Chroma-Key Processing On/Off 0: Off 1: On

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

NOTE

Alpha blending and Chroma-Key features are not supported for Graphic Layer 0 (GR0).

38.4.3.52 Alpha Blending Control Register 8 (Graphics 0) (GR0_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_CK_KCLUT[7:0]								GR0_CK_KG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_CK_KB[7:0]								GR0_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR0_CK_ KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR0_CK_ KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR0_CK_ KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR0_CK_ KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

NOTE

Alpha blending and Chroma-Key features are not supported for Graphic Layer 0 (GR0).

38.4.3.53 Alpha Blending Control Register 9 (Graphics 0) (GR0_AB9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_CK_A[7:0]								GR0_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_CK_B[7:0]								GR0_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR0_CK_A [7:0]	0	R/W	Replaced Alpha Signal after RGB-Index Chroma-Key Processing α: Unsigned 8 bits (0 to 255 [LSB]) Note: These bits should always be set to 255 to display the current graphics only.
23 to 16	GR0_CK_G [7:0]	0	R/W	Replaced G Signal after RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR0_CK_B [7:0]	0	R/W	Replaced B Signal after RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR0_CK_R [7:0]	0	R/W	Replaced R Signal after RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

38.4.3.54 Alpha Blending Control Register 10 (Graphics 0) (GR0_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_A0[7:0]								GR0_G0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_B0[7:0]								GR0_R0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR0_A0 [7:0]	0	R/W	CLUT0 α0 Signal Replaced with α signal when in the CLUT0 format and CLUT0 = 0. Replaced with α signal when in the αRGB1555/RGBα5551 format and α = 0. Note: These bits should always be set to 255 to display the current graphics only.
23 to 16	GR0_G0 [7:0]	0	R/W	CLUT0 G0 Signal Replaced with G signal when in the CLUT0 format and CLUT0 = 0.
15 to 8	GR0_B0 [7:0]	0	R/W	CLUT0 B0 Signal Replaced with B signal when in the CLUT0 format and CLUT0 = 0.
7 to 0	GR0_R0 [7:0]	0	R/W	CLUT0 R0 Signal Replaced with R signal when in the CLUT0 format and CLUT0 = 0.

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

38.4.3.55 Alpha Blending Control Register 11 (Graphics 0) (GR0_AB11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_A1[7:0]								GR0_G1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_B1[7:0]								GR0_R1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR0_A1 [7:0]	0	R/W	CLUT1 α1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the αRGB1555/RGBα5551 format and α = 1. Note: These bits should always be set to 255 to display the current graphics only.
23 to 16	GR0_G1 [7:0]	0	R/W	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
15 to 8	GR0_B1 [7:0]	0	R/W	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
7 to 0	GR0_R1 [7:0]	0	R/W	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

38.4.3.56 Background Color Control Register (Graphics 0) (GR0_BASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR0_BASE_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_BASE_B[7:0]								GR0_BASE_R[7:0]							
Initial value:	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR0_BASE_G[7:0]	0	R/W	Background Color G/Y Signal G/Y: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR0_BASE_B[7:0]	128	R/W	Background Color B/Cb Signal B: Unsigned 8 bits (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
7 to 0	GR0_BASE_R[7:0]	128	R/W	Background Color R/Cr Signal R: Unsigned 8 bits (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

38.4.3.57 CLUT Table Control Register (Graphics 0) (GR0_CLUT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_CLT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR0_CLT_SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. Referring to the CLUT table 0 value to expand to αRGB8888 The CPU side can read-access or write-access to the CLUT table 1. 1: Selects CLUT table 1. Referring to the CLUT table 1 value to expand to αRGB8888 The CPU side can read-access or write-access to the CLUT table 0.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

NOTE

Before switching CLUT table by GR_CLT_SEL, CPU must wait until the read value from the last written address is same as the last written value.

Refer to Section 38.6.1.15, CLUT Table for detail.

38.4.3.58 SCL0 Register Update Control Register (SC1_SCL0_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SC1_SCL0_VEN_D	SC1_SCL0_VEN_C	—	—	—	SC1_SCL0_UPDATE	—	—	—	SC1_SCL0_VEN_B	—	—	—	SC1_SCL0_VEN_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/WC1	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	SC1_SCL0_VEN_D	0	R/WC1	Scaling-Up Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
12	SC1_SCL0_VEN_C	0	R/WC1	Scaling-Down Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC1_SCL0_UPDATE	0	R/WC1	SYNC Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC1_SCL0_VEN_B	0	R/WC1	Synchronization Control and Scaling-up Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_SCL0_VEN_A	0	R/WC1	Scaling-Down Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

38.4.3.59 Mask Control Register (SC1_SCL0_FRC1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC1_RES_VMASK[15:0]															
Initial value:	0	0	0	0	1	0	1	0	1	1	1	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC1_RES_VMASK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SC1_RES_VMASK [15:0]	2800	R/W	Repeated Vsync Signal Masking Period Sets the repeated Vsync signal masking period beginning at a Vsync signal in terms of 128 pixel-clock periods. Masking period [usec] = SC1_RES_VMASK[15:0] × 128 ÷ pixel clock frequency [MHz]
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_RES_ VMASK_ON	1	R/W	Repeated Vsync Signal Masking Control 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled.

Note: This register is updated when the SC1_SCL0_UPDATE bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

38.4.3.60 Missing Vsync Compensation Control Register (SC1_SCL0_FRC2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC1_RES_VLACK[15:0]															
Initial value:	0	0	0	0	1	1	1	0	0	0	0	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC1_RES_VLACK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SC1_RES_ VLACK [15:0]	3600	R/W	Missing-Sync Compensating Pulse Output Wait Time Sets the wait time before outputting a missing-sync compensating pulse after a Vsync signal. Wait time [usec] = SC1_RES_VLACK[15:0] × 128 ÷ pixel clock frequency [MHz]
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_RES_ VLACK_ON	1	R/W	Missing Vsync Signal Compensation 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.

Note: This register is updated when the SC1_SCL0_UPDATE bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

38.4.3.61 Output Sync Select Register (SC1_SCL0_FRC3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC1_RES_FV[10:0]	524	R/W	Free-Running Vsync Period Setting Free-running Vsync period = (SC1_RES_FV[10:0] + 1) × horizontal period [usec]
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC1_RES_FH[10:0]	799	R/W	Hsync Period Setting Hsync period [usec] = (SC1_RES_FH[10:0] +1) ÷ pixel clock frequency [MHz]

Note: This register is updated when the SC1_SCL0_UPDATE bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

38.4.3.63 Output Delay Control Register (SC1_SCL0_FRC5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC1_RES_FLD_DLY_SEL	SC1_RES_VSDLY[7:0]							
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC1_RES_FLD_DLY_SEL	1	R/W	Field Determination Signal Delay Control 0: No delay 1: Delay of one vertical cycle
7 to 0	SC1_RES_VSDLY[7:0]	1	R/W	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: SC1_RES_VSDLY[7:0] × output Hsync period [usec]

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

38.4.3.64 Full-Screen Vertical Size Register (SC1_SCL0_FRC6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC1_RES_F_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC1_RES_F_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC1_RES_F_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC1_RES_F_VS[10:0] + SC1_RES_F_VW[10:0] should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC1_RES_F_VW[10:0]	480	R/W	Vertical Enable Signal Width for Full Screen (lines) Note: SC1_RES_F_VS[10:0] + SC1_RES_F_VW[10:0] should be equal to or less than 2039 (lines).

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

38.4.3.65 Full-Screen Horizontal Size Register (SC1_SCL0_FRC7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC1_RES_F_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC1_RES_F_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC1_RES_F_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Full Screen. (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC1_RES_F_HS[10:0] + SC1_RES_F_HW[10:0] should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC1_RES_F_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) **Notes:** 1. SC1_RES_F_HS[10:0] + SC1_RES_F_HW[10:0] should be equal to or less than 2015 (clock cycles). 2. In the case of video output format is Serial RGB(OUT_SET.OUT_FORMAT[[1:0] = 3), it is nessesary to add 2 to value in SC1_RES_F_HW.

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

38.4.3.66 Vsync Detection Register (SC1_SCL0_FRC9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC1_RES_QVLOCK	—	—	—	SC1_RES_QVLACK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC1_RES_QVLOCK	0	R	Locked Vsync Signal Detection Flag 1: Repeated and missing Vsync signal input has not been detected for four or more vertical periods. 0: Repeated or missing Vsync signal input has been detected.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_RES_QVLACK	0*1	R	Missing Vsync Signal Detection Flag 1: Missing Vsync signal input has been detected. 0: Missing Vsync signal input has not been detected.

Note 1. SC1_RES_QVLACK changes immediately from 0 to 1, if the video output clock is enabled. It changes back to 0 after detection of the first VSync. So interrupt on missing Vsync shall be enabled only from the second Vsync onwards.

38.4.3.67 Scaling-Down Control Register (SC1_SCL0_DS1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC1_RES_DS_V_ON	—	—	—	SC1_RES_DS_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC1_RES_DS_V_ON	1	R/W	Vertical Scale Down On/Off 0: Off 1: Setting prohibited
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_RES_DS_H_ON	1	R/W	Horizontal Scale Down On/Off 0: Off 1: Setting prohibited

Note: This register is updated when the SC1_SCL0_VEN_A bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

NOTE

The down-scaler of scaler block 1 is not available.Screen Synthesis

The initial value “1” of the SC1_RES_DS_V_ON and SC1_RES_DS_H_ON bits must be changed to “0” when up-scaler is used at scaler block 1.

38.4.3.68 Vertical Scaling Register (SC1_SCL0_DS6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1_RES_V_RATIO[15:0]															
Initial value:	0	0	0	0	0	1	1	1	1	1	1	1	1	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC1_RES_V_RATIO [15:0]	2044	R/W	Vertical Scale Up/Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: round (SC1_RES_VW ÷ SC1_RES_OUT_VW × 4096) For scale up: round (SC1_RES_IN_VW[10:0] ÷ SC1_RES_P_VW[10:0] × 4096) SC1_RES_V_RATIO[15:0] < 4096: Scale up SC1_RES_V_RATIO[15:0] = 4096: 100% scale up SC1_RES_V_RATIO[15:0] > 4096: Scale down

Note: These bits updated when the SC1_SCL0_VEN_A and SC1_SCL0_VEN_B bits in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) are 1. Accordingly, even a scaled-up graphics display requires both an input Vsync and output Vsync signal.

38.4.3.69 Scaling-Up Control Register (SC1_SCL0_US1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC1_RES_US_V_ON	—	—	—	SC1_RES_US_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC1_RES_US_V_ON	1	R/W	Vertical Scale Up On/Off 0: Off 1: On **Note:** For D1L2(H) devices this bit must be set to 0.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_RES_US_H_ON	1	R/W	Horizontal Scale Up On/Off 0: Off 1: On **Note:** For D1L2(H) devices this bit must be set to 0.

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

38.4.3.70 Output Image Vertical Size Register (SC1_SCL0_US2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC1_RES_P_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC1_RES_P_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC1_RES_P_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Output Image (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC1_RES_P_VS[10:0] + SC1_RES_P_VW[10:0] should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC1_RES_P_VW[10:0]	480	R/W	Vertical Enable Signal Width for Output Image (lines) Note: SC1_RES_P_VS[10:0] + SC1_RES_P_VW[10:0] should be equal to or less than 2039 (lines).

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

38.4.3.71 Output Image Horizontal Size Register (SC1_SCL0_US3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC1_RES_P_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC1_RES_P_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC1_RES_P_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Output Image (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC1_RES_P_HS[10:0] + SC1_RES_P_HW[10:0] should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC1_RES_P_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: SC1_RES_P_HS[10:0] + SC1_RES_P_HW[10:0] should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

38.4.3.72 Scaling-Up Control Block Input Size Register (SC1_SCL0_US4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC1_RES_IN_VW[10:0]

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC1_RES_US_H_RATIO [15:0]	9224	R/W	Horizontal Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) round (SC1_RES_IN_HW[10:0] ÷ SC1_RES_P_HW[10:0] × 4096) SC1_RES_US_H_RATIO[15:0] < 4096: Scale up SC1_RES_US_H_RATIO[15:0] = 4096: 100% scale up SC1_RES_US_H_RATIO[15:0] > 4096: Setting prohibited

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

38.4.3.74 Horizontal Scale Up Initial Phase Register (SC1_SCL0_US6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SC1_RES_US_H_INTERPOTYP	SC1_RES_US_HT_INIPHASE[11:0]											
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SC1_RES_US_HB_INIPHASE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SC1_RES_US_H_INTERPOTYP	1	R/W	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	SC1_RES_US_HT_INIPHASE[11:0]	0	R/W	Horizontal Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SC1_RES_US_HB_INIPHASE[11:0]	0	R/W	Horizontal Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

38.4.3.75 Trimming Register (SC1_SCL0_US7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1_RES_HCUT[7:0]								SC1_RES_VCUT[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	SC1_RES_HCUT[7:0]	0	R/W	Horizontal Amount of Cut-off Post-Scaling Image (Right and Left Parts) Sets the number of pixel-clock cycles.
7 to 0	SC1_RES_VCUT[7:0]	0	R/W	Vertical Amount of Cut-off Post-Scaling Image (Upper and Lower Parts) Sets the number of lines.

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

38.4.3.76 Frame Buffer Read Select Register (SC1_SCL0_US8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC1_RES_IBUS_SYNC_SEL	—	—	—	SC1_RES_DISP_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC1_RES_IBUS_SYNC_SEL	0	R/W	Sync Signal Select for Frame Buffer Read Block 0: Sync signals from the scaling-up control block 1: Sync signals from the graphics processing block
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_RES_DISP_ON	0	R/W	Post-Scaling Image Frame Display On/Off 0: Frame display off 1: Frame display on

Note: SC1_RES_IBUS_SYNC_SEL is updated when the SC1_SCL0_VEN_B and SC1_SCL0_VEN_D bits in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1. SC1_RES_DISP_ON is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

38.4.3.77 Background Color Register (SC1_SCL0_OVR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	SC1_RES_BK_COL_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1_RES_BK_COL_G[7:0]								SC1_RES_BK_COL_B[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	SC1_RES_BK_COL_R[7:0]	128	R/W	Background Color Setting R/Cr Signal R: 8 bits; unsigned (0 to 255 [LSB]) Cr:8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
15 to 8	SC1_RES_BK_COL_G[7:0]	0	R/W	Background Color Setting G/Y Signal G/Y: 8 bits; unsigned (0 to 255 [LSB])
7 to 0	SC1_RES_BK_COL_B[7:0]	128	R/W	Background Color Setting B/Cb Signal B: 8 bits; unsigned (0 to 255 [LSB]) Cb:8 bits; 128 offset binary; unsigned (0 to 255 [LSB])

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

38.4.3.78 Graphics 1 Register Update Control Register (GR1_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR1_UPDATE	—	—	—	GR1_P_VEN	—	—	—	GR1_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR1_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR1_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR1_IBUS_VEN	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

38.4.3.79 Frame Buffer Read Control Register (Graphics 1) (GR1_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR1_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR1_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when the GR1_IBUS_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

38.4.3.80 Frame Buffer Control Register 1 (Graphics 1) (GR1_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR1_FLD_SEL	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR1_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR1_FLM_SEL[1:0]		—	—	—	—	—	—	—	Caution *
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

CAUTION

The initial value “0” of bit 0 must be changed to “1”.

Bit	Bit Name	Initial Value	R/W	Description
31	GR1_FLD_SEL	0	R/W	Enables or disables top or bottom field selection for the next frame buffer to be read. 0: Field selection is disabled. 1: Top or bottom field can be selected.
30 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR1_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR1_FLM_SEL[1:0]	0	R/W	Selects a frame buffer address setting signal. 1: Selects GR1_FLM_NUM[9:0]. Others: Setting prohibited.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	Bit0	0	R/W	**CAUTION** The initial value “0” of this bit must be changed to “1”.

Note: GR1_FLD_SEL is updated when the GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.
GR1_LN_OFF_DIR is updated when the GR1_IBUS_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.
GR1_FLM_SEL[1:0] is updated when the GR1_P_VEN and GR1_IBUS_VEN bits in the graphics 1 register update control register (GR1_UPDATE) are 1.

38.4.3.81 Frame Buffer Control Register 2 (Graphics 1) (GR1_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR1_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR1_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR1_BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. The address must be 128 byte aligned, so the lower 7 bits must be set to 0.

Note: This register is updated when the GR1_IBUS_VEN and GR1_P_VEN bits in the graphics 1 register update control register (GR1_UPDATE) are 1.

38.4.3.82 Frame Buffer Control Register 3 (Graphics 1) (GR1_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR1_FLD_NXT	GR1_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR1_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GR1_FLD_NXT	0	R/W	Top or Bottom Field Selection for Next Frame Buffer 0: Bottom 1: Top
30 to 16	GR1_LN_ OFF[14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR1_BASE[31:0] Line 1: GR1_BASE[31:0] + GR1_LN_OFF[14:0] × 1 : Line n: GR1_BASE[31:0] + GR1_LN_OFF[14:0] × n The address must be 128 byte aligned, so the lower 7 bits must be set to 0.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR1_FLM_ NUM[9:0]	1	R/W	Frame Number of Frame Buffer Manually set the frame number when GR1_FLM_SEL[1:0] = 1.

Note: GR1_FLD_NXT is updated when the GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.
GR1_LN_OFF[14:0] and GR1_FLM_NUM[9:0] are updated when the GR1_IBUS_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

38.4.3.83 Frame Buffer Control Register 4 (Graphics 1) (GR1_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR1_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR1_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR1_FLM_OFF[22:0]	524288	R/W	Frame Buffer Frame Offset Address Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR1_BASE[31:0] Buffer 1: GR1_BASE[31:0] + GR1_FLM_OFF[22:0] × 1 : Buffer n: GR1_BASE[31:0] + GR1_FLM_OFF[22:0] × n The address must be 128 byte aligned, so the lower 7 bits must be set to 0.

Note: This register is updated when the GR1_IBUS_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

38.4.3.84 Frame Buffer Control Register 5 (Graphics 1) (GR1_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR1_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR1_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR1_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame Number of lines is (GR1_FLM_LNUM[10:0] + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR1_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. (GR1_FLM_LOOP[10:0] + 1) lines are read.

Note: This register is updated when the GR1_IBUS_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

38.4.3.85 Frame Buffer Control Register 6 (Graphics 1) (GR1_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR1_FORMAT[3:0]				—	GR1_HW[10:0]										
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR1_YCC_SWAP[2:0]			GR1_RDSWA[2:0]			—	GR1_CNV444_MD	—	—	GR1_STA_POS[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR1_FORMAT [3:0]	8	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: YCbCr422 9: YCbCr444 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR1_HW [10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR1_HW[10:0] + 1) pixels. Note: The set value should be equal to or more than two.
15 to 13	GR1_YCC_SWAP[2:0]	0	R/W	Controls swapping of data read from buffer in the YCbCr422 format. 0: Cb/Y0/Cr/Y1 1: Y0/Cb/Y1/Cr 2: Cr/Y0/Cb/Y1 3: Y0/Cr/Y1/Cb 4: Y1/Cr/Y0/Cb 5: Cr/Y1/Cb/Y0 6: Y1/Cb/Y0/Cr 7: Cb/Y1/Cr/Y0

Bit	Bit Name	Initial Value	R/W	Description
12 to 10	GR1_ RDSWA [2:0]	0	R/W	8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer reading as follows. Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units. Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units. Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units]
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	GR1_ CNV444_ MD	0	R/W	Sets the interpolation mode for YCbCr422 to YCbCr444 conversion. 0: Hold interpolation 1: Average interpolation
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	GR1_STA_ POS[5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR1_STA_POS[5:0] is skipped from the start of the line.

Note: GR1_YCC_SWAP[2:0], GR1_CNV444, and GR1_STA_POS[5:0] are updated when GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.
GR1_ RDSWA is updated when the GR1_UPDATE bit in the graphics 1 register update control register (GR1_UPDATE) is 1.
GR1_FORMAT[3:0] and GR1_HW[10:0] are updated when GR1_IBUS_VEN and GR1_P_VEN bits in the graphics 1 register update control register (GR1_UPDATE) are 1.

38.4.3.86 Alpha Blending Control Register 1 (Graphics 1) (GR1_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	GR1_CUS_CON_ON	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR1_ARC_MUL	GR1_ACALC_MD	—	GR1_ARC_ON	—	—	—	GR1_ARC_DISP_ON	—	—	—	GR1_GRC_DISP_ON	—	—	GR1_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	GR1_CUS_CON_ON	0	R/W	Enables or disables cascaded connection. 0: Cascaded connection is disabled. 1: Cascaded connection is enabled.
27 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	GR1_ARC_MUL	0	R/W	Enables or disables multiplication with the current α for alpha blending in rectangular area. 0: Disabled 1: Enabled
14	GR1_ACALC_MD	0	R/W	Enables or disables pre-multiplication for alpha blending in pixel units. 0: Disabled 1: Enabled
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR1_ARC_ON	0	R/W	Enables or disables alpha blending in rectangular area. 0: Disabled 1: Enabled
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR1_ARC_DISP_ON	0	R/W	Turns on/off frame-line display of the image area for alpha blending in rectangular area. 0: Frame-line display is turned off. 1: Frame-line display is turned on.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR1_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR1_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display (GR1_BASE[31:0]) 1: Lower-layer graphics display When displaying video image or enlarged graphics, select this setting. 2: Current graphics display When displaying graphics, select this setting. 3: Blended display of lower-layer graphics and current graphics* Note:* When cascaded connection is disabled (GR1_CUS_CON_ON = 0), select this setting whenever chroma-key processing is to proceed. Since only current graphics are to be displayed by chroma-key processing, set the α values for both pixels to be subject to chroma-keying and pixels not to be subject to chroma-keying to 255.

Note: GR1_CUS_CON_ON is updated when GR1_UPDATE bit in the graphics 1 register update control register (GR1_UPDATE) is 1. The other bits are updated when GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

38.4.3.87 Alpha Blending Control Register 2 (Graphics 1) (GR1_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR1_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR1_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR1_GRC_VS[10:0]	0	R/W	Vertical Start Position of Graphics Image Area. Note: The set value should be four or more (lines). GR1_GRC_VS[10:0] + GR1_GRC_VW[10:0] should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR1_GRC_VW[10:0]	0	R/W	Vertical Width of Graphics Image Area. **NOTE** GR1_GRC_VS[10:0] + GR1_GRC_VW[10:0] should be equal to or less than 2039 (lines).

Note: This register is updated when the GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

38.4.3.88 Alpha Blending Control Register 3 (Graphics 1) (GR1_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR1_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR1_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR1_GRC_HS[10:0]	0	R/W	Horizontal Start Position of Graphics Image Area. Note: The set value should be 16 or more (clock cycles). GR1_GRC_HS[10:0] + GR1_GRC_HW[10:0] should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR1_GRC_HW[10:0]	0	R/W	Horizontal Width of Graphics Image Area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR1_HW[10:0] to 2 and GR1_GRC_HW[10:0] to 1 (1 pixel) or 2 (2 pixels). **NOTE** GR1_GRC_HS[10:0] + GR1_GRC_HW[10:0] should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

38.4.3.89 Alpha Blending Control Register 4 (Graphics 1) (GR1_AB4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR1_ARC_VS[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR1_ARC_VW[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR1_ARC_VS[10:0]	0	R/W	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR1_ARC_VW[10:0]	0	R/W	Sets the vertical width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

38.4.3.90 Alpha Blending Control Register 5 (Graphics 1) (GR1_AB5)

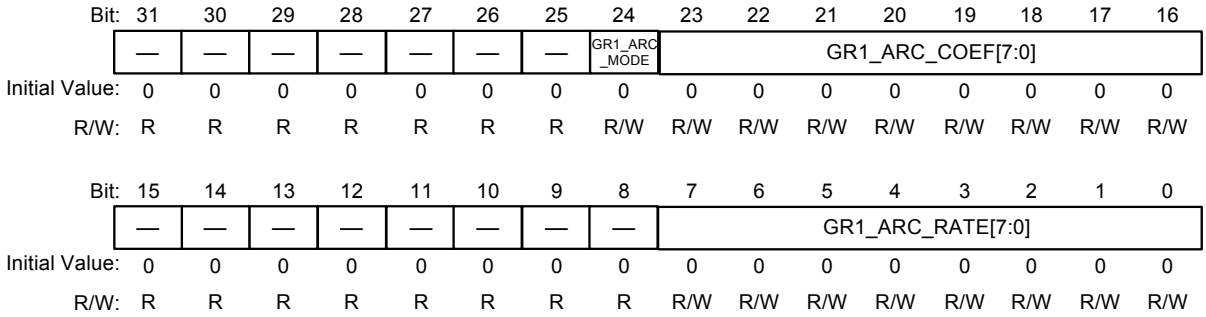
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR1_ARC_HS[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR1_ARC_HW[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR1_ARC_HS[10:0]	0	R/W	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR1_ARC_HW[10:0]	0	R/W	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

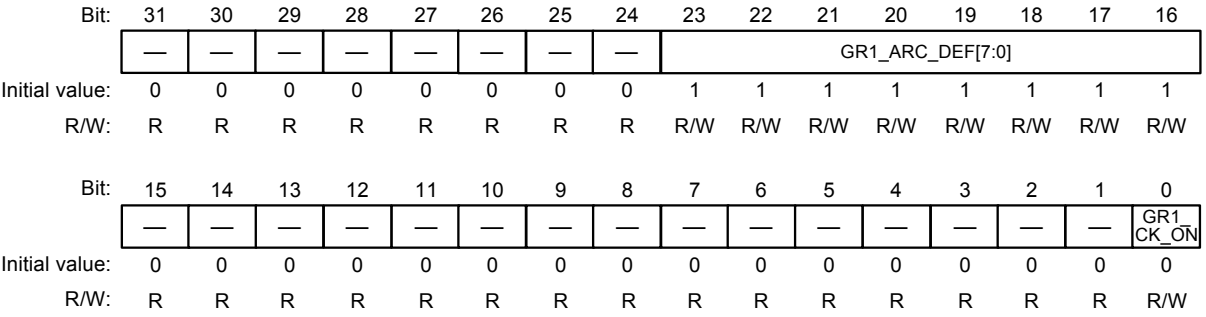
38.4.3.91 Alpha Blending Control Register 6 (Graphics 1) (GR1_AB6)



Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	GR1_ARC_MODE	0	R/W	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
23 to 16	GR1_ARC_COEF[7:0]	0	R/W	Alpha Coefficient for Alpha Blending in Rectangular Area (0 to 255) [7:0]: Variation (absolute value)
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	GR1_ARC_RATE[7:0]	0	R/W	Frame Rate for Alpha Blending in Rectangular Area

Note: This register is updated when GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

38.4.3.92 Alpha Blending Control Register 7 (Graphics 1) (GR1_AB7)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR1_ARC_DEF[7:0]	255	R/W	Initial Alpha Value for Alpha Blending in Rectangular Area
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR1_CK_ON	0	R/W	CLUT-Index/RGB-Index Chroma-Key Processing On/Off 0: Off 1: On

Note: This register is updated when the GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

38.4.3.93 Alpha Blending Control Register 8 (Graphics 1) (GR1_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR1_CK_KCLUT[7:0]								GR1_CK_KG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR1_CK_KB[7:0]								GR1_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR1_CK_KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR1_CK_KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR1_CK_KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR1_CK_KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when the GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

38.4.3.94 Alpha Blending Control Register 9 (Graphics 1) (GR1_AB9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR1_CK_A[7:0]								GR1_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR1_CK_B[7:0]								GR1_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR1_CK_A[7:0]	0	R/W	Replaced Alpha Signal after RGB-Index Chroma-Key Processing α: Unsigned 8 bits (0 to 255 [LSB]) Note: These bits should always be set to 255 to display the current graphics only when cascaded connection is disabled.
23 to 16	GR1_CK_G[7:0]	0	R/W	Replaced G Signal after RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR1_CK_B[7:0]	0	R/W	Replaced B Signal after RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR1_CK_R[7:0]	0	R/W	Replaced R Signal after RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when the GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

38.4.3.95 Alpha Blending Control Register 10 (Graphics 1) (GR1_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR1_A0[7:0]								GR1_G0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR1_B0[7:0]								GR1_R0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR1_A0 [7:0]	0	R/W	CLUT0 α0 Signal Replaced with α signal when in the CLUT0 format and CLUT0 = 0. Replaced with α signal when in the αRGB1555/RGBα5551 format and α = 0. Note: These bits should always be set to 255 to display the current graphics only when cascaded connection is disabled.
23 to 16	GR1_G0 [7:0]	0	R/W	CLUT0 G0 Signal Replaced with G signal when in the CLUT0 format and CLUT0 = 0.
15 to 8	GR1_B0 [7:0]	0	R/W	CLUT0 B0 Signal Replaced with B signal when in the CLUT0 format and CLUT0 = 0.
7 to 0	GR1_R0 [7:0]	0	R/W	CLUT0 R0 Signal Replaced with R signal when in the CLUT0 format and CLUT0 = 0.

Note: This register is updated when the GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

38.4.3.96 Alpha Blending Control Register 11 (Graphics 1) (GR1_AB11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR1_A1[7:0]								GR1_G1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR1_B1[7:0]								GR1_R1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR1_A1 [7:0]	0	R/W	CLUT1 α1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the αRGB1555/RGBα5551 format and α = 1. Note: These bits should always be set to 255 to display the current graphics only when cascaded connection is disabled.
23 to 16	GR1_G1 [7:0]	0	R/W	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
15 to 8	GR1_B1 [7:0]	0	R/W	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
7 to 0	GR1_R1 [7:0]	0	R/W	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: This register is updated when the GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

38.4.3.97 Background Color Control Register (Graphics 1) (GR1_BASE)

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR1_BASE_G[7:0]	0	R/W	Background Color G/Y Signal G/Y: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR1_BASE_B[7:0]	128	R/W	Background Color B/Cb Signal B: Unsigned 8 bits (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
7 to 0	GR1_BASE_R[7:0]	128	R/W	Background Color R/Cr Signal R: Unsigned 8 bits (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])

Note: This register is updated when the GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

38.4.3.98 CLUT Table Control Register (Graphics 1) (GR1_CLUT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR1_CLT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR1_CLT_SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. Referring to the CLUT table 0 value to expand to αRGB8888 The CPU side can read-access or write-access to the CLUT table 1. 1: Selects CLUT table 1. Referring to the CLUT table 1 value to expand to αRGB8888 The CPU side can read-access or write-access to the CLUT table 0.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when the GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

NOTE

Before switching CLUT table by GR_CLT_SEL, CPU must wait until the read value from the last written address is same as the last written value.

Refer to Section 38.6.1.15, CLUT Table for detail.

38.4.3.99 Status Monitor Register (Graphics 1) (GR1_MON)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR1_ARC_ST	0	R	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

38.4.4 Usage Method

38.4.4.1 Scaling Setting Example for Graphics Display

(1) Angle of View for Graphics Display

This section describes an example of setting the signals of the input and output angles of view shown in **Table 38.88**.

Table 38.88 Input and Output Angles of View for Graphics Display

Graphics Size	Output Signal	Graphics Signal Format
640 × 480	640 × 480	RGB888

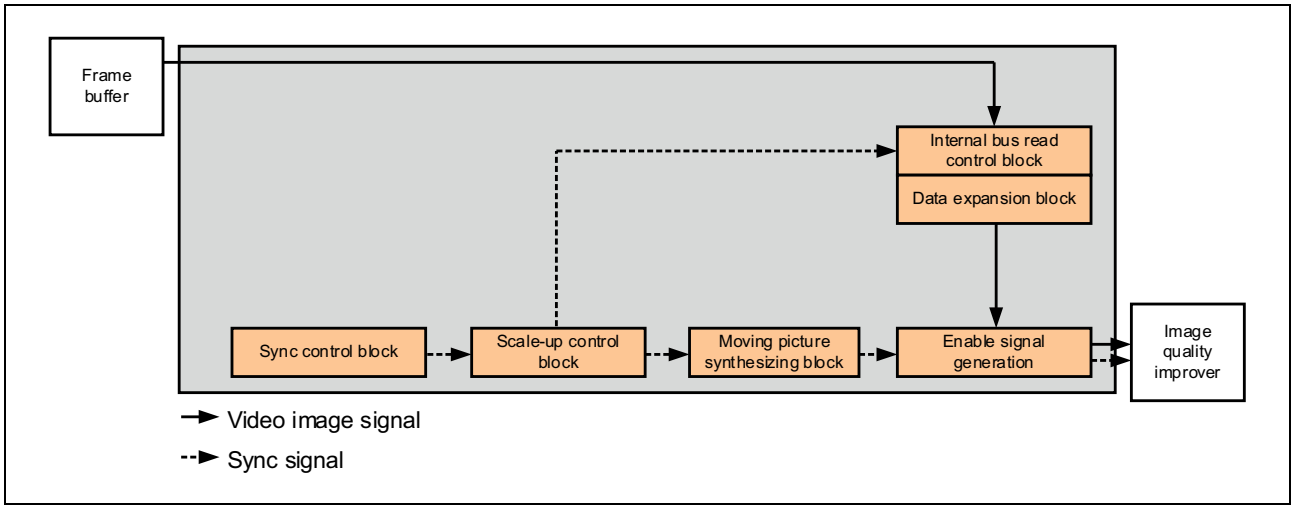

Figure 38.40 Signal Paths for Graphics Display

(2) Setting Frame Buffer Access Area

In the frame buffer in which graphics data is stored, graphics data needs to be expanded in the area of 640 × 480 pixels or larger.

Here, the frame buffer area in which graphics data is expanded is assumed to be 640 × 480 pixels.

Since the frame buffer is accessed in 64-bit units, RGB888 (32 bits) is accessed in 2-pixel units.

The line offset address values to be set are:

GR_LN_OFF[14:0] = 640 × 4 = 2560

The frame offset address values to be set are:

GR_FLM_OFF[22:0] = GR_LN_OFF[14:0] × 480 = 1228800

(3) Register Setting Example

Table 38.89 Register Setting Example for Graphics Display

Register Name	Bit Name	Settings	Remarks
Synchronization Control			
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Free-running Vsync selected (when the appropriate input signal is available, an external sync can also be selected)
SC_SCL0_FRC4	SC_RES_FV[10:0]	524	Vertical period width of output signal (period width = set value + 1)
SC_SCL0_FRC4	SC_RES_FH[10:0]	799	Horizontal period width of output signal (period width = set value + 1)
Size of Angle of View			
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	35	Vertical valid start position of full screen
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	480	Vertical valid width of full screen
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	144	Horizontal valid start position of full screen
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	640	Horizontal valid width of full screen
GR_AB2	GR_GRC_VS[10:0]	35	Vertical valid start position of graphics output
GR_AB2	GR_GRC_VW[10:0]	480	Vertical valid width of graphics output
GR_AB3	GR_GRC_HS[10:0]	144	Horizontal valid start position of graphics output
GR_AB3	GR_GRC_HW[10:0]	640	Horizontal valid width of graphics output
Frame Buffer Read Setting			
GR_FLM1	GR_FLM_SEL[1:0]	1	Frame number setting with register
GR_FLM3	GR_FLM_NUM[9:0]	0	Frame number of frame buffer (0 in setting example)
GR_FLM5	GR_FLM_LNUM[10:0]	479	Number of graphics lines (number of lines = set value + 1)
GR_FLM6	GR_HW[10:0]	639	Horizontal valid width of graphics (valid width = set value + 1)
GR_FLM2	GR_BASE[31:0]	0	Conforming to graphics expansion setting (0 in setting example)
GR_FLM3	GR_LN_OFF[14:0]	2560	Conforming to graphics expansion setting
Frame Buffer Read Setting			
GR_FLM4	GR_FLM_OFF[22:0]	1228800	Conforming to graphics expansion setting
GR_FLM6	GR_FORMAT[3:0]	1	Frame buffer read format RGB888
GR_FLM_RD	GR_R_ENB	1	Frame buffer read enabled
Scaling-up Selection			
SC_SCL0_US8	SC_RES_IBUS_SYNC_SEL	1	Graphics output displayed
GR_AB1	GR_DISP_SEL[1:0]	2	Graphics display selected

38.4.4.2 Scaling Setting Example for Scaled-up Graphics Display

(1) Angles of View for Input and Output

This section describes an example of setting the signals of the input and output angles of view shown in **Table 38.90**.

Table 38.90 Input and Output Angles of View for Scaled-up Graphics Display

Graphics Size	Output Signal	Graphics Signal Format
640 × 480	800 × 600	RGB565

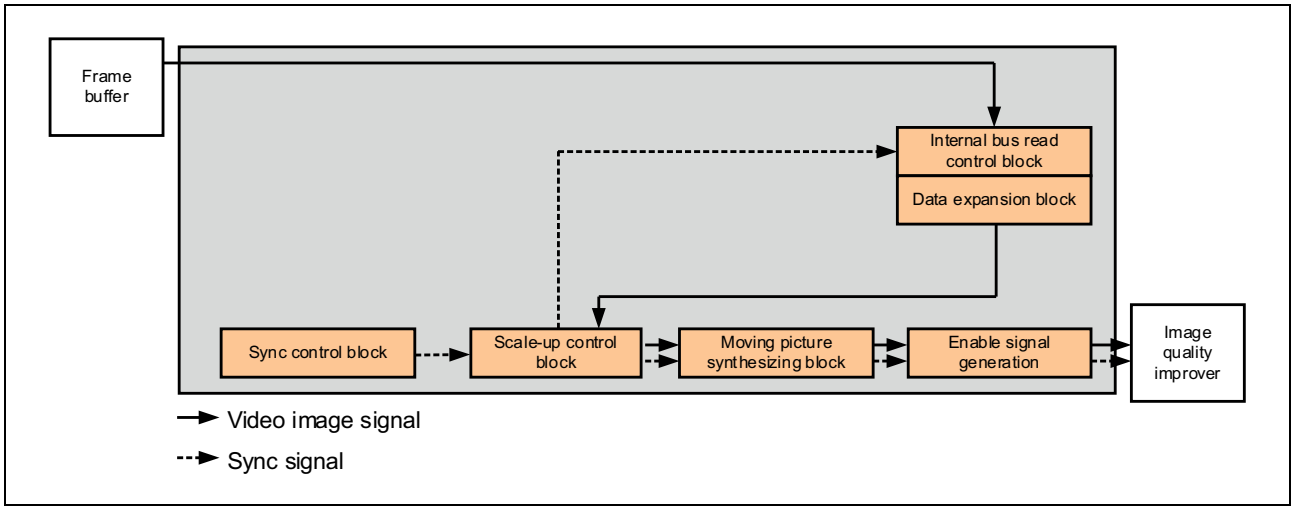

Figure 38.41 Signal Paths for Scaled-up Graphics Display

(2) Horizontal Scaling (Horizontal Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

RATIO_org = round (640 ÷ 800 × 4096) = 3277

σ = (3277 × (800 − 1) − (640 − 1) × 4096) ÷ (800 − 1) = 1.23

Horizontal scaling ratio = round (3277 − (1.23)) = 3276

(3) Vertical Scaling (Vertical Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

RATIO_org = round (480 ÷ 600 × 4096) = 3277

σ = (3277 × (600 − 1) − (480 − 1) × 4096) ÷ (600 − 1) = 1.57

Vertical scaling ratio = round (3277 − (1.57)) = 3275

(4) Setting Frame Buffer Access Area

In the frame buffer in which graphics data is stored, graphics data needs to be expanded in the area of 640 × 480 pixels or larger.

Here, the frame buffer area in which graphics data is expanded is assumed to be 640 × 480 pixels.

Since the frame buffer is accessed in 64-bit units, RGB565 (16 bits) is accessed in 4-pixel units.

The line offset address values to be set are:

GR_LN_OFF[14:0] = 640 × 2 = 1280

The frame offset address values to be set are:

GR_FLM_OFF[22:0] = GR_LN_OFF[14:0] × 480 = 614400

(5) Register Setting Example

Table 38.91 Register Setting Example for Scaled-up Graphics Display

Register Name	Bit Name	Settings	Remarks
Synchronization Control			
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Free-running Vsync selected (when the appropriate input signal is available, an external sync can also be selected)
SC_SCL0_FRC4	SC_RES_FV[10:0]	668	Vertical period width of output signal (period width = set value + 1)
SC_SCL0_FRC4	SC_RES_FH[10:0]	1040	Horizontal period width of output signal (period width = set value + 1)
Size of Angle of View			
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	27	Vertical valid start position of full screen
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	600	Vertical valid width of full screen
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	216	Horizontal valid start position of full screen
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	800	Horizontal valid width of full screen
SC_SCL0_US2	SC_RES_P_VS[10:0]	27	Vertical valid start position of image output
SC_SCL0_US2	SC_RES_P_VW[10:0]	600	Vertical valid width of image output
SC_SCL0_US3	SC_RES_P_HS[10:0]	216	Horizontal valid start position of image output
SC_SCL0_US3	SC_RES_P_HW[10:0]	800	Horizontal valid width of image output
Scaling Setting			
SC_SCL0_US5	SC_RES_US_H_RATIO[15:0]	3276	Horizontal scaling-up because SC_RES_US_H_RATIO is smaller than 4096
SC_SCL0_DS6	SC_RES_V_RATIO[15:0]	3275	Vertical scaling-up because SC_RES_V_RATIO is smaller than 4096
SC_SCL0_US1	SC_RES_US_H_ON	1	Horizontal scaling-up on
SC_SCL0_US1	SC_RES_US_V_ON	1	Vertical scaling-up on
SC_SCL0_US4	SC_RES_IN_VW[10:0]	480	Vertical width of frame buffer read
SC_SCL0_US4	SC_RES_IN_HW[10:0]	640	Horizontal width of frame buffer read
Frame Buffer Read Setting			
GR_FLM1	GR_FLM_SEL[1:0]	1	Frame number setting with register
GR_FLM3	GR_FLM_NUM[9:0]	0	Frame number of frame buffer (0 in setting example)
GR_FLM2	GR_BASE[31:0]	0	Conforming to graphics expansion setting (0 in setting example)
GR_FLM3	GR_LN_OFF[14:0]	1280	Conforming to graphics expansion setting
GR_FLM4	GR_FLM_OFF[22:0]	614400	Conforming to graphics expansion setting
GR_FLM6	GR_FORMAT[3:0]	0	Frame buffer read format RGB565
GR_FLM_RD	GR_R_ENB	1	Frame buffer read enabled
Scaling-up Selection			
SC_SCL0_US8	SC_RES_IBUS_SYNC_SEL	0	Scaled-up video signal displayed
GR_AB1	GR_DISP_SEL[1:0]	1	Scaling display selected

38.5 Image Quality Improver

38.5.1 Image Quality Improver Functions

38.5.1.1 Overview of Functions

The image quality improver subjects scaled YCbCr signals to GBR conversion by using a color matrix.

The image quality improver does not act on RGB signals.

Figure 38.42 is a functional block diagram of the image quality improver. Image quality improvers 0 and 1 are connected to scalers 0 and 1, respectively.

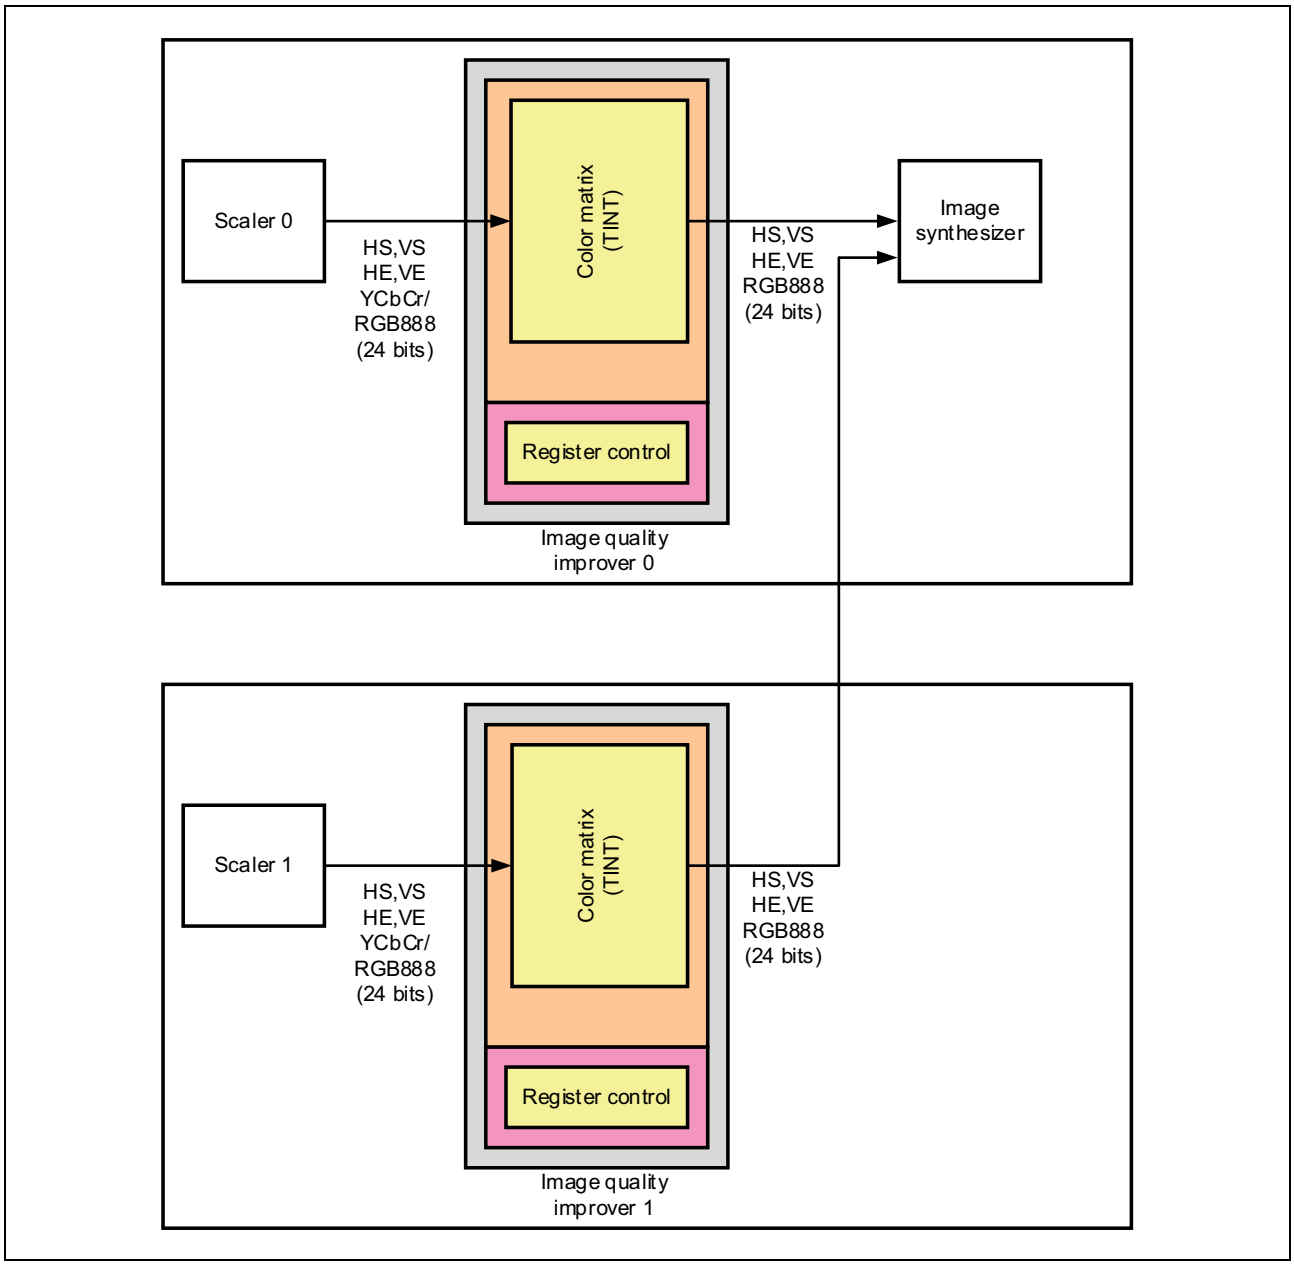

Figure 38.42 Functional Block Diagram of Image Quality Improver

38.5.1.2 Register Update Control

The control register for image quality improver controls the update timing entirely by vertical synchronous signals.

The vertical synchronous signal launched after the update control register is set to 1 is reflected in various registers, following which the update control register is automatically cleared to 0.

Note that there are two image quality improvers and registers for each improver can be identified by the number in the register name like ADJ0_xxxx and ADJ1_xxxx, respectively. In the sections except for Register Description, however, the number is omitted like ADJ_xxxx for convenience sake.

Table 38.92 Register Update Control

Register Name	Bit Name	Initial Value	Description
ADJ_UPDATE	ADJ_VEN	0	Image Quality Improver Register Update 0: Register is not updated. 1: Register is updated by launch of vertical synchronous signal.

38.5.1.3 Color Matrix

Color matrix is performed by adjusting the offset of each input signal and nine-axis gain. This allows YCbCr to GBR conversion.

(1) GBR to GBR Conversion

YGIN_A = YGIN + ADJ_MTX_YG − 128

CBBIN_A = CBBIN + ADJ_MTX_B − 128

CRRIN_A = CRRIN + ADJ_MTX_R − 128

YGOUT = (ADJ_MTX_GG × YGIN_A + ADJ_MTX_GB × CBBIN_A + ADJ_MTX_GR × CRRIN_A) ÷ 256

CBBOUT = (ADJ_MTX_BG × YGIN_A + ADJ_MTX_BB × CBBIN_A + ADJ_MTX_BR × CRRIN_A) ÷ 256

CRROUT = (ADJ_MTX_RG × YGIN_A + ADJ_MTX_RB × CBBIN_A + ADJ_MTX_RR × CRRIN_A) ÷ 256

(2) YCbCr to GBR Conversion

YGIN_A = YGIN + ADJ_MTX_YG − 128

CBBIN_A = CBBIN − 128

CRRIN_A = CRRIN − 128

YGOUT = (ADJ_MTX_GG × YGIN_A + ADJ_MTX_GB × CBBIN_A + ADJ_MTX_GR × CRRIN_A) ÷ 256

CBBOUT = (ADJ_MTX_BG × YGIN_A + ADJ_MTX_BB × CBBIN_A + ADJ_MTX_BR × CRRIN_A) ÷ 256

CRROUT = (ADJ_MTX_RG × YGIN_A + ADJ_MTX_RB × CBBIN_A + ADJ_MTX_RR × CRRIN_A) ÷ 256

Table 38.93 Matrix Coefficients (Standard Values) of SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	Bit Setting	Coefficient	Bit Setting	Coefficient	Bit Setting
YGOUT	1.000	ADJ_MTX_GG = 256	–0.344	ADJ_MTX_GB = 1960	–0.714	ADJ_MTX_GR = 1865
CBBOUT	1.000	ADJ_MTX_BG = 256	1.772	ADJ_MTX_BB = 454	0.000	ADJ_MTX_BR = 0
CRROUT	1.000	ADJ_MTX_RG = 256	0.000	ADJ_MTX_RB = 0	1.402	ADJ_MTX_RR = 359

Table 38.94 Color Matrix Control

Register Name	Bit Name	Initial Value	Description
ADJ_MTX_MODE	ADJ_MTX_MD[1:0]	2	Operating Mode 0: GBR → GBR 1: Setting prohibited 2: YCbCr → GBR 3: Setting prohibited
ADJ_MTX_YG_ADJ0	ADJ_MTX_YG[7:0]	128	Y/G Signal Offset (DC) Adjustment Unsigned (0 (-128) to 128(0) to 255 (+127) [LSB])
ADJ_MTX_CBB_ADJ0	ADJ_MTX_B[7:0]	128	B Signal Offset (DC) Adjustment Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
ADJ_MTX_CRR_ADJ0	ADJ_MTX_R[7:0]	128	R Signal Offset (DC) Adjustment Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
ADJ_MTX_YG_ADJ0	ADJ_MTX_GG[10:0]	256	Gain Adjustment of Y/G Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
ADJ_MTX_YG_ADJ1	ADJ_MTX_GB[10:0]	1960	Gain Adjustment of Cb/B Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
ADJ_MTX_YG_ADJ1	ADJ_MTX_GR[10:0]	1865	Gain Adjustment of Cr/R Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
ADJ_MTX_CBB_ADJ0	ADJ_MTX_BG[10:0]	256	Gain Adjustment of Y/G Signal of B Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
ADJ_MTX_CBB_ADJ1	ADJ_MTX_BB[10:0]	454	Gain adjustment of Cb/B signal of B Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
ADJ_MTX_CBB_ADJ1	ADJ_MTX_BR[10:0]	0	Gain Adjustment of Cr/R Signal of B Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
ADJ_MTX_CRR_ADJ0	ADJ_MTX_RG[10:0]	256	Gain Adjustment of Y/G Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
ADJ_MTX_CRR_ADJ1	ADJ_MTX_RB[10:0]	0	Gain Adjustment of Cb/B Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
ADJ_MTX_CRR_ADJ1	ADJ_MTX_RR[10:0]	359	Gain Adjustment of Cr/R Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

38.5.2 Register Description

Table 38.95 and **Table 38.96** show the register configurations.

[Symbols used in Register Description]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Read and write. Bit is initialized if 0 is written, and ignored if 1 is written.

R/WC1: Read and write. Bit is initialized if 1 is written, and ignored if 0 is written.

R: Read-only. The write value should always be 0.

—/W: Write-only. Read value is undefined.

Table 38.95 Image Quality Improver Register Configuration (Channel 0)

Module Name	Register Name	Symbol	R/W	Initial Value	Address	Access Size

NOTE

Register access sizes other than defined in the table above are not supported.

NOTE

In the header files the names of the above registers are defined in the following format:

<ModuleName> + <Symbol>.

<ModuleName> and <Symbol> are defined in the above table.

38.5.2.1 Register Update Control Register in Image Quality Improver (ADJ0_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADJ0_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ADJ0_VEN	0	R/WC1	Image Quality Improver Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

38.5.2.2 Matrix Mode Register in Image Quality Improver (ADJ0_MTX_MODE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADJ0_MTX_MD[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	ADJ0_MTX_MD[1:0]	2	R/W	Operating Mode 0: GBR → GBR 1: Setting prohibited 2: YCbCr → GBR 3: Setting prohibited

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

38.5.2.3 Matrix YG Control Register 0 in Image Quality Improver (ADJ0_MTX_YG_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	ADJ0_MTX_YG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADJ0_MTX_GG[10:0]										
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	ADJ0_MTX_YG[7:0]	128	R/W	Y/G Signal Offset (DC) Adjustment Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_GG[10:0]	256	R/W	Gain Adjustment of Y/G Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

38.5.2.4 Matrix YG Control Register 1 in Image Quality Improver (ADJ0_MTX_YG_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ADJ0_MTX_GB[10:0]										
Initial value:	0	0	0	0	0	1	1	1	1	0	1	0	1	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADJ0_MTX_GR[10:0]										
Initial value:	0	0	0	0	0	1	1	1	0	1	0	0	1	0	0	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ADJ0_MTX_GB[10:0]	1960	R/W	Gain Adjustment of Cb/B Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_GR[10:0]	1865	R/W	Gain Adjustment of Cr/R Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

38.5.2.5 Matrix CBB Control Register 0 in Image Quality Improver (ADJ0_MTX_CBB_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	ADJ0_MTX_B[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADJ0_MTX_BG[10:0]										
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	ADJ0_MTX_B [7:0]	128	R/W	B Signal Offset (DC) Adjustment Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_BG [10:0]	256	R/W	Gain Adjustment of Y/G Signal of B Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

38.5.2.6 Matrix CBB Control Register 1 in Image Quality Improver (ADJ0_MTX_CBB_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ADJ0_MTX_BB[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	0	0	0	1	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADJ0_MTX_BR[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ADJ0_MTX_BB [10:0]	454	R/W	Gain Adjustment of Cb/B Signal of B Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_BR [10:0]	0	R/W	Gain Adjustment of Cr/R Signal of B Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

38.5.2.7 Matrix CRR Control Register 0 in Image Quality Improver (ADJ0_MTX_CRR_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	ADJ0_MTX_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADJ0_MTX_RG[10:0]										
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	ADJ0_MTX_R [7:0]	128	R/W	R Signal Offset (DC) Adjustment Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_RG [10:0]	256	R/W	Gain Adjustment of Y/G Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

38.5.2.8 Matrix CRR Control Register 1 in Image Quality Improver (ADJ0_MTX_CRR_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ADJ0_MTX_RB[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADJ0_MTX_RR[10:0]										
Initial value:	0	0	0	0	0	0	0	1	0	1	1	0	0	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ADJ0_MTX_RB [10:0]	0	R/W	Gain Adjustment of Cb/B Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_RR [10:0]	359	R/W	Gain Adjustment of Cr/R Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

38.5.2.9 Register Update Control Register in Image Quality Improver (ADJ1_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADJ1_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ADJ1_VEN	0	R/WC1	Image Quality Improver Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

38.5.2.10 Matrix Mode Register in Image Quality Improver (ADJ1_MTX_MODE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADJ1_MTX_MD[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	ADJ1_MTX_MD[1:0]	2	R/W	Operating Mode 0: GBR → GBR 1: Setting prohibited 2: YCbCr → GBR 3: Setting prohibited

Note: This register is updated when ADJ1_VEN in ADJ1_UPDATE is 1.

38.5.2.11 Matrix YG Control Register 0 in Image Quality Improver (ADJ1_MTX_YG_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	ADJ1_MTX_YG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADJ1_MTX_GG[10:0]										
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	ADJ1_MTX_YG[7:0]	128	R/W	Y/G Signal Offset (DC) Adjustment Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ1_MTX_GG[10:0]	256	R/W	Gain Adjustment of Y/G Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ1_VEN in ADJ1_UPDATE is 1.

38.5.2.12 Matrix YG Control Register 1 in Image Quality Improver (ADJ1_MTX_YG_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ADJ1_MTX_GB[10:0]										
Initial value:	0	0	0	0	0	1	1	1	1	0	1	0	1	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADJ1_MTX_GR[10:0]										
Initial value:	0	0	0	0	0	1	1	1	0	1	0	0	1	0	0	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ADJ1_MTX_GB[10:0]	1960	R/W	Gain Adjustment of Cb/B Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ1_MTX_GR[10:0]	1865	R/W	Gain Adjustment of Cr/R Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ1_VEN in ADJ1_UPDATE is 1.

38.5.2.13 Matrix CBB Control Register 0 in Image Quality Improver (ADJ1_MTX_CBB_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	ADJ1_MTX_B[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0

26 to 16	ADJ1_MTX_RB [10:0]	0	R/W	Gain Adjustment of Cb/B Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ1_MTX_RR [10:0]	359	R/W	Gain Adjustment of Cr/R Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ1_VEN in ADJ1_UPDATE is 1.

38.5.3 Usage Method

38.5.3.1 Setting Method for Color Matrix Data Conversion

GBR signals are assumed to be input to the circuit subsequent to the image quality improver; therefore, the output from the color matrix circuit should be in the GBR format.

Table 38.97 shows an example of GBR conversion setting.

Table 38.97 Recommended Setting Values for Matrix Conversion

		GBR to GBR Conversion	YCBCR to GBR Conversion
Register Name	**Bit Name**	**Recommended Values**	**Recommended Values**
ADJ_MTX_MODE	ADJ_MTX_MD[1:0]	0	2
ADJ_MTX_YG_ADJ0	ADJ_MTX_YG[7:0]	128	128
ADJ_MTX_CBB_ADJ0	ADJ_MTX_B[7:0]	128	128
ADJ_MTX_CRR_ADJ0	ADJ_MTX_R[7:0]	128	128
ADJ_MTX_YG_ADJ0	ADJ_MTX_GG[10:0]	256	256
ADJ_MTX_YG_ADJ1	ADJ_MTX_GB[10:0]	0	1960
ADJ_MTX_YG_ADJ1	ADJ_MTX_GR[10:0]	0	1865
ADJ_MTX_CBB_ADJ0	ADJ_MTX_BG[10:0]	0	256
ADJ_MTX_CBB_ADJ1	ADJ_MTX_BB[10:0]	256	454
ADJ_MTX_CBB_ADJ1	ADJ_MTX_BR[10:0]	0	0
ADJ_MTX_CRR_ADJ0	ADJ_MTX_RG[10:0]	0	256
ADJ_MTX_CRR_ADJ1	ADJ_MTX_RB[10:0]	0	0
ADJ_MTX_CRR_ADJ1	ADJ_MTX_RR[10:0]	256	359

Note: ADJ_VEN in ADJ_UPDATE should be set to 1 after setting the registers.

38.6 Image Synthesizer

38.6.1 Image Synthesizer Functions

38.6.1.1 Overview of Functions

The image synthesizer reads graphics data from the frame buffer and displays the synthesized image on the screen.

Two video planes + two graphics planes, one video plane + three graphics planes, or four graphics planes can be selected for synthesis.

RGB565, RGB888, αRGB1555, αRGB4444, αRGB8888, RGBα5551, RGBα8888, CLUT8, CLUT4, CLUT1, YCbCr422 (for the graphics 0 and 1 processes), and YCbCr444 (for the graphics 0 and 1 processes) formats can be used for graphics data, and RGB565, RGB888, YCbCr422, and YCbCr444 formats for video data.

On each of the graphics planes, background color, lower-layer graphics, current graphics, or blended image (for the graphics 1, 2, and 3 processes and VIN synthesizer) of lower-layer graphics and current graphics can be displayed.

In the VIN synthesizer, graphics data is not read and images (for the graphics 0 and 1 processes) are blended.

The functional block diagram of the image synthesizer is shown below.

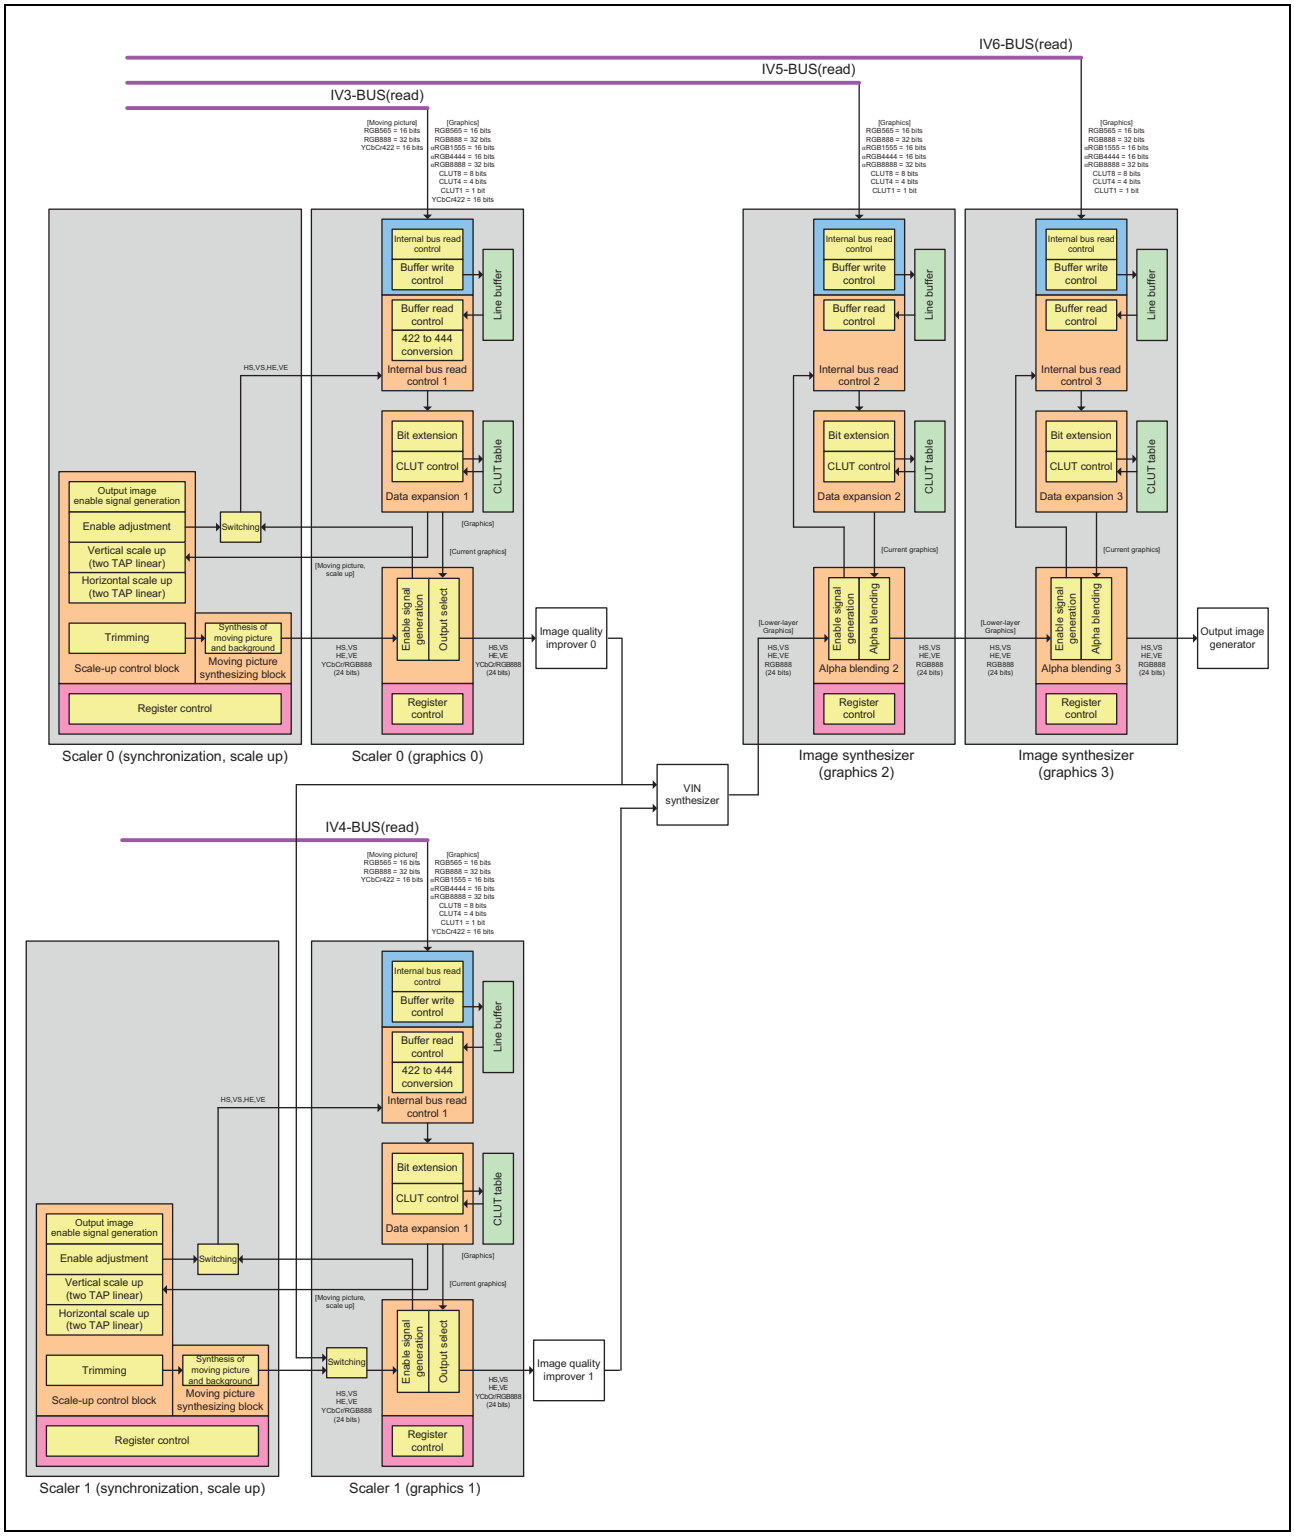

Figure 38.43 Functional Block Diagram of Image Synthesizer

38.6.1.2 Graphics Data Read Control

Graphics data read can be controlled for the five processes: the graphics 0 process in the scaler 0, the graphics 1 process in the scaler 1, the graphics 2 and 3 processes in the image synthesizer, and the graphics OIR process in the output image generator.

The register bits of each process can be identified by the number in the register name like GR0_xxxx, GR1_xxxx, GR2_xxxx, GR3_xxxx, and GR_OIR_xxxx, respectively. In the sections except for Register Descriptions, however, the number is omitted like GR_xxxx for convenience sake.

In the VIN synthesizer, graphics data read is not controlled and the blending register GR_VIN_xxxx is present. In this manual, the name is omitted like GR_xxxx for convenience sake. The synthesizer does not have the read control register (GR_FLM).

(1) Updating Registers

The Vsync signal is used to control the update timing of the registers for graphics display and frame buffer read control, except for some of the registers.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 38.98 Register Update Control

Register Name	Bit Name	Initial Value	Description
GR_UPDATE	GR_UPDATE	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
GR_UPDATE	GR_P_VEN	0	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_IBUS_VEN	0	Frame Buffer Read Register Update*1 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

Note 1. This bit is not supported for the VIN synthesizer.

(2) Frame Buffer Control Mode

More than one frame of data is read from the frame buffer.

For graphics data, set the GR_FLM_SEL[1:0] bits to 1, and set the specific display frame number with the GR_FLM_NUM[9:0] bits. For video data, select a mode with the GR_FLM_SEL[1:0] bits depending on the writing process used; the quantity of the frames used for video data is set in the writing process block.

Table 38.99 Frame Buffer Control Mode

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_FLM_SEL[1:0]	0	Frame Buffer Address Setting Signal Select 0: Control linked to scaling-down process, or frame 0 selected. *1 1: Register GR_FLM_NUM selected. 2: Control linked to distortion correction, or frame 0 selected. *2 3: Control linked to pointer buffer, or setting prohibited. *3
GR_FLM3	GR_FLM_NUM[9:0]	0	Frame Number of Frame Buffer Manually set the frame number when GR_FLM_SEL = 1.

Note 1. For the graphics 0 process, frame buffer control links to the scaling-down process. For the graphics 2 and 3 processes, frame 0 is selected.

Note 2. For the graphics OIR process, frame buffer control links to distortion correction. For the graphics 1, 2 and 3

processes, frame 0 is selected.

Note 3. This configuration is prohibit for graphics 2 and 3 .

(3) Frame Buffer Read Control

The following bit enables or disables read access to the frame buffer.

Table 38.100 Frame Buffer Read Control

Register Name	Bit Name	Initial Value	Description
GR_FLM_RD	GR_R_ENB	0	Frame Buffer Read Enable 0: Disables read access to the frame buffer. 1: Enables read access to the frame buffer.

(4) Frame Buffer Size

The following bits set the size of the frame buffer to be read.

The numbers of horizontal pixels and of lines in the vertical direction are set with the GR_HW[10:0] and GR_FLM_LNUM[10:0] bits, respectively.

Table 38.101 Frame Buffer Size

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_HW[10:0]	0	Sets the width of the horizontal valid period. The width is (GR_HW + 1) pixels. Note: Set to 2 or greater.
GR_FLM5	GR_FLM_LNUM[10:0]	0	Sets the number of lines in a frame The number of lines is (GR_FLM_LNUM + 1).

(5) Calculating Addresses in Frame Buffer

The data area in the frame buffer is defined using the addresses specified by GR_BASE[31:0], GR_LN_OFF[14:0], and GR_FLM_OFF[22:0] bits and the display frame number.

The GR_LN_OFF[14:0] and GR_FLM_OFF[22:0] bits should be set in units of 128 bytes (the lower seven bits should be fixed to 000 0000).

The GR_BASE[31:0] bits should be set in units of 128 bytes to set the display data start position (the lower seven bits should be fixed).

(6) Restriction

For any buffer that is read by any VDCE layer (GR0-GR3 and OIR), following care must be taken. In addition to the memory area occupied by the frame buffer, the next 256 bytes of memory must be readable by the same VDCE layer. The layer will neither use or modify the data in this area, so it may be used by any other VDCE layer, VOWE Drawing List, GPU Drawing List or other macro.

The memory area may overlap into other address regions given that they are allowed to be read. This excludes reserved areas as well as unavailable areas (e.g. SDRA, if external SDRAM is not connected).

Recommendations:

If SDRAM is not available, place GPU working memory or VOWE command list at the end of VRAM. Remaining VRAM can be used without restrictions.

If SDRAM is available, place GPU working memory or VOWE command list at the end of SDRAM. Remaining VRAM and SDRAM can be used without restrictions.

Example:

SDRAM is available from 4000 0000_H to 5FFF $FFFF_H$. We have a buffer of 320 x 240, 4 BPP, Stride: 256 px using 5 0000_H bytes of memory.

If you place it into SDRAM area, do not use 5FFB 0000_H - 5FFF $FFFF_H$, as the next 256 bytes (6000 0000_H - 6000 $00FF_H$) are reserved addresses.

Use 5FFA $FF00_H$ - 5FFF $FF00_H$ or any smaller start address down to the start of VRAM area.

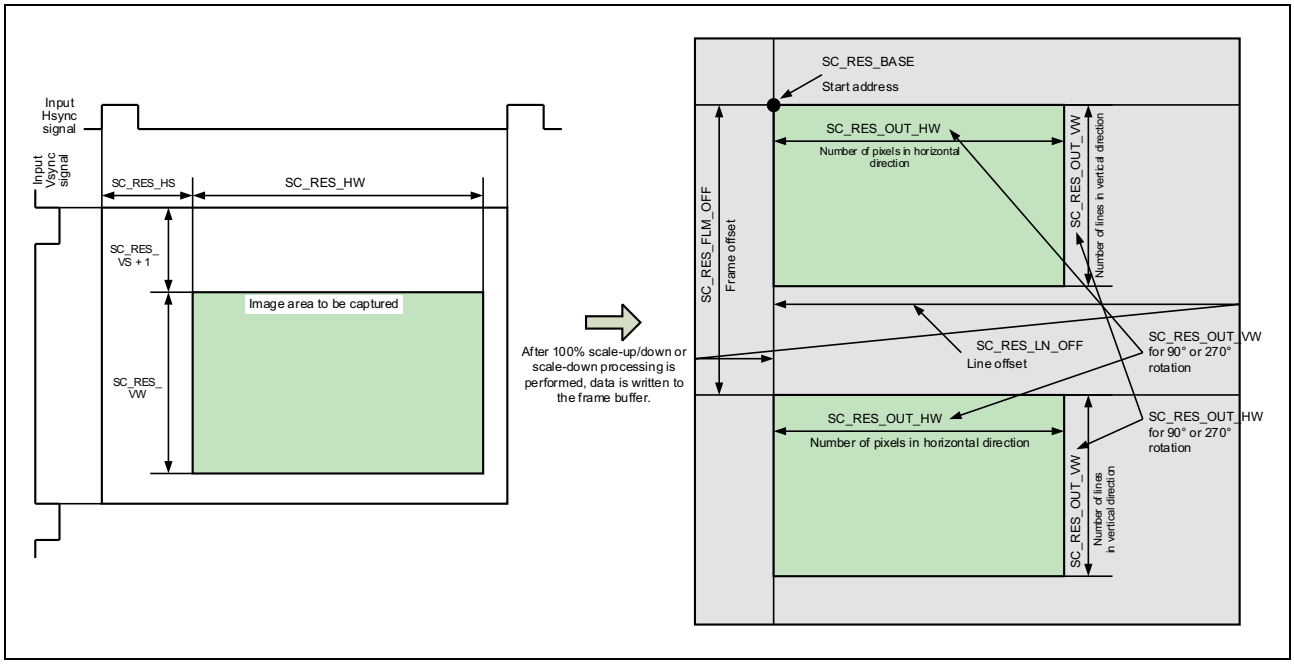

Figure 38.44 Data Arrangement in Frame Buffer

Table 38.102 Calculation of Addresses in Frame Buffer

Register Name	Bit Name	Initial Value	Description
GR_FLM2	GR_BASE[31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. The lower seven bits should be fixed to 000 0000.
GR_FLM3	GR_LN_OFF[14:0]	0	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0:GR_BASE Line 1:GR_BASE + GR_LN_OFF × 1 : Line n: GR_BASE + GR_LN_OFF × n The lower seven bits should be fixed to 000 0000.
GR_FLM4	GR_FLM_OFF[22:0]	0	Frame Buffer Frame Offset Address (lower) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR_BASE Buffer 1: GR_BASE + GR_FLM_OFF × 1 : Buffer n: GR_BASE + GR_FLM_OFF × n The lower seven bits should be fixed to 000 0000.

(7) Setting Frame Buffer Size Smaller than One Frame

Frame buffer size can be set in one-line units.

When the number of lines set with the GR_FLM_LOOP[10:0] bits is smaller than the value of the GR_FLM_LNUM[10:0] bits, data is again read from the start address of the frame buffer after the number of lines set with the (GR_FLM_LOOP[10:0] + 1) bits have been read.

Table 38.103 Setting of Frame Buffer Size Smaller than One Frame

Register Name	Bit Name	Initial Value	Description
GR_FLM5	GR_FLM_LOOP[10:0]	1023	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR_FLM_LOOP + 1).

(8) Line Offset Control for Frame Buffer

The following bit sets the line offset address direction of the frame buffer.

Table 38.104 Line Offset Address Direction Control for Frame Buffer

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_LN_OFF_DIR	0	Selects the line offset address direction of the frame buffer. 0:Increments the address by the line offset address. 1:Decrements the address by the line offset address.

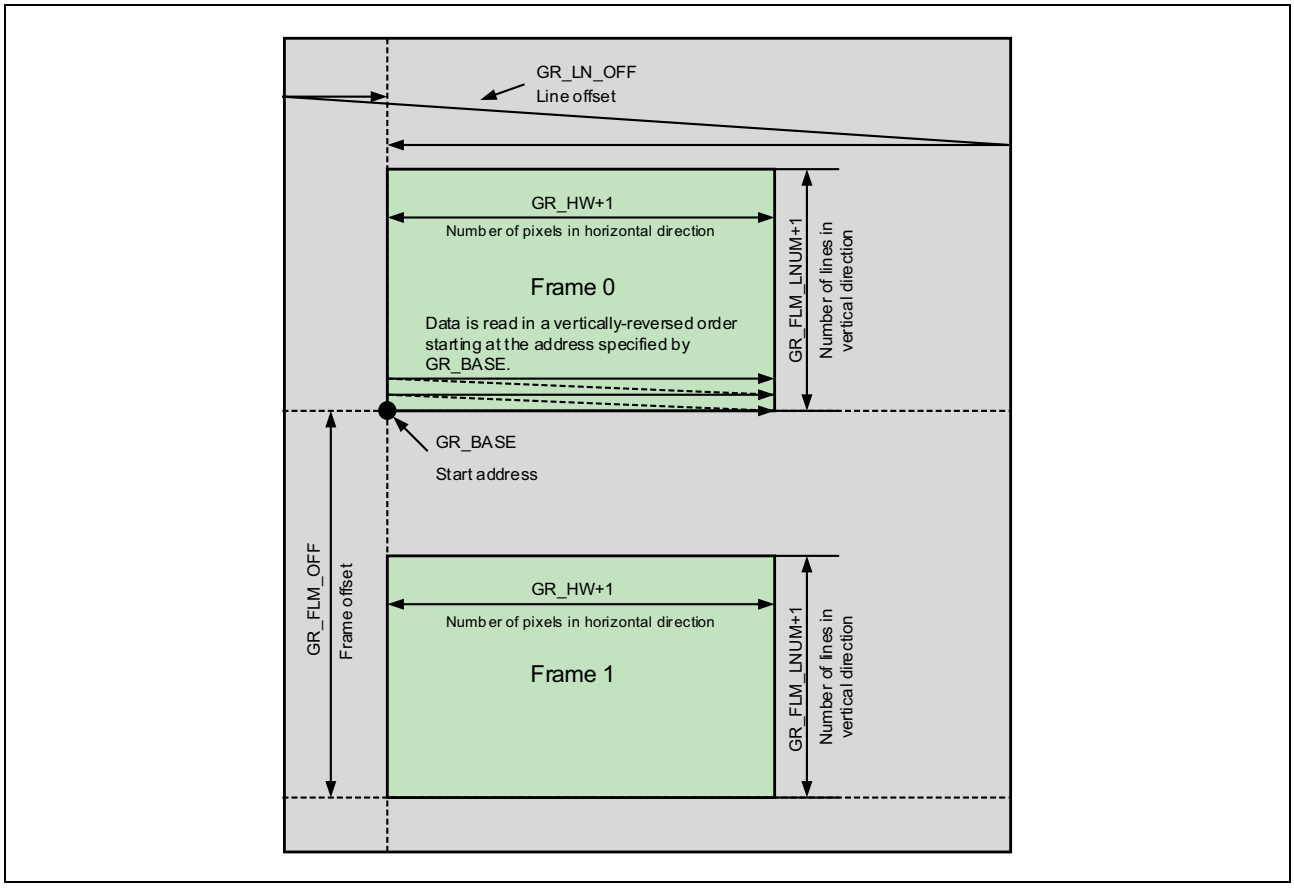

Figure 38.45 Data Arrangement with Line Offset and Decrement Control

(9) Selecting Format of Frame Buffer Read Signal

Signal formats RGB565, RGB888, αRGB1555, αRGB4444, αRGB8888, RGBα5551, RGBα8888, CLUT8, CLUT4 and CLUT1 are supported for the graphics 0, 1, 2, 3, and OIR processes. The YCbCr422 and YCbCr444 formats are also supported for the graphics 0 and 1 processes.

The GR_FORMAT[3:0] bits select a signal format.

Table 38.105 Format Selection for Frame Buffer Read Signal

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_FORMAT[3:0]	0	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: YCbCr422 or setting prohibited *1 9: YCbCr444 or setting prohibited *1 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited

Note 1. Setting this value selects YCbCr422 and YCbCr444 for the graphics 0 and 1 processes, and is prohibited for the graphics 2, 3, and OIR processes.

(10) Endian Control

In the frame buffer, data is handled in 64-bit units, and endian of the data to be read can be controlled by setting the GR_RDSWA[2:0] bits. Bit 0 of these bits indicates whether 8-bit data is swapped. Bit 1 indicates whether 16-bit data is swapped. Bit 2 indicates whether 32-bit data is swapped. In the YCbCr422 format, data can be arranged with the GR_YCC_SWAP[2:0] bits.

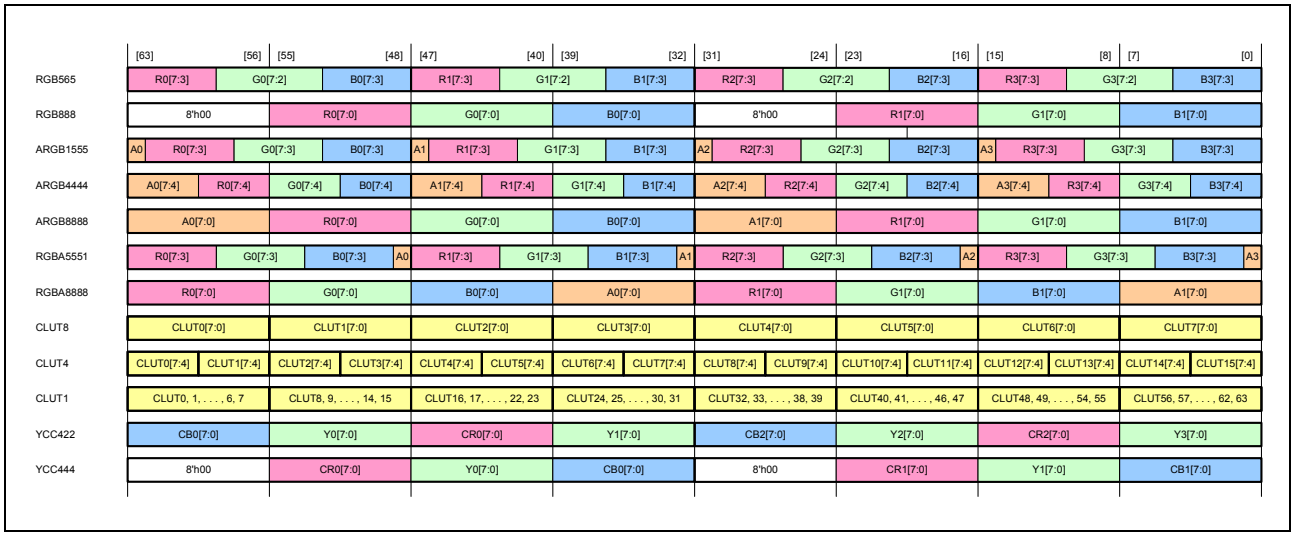

Figure 38.46 Data Arrangement with Endian Control Disabled (GR_RDSWA = 000)

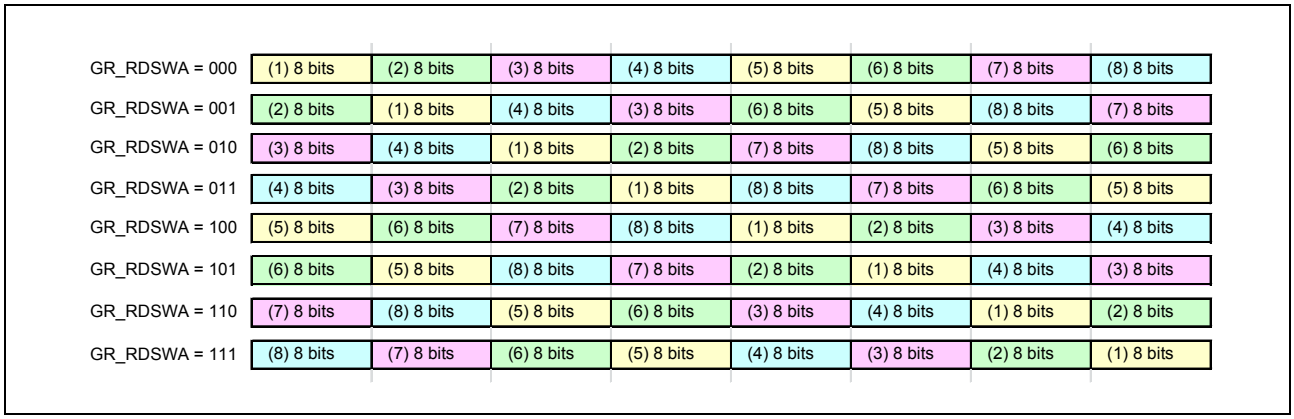

Figure 38.47 Data Arrangement with Endian Control Enabled

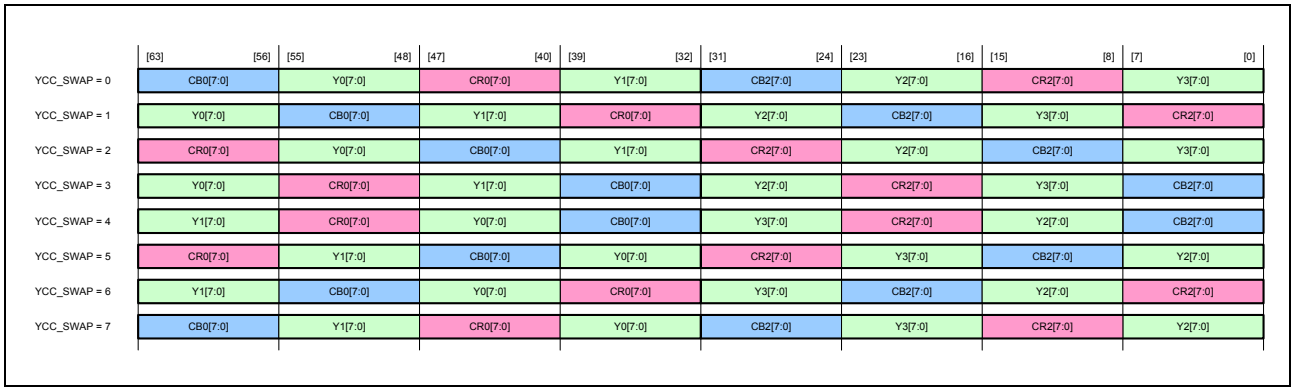

Figure 38.48 YCbCr422 Data Arrangement with Swapping Enabled

Table 38.106 Endian Control

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_RDSWA[2:0]	0	Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]
GR_FLM6	GR_YCC_SWAP [2:0]	0	Controls swapping of data read from buffer in the YCbCr422 format. *1 0: Cb/Y0/Cr/Y1 1: Y0/Cb/Y1/Cr 2: Cr/Y0/Cb/Y1 3: Y0/Cr/Y1/Cb 4: Y1/Cr/Y0/Cb 5: Cr/Y1/Cb/Y0 6: Y1/Cb/Y0/Cr 7: Cb/Y1/Cr/Y0

Note 1. These bits are supported for the graphics 0 and 1 processes only.

(11) Display Start Pixel Setting for Read Data

When a horizontal offset is applied to display the image data in the frame buffer, the display start pixel is set with the GR_BASE[31:0] and GR_STA_POS[5:0] bits. Calculation of the values for the GR_BASE[31:0] and GR_STA_POS[5:0] bits depends on the signal format. The display start pixel can be calculated with the formulas in the table below, where H_OFF is a horizontal offset from the display start pixel.

Table 38.107 Calculation of Display Start Position for Various Signal Formats

Signal Format of Video/Graphics	Number of Bits per Pixel	Calculation Formula *1
RGB888 αRGB8888, RGBα8888 YCbCr422*2 YCbCr444*3	32	GR_BASE[31:7] += int (H_OFF ÷ 2) * BPP GR_STA_POS[5:0] = mod (H_OFF ÷ 2)
RGB565 αRGB1555, RGBα5551 αRGB4444	16	GR_BASE[31:7] += int (H_OFF ÷ 4) * BPP GR_STA_POS[5:0] = mod (H_OFF ÷ 4)
CLUT8	8	GR_BASE[31:7] += int (H_OFF ÷ 8) * BPP GR_STA_POS[5:0] = mod (H_OFF ÷ 8)
CLUT4	4	GR_BASE[31:7] += int (H_OFF ÷ 16) * BPP GR_STA_POS[5:0] = mod (H_OFF ÷ 16)
CLUT1	1	GR_BASE[31:7] += int (H_OFF ÷ 64) * BPP GR_STA_POS[5:0] = mod (H_OFF ÷ 64)

Note 1. The functions int() and mod() output a quotient and a remainder, respectively.
Note 2. The YCbCr422 format is not supported for the graphics 2, 3, and OIR processes.
In the YCbCr422 format, 32 bits are used for two pixels (Cb, Y0, Cr, and Y1 components). Therefore, the start position is controlled in units of 32 bits.
Note 3. The YCbCr444 format is not supported for the graphics 2, 3, and OIR processes.

Table 38.108 Setting of Display Start Pixel of Read Data

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_STA_POS[5:0]	0	Sets the amount of pixels to be skipped through. Specifically pixels amount equal to the amount indicated by GR_STA_POS is skipped from the start of the line.
GR_FLM2	GR_BASE[31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. The lower seven bits should be fixed to 000 0000.

(12) YCbCr422 to YCbCr444 Conversion

Data format for the graphics 0 and 1 processes are converted from YCbCr422 to YCbCr444.

This function is not supported for the graphics 2, 3, and OIR processes.

Table 38.109 YCbCr422 to YCbCr444 Conversion

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_CNV444_MD	0	Sets the interpolation mode for YCbCr422 to YCbCr444 conversion. *1 0: Hold interpolation 1: Average interpolation

Note 1. This register is not provided for the graphics 2, 3, and OIR processes, for which the YCbCr422 format is not supported.

(13) Bit Extension

When the value of the GR_FORMAT[3:0] bits is 0 to 3, the RGB565, RGB888, αRGB1555, and αRGB4444 formats are converted to the αRGB8888 format. When the value of the GR_FORMAT[3:0] bits is 10, the RGBα5551 format is converted to the RGBα8888 format. The RGBα5551 to RGBα8888 format conversion is omitted because it differs from the αRGB5551 to αRGB8888 format conversion only in the position of α.

- RGB565 to αRGB8888 Format Conversion

  After conversion, α[7:0] is fixed to 255.

  After conversion, R[7:0] = R[4:0] × 263 ÷ 32 (round off to an integer), approximation of #R[4:0] × 255 ÷ 31

  After conversion G[7:0] = G[5:0] × 259 ÷ 64 (round off to an integer), approximation of #G[5:0] × 255 ÷ 63

  After conversion, B[7:0] = B[4:0] × 263 ÷ 32 (round off to an integer), approximation of #B[4:0] × 255 ÷ 31

- RGB888 to αRGB8888 Format Conversion

  After conversion, α[7:0] is fixed to 255.

- αRGB1555 to αRGB8888 Format Conversion

  After conversion, α[7:0] is GR_A1 when α input is 1, and GR_A0 when 0.

After conversion, R[7:0] = R[4:0] × 263 ÷ 32 (round off to an integer), approximation of #R[4:0] × 255 ÷ 31

After conversion, G[7:0] = G[4:0] × 263 ÷ 32 (round off to an integer), approximation of #G[4:0] × 255 ÷ 31

After conversion, B[7:0] = B[4:0] × 263 ÷ 32 (round off to an integer), approximation of #B[4:0] × 255 ÷ 31

- αRGB4444 to αRGB8888 Format Conversion

  After conversion, α[7:0] = α[3:0] × 17

  After conversion, R[7:0] = R[3:0] × 17

  After conversion, G[7:0] = G[3:0] × 17

  After conversion, B[7:0] = B[3:0] × 17

(14) Buffer Underflow Processing

When data read from the frame buffer cannot be completed due to bus-traffic related problems, an underflow interrupt signal is output.

38.6.1.3 Setting Graphics Display Area

The graphics display area is set with the GR_GRC_HS[10:0], GR_GRC_HW[10:0], GR_GRC_VS[10:0], and GR_GRC_VW[10:0] bits based on the rising edges of the Hsync and Vsync signals.

Figure 38.49 shows the graphics display area.

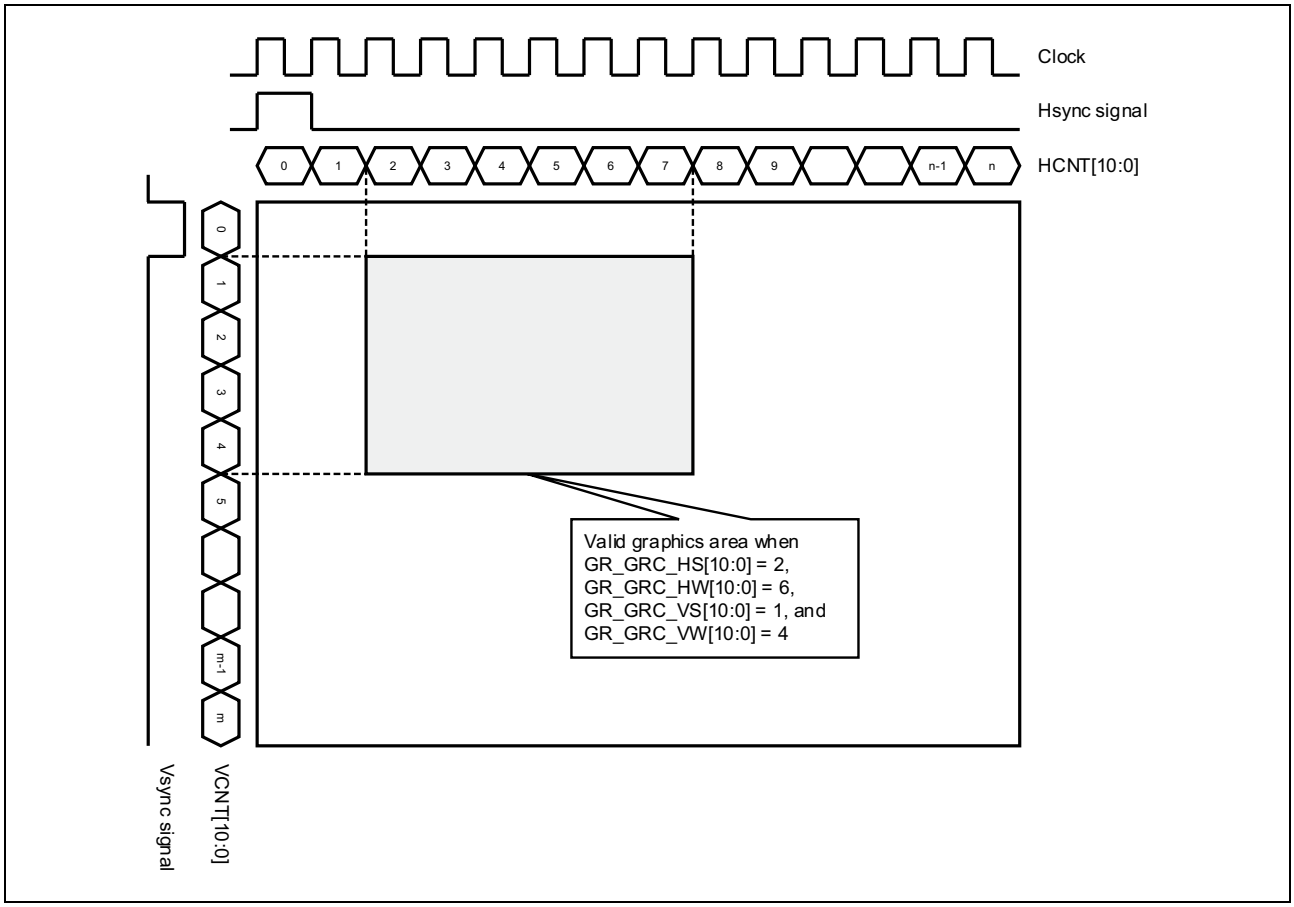

Figure 38.49 Graphics Display Area

The frame line of the graphics area can be displayed by setting the GR_GRC_DISP_ON bit to 1.

Table 38.110 Graphics Image Area Setting

Register Name	Bit Name	Initial Value	Description
GR_AB3	GR_GRC_HS[10:0]	0	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR_GRC_HS + GR_GRC_HW should be smaller than or equal to 2015 clocks.
GR_AB3	GR_GRC_HW[10:0]	0	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR_HW to 2 and GR_GRC_HW to 1 (1-pixel) or 2 (2-pixel).
GR_AB2	GR_GRC_VS[10:0]	0	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR_GRC_VS + GR_GRC_VW should be smaller than or equal to 2039 lines.
GR_AB2	GR_GRC_VW[10:0]	0	Sets the vertical width of the graphics image area.
GR_AB1	GR_GRC_DISP_ON	0	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on

38.6.1.4 Interrupt Generation at Specified Line

An interrupt signal can be generated at the line specified with the GR_LINE[10:0] bits.

Table 38.111 Interrupt Generation at Specified Line

Register Name	Bit Name	Initial Value	Description*1
GR_CLUT_INT	GR_LINE[10:0]	0	Line Interrupt Set When the number of lines matches the value of the GR_LINE bits, an interrupt signal is output. This function is supported for the graphics 3 and OIR processes only. This function supported for the graphics 3 process is enabled even when the graphics 3 process is not used. This function supported for the graphics OIR process is enabled only when the output image generator is enabled.

Note 1. This function is supported for the graphics 3 and OIR processes only; these bits are not supported for the graphics 0, 1, and 2 processes.

38.6.1.5 Formats of Frame Buffer Read Signals and Corresponding Alpha Blending Types

Setting the GR_FORMAT[3:0] bits selects the format of the signal read from the frame buffer.

Table 38.112 shows the signal formats and the corresponding alpha blending types. The priority of the alpha value is: alpha blending in rectangular area > chroma-key processing > alpha blending in pixel units.

Table 38.112 Formats of Frame Buffer Read Signal and Corresponding Alpha Blending Types

GR_FORMAT[3:0]	Signal Format	Alpha Blending in Rectangular Area	RGB-Index Chroma-Key Processing	CLUT-Index Chroma-Key Processing	Alpha Blending in Pixel Units
0	RGB565	Supported	Supported	Not supported	Not supported *2
1	RGB888	Supported	Supported	Not supported	Not supported *2
2	αRGB1555	Supported	Supported *1*3	Not supported	Supported *3
3	αRGB4444	Supported	Supported *1	Not supported	Supported
4	αRGB8888	Supported	Supported	Not supported	Supported
5	CLUT8	Supported	Not supported	Supported	Supported
6	CLUT4	Supported	Not supported	Supported	Supported
7	CLUT1	Supported *4	Not supported	Supported *4	Supported *4
8	YCbCr422	Not supported *5	Not supported *5	Not supported *5	Not supported *5
9	YCbCr444	Not supported *5	Not supported *5	Not supported *5	Not supported *5
10	RGBα5551	Supported	Supported *1*3	Not supported	Supported *3
11	RGBα8888	Supported	Supported	Not supported	Supported

Note 1. When each color component of the RGB signal read from the frame buffer is not 8 bits, it is converted to 8 bits by calculation in RGB-index chroma-key processing. (See Section (13), Bit Extension.)

Note 2. Since α value is 255, the current graphics is always displayed.

Note 3. α value for data read from the frame buffer is specified with one bit. This one-bit signal selects one of the two registers, each of which holds an 8-bit α value.

Note 4. CLUT value for the frame buffer signal is specified with one bit. This one-bit signal selects one of the two registers, each of which holds the α, G, B, and R values (8 bits for each value). The CLUT table is not referenced.

Note 5. YCbCr422 and YCbCr444 are supported for the graphics 0 and 1 processes, but any type of blending and chroma-key processing cannot be used.

38.6.1.6 Display Selection

The GR_DISP_SEL[1:0] bits select the graphics to be displayed from the background color, the lower-layer graphics, the current graphics, and the blended image of the lower-layer graphics and the current graphics. For blending, alpha blending in a rectangular area, multiplication with current alpha at alpha blending in a rectangular area, RGB-index chroma-key processing, CLUT-index chroma-key processing, alpha blending in one-pixel units, or premultiplication at alpha blending in one-pixel units can be selected. Only alpha blending in a rectangular area can be selected in the VIN synthesizer.

Table 38.113 shows the settings for various display types.

Table 38.113 Settings for Various Display Types

GR_DISP_SEL [1:0]	GR_ARC_ON	GR_CK_ON	GR_ARC_MUL	GR_ACALC_MD	Processing for Graphics Area	Processing for the Area outside the Graphics Area
0	—	—	—	—	Background color	Background color
1	—	—	—	—	Lower-layer graphics	Lower-layer graphics
2	—	—	—	—	Current graphics	Background color
3	1	—	0	0	Alpha blending in a rectangular area*1	Lower-layer graphics
3	1	—	0	1	Setting prohibited	
3	1	—	1	0	Multiplication with current alpha at alpha blending in a rectangular area*2	Lower-layer graphics
3	1	—	1	1	Multiplication with current alpha at alpha blending in a rectangular area with alpha premultiplied*2	Lower-layer graphics
3	0	1	—	—	RGB-index or CLUT-index chroma-key processing*3	Lower-layer graphics
3	0	0	—	0	Alpha blending in one-pixel units*2	Lower-layer graphics
3	0	0	—	1	Premultiplication at alpha blending in one-pixel units*2	Lower-layer graphics

Note 1. The alpha blending in a rectangular area is not supported for the graphics 0 process in the scaler and the graphics OIR process. When this processing is selected in the VIN synthesizer, cascaded connection cannot be selected in the scaler.

Note 2. The multiplication with current alpha at alpha blending in a rectangular area and alpha blending function in one-pixel units are supported for the graphics 1, 2, and 3 processes only.

Note 3. The RGB-index or CLUT-index chroma-key processing is not supported for the VIN synthesizer and OIR.

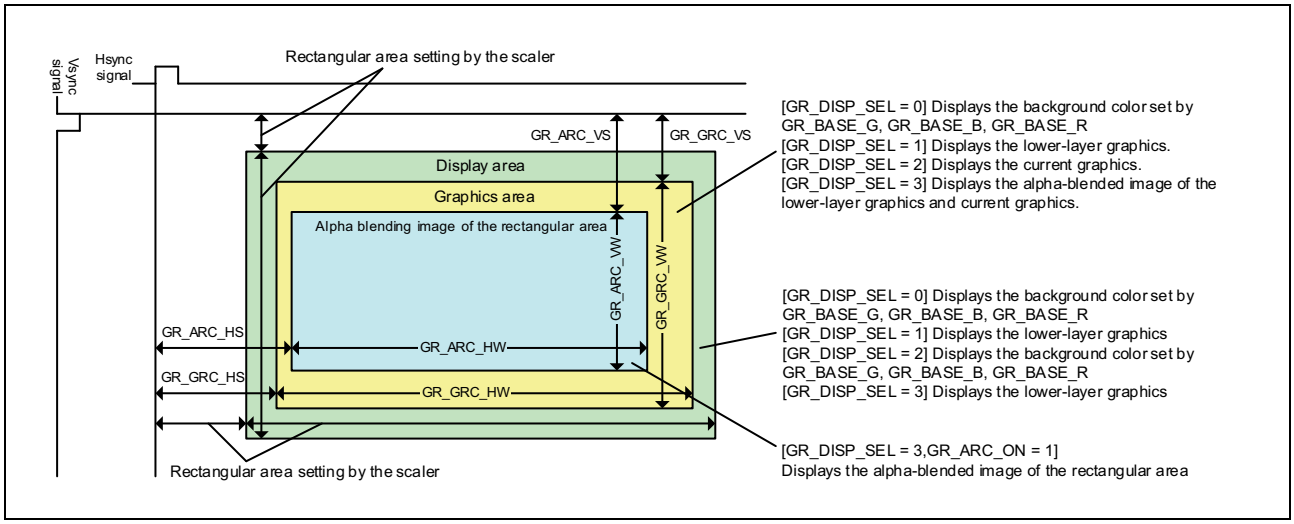

Figure 38.50 Graphic Display Types

Figure 38.51 shows the graphics planes displayed when the GR_DISP_SEL bits are set to 3.

For correspondence between the lower-layer graphics and the current graphics, see **Figure 38.43**.

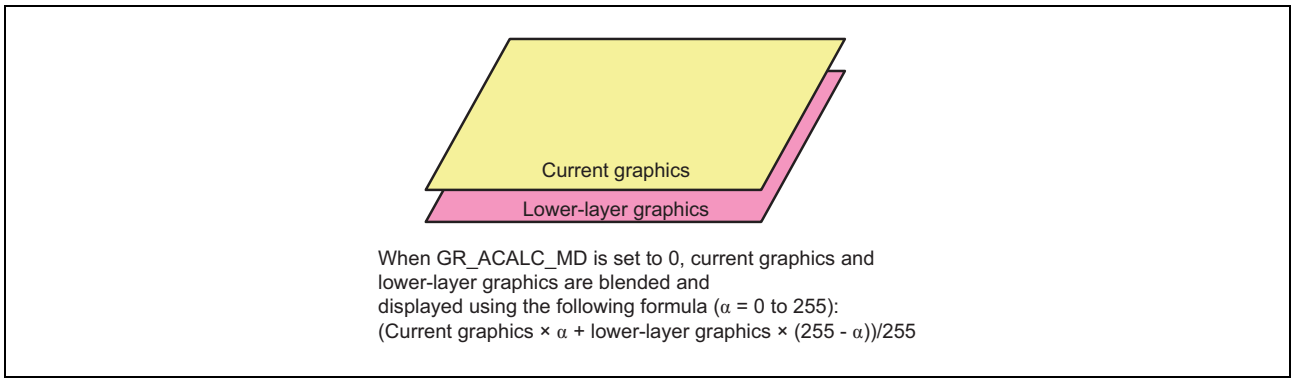

Figure 38.51 Graphics Planes with GR_DISP_SEL Set to 3

Table 38.114 Alpha Blending Setting (1/2)

Register Name	Bit Name	Initial Value	Description
GR_AB1	GR_DISP_SEL [1:0]	0	Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics*1 Note: The outside of a layer is only transparent if 3 is selected. If 2 is selected, the color outside of the layer is the color contained in GR_BASE register.
GR_AB1	GR_ARC_ON	0	Turns on/off alpha blending in a rectangular area.*2 0: Off 1: On

Table 38.114 Alpha Blending Setting (2/2)

Register Name	Bit Name	Initial Value	Description
GR_AB1	GR_ARC_MUL	0	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area*3 0: Off 1: On
GR_AB1	GR_ACALC_MD	0	Turns on/off premultiplication processing at alpha blending in one-pixel units*3 0: Off 1: On
GR_AB7	GR_CK_ON	0	Turns on/off CLUT-index/RGB-index chroma-key processing. *4 0: Off 1: On

Note 1. The graphics 0 and OIR processes support the chroma-key processing only. When performing chroma-key processing, set the α value for converting the pixels to be subjected to chroma-key processing, and the α value of the pixels not to be subjected to the chroma-key processing to 255 to display the current graphics only. The VIN synthesizer supports display processing with alpha blending in a rectangular area only.

Note 2. This function is supported only for the graphics 1, 2, and 3 processes and the VIN synthesizer. This bit is not provided for the graphics 0 and OIR processes.

Note 3. This function is supported only for the graphics 1, 2, and 3 processes. This bit is not provided for the graphics 0 and OIR processes and the VIN synthesizer and OIR.

Note 4. This bit is not provided for the VIN synthesizer.

38.6.1.7 Background Color Display Processing

The color set with the GR_BASE_G[7:0], GR_BASE_B[7:0], and GR_BASE_R[7:0] bits is displayed.

G output = GR_BASE_G

B output = GR_BASE_B

R output = GR_BASE_R

Table 38.115 Background Color Setting

Register Name	Bit Name	Initial Value	Description
GR_BASE	GR_BASE_G[7:0]	0	Background color G signal G: 8 bits; unsigned (0 to 255 [LSB])
GR_BASE	GR_BASE_B[7:0]	0	Background color B signal B: 8 bits; unsigned (0 to 255 [LSB])
GR_BASE	GR_BASE_R[7:0]	0	Background color R signal R: 8 bits; unsigned (0 to 255 [LSB])

38.6.1.8 Lower-Layer Graphics Display Processing

The lower-layer graphics are displayed as follows:

G output = G input of lower-layer graphics

B output = B input of lower-layer graphics

R output = R input of lower-layer graphics

38.6.1.9 Current Graphics Display Processing

The current graphics are displayed as follows:

G output = G input of current graphics

B output = B input of current graphics

R output = R input of current graphics

38.6.1.10 Display with Alpha Blending in a Rectangular Area

The rectangular area subjected to alpha blending is set with the GR_ARC_HS[10:0], GR_ARC_HW[10:0], GR_ARC_VS[10:0], and GR_ARC_VW[10:0] bits based on the rising edges of the Hsync and Vsync signals. This function is not supported for the graphics 0 and OIR processes.

Figure 38.52 shows the rectangular area setting for alpha blending.

NOTE

Alpha blending and Chroma-Key features are not supported for Graphic Layer 0 (GR0).

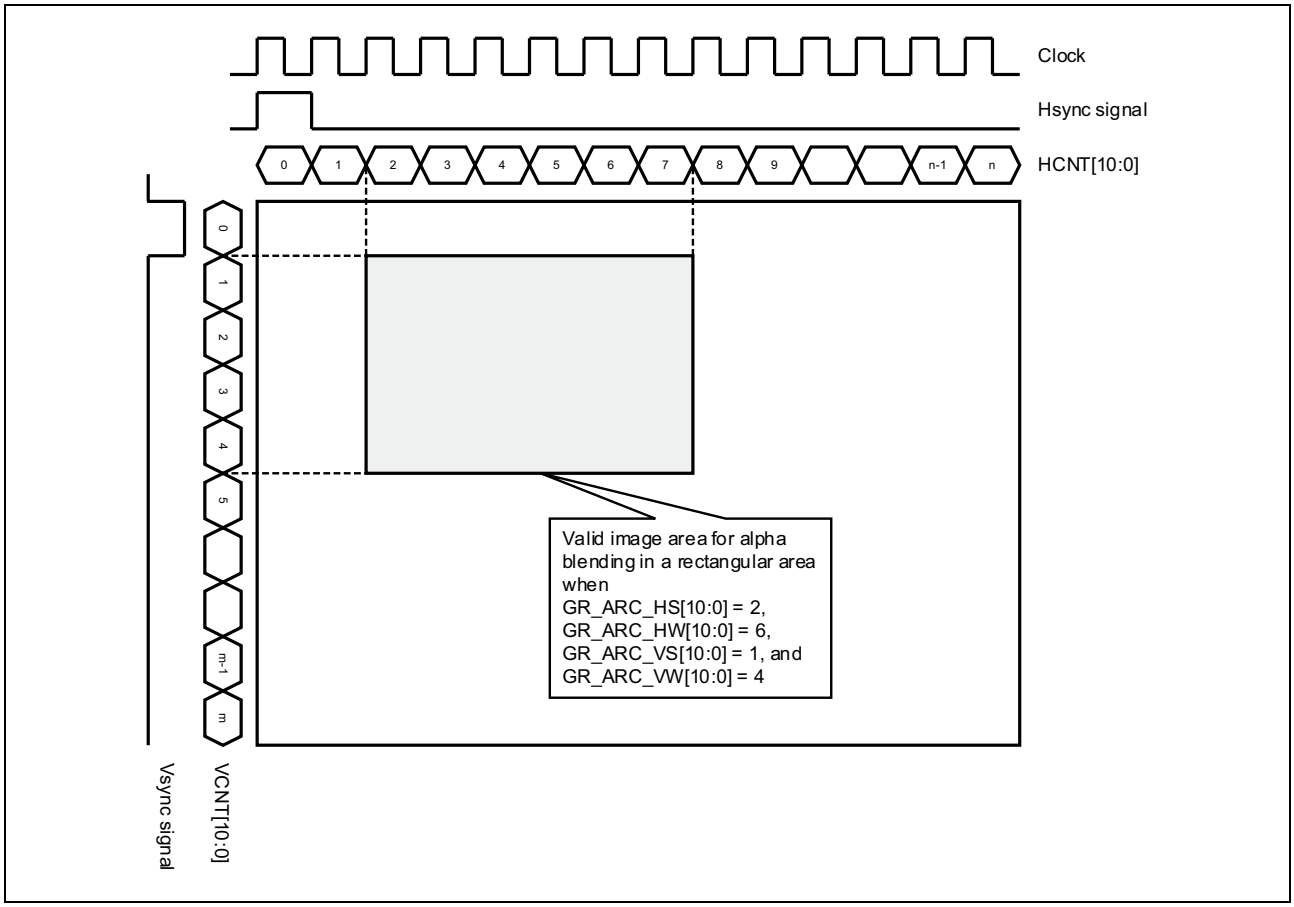

Figure 38.52 Rectangular Area Setting for Alpha Blending

The frame line of graphics area can be displayed by setting the GR_ARC_DISP_ON bit to 1.

Table 38.116 Setting of Rectangular Area for Alpha Blending (1/2)

Register Name	Bit Name	Initial Value	Description
GR_AB5	GR_ARC_HS[10:0]	0	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
GR_AB5	GR_ARC_HW[10:0]	0	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.

Table 38.116 Setting of Rectangular Area for Alpha Blending (2/2)

Register Name	Bit Name	Initial Value	Description
GR_AB4	GR_ARC_VS[10:0]	0	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
GR_AB4	GR_ARC_VW[10:0]	0	Sets the vertical width of the valid image area for alpha blending in a rectangular area.
GR_AB1	GR_ARC_DISP_ON	0	Turns on/off frame-line display of the valid image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on

In alpha blending in a rectangular area, the current graphics are faded in or out by setting the fade-in or fade-out coefficients with the GR_ARC_DEF[7:0], GR_ARC_MODE, GR_ARC_COEF[7:0], and GR_ARC_RATE[7:0] bits.

First, the value of the GR_ARC_DEF[7:0] bits is assigned to the α value.

Then, each time the Vsync signal rises for the number of times set with the GR_ARC_RATE[7:0] bits + 1, the value of the GR_ARC_COEF[7:0] bit is added to or subtracted from the α value.

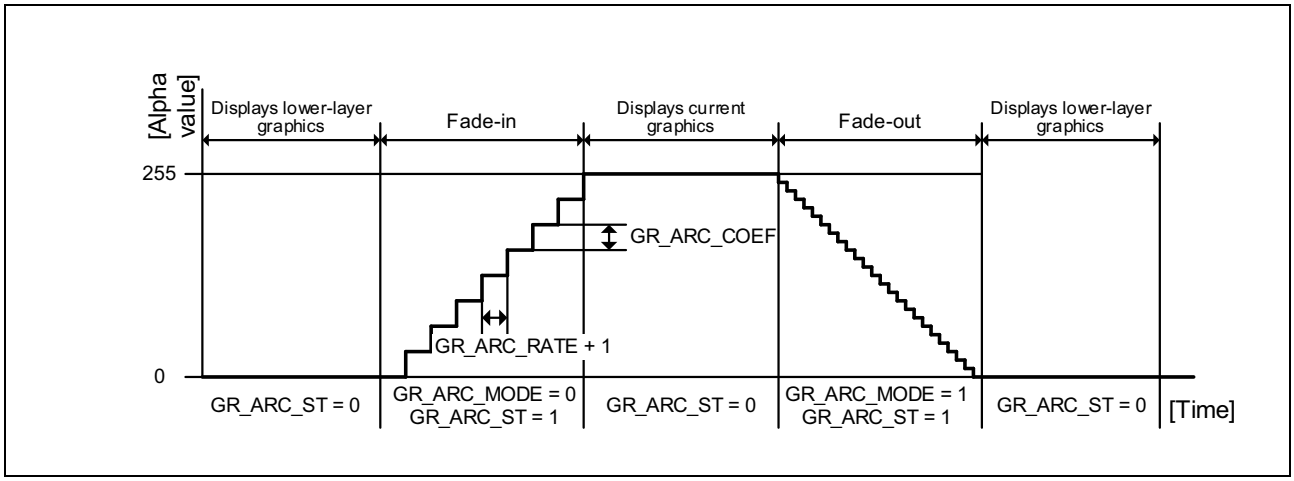

Figure 38.53 Fade In and Fade Out

Table 38.117 Setting for Alpha Blending in a Rectangular Area

Register Name	Bit Name	Initial Value	Description
GR_AB7	GR_ARC_DEF[7:0]	0	Sets the initial alpha value for alpha blending in a rectangular area.
GR_AB6	GR_ARC_MODE	0	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
GR_AB6	GR_ARC_COEF[7:0]	0	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
GR_AB6	GR_ARC_RATE[7:0]	0	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.
GR_MON	GR_ARC_ST	—	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

The values specified with the following expressions are used in the alpha blending calculation described in Section 38.6.1.14, Alpha Blending Calculation.

α value = Fade-in/out coefficient

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

38.6.1.11 RGB-Index Chroma-Key Processing

The pixels that satisfy all the expressions below are subjected to RGB-index chroma-key processing.

G input of the current graphics = GR_CK_KG

B input of the current graphics = GR_CK_KB

R input of the current graphics = GR_CK_KR

In RGB-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in Section 38.6.1.14, Alpha Blending Calculation. This function is not supported in the VIN synthesizer.

α value = GR_CK_A

G value = GR_CK_G

B value = GR_CK_B

R value = GR_CK_R

For the pixels that are not subjected to RGB-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in **Section 38.6.1.14, Alpha Blending Calculation**.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

Table 38.118 Setting for RGB-Index Chroma-Key Processing

Register Name	Bit Name	Initial Value	Description
GR_AB8	GR_CK_KG[7:0]	0	G Signal for RGB-Index Chroma-Key Processing G: 8 bits; unsigned (0 to 255 [LSB])
GR_AB8	GR_CK_KB[7:0]	0	B Signal for RGB-Index Chroma-Key Processing B: 8 bits; unsigned (0 to 255 [LSB])
GR_AB8	GR_CK_KR[7:0]	0	R Signal for RGB-Index Chroma-Key Processing R: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_A[7:0]	0	Replaced Alpha Signal after RGB-Index Chroma-Key Processing*1 α: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_G[7:0]	0	Replaced G Signal after RGB-Index Chroma-Key Processing G: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_B[7:0]	0	Replaced B Signal after RGB-Index Chroma-Key Processing B: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_R[7:0]	0	Replaced R Signal after RGB-Index Chroma-Key Processing R: 8 bits; unsigned (0 to 255 [LSB])

Note 1. To use this function for the graphics 0 and OIR processes, the alpha value should be set to 255.

NOTE

Alpha blending and Chroma-Key features are not supported for Graphic Layer 0 (GR0).

38.6.1.12 CLUT-Index Chroma-Key Processing

The pixels that satisfy the expression below are subjected to CLUT-index chroma-key processing.

CLUT input of the current graphics = GR_CK_KCLUT

In CLUT-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in Section 38.6.1.14, Alpha Blending Calculation. This function is not supported in the VIN synthesizer and OIR.

α value = GR_CK_A

G value = GR_CK_G

B value = GR_CK_B

R value = GR_CK_R

For the pixels that are not subjected to CLUT-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in **Section 38.6.1.14, Alpha Blending Calculation**.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

NOTE

Alpha blending and Chroma-Key features are not supported for Graphic Layer 0 (GR0).

38.6.1.13 Display with Alpha Blending in One-Pixel Units

In the alpha blending in one-pixel units, the values specified with the following expressions are used in the alpha blending calculation described in Section 38.6.1.14, Alpha Blending Calculation. This function is not supported in the graphics 0 and OIR processes and the VIN synthesizer.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

38.6.1.14 Alpha Blending Calculation

Alpha blending of two input signals is performed using the α value as described below (rounded up if the result includes a decimal fraction).

[GR_ACALC_MD = 0]

G output = (G value × α value + G input of the lower-layer graphics × (255 − α value)) ÷ 256

B output = (B value × α value + B input of the lower-layer graphics × (255 − α value)) ÷ 256

R output = (R value × α value + R input of the lower-layer graphics × (255 − α value)) ÷ 256

[GR_ACALC_MD = 1 (premultiplication)]

G output = (G value + G input of the lower-layer graphics × (255 − α value)) ÷ 256

B output = (B value + B input of the lower-layer graphics × (255 − α value)) ÷ 256

R output = (R value + R input of the lower-layer graphics × (255 − α value)) ÷ 256

38.6.1.15 CLUT Table

When the signal format is CLUT8 or CLUT4, the format is converted to αRGB8888 based on the CLUT table. When the format is CLUT1, it is converted to αRGB8888 based on the register value.

Figure 38.54 shows data arrangement in the CLUT table.

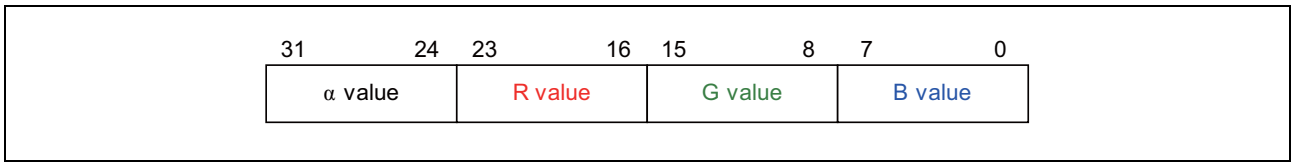

Figure 38.54 Data Arrangement in CLUT Table

For the addresses of the CLUT tables, see the register configuration described in **Section 38.6.2, Register Descriptions**.

Two CLUT tables (CLUT table 0, CLUT table 1) on the different planes are allocated to the same address and one of the tables is selected with the GR_CLT_SEL bit. This allows rewriting one CLUT table when this module refers to the other CLUT table.

Table 38.119 CLUT Table Selection

Register Name	Bit Name	Initial Value	Description
GR_CLUT	GR_CLT_SEL	0	CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to αRGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to αRGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.

NOTE

Before switching CLUT table by GR_CLT_SEL, CPU must wait until the read value from the last written address is same as the last written value.

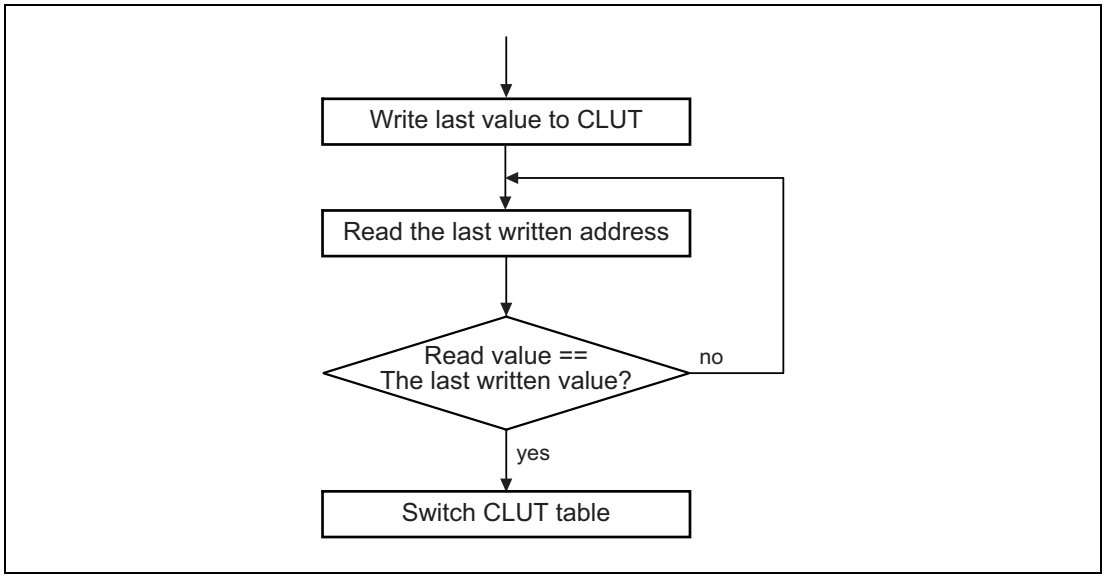

Figure 38.55 CLUT switching

38.6.1.16 Multiplication Processing with Current Alpha at Alpha Blending in Rectangular Area

In multiplication processing with current alpha at alpha blending in a rectangular area, the values specified with the following expressions are used in the alpha blending calculation described in Section 38.6.1.14, Alpha Blending Calculation.

[GR_ARC_MUL = 0]

α value = Fade-in/out coefficient

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

[GR_ARC_MUL = 1]

α value = Fade-in/out coefficient x α input of current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

38.6.1.17 Selection of Lower-Layer/Current Graphics in VIN Synthesizer

Graphics 0 and 1 are allocated to the lower-layer/current graphics in the VIN synthesizer, respectively.

Table 38.120 Selection of Lower-Layer Plane in Scaler

Register Name	Bit Name	Initial Value	Description
GR_VIN_AB1	GR_VIN_SCL_UND_SEL	0	Specifies lower-layer plane in the scaler. 0: Selects graphics 0 as lower-layer graphics and graphics 1 as current graphics. 1: Selects graphics 1 as lower-layer graphics and graphics 0 as current graphics.

38.6.2 Register Descriptions

Table 38.121 to **Table 38.128** show the register configuration.

- Symbols used in Register Description:

  Initial value: Register value after a reset

  —: Undefined value

  R/W: Readable/writable. The written value can be read.

  R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

  R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

  R: Read-only. The write value should always be 0.

  —/W: Write-only. The read value is undefined.

Table 38.121 shows the register configuration for the graphics 2 process of channel 0.

Table 38.122 shows the register configuration for the graphics 3 process of channel 0.

Table 38.123 shows the CLUT table configuration of channel 0.

Table 38.124 shows the register configuration for the VIN synthesizer of channel 0.

Table 38.125 shows the register configuration for the graphics 2 process of channel 1.

Table 38.126 shows the register configuration for the graphics 3 process of channel 1.

Table 38.127 shows the CLUT table configuration of channel 1.

Table 38.128 shows the register configuration for the VIN synthesizer of channel 1.

The register configuration for the graphics 0 and 1 processes is described in Section 38.4, Scaler.

Table 38.121 Register Configuration of the Image Synthesizer (Graphics 2 Process) (Channel 0) (1/2)

Module Name	Register Name	Symbol	R/W	Initial Value	Address	Access Size
VDCE0	Graphics 2 register update control register	GR2_UPDATE	R/WC1	H'0000 0000	<VDCE0_base> + 1700	32

Module Name	Register Name	Symbol	R/W	Initial Value	Address	Access Size
VDCE1	Alpha blending control register 7 (VIN synthesizer)	GR_VIN_AB7	R/W	H'00FF 0000	<VDCE1_base> + 1E38	32
VDCE1	Background color control register (VIN synthesizer)	GR_VIN_BASE	R/W	H'0000 0000	<VDCE1_base> + 1E4C	32
VDCE1	Status monitor register (VIN synthesizer)	GR_VIN_MON	R	H'0000 0000	<VDCE1_base> + 1E54	32

NOTE

Register access sizes other than defined in the table above are not supported.

NOTE

In the header files the names of the above registers are defined in the following format:

<ModuleName> + <Symbol>.

<ModuleName> and <Symbol> are defined in the above table.

38.6.2.1 Graphics 2 Register Update Control Register (GR2_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR2_UPDATE	—	—	—	GR2_P_VEN	—	—	—	GR2_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR2_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR2_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_IBUS_VEN	0	R/WC1	Frame Buffer Read Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

38.6.2.2 Frame Buffer Read Control Register (Graphics 2) (GR2_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

38.6.2.3 Frame Buffer Control Register 1 (Graphics 2) (GR2_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR2_FLM_SEL[1:0]		—	—	—	—	—	—	—	Caution *
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

CAUTION

The initial value “0” of bit 0 must be changed to “1”.

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR2_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR2_FLM_SEL[1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Selects frame 0. 1: Selects register GR2_FLM_NUM[9:0]. 2: Selects frame 0. 3: Setting prohibited
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	Bit0	0	R/W	**CAUTION** The initial value “0” of this bit must be changed to “1”.

Note: GR2_LN_OFF_DIR and GR2_FLM_SEL[1:0] are updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

38.6.2.4 Frame Buffer Control Register 2 (Graphics 2) (GR2_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR2_BASE [31:0]	0	R/W	Frame Buffer Base Address (upper) Sets the start address of the frame buffer where frame data is to be stored. The address must be 128 byte aligned, so the lower 7 bits must be set to 0.

Note: This register is updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

NOTE

Check restriction concerning frame buffer addressing in Section 38.6.1.2, Graphics Data Read Control.

38.6.2.5 Frame Buffer Control Register 3 (Graphics 2) (GR2_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	GR2_LN_OFF[14:0]														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR2_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	GR2_LN_OFF[14:0]	0	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR2_BASE[31:0] Line 1: GR2_BASE[31:0] + GR2_LN_OFF[14:0] × 1 : Line n: GR2_BASE[31:0] + GR2_LN_OFF[14:0] × n The address must be 128 byte aligned, so the lower 7 bits must be set to 0.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR2_FLM_NUM[9:0]	0	R/W	Frame Number of Frame Buffer Manually set the frame number when GR2_FLM_SEL[1:0] = 1.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

38.6.2.6 Frame Buffer Control Register 4 (Graphics 2) (GR2_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR2_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR2_FLM_OFF[22:0]	0	R/W	Frame Buffer Frame Offset Address (upper) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR2_BASE[31:0] Buffer 1: GR2_BASE[31:0] + GR2_FLM_OFF[22:0] × 1 : Buffer n: GR2_BASE[31:0] + GR2_FLM_OFF[22:0] × n The address must be 128 byte aligned, so the lower 7 bits must be set to 0.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

38.6.2.7 Frame Buffer Control Register 5 (Graphics 2) (GR2_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_FLM_ LNUM[10:0]	0	R/W	Sets number of lines in a frame The number of lines is (GR2_FLM_LNUM[10:0] + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_FLM_ LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR2_FLM_LOOP[10:0] + 1).

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

38.6.2.8 Frame Buffer Control Register 6 (Graphics 2) (GR2_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_FORMAT[3:0]				—	GR2_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GR2_RDSWA[2:0]			—	—	—	—	GR2_STA_POS[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR2_ FORMAT [3:0]	0	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: Setting prohibited 9: Setting prohibited 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR2_HW [10:0]	0	R/W	Sets the width of the horizontal enable period. The width is (GR2_HW[10:0] + 1) pixels. Note: Set to 2 or greater.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
12 to 10	GR2_ RDSWA [2:0]	0	R/W	Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	GR2_ STA_POS [5:0]	0	R/W	Sets the amount of pixels to be skipped through. Specifically pixels amount equal to the amount indicated by GR2_STA_POS[5:0] is skipped from the start of the line.

Note: GR2_STA_POS[5:0] is updated when GR2_P_VEN in GR2_UPDATE is 1. GR2_RDSWA[2:0] is updated when GR2_UPDATE in GR2_UPDATE is 1.
GR2_FORMAT[3:0] and GR2_HW[10:0] are updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

38.6.2.9 Alpha Blending Control Register 1 (Graphics 2) (GR2_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_ARC_MUL	GR2_ACALC_MD	—	GR2_ARC_ON	—	—	—	GR2_ARC_DISP_ON	—	—	—	GR2_GRC_DISP_ON	—	—	GR2_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	GR2_ARC_MUL	0	R/W	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area. 0: Off 1: On
14	GR2_ACALC_MD	0	R/W	Turns on/off premultiplication processing at alpha blending in one-pixel units. 0: Off 1: On
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR2_ARC_ON	0	R/W	Turns on/off alpha blending in a rectangular area. 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR2_ARC_DISP_ON	0	R/W	Turns on/off frame-line display of the image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR2_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR2_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.6.2.10 Alpha Blending Control Register 2 (Graphics 2) (GR2_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_GRC_VS[10:0]	0	R/W	Sets the vertical start position of the graphics image area. **NOTE** Set to 4 or greater lines and the result of GR2_GRC_VS[10:0] + GR2_GRC_VW[10:0] should be smaller than or equal to 2039 lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_GRC_VW[10:0]	0	R/W	Sets the vertical width of the graphics image area. **NOTE** GR0_GRC_VS[10:0] + GR0_GRC_VW[10:0] should be equal to or less than 2039 (lines).

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.6.2.11 Alpha Blending Control Register 3 (Graphics 2) (GR2_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_GRC_HS[10:0]	0	R/W	Sets the horizontal start position of the graphics image area. **NOTE** Set to 16 or greater clocks and the result of GR2_GRC_HS[10:0] + GR2_GRC_HW[10:0] should be smaller than or equal to 2015 clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_GRC_HW[10:0]	0	R/W	Sets the horizontal width of the graphics image area. **NOTES** 1. For displaying an image with 1- or 2-pixel horizontal width, set GR2_HW[10:0] to 2 and GR2_GRC_HW[10:0] to 1 (1-pixel) or 2 (2-pixel). 2. GR2_GRC_HS[10:0] + GR2_GRC_HW[10:0] should be smaller than or equal to 2015 clocks.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.6.2.12 Alpha Blending Control Register 4 (Graphics 2) (GR2_AB4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_ARC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_ARC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_ARC_VS[10:0]	0	R/W	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_ARC_VW[10:0]	0	R/W	Sets the vertical width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.6.2.13 Alpha Blending Control Register 5 (Graphics 2) (GR2_AB5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_ARC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_ARC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_ARC_HS[10:0]	0	R/W	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_ARC_HW[10:0]	0	R/W	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.6.2.14 Alpha Blending Control Register 6 (Graphics 2) (GR2_AB6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	GR2_ARC_MODE	GR2_ARC_COEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	GR2_ARC_RATE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	GR2_ARC_MODE	0	R/W	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
23 to 16	GR2_ARC_COEF[7:0]	0	R/W	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	GR2_ARC_RATE[7:0]	0	R/W	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.6.2.15 Alpha Blending Control Register 7 (Graphics 2) (GR2_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR2_ARC_DEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_CK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR2_ARC_DEF[7:0]	255	R/W	Sets the initial alpha value for alpha blending in a rectangular area.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_CK_ON	0	R/W	Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.6.2.16 Alpha Blending Control Register 8 (Graphics 2) (GR2_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_CK_KCLUT[7:0]								GR2_CK_KG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_CK_KB[7:0]								GR2_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_CK_KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR2_CK_KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_CK_KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_CK_KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.6.2.17 Alpha Blending Control Register 9 (Graphics 2) (GR2_AB9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_CK_A[7:0]								GR2_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_CK_B[7:0]								GR2_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_CK_A [7:0]	0	R/W	Replaced Alpha Signal after RGB/CLUT-Index Chroma-Key Processing α: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR2_CK_G [7:0]	0	R/W	Replaced G Signal after RGB/CLUT-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_CK_B [7:0]	0	R/W	Replaced B Signal after RGB/CLUT-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_CK_R [7:0]	0	R/W	Replaced R Signal after RGB/CLUT-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.6.2.18 Alpha Blending Control Register 10 (Graphics 2) (GR2_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_A0[7:0]								GR2_G0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_B0[7:0]								GR2_R0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_A0 [7:0]	0	R/W	CLUT0 α0 Signal Replaced with α signal when in the CLUT0 format and CLUT0= 0. Replaced with α signal when in the αRGB1555 or RGBα5551 format and α = 0.
23 to 16	GR2_G0 [7:0]	0	R/W	CLUT0 G0 Signal Replaced with G signal when in the CLUT0 format and CLUT0 = 0.
15 to 8	GR2_B0 [7:0]	0	R/W	CLUT0 B0 Signal Replaced with B signal when in the CLUT0 format and CLUT0 = 0.
7 to 0	GR2_R0 [7:0]	0	R/W	CLUT0 R0 Signal Replaced with R signal when in the CLUT0 format and CLUT0 = 0.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.6.2.19 Alpha Blending Control Register 11 (Graphics 2) (GR2_AB11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_A1[7:0]								GR2_G1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_B1[7:0]								GR2_R1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_A1 [7:0]	0	R/W	CLUT1 α1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the αRGB1555 or RGBα5551 format and α = 1.
23 to 16	GR2_G1 [7:0]	0	R/W	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
15 to 8	GR2_B1 [7:0]	0	R/W	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
7 to 0	GR2_R1 [7:0]	0	R/W	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.6.2.20 Background Color Control Register (Graphics 2) (GR2_BASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR2_BASE_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_BASE_B[7:0]								GR2_BASE_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR2_BASE_G [7:0]	0	R/W	Background Color G Signal G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_BASE_B [7:0]	0	R/W	Background Color B Signal B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_BASE_R [7:0]	0	R/W	Background Color R Signal R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.6.2.21 CLUT Table Control Register (Graphics 2) (GR2_CLUT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_CLT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR2_CLT_SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to αRGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to αRGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

NOTE

Before switching CLUT table by GR_CLT_SEL, CPU must wait until the read value from the last written address is same as the last written value.

Refer to Section 38.6.1.15, CLUT Table for detail.

38.6.2.22 Status Monitor Register (Graphics 2) (GR2_MON)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_ARC_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_ARC_ST	0	R	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

38.6.2.23 Graphics 3 Register Update Control Register (GR3_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR3_UPDATE	—	—	—	GR3_P_VEN	—	—	—	GR3_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR3_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR3_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_IBUS_VEN	0	R/WC1	Frame Buffer Read Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

38.6.2.24 Frame Buffer Read Control Register (Graphics 3) (GR3_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

38.6.2.25 Frame Buffer Control Register 1 (Graphics 3) (GR3_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR3_FLM_SEL[1:0]		—	—	—	—	—	—	—	Caution *
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

CAUTION

The initial value “0” of bit 0 must be changed to “1”.

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR3_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR3_FLM_SEL[1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Selects frame 0. 1: Selects register GR3_FLM_NUM[9:0]. 2: Selects frame 0. 3: Setting prohibited
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	Bit0	0	R/W	**CAUTION** The initial value “0” of this bit must be changed to “1”.

Note: GR3_LN_OFF_DIR and GR3_FLM_SEL[1:0] are updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

38.6.2.26 Frame Buffer Control Register 2 (Graphics 3) (GR3_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR3_BASE [31:0]	0	R/W	Frame Buffer Base Address (upper) Sets the start address of the frame buffer where frame data is to be stored. The address must be 128 byte aligned, so the lower 7 bits must be set to 0.

Note: This register is updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

38.6.2.27 Frame Buffer Control Register 3 (Graphics 3) (GR3_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	GR3_LN_OFF[14:0]														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR3_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	GR3_LN_OFF[14:0]	0	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR3_BASE[31:0] Line 1: GR3_BASE[31:0] + GR3_LN_OFF[14:0] × 1 : Line n: GR3_BASE[31:0] + GR3_LN_OFF[14:0] × n The address must be 128 byte aligned, so the lower 7 bits must be set to 0.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR3_FLM_NUM[9:0]	0	R/W	Frame Number of Frame Buffer Manually set the frame number when GR3_FLM_SEL[1:0] = 1.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

38.6.2.28 Frame Buffer Control Register 4 (Graphics 3) (GR3_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR3_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR3_FLM_OFF[22:0]	0	R/W	Frame Buffer Frame Offset Address (upper) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR3_BASE[31:0] Buffer 1: GR3_BASE[31:0] + GR3_FLM_OFF[22:0] × 1 : Buffer n: GR3_BASE[31:0] + GR3_FLM_OFF[22:0] × n The address must be 128 byte aligned, so the lower 7 bits must be set to 0.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

38.6.2.29 Frame Buffer Control Register 5 (Graphics 3) (GR3_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame The number of lines is (GR3_FLM_LNUM[10:0] + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR3_FLM_LOOP[10:0] + 1).

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

38.6.2.30 Frame Buffer Control Register 6 (Graphics 3) (GR3_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_FORMAT[3:0]				—	GR3_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GR3_RDSWA[2:0]			—	—	—	—	GR3_STA_POS[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR3_ FORMAT [3:0]	0	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: Setting prohibited 9: Setting prohibited 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR3_HW [10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR3_HW[10:0] + 1) pixels. Note: Set to 2 or greater.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
12 to 10	GR3_ RDSWA [2:0]	0	R/W	Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	GR3_STA_ POS[5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR3_STA_POS[5:0] is skipped from the start of the line.

Note: GR3_STA_POS[5:0] is updated when GR3_P_VEN in GR3_UPDATE is 1. GR3_RDSWA[2:0] is updated when GR3_UPDATE in GR3_UPDATE is 1.
GR3_FORMAT[3:0] and GR3_HW[10:0] are updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

38.6.2.31 Alpha Blending Control Register 1 (Graphics 3) (GR3_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_ARC_MUL	GR3_ACALC_MD	—	GR3_ARC_ON	—	—	—	GR3_ARC_DISP_ON	—	—	—	GR3_GRC_DISP_ON	—	—	GR3_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	GR3_ARC_MUL	0	R/W	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area. 0: Off 1: On
14	GR3_ACALC_MD	0	R/W	Turns on/off premultiplication processing at alpha blending in one-pixel units. 0: Off 1: On
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR3_ARC_ON	0	R/W	Turns on/off alpha blending in a rectangular area. 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR3_ARC_DISP_ON	0	R/W	Turns on/off frame-line display of the image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR3_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR3_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.6.2.32 Alpha Blending Control Register 2 (Graphics 3) (GR3_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_GRC_VS[10:0]	0	R/W	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR3_GRC_VS[10:0] + GR3_GRC_VW[10:0] should be smaller than or equal to 2039 lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_GRC_VW[10:0]	0	R/W	Sets the vertical width of the graphics image area. **NOTE** GR3_GRC_VS[10:0] + GR3_GRC_VW[10:0] should be equal to or less than 2039 (lines).

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.6.2.33 Alpha Blending Control Register 3 (Graphics 3) (GR3_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_GRC_HS[10:0]	0	R/W	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR3_GRC_HS[10:0] + GR3_GRC_HW[10:0] should be smaller than or equal to 2015 clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_GRC_HW[10:0]	0	R/W	Sets the horizontal width of the graphics image area. **NOTES** 1. For displaying an image with 1- or 2-pixel horizontal width, set GR3_HW[10:0] to 2 and GR3_GRC_HW[10:0] to 1 (1-pixel) or 2 (2-pixel). 2. GR3_GRC_HS[10:0] + GR3_GRC_HW[10:0] should be smaller than or equal to 2015 clocks.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.6.2.34 Alpha Blending Control Register 4 (Graphics 3) (GR3_AB4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_ARC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_ARC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_ARC_VS[10:0]	0	R/W	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_ARC_VW[10:0]	0	R/W	Sets the vertical width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.6.2.35 Alpha Blending Control Register 5 (Graphics 3) (GR3_AB5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_ARC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_ARC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_ARC_HS[10:0]	0	R/W	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_ARC_HW[10:0]	0	R/W	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.6.2.36 Alpha Blending Control Register 6 (Graphics 3) (GR3_AB6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	GR3_ARC_MODE	GR3_ARC_COEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	GR3_ARC_RATE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	GR3_ARC_MODE	0	R/W	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
23 to 16	GR3_ARC_COEF[7:0]	0	R/W	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	GR3_ARC_RATE[7:0]	0	R/W	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.6.2.37 Alpha Blending Control Register 7 (Graphics 3) (GR3_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR3_ARC_DEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_CK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR3_ARC_DEF[7:0]	255	R/W	Sets the initial alpha value for alpha blending in a rectangular area.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_CK_ON	0	R/W	Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.6.2.38 Alpha Blending Control Register 8 (Graphics 3) (GR3_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_CK_KCLUT[7:0]								GR3_CK_KG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_CK_KB[7:0]								GR3_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_CK_KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR3_CK_KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_CK_KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_CK_KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.6.2.39 Alpha Blending Control Register 9 (Graphics 3) (GR3_AB9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_CK_A[7:0]								GR3_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_CK_B[7:0]								GR3_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_CK_A [7:0]	0	R/W	Replaced Alpha Signal after RGB/CLUT-Index Chroma-Key Processing α: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR3_CK_G [7:0]	0	R/W	Replaced G Signal after RGB/CLUT-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_CK_B [7:0]	0	R/W	Replaced B Signal after RGB/CLUT-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_CK_R [7:0]	0	R/W	Replaced R Signal after RGB/CLUT-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.6.2.40 Alpha Blending Control Register 10 (Graphics 3) (GR3_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_A0[7:0]								GR3_G0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_B0[7:0]								GR3_R0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_A0 [7:0]	0	R/W	CLUT0 α0 Signal Replaced with α signal when in the CLUT0 format and CLUT0 = 0. Replaced with α signal when in the αRGB1555 or RGBα5551 format and α = 0.
23 to 16	GR3_G0 [7:0]	0	R/W	CLUT0 G0 Signal Replaced with G signal when in the CLUT0 format and CLUT0 = 0.
15 to 8	GR3_B0 [7:0]	0	R/W	CLUT0 B0 Signal Replaced with B signal when in the CLUT0 format and CLUT0 = 0.
7 to 0	GR3_R0 [7:0]	0	R/W	CLUT0 R0 Signal Replaced with R signal when in the CLUT0 format and CLUT0 = 0.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.6.2.41 Alpha Blending Control Register 11 (Graphics 3) (GR3_AB11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_A1[7:0]								GR3_G1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_B1[7:0]								GR3_R1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_A1 [7:0]	0	R/W	CLUT1 α1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the αRGB1555 or RGBα5551 format and α = 1.
23 to 16	GR3_G1 [7:0]	0	R/W	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
15 to 8	GR3_B1 [7:0]	0	R/W	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
7 to 0	GR3_R1 [7:0]	0	R/W	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.6.2.42 Background Color Control Register (Graphics 3) (GR3_BASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR3_BASE_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_BASE_B[7:0]								GR3_BASE_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR3_BASE_G [7:0]	0	R/W	Background Color G Signal G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_BASE_B [7:0]	0	R/W	Background Color B Signal B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_BASE_R [7:0]	0	R/W	Background Color R Signal R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.6.2.43 CLUT Table and Interrupt Control Register (Graphics 3) (GR3_CLUT_INT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_CLT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_LINE[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR3_CLT_SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to αRGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to αRGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_LINE[10:0]	0	R/W	Line Interrupt Set When number of lines matches the value of the GR3_LINE[10:0] bits, an interrupt signal is output. This function is enabled even when the graphics 3 process is not used.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

NOTE

Before switching CLUT table by GR_CLT_SEL, CPU must wait until the read value from the last written address is same as the last written value.

Refer to Section 38.6.1.15, CLUT Table for detail.

38.6.2.44 Status Monitor Register (Graphics 3) (GR3_MON)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_LIN_STAT[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_ARC_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_LIN_STAT[10:0]	0	R	Line Position of Image being Currently Read
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_ARC_ST	0	R	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

38.6.2.45 VIN Synthesizer Register Update Control Register (GR_VIN_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR_VIN_UPDATE	—	—	—	GR_VIN_P_VEN	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR_VIN_UPDATE	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR_VIN_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

38.6.2.46 Alpha Blending Control Register 1 (VIN Synthesizer) (GR_VIN_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GR_VIN_ARC_ON	—	—	—	GR_VIN_ARC_DISP_ON	—	—	—	GR_VIN_GRC_DISP_ON	—	GR_VIN_SCL_UND_SEL	GR_VIN_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	GR_VIN_ARC_ON	0	R/W	Turns on/off alpha blending in a rectangular area. 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR_VIN_ARC_DISP_ON	0	R/W	Turns on/off frame-line display of the image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR_VIN_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	GR_VIN_SCL_UND_SEL	0	R/W	Selection of Lower-Layer Plane in Scaler 0: Selects graphics 0 as lower-layer graphics and graphics 1 as current graphics 1: Selects graphics 1 as lower-layer graphics and graphics 0 as current graphics
1, 0	GR_VIN_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics, or setting prohibited*1

Note 1. This setting is prohibited when the graphics block 0 in scaler 0 and graphics block 1 in scaler 1 are cascaded (GR1_AB1.GR1_CUS_CON_ON = 1).

Note: GR_VIN_SCL_UND_SEL is updated when GR_VIN_UPDATE in GR_VIN_UPDATE is 1. The other bits of this register are updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

38.6.2.47 Alpha Blending Control Register 2 (VIN Synthesizer) (GR_VIN_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR_VIN_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR_VIN_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR_VIN_GRC_VS[10:0]	0	R/W	Sets the vertical start position of the graphics image area. **NOTE** Set to 4 or greater lines and the result of GR_VIN_GRC_VS[10:0] + GR_VIN_GRC_VW[10:0] should be smaller than or equal to 2039 lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR_VIN_GRC_VW[10:0]	0	R/W	Sets the vertical width of the graphics image area. **NOTE** GR_VIN_GRC_VS[10:0] + GR_VIN_GRC_VW[10:0] should be equal to or less than 2039 (lines).

Note: This register is updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

38.6.2.48 Alpha Blending Control Register 3 (VIN Synthesizer) (GR_VIN_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR_VIN_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR_VIN_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR_VIN_GRC_HS[10:0]	0	R/W	Sets the horizontal start position of the graphics image area. **NOTE** Set to 16 or greater clocks and the result of GR_VIN_GRC_HS[10:0] + GR_VIN_GRC_HW[10:0] should be smaller than or equal to 2015 clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR_VIN_GRC_HW[10:0]	0	R/W	Sets the horizontal width of the graphics image area. **NOTES** 1. For displaying an image with 1- or 2-pixel horizontal width, set GR_VIN_GRC_HW[10:0] to 1 (1-pixel) or 2 (2-pixel). 2. GR_VIN_GRC_HS[10:0] + GR_VIN_GRC_HW[10:0] should be smaller than or equal to 2015 clocks.

Note: This register is updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

38.6.2.49 Alpha Blending Control Register 4 (VIN Synthesizer) (GR_VIN_AB4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR_VIN_ARC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR_VIN_ARC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR_VIN_ARC_VS[10:0]	0	R/W	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR_VIN_ARC_VW[10:0]	0	R/W	Sets the vertical width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

38.6.2.50 Alpha Blending Control Register 5 (VIN Synthesizer) (GR_VIN_AB5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR_VIN_ARC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR_VIN_ARC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR_VIN_ARC_HS[10:0]	0	R/W	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR_VIN_ARC_HW[10:0]	0	R/W	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

38.6.2.51 Alpha Blending Control Register 6 (VIN Synthesizer) (GR_VIN_AB6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	GR_VIN_ARC_MODE	GR_VIN_ARC_COEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	GR_VIN_ARC_RATE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	GR_VIN_ARC_MODE	0	R/W	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
23 to 16	GR_VIN_ARC_COEF[7:0]	0	R/W	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	GR_VIN_ARC_RATE[7:0]	0	R/W	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.

Note: This register is updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

38.6.2.52 Alpha Blending Control Register 7 (VIN Synthesizer) (GR_VIN_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR_VIN_ARC_DEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR_VIN_ ARC_DEF [7:0]	255	R/W	Sets the initial alpha value for alpha blending in a rectangular area.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

38.6.2.53 Background Color Control Register (VIN Synthesizer) (GR_VIN_BASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR_VIN_BASE_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR_VIN_BASE_B[7:0]								GR_VIN_BASE_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR_VIN_BASE_G[7:0]	0	R/W	Background Color G Signal G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR_VIN_BASE_B[7:0]	0	R/W	Background Color B Signal B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR_VIN_BASE_R[7:0]	0	R/W	Background Color R Signal R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

38.6.2.54 Status Monitor Register (VIN Synthesizer) (GR_VIN_MON)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR_VIN_ARC_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR_VIN_ARC_ST	0	R	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

38.6.3 Usage Method

38.6.3.1 Mute Image

The initial values of the GR0_DISP_SEL[1:0], GR1_DISP_SEL[1:0], GR2_DISP_SEL[1:0], GR3_DISP_SEL[1:0], GR_VIN_DISP_SEL[1:0], and GR_OIR_DISP_SEL[1:0] bits are all 0. Accordingly, in the initial setting, a background color is displayed both inside and outside the graphics area for the graphics 0, 1, 2, 3, and OIR processes and the VIN synthesizer. Since the default background color is black, the black mute image is displayed in the initial state.

38.6.3.2 Alpha Blending in Rectangular Area

The alpha coefficient and the frame rate can be changed during fade in and fade out by modifying the GR_ARC_MODE, GR_ARC_COEF[7:0] and GR_ARC_RATE[7:0] bits, respectively.

38.7 Output Image Generator

NOTE

The Output Image Generator is not available for D1L2(H) devices.

38.7.1 Output Image Generation Functions

38.7.1.1 Overview of Functions

The output image generator can read the graphics data and display them. In cooperation with the Video Output Warping Engine (VOWE) (channel 0 only), it can also distort the output image according to a display panel.

When the output image generator is not in use, the signals from the image synthesizer can be output directly to the output control block, bypassing the output image generator.

The output image generator has the same circuit configuration as the scaler. However, note the following differences from the scaler.

(1) The scaling-up/-down function is not available.

(2) The rotation control function is not available.

(3) The pointer buffer function is not available.

(4) The field control function is not available because the inputs are always progressive signals.

(5) The I/O signals are always RGB signals.

The functional block diagram of the output image generator is shown below.

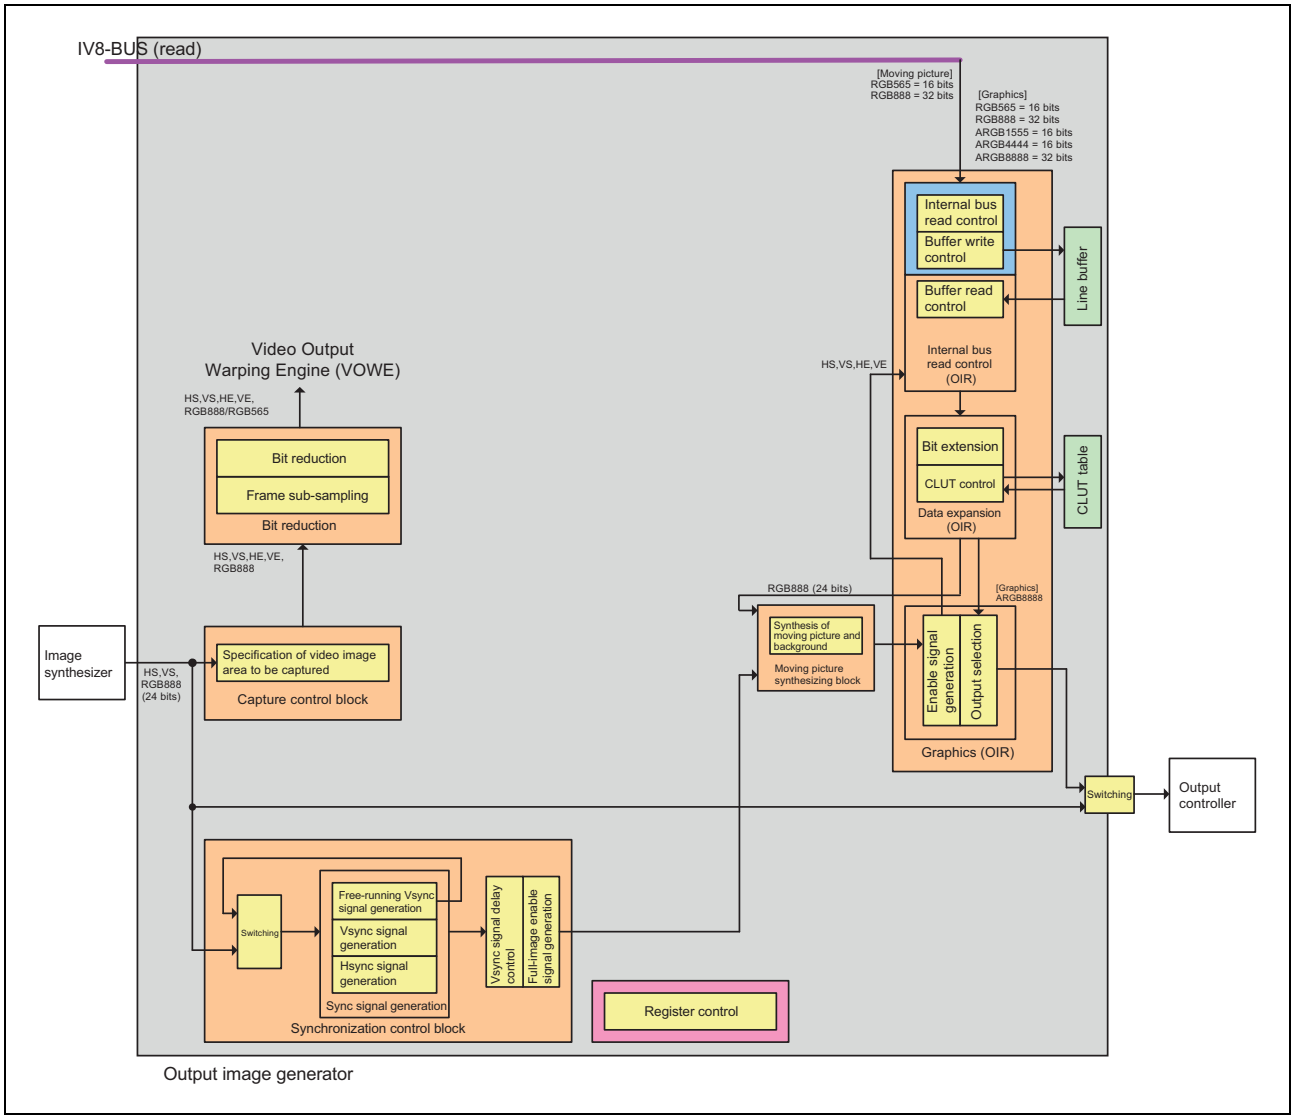

Figure 38.56 Functional Block Diagram of Output Image Generator

38.7.1.2 Register Control

(1) Updating Registers

The Vsync signal is used to control the update timing of all the registers of the output image generator and graphics block (OIR) except some registers of the sync control block.

After 1 is set to the bits in the update control register, the contents of the relevant registers are modified at the rising edge of the Vsync signal. The update control register is automatically cleared to 0 after the modification.

Table 38.129 Register Update Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_ UPDATE	OIR_SCL0_ UPDATE	0	SYNC Control Register Update 0: Registers are not updated. 1: Registers are updated.
OIR_SCL0_ UPDATE	OIR_SCL0_ VEN_D	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
OIR_SCL0_ UPDATE	OIR_SCL0_ VEN_C	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
OIR_SCL0_ UPDATE	OIR_SCL0_ VEN_B	0	Synchronization Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
OIR_SCL0_ UPDATE	OIR_SCL0_ VEN_A	0	Scaling-Down Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
OIR_SCL1_ UPDATE	OIR_SCL1_ UPDATE_A	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
OIR_SCL1_ UPDATE	OIR_SCL1_ VEN_B	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
OIR_SCL1_ UPDATE	OIR_SCL1_ VEN_A	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_OIR_UPDATE	GR_OIR_P_ VEN	0	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_OIR_UPDATE	GR_OIR_IBUS_ VEN	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

The registers controlled by OIR_SCL0_VEN_A, OIR_SCL_0_VEN_C, OIR_SCL1_VEN_A, and OIR_SCL1_VEN_B are modified at the rising edge of the input Vsync signal.

The registers controlled by OIR_SCL0_VEN_B, OIR_SCL0_VEN_D, GR_OIR_P_VEN, and GR_OIR_IBUS_VEN are modified at the rising edge of the output Vsync signal.

38.7.1.3 Enabling or Disabling Output Image Generator

The output image generator can be enabled or disabled. If it is disabled, the input data from the image synthesizer is directly output, bypassing the output image generator.

Table 38.130 Output Image Generator Enable Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_FRC3	OIR_RES_EN	0	For VDCE0 only:*1*2 Enabling or Disabling the Output Image Generator 0: The output image generator is disabled (the input data from the image synthesizer is directly output). 1: The output image generator is enabled.

Note 1. For VDCE1 the output image generator must be disabled, thus OIR_RES_EN = 0.

Note 2. For D1L2(H) devices OIR_RES_EN must remain 0.

38.7.1.4 Synchronization Control

(1) Selecting Vsync Signal

The Vsync signal to be output from the output image generator can be selected.

Table 38.131 Vsync Signal Selection Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_FRC3	OIR_RES_VS_SEL	1	Vsync Signal Output Select 0: Vsync signal input from the image synthesizer 1: Internally generated free-running Vsync signal

CAUTION

Using external VSYNC does not mean the whole timing is taken from externally. Only the VSYNC is synchronised.

This means if the same timing as for SC0 should be used the same timing for OIR layer as SC0 has to be selected and external VSYNC input has to be selected.

(2) Masking Repeated Vsync Signals

Take measures against the repeated Vsync signals by using the Vsync control block in the scaler. Accordingly, repeated Vsync signal masking control must be disabled in the output image generator when it is in use.

Table 38.132 Repeated Vsync Signal Mask Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_FRC1	OIR_RES_VMASK_ON	1	Repeated Vsync Signal Masking Control This bit should always be set to 0 when the output image generator is in use. 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled.

(3) Compensating for Missing Vsync Signals

Take measures against the missed Vsync signals by using the Vsync control block in the scaler. Accordingly, compensation of missing Vsync signals must be disabled in the output image generator when it is in use.

Table 38.133 Missing Vsync Compensation Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_FRC2	OIR_RES_VLACK_ON	1	Missing Vsync Signal Compensation This bit should always be set to 0 when the output image generator is in use. 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.

(4) Free-Running Period

Free-running Vsync and Hsync periods can be set.

Hsync period [usec] = (RES_FH + 1) ÷ pixel clock frequency [MHz]

Vsync period [usec] = horizontal period [usec] × (RES_FV + 1)

Table 38.134 Free-Running Period Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_FRC4	OIR_RES_FV [10:0]	524	Free-Running Vsync Period Setting Free-running Vsync period = (OIR_RES_FV[10:0] + 1) × horizontal period [usec]
OIR_SCL0_FRC4	OIR_RES_FH [10:0]	799	Hsync Period Setting Hsync period [usec] = (OIR_RES_FH[10:0] +1) ÷ pixel clock frequency [MHz]

When selecting a Vsync signal input from the image synthesizer, set the OIR_RES_VS_SEL bit to 0. At this time, the internally generated free-running Vsync signal is not output.

In the meantime, the Hsync signal is always generated according to the free-running signal setting and output from the output image generator.

(5) Vsync Signal Delay Control

Delay of Vsync signal output from the output image generator can be controlled.

The delay is used to adjust the frame buffer read timing.

Table 38.135 Vsync Output Delay Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_ FRC5	OIR_RES_VSDLY [7:0]	1	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: OIR_RES_VSDLY[7:0] × output Hsync period [usec]

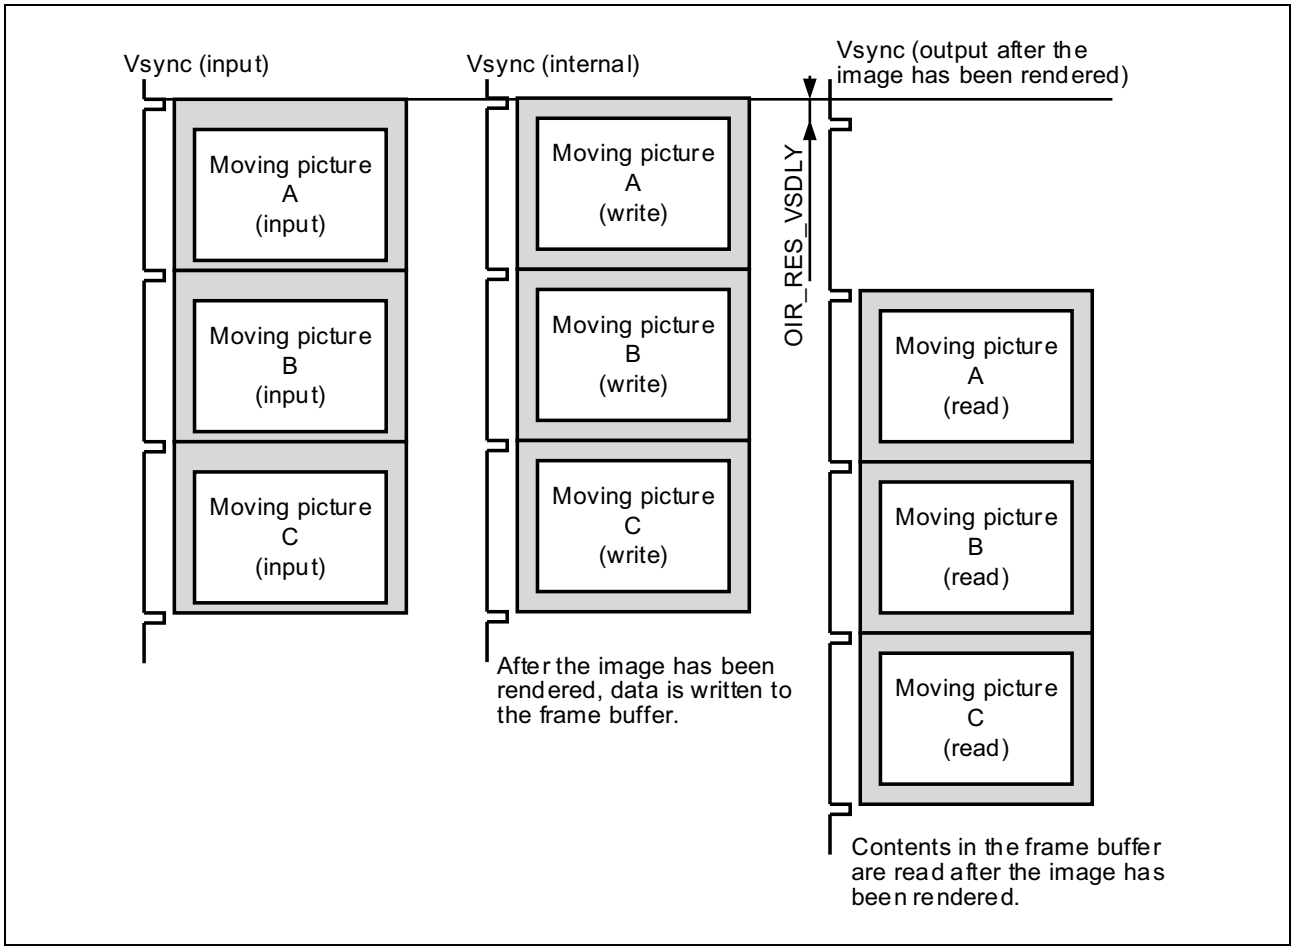

Figure 38.57 Vsync Signal Phases (Two Frame-Buffer Planes Used)

38.7.1.5 Setting Angle of View

(1) Setting Image Area to be Captured

The area to be captured for the input image can be set.

The area is defined by specifying its start position and width based on the input Hsync and Vsync signals.

Table 38.136 Control of Image Area to be Captured

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_DS2	OIR_RES_VS [10:0]	18	Vertical Position Setting for Video Signal Capturing (VSYNC + (V backporch - 1) lines) Note: The set value should be four or more (lines). OIR_RES_VS[10:0] + OIR_RES_VW[10:0] should be equal to or less than 2039 (lines).
OIR_SCL0_DS2	OIR_RES_VW [10:0]	240	Vertical Width of Video Signal to be Captured (lines) Note: OIR_RES_VS[10:0] + OIR_RES_VW[10:0] should be equal to or less than 2039 (lines).
OIR_SCL0_DS3	OIR_RES_HS [10:0]	244	Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). OIR_RES_HS[10:0] + OIR_RES_HW[10:0] should be equal to or less than 2015 (clock cycles).
OIR_SCL0_DS3	OIR_RES_HW [10:0]	1440	Horizontal Width of Video Signal to be Captured (video-image clock cycles) Note: OIR_RES_HS[10:0] + OIR_RES_HW[10:0] should be equal to or less than 2015 (clock cycles).

(2) Generating a Full-Screen Enable Signal

The valid period of the full screen to be output from the output image generator can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the output image generator.

The vertical front porch should be set to four or more lines, and the horizontal front porch should be 16 or more clock cycles.

Table 38.137 Full-Screen Enable Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_FRC6	OIR_RES_F_VS [10:0]	35	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). OIR_RES_F_VS[10:0] + OIR_RES_F_VW[10:0] should be equal to or less than 2039 (lines).
OIR_SCL0_FRC6	OIR_RES_F_VW [10:0]	480	Vertical Enable Signal Width for Full Screen (lines) Note: OIR_RES_F_VS[10:0] + OIR_RES_F_VW[10:0] should be equal to or less than 2039 (lines).
OIR_SCL0_FRC7	OIR_RES_F_HS [10:0]	144	Horizontal Enable Signal Start Position for Full Screen. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). OIR_RES_F_HS[10:0] + OIR_RES_F_HW[10:0] should be equal to or less than 2015 (clock cycles).
OIR_SCL0_FRC7	OIR_RES_F_HW [10:0]	640	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note: OIR_RES_F_HS[10:0] + OIR_RES_F_HW[10:0] should be equal to or less than 2015 (clock cycles).

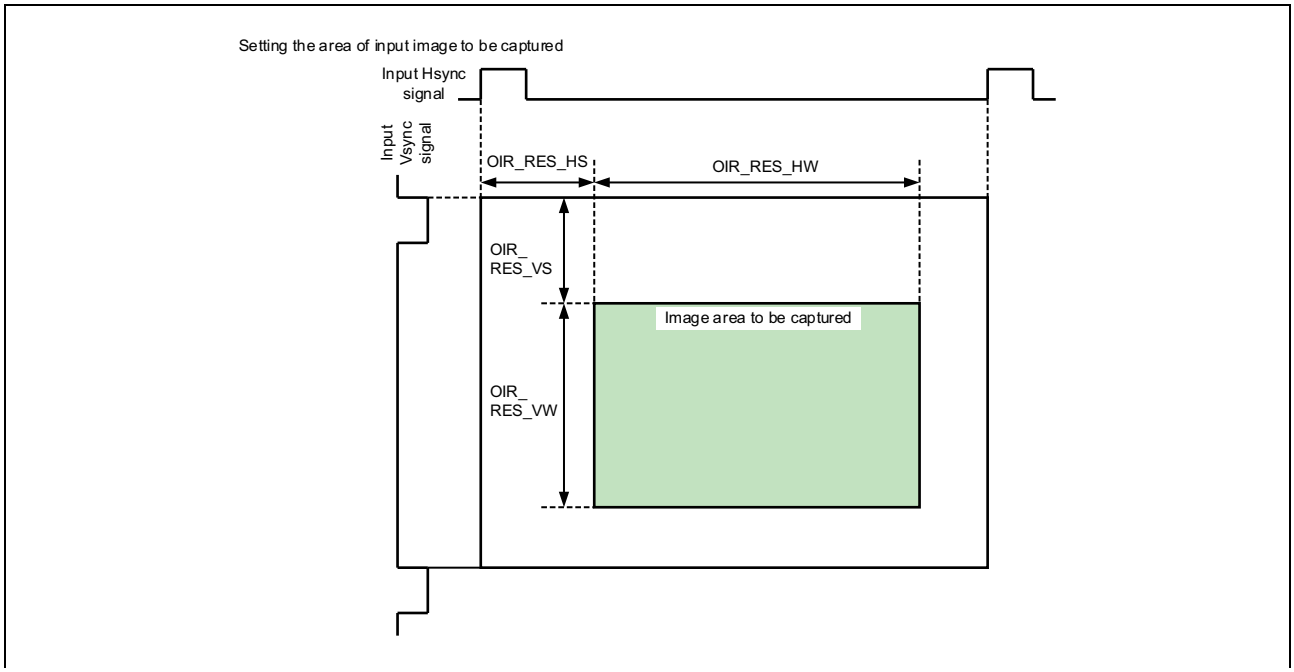

Figure 38.58 Enable Settings

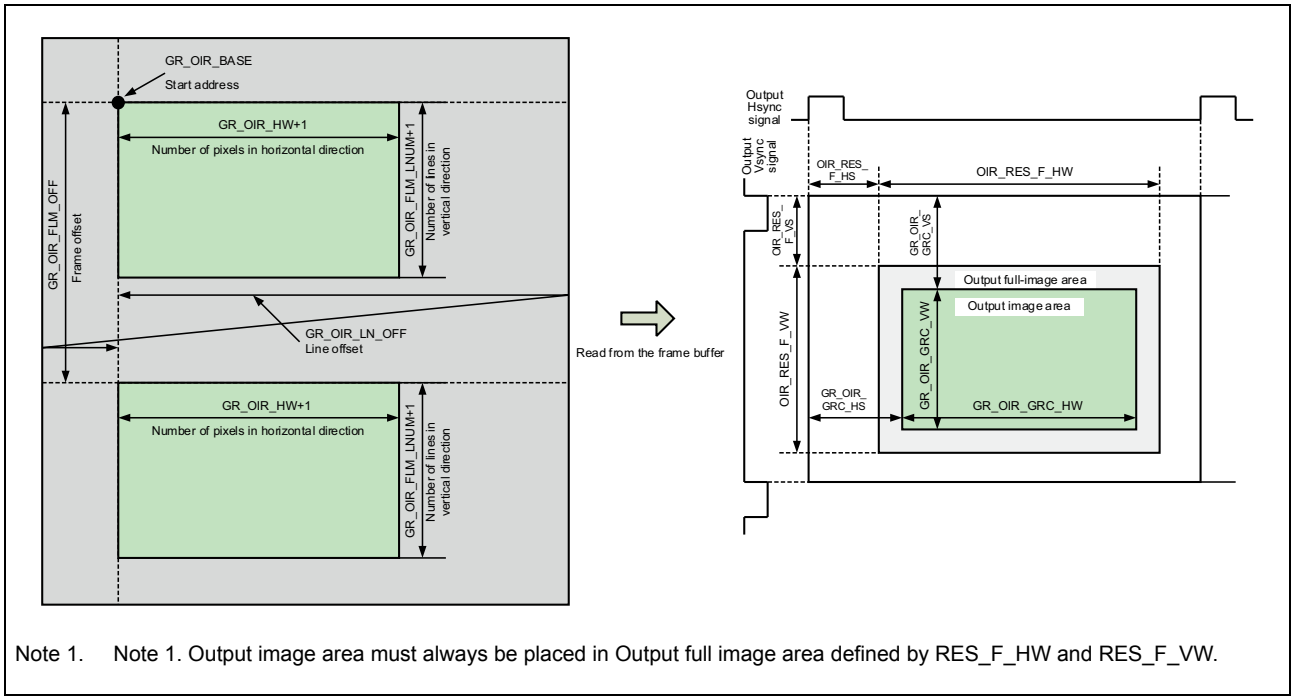
38.7.1.6 Graphics (OIR) Processing

Scale-up processing is not possible in the generator.

Table 38.138 Graphics (OIR) Processing Block

Type of Output Image Generation Display	Sync Signals for Frame Buffer Read	Frame Buffer Read Size Setting Bits	Display Enabling Bits
Graphics display	Output from graphics (OIR) processing block	GR_OIR_FLM_LNUM[10:0]*1 GR_OIR_HW[10:0]*1	GR_OIR_GRC_VS[10:0] GR_OIR_GRC_VW[10:0] GR_OIR_GRC_HS[10:0] GR_OIR_GRC_HW[10:0]

Note 1. The value set to the register + 1 is the actual read size.



Note 1. Note 1. Output image area must always be placed in Output full image area defined by RES_F_HW and RES_F_VW.

Figure 38.59 Area Setting for Graphics Display

For details on the graphics processing, refer to the Section 38.6, Image Synthesizer.

38.7.2 Register Descriptions

Table 38.139 shows the register configuration.

- Symbols used in Register Description:

  Initial value: Register value after a reset

  —: Undefined value

  R/W: Readable/writable. The written value can be read.

  R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

  R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

  R: Read-only. The write value should always be 0.

  —/W: Write-only. The read value is undefined.

Table 38.139 Register Configuration of the Output Image Generator (Ch0) (1/2)

Module Name	Register Name	Symbol	R/W	Initial Value	Address	Access Size
VDCE0	SCL0 register update control register (OIR)	OIR_SCL0_UPDATE	R/WC1	H'0000 0000	<VDCE0_base> + 1E80	32

VDCE0	CLUT table control register (Graphics (OIR))	GR_OIR_CLUT	R/W	H'0000 0000	<VDCE0_base> + 1FD0	32
VDCE0	Status monitor register (Graphics (OIR))	GR_OIR_MON	R	H'0000 0000	<VDCE0_base> + 1FD4	32

NOTE

Register access sizes other than defined in the table above are not supported.

NOTE

In the header files the names of the above registers are defined in the following format:

<ModuleName> + <Symbol>.

<ModuleName> and <Symbol> are defined in the above table.

38.7.2.1 SCL0 Register Update Control Register (OIR_SCL0_UPDATE)

NOTE

This register is not available in D1L2 devices.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OIR_RES_VMASK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	OIR_RES_VMASK[15:0]	2800	R/W	Repeated Vsync Signal Masking Period This setting is ignored.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OIR_RES_VMASK_ON	1	R/W	Repeated Vsync Signal Masking Control This bit should always be set to 0 when the output image generator is in use. 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled.

Note: This register is updated when the OIR_SCL0_UPDATE bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

38.7.2.3 Missing Vsync Compensation Control Register (OIR_SCL0_FRC2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OIR_RES_VLACK[15:0]															
Initial value:	0	0	0	0	1	1	1	0	0	0	0	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OIR_RES_VLACK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	OIR_RES_VLACK[15:0]	3600	R/W	Missing-Sync Compensating Pulse Output Wait Time This setting is ignored.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OIR_RES_VLACK_ON	1	R/W	Missing Vsync Signal Compensation This bit should always be set to 0 when the output image generator is in use. 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.

Note: This register is updated when the OIR_SCL0_UPDATE bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

38.7.2.4 Output Sync Select Register (OIR_SCL0_FRC3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OIR_RES_EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OIR_RES_VS_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	OIR_RES_EN	0	R/W	Enabling or Disabling the Output Image Generator 0: The input signal from the image synthesizer is directly output. 1: Signals from the graphics block (OIR) are output.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OIR_RES_VS_SEL	1	R/W	Vsync Signal Output Select 0: Vsync signal input from the image synthesizer 1: Internally generated free-running Vsync signal

Note: This register is updated when the OIR_SCL0_UPDATE bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

38.7.2.5 Free-Running Period Control Register (OIR_SCL0_FRC4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OIR_RES_FV[10:0]										
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	1	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OIR_RES_FH[10:0]										
Initial value:	0	0	0	0	0	0	1	1	0	0	0	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_RES_FV[10:0]	524	R/W	Free-Running Vsync Period Setting Free-running Vsync period = (OIR_RES_FV[10:0] + 1) × horizontal period [usec]
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	OIR_RES_FH[10:0]	799	R/W	Hsync Period Setting Hsync period [usec] = (OIR_RES_FH[10:0] +1) ÷ pixel clock frequency [MHz]

Note: This register is updated when the OIR_SCL0_UPDATE bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

38.7.2.6 Output Delay Control Register (OIR_SCL0_FRC5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	OIR_RES_VSDLY[7:0]							
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
7 to 0	OIR_RES_VSDLY[7:0]	1	R/W	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: OIR_RES_VSDLY[7:0] × output Hsync period [usec]

Note: This register is updated when the OIR_SCL0_VEN_B bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

38.7.2.7 Full-Screen Vertical Size Register (OIR_SCL0_FRC6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OIR_RES_F_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OIR_RES_F_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_RES_F_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). OIR_RES_F_VS[10:0] + OIR_RES_F_VW[10:0] should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	OIR_RES_F_VW[10:0]	480	R/W	Vertical Enable Signal Width for Full Screen (lines) Note: OIR_RES_F_VS[10:0] + OIR_RES_F_VW[10:0] should be equal to or less than 2039 (lines).

Note: This register is updated when the OIR_SCL0_VEN_B bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

38.7.2.8 Full-Screen Horizontal Size Register (OIR_SCL0_FRC7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OIR_RES_F_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OIR_RES_F_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_RES_F_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Full Screen. (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). OIR_RES_F_HS[10:0] + OIR_RES_F_HW[10:0] should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	OIR_RES_F_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) **Note:** 1. OIR_RES_F_HS[10:0] + OIR_RES_F_HW[10:0] should be equal to or less than 2015 (clock cycles). 2. In the case of video output format is Serial RGB(OUT_SET.OUT_FORMAT[[1:0] = 3), it is nessesary to add 2 to value in OIR_RES_F_HW.

Note: This register is updated when the OIR_SCL0_VEN_B bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

38.7.2.9 Scaling-Down Control Register (OIR_SCL0_DS1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	Caution *	—	—	—	Caution *
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

CAUTION

The initial value “1” of bits 4 and 0 must be changed to “0”.

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	Bit4	1	R/W	**CAUTION** The initial value “1” of this bit must be changed to “0”.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	Bit0	1	R/W	**CAUTION** The initial value “1” of this bit must be changed to “0”.

38.7.2.10 Vertical Capture Size Register (OIR_SCL0_DS2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OIR_RES_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OIR_RES_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_RES_VS [10:0]	18	R/W	Vertical Position Setting for Video Signal Capturing (VSYNC + (V backporch - 1) lines) Note: The set value should be four or more (lines). OIR_RES_VS[10:0] + OIR_RES_VW[10:0] should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	OIR_RES_VW [10:0]	240	R/W	Vertical Width of Video Signal to be Captured (Lines) Note: OIR_RES_VS[10:0] + OIR_RES_VW[10:0] should be equal to or less than 2039 (lines).

Note: This register is updated when the OIR_SCL0_VEN_A bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

38.7.2.11 Horizontal Capture Size Register (OIR_SCL0_DS3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OIR_RES_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OIR_RES_HW[10:0]										
Initial value:	0	0	0	0	0	1	0	1	1	0	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_RES_HS [10:0]	244	R/W	Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). OIR_RES_HS[10:0] + OIR_RES_HW[10:0] should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	OIR_RES_HW [10:0]	1440	R/W	Horizontal Width of Video Signal to be Captured (Video-image clock cycles) Note: OIR_RES_HS[10:0] + OIR_RES_HW[10:0] should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the OIR_SCL0_VEN_A bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

38.7.2.12 Scaling-Down Control Block Output Size Register (OIR_SCL0_DS7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OIR_RES_OUT_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OIR_RES_OUT_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_RES_OUT_VW[10:0]	240	R/W	Number of Valid Lines in Vertical Direction Output by Scaling-down Control Block (lines) This bit setting is used for the number of lines to be written to VOWE.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	OIR_RES_OUT_HW[10:0]	640	R/W	Number of Valid Horizontal Pixels Output by Scaling-Down Control Block (video-image clock cycles) Note: The OIR_RES_OUT_HW[10:0] value should be aligned in 4-pixel units and equal to or smaller than the OIR_RES_HW[10:0] value.

Note: This register is updated when the OIR_SCL0_VEN_A or OIR_SCL0_VEN_C bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

38.7.2.13 Scaling-Up Control Register (OIR_SCL0_US1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	Caution *	—	—	—	Caution *
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

CAUTION

The initial value “1” of bits 4 and 0 must be changed to “0”.

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	Bit4	1	R/W	**CAUTION** The initial value “1” of this bit must be changed to “0”.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	Bit0	1	R/W	**CAUTION** The initial value “1” of this bit must be changed to “0”.

38.7.2.14 Output Image Vertical Size Register (OIR_SCL0_US2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OIR_RES_P_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OIR_RES_P_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_RES_P_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Output Image (VSYNC + V backporch lines) Note: The set value should be four or more (lines). OIR_RES_P_VS[10:0] + OIR_RES_P_VW[10:0] should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	OIR_RES_P_VW[10:0]	480	R/W	Vertical Enable Signal Width for Output Image (lines) Note: OIR_RES_P_VS[10:0] + OIR_RES_P_VW[10:0] should be equal to or less than 2039 (lines).

Note: This register is updated when the OIR_SCL0_VEN_B bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

38.7.2.15 Output Image Horizontal Size Register (OIR_SCL0_US3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OIR_RES_P_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OIR_RES_P_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_RES_P_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Output Image (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). OIR_RES_P_HS[10:0] + OIR_RES_P_HW[10:0] should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	OIR_RES_P_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: OIR_RES_P_HS[10:0] + OIR_RES_P_HW[10:0] should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the OIR_SCL0_VEN_B bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

38.7.2.16 Frame Buffer Read Select Register (OIR_SCL0_US8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	Caution *	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R

CAUTION

The initial value “0” of bit 4 must be changed to “1”.

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	Bit4	0	R/W	**CAUTION** The initial value “0” of this bit must be changed to “1”.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

38.7.2.17 SCL1 Register Update Control Register (OIR_SCL1_UPDATE)

NOTE

This register is not available in D1L2 devices.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OIR_SCL1_UPDATE_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	OIR_SCL1_UPDATE_A	0	R/W	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	OIR_SCL1_VEN_B	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OIR_SCL1_VEN_A	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

38.7.2.18 Writing Mode Register (OIR_SCL1_WR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	Caution*		—	Caution*
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W

CAUTIONS

1. **The initial value "00_B" of bits [3:2] must be changed to "10_B".**
2. **The initial value "0" of bit 0 must be changed to "1".**

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3, 2	Bit[3:2]	All 0	R/W	**CAUTION** The initial value "00_B" of these bits must be changed to "10_B".
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	Bit0	0	R/W	**CAUTION** The initial value "0" of this bit must be changed to "1".

38.7.2.19 Frame Sub-Sampling Register (OIR_SCL1_WR5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	Caution *	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

CAUTION

The initial value “1” of bit 12 must be changed to “0”.

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	Bit12	1	R/W	**CAUTION** The initial value “1” of this bit must be changed to “0”.
11 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

38.7.2.20 Graphics (OIR) Register Update Control Register (GR_OIR_UPDATE)

NOTE

This register is not available in D1L2 devices.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR_OIR_UPDATE	—	—	—	GR_OIR_P_VEN	—	—	—	GR_OIR_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR_OIR_UPDATE	0	R/W	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR_OIR_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR_OIR_IBUS_VEN	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

38.7.2.21 Frame Buffer Read Control Register (Graphics (OIR)) (GR_OIR_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR_OIR_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR_OIR_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when the GR_OIR_IBUS_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

38.7.2.22 Frame Buffer Control Register 1 (Graphics (OIR)) (GR_OIR_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	Caution*		—	—	—	—	—	—	—	Caution*
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W

CAUTIONS

1. **The initial value "00_B" of bits [9:8] must be changed to "10_B".**
2. **The initial value "0" of bit 0 must be changed to "1".**

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	Bit[9:8]	0	R/W	**CAUTION** The initial value "00_B" of these bits must be changed to "10_B".
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	Bit0	0	R/W	**CAUTION** The initial value "0" of this bit must be changed to "1".

NOTES

1. Bit[9:8] is updated when the GR_OIR_IBUS_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.
   Bit0 is updated when the GR_OIR_IBUS_VEN and GR_OIR_P_VEN bits in the graphics (OIR) register update control register (GR_OIR_UPDATE) are 1.
2. Check restriction frame buffer addressing in Section 38.6.1.2, Graphics Data Read Control.

38.7.2.23 Frame Buffer Control Register 2 (Graphics (OIR)) (GR_OIR_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR_OIR_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR_OIR_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR_OIR_BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. The address must be 128 byte aligned, so the lower 7 bits must be set to 0.

Note: This register is updated when the GR_OIR_IBUS_VEN or GR_OIR_P_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

38.7.2.24 Frame Buffer Control Register 3 (Graphics (OIR)) (GR_OIR_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	GR_OIR_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	GR_OIR_LN_OFF [14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR_OIR_BASE[31:0] Line 1: GR_OIR_BASE[31:0] + GR_OIR_LN_OFF[14:0] × 1 : Line n: GR_OIR_BASE[31:0] + GR_OIR_LN_OFF[14:0] × n The address must be 128 byte aligned, so the lower 7 bits must be set to 0.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when the GR_OIR_IBUS_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

38.7.2.25 Frame Buffer Control Register 4 (Graphics (OIR)) (GR_OIR_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR_OIR_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR_OIR_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR_OIR_FLM_OFF[22:0]	524288	R/W	Frame Buffer Frame Offset Address Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR_OIR_BASE[31:0] Buffer 1: GR_OIR_BASE[31:0] + GR_OIR_FLM_OFF[22:0] × 1 : Buffer n: GR_OIR_BASE[31:0] + GR_OIR_FLM_OFF[22:0] × n The address must be 128 byte aligned, so the lower 7 bits must be set to 0.

Note: This register is updated when the GR_OIR_IBUS_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

38.7.2.26 Frame Buffer Control Register 5 (Graphics (OIR)) (GR_OIR_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR_OIR_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR_OIR_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR_OIR_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame Number of lines is (GR_OIR_FLM_LNUM[10:0] + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR_OIR_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. (GR_OIR_FLM_LOOP[10:0] + 1) lines are read.

Note: This register is updated when the GR_OIR_IBUS_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

38.7.2.27 Frame Buffer Control Register 6 (Graphics (OIR)) (GR_OIR_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR_OIR_FORMAT[3:0]				—	GR_OIR_HW[10:0]										
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GR_OIR_RDSWA[2:0]			—	—	—	—	GR_OIR_STA_POS[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR_OIR_FORMAT [3:0]	8	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: Setting prohibited 6: Setting prohibited 7: Setting prohibited 8: Setting prohibited 9: Setting prohibited 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR_OIR_HW[10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR_OIR_HW[10:0] + 1) pixels. Note: The set value should be equal to or more than two.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
12 to 10	GR_OIR_RDSWA [2:0]	0	R/W	8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer writing as follows. Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units. Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units. Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units]
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	GR_OIR_STA_POS [5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR_OIR_STA_POS[5:0] is skipped from the start of the line.

Note: GR_OIR_STA_POS[5:0] is updated when GR_OIR_P_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.
GR_OIR_RDSWA[2:0] is updated when GR_OIR_UPDATE bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.
GR_OIR_FORMAT[3:0] and GR_OIR_HW[10:0] are updated when GR_OIR_IBUS_VEN or GR_OIR_P_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

38.7.2.28 Alpha Blending Control Register 1 (Graphics (OIR)) (GR_OIR_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	GR_OIR_GRC_DISP_ON	—	—	GR_OIR_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR_OIR_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on **NOTE** GR_OIR_GRC_DISP_ON is not available in D1L2 devices.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR_OIR_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display (GR_OIR_BASE[31:0]) 1: Setting prohibited 2: Current graphics display When displaying graphics, select this setting. 3: Blended display of lower-layer graphics and current graphics* Note: * Select this setting whenever chroma-key processing is to proceed. Since only current graphics are to be displayed by chroma-key processing, set the α values for both pixels to be subject to chroma-keying and pixels not to be subject to chroma-keying to 255.

Note: This register is updated when GR_OIR_P_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

38.7.2.29 Alpha Blending Control Register 2 (Graphics (OIR)) (GR_OIR_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR_OIR_GRC_VS[10:0]

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR_OIR_GRC_VS[10:0]	0	R/W	Vertical Start Position of Graphics Image Area. **NOTE** The set value should be four or more (lines). GR_OIR_GRC_VS[10:0] + GR_OIR_GRC_VW[10:0] should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR_OIR_GRC_VW[10:0]	0	R/W	Vertical Width of Graphics Image Area. **NOTE** GR_OIR_GRC_VS[10:0] + GR_OIR_GRC_VW[10:0] should be equal to or less than 2039 (lines).

Note: This register is updated when the GR_OIR_P_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

38.7.2.30 Alpha Blending Control Register 3 (Graphics (OIR)) (GR_OIR_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR_OIR_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR_OIR_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR_OIR_GRC_HS[10:0]	0	R/W	Horizontal Start Position of Graphics Image Area. **NOTE** The set value should be 16 or more (clock cycles). GR_OIR_GRC_HS[10:0] + GR_OIR_GRC_HW[10:0] should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR_OIR_GRC_HW[10:0]	0	R/W	Horizontal Width of Graphics Image Area. **NOTES** 1. For displaying an image with 1- or 2-pixel horizontal width, set GR_OIR_HW[10:0] to 2 and GR_OIR_GRC_HW[10:0] to 1 (1 pixel) or 2 (2 pixels). 2. GR_OIR_GRC_HS[10:0] + GR_OIR_GRC_HW[10:0] should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the GR_OIR_P_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

38.7.2.31 Alpha Blending Control Register 7 (Graphics (OIR)) (GR_OIR_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR_OIR_BASE_G[7:0]	0	R/W	Background Color G Signal G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR_OIR_BASE_B[7:0]	128	R/W	Background Color B Signal B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR_OIR_BASE_R[7:0]	128	R/W	Background Color R Signal R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when the GR_OIR_P_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

38.7.2.35 CLUT Table Control Register (Graphics (OIR)) (GR_OIR_CLUT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR_OIR_LINE[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR_OIR_LINE[10:0]	0	R/W	Line interrupt Setting Outputs an interrupt signal when the number of lines matches with the value of GR_OIR_LINE[10:0]. This function is enabled only when the output image generator is enabled (OIR_SCL0_FRC3.OIR_RES_EN = 1).

Note: This register is updated when the GR_OIR_P_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

38.7.2.36 Status Monitor Register (GR_OIR_MON)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OIR_LIN_STAT[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_LIN_STAT[10:0]*1	All 0	R	Line Position of Image Currently Being Read
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. OIR_LIN_STAT[10:0] changes immediately, when the video output clock is enabled.

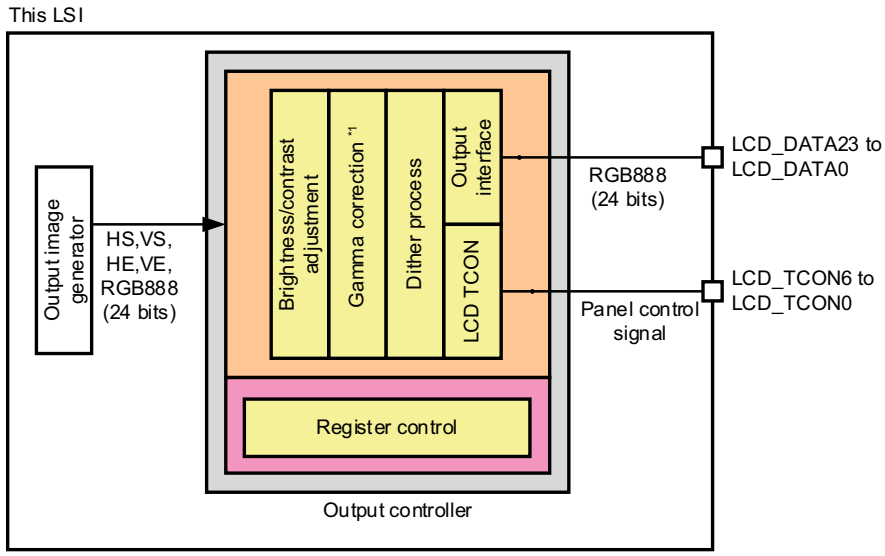
38.8 Output Controller

38.8.1 Output Controller Functions

38.8.1.1 Overview of Functions

The output controller subjects RGB signals output from the output image generator to brightness adjustment, contrast adjustment, gamma correction (not for D1L2(H) devices) of individual RGB, dither process, and output format conversion. The output controller also generates various timing signals for LCD panel drive.

Figure 38.60 shows the function block diagram of the output controller.



Note 1. Gamma correction is not available for D1L2(H) devices.

Figure 38.60 Functional Block Diagram of Output Controller

38.8.1.2 Register Update Control

The Vsync signal is used to control the update timing of all the registers of the output controller.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 38.140 Register Update Control (1/2)

Register Name	Bit Name	Initial Value	Description
OUT_UPDATE	OUTCNT_VEN	0	Brightness/Contrast Control, Dither Process, Output Interface Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_G_UPDATE	GAM_G_VEN	0	Gamma Correction (G) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

Table 38.140 Register Update Control (2/2)

Register Name	Bit Name	Initial Value	Description
GAM_B_UPDATE	GAM_B_VEN	0	Gamma Correction (B) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_R_UPDATE	GAM_R_VEN	0	Gamma Correction (R) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
TCON_UPDATE	TCON_VEN	0	LCD TCON Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

38.8.1.3 Route Selection

The processing sequence of the brightness/contrast control and gamma correction control can be swapped according to the settings of the register.

Table 38.141 Route Selection

Register Name	Bit Name	Initial Value	Description
OUT_CLK_PHASE	OUTCNT_ FRONT_GAM	0	Correction Circuit Sequence Control 0: Brightness → contrast → gamma correction 1: Gamma correction → contrast → brightness

38.8.1.4 Panel Brightness Adjustment

Brightness (DC) adjustment is individually performed for RGB signals from output image generator.

(BRT_R/G/BOUT after brightness adjustment has many bits to prevent overflow or underflow. The overflow or underflow process is performed at contrast calculation.)

(1) Calculation formulas for brightness (DC) adjustment

$$BRT\_GOUT = GIN + PBRT\_G - 512$$

$$BRT\_BOUT = BIN + PBRT\_B - 512$$

$$BRT\_ROUT = RIN + PBRT\_R - 512$$

Table 38.142 Brightness (DC) Adjustment

Register Name	Bit Name	Initial Value	Description
OUT_BRIGHT1	PBRT_G[9:0]	512	Brightness (DC) Adjustment of G Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)
OUT_BRIGHT2	PBRT_B[9:0]	512	Brightness (DC) Adjustment of B Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)
OUT_BRIGHT2	PBRT_R[9:0]	512	Brightness (DC) Adjustment of R Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)

38.8.1.5 Contrast Adjustment

Contrast is calculated for RGB signals obtained after brightness calculation.

(If an overflow or underflow occurs, contrast is clipped to the maximum or minimum value.)

(1) Calculation formulas for contrast (gain) adjustment

GOUT = BRT_GOUT × CONT_G/128

BOUT = BRT_BOUT × CONT_B/128

ROUT = BRT_ROUT × CONT_R/128

Table 38.143 Contrast (Gain) Adjustment

Register Name	Bit Name	Initial Value	Description
OUT_CONTRAST	CONT_G [7:0]	128	Contrast (Gain) Adjustment of G Signal 0/128 to 255/128 (approx.2 times)
OUT_CONTRAST	CONT_B [7:0]	128	Contrast (Gain) Adjustment of B Signal 0/128 to 255/128 (approx.2 times)
OUT_CONTRAST	CONT_R [7:0]	128	Contrast (Gain) Adjustment of R Signal 0/128 to 255/128 (approx.2 times)

38.8.1.6 Gamma Correction

Gamma correction is carried out by dividing an input signal having 256 gradation levels into 32 and controlling the gain of each area. Gain coefficient of each area can be set as 0 to approx. 2.0 [times]

(1) Gamma correction formula for each area

$DOUT = ((DIN - TH_{(n)}) \times GAIN_{(n)} + OFFSET_{(n)})/256$

DIN: Input signal (8-bit)

DOUT: Output signal (10-bit)

TH(n): Threshold (8-bit)

OFFSET(n): Offset value (19-bit)

GAIN(n): Gain coefficient (11-bit)

(2) Offset calculation formulas for each area

$OFFSET_{(n)} = OFFSET_{(n-1)} + DEF\_O_{(n)}$ (When n = 0, $OFFSET_{(0)} = 0$.)

$DEF\_O_{(n)} = (TH_{(n)} - TH_{(n-1)}) \times GAIN_{(n-1)}$ (When n = 0, $OFFSET_{(0)} = 0$.)

OFFSET(n): Offset value of current area (19-bit)

OFFSET(n-1): Offset value of previous area (19-bit)

DEF_O(n): Difference in offset value of Current and previous area (19-bit)

TH(n): Threshold of current area (8-bit)

TH(n-1): Threshold of previous area (8-bit)

GAIN(n-1): Gain coefficient of previous area (11-bit)

38.8.1.7 Dither Process

Dither process is carried out by adjusting brightness/contrast or reducing 10-bit RGB signals output from the gamma correction block to 8-bit, 6-bit, or 5-bit RGB signals. The operation mode of dither process can be selected from truncate mode, round-off mode, 2 × 2 pattern dither mode and random pattern dither mode.

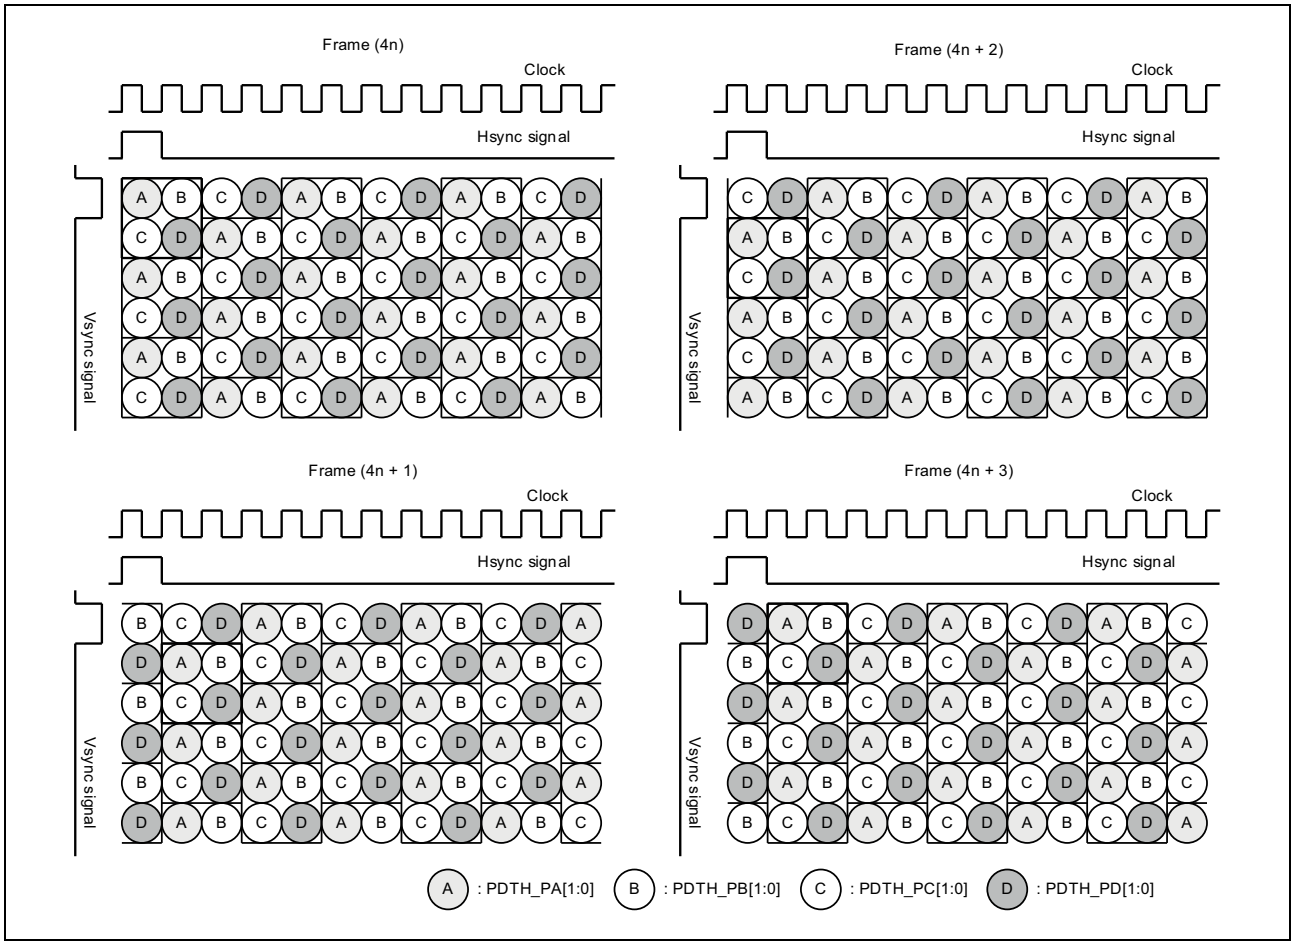

Figure 38.63 Operation Specification of 2 × 2 Pattern Dither

The conversion equations are as follows.

[Truncate mode]

(a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 (truncate the number below the decimal point)

(b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 (truncate the number below the decimal point)

(c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 (truncate the number below the decimal point)

[Round-off mode]

(a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 (round off to an integer)

(b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 (round off to an integer)

(c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 (round off to an integer)

[2 × 2 pattern dither mode, random pattern dither mode]

(a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

(b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

(c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

Table 38.145 Panel Dither Correction

Register Name	Bit Name	Initial Value	Description

OUT_PDTHA	PDTH_PB[1:0]	0	Pattern Value (B) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
OUT_PDTHA	PDTH_PC[1:0]	2	Pattern Value (C) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
OUT_PDTHA	PDTH_PD[1:0]	1	Pattern Value (D) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])

38.8.1.8 Output Format Conversion

In output format conversion, the RGB signal after dither process is converted to LCD output signal having any of the following formats, namely, parallel RGB888, parallel RGB666, parallel RGB565, and serial RGB.

Further, converted data can be allocated to LCD output pins as selected.

(1) Bit Allocation of LCD Signals for RGB888 Output

Table 38.146 shows the RGB signal input allocated to the LCD signal output for RGB888 output.

R/G/BIN[7:0] are the RGB internal signals after dither process.

Table 38.146 Bit Allocation of RGB Signal Input for RGB888 Output

(4) Bit Allocation of LCD Serial for Serial RGB Output

For serial RGB output, RGB signal input shown **Table 38.149** is allocated to rgb internal signals and the signals are converted from parallel to serial format and output as LCD signals. R/G/BIN[7:0] are the RGB internal signals after dither process.

The internal signals r[7:0], g[7:0], and b[7:0] are serially output to LCD_DATA7 to LCD_DATA0.

Table 38.149 Bit Allocation of RGB Signal Input for RGB565 Output

OUT_FORMAT[1:0]	3	3	3	3

(5) Parallel to Serial Conversion

As shown in the table below, four types of parallel to serial conversions are possible by controlling clock speed mode and selecting the scan direction ('n' in the table are natural numbers).

Table 38.150 Specifications of Serial RGB Output

OUT_FRQ_SEL[1:0]	1	1	1	1	2	2
OUT_DIR_SEL	**0**	**1**	**0**	**1**	**0**	**1**
OUT_SEQ_SEL	**0**	**0**	**1**	**1**	**–**	**–**
Line (2n-1)	Repeated (r → g → b)	Repeated (b → g → r)	Repeated (r → g → b)	Repeated (b → g → r)	Repeated (r → g → b → X)	Repeated (X → b → g → r)
Line 2n	Repeated (g → b → r)	Repeated (r → b → g)	Repeated (r → g → b)	Repeated (b → g → r)	Repeated (r → g → b → X)	Repeated (X → b → g → r)

The following figures show the timing of parallel to serial conversion in triple speed and quadruple speed modes, respectively.

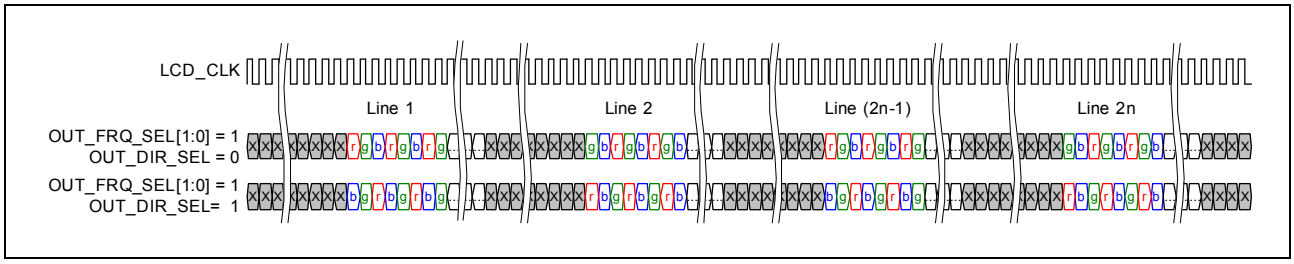

Figure 38.64 Timing of Parallel to Serial Conversion in Triple Speed Mode (OUT_SEQ_SEL = 0)

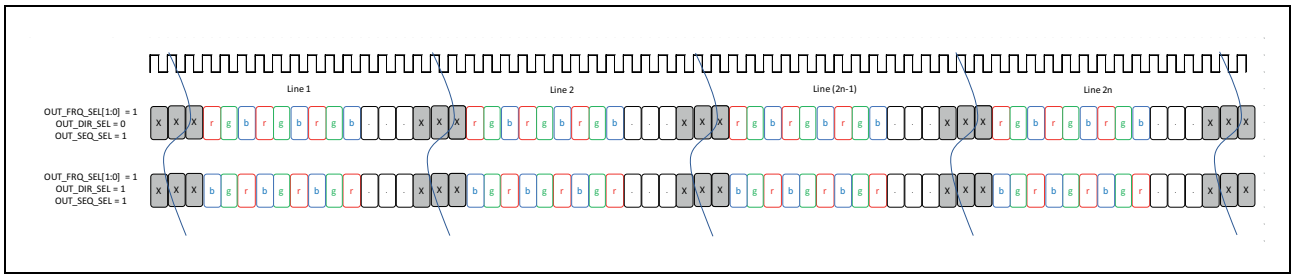

Figure 38.65 Timing of Parallel to Serial Conversion in Triple Speed Mode Mode (OUT_SEQ_SEL = 1)

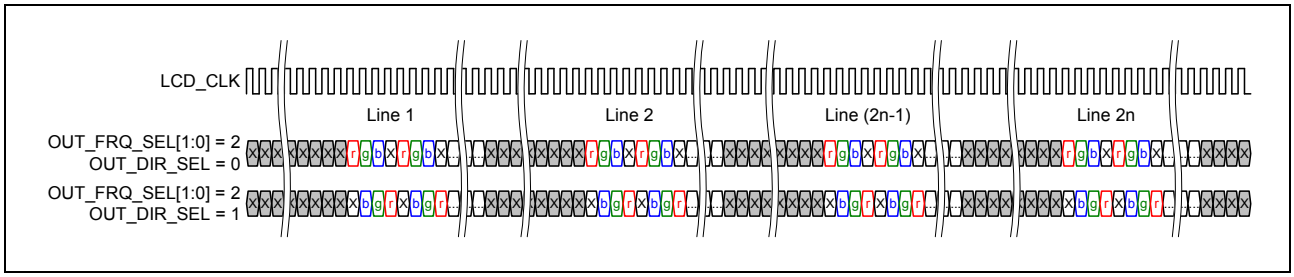

Figure 38.66 Timing of Parallel to Serial Conversion in Quadruple Speed Mode

During serial output, the phase timing with the HE signal can be adjusted by OUT_PHASE[0:1].

The following figure shows the timing of the clock phases of the serial RGB output (triple speed mode).

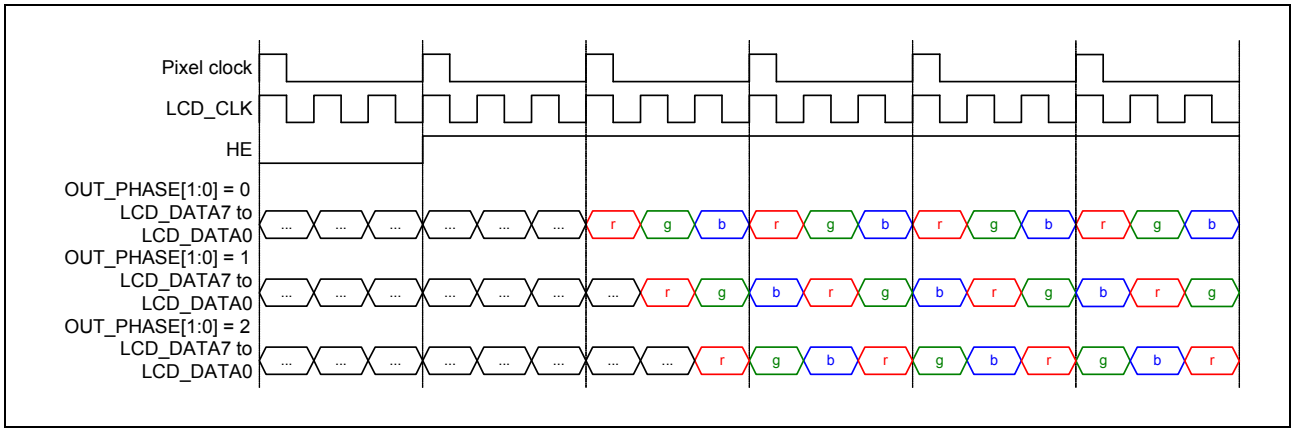

Figure 38.67 Timing of Clock Phases of Serial RGB Output (Triple Speed Mode)

The following figure shows the timing of the clock phases of the serial RGB output (quadruple speed mode).

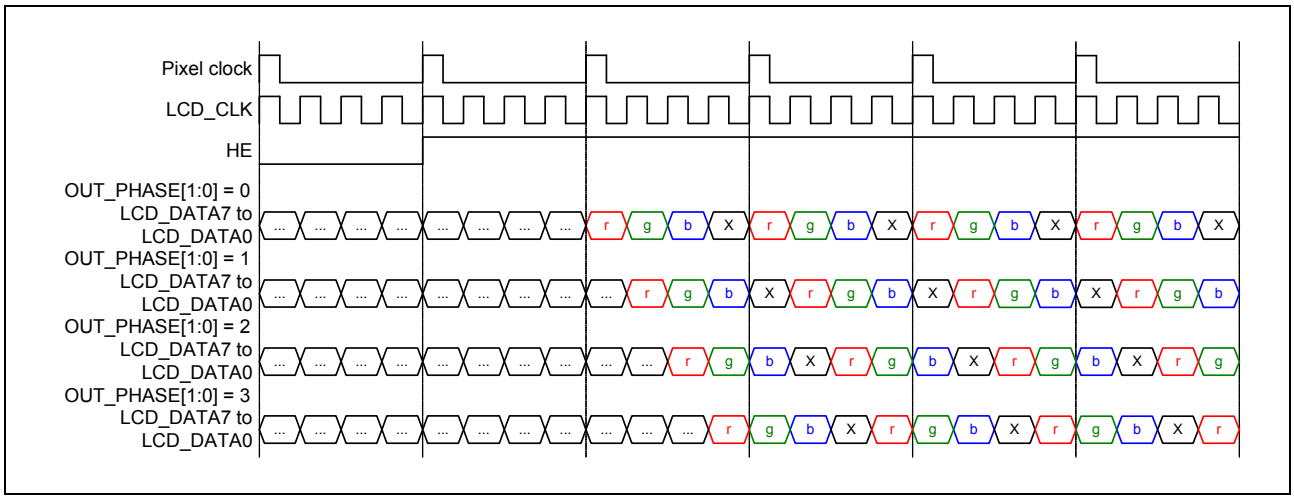

Figure 38.68 Timing of Clock Phases of Serial RGB Output (Quadruple Speed Mode)

Table 38.151 Output Format Conversion (1/2)

Register Name	Bit Name	Initial Value	Description
OUT_SET	OUT_FORMAT[1:0]	0	Output Format Select 0: RBG888 1: RGB666 2: RGB565 3: Serial RGB
OUT_SET	OUT_ENDIAN_ON	0	Bit Endian Change On/Off Control 0: Off 1: On
OUT_SET	OUT_SWAP_ON	0	B/R Signal Swap On/Off Control 0: Off 1: On

Table 38.151 Output Format Conversion (2/2)

Register Name	Bit Name	Initial Value	Description
OUT_SET	OUT_FRQ_SEL[1:0]	0	Clock Frequency Control 0: 100% speed — (parallel RGB) 1: Triple speed — (serial RGB) 2: Quadruple speed — (serial RGB) 3: Setting prohibited
OUT_SET	OUT_DIR_SEL	0	Scan Direction Select 0: Forward scan 1: Reverse scan
OUT_SET	OUT_PHASE[1:0]	0	Clock Phase Adjustment for Serial RGB Output • Triple speed mode 0: 0 (clk) 1: 1 (clk) 2: 2 (clk) 3: Setting prohibited • Quadruple speed mode 0: 0 (clk) 1: 1 (clk) 2: 2 (clk) 3: 3 (clk)

NOTE

In the case of Serial RGB, horizontal enable signal width for full screen (SC0_SCL0_FRC7.SC0_RES_F_HW[10:0]) must be set the original (parallel RGB) width plus 2.

38.8.1.9 LCD TCON

The LCD TCON generates various timing signals for driving the LCD panel.

Specifically, the timing include two vertical panel driver signals, five horizontal panel driver signals, and one composite signal of the vertical and horizontal panel driver signals. **Table 38.152** lists the timing signals that are generated by LCD TCON

Table 38.152 Signals Generated by LCD TCON

Signal Name	Type	Description
STVA/VS	Vertical	• Gate start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. • Vsync signal The width, position, and polarity of the sync signal can be controlled.
STVB/VE	Vertical	• Gate start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. • Vertical enable signal The width, position, and polarity of the sync signal can be controlled.
STVA/HS	Horizontal	• Source start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. • Hsync signal The width, position, and polarity of the sync signal can be controlled.
STB/LP/HE	Horizontal	• Source strobe signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. • Horizontal enable signal The width, position, and polarity of the enable signal can be controlled.
CPV/GCK	Horizontal	• Gate clock signal The pulse width, pulse position, and pulse polarity of the signal can be controlled.
POLA	Horizontal	• VCOM voltage polarity control signal The polarity inversion position, and polarity inversion operation (1 × 1, 1 × 2, 2 × 2) can be controlled.
POLB	Horizontal	• VCOM voltage polarity control signal The polarity inversion position, and polarity inversion operation (1 × 1, 1 × 2, 2 × 2) can be controlled.
DE	Horizontal/Vertical	• Data enable signal The width, position, and polarity of the enable signal can be controlled.

(1) Horizontal Reference Offset Control

The horizontal reference offset control enables generation of a reference signal with a clock delay equivalent to the value of TCON_OFFSET[10:0] from the rising edge of the Hsync signal. If a signal that spans across the Hsync signal needs to be generated, such a signal is generated with reference to the offset reference signal.

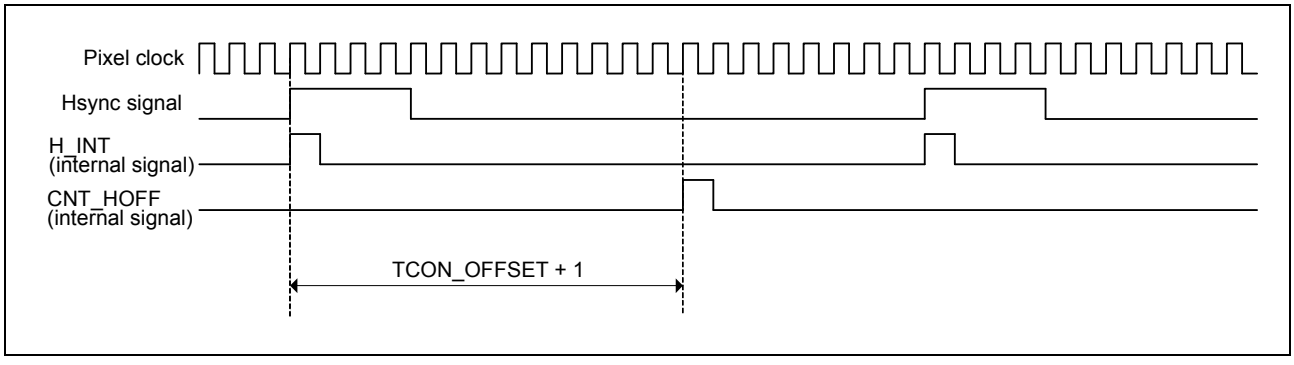

Figure 38.69 Generation of Offset Horizontal Reference (H_OFF) Signal

Table 38.153 Horizontal Reference Signal Selection

Register Name	Bit Name	Initial Value	Description
TCON_TIM	TCON_OFFSET[10:0]	0	Offset Hsync Signal Timing Sets the clock cycle count from the rising edge of the Hsync signal.
TCON_TIM_STH2	TCON_STH_HS_SEL	0	STH Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_STB2	TCON_STB_HS_SEL	0	STB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_CPV2	TCON_CPV_HS_SEL	0	CPV Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_POLA2	TCON_POLA_HS_SEL	0	POLA Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_POLB2	TCON_POLB_HS_SEL	0	POLB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference

Note: When generating the POLA and POLB signals in reverse mode, the bits TCON_POLA_HS_SEL and TCON_POLB_HS_SEL should be set to 0.

(2) Horizontal Panel Driver Signal Generation (A)

Horizontal synchronous panel driver signal generation (A) involves generation of a timing signal that changes twice in a horizontal period according to the values of TCON_xxxx_HS[10:0] and TCON_xxxx_HW[10:0] bits, which set the first changing timing and the second changing timing, respectively.

The internal counter performs the following operations.

1. Resets the counter value at the rising edge of the Hsync signal as the reference.
2. Increments the counter value at the rising edge of the panel clock.

A fixed output value of 0 can be obtained by setting 0 in TCON_xxxx_HW[10:0], which set the second changing timing.

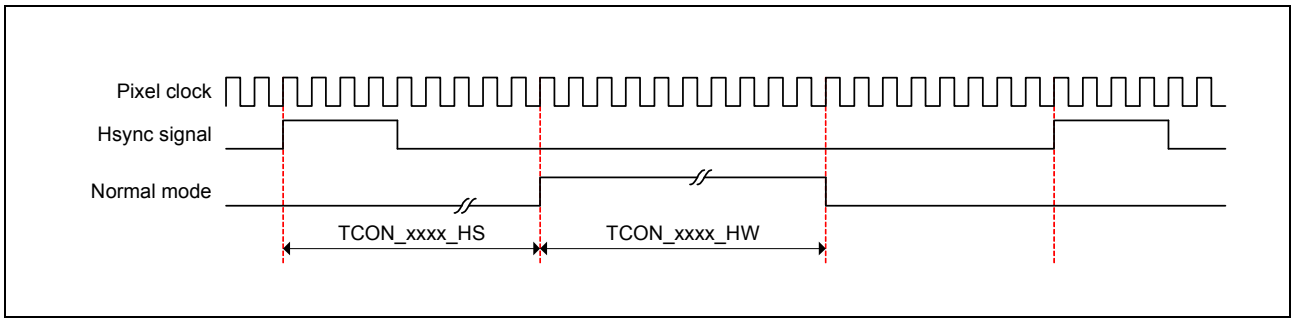

Figure 38.70 Horizontal Panel Driver Signal (in Normal Mode)

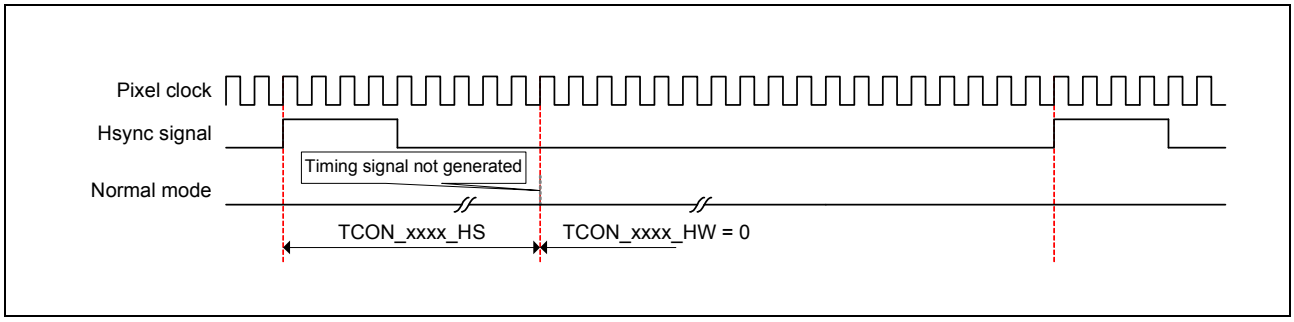

Figure 38.71 Horizontal Panel Driver Signal (in Normal Mode and When TCON_xxxx_HW_ = 0)

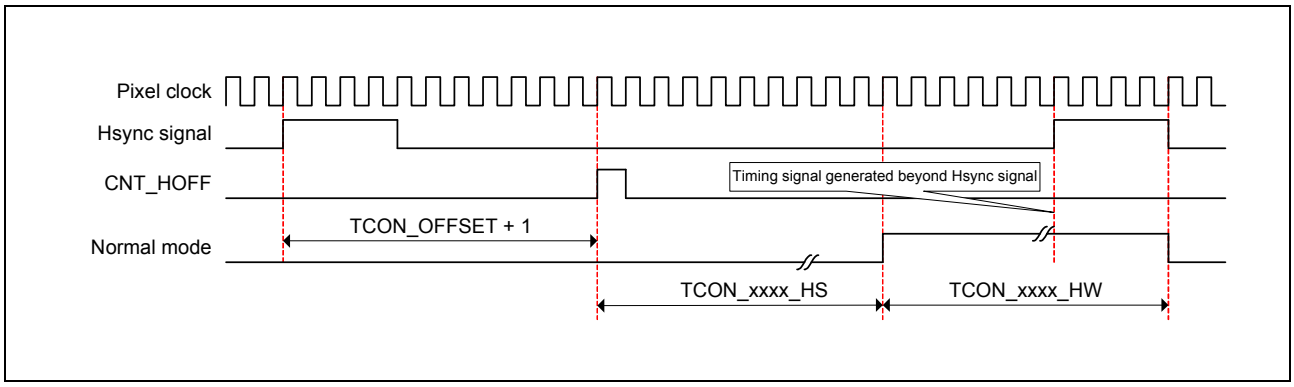

Figure 38.72 Horizontal Panel Driver Signal (in Normal Mode and When Offset Horizontal Reference is Used)

Table 38.154 Settings for Horizontal Panel Driver Signal Generation (A)

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STH1	TCON_STH_HS[10:0]	0	STH Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STH_HS[10:0] from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_STH1	TCON_STH_HW[10:0]	96	STH Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STH_HW[10:0] (clock cycles)
TCON_TIM_STB1	TCON_STB_HS[10:0]	144	STB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STB_HS[10:0] from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_STB1	TCON_STB_HW[10:0]	640	STB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STB_HW[10:0] (clock cycles)
TCON_TIM_CPV1	TCON_CPV_HS[10:0]	0	CPV Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_CPV_HS[10:0] from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_CPV1	TCON_CPV_HW[10:0]	0	CPV Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_CPV_HW[10:0] (clock cycles)

(3) Horizontal Panel Driver Signal Generation (B)

In addition to the normal mode operation described in (2), reverse mode operation, that is, horizontal panel driver signal generation (B) is provided. In reverse mode, operation starts at the rising edge of the

Vsync signal as the reference and a signal is generated such that its polarity is inverted every horizontal period in the timing set by the TCON_xxxx_HS[10:0] bits, which set the first changing timing.

In reverse mode, regardless of whether the number of lines in the vertical direction is odd or even, the polarity of the signals generated is inverted every vertical period. The following three reverse modes are selectable for polarity inversion operation.

Table 38.155 Horizontal Panel Driver Signal Generation Modes

Register Name	Bit Name	Initial Value	Description
TCON_TIM_POLA2	TCON_POLA_MD [1:0]	1	POLA Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
TCON_TIM_POLB2	TCON_POLB_MD [1:0]	1	POLB Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.

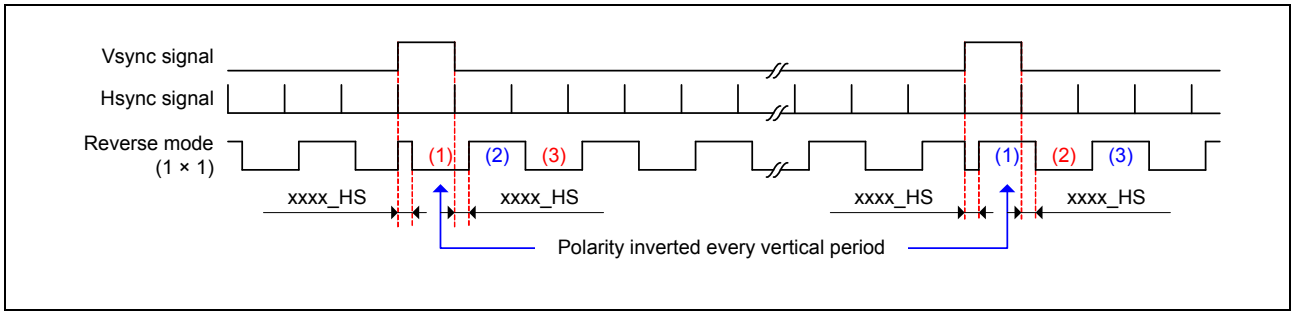

Figure 38.73 Horizontal Panel Driver Signal (in 1 × 1 Reverse Mode)

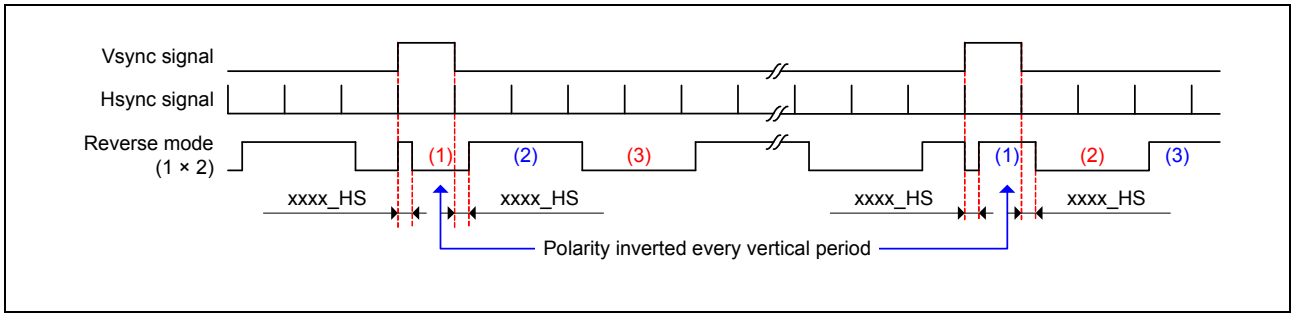

Figure 38.74 Horizontal Panel Driver Signal (in 1 × 2 Reverse Mode)

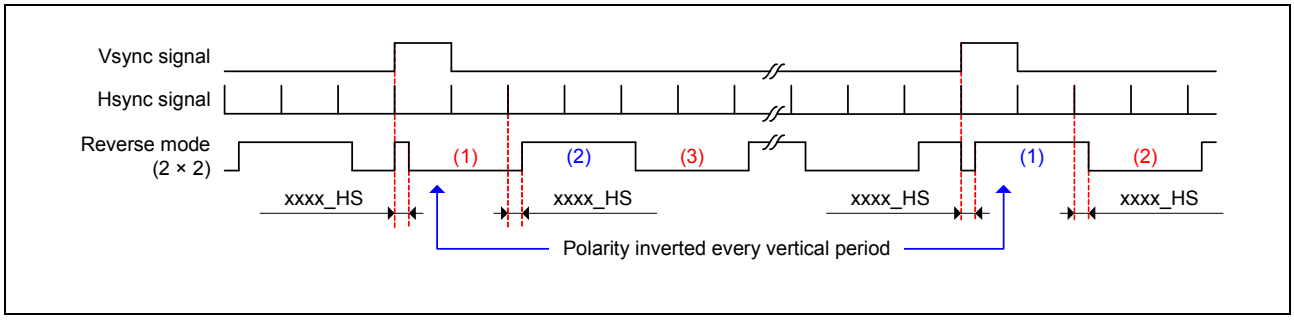

Figure 38.75 Horizontal Panel Driver Signal (in 2 × 2 Reverse Mode)

Table 38.156 Settings of Horizontal Panel Driver Signal Generation (B)

Register Name	Bit Name	Initial Value	Description
TCON_TIM_POLA1	TCON_POLA_HS [10:0]	0	POLA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLA_HS[10:0] from the rising edge of the Hsync signal (clock cycles) Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater.
TCON_TIM_POLA1	TCON_POLA_HW [10:0]	0	POLA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLA_HW[10:0] (clock cycles)
TCON_TIM_POLB1	TCON_POLB_HS [10:0]	0	POLBA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLB_HS[10:0] from the rising edge of the Hsync signal (clock cycles) Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater.
TCON_TIM_POLB1	TCON_POLB_HW [10:0]	0	POLB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLB_HW[10:0] (clock cycles)

(4) Vertical Panel Driver Signal Generation

The vertical synchronous panel driver signal generation involves the following operations.

1. Initialization at the rising edge of the Vsync signal
2. Generation of a timing signal that changes twice in a vertical period according to the values of the internal counter, and TCON_xxxx_VS[10:0] and TCON_xxxx_VW[10:0] bits, which set the first changing timing and the second changing timing, respectively.

The internal counter increments the counter value in the following two cases.

1. At the rising edge of the Hsync signal
2. At the point reached after a clock delay specified by the value of TCON_HALF[10:0] from the rising edge of the Hsync signal (normally, 1/2fH is set).

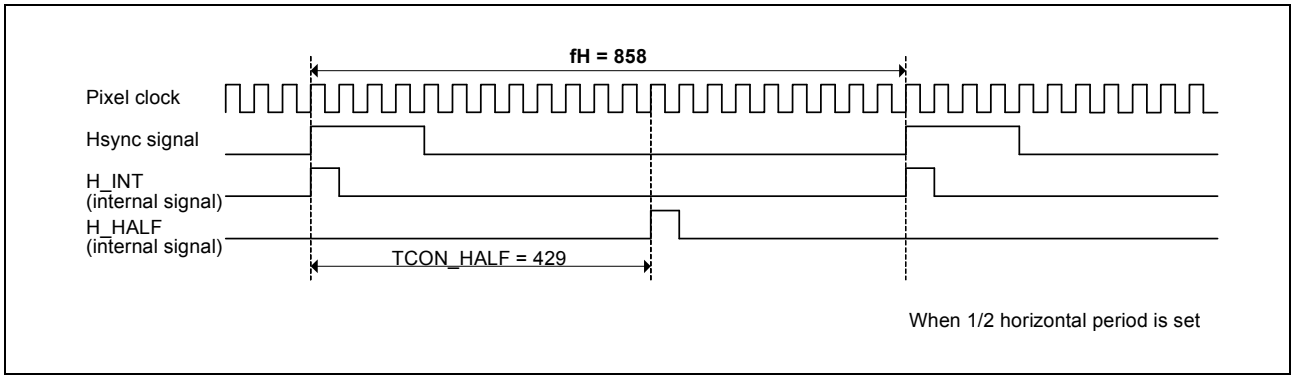

Figure 38.76 1/2 Pulse (H_HALF) Signal Generation

Table 38.157 Settings of 1/2 Pulse (H_HALF) Signal Generation

Register Name	Bit Name	Initial Value	Description
TCON_TIM	TCON_HALF[10:0]	400	1/2fH Timing Specifies the clock count from the rising edge of the Hsync signal as the counting timing of horizontal counter

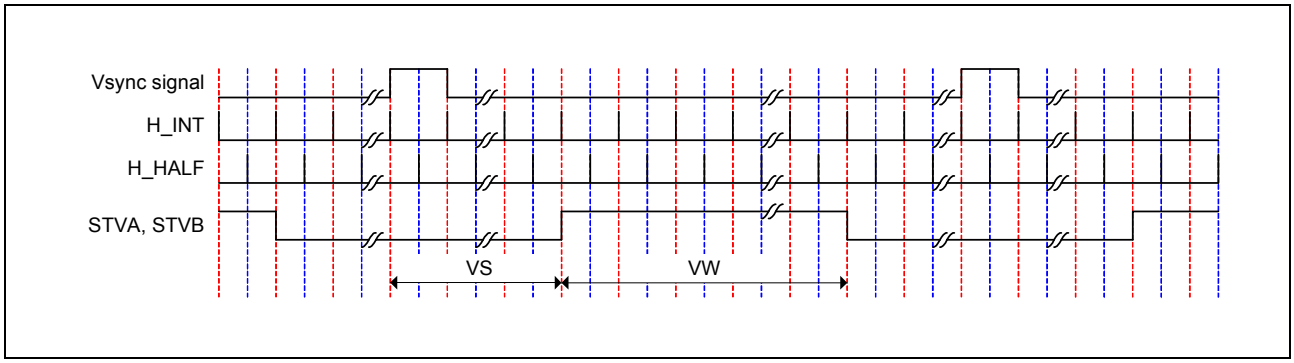

Figure 38.77 Vertical Panel Driver Signal (H_INT Reference Operation)

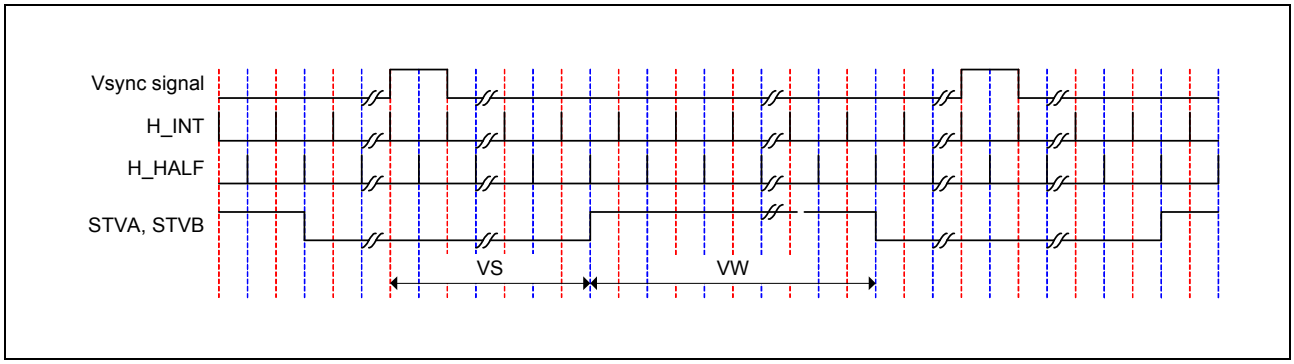

Figure 38.78 Vertical Panel Driver Signal (H_HALF Reference Operation)

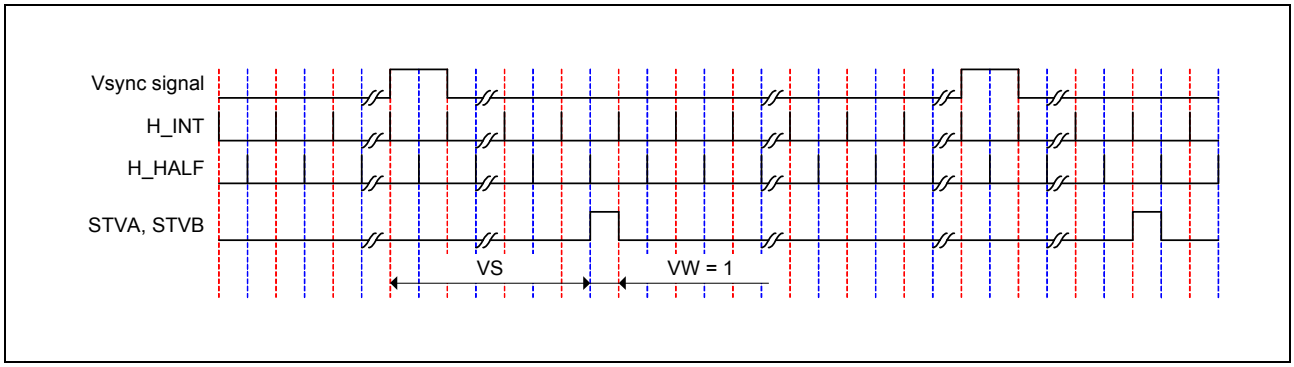

Figure 38.79 Vertical Panel Driver Signal (H_INT and H_HALF Reference Operation)

Table 38.158 Vertical Panel Driver Signal Generation

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA1	TCON_STVA_VS[10:0]	0	STVA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVA_VS[10:0] from the rising edge of the Vsync signal (1/2fH cycles)
TCON_TIM_STVA1	TCON_STVA_VW[10:0]	4	STVA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVA_VW[10:0] (1/2fH cycles)
TCON_TIM_STVB1	TCON_STVB_VS[10:0]	70	STVB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVB_VS[10:0] from the rising edge of the Vsync signal (1/2fH cycles)
TCON_TIM_STVB1	TCON_STVB_VW[10:0]	960	STVB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVB_VW[10:0] (1/2fH cycles)

(5) DE Timing Signal Generation

DE timing signal generation involves generation of data enable signal (DE) that indicates the valid period of the video signal by synthesizing the horizontal panel driver (HE) signal and the vertical panel driver (VE) signal (AND).

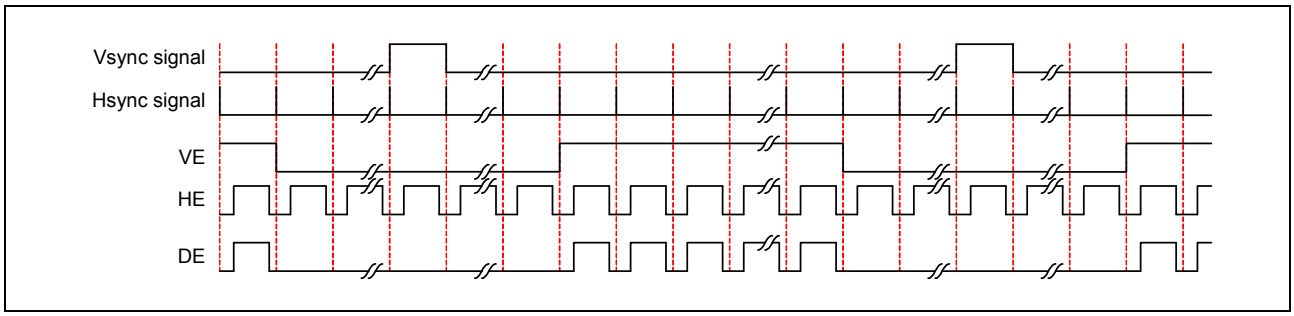

Figure 38.80 Data Enable Signal Generation

(6) Polarity Inversion

Polarity inversion enables inversion of polarity of each signal generated by the signal generating circuit.

Table 38.159 Panel Driver Signal Polarity Inversion Control

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA2	TCON_STVA_INV	1	Polarity Inversion Control of STVA Signal 0: Not inverted 1: Inverted
TCON_TIM_STVB2	TCON_STVB_INV	0	Polarity Inversion Control of STVB Signal 0: Not inverted 1: Inverted
TCON_TIM_STH2	TCON_STH_INV	1	Polarity Inversion Control of STH Signal 0: Not inverted 1: Inverted
TCON_TIM_STB2	TCON_STB_INV	0	Polarity Inversion Control of STB Signal 0: Not inverted 1: Inverted
TCON_TIM_CPV2	TCON_CPV_INV	0	Polarity Inversion Control of CPV Signal 0: Not inverted 1: Inverted
TCON_TIM_POLA2	TCON_POLA_INV	0	Polarity Inversion Control of POLA Signal 0: Not inverted 1: Inverted
TCON_TIM_POLB2	TCON_POLB_INV	0	Polarity Inversion Control of POLB Signal 0: Not inverted 1: Inverted
TCON_TIM_DE	TCON_DE_INV	0	Polarity Inversion Control of DE Signal 0: Not inverted 1: Inverted

(7) Output Selection

An output pin is selected for every signal subjected to polarity inversion control.

Table 38.160 Panel Driver Signal Output Selection

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA2	TCON_STVA_SEL [2:0]	0	Output Signal Select for LCD_TCON0 Pin 0: STVA/VS Others: prohibited
TCON_TIM_STVB2	TCON_STVB_SEL [2:0]	1	Output Signal Select for LCD_TCON1 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE
TCON_TIM_STH2	TCON_STH_SEL [2:0]	2	Output Signal Select for LCD_TCON2 Pin 2: STH/SP/HS Others: prohibited
TCON_TIM_STB2	TCON_STB_SEL [2:0]	7	Output Signal Select for LCD_TCON3 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE*1
TCON_TIM_CPV2	TCON_CPV_SEL [2:0]	4	Output Signal Select for LCD_TCON4 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE
TCON_TIM_POLA2	TCON_POLA_SEL [2:0]	5	Output Signal Select for LCD_TCON5 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE
TCON_TIM_POLB2	TCON_POLB_SEL [2:0]	6	Output Signal Select for LCD_TCON6 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note 1. Though the signal of the LCD_TCON3 pin can be freely selected from the list, it is recommended to select the DE signal (TCON_STB_SEL[2:0] = 7). This way the DE signal is located in the neighborhood of the other TCON signals at the device package, which might ease the PCB layout.

(8) Output Phase Selection

The output phase can be individually selected for the video output signal and the various timing output signals based on the LCD_CLK (panel clock).

Table 38.161 Panel Output Signal Phase Selection

Register Name	Bit Name	Initial Value	Description
OUT_CLK_PHASE	OUTCNT_LCD_EDGE	0	Output Phase Control of LCD_DATA23 to LCD_DATA0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STVA_EDGE	0	Output Phase Control of LCD_TCON0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STVB_EDGE	0	Output Phase Control of LCD_TCON1 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STH_EDGE	0	Output Phase Control of LCD_TCON2 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STB_EDGE	0	Output Phase Control of LCD_TCON3 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_CPV_EDGE	0	Output Phase Control of LCD_TCON4 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_POLA_EDGE	0	Output Phase Control of LCD_TCON5 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_POLB_EDGE	0	Output Phase Control of LCD_TCON6 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin

38.8.2 Register Descriptions

Table 38.162 to **Table 38.167** shows the register configuration.

- Symbols used in Register Description:

  Initial value: Register value after a reset

  —: Undefined value

  R/W: Readable/writable. The written value can be read.

  R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

  R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

  R: Read-only. The write value should always be 0.

  —/W: Write-only. The read value is undefined.

VDCE1	Panel dither register	OUT_PDTHA	R/W	H'0000 3021	<VDCE1_base> + 1A14	32
VDCE1	Output phase control register	OUT_CLK_PHASE	R/W	H'0000 0000	<VDCE1_base> + 1A24	32

NOTE

Register access sizes other than defined in the table above are not supported.

NOTE

In the header files the names of the above registers are defined in the following format:

<ModuleName> + <Symbol>.

<ModuleName> and <Symbol> are defined in the above table.

38.8.2.1 Register Update Control Register G in Gamma Correction Block (GAM_G_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GAM_G_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAM_G_VEN	0	R/WC1	Gamma Correction (G) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

38.8.2.2 Function Switch Register in Gamma Correction Block (GAM_SW)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value:	0	0	0	0	0	0	0	1	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_OFFSET[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_HALF[10:0]	400	R/W	1/2fH Timing Specifies the clock count from the rising edge of the Hsync signal as the counting timing of horizontal counter.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_OFFSET[10:0]	0	R/W	Offset Hsync Signal Timing Sets the clock cycle count from the rising edge of the Hsync signal.

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

38.8.2.34 TCON Vertical Timing Setting Register A1 (TCON_TIM_STVA1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STVA_VS[10:0]

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STVA_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STVA_VS [10:0]	0	R/W	STVA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVA_VS[10:0] from the rising edge of the Vsync signal (1/2fH cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STVA_VW [10:0]	4	R/W	STVA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVA_VW[10:0] (1/2fH cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

38.8.2.35 TCON Vertical Timing Setting Register A2 (TCON_TIM_STVA2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TCON_STVA_INV	—	TCON_STVA_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STVA_INV	1	R/W	Polarity Inversion Control of STVA Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STVA_SEL [2:0]	0	R/W	Output Signal Select for LCD_TCON0 Pin 0: STVA/VS all others: prohibited

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

38.8.2.36 TCON Vertical Timing Setting Register B1 (TCON_TIM_STVB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STVB_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STVB_VW[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STVB_VS [10:0]	70	R/W	STVB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVB_VS[10:0] from the rising edge of the Vsync signal (1/2fH cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STVB_VW [10:0]	960	R/W	STVB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVB_VW[10:0] (1/2fH cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

38.8.2.37 TCON Vertical Timing Setting Register B2 (TCON_TIM_STVB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TCON_STVB_INV	—	TCON_STVB_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STVB_INV	0	R/W	Polarity Inversion Control of STVB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STVB_SEL [2:0]	1	R/W	Output Signal Select for LCD_TCON1 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

38.8.2.38 TCON Horizontal Timing Setting Register STH1 (TCON_TIM_STH1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STH_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STH_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STH_HS [10:0]	0	R/W	STH Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STH_HS[10:0] from the rising edge of the Hsync signal (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STH_HW [10:0]	96	R/W	STH Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STH_HW[10:0] (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

38.8.2.39 TCON Horizontal Timing Setting Register STH2 (TCON_TIM_STH2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCON_STH_HS_SEL	—	—	—	TCON_STH_INV	—	TCON_STH_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0..
8	TCON_STH_HS_SEL	0	R/W	STH Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STH_INV	1	R/W	Polarity Inversion Control of STH Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STH_SEL[2:0]	2	R/W	Output Signal Select for LCD_TCON2 Pin 2: STH/SP/HS all others: prohibited

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

38.8.2.40 TCON Horizontal Timing Setting Register STB1 (TCON_TIM_STB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STB_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STB_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STB_HS [10:0]	144	R/W	STB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STB_HS[10:0] from the rising edge of the Hsync signal (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STB_HW [10:0]	640	R/W	STB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STB_HW[10:0] (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

38.8.2.41 TCON Horizontal Timing Setting Register STB2 (TCON_TIM_STB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCON_STB_HS_SEL	—	—	—	TCON_STB_INV	—	TCON_STB_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_STB_HS_SEL	0	R/W	STB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STB_INV	0	R/W	Polarity Inversion Control of STB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STB_SEL[2:0]	7	R/W	Output Signal Select for LCD_TCON3 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE*1

Note 1. Though the signal of the LCD_TCON3 pin can be freely selected from the list, it is recommended to select the DE signal (TCON_STB_SEL[2:0] = 7). This way the DE signal is located in the neighborhood of the other TCON signals at the device package, which might ease the PCB layout.

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

38.8.2.42 TCON Horizontal Timing Setting Register CPV1 (TCON_TIM_CPV1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_CPV_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_CPV_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_CPV_HS [10:0]	0	R/W	CPV Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_CPV_HS[10:0] from the rising edge of the Hsync signal (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_CPV_HW [10:0]	0	R/W	CPV Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_CPV_HW[10:0] (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

38.8.2.43 TCON Horizontal Timing Setting Register CPV2 (TCON_TIM_CPV2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCON_CPV_HS_SEL	—	—	—	TCON_CPV_INV	—	TCON_CPV_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_CPV_HS_SEL	0	R/W	CPV Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_CPV_INV	0	R/W	Polarity Inversion Control of CPV Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_CPV_SEL[2:0]	4	R/W	Output Signal Select for LCD_TCON4 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

38.8.2.44 TCON Horizontal Timing Setting Register POLA1 (TCON_TIM_POLA1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_POLA_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_POLA_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_POLA_HS [10:0]	0	R/W	POLA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLA_HS[10:0] from the rising edge of the Hsync signal (clock cycles). Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_POLA_HW [10:0]	0	R/W	POLA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLA_HW[10:0] (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

38.8.2.45 TCON Horizontal Timing Setting Register POLA2 (TCON_TIM_POLA2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TCON_POLA_MD[1:0]		—	—	—	TCON_POLA_HS_SEL	—	—	—	TCON_POLA_INV	—	TCON_POLA_SEL[2:0]		
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	1	0	1
R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	TCON_POLA_MD [1:0]	1	R/W	POLA Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_POLA_HS _SEL	0	R/W	POLA Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_POLA_INV	0	R/W	Polarity Inversion Control of POLA Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_POLA_SEL [2:0]	5	R/W	Output Signal Select for LCD_TCON5 pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

38.8.2.46 TCON Horizontal Timing Setting Register POLB1 (TCON_TIM_POLB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_POLB_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_POLB_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_POLB_HS [10:0]	0	R/W	POLB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLB_HS[10:0] from the rising edge of the Hsync signal (clock cycles). Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_POLB_HW [10:0]	0	R/W	POLB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLB_HW[10:0] (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

38.8.2.47 TCON Horizontal Timing Setting Register POLB2 (TCON_TIM_POLB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TCON_POLB_MD[1:0]		—	—	—	TCON_POLB_HS_SEL	—	—	—	TCON_POLB_INV	—	TCON_POLB_SEL[2:0]		
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1	0
R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	TCON_POLB_MD [1:0]	1	R/W	POLB Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_POLB_HS _SEL	0	R/W	POLB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_POLB_INV	0	R/W	Polarity Inversion Control of POLB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_POLB_SEL [2:0]	6	R/W	Output Signal Select for LCD_TCON6 pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

38.8.2.48 TCON Data Enable Polarity Setting Register (TCON_TIM_DE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TCON_DE_INV
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TCON_DE_INV	0	R/W	Polarity Inversion Control of DE Signal 0: Not inverted 1: Inverted

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

38.8.2.49 Register Update Control Register in Output Controller (OUT_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OUTCNT_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OUTCNT_VEN	0	R/WC1	Brightness/Contrast, Dither Process, Output Interface Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

38.8.2.50 Output Interface Register (OUT_SET)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	OUT_ENDIAN_ON	—	—	—	OUT_SWAP_ON	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	OUT_FORMAT[1:0]		—	—	OUT_FRQ_SEL[1:0]		—	—	OUT_SEQ_SEL	OUT_DIR_SEL	—	—	OUT_PHASE[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	OUT_ENDIAN_ON	0	R/W	Bit Endian Change On/Off Control 0: Off 1: On
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	OUT_SWAP_ON	0	R/W	B/R Signal Swap On/Off Control 0: Off 1: On
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	OUT_FORMAT[1:0]	0	R/W	Output Format Select 0: RBG888 1: RGB666 2: RGB565 3: Serial RGB (D1M1A and D1M1-V2 only)
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	OUT_FRQ_SEL[1:0]	0	R/W	Clock Frequency Control 0: 100% speed — (parallel RGB) 1: Triple speed — (serial RGB) 2: Quadruple speed — (serial RGB) 3: Setting prohibited
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	OUT_SEQ_SEL	0	R/W	Output Sequence Select in triple speed mode For the detail, please refer (5) Parallel to Serial Conversion in Section 38.8.1.8, Output Format Conversion 0: R/G/B output sequence is swapped at the next line 1: R/G/B output sequence is fixed at every line

Bit	Bit Name	Initial Value	R/W	Description
4	OUT_DIR_SEL	0	R/W	Scan Direction Select 0: Forward scan 1: Reverse scan
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	OUT_PHASE[1:0]	All 0	R/W	Clock Phase Adjustment During Serial RGB Output • Triple speed mode 0: 0 (clk) 1: 1 (clk) 2: 2 (clk) 3: 0 Setting prohibited • Quadruple speed mode 0: 0 (clk) 1: 1 (clk) 2: 2 (clk) 3: 3 (clk)

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

38.8.2.51 Brightness (DC) Correction Register 1 (OUT_BRIGHT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PBRT_G[9:0]									
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	PBRT_G[9:0]	512	R/W	Brightness (DC) Adjustment of G Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

38.8.2.52 Brightness (DC) Correction Register 2 (OUT_BRIGHT2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	PBRT_B[9:0]									
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PBRT_R[9:0]									
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	PBRT_B[9:0]	512	R/W	Brightness (DC) Adjustment of B Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	PBRT_R[9:0]	512	R/W	Brightness (DC) Adjustment of R Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

38.8.2.53 Contrast (Gain) Correction Register (OUT_CONTRAST)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CONT_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CONT_B[7:0]								CONT_R[7:0]							
Initial value:	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	CONT_G[7:0]	128	R/W	Contrast (Gain) Adjustment of G Signal 0/128 to 255/128 (approx.2 times)
15 to 8	CONT_B[7:0]	128	R/W	Contrast (Gain) Adjustment of B Signal 0/128 to 255/128 (approx.2 times)
7 to 0	CONT_R[7:0]	128	R/W	Contrast (Gain) Adjustment of R Signal 0/128 to 255/128 (approx.2 times)

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

38.8.2.54 Panel Dither Register (OUT_PDTHA)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	PDTH_SEL[1:0]		—	—	PDTH_FORMAT[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	PDTH_PA[1:0]		—	—	PDTH_PB[1:0]		—	—	PDTH_PC[1:0]		—	—	PDTH_PD[1:0]	
Initial value:	0	0	1	1	0	0	0	0	0	0	1	0	0	0	0	1
R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	PDTH_SEL[1:0]	0	R/W	Panel Dither Operation Mode 0: Truncate 1: Round-off 2: 2 × 2 pattern dither 3: Random pattern dither
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	PDTH_FORMAT [1:0]	0	R/W	Panel Dither Output Format Select 0: RGB888 1: RGB666 2: RGB565 3: Setting prohibited
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	PDTH_PA[1:0]	3	R/W	Pattern Value (A) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	PDTH_PB[1:0]	0	R/W	Pattern Value (B) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	PDTH_PC[1:0]	2	R/W	Pattern Value (C) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	PDTH_PD[1:0]	1	R/W	Pattern Value (D) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

38.8.2.55 Output Phase Control Register (OUT_CLK_PHASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	OUTCNT_FRONT_GAM	—	—	—	OUTCNT_LCD_EDGE	—	OUTCNT_STVA_EDGE	OUTCNT_STVB_EDGE	OUTCNT_STH_EDGE	OUTCNT_STB_EDGE	OUTCNT_CPV_EDGE	OUTCNT_POLA_EDGE	OUTCNT_POLB_EDGE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	OUTCNT_FRONT_GAM	0	R/W	Correction Circuit Sequence Control 0: Brightness → contrast → gamma correction 1: Gamma correction → contrast → brightness
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	OUTCNT_LCD_EDGE	0	R/W	Output Phase Control of LCD_DATA23 to LCD_DATA0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	OUTCNT_STVA_EDGE	0	R/W	Output Phase Control of LCD_TCON0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
5	OUTCNT_STVB_EDGE	0	R/W	Output Phase Control of LCD_TCON1 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
4	OUTCNT_STH_EDGE	0	R/W	Output Phase Control of LCD_TCON2 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
3	OUTCNT_STB_EDGE	0	R/W	Output Phase Control of LCD_TCON3 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
2	OUTCNT_CPV_EDGE	0	R/W	Output Phase Control of LCD_TCON4 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
1	OUTCNT_POLA_EDGE	0	R/W	Output Phase Control of LCD_TCON5 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
0	OUTCNT_POLB_EDGE	0	R/W	Output Phase Control of LCD_TCON6 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

38.8.3 Usage Methods

38.8.3.1 Gamma Correction Adjustment Method

The characteristics of G, B, R of each panel to be connected should be measured and gamma correction should be made to suit the panel.

Since the gamma correction adjustment depends on to the characteristics of the panel, there are no recommended setting values.

38.8.3.2 Dither Usage Method

Dither is used when pseudo contour is appeared on the display screen.

Table 38.168 Dither Settings

Bit Name	Setting Value
PDTH_FORMAT[1:0]	Selects the format. For RGB888: 0 For RGB666: 1 For RGB565: 2
PDTH_SEL[1:0]	When 2 × 2 pattern dither is to be used: 2
PDTH_PA[1:0]	Normally 3 (initial value)
PDTH_PB[1:0]	Normally 0 (initial value)
PDTH_PC[1:0]	Normally 2 (initial value)
PDTH_PD[1:0]	Normally 1 (initial value)

38.8.3.3 Output Format Adjustment Method

The setting example of the typical output format is shown in **Table 38.169** and **Table 38.170**.

It is necessary to carry out the setting of synchronization system signals of each output format similarly as the setting of output after scaling.

Table 38.169 Setting Example of Synchronizing Signal (1/2)

Register Name	Bit Name	VGA	SVGA	Description
TCON_TIM	TCON_HALF[10:0]	400	528	Sets the half value of 1H time period in clock units.
Vsync signal				
TCON_TIM_STVA1	TCON_STVA_VS[10:0]	0	0	Sets the pulse generation start position from the rising edge of the internal Vsync signal. A 1/2H time period is set as 1.
TCON_TIM_STVA1	TCON_STVA_VW[10:0]	4	8	Sets the changing point from the above pulse generation start position. A 1/2H time period is set as 1.
TCON_TIM_STVA2	TCON_STVA_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STVA2	TCON_STVA_SEL[2:0]	0	0	For STVA output selection: 0
Vertical enable signal				
TCON_TIM_STVB1	TCON_STVB_VS[10:0]	68	44	Sets the pulse generation start position from the rising edge of the internal Vsync signal. A 1/2H time period is set as 1.

Table 38.169 Setting Example of Synchronizing Signal (2/2)

Register Name	Bit Name	VGA	SVGA	Description
TCON_TIM_STVB1	TCON_STVB_VW[10:0]	960	1200	Sets the changing point from the above pulse generation start position. A 1/2H time period is set as 1.
TCON_TIM_STVB2	TCON_STVB_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STVB2	TCON_STVB_SEL[2:0]	1	1	For STVB output selection: 1

Register Name	Bit Name	VGA	SVGA	Description
Hsync signal				
TCON_TIM_STH1	TCON_STH_HS[10:0]	0	0	Sets the pulse generation start position from the rising edge of the internal Hsync signal.
TCON_TIM_STH1	TCON_STH_HW[10:0]	96	128	Sets the changing point from the above pulse generation start position.
TCON_TIM_STH2	TCON_STH_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STH2	TCON_STH_SEL[2:0]	2	2	For STH output selection: 2
Horizontal enable signal				
TCON_TIM_STB1	TCON_STB_HS[10:0]	128	192	Sets the pulse generation start position from the rising edge of the internal Hsync signal.
TCON_TIM_STB1	TCON_STB_HW[10:0]	640	800	Sets the changing point from the above pulse generation start position.
TCON_TIM_STB2	TCON_STB_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STB2	TCON_STB_SEL[2:0]	3	3	For STB output selection: 3

Table 38.170 Setting Example of Data System

Register Name	Bit Name	RGB888	RGB ()	Description
OUT_SET	OUT_ENDIAN_ON	0	0	When bit endian is changed: 1
OUT_SET	OUT_SWAP_ON	0	0	When B/R is to be swapped: 1
OUT_SET	OUT_FORMAT[1:0]	0	3	Sets the output format. For RGB888: 0 For RGB666: 1 For RGB565: 2 For serial RGB: 3
OUT_SET	OUT_FRQ_SEL[1:0]	0	1	Sets the output clock. For RGB888, RGB666, RGB565: 0 For triple speed serial RGB output: 1 For quadruple serial RGB output: 2
OUT_SET	OUT_DIR_SEL	0	0	When data arrangement of the serial RGB output is to be reversed: 1

38.9 System Controller

38.9.1 System Controller Functions

38.9.1.1 Overview of Functions

The system controller provides interrupt control, panel clock control, CLUT table read select signal status flag output functions.

38.9.1.2 Interrupt Control

Several interrupt signals are output from the scaler and image synthesizer. The system controller controls whether to output these interrupt signals.

One is written to the corresponding INT_STA* bit when an interrupt signal is to be accepted. After 1 has been written to the bit, however, its value is still read out as 0 until the interrupt signal is accepted. Once the interrupt signal has been accepted, the INT_STA* bit is read out as 1.

The bit for an accepted interrupt signal is cleared by writing 0 to the INT_STA* bit. If further interrupt signals are to be accepted after the INT_STA* bit has been cleared, 1 is again written to the bit.

NOTE

Interrupts settings should be set after clock supply to VDCE in order to avoid unexpected interrupts.

About VDCE clock, refer to Section 38.1.3, Clock supply.

Table 38.171 Interrupt Signals

Request Source Name	Bit Name	Function
S0_VI_VSYNC	INT_STA 0	Vsync signal input to scaler 0
S0_LO_VSYNC	INT_STA 1	Vsync signal output from scaler 0
S0_VSYNCERR	INT_STA 2	Missing Vsync signal for scaler 0
GR3_VLINE	INT_STA 3	Specified line signal for panel output in graphics 3
S0_VFIELD	INT_STA 4	Field end signal for recording function in scaler 0
IV1_VBUFERR	INT_STA 5	Frame buffer write overflow signal for scaler 0
IV3_VBUFERR	INT_STA 6	Frame buffer read underflow signal for graphics 0
IV5_VBUFERR	INT_STA 7	Frame buffer read underflow signal for graphics 2
IV6_VBUFERR	INT_STA 8	Frame buffer read underflow signal for graphics 3
S1_LO_VSYNC	INT_STA 11	Vsync signal output from scaler 1
S1_VSYNCERR	INT_STA 12	Missing Vsync signal for scaler 1
IV4_VBUFERR	INT_STA 15	Frame buffer read underflow signal for graphics 1
OIR_VI_VSYNC	INT_STA 17	Vsync signal input to output image generator
OIR_LO_VSYNC	INT_STA 18	Vsync signal output from output image generator
OIR_VLINE	INT_STA 19	Specified line signal for panel output in output image generator
IV8_VBUFERR	INT_STA 22	Frame buffer read underflow signal for graphics (OIR)

Table 38.172 Interrupt Clear/Hold Settings (1/2)

Register Name	Bit Name	Initial Value	Description
SYSCNT_INT1	INT_STA0	0	S0_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA1	0	S0_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA2	0	S0_VSYNCERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA3	0	GR3_VLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA4	0	S0_VFIELD Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA5	0	IV1_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA6	0	IV3_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA7	0	IV5_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA8	0	IV6_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA11	0	S1_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA12	0	S1_VSYNCERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA15	0	IV4_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

Table 38.172 Interrupt Clear/Hold Settings (2/2)

Register Name	Bit Name	Initial Value	Description
SYSCNT_INT3	INT_STA17	0	OIR_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT3	INT_STA18	0	OIR_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT3	INT_STA19	0	OIR_VLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT3	INT_STA22	0	IV8_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

Table 38.173 Interrupt Output On/Off Settings (1/2)

Register Name	Bit Name	Initial Value	Description
SYSCNT_INT4	INT_OUT0_ON	0	S0_VI_VSYNC Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT1_ON	0	S0_LO_VSYNC Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT2_ON	0	S0_VSYNCERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT3_ON	0	GR3_VLINE Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT4_ON	0	S0_VFIELD Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT5_ON	0	IV1_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT6_ON	0	IV3_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT7_ON	0	IV5_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT5	INT_OUT8_ON	0	IV6_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT5	INT_OUT11_ON	0	S1_LO_VSYNC Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT5	INT_OUT12_ON	0	S1_VSYNCERR Interrupt Output On/Off 0: Off 1: On

Table 38.173 Interrupt Output On/Off Settings (2/2)

Register Name	Bit Name	Initial Value	Description
SYSCNT_INT5	INT_OUT15_ON	0	IV4_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT6	INT_OUT18_ON	0	OIR_LO_VSYNC Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT6	INT_OUT19_ON	0	OIR_VLINE Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT6	INT_OUT22_ON	0	IV8_VBUFERR Interrupt Output On/Off 0: Off 1: On

38.9.1.3 CLUT Table Read Select Signal Status Flag

The CLUT read select signal status can be read using the flags shown in **Table 38.174**.

Table 38.174 CLUT Table Read Select Signal Status Flags

Register Name	Bit Name	Initial Value	Description
SYSCNT_CLUT	GR0_CLT_SEL_ST	—	Graphics 0 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
SYSCNT_CLUT	GR1_CLT_SEL_ST	—	Graphics 1 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
SYSCNT_CLUT	GR2_CLT_SEL_ST	—	Graphics 2 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
SYSCNT_CLUT	GR3_CLT_SEL_ST	—	Graphics 3 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.

38.9.2 Register Descriptions

The following register sets are allocated in the SH register map area.

- Symbols used in Register Descriptions

  Initial value: Register value after a reset

  —: Undefined value

  R/W: Readable/writable. The written value can be read.

  R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

  R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

  R: Read-only. The write value should always be 0.

  —/W: Write-only. The read value is undefined.

Table 38.175 Register Configuration of System Controller (CH0)

Module Name	Register Name	Symbol	R/W	Initial Value	Address	Access Size
VDCE0	Interrupt control register 1	SYSCNT_INT1	R/W	H'0000 0000	<VDCE0_base> + 1A80	32
VDCE0	Interrupt control register 2	SYSCNT_INT2	R/W	H'0000 0000	<VDCE0_base> + 1A84	32
VDCE0	Interrupt control register 3	SYSCNT_INT3	R/W	H'0000 0000	<VDCE0_base> + 1A88	32
VDCE0	Interrupt control register 4	SYSCNT_INT4	R/W	H'0000 0000	<VDCE0_base> + 1A8C	32
VDCE0	Interrupt control register 5	SYSCNT_INT5	R/W	H'0000 0000	<VDCE0_base> + 1A90	32
VDCE0	Interrupt control register 6	SYSCNT_INT6	R/W	H'0000 0000	<VDCE0_base> + 1A94	32
VDCE0	CLUT table read select signal status register	SYSCNT_CLUT	R	H'0000	<VDCE0_base> + 1A9A	16

Table 38.176 Register Configuration of System Controller (CH1)

Module Name	Register Name	Symbol	R/W	Initial Value	Address	Access Size
VDCE1	Interrupt control register 1	SYSCNT_INT1	R/W	H'0000 0000	<VDCE1_base> + 1A80	32
VDCE1	Interrupt control register 2	SYSCNT_INT2	R/W	H'0000 0000	<VDCE1_base> + 1A84	32
VDCE1	Interrupt control register 3	SYSCNT_INT3	R/W	H'0000 0000	<VDCE1_base> + 1A88	32
VDCE1	Interrupt control register 4	SYSCNT_INT4	R/W	H'0000 0000	<VDCE1_base> + 1A8C	32
VDCE1	Interrupt control register 5	SYSCNT_INT5	R/W	H'0000 0000	<VDCE1_base> + 1A90	32
VDCE1	Interrupt control register 6	SYSCNT_INT6	R/W	H'0000 0000	<VDCE1_base> + 1A94	32
VDCE1	CLUT table read select signal status register	SYSCNT_CLUT	R	H'0000	<VDCE1_base> + 1A9A	16

NOTE

Register access sizes other than defined in the table above are not supported.

NOTE

In the header files the names of the above registers are defined in the following format:

<ModuleName> + <Symbol>.

<ModuleName> and <Symbol> are defined in the above table.

38.9.2.1 Interrupt Control Register 1 (SYSCNT_INT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INT_STA7	—	—	—	INT_STA6	—	—	—	INT_STA5	—	—	—	INT_STA4
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	INT_STA3	—	—	—	INT_STA2	—	—	—	INT_STA1	—	—	—	INT_STA0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INT_STA7	0	R/W	IV5_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INT_STA6	0	R/W	IV3_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INT_STA5	0	R/W	IV1_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INT_STA4	0	R/W	S0_VFIELD Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	INT_STA3	0	R/W	GR3_VLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
8	INT_STA2	0	R/W	S0_VSYNCERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INT_STA1	0	R/W	S0_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INT_STA0	0	R/W	S0_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

38.9.2.2 Interrupt Control Register 2 (SYSCNT_INT2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INT_STA15	—	—	—	—	—	—	—	—	—	—	—	INT_STA12
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	INT_STA11	—	—	—	—	—	—	—	—	—	—	—	INT_STA8
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INT_STA15	0	R/W	IV4_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
27 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INT_STA12	0	R/W	S1_VSYNCERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	INT_STA11	0	R/W	S1_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
11 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INT_STA8	0	R/W	IV6_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

38.9.2.3 Interrupt Control Register 3 (SYSCNT_INT3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	INT_STA22	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	INT_STA19	—	—	—	INT_STA18	—	—	—	INT_STA17	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INT_STA22	0	R/W	IV8_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
23 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	INT_STA19	0	R/W	OIR_VLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INT_STA18	0	R/W	OIR_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INT_STA17	0	R/W	OIR_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

38.9.2.4 Interrupt Control Register 4 (SYSCNT_INT4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INT_OUT7_ON	—	—	—	INT_OUT6_ON	—	—	—	INT_OUT5_ON	—	—	—	INT_OUT4_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	INT_OUT3_ON	—	—	—	INT_OUT2_ON	—	—	—	INT_OUT1_ON	—	—	—	INT_OUT0_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INT_OUT7_ON	0	R/W	IV5_VBUFERR Interrupt Output On/Off 0: Off 1: On
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Section 39 Video Output Warping Engine (VOWE)

This section contains a description of the RH850/D1L/D1M specific properties of the Video Output Warping Engine, such as the number of units, register base addresses, etc.

The functional description of the Video Output Warping Engine is available under non-disclosure agreement.

For details, contact your local sales representatives.

39.1 Features of RH850/D1L/D1M VOWE

39.1.1 Number of Units

This microcontroller has the following number of units of the VOWE.

Table 39.1 Units

Video Data Controller E (VDCE)	D1L1	D1L2(H)	D1M1(H) D1M1-V2 D1M1A	D1M2(H)
Units	–	–	1	1
Names	–	–	VOWE	VOWE

39.1.2 Register Base Address

VOWE base addresses are listed in the following table.

VOWE register addresses are given as offsets from the base addresses in general.

Table 39.2 Register Base Address

Base Address Name	Base Address
<VOWE_base>	F200 0000_H

39.1.3 Clock Supply

The VOWE clock supply is shown in the following table.

Table 39.3 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
VOWE	VOWE operation clock	C_ISO_CPUCLK
	Cross-connect bus clock	C_ISO_XCCLK
	PCLK	C_ISO_XCCLK/2
	Video Out Pixel Clock	Video channels clock generator C_ISO_VDCE0CLK

39.1.4 Interrupt Request

VOWE interrupt requests are listed in the following table.

Table 39.4 Interrupt Requests

VOWE signals	Function	Connected to
VOWEINT	Common interrupt	Interrupt Controller INTVOWE0

39.1.5 Reset Sources

VOWE reset sources are listed in the following table. VOWE is initialized by these reset sources.

Table 39.5 Reset Sources

Unit Name	Reset Source
VOWE	• Reset Controller SYSRES • Reset upon wake-up from DEEPSTOP mode

39.1.6 Bus master ID

The Video Output Warping Engine bus master interfaces are connected to the cross-connect system XC2, which forms an own master ID domain.

Since Video Output Warping Engine accesses the XC0 and XC1 cross-connects through the Sprite Engine master interfaces, the master ID of the respective Sprite Engine master interface appears on the XC0/XC1 cross-connects.

The following table shows the Video Output Warping Engine master interfaces IDs, their connection to an XC2 layer and the Sprite Engine slave interface.

Table 39.6 Video Output Warping Engine master ID

		XC2 cross-connect		Sprite Engine	
Master I/F	Access	Master ID	XC2 layer	XC2 slave	XC0/XC1 master ID
Video Output Warping Engine	W	6	XC2_2	Sprite Unit 1	MSTID10
	R				

For detailed information about the cross-connection systems and the usage of the master IDs refer to Section 14.2, Cross-connect systems.

Section 40 Video Output Checker A (VOCA)

This section contains a generic description of the Video Output Checker.

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.
The subsequent sections describe the features that apply to all implementations.

40.1 Overview of the RH850/D1L/D1M Video Output Checkers

40.1.1 Units

This microcontroller has the following number of units of the Video Output Checker.

Table 40.1 Units

Video Output Checker (VOCA)	D1L1	D1L2(H)	D1M1(H) D1M1-V2 D1M1A	D1M2(H)
Units	0	0	1	1
Names	–	–	VOCA0	VOCA0

Unit index n

Throughout this section, the individual units of the Video Output Checkers are identified by the index “n” (n = 0), for example VOCAnEN for the VOCAn enable register.

Monitor index m

Throughout this section, the individual monitors of the Video Output Checkers are identified by the index “m” (m = 0 to 15), for example VOCAnMmCFG0 for the VOCAn monitor channel m start point register.

Video channel index j

Throughout this section, the individual video channels are identified by the index “j”.

Table 40.2 Video channels index

Video channel index	D1M1(H), D1M1-V2	D1M1A, D1M2(H)
Video channels	1	2
Video channel index	j = 0	j = 0, 1

40.1.2 Register addresses

All Video Output Checker register addresses are given as address offsets from the individual base addresses <VOCAn_base>.
The <VOCAn_base> addresses of each VOCAn are listed in the following table:

Table 40.3 Register base addresses <VOCAn_base>

VOCAn unit	<VOCAn_base> address
VOCA0	FFFD 8000_H

40.1.3 Clock supply

All Video Output Checkers provide two clock inputs.

Table 40.4 Clock supply

VOCAn unit	VOCAn clock	Connected to
VOCA0	PCLK	Clock Controller C_ISO_PCLK
	Activity Monitor operation clock	Clock Controller f_{RL}

40.1.4 Interrupts

The Video Output Checkers can generate the following interrupt requests:

Table 40.5 VOCAn interrupt requests

VOCA0 signals	Function	Connected to
VOC_INT	Video Output Monitor error interrupt	Both interrupts are logically OR combined and input to the Error Control Module INTVOCAERR
ACTMON_INT	Activity Monitor error interrupt	

40.1.5 Reset sources

The Video Output Checkers and their registers are initialized by the following reset signal:

Table 40.6 Reset sources

Reset target	Reset signal
VOCAn module	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

40.1.6 Internal signals

The internal signal connections of the Video Output Checkers are listed in the following table.

Table 40.7 VOCAn internal signal connections

VOCA0 signals	Function	Connected to
Video Output Checker connection to Video Data Controller VDCE0:		
VCLK0	Pixel clock	Video channels clock generator C_ISO_VDCE0CLK
VSYNC0	Vertical synchronization	Port VDCE0_VO_TCON0
HSYNC0	Horizontal synchronization	Port VDCE0_VO_TCON2
RGB444	Most significant 4 bit of each RGB color component	R[7:4], G[7:4], B[7:4]
Video Output Checker connection to Video Data Controller VDCE1 (for D1M2(H) and D1M1A only):		
VCLK1	Pixel clock	Video channels clock generator C_ISO_VDCE1CLK
VSYNC1	Vertical synchronization	Port VDCE1_VO_TCON0
HSYNC1	Horizontal synchronization	Port VDCE1_VO_TCON2
RGB444	Most significant 4 bit of each RGB color component	R[7:4], G[7:4], B[7:4]

40.2 Functions Overview

The Video Output Checker allows to check whether the display content is correctly output by the Video Output.

Main purpose of the Video Output Checker is to secure perceivable appearance of warning symbols on the display. Such warning symbols are normally clearly distinctive in terms of shape and color against other display content.

Features summary

- Total of up to 16 monitored areas
- Up to 32,768 pixels in total over all monitored areas
- Four programmable reference color ranges for each monitored area
- Programmable discriminator threshold for fail/pass decision
- Interrupt generation upon
  - symbol detection mismatch
  - Activity Monitor
- Support both video channels of D1M2H and D1M1A devices, that means in particular:
  - Total of up to 16 monitored areas on both video output screens supported
  - Different number of monitored areas can be assigned to the video outputs
  - Activity Monitor supports two separate time windows for the video output channels.

The interrupts are input to the Error Control Module and thus can generate interrupts or a reset.

Restriction

VOCA doesn't support the use of the Serial RGB I/F. For the detail of Serial RGB, please refer (5) Parallel to Serial Conversion in Section 38.8.1.8, Output Format Conversion.

Block Diagram

The block diagram shows the main components of the VOCA.

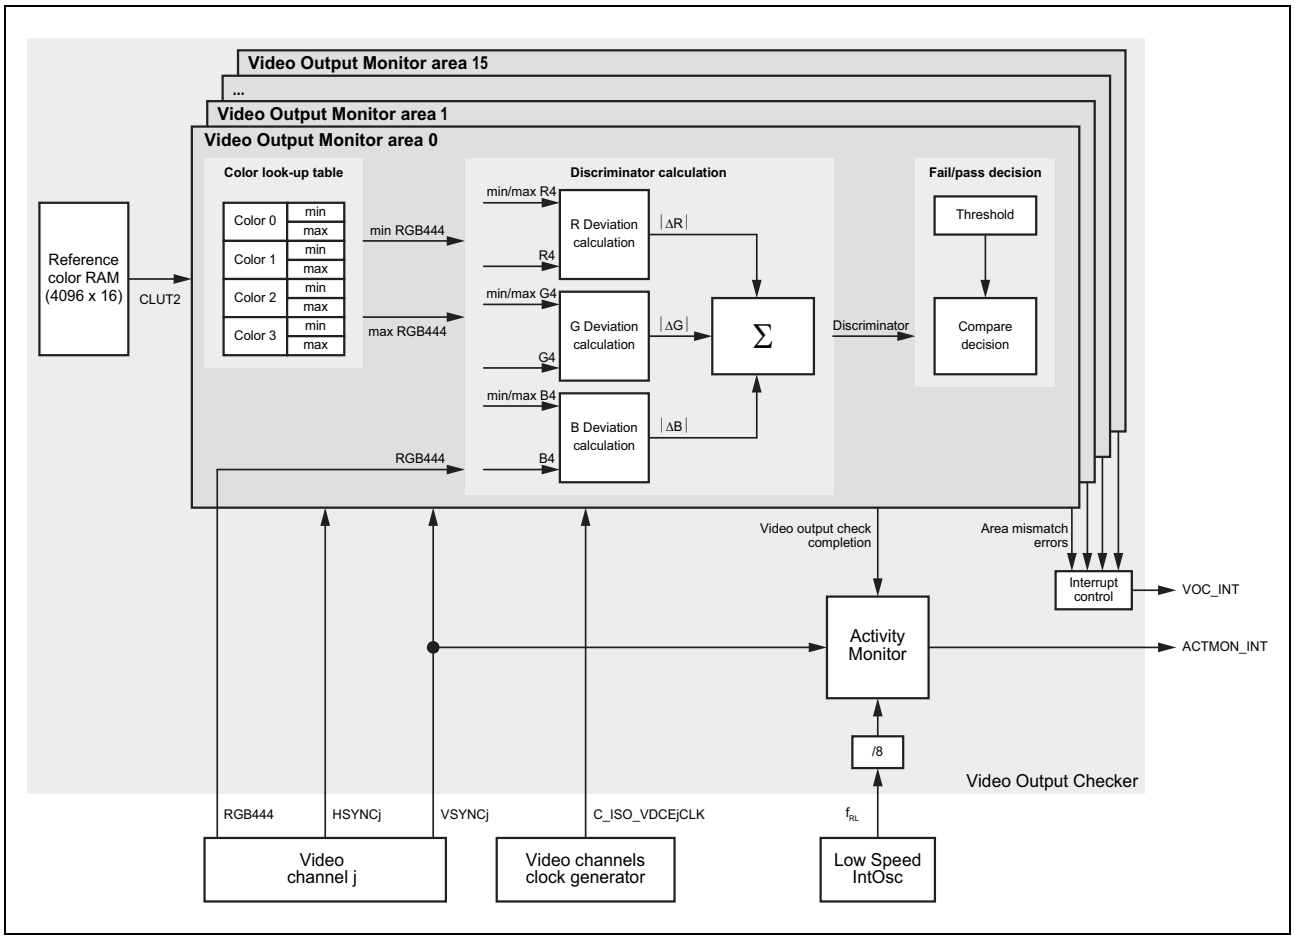

Figure 40.1 Block diagram of the Video Output Checker A

40.3 Functional Description

40.3.1 Video Output Monitoring Basic Procedure

The video output pixels of a rectangle area, that is supposed to show, for unit, a warning symbol, are tested against a reference image.
For that purpose a discriminator is calculated, which is a measure of the deviation between the output rectangle and its reference. If the discriminator exceeds a certain threshold the output is judged as incorrect.

In order to cope with unpredictable symbol background pattern (for unit because of dithering during of video output format expansion, life video background, multi-layer blending effects, gamma correction, etc.) the discriminator calculation

- is performed on reduced 12-bit RGB444 color format instead of 16-/18-/24-bit color
- compares against a reference color range (minimum/maximum reference color component) rather than on a particular 12-bit color reference value
- forms an integral value over all pixels of the entire rectangular area.

This way the calculation algorithm yields a robust correlation measure between the reference and video output content.

Discriminator calculation

The discriminator value D is a sum of deviations ΔR, ΔG, ΔB of the video output pixel color components from the allowed minimum/maximum reference color component range.

$$D = \Sigma (\Delta R + \Delta G + \Delta B)$$

In the following C stands for the color components R, G and B.

The video data is compared pixel- and color-component-wise with the reference range:

- A video output pixel is judged as correct if its color component values C_{VO} are in the minimum/maximum range (C_{REFmin}/C_{REFmax}) of the reference color component values, i.e.
  - if $C_{REFmin} \leq C_{VO} \leq C_{REFmax}$: $\Delta C = 0$
- If a video output color component value C_{VO} is outside the reference range, its contribution ΔC to the discriminator D is:
  - – if $C_{VO} < C_{REFmin}$: $\Delta C = C_{REFmin} - C_{VO}$
  - – if $C_{VO} > C_{REFmax}$: $\Delta C = C_{VO} - C_{REFmax}$

The following figure gives an example how a discriminator is calculated:

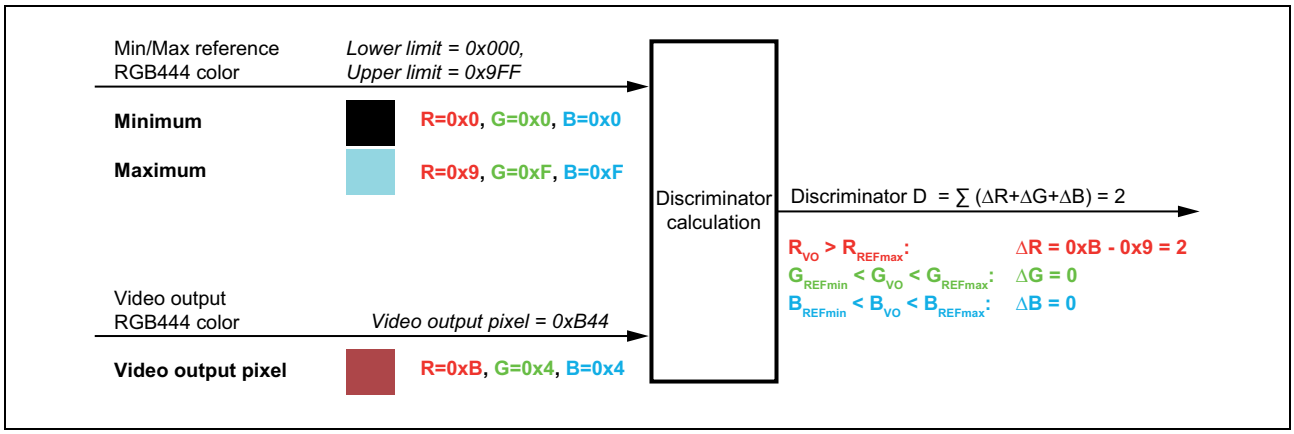

Figure 40.2 Deviation calculation example

Error judgement

The discriminator value D of the monitored area is compared against an acceptance threshold THS:

- if D ≥ THS: content of output rectangle area is erroneous
- if D < THS: content of output rectangle area is not erroneous

40.3.2 Video Channels selection

Before any Video Output Monitor or Activity Monitor is used, the availability of a certain video channel j must be selected:

- VOCAnACTj.VOCAnVOUTj = 0: Video channel j is not available
- VOCAnACTj.VOCAnVOUTj = 1: Video channel j is available

Refer to "Overview of the RH850/D1L/D1M Video Output Checkers" in the first subsection to check which video channels are available in a particular device.

40.3.3 Video Output Monitor implementation

The Video Output Monitor can supervise up to 16 (m = 0 to 15) areas of the video channel's screen.

Each Monitor can be enabled and disabled separately:

- VOCAnEN.VOCAnENm = 0: Monitor m is disabled
- VOCAnEN.VOCAnENm = 1: Monitor m is enabled

Each Monitor can be assigned to monitor an area of the video channel j (j = 0, 1). The assignment is done via the Video Output Monitor channel assignment register:

- VOCAnCH.VOCAnCHm = 0: Monitor m is assigned to video channel 0
- VOCAnCH.VOCAnCHm = 1: Monitor m is assigned to video channel 1

40.3.3.1 Video Monitor area definition

The area m to be monitored is defined relative to the HSYNC and VSYNC signals of the video output channel j:

- VOCAnOFFSj.VOCAnHOFFSj/.VOCAnVOFFSj:
  start of the active video output screen in horizontal/vertical direction

  The back porch offset values specify the number of pixels between the falling edge of the HSYNC or VSYNC pulse and the beginning of the active screen output. Thus the offset values to specify depend on the polarity of the HSYNC and VSYNC signals:

  – If the SYNC signal is active high (refer to **Figure 40.3**):
    offset value = back porch
    = time between the end of the SYNC pulse and the active screen output
  – If the SYNC signal is active low (refer to **Figure 40.4**):
    offset value = SYNC pulse width + back porch
    = time between the beginning of SYNC pulse and the active screen output
- VOCAnMmCFG0.VOCAnMmHSTRT/.VOCAnMmVSTRT:
  horizontal/vertical coordination of the first pixel of the monitor area m
- VOCAnMmCFG1.VOCAnMmHSIZE/.VOCAnMmVSIZE:
  horizontal/vertical size of the monitor area m (max. horizontal/vertical size is 128)

All values in horizontal direction (VOCAnHOFFSj, VOCAnMmHSTRT, VOCAnMmHSIZE) are defined in pixel units.
All values in vertical direction (VOCAnVOFFSj, VOCAnMmVSTRT, VOCAnMmVSIZE) are defined in line units.

CAUTION

The back and front porch of the video signal must have at least a width of one pixel.

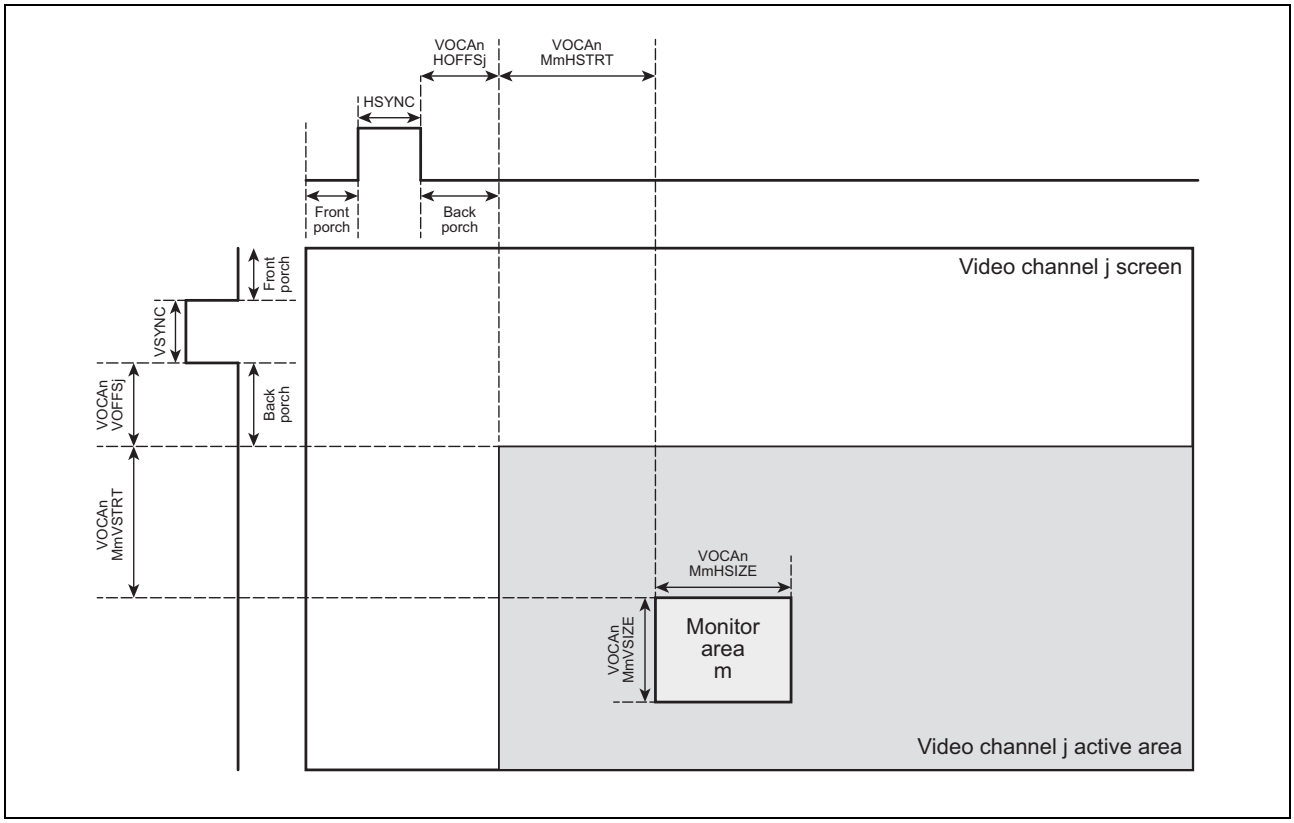

Figure 40.3 Monitor area definition with active high HSYNC and VSYNC

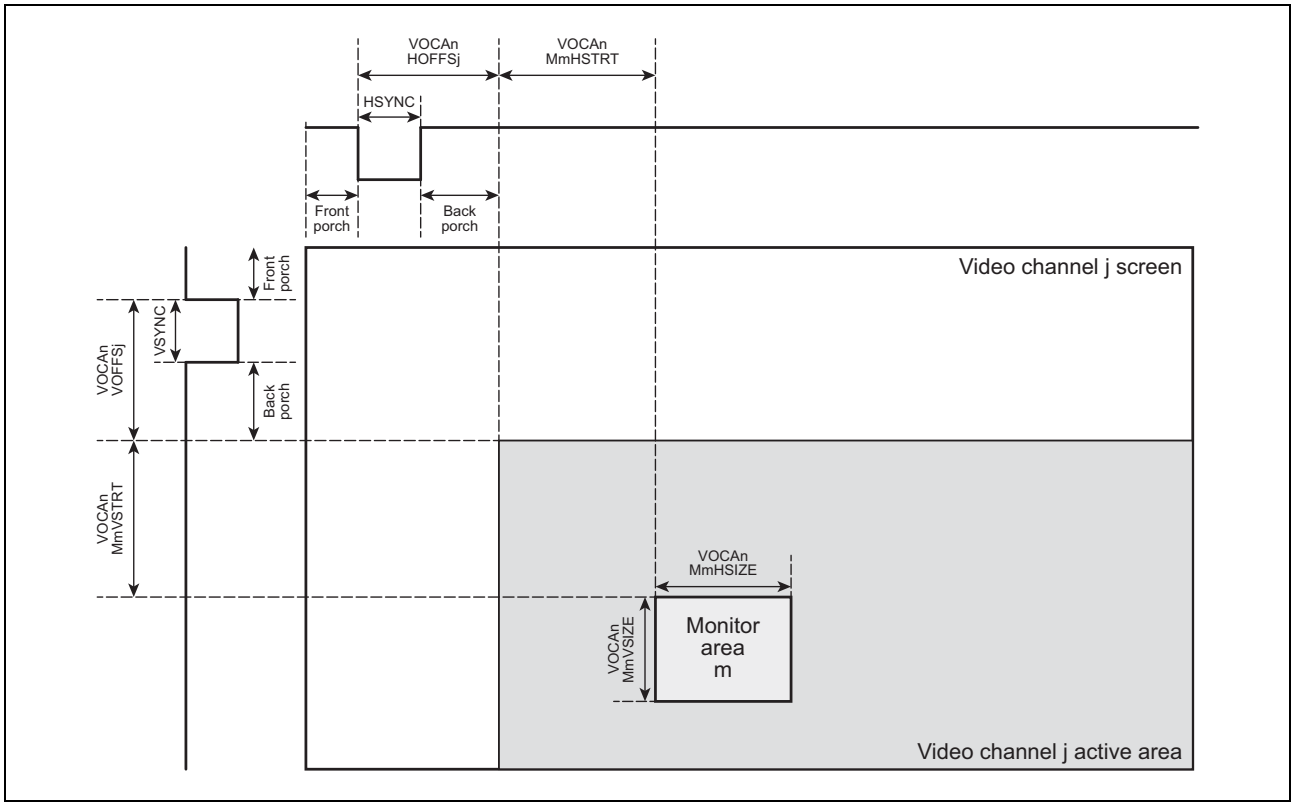

Figure 40.4 Monitor area definition with active low HSYNC and VSYNC

40.3.3.2 Reference color

The reference colors for the discriminator calculation are stored as 2-bit CLUT2 indices, that select one out of four 12-bpp RGB444 colors from a color look-up table.

Reference color definition

Each RGB444 reference color describes an acceptance range by an upper and lower limit for each of the RGB components.
The limit values for each of the four reference colors for each monitor area m are defined by the registers VOCAnMmCFG4 to VOCAnMmCFG7 with following content:

- VOCAnMmRUP[3:0]/RLO[3:0]: upper/lower limit of red component
- VOCAnMmGUP[3:0]/GLO[3:0]: upper/lower limit of green component
- VOCAnMmBUP[3:0]/BLO[3:0]: upper/lower limit of blue component

Reference color selection

The 2-bpp CLUT2 indices are stored in the reference color RAM. The RAM is organized as 4096 x 16 bit.

The address of the reference color CLUT2 index of the first pixel of the monitor area m is defined in the Video Output Monitor m reference color RAM address register VOCAnMmCFG2m.VOCAnMmADDR[11:0] in the range of 0 to 4095, i.e. 000_H to FFF_H.

The 2-bpp CLUT2 indices are stored in the color RAM via the registers VOCAnEXPD0000 to VOCAnEXPD4095.

The addresses of the monitor areas reference color indices can be freely assigned in the RAM. The table below gives an examples for three monitored areas (m = 0, 2, 10) of different size.

NOTES

1. The total number of monitored pixel is limited to 32,768 pixels.
2. The RAM areas, assigned to different monitor areas, must not overlap.

Table 40.8 Reference color RAM example

Monitor area	VOCAnMmCFG2	RAM address	Bit*1 15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
not used		000_H																
		001_H																
		...

	...	...	...		...		...		...		...		...		...		...	
	VOCAnM10ADDR + 262	196_H	I2096		I2097		I2098		I2099		–		–		–		–	
not used		...																
m = 2 128 x 128 pixel	VOCAnM2ADDR	800_H	I0		I1		I2		I3		I4		I5		I6		I7	
	VOCAnM2ADDR + 1	801_H	I8		I9		I10		I11		I12		I13		I14		I15	
	...	...	...		...		...		...		...		...		...		...	
	VOCAnM2ADDR + 2047	FFF_H	I16376		I16377		I16378		I16379		I16380		I16381		I16382		I16383	

Note 1. “I” stands for a 2-bpp CLUT2 color index.

40.3.3.3 Video Output Monitor error notification

An error during check of the Video Output Monitor area m can be detected for two reasons:

Monitor area m content mismatch error

Such error is detected, if the content check (with respect to discriminator vs. acceptance threshold) fails.
Upon detection of such error

- the monitor m area error bit VOCAnSTR.VOCAnEm is set
- the Video Output Monitor interrupt VOC_INT is asserted.

Monitor area m parameter error

Such error is detected, if the definition of a monitored area m (area m start point in VOCAnMmCFG0 and size in VOCAnMmCFG1) does not fit to the active screen size of the related video channel.
Upon detection of such error

- the parameter error VOCAnSTR.VOCAnE18 flag is set
- the monitor m area error bit VOCAnSTR.VOCAnEm is set
- the Video Output Monitor interrupt VOC_INT is asserted.

NOTES

1. The error flags in the status register VOCAnSTR remain set until they are cleared via the control register VOCAnCTL. Refer to “Video Output Monitor error flag clearing procedure” below for details.

2. The VOC_INT remains asserted as long as any of the Video Output Monitor error flags VOCAnE18 and VOCAnEm are set.

Video Output Monitor error flag clearing procedure

In order to clear a Video Output Monitor error flag, that has been set due to a content mismatch or parameter error detection, proceed as follows:

1. Evaluate the error source via the error flags in the status register VOCAnSTR.
2. Disable INTVOCAERR in the Error Control Module (by setting its error input mask in the Error Control Module).
3. Disable all Video Output Monitors by VOCAnEN.VOCAnENm = 0.
4. Wait until Video Output Monitors are inactive, i.e. until VOCAnSTR.VOCAnVOCSTR = 0.
5. Clear all Video Output Monitor error flags by
   - VOCAnCTL.VOCAnCLm = 1 for content mismatch errors
   - VOCAnCTL.VOCAnCL18 = 1 and VOCAnCTL.VOCAnCLm = 1 for parameter error
6. Release all Video Output Monitor error flags clear by
   - VOCAnCTL.VOCAnCLm = 0 for content mismatch errors
   - VOCAnCTL.VOCAnCL18 = 0 and VOCAnCTL.VOCAnCLm = 0 for parameter error
7. Verify that all Video Output Monitor error flags are reset, i.e. that
   - VOCAnSTR.VOCAnEm = 0: no content mismatch error
   - VOCAnSTR.VOCAnE18 = 0 and VOCAnSTR.VOCAnEm = 0: no parameter error

   If any of the above error flags are not cleared, return to **5.**
8. Enable INTVOCAERR in the Error Control Module (by resetting its error input mask in Error Control Module).
9. Enable required Video Output Monitor m by VOCAnEN.VOCAnENm = 1.

Interrupt masking

Assertion of an error interrupt VOC_INT can be disabled:

- VOCAnCTL.VOCAnMKINT = 0:
  VOC_INT is generated in case of a Video Output Monitor error detection
- VOCAnCTL.VOCAnMKINT = 1:
  no VOC_INT is generated in case of a Video Output Monitor error detection

Note that VOCAnCTL.VOCAnMKINT affects also the Activity Monitor interrupt ACTMON_INT.

40.3.3.4 Monitoring sequence

In each video output frame only a single Video Output Monitor area m is examined.

Priority of monitor areas

If several monitor areas are enabled the monitoring order follows a fixed priority:

priority of m = 0 > m = 1 > ... > m = 15

Detection timing

The time for a content mismatch detection depends on the total number of monitored areas.

The maximum detection time of an erroneous area is calculated by

(number of monitored areas x 2) / framerate

NOTE

The maximum detection time of an erroneous frame assumes that the VOCA needs to switch between the video channels after each Video Output Monitor frame and that the switching to the other video channel takes one frame for synchronization.

It is recommended to setup the Video Output Monitors in a way, that video channel switching is minimized. i.e. set up Video Output Monitors related to the same video channel consecutively. (example: M0 to M7: video channel 0, M8 to M15: video channel 1)

This will shorten the detection time to

(number of monitoring area + 2) / frame rate

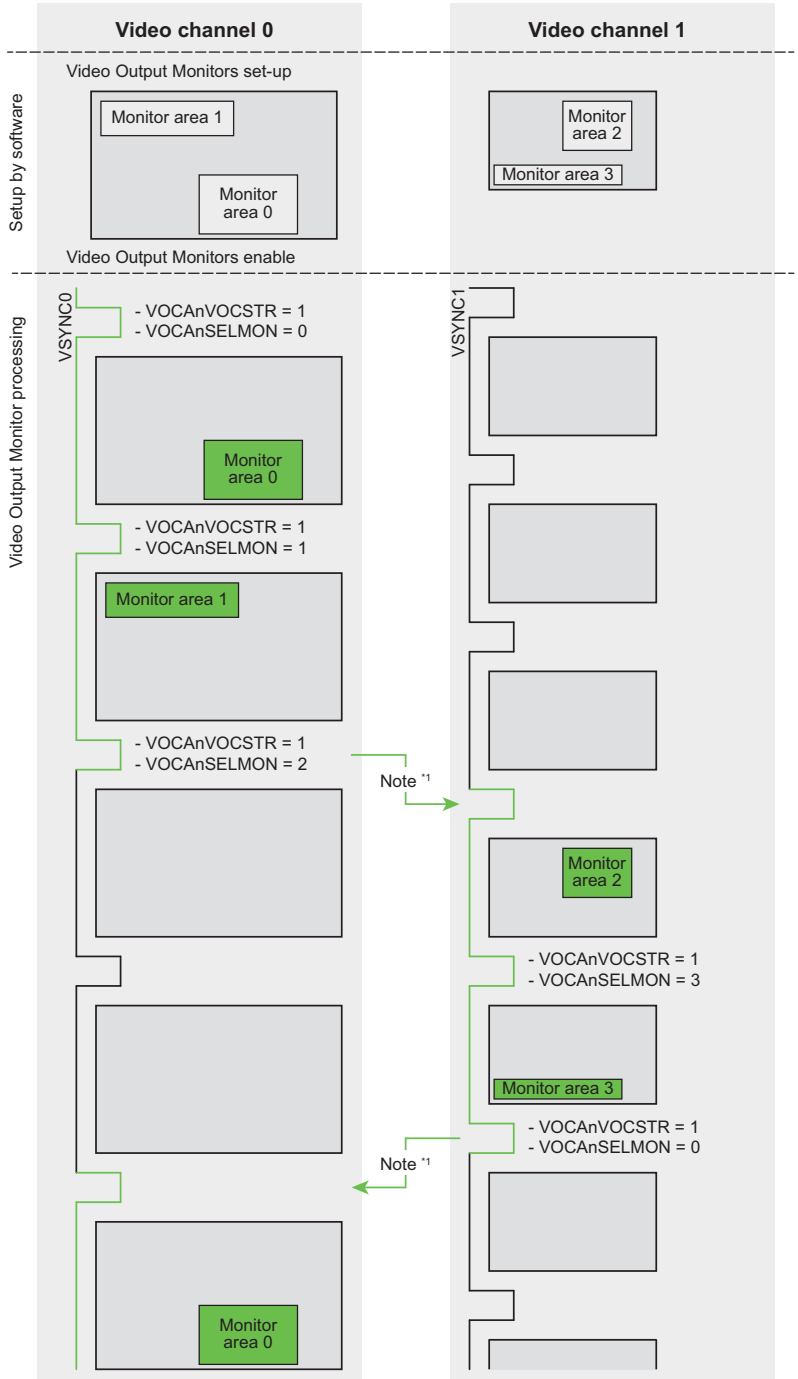
Monitor process status

The current Video Output Monitor process status is reflected in the status register VOCAnSTR:

- VOCAnVOCSTR:
  Video Output Monitor is active in the current video channel frame.
- VOCAnSELMON[3:0]:
  - If the vertical synchronizing signal is active low, VOCAnSELMON[3:0] indicate the number of the current video channel frame, that is monitored.
  - If the vertical synchronizing signal is active high, VOCAnSELMON[3:0] indicate the number of the previous video channel frame.

These status bits are valid for the current video channel frame.

The following diagram shows an example for sequence, with monitor areas for both video channels.



Note 1. During switching between the video channels the Video Output Monitor status indicator VOCAnVOCSTR becomes 0 meanwhile.

Figure 40.5 Video Output Monitor processing sequence example

40.3.4 Activity Monitor

The Activity Monitor controls whether

- the Video Output Monitor has completed the check of a monitor area before the next VSYNC signal occurs and
- the next VSYNC signal is asserted within a certain time window.

If any of the above two conditions is not fulfilled the Activity Monitor notifies an error.

NOTE

Since the Activity Monitor requires active Video Output Monitors on the video channel to check activity, at least one Video Output Monitor must be enabled for the respective video channel.

That means at least one Video Output Monitor with

VOCAnEN.VOCAnENm = 1 and VOCAnCH.VOCAnCHm = 0 (assigned to video channel 0)

VOCAnEN.VOCAnENm = 1 and VOCAnCH.VOCAnCHm = 1 (assigned to video channel 1)

must be set up, if the activity of both video channels shall be monitored.

If only the Activity Monitor is to be used, but no Video Output Monitor on a certain video channel, enable a Video Output Monitor for that video channel and set it up in such a way that it does not generate any Video Output Monitor errors.

This can be achieved by selecting the range of all reference colors to maximum, i.e.

VOCAnMmCFG4m = VOCAnMmCFG5m =
VOCAnMmCFG6m = VOCAnMmCFG7m = 0FFF 0000_H

If the Activity Monitor for only channel 1 is to be enabled, channel 0 also is monitored at first because channel 0 is selected by default.

Activity Monitors activation

The Activity Monitors for both video channels can be enabled and disabled all together:

- VOCAnEN.VOCAnEN16 = 0: Activity Monitors inactive
- VOCAnEN.VOCAnEN16 = 1: Activity Monitors active

40.3.4.1 Activity Monitors set-up

The time window for a valid VSYNC signal is determined by a counter, that is operated with the clock of the Low Speed IntOsc $f_{RL}/8$, i.e. with nominal 30 kHz. The time window's duration and location on the time axis is set up via the timing register VOCAnTIMEj for each of both video channels j = 0, 1:

- VOCAnTIMEj.VOCAnMINj: minimum detection time of Activity Monitors for video channel j
- VOCAnTIMEj.VOCAnMAXj: maximum detection time of Activity Monitors for video channel j

Both values are defined as a multiple of 8 x $T_{RL} = 8/f_{RL}$ = 0.033 ms up to

- VOCAnTIMEj.VOCAnMINj: 136.467 ms
- VOCAnTIMEj.VOCAnMAXj: 136.5 ms

NOTES

1. Subject to the Activity Monitor check in a certain video channel frame is always the current monitor area for that frame, i.e. the area m, indicated by VOCAnSTR.VOCAnSELMON[3:0].
2. The time window definitions VOCAnTIMEj.VOCAnMINj/MAXj are automatically selected for the video channel j, that is assigned to the current monitor area via the Video Output Monitor channel assignment VOCAnCHm.

40.3.4.2 Activity Monitors error notification

The Activity Monitor notifies an error

- at the end of the current video channel frame, if the active Video Output Monitor does not complete area m processing or
- at the end of the time window, if the VSYNC signal does not occur within the allowed time window.

Upon detection of such error

- the Activity Monitor error bit
  - VOCAnSTR.VOCAnE16 for video channel 0 error
  - VOCAnSTR.VOCAnE17 for video channel 1 error

  is set
- the Activity Monitor error interrupt ACTMON_INT asserted

NOTES

1. The error flags in the status register VOCAnSTR remain set until they are cleared via the control register VOCAnCTL. Refer to “Activity Monitors error flag clearing procedure” below for details.
2. The ACTMON_INT remains asserted as long as any of the Activity Monitor error flags VOCAnE16 and VOCAnE17 are set.
3. When the Activity Monitor error interrupt ACTMON_INT occur with Activity Monitor channel x error, the software must handle the cause of this error first. I.e. resolve the cause for the missing or wrong pixel clock condition of the video output channel x.
   In case that the pixel clock of video output channel x is missing at all, the continuation of VOCA operation else might cause the error for the other Activity Monitor channel y not to be generated.

Activity Monitors error flag clearing procedure

In order to clear an Activity Monitor error flag proceed as follows:

1. Evaluate the error source via the error flags in the status register VOCAnSTR.
2. Disable INTVOCAERR in the Error Control Module (by setting its error input mask in the Error Control Module).
3. Disable the Activity Monitors by VOCAnEN.VOCAnEN16 = 0.

4. Wait until Activity Monitors are inactive, i.e. until VOCAnSTR.VOCAnACTSTR = 0.
5. Clear all Activity Monitor error flags by VOCAnCTL.VOCAnCL[17:16] = 1.
6. Release all Activity Monitor error flags clear by VOCAnCTL.VOCAnCL[17:16] = 0.
7. Verify that all Activity Monitor error flags are reset, i.e. that VOCAnSTR.VOCAnE[17:16] = 0. If any of the above error flags are not cleared, return to **5.**
8. Enable INTVOCAERR in the Error Control Module (by resetting its error input mask in Error Control Module).
9. Enable the Activity Monitors by VOCAnEN.VOCAnEN16 = 1.

Interrupt masking

Assertion of an error interrupt ACTMON_INT can be disabled:

- VOCAnCTL.VOCAnMKINT = 0:
  ACTMON_INT is generated in case of an Activity Monitor error detection
- VOCAnCTL.VOCAnMKINT = 1:
  no ACTMON_INT is generated in case of an Activity Monitor error detection

Note that VOCAnCTL.VOCAnMKINT affects also the Video Output Monitor interrupt VOC_INT.

Figure 40.6 shows an example with correct detection of the Video Output Monitor completion and VSYNC signal. Thus no error is reported.

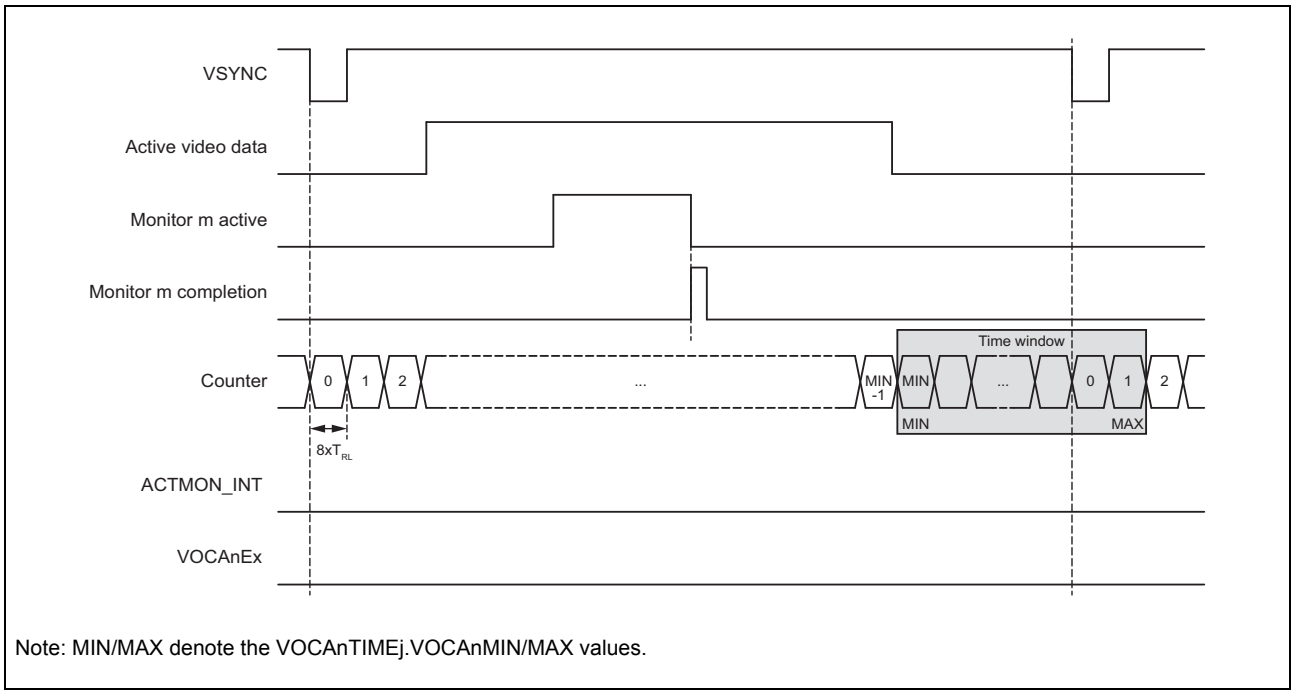


Figure 40.6 Activity Monitor process without error detection

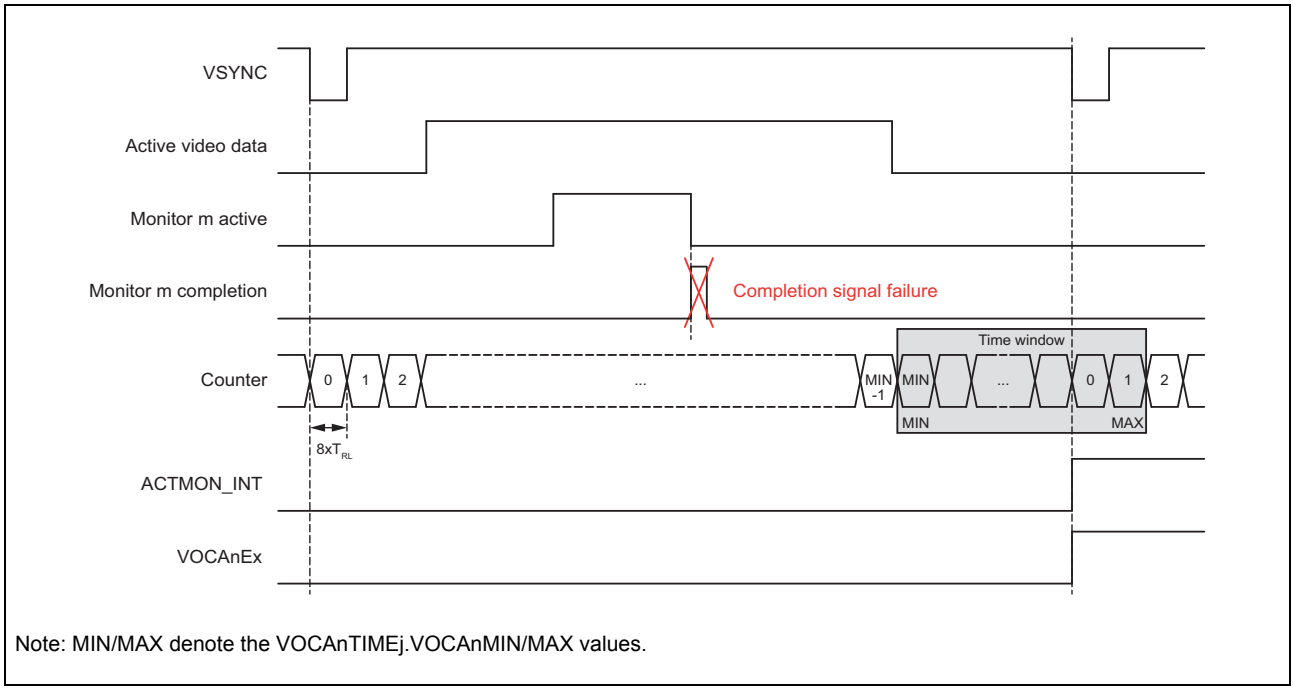
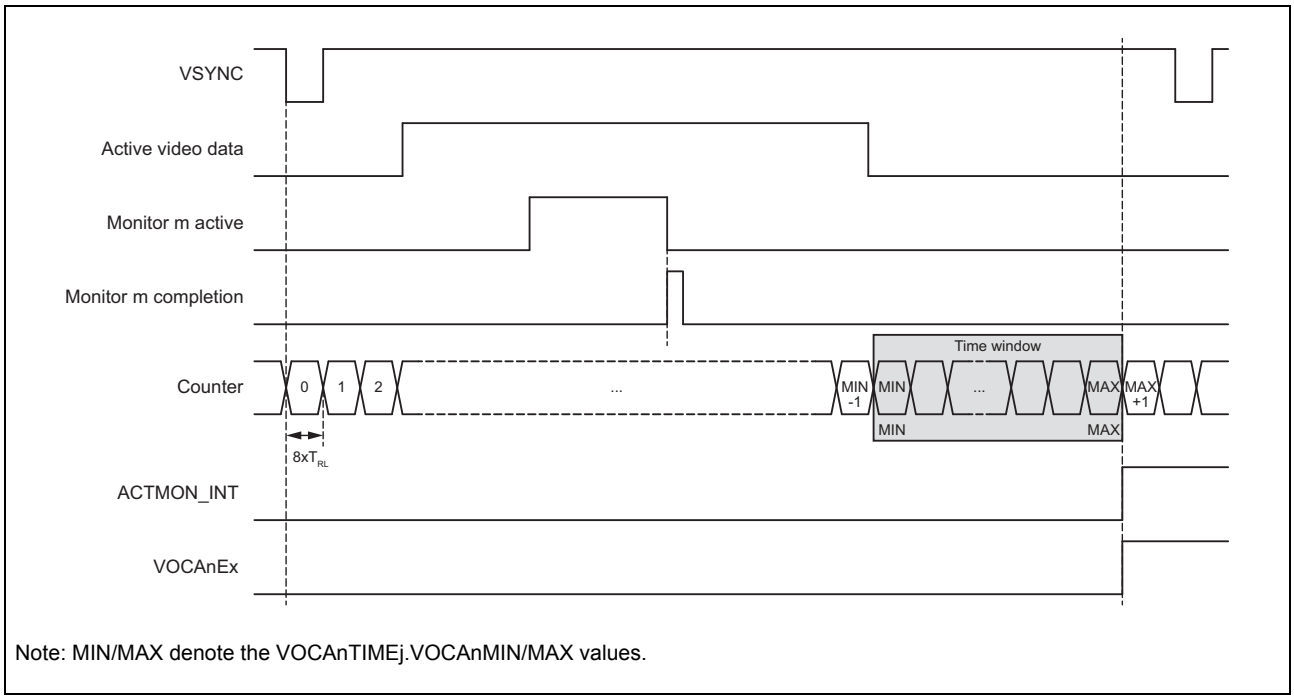
Figure 40.7 shows an example with detection of a missing Video Output Monitor completion signal. The Activity Monitor error flag VOCAnSTR.VOCAnE16/E17 for video channel 0/1 is set and the ACTMON_INT interrupt is asserted.



Note: MIN/MAX denote the VOCAnTIMEj.VOCAnMIN/MAX values.

Figure 40.7 Activity Monitor process with error detection due to missing Video Output Monitor completion signal

Figure 40.8 shows an example with detection of a missing VSYNC signal within the time window. The Activity Monitor error flag VOCAnSTR.VOCAnE16/E17 for video channel 0/1 is set and the ACTMON_INT interrupt is asserted.



Note: MIN/MAX denote the VOCAnTIMEj.VOCAnMIN/MAX values.

Figure 40.8 Activity Monitor process with error detection due to missing VSYNC in the time window

40.3.4.3 Safety aspects

By use of the Activity Monitor the operation of several video channel functions are indirectly supervised:

- VSYNC/HSYNC signals of the video channel
- video channel pixel clock
- operation of the Video Output Monitor

If any of the above modules operations fail, the Activity Monitor is able to detect such malfunction and issues error notifications.

40.4 Registers

This section contains a description of all registers of the VOCA.

40.4.1 VOCA registers overview

The VOCA is controlled and operated by the following registers:

Table 40.9 VOCA register overview

Register Name	Symbol	Address
Status register	VOCAnSTR	<VOCAn_base>
Control register	VOCAnCTL	<VOCAn_base> + 04_H
Video Output and Activity Monitor enable register	VOCAnEN	<VOCAn_base> + 08_H
Video Output Monitor channel assignment register	VOCAnCH	<VOCAn_base> + $0C_H$
Video channel 0 Activity Monitor detection time register	VOCAnTIME0	<VOCAn_base> + 10_H
Video channel 1 Activity Monitor detection time register	VOCAnTIME1	<VOCAn_base> + 14_H
Video channel 0 back porch offset register	VOCAnOFFS0	<VOCAn_base> + 20_H
Video channel 1 back porch offset register	VOCAnOFFS1	<VOCAn_base> + 24_H
Video channel 0 image size register	VOCAnDISP0	<VOCAn_base> + 28_H
Video channel 1 image size register	VOCAnDISP1	<VOCAn_base> + $2C_H$
Video channel 0 selection register	VOCAnACT0	<VOCAn_base> + 30_H
Video channel 1 selection register	VOCAnACT1	<VOCAn_base> + 34_H
Video Output Monitor discriminator register	VOCAnDIFF	<VOCAn_base> + 40_H
Video output monitor m area start point	VOCAnMmCFG0	<VOCAn_base> + 100_H + m x 20_H
Video output monitor m area size	VOCAnMmCFG1	<VOCAn_base> + 104_H + m x 20_H
Video output monitor m reference color RAM start address	VOCAnMmCFG2	<VOCAn_base> + 108_H + m x 20_H
Video output monitor m acceptance threshold	VOCAnMmCFG3	<VOCAn_base> + $10C_H$ + m x 20_H
Video output monitor m reference color 0	VOCAnMmCFG4	<VOCAn_base> + 110_H + m x 20_H
Video output monitor m reference color 1	VOCAnMmCFG5	<VOCAn_base> + 114_H + m x 20_H
Video output monitor m reference color 2	VOCAnMmCFG6	<VOCAn_base> + 118_H + m x 20_H
Video output monitor m reference color 3	VOCAnMmCFG7	<VOCAn_base> + $11C_H$ + m x 20_H
Video output monitor reference RAM register 0	VOCAnEXPD0000	<VOCAn_base> + 300_H
...	...	...
Video output monitor reference RAM register 4095	VOCAnEXPD4095	<VOCAn_base> + $42FC_H$

<VOCAn_base>

The base addresses <VOCAn_base> of the VOCAn is defined in "Register base addresses <VOCAn_base>" in the section above.

NOTES

1. The index m is representing a double-digit number for these registers.
2. The index k is representing a 4-digit number for these registers.

40.4.2 VOCAn control registers details

40.4.2.1 VOCAnSTR – Status register

This register holds various status and error information.

Access: This register can be accessed in 32-bit units.

Address: <VOCAn_base>

Initial value: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	VOCAn ACTSTR	VOCAn E18	VOCAn VOCSTR	VOCAnSELMON[3:0]				VOCAn E17	VOCAn E16
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VOCAnEm															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 40.10 VOCAnSTR register contents

Bit position	Bit name	Function
31 to 25	Reserved	When read, the value after reset is returned.
24	VOCAnACTSTR	Activity Monitor status 0: not active 1: active
23	VOCAnE18	Parameter error Area of Video Output Monitor surpasses the size of video channel image If this error occurs, the related Video Output Monitor error (VOCAnEm) flag is also set. 0: no error occurred 1: error occurred*1*3
22	VOCAn VOCSTR	VOC monitor status 0: Video Output Monitor not active in current video channel frame*4 1: Video Output Monitor active in current video channel frame
21 to 18	VOCAn SELMON[3:0]	• If the vertical synchronizing signal is active low, VOCAnSELMON[3:0] indicate the number of the current video channel frame, that is monitored. • If the vertical synchronizing signal is active high, VOCAnSELMON[3:0] indicate the number of the previous video channel frame.
17	VOCAnE17	Activity Monitor of video channel 1 error 0: no error occurred 1: error occurred*1*2 **NOTE** This bit must be kept 0 in D1M1(H) and D1M1-V2 devices.
16	VOCAnE16	Activity Monitor of video channel 0 error 0: no error occurred 1: error occurred*1*2
15 to 0	VOCAnEm	Video Output Monitor area m error 0: no error occurred 1: error occurred*1*3

Note 1. These error flags are cleared via the corresponding clear bits in the control register VOCAnCTL.

Note 2. If any Activity Monitor error occurred, the Activity Monitor error interrupt ACTMON_INT is asserted.
Note 3. If any Video Output Monitor occurred, the Video Output Monitor error interrupt VOC_INT is asserted.
Note 4. As there is no Video Output Monitor checked during the switching of the video channel, the status of VOCAnVOCSTR will be 0 in this case, even if one (or more) VOC Monitor is enabled (VOCAnENm = 1).

40.4.2.2 VOCAnCTL – Control register

This register is used to mask interrupts, apply a software reset and to clear the error flags in the status register VOCAnSTR.

Access: This register can be accessed in 32-bit units.
Address: <VOCAn_base> + 04_H
Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VOCAn MKVOC	VOCAn MKINT	VOCAn SRST	–	–	–	–	–	–	–	–	–	–	VOCAn CL18	VOCAn CL17	VOCAn CL16
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VOCAnCLm															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40.11 VOCAnCTL register contents (1/2)

Bit position	Bit name	Function
31	VOCAnMKVOC *3	Video Output Monitor and Activity Monitor stop control 0: Video Output Monitor and Activity Monitor operating 1: Video Output Monitor and Activity Monitor stopped
28 to 19	Reserved	When read, the value after reset is returned. When written, write the value after reset.
30	VOCAnMKINT	Interrupt masking 0: VOC_INT and ACTMON_INT interrupts are generated upon error detections 1: VOC_INT and ACTMON_INT interrupts are not generated upon error detections
29	VOCAnSRST	Software reset Write: 0: no function 1: apply software reset to VOCA module Read: 0: software reset released 1: software reset active Refer also to Section (1), Software reset procedure.
18	VOCAnCL18	Parameter error clear 0: sets VOCAnCL18 = 0 1: clear VOCAnSTR.VOCAnE18 Clearing the error flag has to be done by a certain procedure. Refer to “Video Output Monitor error flag clearing procedure” in **Section 40.3.3.3** for details.

Table 40.11 VOCAnCTL register contents (2/2)

Bit position	Bit name	Function
17	VOCAnCL17	Activity Monitor of video channel 1 error flag clear 0: sets VOCAnCL17 = 0 1: clear VOCAnSTR.VOCAnE17*1 Clearing the error flag has to be done by a certain procedure. Refer to “Activity Monitors error flag clearing procedure” in Section 40.3.4.2, Activity Monitors error notification for details.
16	VOCAnCL16	Activity Monitor of video channel 0 error flag clear 0: sets VOCAnCL16 = 0 1: clear VOCAnSTR.VOCAnE16*1 Clearing the error flag has to be done by a certain procedure. Refer to “Activity Monitors error flag clearing procedure” in Section 40.3.4.2, Activity Monitors error notification for details.
15 to 0	VOCAnCLm	Video Output Monitor m error flag clear 0: sets VOCAnCLm = 0 1: clear VOCAnSTR.VOCAnEm*2 Clearing the error flag has to be done by a certain procedure. Refer to “Video Output Monitor error flag clearing procedure” in Section 40.3.3.3, Video Output Monitor error notification for details.

Note 1. If both Activity Monitor errors are cleared, the Activity Monitor error interrupt ACTMON_INT is de-asserted.

Note 2. If all Video Output Monitor errors are cleared, the Video Output Monitor error interrupt VOC_INT is de-asserted.

Note 3. The stop mode may be activated by setting VOCAnCTL.VOCAnMKVOC = 1 during Video Output Monitor error interrupt VOC_INT that indicates the detection of an area error. By this the detection of the first area m error will cause the Video Output Monitor to stop.
When Video Output monitor is reopened, VOCAnCTL.VOCAnMKVOC must be set to 0 after error handling operation.

(1) Software reset procedure

The following sequence describes the procedure to issue a software reset of the VOCA unit.

1. Apply software reset by setting VOCAnCTL.VOCAnSRST = 1.
2. Wait until software reset released state reached by polling until VOCAnCTL.VOCAnSRST = 0.
3. Wait for occurrence of next Video Data Controller interrupt INTVDCE0S0LOVSYNC.

The VOCA software reset has been completed.

40.4.2.3 VOCAnEN – Video Output and Activity Monitor enable register

This register is enable/disable each Video Output Monitor.

Access: This register can be accessed in 32-bit units.

Address: <VOCAn_base> + 08_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	VOCAnEN16
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VOCAnENm															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40.12 VOCAnEN register contents

Bit position	Bit name	Function
31 to 17	Reserved	When read, the value after reset is returned. When written, write the value after reset.
16	VOCAnEN16	Enable/disable Activity Monitors 0: Activity Monitors disabled 1: Activity Monitors enabled
15 to 0	VOCAnENm	Enable/disable Video Output Monitor m 0: Video Output Monitor m disabled 1: Video Output Monitor m enabled

Enabled or disabling of the Activity Monitors or of a Video Output Monitor m becomes effective with the next frame of the assigned video channel, i.e. with its next VSYNC.

CAUTION

If the Video Output Monitor or the Activity Monitor are used, VOCAnEN.VOCAnENm or VOCAnEN.VOCAnEN16 must be set after above one frame period has elapsed since enabling video output by OUT_UPDATE.OUTCNT_VEN.

40.4.2.4 VOCAnCH – Video Output Monitor channel assignment register

This register is used to assign one of both video channels to each Video Output Monitor.

Access: This register can be accessed in 32-bit units.

Address: <VOCAn_base> + $0C_H$

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VOCAnCHm															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40.13 VOCAnCH register contents

Bit position	Bit name	Function
31 to 16	Reserved	When read, the value after reset is returned. When written, write the value after reset.
15 to 0	VOCAnCHm	Video channel assignment to Video Output Monitor m 0: video channel 0 assigned to Video Output Monitor m 1: video channel 1 assigned to Video Output Monitor m

NOTE

This register value must be kept 0000 0000_H in D1M1(H) and D1M1-V2 devices.

CAUTION

Changing the VOCAnCHm bit is only allowed, when the respective Video Monitor m is disabled, i.e. VOCAnEN.VOCAnENm = 0.

40.4.2.5 VOCAnTIMEj – Video channel j Activity Monitor detection time register

These registers specify the upper and lower detection time for Activity Monitor for both video channels.

The timing values in this register are specified in units of nominal $8/f_{RL}$ = 0.033 ms, where f_{RL} is the nominal frequency 240 kHz of the Low Speed IntOsc.

Access: This register can be accessed in 32-bit units.

Address: VOCAnTIME0: <VOCAn_base> + 10_H
VOCAnTIME1: <VOCAn_base> + 14_H *1

Initial value: 0000 0000_H

Note 1. This register is only available in D1M2(H) and D1M1A devices.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	VOCAnMAXj[11:0]

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40.14 VOCAnTIMEj register contents

Bit position	Bit name	Function
31 to 28	Reserved	When read, the value after reset is returned. When written, write the value after reset.
27 to 16	VOCAn MAXj[11:0]	Upper detection time for Activity Monitor in 0.033 ms units 0: 0 ms 1: 0.033 ms 2: 0.067 ms 3: 0.1 ms ... 4094: 136.467 ms 4095: Reserved
15 to 12	Reserved	When read, the value after reset is returned. When written, write the value after reset.
11 to 0	VOCAn MINj[11:0]	Lower detection time for Activity Monitor in 0.033 ms units 0: 0 ms 1: 0.033 ms 2: 0.067 ms 3: 0.1 ms ... 4094: 136.467 ms 4095: 136.5 ms

CAUTION

Writing to these registers is only allowed, when the Activity Monitors are disabled, i.e. VOCAnEN.VOCAnEN16 = 0.

40.4.2.6 VOCAnOFFSj – Video channel j back porch offset register

These registers specify the horizontal and vertical back porch offsets of video channel's timing signals.

Access: This register can be accessed in 32-bit units.

Address: VOCAnOFFS0: <VOCAn_base> + 20_H
VOCAnOFFS1: <VOCAn_base> + 24_H *1

Initial value: $0001\ 0001_H$

Note 1. This register is only available in D1M2(H) and D1M1A devices.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	VOCAnHOFFSj[10:0]										
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Table 40.15 VOCAnOFFSj register contents

Bit position	Bit name	Function
31 to 27	Reserved	When read, the value after reset is returned. When written, write the value after reset.
26 to 16	VOCAn HOFFSj[10:0]	Horizontal back porch offset of video channel j in pixels
15 to 11	Reserved	When read, the value after reset is returned. When written, write the value after reset.
10 to 0	VOCAn VOFFSj[10:0]	Vertical back porch offset of video channel j in lines

Refer to Section 40.3.3.1, Video Monitor area definition for details about the offset definition.

CAUTION

This register value needs to be set before it can be used for any monitoring purposes.

40.4.2.7 VOCAnDISPj – Video channel j image size register

These registers specify size of the image of the video channels.

Access: This register can be accessed in 32-bit units.

Address: VOCAnDISP0: <VOCAn_base> + 28_H
VOCAnDISP1: <VOCAn_base> + $2C_H$ *1

Initial value: $0001\ 0001_H$

Note 1. This register is only available in D1M2(H) and D1M1A devices.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	VOCAnHSIZEj[11:0]

Table 40.16 VOCAnDISPj register contents

Bit position	Bit name	Function
31 to 28	Reserved	When read, the value after reset is returned. When written, write the value after reset.
27 to 16	VOCAn HSIZEj[11:0]	Horizontal size of the video channel j image in pixels
15 to 12	Reserved	When read, the value after reset is returned. When written, write the value after reset.
11 to 0	VOCAn VSIZEj[11:0]	Vertical size of the video channel j image in pixels

CAUTION

This register value needs to be set before it can be used for any monitoring purposes.

40.4.2.8 VOCAnACTj – Video channel j selection register

These registers specify which video channel is available in the device.

Access: This register can be accessed in 32-bit units.

Address: VOCAnACT0: <VOCAn_base> + 30_H
VOCAnACT1: <VOCAn_base> + 34_H

Initial value: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	VOCAn VOUTj
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 40.17 VOCAnACTj register contents

Bit position	Bit name	Function
31 to 1	Reserved	When read, the value after reset is returned. When written, write the value after reset.
0	VOCAn VOUTj	Video channel j availability selection 0: Video channel j is not available 1: Video channel j is available

NOTES

1. Video channel j needs to be selected as available (VOCAnVOUTj = 1) before it can be used for any monitoring purposes.
2. In D1M1(H) devices, video channel 0 only needs to be selected as available (VOCAnVOUT0=1, VOCAnVOUT1=0) before it can be used for any monitoring purposes.

40.4.2.9 VOCAnDIFF – Video Output Monitor discriminator register

This register shows the calculated discriminator value D for a single Video Output Monitor area. Refer to Section 40.3.1, Video Output Monitoring Basic Procedure for details about the discriminator calculation.

This register is to be used only for debugging purposes and in the way shown below:

1. Disable all Video Output Monitor areas m (VOCAnEN.VOCAnENm = 0).
2. Enable the single area m to be evaluated (VOCAnEN.VOCAnENm = 1).
3. Disable the evaluated single area m (VOCAnEN.VOCAnENm = 0).
4. Wait until monitoring becomes inactive, i.e. until VOCAnSTR.VOCAnVOCSTR = 0.
5. The last calculated discriminator can be read from the VOCAnDIFF register.

Access: This register can be accessed in 32-bit units.

Address: <VOCAn_base> + 40_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 40.18 VOCAnDIFF register contents

Bit position	Bit name	Function
31 to 18	Reserved	When read, the value after reset is returned. When written, write the value after reset.
17 to 0	VOCAn DIFF0[17:0]	Last discriminator value

40.4.2.10 VOCAnMmCFG0 – Video Output Monitor m area register

These registers specify the screen area to be monitored by the Video Output Monitor m.

Access: This register can be accessed in 32-bit units.

Address: <VOCAn_base> + 100_H + m x 20_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 40.19 VOCAnMmCFG0 register contents

Bit position	Bit name	Function
31 to 27	Reserved	When read, the value after reset is returned. When written, write the value after reset.
26 to 16	VOCAn MmHSTRT[10:0]	Video Output Monitor m area horizontal start point in pixels
15 to 11	Reserved	When read, the value after reset is returned. When written, write the value after reset.
10 to 0	VOCAn MmVSTRT[10:0]	Video Output Monitor m area vertical start point in pixels

CAUTION

Changing this register is only allowed, when the respective Video Monitor m is disabled, i.e. VOCAnEN.VOCAnENm = 0.

40.4.2.11 VOCAnMmCFG1 – Video Output Monitor m area size register

These registers specify the area size to be monitored by the Video Output Monitor m.

Access: This register can be accessed in 32-bit units.

Address: <VOCAn_base> + 104_H + m x 20_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	VOCAnMmHSIZE[7:0]

Table 40.20 VOCAnMmCFG1 register contents

Bit position	Bit name	Function
31 to 24	Reserved	When read, the value after reset is returned. When written, write the value after reset.
23 to 16	VOCAn MmHSIZE[7:0]	Video Output Monitor m area horizontal size in pixels **Note:** Setting the value more than 128 is not allowed.
15 to 8	Reserved	When read, the value after reset is returned. When written, write the value after reset.
7 to 0	VOCAn MmVSIZE[7:0]	Video Output Monitor m area vertical size in pixels **Note:** Setting the value more than 128 is not allowed.

CAUTION

Changing this register is only allowed, when the respective Video Monitor m is disabled, i.e. VOCAnEN.VOCAnENm = 0.

40.4.2.12 VOCAnMmCFG2 – Video Output Monitor m reference color RAM address register

These registers specify the first address of the 2-bit color index in the reference RAM for Video Output Monitor m reference colors.

Access: This register can be accessed in 32-bit units.

Address: <VOCAn_base> + 108_H + m x 20_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	–	–	–	–	VOCAnMmADDR[11:0]											
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40.21 VOCAnMmCFG2 register contents

Bit position	Bit name	Function
31 to 12	Reserved	When read, the value after reset is returned. When written, write the value after reset.
11 to 0	VOCAn MmADDR[11:0]	Video Output Monitor m reference RAM start address.

CAUTION

Changing this register is only allowed, when the respective Video Monitor m is disabled, i.e. VOCAnEN.VOCAnENm = 0.

40.4.2.13 VOCAnMmCFG3 – Video Output Monitor m acceptance threshold register

These registers specify the threshold to be compared against the calculated discriminator.

Access: This register can be accessed in 32-bit units.

Address: <VOCAn_base> + $10C_H$ + m x 20_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	–	–	–	–	–	–	–	–	–	–	–	–	–	–	VOCAnMm THSH[17:16]	
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VOCAnMmTHSH[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 40.22 VOCAnMmCFG3 register contents

Bit position	Bit name	Function
31 to 18	Reserved	When read, the value after reset is returned. When written, write the value after reset.
17 to 0	VOCAn MmTHSH[17:0]	Video Output Monitor m acceptance threshold Setting VOCAnMmTHSH[17:0] = 0 means, the Video Output Monitor always reports an error.

CAUTION

Changing this register is only allowed, when the respective Video Monitor m is disabled, i.e. VOCAnEN.VOCAnENm = 0.

NOTE

In the use case the worst threshold is assumed for a 25 % difference per pixel color on a 128 x 128 pixel monitor area. With this case the full threshold range of VOCAnMmTHSH[17:0] which is limited to 18 bit is sufficient.

When using a monitoring size of over 64 x 64 pixel please pay attention that the maximum value of the threshold (and discriminator) range given by VOCAnMmTHSH[17:0] is saturated with 0x3FFFF.

40.4.2.14 VOCAnMmCFG4 – Video Output Monitor m reference color 0 register

These registers specify the minimum/maximum values of reference color 0.

Access: This register can be accessed in 32-bit units.

Address: <VOCAn_base> + 110_H + m x 20_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

3 to 0	VOCAn MmBLO3[3:0]	Video Output Monitor m reference color 3: blue lower limit

CAUTION

Changing this register is only allowed, when the respective Video Monitor m is disabled, i.e. VOCAnEN.VOCAnENm = 0.

40.4.2.18 VOCAnEXPDk – Video Output Monitor reference RAM register k (k = 0 to 4095)

These registers define the 2-bpp CLUT2 indices of the reference colors.
For further details refer to Section 40.3.3.2, Reference color.

Access: This register can be accessed in 32-bit units.

Address: <VOCAn_base> + 300_H + k x 4_H

Initial value: 0000 $XXXX_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 40.27 VOCAnEXPDk register contents

Bit position	Bit name	Function
31 to 16	Reserved	When read, the value after reset is returned. When written, write the value after reset.
15 to 14	I0[1:0]	CLUT2 index of pixel x
13 to 12	I1[1:0]	CLUT2 index of pixel x+1
11 to 10	I2[1:0]	CLUT2 index of pixel x+2
9 to 8	I3[1:0]	CLUT2 index of pixel x+3
7 to 6	I4[1:0]	CLUT2 index of pixel x+4
5 to 4	I5[1:0]	CLUT2 index of pixel x+5
3 to 2	I6[1:0]	CLUT2 index of pixel x+6
1 to 0	I7[1:0]	CLUT2 index of pixel x+7

CAUTION

Changing this register is only allowed, when the respective Video Monitor m is disabled, i.e. VOCAnEN.VOCAnENm = 0.

40.5 Usage Notes

40.5.1 Procedure for entering and resuming DEEPSTOP

If VOCA and all DISCOMn are not used, always mask INTVOCAERR.
In other case, mask error signals of INTVOCAERR on ECM, before entering DEEPSTOP.
And after resuming from DEEPSTOP, clear the error status flag of INTVOCAERR, clear error status flags of VOCA and set expected mask setting of ECM again.

(a) in case VOCA is used

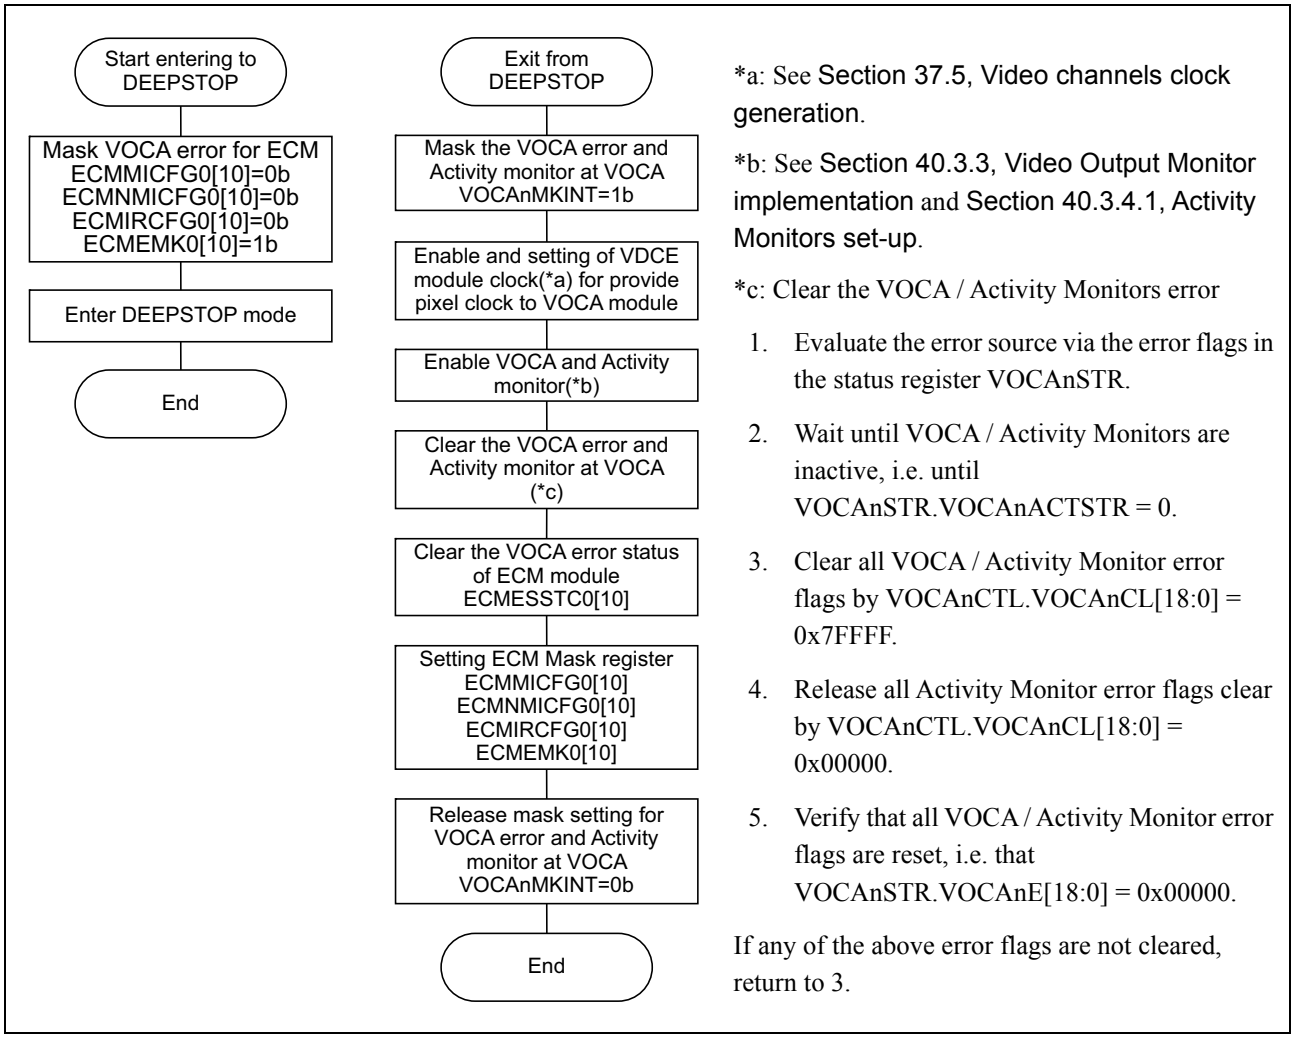

Figure 40.9 Workaround of unintended VOCA error (if VOCA is used)

(b) in case VOCA is not used

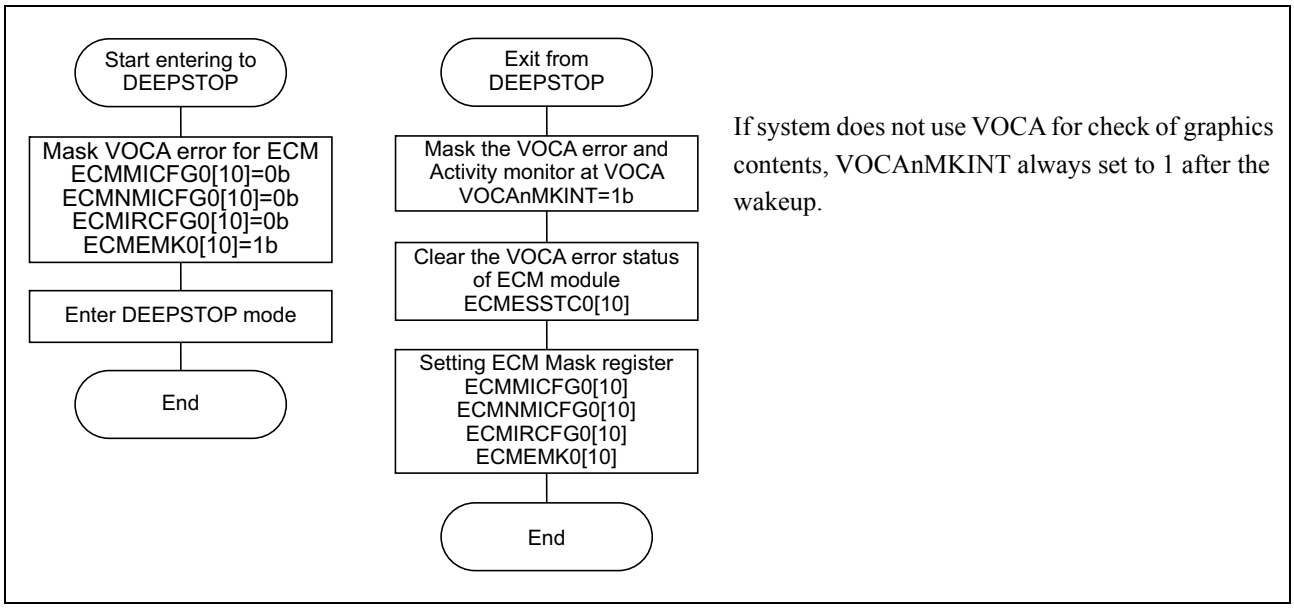

Figure 40.10 Workaround of unintended VOCA error (if VOCA is not used)

Section 41 Display Output Comparator (DISCOM)

This section contains a generic description of the Display Output Comparator (DISCOM).

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.
The subsequent sections describe the features that apply to all implementations.

41.1 Overview of the RH850/D1L/D1M Display Output Comparator

41.1.1 Units

This microcontroller has the following number of units of the Display Output Comparator.

Table 41.1 Units

Display Output Comparator (DISCOM)	D1L1	D1L2(H)	D1M1(H) D1M1-V2	D1M1A D1M2(H)
Units	0	0	2	4
Names	–	–	DISCOM0 to DISCOM1	DISCOM0 to DISCOM3

Unit index n

Throughout this section, the individual units of the Display Output Comparators are identified by the index “n” (n = 0 to 3).

41.1.2 Register addresses

All Display Output Comparator register addresses are given as address offsets from the individual base addresses <DISCOMn_base>.
The <DISCOMn_base> addresses of each DISCOMn are listed in the following table:

Table 41.2 Register base addresses <DISCOMn_base>

DISCOMn unit	<DISCOMn_base> address
DISCOM0	F200 9000_H
DISCOM1	F200 9400_H
DISCOM2	F200 9800_H
DISCOM3	F200 $9C00_H$

41.1.3 Clock supply

All Display Output Comparators provide two clock inputs.

Table 41.3 Clock supply

DISCOMn unit	DISCOMn clock	Connected to
DISCOM0 DISCOM1	Register access clock PCLK	Clock Controller C_ISO_PCLK
	Video channel 0 pixel clock	Video channel clock generators C_ISO_VDCE0CLK
DISCOM2 DISCOM3	Register access clock PCLK	Clock Controller C_ISO_PCLK
	Video channel 1 pixel clock	Video channel clock generators C_ISO_VDCE1CLK

41.1.4 Interrupts

The Display Output Comparators can generate the following interrupt requests:

Table 41.4 DISCOMn interrupt requests

DISCOMn signals	Function	Connected to
CMPI	Comparison error interrupts	All DISCOM interrupts are logically OR combined with the interrupt outputs of the Video Output Checker (VOCA) and input to the Error Control Module INTVOCAERR

41.1.5 Reset sources

The Display Output Comparators and their registers are initialized by the following reset signal:

Table 41.5 Reset sources

DISCOMn unit	Reset signal
DISCOMn	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

41.1.6 Connection of the DISCOM units to the Video Channels

The connection of the Display Output Comparator modules to the video channels of the Video Display Controller is shown in the following figure.

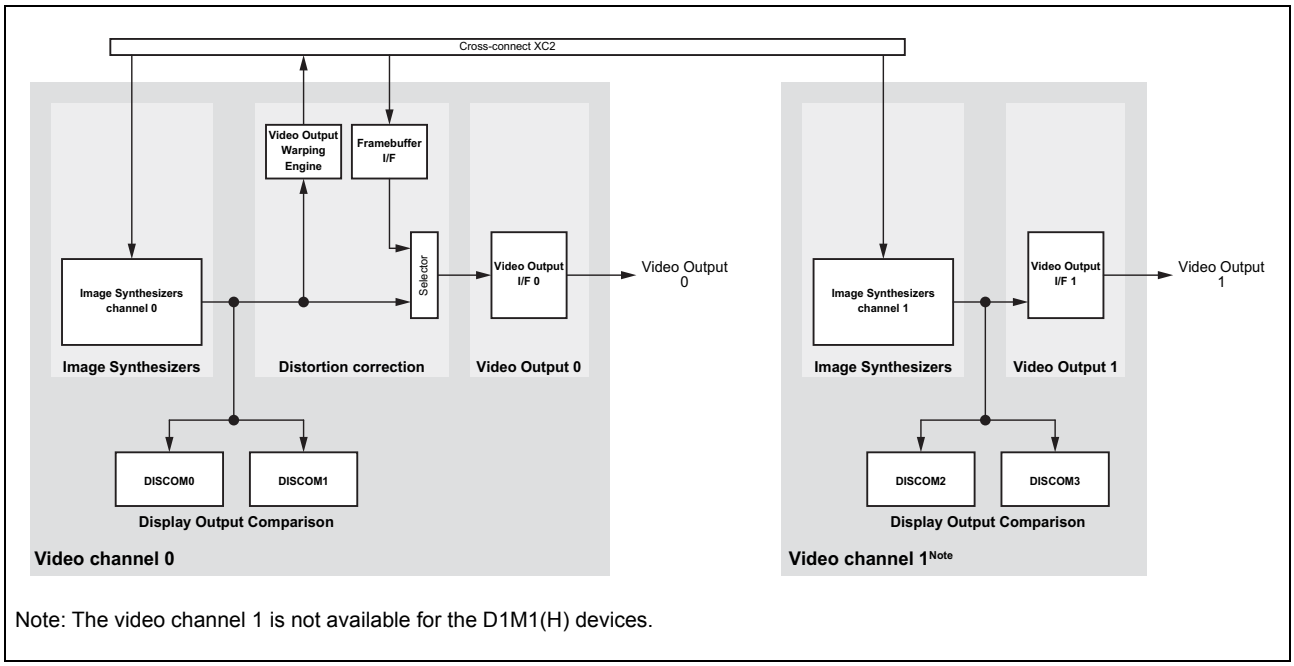

Figure 41.1 DISCOM connections to the video channels

Two rectangular areas of each video channel can be monitored.

41.2 Features

The Display Out Comparison Unit (DISCOM) checks whether the data output from the Video Display Controller (VDCE) agrees with the expected graphics data. This checking is accomplished by comparing the CRC code of the data output from the graphics display module with the pre-calculated CRC code of the expected graphics data.

This module has the following features.

- Comparison of Data after α Blending
  The CRC code of the graphics data obtained after alpha blending in the graphics display module can be compared with the expected CRC code.
- Rectangular Area Specification
  The rectangular area can be specified based on the graphics data output from the graphics display module and its CRC code can be compared with the expected CRC code.
- Pixel format: 32-bit αRGB888 with fixed a = FF_H
- CRC is calculated from most significant byte (MSB) to least significant byte (LSB)

41.3 Block Diagram

An overall block diagram of this module is shown in figure below.

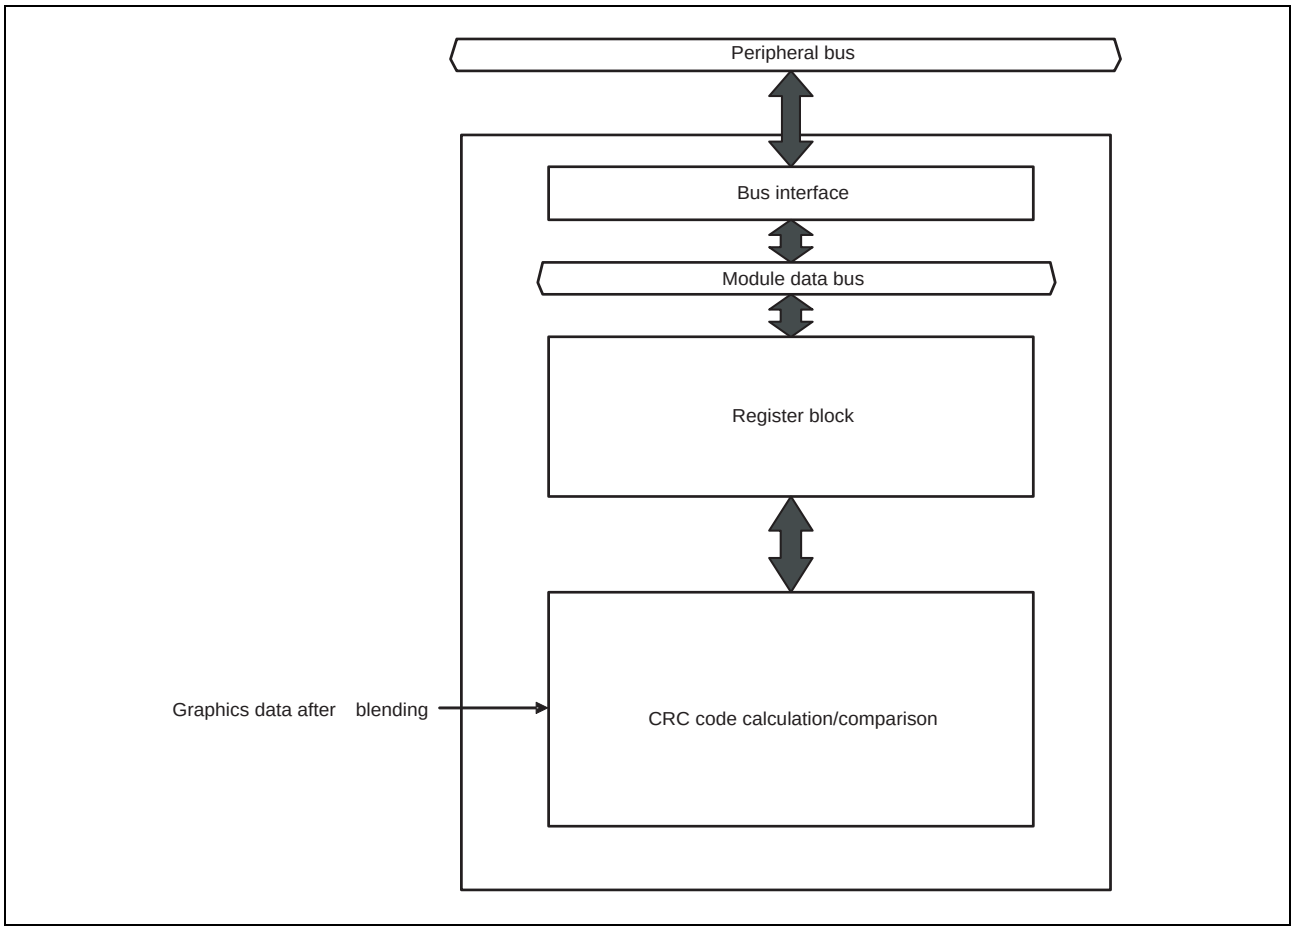

Figure 41.2 Block Diagram

41.4 Register Descriptions

The following table shows the register configuration.

Table 41.6 Register Configuration

Module Name	Register Name	Symbol	R/W	Address	Access Size
DISCOMn	Control register	DOCMCR	R/W	<DISCOMn_base> + 00_H	32
DISCOMn	Status register	DOCMSTR	R	<DISCOMn_base> + 04_H	32
DISCOMn	Status clear register	DOCMCLSTR	R/W	<DISCOMn_base> + 08_H	32
DISCOMn	Interrupt enable register	DOCMIENR	R/W	<DISCOMn_base> + $0C_H$	32
DISCOMn	Operation parameter setting register	DOCMPMR	R/W	<DISCOMn_base> + 14_H	32
DISCOMn	Expected CRC code register	DOCMECRCR	R/W	<DISCOMn_base> + 18_H	32
DISCOMn	Calculated CRC code value register	DOCMCCRCR	R	<DISCOMn_base> + $1C_H$	32
DISCOMn	Horizontal start position setting register	DOCMSPXR	R/W	<DISCOMn_base> + 20_H	32
DISCOMn	Vertical start position setting register	DOCMSPYR	R/W	<DISCOMn_base> + 24_H	32
DISCOMn	Horizontal size setting register	DOCMSZXR	R/W	<DISCOMn_base> + 28_H	32
DISCOMn	Vertical size setting register	DOCMSZYR	R/W	<DISCOMn_base> + $2C_H$	32
DISCOMn	CRC code initialization register	DOCMCRCIR	R/W	<DISCOMn_base> + 30_H	32

NOTE

In the header files the names of the above registers are defined in the following format:

<ModuleName> + <Symbol>.

<ModuleName> and <Symbol> are defined in the above table.

41.4.1 Control Register (DOCMCR)

DOCMCR turns CRC code comparison on or off.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CMPRU
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CMPR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 41.7 DOCMCR register contents

Bit	Bit Name	Description
31 to 17	–	Reserved These bits are always read as 0. The write value should always be 0.
16	CMPRU	Display Out Comparison Update Value Reflects the internal update of the CMPR bit. It should be checked that this bit is 0 before updating the registers other than the CMPR bit in DOCMCR, DOCMCLSTR, and DOCMIENR. For details, see Section 41.5.7, Register Update Timing.
15 to 1	-	Reserved These bits are always read as 0. The write value should always be 0.
0	CMPR	Display Out Comparison Execution Executes display out comparison. This bit is loaded inside when the start of the valid period of the graphics data is detected. For details, see Section 41.5.7, Register Update Timing. 0: Stops display out comparison. 1: Executes display out comparison.

41.4.2 Status Register (DOCMSTR)

DOCMSTR returns the comparison result of the CRC code. The result is reflected in this register when the end of the valid period of the graphics data is detected.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CMPST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 41.8 DOCMSTR register contents

Bit	Bit Name	Description
31, 30	–	Reserved Values read from these bits are undefined. The write value should always be 0.
29 to 1	–	Reserved These bits are always read as 0. The write value should always be 0.
0	CMPST	Display Out Comparison Status 0: Compared CRC codes match. 1: Compared CRC codes do not match.

41.4.3 Status Clear Register (DOCMCLSTR)

Writing 1 to the CMPCLST bit causes clearing of the CMPST bit in DOCMSTR to 0. However, clearing of the CMPST bit in DOCMSTR after 1 is written to the CMPCLST bit takes a fixed amount of time. Confirm that the CMPST bit in DOCMSTR is actually cleared after writing 1 to the CMPCLST bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CMP CLST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 41.9 DOCMCLSTR register contents

Bit	Bit Name	Description
31 to 1	–	Reserved These bits are always read as 0. The write value should always be 0.
0	CMPCLST	Display Out Comparison Status Clear Setting this bit to 1 clears the CMPST bit in DOCMSTR to 0. This bit is always read as 0.

41.4.4 Interrupt Enable Register (DOCMIENR)

DOCMIENR enables interrupt of the corresponding status bits in DOCMSTR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CMPIEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 41.10 DOCMIENR register contents

Bit	Bit Name	Description
31 to 1	–	Reserved These bits are always read as 0. The write value should always be 0.
0	CMPIEN	Display Out Comparison Mismatch Detection Interrupt Enable Enables/disables the display out comparison mismatch detection interrupt (CMPI) when the CMPST bit in DOCMSTR is set to 1. 0: Disables the display out comparison mismatch detection interrupt (CMPI). 1: Enables the display out comparison mismatch detection interrupt (CMPI).

41.4.5 Operation Parameter Setting Register (DOCMPMR)

DOCMPMR selects the graphics data and sets the pixel format.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CMPBT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMPDFA[7:0]								CMP DAUF	-	-	-	CMPSELP[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Table 41.11 DOCMPMR register contents

Bit	Bit Name	Description
31 to 17	–	Reserved These bits are always read as 0. The write value should always be 0.
16	CMPBT	Pixel Format Data Width 0: 32-bit 1: prohibited **CAUTION** The default value “0” must not be changed.
15 to 8	CMPDFA [7:0]	Display Out Comparison Default α Value FF_H: α = FF_H all others: prohibited **CAUTION** The default value “00_H” must be changed to “FF_H”.
7	CMPDAUF	Display Out Comparison Default α Value Use 0: prohibited 1: use default α value CMPDFA[7:0] = FF_H **CAUTION** The default value “0” must be changed to “1”.
6 to 4	–	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CMPSELP [3:0]	Display Out Comparison input selection Selects the graphics data for CRC code comparison. 9: Selects graphics data after α blending. Other than above: Setting prohibited **CAUTION** The default value “0” must be changed to “9”.

41.4.6 Expected CRC Code Register (DOCMECRCR)

DOCMECRCR specifies the CRC code of the expected graphics data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMPECRC[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMPECRC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 41.12 DOCMECRCR register contents

Bit	Bit Name	Description
31 to 0	CMPECRC [31:0]	Expected Display Out Comparison CRC Code The expected CRC code value of the selected graphics data or rectangular area

41.4.7 Calculated CRC Code Value Register (DOCMCCRCR)

The CRC code calculation result can be read from this register. The calculation result is reflected in this register when the end of the valid period of the graphics data is detected.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMPCCRC[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMPCCRC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 41.13 DOCMCCRCR register contents

Bit	Bit Name	Description
31 to 0	CMPCCRC [31:0]	Calculated Display Out Comparison CRC Code Value The calculated CRC code value of the selected graphics data or rectangular area

41.4.8 Horizontal Start Position Setting Register (DOCMSPXR)

DOCMSPXR specifies the horizontal start position of the rectangular area for which the CRC code is calculated.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	CMPSPX[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 41.14 DOCMSPXR register contents

Bit	Bit Name	Description
31 to 11	–	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	CMPSPX [10:0]	Display Out Comparison Horizontal Start Position Specifies the horizontal start position of the rectangular area for which the CRC code is calculated. The set value should be smaller than or equal to the horizontal size of the graphics data.

41.4.9 Vertical Start Position Setting Register (DOCMSPYR)

DOCMSPYR specifies the vertical start position of the rectangular area for which the CRC code is calculated.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 41.15 DOCMSPYR register contents

Bit	Bit Name	Description
31 to 11	–	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	CMPSPY [10:0]	Display Out Comparison Vertical Start Position Specifies the vertical start position of the rectangular area for which the CRC code is calculated. The set value should be smaller than or equal to the vertical size of the graphics data.

41.4.10 Horizontal Size Setting Register (DOCMSZXR)

DOCMSZXR specifies the horizontal size of the rectangular area for which the CRC code is calculated.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 41.16 DOCMSZXR register contents

Bit	Bit Name	Description
31 to 11	–	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	CMPSZX [10:0]	Display Out Comparison Horizontal Size Specifies the horizontal size of the rectangular area for which the CRC code is calculated. The value should be set as follows: Horizontal size of the graphics data ≥ Horizontal start position (CMPSPX[10:0]) + Horizontal size (CMPSZX[10:0]).

41.4.11 Vertical Size Setting Register (DOCMSZYR)

DOCMSZYR specifies the vertical size of the rectangular area for which the CRC code is calculated.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	CMPSZY[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 41.17 DOCMSZYR register contents

Bit	Bit Name	Description
31 to 11	–	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	CMPSZY [10:0]	Display Out Comparison Vertical Size Specifies the vertical size of the rectangular area for which the CRC code is calculated. The value should be set as follows: Vertical size of the graphics data ≥ Vertical start position (CMPSPY[10:0]) + Vertical size (CMPSZY[10:0]).

41.4.12 CRC Code Initialization Register (DOCMCRCIR)

DOCMCRCIR is used to specify the initial value of the CRC code.

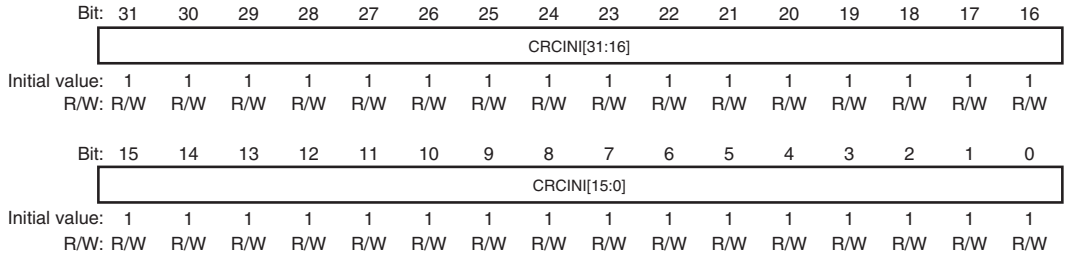

Table 41.18 DOCMCRCIR register contents

Bit	Bit Name	Description
31 to 0	CRCINI [31:0]	Display Output CRC Comparison Initial Value These bits specify the initial value of the CRC for the rectangular area of the selected graphics data.

41.5 Operation

41.5.1 Overview of Operations

This module is capable of calculating the CRC code of the arbitrary rectangular area of graphics data. By comparing the CRC code with the pre-calculated expected CRC code value, this module can detect whether the display output is obtained as expected.

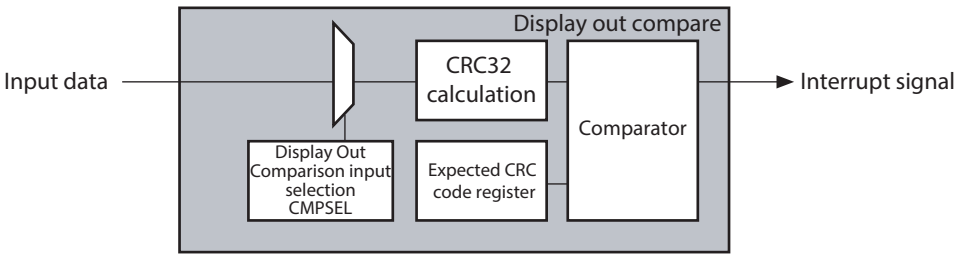
Main features of this module are as follows.

- Arbitrary rectangular area of the selected graphics data can be specified
- Pixel format: 32-bit αRGB8888 with fixed a = FF_H
- Interrupt is generated when the compared CRC codes do not match.

41.5.2 System Configuration

This module is configured as shown in the figure below.

The CRC code is calculated after receiving the graphics data output from the graphics display module. The calculated CRC code is then compared with the pre-calculated expected CRC code value.



Note: The input data selection DOCMPMR.CMPSEL[3:0] must be set to 9.

Figure 41.3 System Configuration

41.5.3 CRC Calculation Method

The display out comparison unit generates a 32-bit CRC code by using the following CRC polynomial (IEEE802.3).

$$x^{32}+ x^{26}+ x^{23}+ x^{22}+ x^{16}+ x^{12}+ x^{11}+ x^{10}+ x^{8}+ x^{7}+ x^{5}+ x^{4}+ x^{2}+ x+1$$

CRC is sequentially calculated beginning with LSB in pixel units.

In other words it is calculated in units of 32 bits. During CRC calculation of data, pixel data is input when the graphics data is output (top left to bottom right).

41.5.4 Pixel Format

41.5.4.1 Pixel Format Specification

DOCMPMR specifies the pixel format. The pixel formats are given in the following table.

Table 41.19 Pixel Format

Bits in DOCMPMR		CMPBT	CMPDFA[7:0]	CMPDAUF
32 bits/pixel	αRGB8888 (fixed a = FF_H)	0	FF_H	1

Data arrangement for each pixel format is given below.

- αRGB8888 (32 bits/pixel)

1 1 1 1 1 1 1 1 b23 b16	b15 b8	b7 b0
α = FF_H, 8 bits	Red 8 bits	Green 8 bits	Blue 8 bits

41.5.5 Rectangular Area Settings

Based on the selected graphics data, the start position and size of the rectangular area for which the CRC code is calculated can be set with the registers. The following figure and table show such a rectangular area and the register settings for the area.

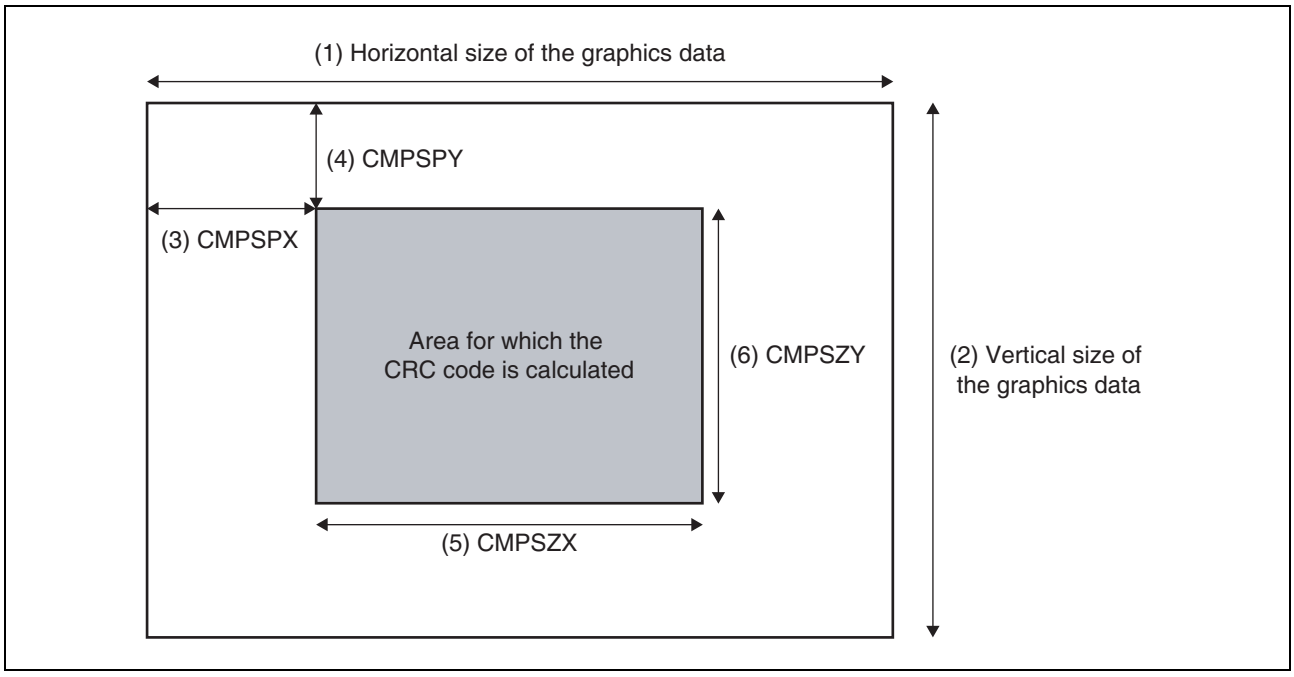


Figure 41.4 Rectangular Area for which the CRC Code is Calculated

Table 41.20 Register Settings for the Rectangular Area for which the CRC Code is Calculated

No.	Symbol in the Figure	Register Used for Setting	Description
(1)	Horizontal size of the graphics data		Horizontal size of the graphics data. Set the size using the graphics display module.
(2)	Vertical size of the graphics data		Vertical size of the graphics data. Set the size using the graphics display module.
(3)	CMPSPX (horizontal start position)	DOCMSPXR	Set the horizontal distance from the upper left origin of the graphics data to the rectangular area for which the CRC code is calculated in pixel units.
(4)	CMPSPY (vertical start position)	DOCMSPYR	Set the vertical distance from the upper left origin of the graphics data to the rectangular area for which the CRC code is calculated in line units.
(5)	CMPSZX (horizontal size)	DOCMSZXR	Set the horizontal size of the rectangular area for which the CRC code is calculated in pixel units. The value should be set as follows: Horizontal size of the graphics data ≥ CMPSPX + CMPSZX.
(6)	CMPSZY (vertical size)	DOCMSZYR	Set the vertical size of the rectangular area for which the CRC code is calculated in line units. The value should be set as follows: Vertical size of the graphics data ≥ CMPSPY + CMPSZY.

41.5.6 CRC Calculation Time Period and Comparison Timing

Figure 41.5 shows the CRC calculation time period and timing of comparing the calculated result with the expected value.

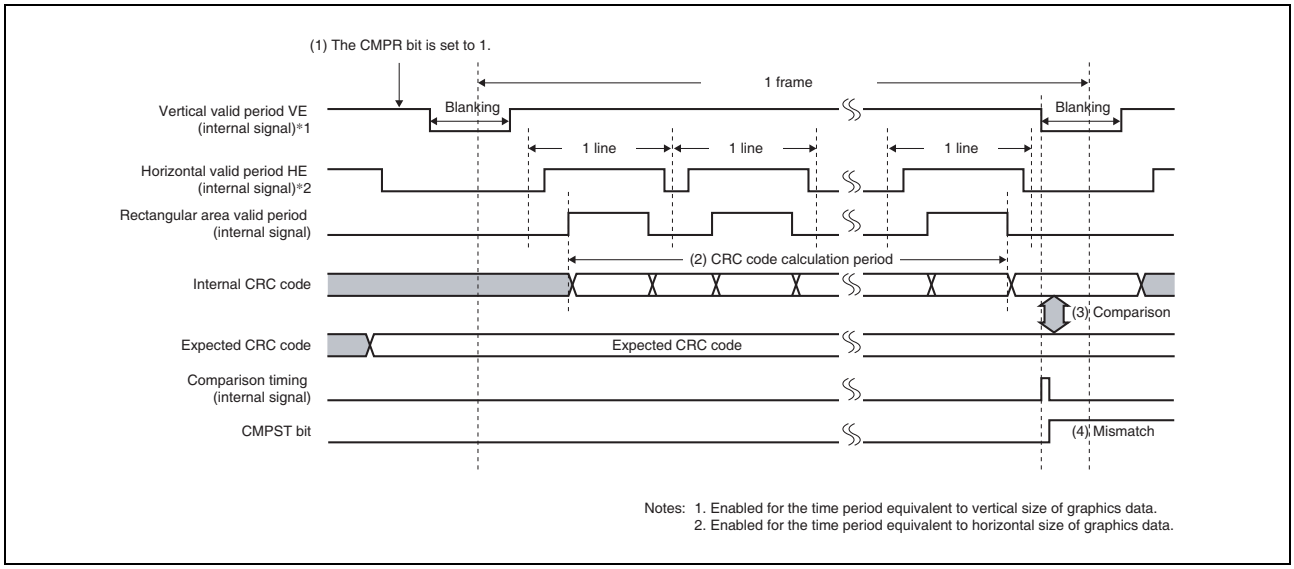

Figure 41.5 CRC Calculation Time Period and Timing of Comparing the Calculated Result with the Expected Value

[Operation]

(1) The operation starts at the next frame after the CMPR bit in DOCMCR is set to 1. For the register update timing, see Section 41.5.7, Register Update Timing.

(2) CRC code is calculated in the set rectangular area.

(3) The CRC code calculation result is compared with the expected CRC code value (DOCMECRCR) at the end of the valid period of the graphics data.

(4) If the compared CRC codes do not match, the CMPST bit in DOCMSTR is set.

41.5.7 Register Update Timing

41.5.7.1 Timing when Register Values are Loaded Inside

All the register bits except the CMPR bit in DOCMCR are loaded inside immediately after the registers are written to. Thus, if the register is updated with the CMPRU bit in DOCMCR as 1, an unexpected result is likely to be obtained in the CRC code calculation. The registers that affect the CRC code calculation (i.e., registers other than DOCMCLSTR and DOCMIENR) should be updated after confirming that the CMPRU bit in DOCMCR is 0.

The CMPR bit in DOCMCR is loaded inside upon detection of the start of the valid period of the graphics data. Thus, even if the register is rewritten to in the middle of a frame, the CRC code calculation of the frame does not get affected.

41.5.7.2 Timing when Internal State is Reflected in Registers

The internal state is reflected in DOCMSTR and DOCMCCRCR at the end of the valid period of the graphics data. The internal state of the CMPR bit is reflected in the CMPRU bit in DOCMCR at the start of the valid period of the graphics data.

The figure below shows the register update timing.

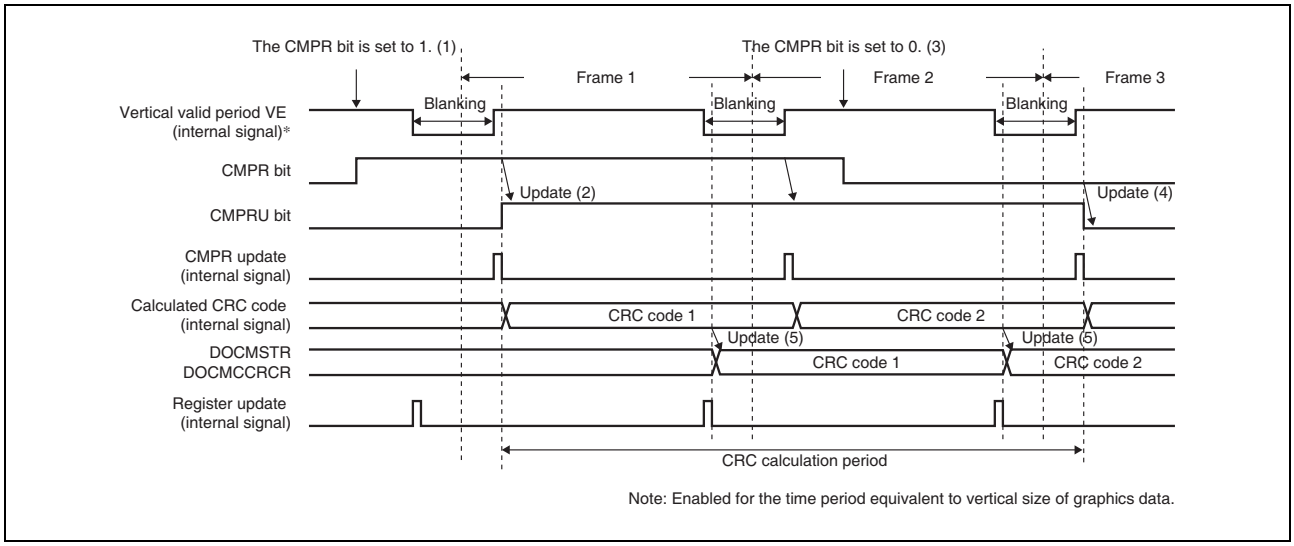

Figure 41.6 Register Update Timing

[Operation]

(1) The CMPR bit is set to 1. This bit is not immediately loaded inside.

(2) CRC calculation is carried out after the CMPR bit value is loaded inside upon detection of the start of the valid period of the graphics data.

(3) To suspend the CRC comparison, the CMPR bit is set to 0. Similarly to (1), this bit is not immediately loaded inside.

(4) The CRC calculation is suspended after the CMPR bit value is loaded inside upon detection of the start of the valid period of the graphics data.

(5) The internal state is reflected in the register at the end of the valid period of the graphics data.

41.5.8 Operation Flow

41.5.8.1 Procedure for Starting Display Out Comparison

The following figure shows a sample procedure for starting the display out comparison.

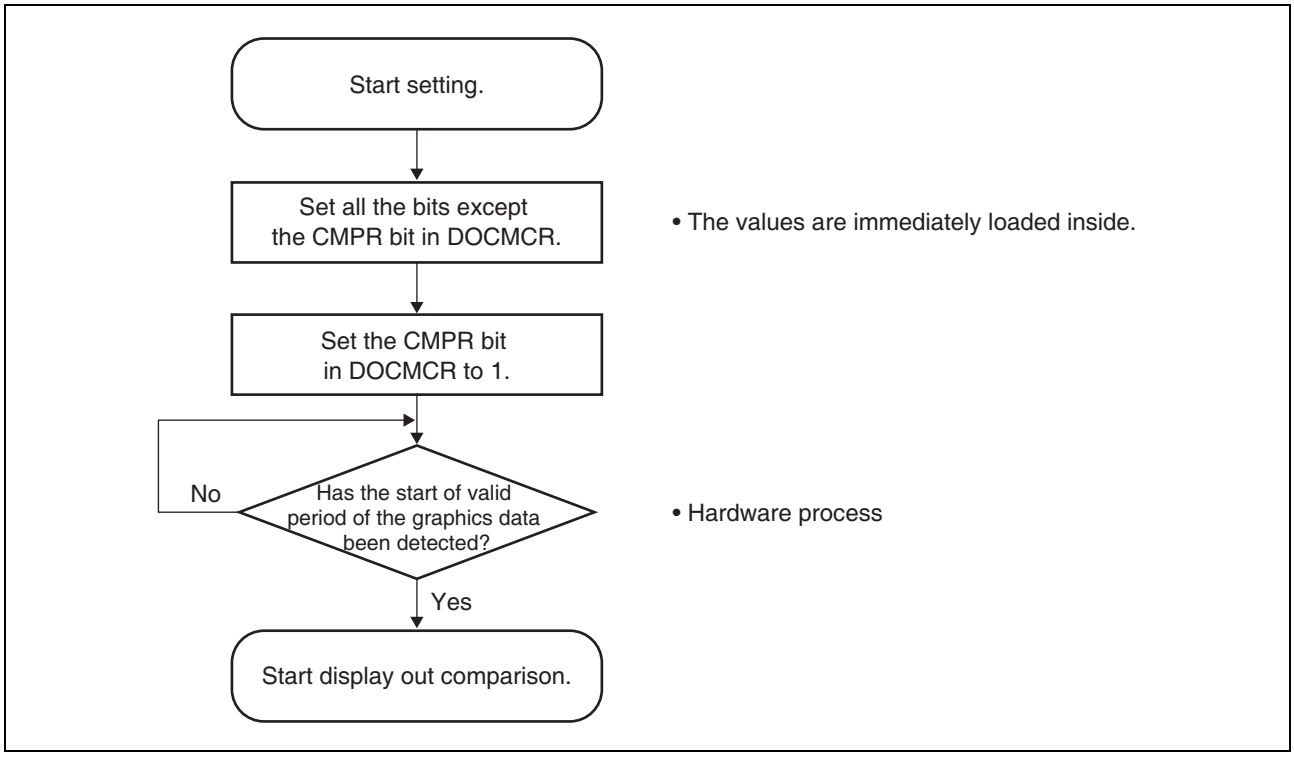

Figure 41.7 Sample Procedure for Starting the Display Out Comparison

41.5.8.2 Procedure for Changing Register Setting with stopping display output comparison

The following figure shows a sample procedure for changing the register setting during display out comparison.

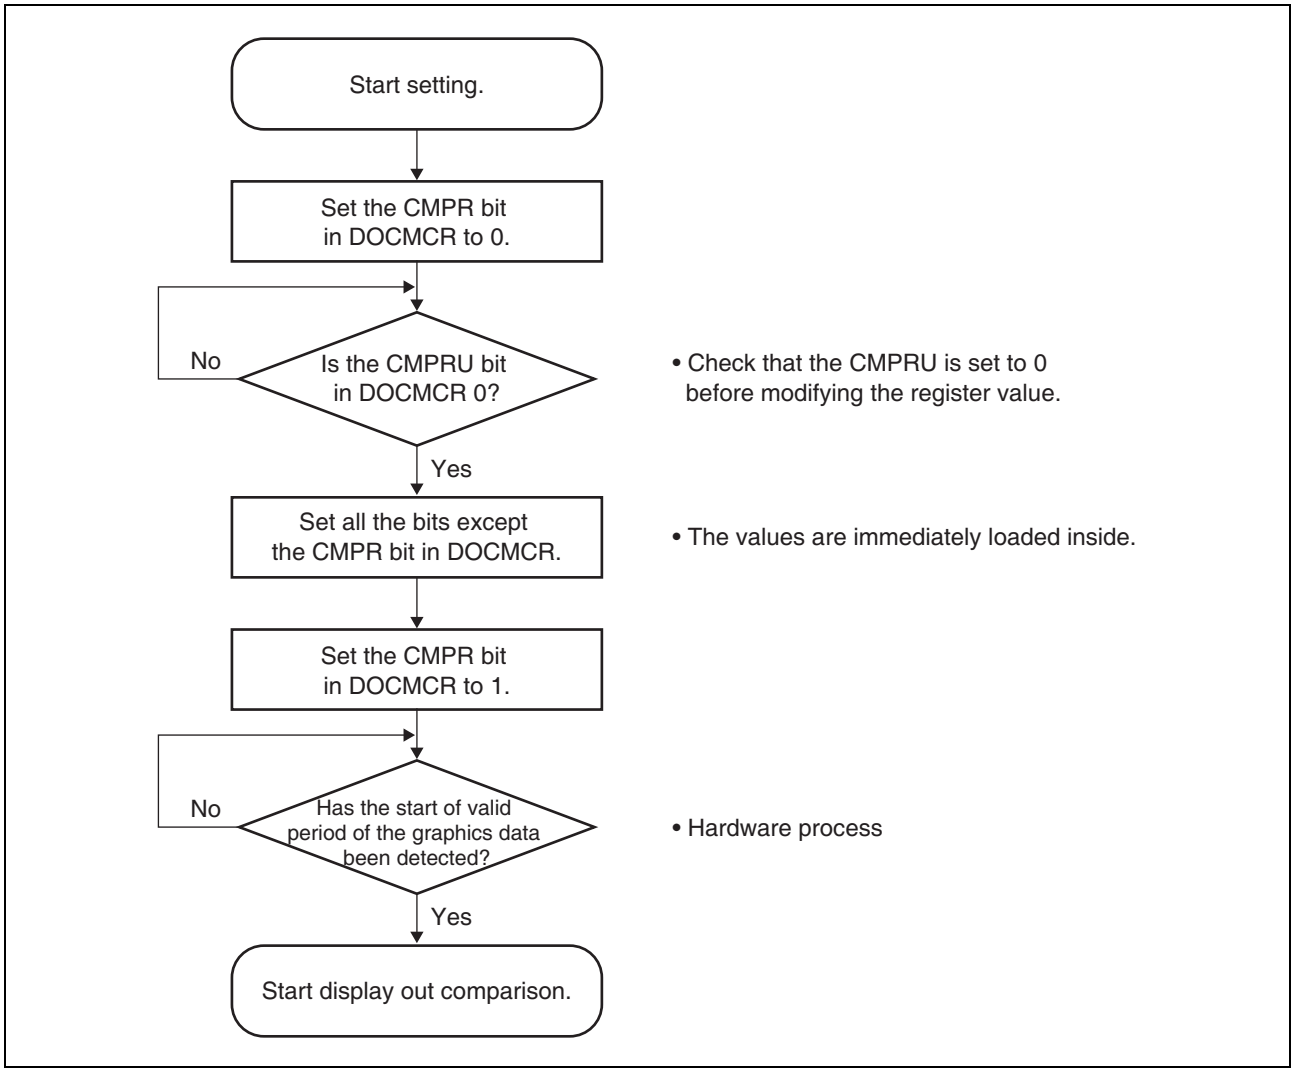

Figure 41.8 Sample Procedure for Changing the Register Setting with stopping Display Out Comparison

41.5.8.3 Procedure for Changing Register Setting without stopping display output comparison

Since the register settings for the next CRC calculation must be valid at the end of the vertical blanking period, it is also possible to change all registers within the vertical blanking period without stopping the CRC calculation.

That means it's not necessary to set the CMPR bit of the DOCMCR register to 0 and to wait until the CMPRU bit of the DOCMCR register has become 0, provided it is guaranteed that all register modifications are completed before the end of the vertical blanking period.

The start of the vertical blanking period is indicated by the interrupt INTVDCEnGR3VBLANK of the respective video channel n (n = 0, 1).

The following diagram outlines the procedure of a register update without stopping the display output comparison.

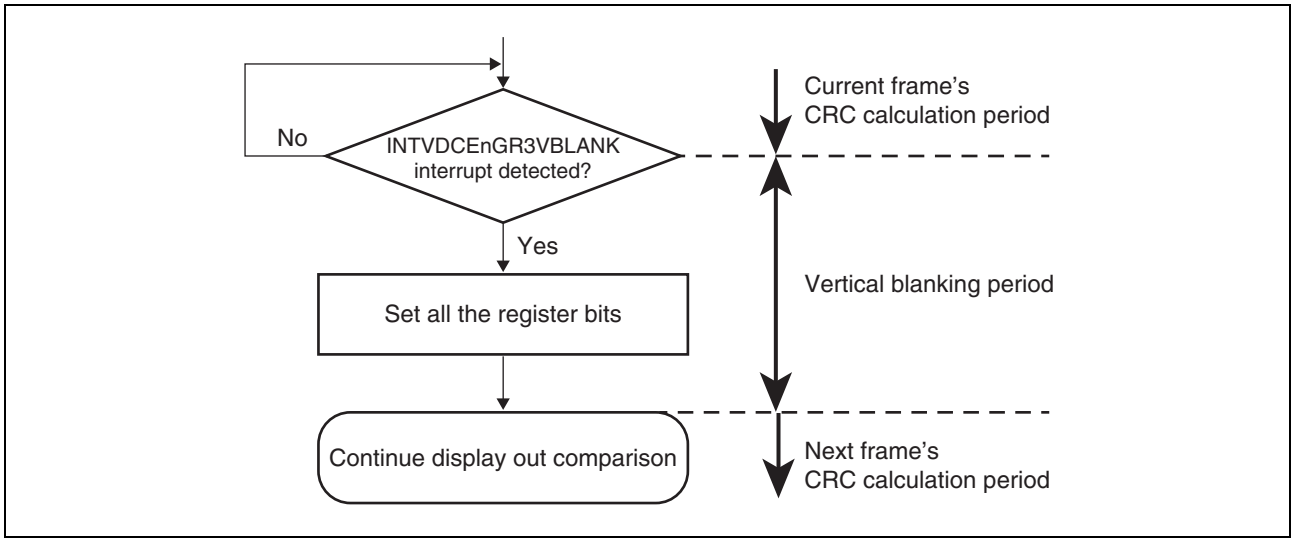

Figure 41.9 Sample Procedure for Changing the Register Setting without stopping Display Out Comparison

41.6 Interrupt

The display out comparison mismatch detection interrupt is provided as an interrupt source.

The interrupt request is generated when the CMPIEN bit in DOCMIENR and the CMPST bit in DOCMSTR are both set to 1.

41.7 Usage Note

41.7.1 Expected CRC Value

The graphics data after α blending should be selected at the time of debugging and the calculated CRC code value read from DOCMCCRCR should be used as the expected CRC code value. This is because there is a possibility of mismatching of the result of superimposition of the graphics data by the software and the result of superimposition by the graphics display module due to an error in calculation when the graphics data after α blending is selected.

41.7.2 Expansion Control Functionality

When scaling settings are applied for expansion processing by the Video Display Controller, this module becomes incapable of generating CRC codes. Stop this module while expansion processing is being applied.

Section 42 2D Graphics Processing Unit (GPU2D)

This section describes briefly the features of the 2D Graphics Processing Unit and contains a list of its registers.

42.1 Overview of the RH850/D1L/D1M 2D Graphics Processing Unit

42.1.1 Units

This microcontroller has the following number of units of the 2D Graphics Processing Unit.

Table 42.1 Units

2D Graphics Processing Unit (GPU2D)	D1L1	D1L2(H)	D1M1(H) D1M1-V2 D1M1A	D1M2(H)
Units	0	0	1	1
Names	–	–	GPU2D0	GPU2D0

42.1.2 Register addresses

All 2D Graphics Processing Unit register addresses are given as address offsets from the individual base addresses <GPU2Dn_base>.
The <GPU2Dn_base> addresses of each GPU2Dn are listed in the following table:

Table 42.2 Register base addresses <GPU2Dn_base>

GPU2Dn unit	<GPU2Dn_base> address
GPU2D0	FFFD 0000_H

42.1.3 Clock supply

All 2D Graphics Processing Units provide two clock inputs.

Table 42.3 Clock supply

GPU2Dn unit	GPU2Dn clock	Connected to
GPU2D0	PBUS clock	Clock Controller C_ISO_PCLK
	GPU2D operation clock	• D1M1(H), D1M1-V2, D1M1A: Clock Controller C_ISO_XCCLK • D1M2(H): Clock Controller C_ISO_CPUCLK

42.1.4 Interrupts

The 2D Graphics Processing Units can generate the following interrupt requests:

Table 42.4 GPU2Dn interrupt requests

GPU2D0 signals	Function	Connected to
pause_irq_o	Pause interrupt	Interrupt Controller INTGPU2D0PAUSE
sync_irq_o	SYNC interrupt	Interrupt Controller INTGPU2D0SYNC
special_irq_o	Stop / Stall / MBI Error interrupt	Interrupt Controller INTGPU2D0SP

42.1.5 Reset sources

The 2D Graphics Processing Units and their registers are initialized by the following reset signal:

Table 42.5 Reset sources

GPU2Dn unit	Reset signal
GPU2D0	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

42.1.6 Bus master ID

The 2D Graphics Processing Unit bus master interface is connected to the XC1cross-connect system. The master interface has the following master ID:

GPU2D: MSTID4

42.2 Functional Overview

GPU2D is a 2D render core targeting high resolution displays. The most important aspect to be considered for such displays is the necessary pixel fill rate to provide high rendering frame rates even when writing multiple MPixels per frame.

Compared to 2D Drawing Engine (DRW) from Dx4 dashboard controller series, the primary differences are:

- Completely newly developed low-overhead enumeration
- Bézier lines and Bézier segments
- Multi-Texturing (two textures)
- Flexible colorization using multiple passes (three colorization passes)
- Prefetching of textures to hide texture read latency
- Texture address swizzling and tiling for higher texturing performance
- Dedicated clear unit for fill of memory regions with maximum bandwidth
- completely overworked display list handling and device context switch support

The GPU2D driver targets to provide a slim, small-footprint interface to the hardware features while hiding the complexity of efficiently using the hardware module from the user.

- GPU2D provides high quality 2D rendering
  - general sub pixel accuracy
  - direct edge anti-aliasing support

Compatibility

- Software compatible to the 2D Drawing Engine (DRW) of the Dx4 series, but delivers about four times performance
- GPU2D supports OpenVG
  - direct Bézier curve rendering
  - multi-texturing to support images and gradients
  - support for an unlimited number of scissor rectangles
  - extended blending modes
  - global alpha mask

BitBLT engine

- GPU2D supports the typical BitBLT functions
  - Direct blit and stretch blit
  - Transparency and color keying
  - Bilinear filtering
  - Per pixel alpha blending
  - Coloring
  - RLE decompression
  - RLE decompression formats: 8 bpp, 16 bpp, 24 bpp, 32 bpp
- Texture mapping
  - Perspective 3D texturing, supporting cover flow effects
  - Multi-texturing for sophisticated shading effects
  - Dot3 bump mapping allows 3D per-pixel lighting effects
  - Very suitable for dashboard needles

Direct RLE texture input

- Textures can be RLE compressed
  - Targa tga file format
  - Restart from any texture position (fast forward)
    RLE textures shall be mapped completely from texture start for best performance
- Input color formats
  - αRGB8888, RGBα8888, αRGB4444, RGBα4444, αRGB1555, RGBα5551, RGB565
  - Color Look-Up (CLUT) or luminance formats αL88, αL44, αL8, αL4, αL2, αL1
- Typical size compression of factor 4 possible
  - Fitting smaller color format = factor 2, RLE = factor 2
  - Most effective for larger monochrome parts as in GUI elements
  - GPU2D cannot generate RLE textures on the fly, but they are stored pre-rendered in texture memory

Various texturing options

- Perspective correct texturing for 3D effects
- Multi texturing for illumination effects
- Bump mapping for surface modelling
- Freely programmable 7x7 filter matrix, e.g. can be used to calculate blurring effects on the fly

Vector drawing engine

- OpenVG compatible
- Lines
  - Arbitrary width
  - Round endpoints
  - Truncated endpoints
  - Alpha gradients
  - Soft edges (blurring)
- Polygons
  - Triangles and Quadrangles
  - Alpha gradients
  - Soft edges (blurring)
  - Per edge controls for anti aliasing

Direct Bézier Rendering

- Bézier curves describe smooth outlines
  - No sharp corners
  - Few curve control points
- Compatible with Truetype
- Very effective for OpenVG support

General features

- Command Stream execution from ring-buffer
  - No stream size limit due to memory availability
  - Reduced latency from API call to displayed frame
    - Start frame rendering already with first object instead after last
    - Faster interaction through HMI
- Drawing command lists support
  - Checksums in drawing command stream for safety
  - Automatically stop on error in command stream and interrupt generation towards the CPU
  - CPU can recover the error and drawing engine can continue without artefacts
- Performance Verification
  - Performance Counters
  - Visualize enumeration efficiency
  - Visualize cache burst access lengths
- Readout or active dumping of full internal state
  - All registers, call stack, CLUT content
- Forced stop of execution

– Fast and efficient task switch
– Let core dump internal state for later resume

42.3 GPU2D registers overview

This section contains a list of all registers of the 2D Graphics Processing Unit.

42.3.1 Register lists by function

The 2D Graphics Processing Unit is controlled and operated by the following registers:

Table 42.6 STC registers

Register name	Shortcut	Address
STC version	GPU2D0STC_VERSION	<GPU2Dn_base> + 000_H
STC configuration 1	GPU2D0STC_CONFIG_1	<GPU2Dn_base> + 004_H
STC configuration 2	GPU2D0STC_CONFIG_2	<GPU2Dn_base> + 008_H
STC configuration 3	GPU2D0STC_CONFIG_3	<GPU2Dn_base> + $00C_H$
Modules busy bits	GPU2D0STC_BUSY_STATUS	<GPU2Dn_base> + 010_H
STC control	GPU2D0STC_CONTROL	<GPU2Dn_base> + 014_H
STC interrupt status/clear	GPU2D0STC_INTERRUPT_STATUS_CLEAR	<GPU2Dn_base> + 018_H
Stream start address	GPU2D0STC_STREAM_ADDRESS	<GPU2Dn_base> + $01C_H$
Ring pause address	GPU2D0STC_RING_PAUSE_ADDRESS	<GPU2Dn_base> + 020_H
Current ring address	GPU2D0STC_CURRENT_RING_ADDRESS	<GPU2Dn_base> + 024_H
Current stream address	GPU2D0STC_CURRENT_STREAM_ADDRESS	<GPU2Dn_base> + 028_H
Checksum	GPU2D0STC_CHECKSUM	<GPU2Dn_base> + $02C_H$
Synchronization ID	GPU2D0STC_SYNCHRONIZATION_ID_0	<GPU2Dn_base> + 030_H
Synchronization ID	GPU2D0STC_SYNCHRONIZATION_ID_1	<GPU2Dn_base> + 034_H
Synchronization ID	GPU2D0STC_SYNCHRONIZATION_ID_2	<GPU2Dn_base> + 038_H
Call Stack Pointer	GPU2D0STC_CALL_STACK_POINTER	<GPU2Dn_base> + $03C_H$
Call Stack Entry	GPU2D0STC_CALL_STACK_ENTRY_0	<GPU2Dn_base> + 040_H
Call Stack Entry	GPU2D0STC_CALL_STACK_ENTRY_1	<GPU2Dn_base> + 044_H
Call Stack Entry	GPU2D0STC_CALL_STACK_ENTRY_2	<GPU2Dn_base> + 048_H
Call Stack Entry	GPU2D0STC_CALL_STACK_ENTRY_3	<GPU2Dn_base> + $04C_H$
Call Stack Entry	GPU2D0STC_CALL_STACK_ENTRY_4	<GPU2Dn_base> + 050_H
Call Stack Entry	GPU2D0STC_CALL_STACK_ENTRY_5	<GPU2Dn_base> + 054_H
Call Stack Entry	GPU2D0STC_CALL_STACK_ENTRY_6	<GPU2Dn_base> + 058_H
Call Stack Entry	GPU2D0STC_CALL_STACK_ENTRY_7	<GPU2Dn_base> + $05C_H$
Performance Counter Values	GPU2D0STC_PERFORMANCE_COUNTER_VALUES_0	<GPU2Dn_base> + 080_H
Performance Counter Values	GPU2D0STC_PERFORMANCE_COUNTER_VALUES_1	<GPU2Dn_base> + 084_H
Performance Counter Values	GPU2D0STC_PERFORMANCE_COUNTER_VALUES_2	<GPU2Dn_base> + 088_H
Performance Counter Values	GPU2D0STC_PERFORMANCE_COUNTER_VALUES_3	<GPU2Dn_base> + $08C_H$

Table 42.7 PSU Pixel Selection registers

Register name	Shortcut	Address
Bounding box upper left corner	GPU2D0PSU_LIM_BBOX_MIN	<GPU2Dn_base> + 200_H
Bounding box lower right corner	GPU2D0PSU_LIM_BBOX_MAX	<GPU2Dn_base> + 204_H
Start position for enumeration	GPU2D0PSU_LIM_START	<GPU2Dn_base> + 208_H
Pixel selection unit Limiter control register	GPU2D0PSU_LIM_CTRL	<GPU2Dn_base> + $20C_H$
Enumeration stripes width and offset	GPU2D0PSU_LIM_STRIPE	<GPU2Dn_base> + 210_H
Bézier control	GPU2D0PSU_BEZ_CTRL	<GPU2Dn_base> + 214_H
Offset to Limiter value for Bézier function (14.18 signed fixed point)	GPU2D0PSU_BEZ_VOFF_0	<GPU2Dn_base> + 218_H
Offset to Limiter value for Bézier function (14.18 signed fixed point)	GPU2D0PSU_BEZ_VOFF_1	<GPU2Dn_base> + $21C_H$
Bézier antialiasing and width control	GPU2D0PSU_BEZ_AA_CTRL	<GPU2Dn_base> + 220_H
Initial Limiter value of enumeration start position (14.18 signed fixed point)	GPU2D0PSU_LIM_VSTART_0	<GPU2Dn_base> + 224_H
Fractional part of Limiter x step (2.18 signed fixed point)	GPU2D0PSU_LIM_DX_0	<GPU2Dn_base> + 228_H
Fractional part of Limiter y step (2.18 signed fixed point)	GPU2D0PSU_LIM_DY_0	<GPU2Dn_base> + $22C_H$
Initial Limiter value of enumeration start position (14.18 signed fixed point)	GPU2D0PSU_LIM_VSTART_1	<GPU2Dn_base> + 230_H
Fractional part of Limiter x step (2.18 signed fixed point)	GPU2D0PSU_LIM_DX_1	<GPU2Dn_base> + 234_H
Fractional part of Limiter y step (2.18 signed fixed point)	GPU2D0PSU_LIM_DY_1	<GPU2Dn_base> + 238_H
Initial Limiter value of enumeration start position (14.18 signed fixed point)	GPU2D0PSU_LIM_VSTART_2	<GPU2Dn_base> + $23C_H$
Fractional part of Limiter x step (2.18 signed fixed point)	GPU2D0PSU_LIM_DX_2	<GPU2Dn_base> + 240_H
Fractional part of Limiter y step (2.18 signed fixed point)	GPU2D0PSU_LIM_DY_2	<GPU2Dn_base> + 244_H
Initial Limiter value of enumeration start position (14.18 signed fixed point)	GPU2D0PSU_LIM_VSTART_3	<GPU2Dn_base> + 248_H
Fractional part of Limiter x step (2.18 signed fixed point)	GPU2D0PSU_LIM_DX_3	<GPU2Dn_base> + $24C_H$
Fractional part of Limiter y step (2.18 signed fixed point)	GPU2D0PSU_LIM_DY_3	<GPU2Dn_base> + 250_H
Initial Limiter value of enumeration start position (14.18 signed fixed point)	GPU2D0PSU_LIM_VSTART_4	<GPU2Dn_base> + 254_H
Fractional part of Limiter x step (2.18 signed fixed point)	GPU2D0PSU_LIM_DX_4	<GPU2Dn_base> + 258_H
Fractional part of Limiter y step (2.18 signed fixed point)	GPU2D0PSU_LIM_DY_4	<GPU2Dn_base> + $25C_H$
Initial Limiter value of enumeration start position (14.18 signed fixed point)	GPU2D0PSU_LIM_VSTART_5	<GPU2Dn_base> + 260_H
Fractional part of Limiter x step (2.18 signed fixed point)	GPU2D0PSU_LIM_DX_5	<GPU2Dn_base> + 264_H
Fractional part of Limiter y step (2.18 signed fixed point)	GPU2D0PSU_LIM_DY_5	<GPU2Dn_base> + 268_H
Debug control	GPU2D0PSU_DEBUG_CTRL	<GPU2Dn_base> + $26C_H$
Maximum coordinates generated by PSU, clipping limits for bounding box	GPU2D0PSU_LIM_MAX_COORD	<GPU2Dn_base> + 270_H

Table 42.8 Texture U/V Interpolation registers

Register name	Shortcut	Address
Start value for texture U coordinate	GPU2D0TXA_U_OFFSET_0	<GPU2Dn_base> + 300_H
Start value for texture V coordinate	GPU2D0TXA_V_OFFSET_0	<GPU2Dn_base> + 304_H
Increment of texture U coordinate for a pixel step in X direction	GPU2D0TXA_DUX_0	<GPU2Dn_base> + 308_H
Increment of texture U coordinate for a pixel step in Y direction	GPU2D0TXA_DUY_0	<GPU2Dn_base> + $30C_H$
Increment of texture V coordinate for a pixel step in X direction	GPU2D0TXA_DVX_0	<GPU2Dn_base> + 310_H
Increment of texture V coordinate for a pixel step in Y direction	GPU2D0TXA_DVY_0	<GPU2Dn_base> + 314_H
Start value for texture U coordinate.	GPU2D0TXA_U_OFFSET_1	<GPU2Dn_base> + 318_H
Start value for texture V coordinate.	GPU2D0TXA_V_OFFSET_1	<GPU2Dn_base> + $31C_H$
Increment of texture U coordinate for a pixel step in X direction	GPU2D0TXA_DUX_1	<GPU2Dn_base> + 320_H
Increment of texture U coordinate for a pixel step in Y direction	GPU2D0TXA_DUY_1	<GPU2Dn_base> + 324_H
Increment of texture V coordinate for a pixel step in X direction	GPU2D0TXA_DVX_1	<GPU2Dn_base> + 328_H
Increment of texture V coordinate for a pixel step in Y direction	GPU2D0TXA_DVY_1	<GPU2Dn_base> + $32C_H$

Table 42.9 ZSS, Texture RHW and Z Interpolation registers

Register name	Shortcut	Address
ZSA cache scheduler pitch	GPU2D0ZSS_PITCH	<GPU2Dn_base> + 400_H
ZSA cache scheduler span config	GPU2D0ZSS_SPAN_CONFIG	<GPU2Dn_base> + 404_H
Start value for Z coordinate	GPU2D0TXA_Z_OFFSET	<GPU2Dn_base> + 408_H
Increment of Z coordinate for a pixel step in X direction	GPU2D0TXA_DZX	<GPU2Dn_base> + $40C_H$
Increment of Z coordinate for a pixel step in Y direction	GPU2D0TXA_DZY	<GPU2Dn_base> + 410_H
Start value for RHW attribute (1/w) of Z	GPU2D0TXA_Z_RHW_OFFSET	<GPU2Dn_base> + 414_H
Increment of RHW attribute of Z for a pixel step in X direction	GPU2D0TXA_Z_DRHWX	<GPU2Dn_base> + 418_H
Increment of RHW attribute of Z for a pixel step in Y direction	GPU2D0TXA_Z_DRHWY	<GPU2Dn_base> + $41C_H$
Start value for RHW attribute (1/w)	GPU2D0TXA_RHW_OFFSET_0	<GPU2Dn_base> + 420_H
Increment of RHW attribute for a pixel step in X direction	GPU2D0TXA_DRHWX_0	<GPU2Dn_base> + 424_H
Increment of RHW attribute for a pixel step in Y direction	GPU2D0TXA_DRHWY_0	<GPU2Dn_base> + 428_H
Start value for RHW attribute (1/w)	GPU2D0TXA_RHW_OFFSET_1	<GPU2Dn_base> + $42C_H$
Increment of RHW attribute for a pixel step in X direction	GPU2D0TXA_DRHWX_1	<GPU2Dn_base> + 430_H
Increment of RHW attribute for a pixel step in Y direction	GPU2D0TXA_DRHWY_1	<GPU2Dn_base> + 434_H

Table 42.10 ZSA Pipeline + TXA registers

Register name	Shortcut	Address
ZSA control register	GPU2D0ZSA_CTRL	<GPU2Dn_base> + 600_H
ZSA buffer start address	GPU2D0ZSC_START_ADDRESS	<GPU2Dn_base> + 604_H
ZSA Unit Control register 1	GPU2D0ZSU_CTRL1	<GPU2Dn_base> + 608_H
ZSA Unit Control register 2	GPU2D0ZSU_CTRL2	<GPU2Dn_base> + $60C_H$

Control structure for Op2a (Alpha and RGB path)	GPU2D0COL_ARGB_OP2A_0	<GPU2Dn_base> + $B08_H$
Control structure for Op2b (Alpha and RGB path)	GPU2D0COL_ARGB_OP2B_0	<GPU2Dn_base> + $B0C_H$
Control structure for Op3 (Alpha and RGB path)	GPU2D0COL_ARGB_OP3_0	<GPU2Dn_base> + $B10_H$
Control structure for core output (Alpha and RGB path)	GPU2D0COL_ARGB_OUT_0	<GPU2Dn_base> + $B14_H$
Control structure for Op1a (Alpha and RGB path)	GPU2D0COL_ARGB_OP1A_1	<GPU2Dn_base> + $B18_H$
Control structure for Op1b (Alpha and RGB path)	GPU2D0COL_ARGB_OP1B_1	<GPU2Dn_base> + $B1C_H$
Control structure for Op2a (Alpha and RGB path)	GPU2D0COL_ARGB_OP2A_1	<GPU2Dn_base> + $B20_H$
Control structure for Op2b (Alpha and RGB path)	GPU2D0COL_ARGB_OP2B_1	<GPU2Dn_base> + $B24_H$
Control structure for Op3 (Alpha and RGB path)	GPU2D0COL_ARGB_OP3_1	<GPU2Dn_base> + $B28_H$
Control structure for core output (Alpha and RGB path)	GPU2D0COL_ARGB_OUT_1	<GPU2Dn_base> + $B2C_H$
Control structure for Op1a (Alpha and RGB path)	GPU2D0COL_ARGB_OP1A_2	<GPU2Dn_base> + $B30_H$
Control structure for Op1b (Alpha and RGB path)	GPU2D0COL_ARGB_OP1B_2	<GPU2Dn_base> + $B34_H$
Control structure for Op2a (Alpha and RGB path)	GPU2D0COL_ARGB_OP2A_2	<GPU2Dn_base> + $B38_H$
Control structure for Op2b (Alpha and RGB path)	GPU2D0COL_ARGB_OP2B_2	<GPU2Dn_base> + $B3C_H$
Control structure for Op3 (Alpha and RGB path)	GPU2D0COL_ARGB_OP3_2	<GPU2Dn_base> + $B40_H$
Control structure for core output (Alpha and RGB path)	GPU2D0COL_ARGB_OUT_2	<GPU2Dn_base> + $B44_H$

Table 42.14 Blending Pipeline registers

Register name	Shortcut	Address
Framebuffer pixel organization/format	GPU2D0FB_PIXEL_ORG	<GPU2Dn_base> + $C00_H$
Framebuffer start address	GPU2D0FBC_START_ADDRESS	<GPU2Dn_base> + $C04_H$
Blend unit factor and mode	GPU2D0BLU_BLEND	<GPU2Dn_base> + $C08_H$
Blend unit dither control	GPU2D0BLU_DITHER	<GPU2Dn_base> + $C0C_H$
Blend unit write control	GPU2D0BLU_WRITE	<GPU2Dn_base> + $C10_H$

Table 42.15 PFC registers

Register name	Shortcut	Address
Performance counter enable	GPU2D0PFC_ENABLE	<GPU2Dn_base> + $E00_H$
Performance counter clear	GPU2D0PFC_CLEAR	<GPU2Dn_base> + $E04_H$
Performance counter event selection	GPU2D0PFC_EVENT_SELECT_0	<GPU2Dn_base> + $E08_H$
Performance counter event selection	GPU2D0PFC_EVENT_SELECT_1	<GPU2Dn_base> + $E0C_H$
Performance counter event selection	GPU2D0PFC_EVENT_SELECT_2	<GPU2Dn_base> + $E10_H$
Performance counter event selection	GPU2D0PFC_EVENT_SELECT_3	<GPU2Dn_base> + $E14_H$

Table 42.16 CLR registers

Register name	Shortcut	Address
Clear unit color value	GPU2D0CLR_VALUE	<GPU2Dn_base> + $F00_H$
Clear unit line config	GPU2D0CLR_LINE_CONFIG	<GPU2Dn_base> + $F04_H$
Clear unit number of lines	GPU2D0CLR_CTRL	<GPU2Dn_base> + $F08_H$
Framebuffer start address for clear unit	GPU2D0CLR_START_ADDRESS	<GPU2Dn_base> + $F0C_H$

<GPU2Dn_base>

The base addresses <GPU2Dn_base> of the GPU2Dn is defined in the first section of this chapter under the key word “Register addresses”.

42.3.2 Register list by address

Table 42.17 Register list by address (1/5)

Register name	Shortcut	R/W	Address	Access Size
STC version	GPU2D0STC_VERSION	R	FFFD0000	32
STC configuration 1	GPU2D0STC_CONFIG_1	R	FFFD0004	32
STC configuration 2.	GPU2D0STC_CONFIG_2	R	FFFD0008	32
STC configuration 3.	GPU2D0STC_CONFIG_3	R	FFFD000C	32
Modules busy bits	GPU2D0STC_BUSY_STATUS	R	FFFD0010	32
STC control	GPU2D0STC_CONTROL	R/W	FFFD0014	32
STC interrupt status/clear	GPU2D0STC_INTERRUPT_STATUS_CLEAR	R/W	FFFD0018	32
Stream start address	GPU2D0STC_STREAM_ADDRESS	R/W	FFFD001C	32
Ring pause address	GPU2D0STC_RING_PAUSE_ADDRESS	R/W	FFFD0020	32
Current ring address	GPU2D0STC_CURRENT_RING_ADDRESS	R	FFFD0024	32
Current stream address	GPU2D0STC_CURRENT_STREAM_ADDRESS	R	FFFD0028	32
Checksum	GPU2D0STC_CHECKSUM	R/W	FFFD002C	32
Synchronization ID	GPU2D0STC_SYNCHRONIZATION_ID_0	R/W	FFFD0030	32
Synchronization ID	GPU2D0STC_SYNCHRONIZATION_ID_1	R/W	FFFD0034	32
Synchronization ID	GPU2D0STC_SYNCHRONIZATION_ID_2	R/W	FFFD0038	32
Call Stack Pointer	GPU2D0STC_CALL_STACK_POINTER	R/W	FFFD003C	32
Call Stack Entry	GPU2D0STC_CALL_STACK_ENTRY_0	R/W	FFFD0040	32
Call Stack Entry	GPU2D0STC_CALL_STACK_ENTRY_1	R/W	FFFD0044	32
Call Stack Entry	GPU2D0STC_CALL_STACK_ENTRY_2	R/W	FFFD0048	32
Call Stack Entry	GPU2D0STC_CALL_STACK_ENTRY_3	R/W	FFFD004C	32
Call Stack Entry	GPU2D0STC_CALL_STACK_ENTRY_4	R/W	FFFD0050	32
Call Stack Entry	GPU2D0STC_CALL_STACK_ENTRY_5	R/W	FFFD0054	32
Call Stack Entry	GPU2D0STC_CALL_STACK_ENTRY_6	R/W	FFFD0058	32
Call Stack Entry	GPU2D0STC_CALL_STACK_ENTRY_7	R/W	FFFD005C	32

Framebuffer start address for clear unit	GPU2D0CLR_START_ADDRESS	R/W	FFFD0F0C	32

42.4 Setup of the GPU2D

1. Set Stream commands list to memory.
   Regarding the usage of stream command, please refer D/AVE HD Technical Reference Manual.
2. Set stream address to GPU2D registers
   - GPU2D0STC_RING_PAUSE_ADDRESS[020H] = stream end address
   - GPU2D0STC_STREAM_ADDRESS[01CH]= stream start address

   After setting GPU2D0STC_STREAM_ADDRESS, GPU2D automatically starts to read stream commands and execute them.

Section 43 Sprite Engine (SPEA)

This section contains a generic description of the Sprite Engine.

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.
The subsequent sections describe the features that apply to all implementations.

43.1 Overview of the Sprite and RLE Units

43.1.1 Units

This microcontroller has the following number of units of the Sprite Engine.

Table 43.1 Units

Sprite Engine (SPEA)	D1L1	D1L2(H)	D1M1(H) D1M1-V2	D1M1A	D1M2(H)
Units	0	1	1	1	1
Names	–	SPEA0	SPEA0	SPEA0	SPEA0

43.1.2 Sprite and RLE Units indices

In this section following indices are used:

Table 43.2 Indices

Index	Meaning
n	Sprite Engine (SPEA) unit index n Throughout this section, the individual units of the Sprite Engines are identified by the index “n” (n = 0), for example, SPEAnPHAi for the SPEAn physical address register of RLE Engine i.
i	RLE Engine number index i The two entities of an RLE Engine are identified by the index “i” (i = 0, 1), for example, SPEAnPHAi for the physical address register of RLE Engine i.
j	RLE Unit number index j The RLE Units are identified by the index “j”: • D1L2(H), D1M1(H), D1M2(H): j = 0 • D1M1-V2, D1M1A: j = 0 to 3, for example, SPEAnRjPHAi for the physical address register of RLE Unit j.
k	Sprite Unit number index k The Sprite Units are identified by the index “k”: • D1L2(H), D1M1(H), D1M2(H): k = 0 to 2 • D1M1-V2, D1M1A: k = 0 to 3, for example, SPEAnSkEN for the enable register of Sprite Unit k.
m	Sprite index m The 16 sprites of a Sprite Unit k are identified by the index “m” (m = 0 to 15), for example, SPEAnSkDAm for the destination address register of Sprite Unit k’s sprite m.

43.1.3 Register addresses

All Sprite Engines register addresses are given as address offsets from the individual base addresses <SPEAn_base>.
The <SPEAn_base> addresses of each SPEAn are listed in the following table:

Table 43.3 Register base addresses <SPEAn_base>

SPEAn unit	<SPEAn_base> address
SPEA0	FFFD 4000_H

43.1.4 Clock supply

All Sprite Engines provide one clock input.

Table 43.4 Clock supply

SPEAn unit	SPEAn clock	Connected to
SPEA0	PBUS clock	Clock Controller C_ISO_PCLK
	Cross-connect clock	Clock Controller C_ISO_XCCLK

43.1.5 Reset sources

The Sprite Engines and their registers are initialized by the following reset signal:

Table 43.5 Reset sources

SPEAn unit	Reset signal
SPEA0	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

43.1.6 Internal signal connections

The internal signal connections of the Sprite Engine are listed in the following table.

Table 43.6 SPEA internal signal connections

SPEAn signal	Function	Connected to
VUPDATE0	Sprite definition registers update triggers	Sprite Engine registers update control VUPDATE0
VUPDATE1		Sprite Engine registers update control VUPDATE1

Refer to Section 37.6, Sprite Engine registers update control for details the sprite definition registers update trigger selections.

43.1.7 Bus master IDs

The Sprite Engines bus master interfaces are connected to the XC0 cross-connect system. The master interfaces have the following master IDs:

- All devices except D1M1A, D1M1-V2
  - RLE unit: MSTID8
  - Sprite unit 0: MSTID9
  - Sprite unit 1: MSTID10
  - Sprite unit 2: MSTID11
- D1M1A, D1M1-V2
  - RLE unit 0/Sprite unit 3: MSTID8
  - RLE unit 1/Sprite unit 0: MSTID9
  - RLE unit 2/Sprite unit 1: MSTID10
  - RLE unit 3/Sprite unit 2: MSTID11

43.2 Functional Overview

The Image Synthesizers can select different ways to acquire their data from the memory for adding a layer to the image to be displayed:

- Direct access
  The color data to be processed by an Image Synthesizer is read directly in the correct format out of the memory.
  All video channel's Image Synthesizer's 0 to 3 can directly access the memory.
- RLE (run-length encoded) layer
  RLE compressed color data in the memory is expanded and delivered to the Image Synthesizer as separate pixel color data.
  - All devices except D1M1A, D1M1-V2
    The video channel's Image Synthesizer 0, which determines the background layer, can use an RLE layer.
  - D1M1A, D1M1-V2
    All Image Synthesizers can use an RLE layer.
- Sprite layer
  A layer with up to 16 rectangle areas, which can be placed anywhere on the layer area.
  Since only the color data for these rectangles - and not for the entire layer - need to be stored in memory, required memory occupation and bandwidth is minimized.
  - All devices except D1M1A, D1M1-V2
    The video channel's Image Synthesizer's 1 to 3, which add the layers 1 to 3, can use Sprite layers
  - D1M1A, D1M1-V2
    All Image Synthesizers can use Sprite layers.

Features summary

- RLE Units
  - separate RLE Engines for each video channel's background layer, which is generated by an Image Synthesizer (only by Image Synthesizer 0 for all devices except D1M1A, D1M1-V2)
  - RLE compressed data in Targa format
  - RLE compressed color data formats: 24 bpp, 18 bpp and 8 bpp
- Sprite Units
  - four Sprite Units for video channel's layer 0 to 3, which are generated by an Image Synthesizer (only by Image Synthesizer 1 to 3 for all devices except D1M1A, D1M1-V2)
  - each Sprite Unit is shared by two Image Synthesizers, one from each video channel
  - up to 16 separate sprites processed by each Sprite Unit
  - each sprite of each Sprite Unit can be freely assigned to both Image Synthesizers
  - all Image Synthesizer's color data formats are supported
- RLE/Sprite Units (D1M1A, D1M1-V2 only)
  - RLE/Sprite Units are selectable to be RLE unit or Sprite Unit by register setting.
  - four RLE/Sprite Units are connected to XC2 cross-connect

43.3 RLE Units Functional Description

The following figure shows the block diagram of the RLE Units.

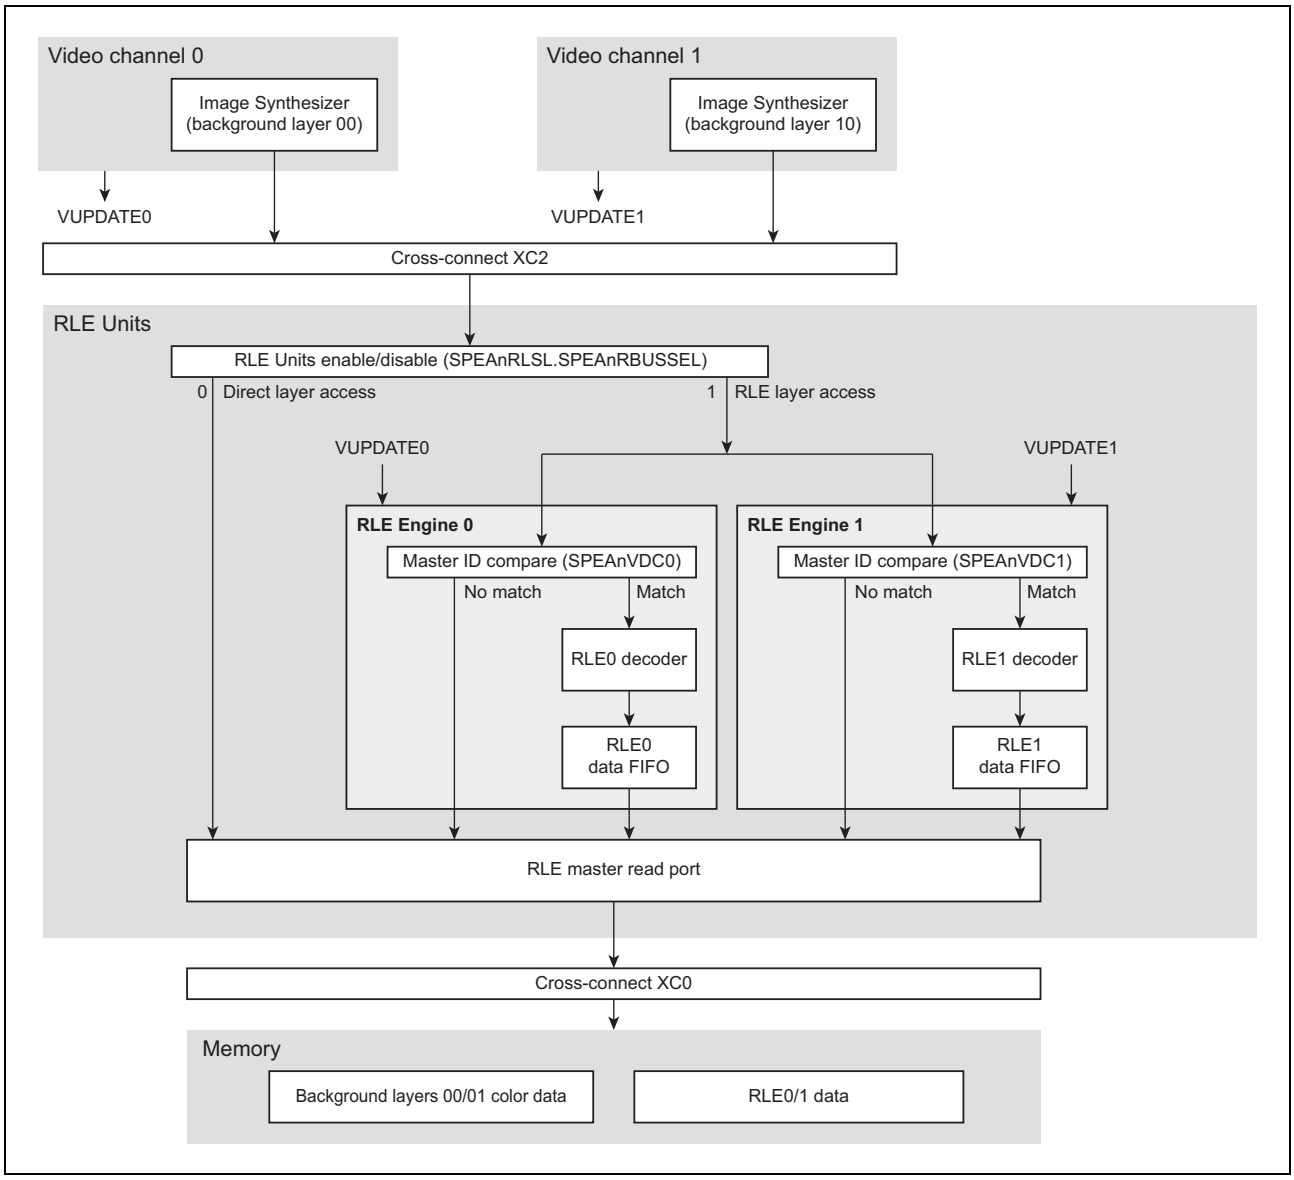

Figure 43.1 RLE Engines block diagram (all devices except D1M1A, D1M1-V2)

The Image Synthesizers 00 and 10 (background layers) can read RLE compressed color data from the memory via an RLE Engine.
If a background layer Image Synthesizer does not read RLE data, it accesses the physical memory for reading frame buffer data directly.

NOTE

Refer to Section 43.5, RLE/Sprite Units (D1M1A, D1M1-V2 only) for details about the D1M1A, D1M1-V2 RLE configuration.

RLE Engines enable

The RLE Engines can be enabled and disabled:

RLE or direct layer selection is done by a bypass switch:

- SPEAnRLSL.SPEAnRBUSSEL = 0: RLE Engines disabled
  The Image Synthesizer performs direct layer accesses to the memory.
- SPEAnRLSL.SPEAnRBUSSEL = 1: RLE Engines enabled
  The Image Synthesizer performs RLE layer accesses.

Direct or RLE layer access is commonly selected for the background layer of both video channels.

RLE Engines assignment and activation

Each Image Synthesizer background layer has its own RLE Engine:

- video channel 0 Image Synthesizer layer 00 uses RLE Engine 0
- video channel 1 Image Synthesizer layer 10 uses RLE Engine 1

Separate activation and de-activation of an RLE Engine for a background layer is done by compare of the Image Synthesizers cross-connect master ID with the predefined master ID in the respective RLE Engine.

The master ID to active the RLE Engine i is programmable in the SPEAnVDCi register.
If the ID of the master, reading data via an RLE Engine, does not match the SPEAnVDCi ID, the RLE decoder of RLE Engine i is deactivated.

RLE Units data FIFO

The data read from the memory by an RLE Engine is stored in a RLE data FIFO, that allows prefetching of memory data.
The prefetching of data can be influenced by the FIFO fill stage and the length of the read bursts, the RLE Engine issues read accesses towards the memory via the XC0 cross-connect.

The size of each RLE data FIFO is 1024 bit, organized as 16 x 64 bit.

Two values in the RLE prefetch configuration register SPEAnRCFG allow to configure the FIFO fill threshold when a new read burst is issued and the length of the burst:

- SPEAnRDTH[2:0] set the FIFO fill threshold for the next data prefetch
  The threshold is defined as SPEAnRDTH[2:0] x 64 bit.
- SPEAnRLEN[2:0] set the burst length for the next data prefetch
  The burst length is defined as SPEAnRLEN[2:0] x 64 bit.

NOTE

The burst size SPEAnRLEN[2:0] and the prefetch timing SPEAnRDTH[2:0] must be set to values, that prevent the RLE data FIFO from overflow.
The RLE data FIFO size is 1024 bit.

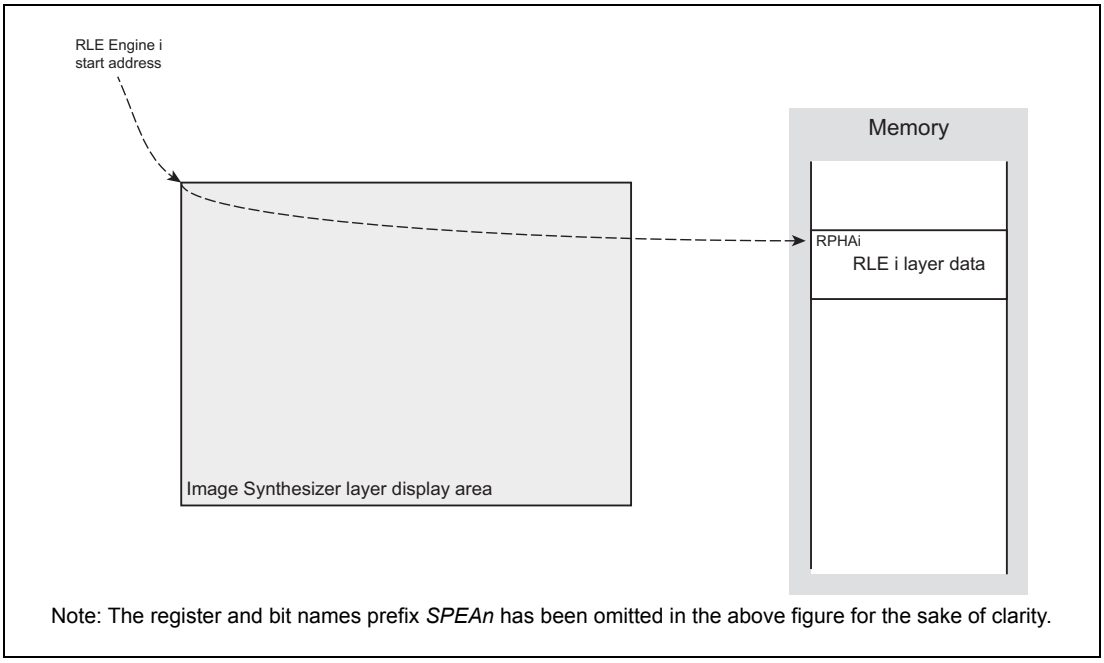
43.3.1 RLE layer definition

The RLE Unit j Engine i identifies a RLE layer read access of an Image Synthesizer by

- Image Synthesizer's bus master ID
  The valid bus master ID is defined in the read master ID register SPEAnVDCi
- the Image Synthesizer's read address of the first layer pixel
  The valid address is defined in the start address register SPEAnSTAi, that marks the virtual frame start address.

If an Image Synthesizer read access matches the valid master ID and address, the RLE Engine reads RLE data from the memory address, defined by the physical address register SPEAnPHAi.

Since the entire Image Synthesizer layer data is read via the RLE Engine, the RLE Engine reads data from the memory consecutively, until the Image Synthesizer issues the start address SPEAnSTAi again. This causes the RLE Engine to restart data read from address SPEAnPHAi.



Note: The register and bit names prefix *SPEAn* has been omitted in the above figure for the sake of clarity.

Figure 43.2 RLE definitions

CAUTION

As the RLE Engine is reading the memory consecutively, the following Image Synthesizer restrictions need to be considered:

1. **The Image Synthesizer always issues read bursts aligned to 128byte.**
   If an image width does not fit to this alignment, some dummy border (some pixels in each line) needs to be added.
2. **The Image Synthesizer performs an additional burst read of 128 bytes after every line.**
   In order to display its contents correctly any compressed image needs an additional "dummy border" of 32 pixels on its right side.

Example: for an 32 bpp image of 240 pixel width following dummy border needs to be added: In each line 16 pixels need to satisfy the first restriction and 32 pixels to satisfy

the second. The resulting total image width will be 288 pixel.

43.3.2 Color modes

The following table lists the possible combinations of the

- color data formats selectable in the Image Synthesizer,
- RLE color mode selection and the data format delivered to the Image Synthesizer
- color data format in the memory

when RLE data is used for the background layer.

Table 43.7 RLE Units supported color formats

Image Synthesizer color format selection		RLE Engine configuration		
		Color mode selection	Image Synthesizer data	Color data in the memory
32 bpp	αRGB8888	SPEAnRCMi = 2: 24 bpp	RGB888 with α = 1	RGB888
		SPEAnRCMi = 1: 18 bpp	RGB666 expanded to RGB888 with α = 1	RGB666
	RGBα8888	not supported	–	–
24 bpp	RGB888	SPEAnRCMi = 2: 24 bpp	RGB888	RGB888
		SPEAnRCMi = 1: 18 bpp	RGB666 expanded to RGB888	RGB666
16 bpp	RGB565 αRGB1555, RGBα5551 αRGB4444	not supported by RLE units	–	–
8 bpp	CLUT8	SPEAnRCMi = 0: 8 bpp	1 x 8 bpp in 1 byte	One 8 bpp color index in one byte
4 bpp	CLUT4	SPEAnRCMi = 0: 8 bpp	2 x 4 bpp in 1 byte	Two 4 bpp color indices in one byte
1 bpp	CLUT1	SPEAnRCMi = 0: 8 bpp	8 x 1 bpp in 1 byte	Eight 1 bpp color indices in one byte

Color expansion

Depending on the color format the Image Synthesizer is expecting, the color data read from the memory is expanded to fit a 32-bit word.

The following diagrams show how memory data in different formats are passed to the Image Synthesizer.

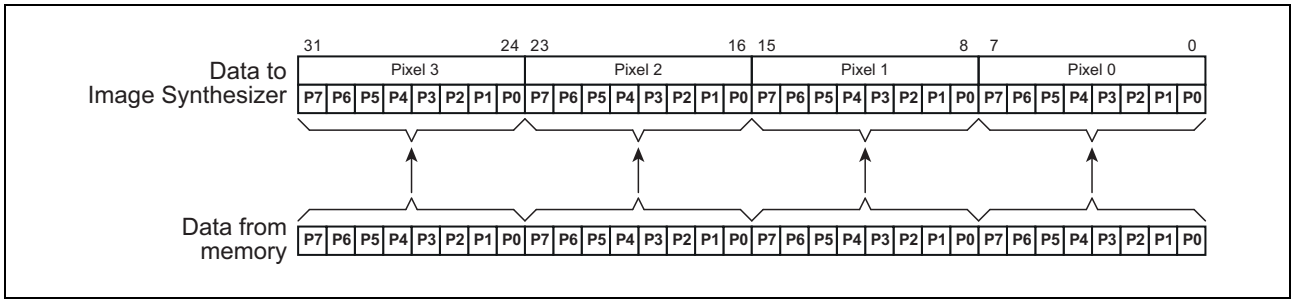


Figure 43.3 8 bpp color expansion to 32 bpp

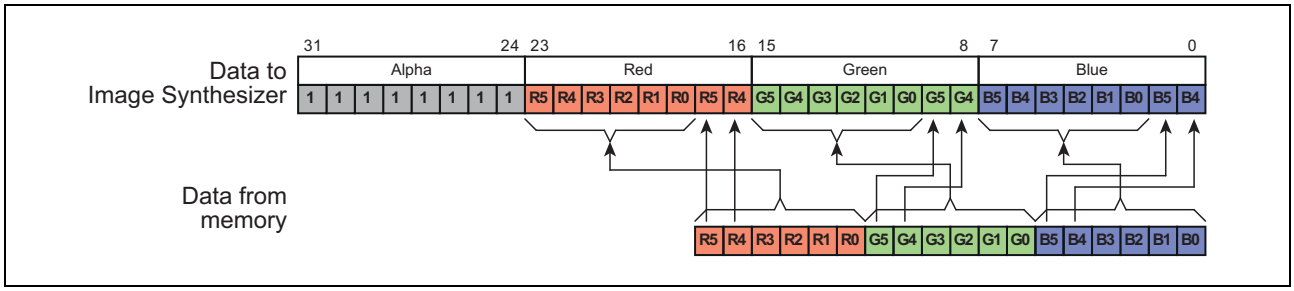

Figure 43.4 18 bpp color expansion to 32 bpp

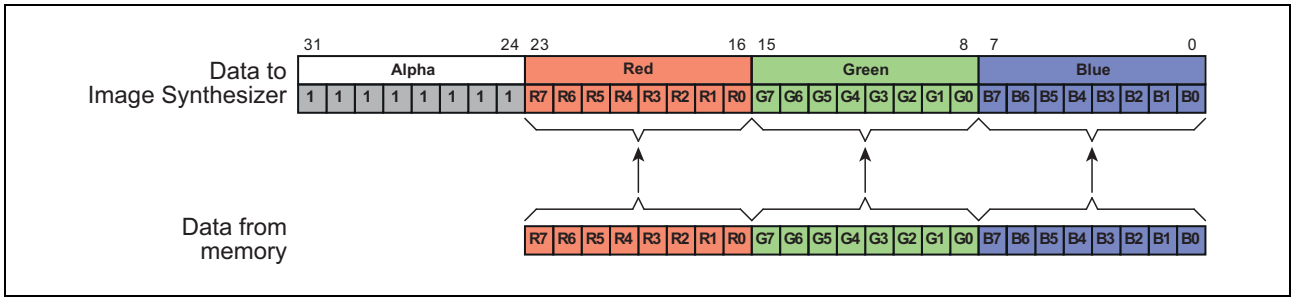

Figure 43.5 24 bpp color expansion to 32 bpp

CAUTION

If an RLE Unit reads data from the on-chip Video RAM, a direct 32-bit access area (with or without Error Correction Coding) must be used in order to avoid additional wrapping/unwrapping of the color data by the Video RAM Wrapper.

43.3.3 RLE data packets in the memory

The RLE Units support Targa RLE data packet formats.
The Targa RLE packets comprise two types of data elements:

- run-length packets
- raw packets

The packet consists of two fields:

- Control byte: defines the type of data and the number of pixels covered by the packet

- Data field: defines the pixels color data

Table 43.8 RLE Targa packets

Packet type	Control byte		Data field
Run-length	• Packet type = 1 for run-length packet • Size: 1 bit	• Pixel count = (number of pixel repetitions with color of data field) - 1 • Size: 7 bit	• Pixel color • Size: pixel bpp
Raw	• Packet type = 0 for raw packet • Size: 1 bit	• Pixel count = (number of pixels in following data field) - 1 • Size: 7 bit	• Pixels color • Size: pixel bpp x pixel count

43.3.4 Packet arrangement in the memory

Padding bits

A data packet must always start at a byte boundary. Thus it may be necessary to add padding bits to the previous packet.

The following diagrams show the arrangement of run-length and raw packets with different color format in the memory.

Figure 43.6 Run-length data packets in the memory

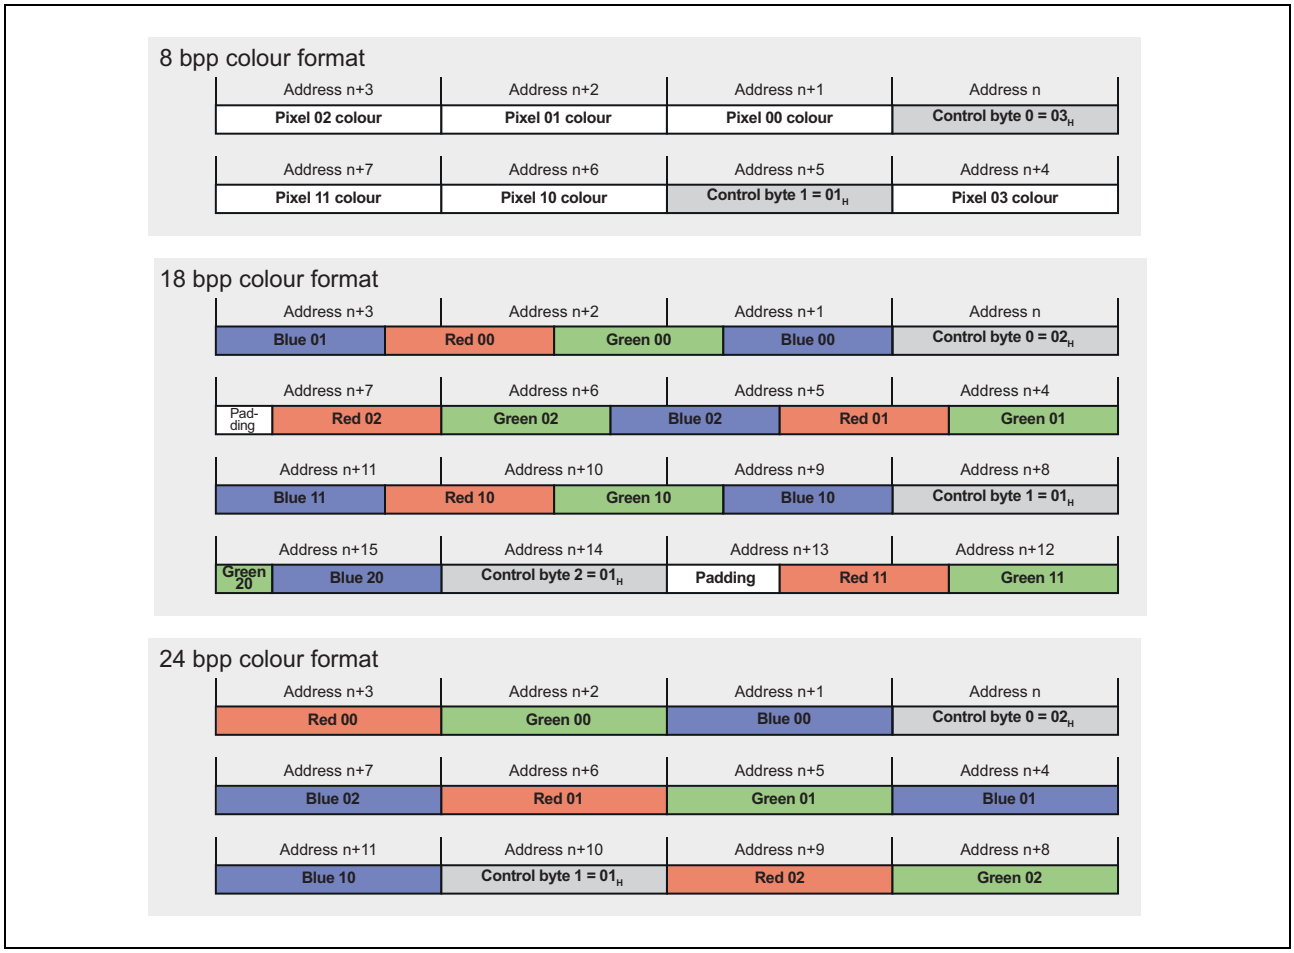

Figure 43.7 Raw data packets in the memory

The following diagram shows an example with a mixture of different packet types with 18 bpp data.

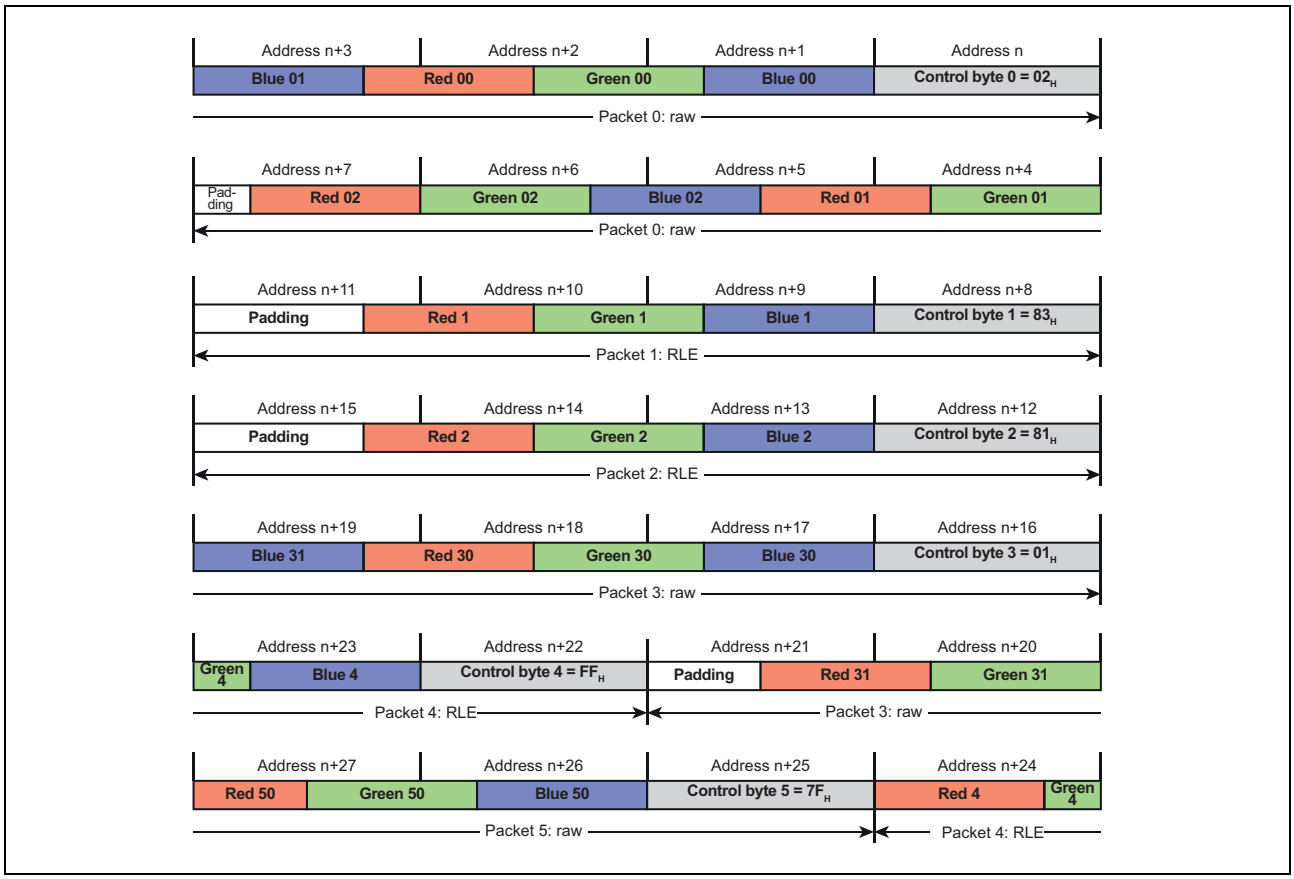

Figure 43.8 Mixture of RLE and raw data packets in the memory

43.3.5 RLE definition registers modification

The RLE definition registers are buffered.
While the RLE definition registers are in operation, the buffer registers can be modified without disturbing the video output.
In case the RLE definitions must be changed, the buffer registers are written with new values and all new sprite definitions become active with the start of a new video output frame, i.e. with a VUPDATEn (n = 0 or 1) signal.

The buffered RLE Engine i definition registers are:

- Start address register SPEAnSTAi
- physical address register SPEAnPHAi
- read master ID register SPEAnVDCi
- color mode register SPEAnRCMi

When setup of new RLE definitions is completed, the update of all definition registers of RLE Engine i must be requested via the SPEAnRUP register:

- D1L2(H), D1M1(H), D1M2(H) only
  - SPEAnRUP.SPEAnRUP0 = 1: initiates update of all RLE Engine 0 definition registers with the next VUPDATE0
  - SPEAnRUP.SPEAnRUP1 = 1: initiates update of all RLE Engine 1 definition registers with the next VUPDATE1
- D1M1A, D1M1-V2 only
  - SPEAnRjRUP.SPEAnRUP0 = 1: initiates update of all RLE Unit j, RLE Engine 0 definition registers with the next VUPDATE0
  - SPEAnRjRUP.SPEAnRUP1 = 1: initiates update of all RLE Unit j, RLE Engine 1 definition registers with the next VUPDATE1

CAUTION

All RLE definition buffer registers must not be modified while SPEAnRUPi = 1.

43.4 Sprite Units functional description

The Image Synthesizers for the layers 1 to 3 of the video channel's read accesses to the memory are performed via the XC2 cross-connect and the Sprite Units of the Sprite Engine.

The assignment of the video channel's Image Synthesizer layers to the three Sprite Units is determined by separate layers of the multi-layer cross-connect XC2, as shown in the figure below.

NOTE

Sharing of Sprite Units 0 and 2 by a video channel's layer 3 with the layer 1 of the other video channel achieves an optimum balance of the bandwidth to read from the memory, under the assumption that in most applications
– reading data for most upper layer 3 generates lowest memory bandwidth occupation
– reading data for lowest layer 1 generates highest memory bandwidth occupation.

An Image Synthesizer can use a layer, that can be populated with sprites, through access to a virtual frame buffer, the sprite virtual frame.
If an Image Synthesizer does not implement a sprite layer, it accesses the physical memory for reading frame buffer data directly.

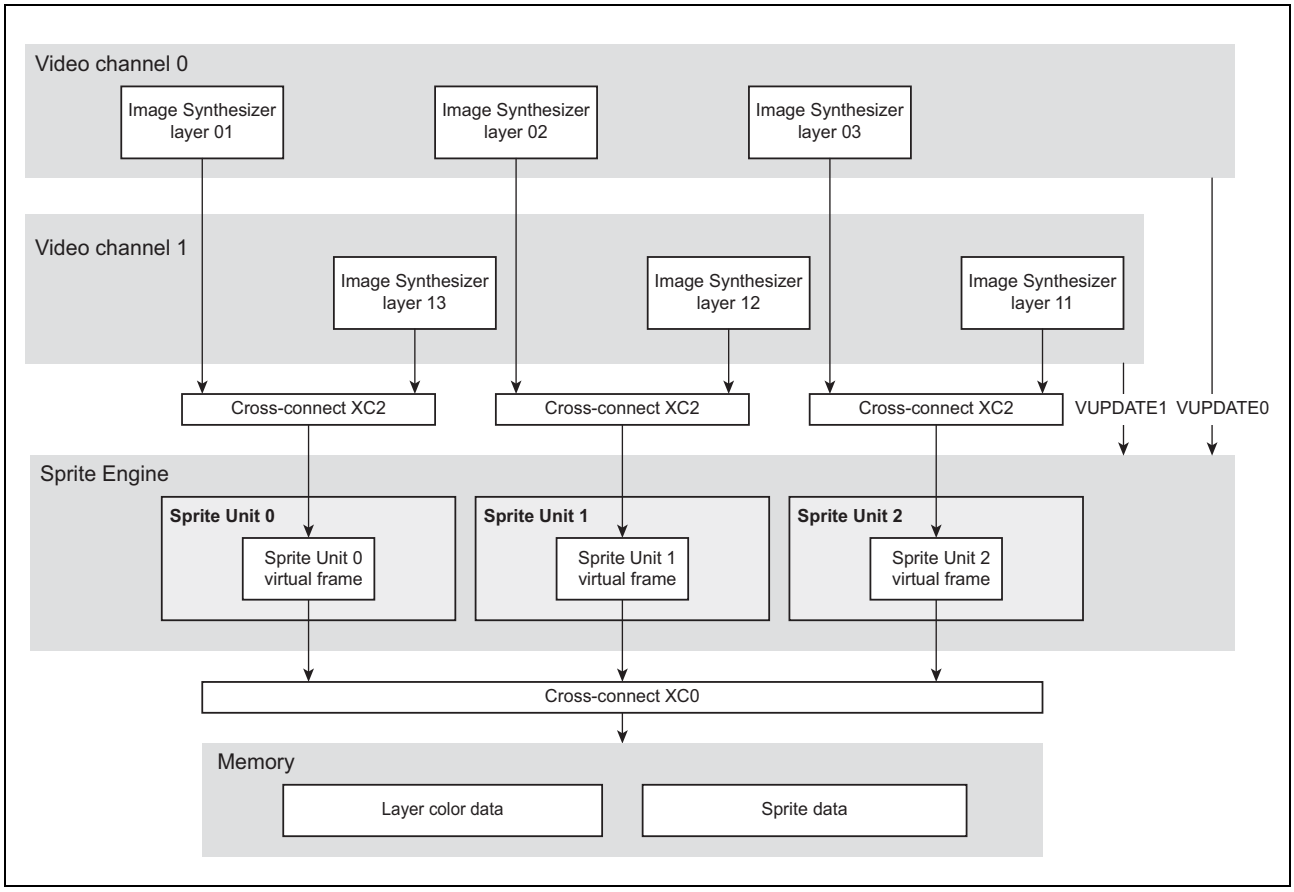

Figure 43.9 Sprite Units block diagram

NOTE

Refer to Section 43.5, RLE/Sprite Units (D1M1A, D1M1-V2 only) for details about the D1M1A, D1M1-V2 RLE configuration.

43.4.1 Sprite virtual frame

The size of the sprite virtual frame is fixed to 8192 x 8192 byte.
Its address is mapped outside of any physical address space, that is used to access the physical memory directly.

The address of the first pixel of the virtual frame is the virtual frame base address

Virtual frame base address = $3000\ 0000_H$

43.4.2 Sprite activation

Each sprite m of a Sprite Unit k can be enabled or disabled separately:

- Sprite enable/disable registers
  - SPEAnSkEN.SPEAnSkENm = 1 enables sprite k
  - SPEAnSkDS.SPEAnSkDSm = 1 disables sprite k

The enable/disable status of each sprite can be read via the SPEAnSkEN register.

43.4.3 Sprite definition

A sprite m of Sprite Unit k is defined by several register settings:

Sprite X/Y position

Sprite X/Y position register SPEAnSkPSm: X/Y position on the sprite virtual frame, with respect to its virtual frame base address.

(a) SPEAnSkPSm.SPEAnSkPSXm: X position

The X position is defined as multiple of 64 bit and thus depends on the sprite color format.
The corresponding pixel position depends on the color format and the amount of pixels fitting into 64 bits.

- 8 bpp color formats: 64 bit / 8 = 8 pixel units
  - possible X positions at a multiple of 8 = 0, 8, 16, 32, 64, ...
  - SPEAnSkPSX[9:0] = X position in pixel / 8
- 16 bpp color formats: 64 bit / 16 = 4 pixel units
  - possible X positions at a multiple of 4 = 0, 4, 8, 12, 16, ...
  - SPEAnSkPSX[9:0] = X position in pixel / 4
- 18/24/32 bpp color formats: 64 bit / 32 = 2 pixel units
  - possible X positions at a multiple of 2 = 0, 2, 4, 6, 8, ...
  - SPEAnSkPSX[9:0] = X position in pixel / 2

(b) SPEAnSkPSm.SPEAnSkPSYm: Y position

The Y position is defined in pixels.

Sprite width and height

Sprite size register SPEAnSkLYm: width SPEAnSkLYWm and height SPEAnSkLYHm

(a) SPEAnSkLYm.SPEAnSkLYWm: width

The width is defined as multiple of 64 bit and thus depends on the sprite color format.

- 8 bpp color formats: 64 bit / 8 = 8 pixel units
  - possible widths: multiple of 8 = 0, 8, 16, 32, 64, ...
  - SPEAnSkLYW[9:0] = width in pixel / 8
- 16 bpp color formats: 64 bit / 16 = 4 pixel units
  - possible widths: multiple of 4 = 0, 4, 8, 12, 16, ...
  - SPEAnSkLYW[9:0] = width in pixel / 4
- 18/24/32 bpp color formats: 64 bit / 32 = 2 pixel units
  - possible X widths: multiple of 2 = 0, 2, 4, 6, 8, ...
  - SPEAnSkLYW[9:0] = width in pixel / 2

(b) SPEAnSkLYm.SPEAnSkLYHm: height

The height is defined in pixels.

Destination address

Destination address register SPEAnSkDAm: address of 1st pixel color data of sprite m in the memory
The destination address must be aligned to 64 bit.

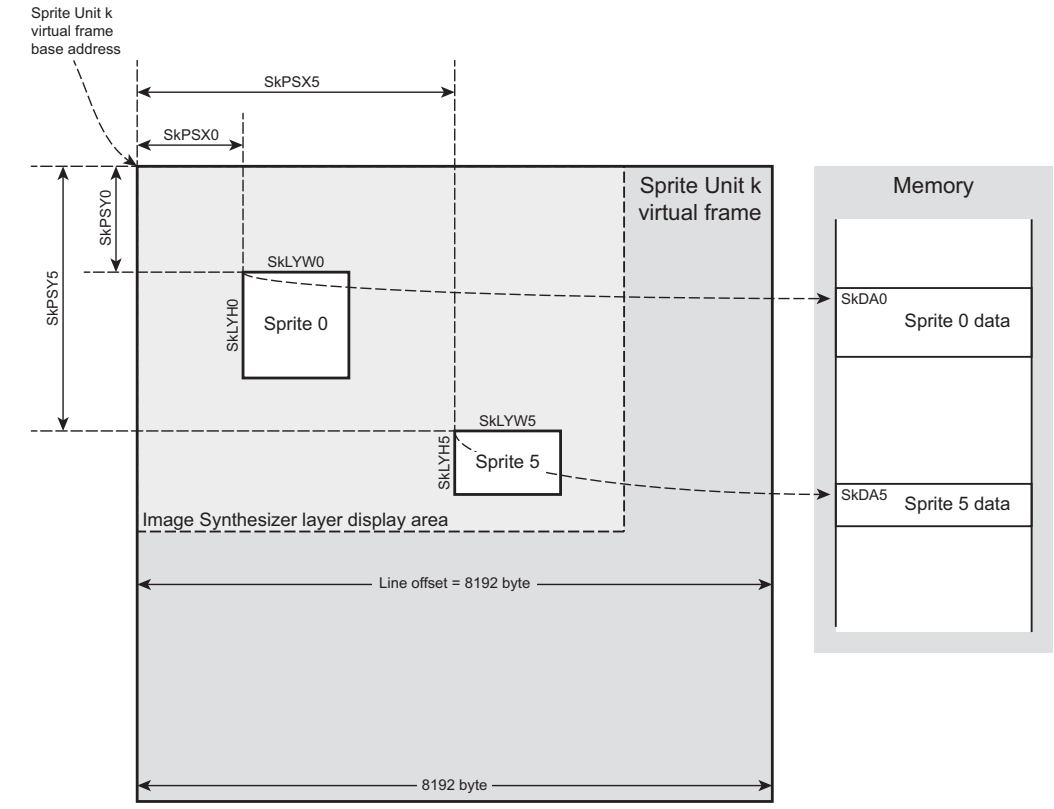
Image Synthesizer line offset

Since the Sprite Unit calculates the address of each new line with respect to the fixed virtual frame width of 8192 Byte, the Image Synthesizer must define the same line offset, when reading layer data via a Sprite Unit.

Note that the maximum number of pixels per line in the virtual frame depends on the color format:

- 18/24/32 bpp: max. 2048 pixels
- 16 bpp: max. 4096 pixels
- 8 bpp: max. 8192 pixels

The figure below shows an example with two enabled sprites.



Note: The register and bit names prefix *SPEAn* has been omitted in the above figure for the sake of clarity.

Figure 43.10 Sprite definitions

43.4.4 Sharing of sprites by two Image Synthesizers

A Sprite Unit can not be exclusively assigned to a certain Image Synthesizer.
It's activation is only determined by the read address from an Image Synthesizer, provided the Sprite Unit is activated by SPEAnSkEN.SPEAnSkENm = 1.

Thus basically both Image Synthesizers will receive the same pixel color data, when they issue the same read address.

If a sprite is used by two Image Synthesizers and the sprite definitions shall be modified while the Sprite Unit is in operation, attention must be paid to the sprite definition update process (see Section 43.4.7, Sprite definition registers modification for details).

43.4.5 Overlapping sprites

Sprites can be also placed overlapping.
In such case a fixed priority order rules which sprite data is forwarded to the Image Synthesizer:

- Sprite m = 0: highest priority
- ...
- Sprite m = 15: lowest priority

The color data of the sprite with the highest priority is forwarded to the Image Synthesizer.

43.4.6 Sprite layer areas without active sprites

Areas of the sprite layer without active sprites return color data with value 0. These data are processed as fully transparent color to the Image Synthesizer.

43.4.7 Sprite definition registers modification

The sprite definition registers are buffered.
While the sprite definition registers are in operation, the buffer registers can be modified without disturbing the video output.
In case the sprite definitions must be change, the buffer registers are written with new values and all new sprite definitions become active with the start of a new video output frame, i.e. with a VUPDATEn (n=0 or 1) signal, provided that update is enabled by SPEAnSkUP.SPEAnSkUPn = 1 (see below for details).

The buffered Sprite Unit k sprite m definition registers are:

- Sprite Unit k enable registers SPEAnSkEN
- Sprite Unit k disable registers SPEAnSkDS
- Destination address registers SPEAnSkDAm
- Width/height registers SPEAnSkLYm
- X/Y position registers SPEAnSkPSm

Each sprite m is assigned to the VUPDATE0 or VUPDATE1 update group via the SPEAnSkVDm register:

- SPEAnSkVDm = 0: Sprite Unit k sprite m definition registers updated with VUPDATE0
- SPEAnSkVDm = 1: Sprite Unit k sprite m definition registers updated with VUPDATE1

All sprite definitions of the VUPDATE0 or VUPDATE1 update group are updated simultaneously with the respective VUPDATE0 or VUPDATE1 signal.

When setup of new sprite definitions is completed, the update of all sprite definition registers of Sprite Unit k must be requested via the SPEAnSkUP register:

- SPEAnSkUP.SPEAnSkUP0 = 1: initiates update of all Sprite Unit k sprite definition registers of update group VUPDATE0 with the next VUPDATE0
- SPEAnSkUP.SPEAnSkUP1 = 1: initiates update of all Sprite Unit k sprite definition registers of update group VUPDATE1 with the next VUPDATE1

CAUTION

All sprite definition buffer registers must not be modified while SPEAnSkUP0 = 1 or SPEAnSkUP1 = 1.

43.5 RLE/Sprite Units (D1M1A, D1M1-V2 only)

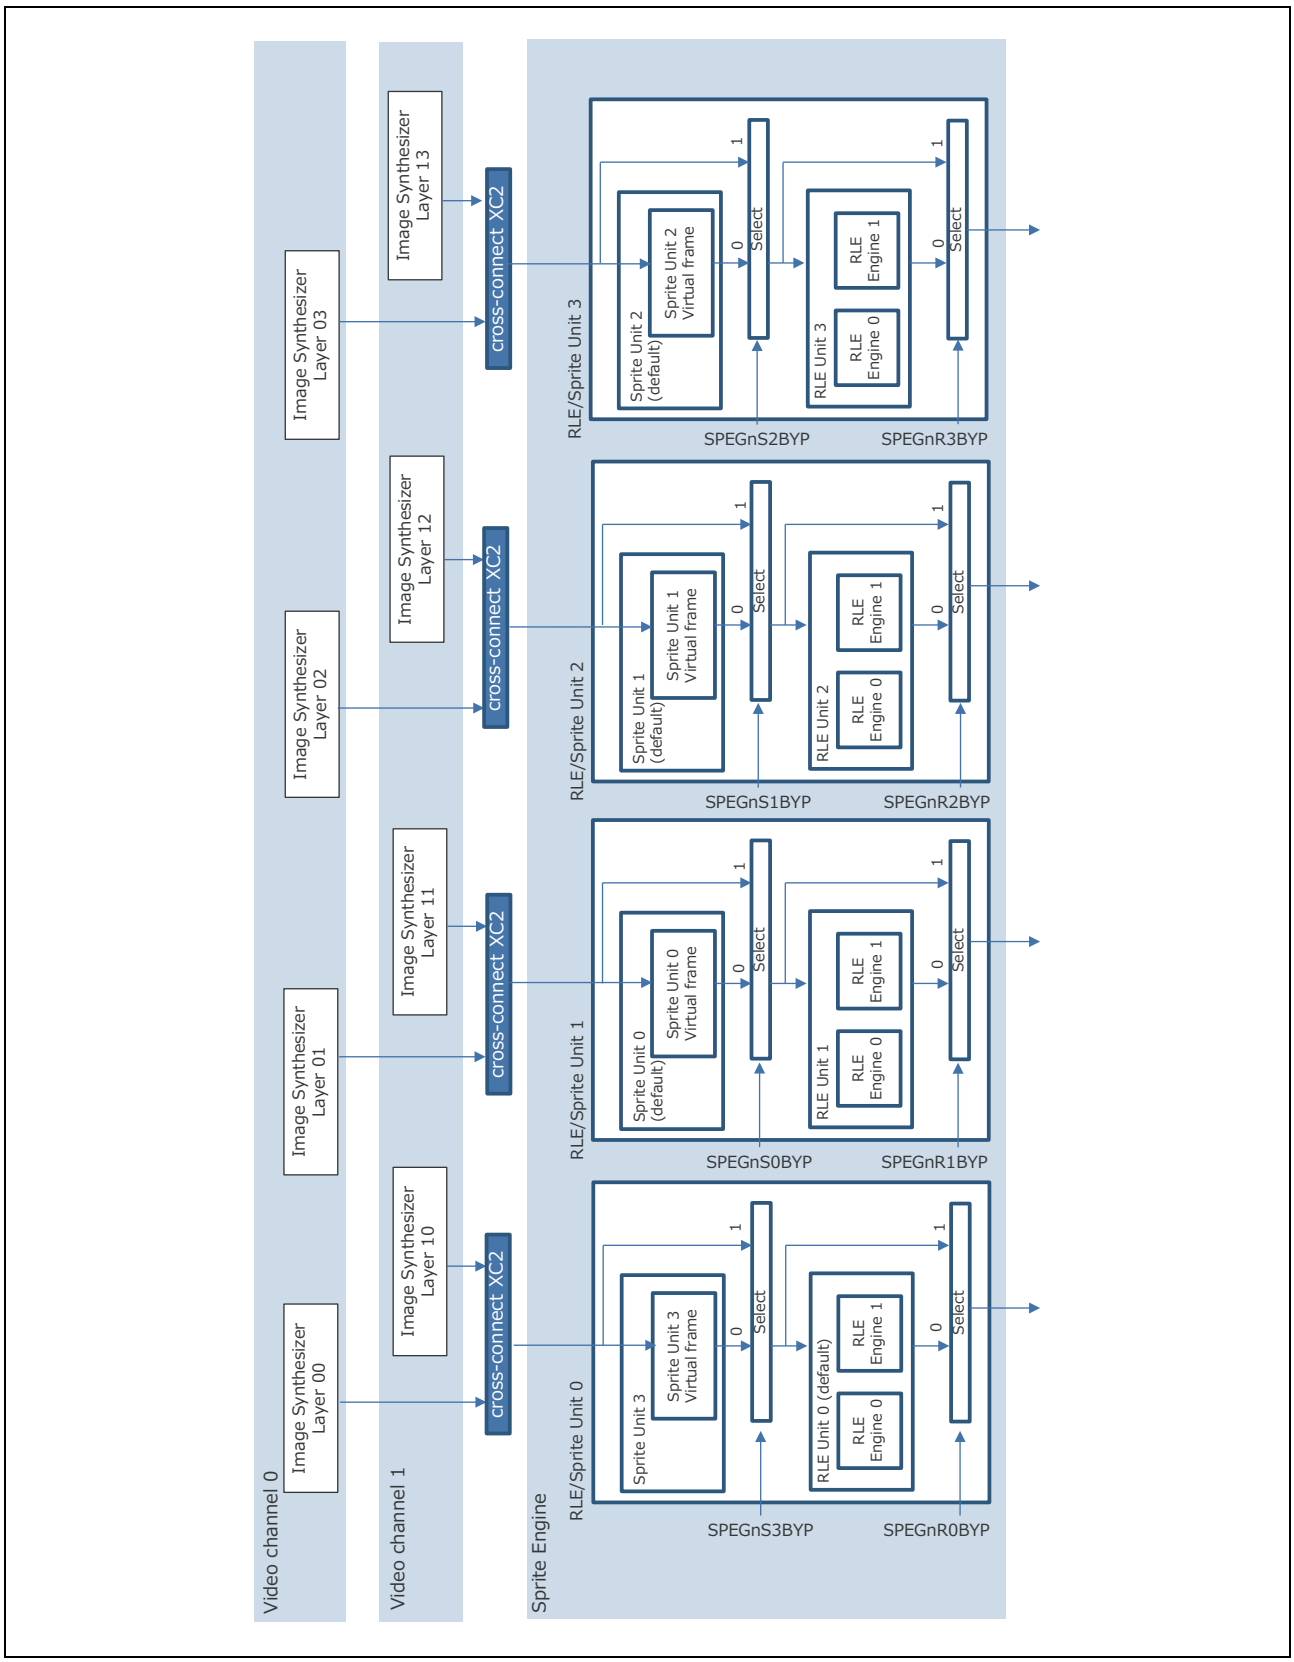


Figure 43.11 D1M1A, D1M1-V2 RLE/Sprite units block diagram

A RLE/Sprite Unit comprises both: an RLE unit and a Sprite Unit. The Usage as RLE or Sprite Unit is selectable. However, it is prohibit to select both units at the same .

SPEGnSmBYP, SPEGnRmBYP select to bypass them. In the initial setting, these register are set as shown in the table below.

Table 43.9 RLE/Sprite Unit initial setting

Unit	Initial register setting		Selected unit
RLE/Sprite Unit 0 (RLE Unit 0/Sprite Unit 3)	SPEGnS3BYP = 1	SPEGnR0BYP = 0	RLE Unit 0
RLE/Sprite Unit 1 (RLE Unit 1/Sprite Unit 0	SPEGnS0BYP = 0	SPEGnR1BYP = 1	Sprite Unit 0
RLE/Sprite Unit 2 (RLE Unit 2/Sprite Unit 1)	SPEGnS1BYP = 0	SPEGnR2BYP = 1	Sprite Unit 1
RLE/Sprite Unit 3 (RLE Unit 3/Sprite Unit 2)	SPEGnS2BYP = 0	SPEGnR3BYP = 1	Sprite Unit 2

NOTES

1. The setting {SPEGnS3BYP, SPEGnR0BYP} = {0,0} is prohibit.
   The setting {SPEGnS0BYP, SPEGnR1BYP} = {0,0} is prohibit.
   The setting {SPEGnS1BYP, SPEGnR2BYP} = {0,0} is prohibit.
   The setting {SPEGnS2BYP, SPEGnR3BYP} = {0,0} is prohibit.
2. When RLE unit is used, SPEAnRLSL.RBUSSEL must be set.

43.6 Sprite and RLE Units Registers

This section contains a description of all registers of the Sprite and RLE Units.

The Sprite and RLE Units are controlled and operated by the following registers:

Table 43.10 Sprite and RLE Units registers overview (all devices except D1M1A, D1M1-V2)

Register name	Shortcut	Address
RLE Units registers		
RLE enable control register	SPEAnRLSL	<SPEAn_base> + 10_H
RLE Engine i start address register	SPEAnSTAi	<SPEAn_base> + 20_H + i x 10_H
RLE Engine i physical address register	SPEAnPHAi	<SPEAn_base> + 24_H + i x 10_H
RLE Engine i read master ID register	SPEAnVDCi	<SPEAn_base> + 28_H + i x 10_H
RLE Engine i color mode register	SPEAnRCMi	<SPEAn_base> + $2C_H$ + i x 10_H
RLE register update request register	SPEAnRUP	<SPEAn_base> + 40_H
RLE configuration register	SPEAnRCFG	<SPEAn_base> + 48_H
Sprite Unit k registers		
Sprite Unit k enable register	SPEAnSkEN	<SPEAn_base> + 100_H + k x 10_H
Sprite Unit k disable register	SPEAnSkDS	<SPEAn_base> + 104_H + k x 10_H
Sprite Unit k update request register	SPEAnSkUP	<SPEAn_base> + 108_H + k x 10_H
Sprite Unit k sprite m destination address register	SPEAnSkDAm	<SPEAn_base> + 400_H + k x 400_H + m x 20_H
Sprite Unit k sprite m VUPDATEn selection register	SPEAnSkVDm	<SPEAn_base> + 404_H + k x 400_H + m x 20_H
Sprite Unit k sprite m width/height register	SPEAnSkLYm	<SPEAn_base> + 408_H + k x 400_H + m x 20_H
Sprite Unit k sprite m X/Y position register	SPEAnSkPSm	<SPEAn_base> + $40C_H$ + k x 400_H + m x 20_H

Table 43.11 RLE/Sprite Units registers overview (D1M1A, D1M1-V2 only)

RLE units j	Register name	Shortcut	Address
j = 0	RLE enable control register	SPEAnRjRLSL	<SPEAn_base> + 10_H

<SPEAn_base>

The base addresses <SPEAn_base> of the SPEAn is defined in the first section of this chapter under the key word “Register addresses”.

43.6.1 RLE Units registers

43.6.1.1 SPEAnRLSL/SPEAnRjRLSL - RLE Units enable control register

The RLE Units can be enabled and disabled via this register.

Access: This register can be accessed in 32-bit units.

Address: SPEAnRLSL: <SPEAn_base> + 10_H
SPEAnRjRLSL (j = 0): <SPEAn_base> + 10_H
SPEAnRjRLSL (j = 1 to 3): <SPEAn_base> + 1010_H + ((j-1) x 100_H) + i x 10_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 43.12 SPEAnRLSL/SPEAnRjRLSL register contents

Bit position	Bit name	Function
31 to 1	Reserved	When read, the value after reset is returned. When written, write the value after reset.
0	SPEAn RBUSSEL	RLE Units enable control 0: RLE Units are disabled (direct layer access) 1: RLE Units are enabled (RLE layer access)

43.6.1.2 SPEAnSTAi/SPEAnRjSTAi - RLE Engine i start address register

This register defines the Image Synthesizer's read address of the 1st pixel to read from the RLE Engine i.

Access: This register can be accessed in 32-bit units.

Address: SPEAnSTAi: <SPEAn_base> + 20_H + i x 10_H
SPEAnRjSTAi (j = 0): <SPEAn_base> + 20_H + i x 10_H
SPEAnRjSTAi (j = 1 to 3): <SPEAn_base> + 1020_H + ((j-1) x 100_H) + i x 10_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPEAnRSTAi[31:16]

Table 43.13 SPEAnSTAi/SPEAnRjSTAi register contents

Bit position	Bit name	Function
31 to 9	SPEAn RSTAi[31:9]	RLE Engine i start address The address must be 128-byte aligned, so the lower 9 bits SPEAnSTAi[8:0] of the address are always 0 0000 0000_B.
8 to 0	Reserved	When read, the value after reset is returned. When written, write the value after reset.

43.6.1.3 SPEAnPHAi/SPEAnRjPHAi - RLE Engine i physical address register

This register defines the address of the RLE Engine i first data in the memory.

Access: This register can be accessed in 32-bit units.

Address: SPEAnPHAi: <SPEAn_base> + 24_H + i x 10_H
SPEAnRjPHAi (j = 0): <SPEAn_base> + 24_H + i x 10_H
SPEAnRjPHAi (j = 1 to 3): <SPEAn_base> + 1024_H + ((j-1) x 100_H) + i x 10_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 43.14 SPEAnPHAi/SPEAnRjPHAi register contents

Bit position	Bit name	Function
31 to 3	SPEAn RPHAi[31:3]	RLE Engine i data memory address The address must be 64-bit aligned, so the lower 3 bits SPEAnPHAi[2:0] of the address are always 000_B.
2 to 0	Reserved	When read, the value after reset is returned. When written, write the value after reset.

43.6.1.4 SPEAnVDCi/SPEAnRjVDCi - RLE Engine i read master ID register

This register selects the video channel to use RLE Engine i.

Access: This register can be accessed in 32-bit units.

Address: SPEAnVDCi: <SPEAn_base> + 28_H + i x 10_H
SPEAnRjVDCi (j = 0): <SPEAn_base> + 28_H + i x 10_H
SPEAnRjVDCi (j = 1 to 3): <SPEAn_base> + 1028_H + ((j-1) x 100_H) + i x 10_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 43.15 SPEAnVDCi/SPEAnRjVDCi register contents

Bit position	Bit name	Function
31 to 4	Reserved	When read, the value after reset is returned. When written, write the value after reset.
3 to 0	SPEAn RVDCi[3:0]	This register defines the valid bus master ID for RLE Engine i. Since both RLE Engines are fixed assigned to the background layers of the video channels, correct setting of SPEAnRVDCi[3:0] is different for both RLE Engines. In order to deactivate a certain RLE Engine SPEAnRVDCi[3:0] must be set to an invalid bus master ID. For details about bus master ID assignment refer to Table 43.16, Master ID assignment (except D1M1A, D1M1-V2) and Section Table 43.17, Master ID assignment (D1M1A, D1M1-V2 only).

CAUTION

SPEAnRVDC0[3:0] and SPEAnRVDC1[3:0] must not define the same master ID, when RLE is enabled.

Table 43.16 Master ID assignment (except D1M1A, D1M1-V2)

SPEAnRVDCi[3:0]	0	1	2	Others
RLE Engine 0	Image Synthesizer 00	Image Synthesizer 10	Invalid master ID*1	Invalid master ID*1
RLE Engine 1				

Note 1. If invalid bus master ID is set to SPEAnRVDCi[3:0], RLE Engine i becomes inactive.

Table 43.17 Master ID assignment (D1M1A, D1M1-V2 only)

SPEAnRVDCi[3:0]		0	1	2	Others
RLE unit 0	RLE Engine 0	Image Synthesizer 00	Image Synthesizer 10	Invalid master ID*1	Invalid master ID*1
	RLE Engine 1				
RLE unit 1	RLE Engine 0	Image Synthesizer 01	Image Synthesizer 13	Output Image Generator	Invalid master ID*1
	RLE Engine 1				
RLE unit 2	RLE Engine 0	Image Synthesizer 02	Image Synthesizer 12	Setting prohibited	Invalid master ID*1
	RLE Engine 1				
RLE unit 3	RLE Engine 0	Image Synthesizer 03	Image Synthesizer 11	Invalid master ID*1	Invalid master ID*1
	RLE Engine 1				

Note 1. If invalid bus master ID is set to SPEAnRVDCi[3:0], RLE Engine i becomes inactive.

43.6.1.5 SPEAnRCMi/SPEAnRjRCMi - RLE Engine i color mode selection register

This register selects the color format of data in memory for RLE Engine i.

Access: This register can be accessed in 32-bit units.

Address: SPEAnRCMi: <SPEAn_base> + $2C_H$ + i x 10_H
SPEAnRjRCMi (j = 0): <SPEAn_base> + $2C_H$ + i x 10_H
SPEAnRjRCMi (j = 1 to 3): <SPEAn_base> + $102C_H$ + ((j-1) x 100_H) + i x 10_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 43.18 SPEAnRCMi/SPEAnRjRCMi register contents

Bit position	Bit name	Function
31 to 2	Reserved	When read, the value after reset is returned. When written, write the value after reset.
1 to 0	SPEAn RCMi[1:0]	RLE Engine i color mode selection 00_B: 8 bpp 01_B: 18 bpp 10_B: 24 bpp 11_B: setting prohibited

43.6.1.6 SPEAnRUP/SPEAnRjRUP - RLE registers update request register

This register controls the update of the RLE Engine's registers.

Access: This register can be accessed in 32-bit units.

Address: SPEAnRUP: <SPEAn_base> + 40_H
SPEAnRjRUPi (j = 0): <SPEAn_base> + 40_H
SPEAnRjRUPi (j = 1 to 3): <SPEAn_base> + 1040_H + ((j-1) x 100_H)

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 43.19 SPEAnRUP/SPEAnRjRUP register contents

Bit position	Bit name	Function
31 to 2	Reserved	When read, the value after reset is returned. When written, write the value after reset.
1	SPEAn RUP1	RLE Engine 1 register update request 0: no function 1: update RLE Engine 1 register with the next VUPDATE1
0	SPEAn RUP0	RLE Engine 0 register update request 0: no function 1: update RLE Engine 0 register with the next VUPDATE0

NOTES

1. The update request bit SPEAnRUPi remains set, after it has been set to 1, until the update is completed. Afterwards it returns to 0 automatically.
2. All RLE definition buffer registers must not be modified while SPEAnRUPi = 1. Refer to Section 43.3.5, RLE definition registers modification for details.

43.6.1.7 SPEAnRjRBYP - RLE unit bypass mode register (D1M1A, D1M1-V2 only)

This register controls the bypass of the RLE unit j.

Access: This register can be accessed in 32-bit units.

Address: SPEAnRjRBYP (j = 0): <SPEAn_base> + 44_H
SPEAnRjRBYP (j = 1 to 3): <SPEAn_base> + 1044_H + ((j-1) x 100_H)

Initial value: for j = 0: $0000\ 0000_H$
for j = 1 to 3: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPEAnRjRBPROT[15:0]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Note 1. 0 for j = 0, 1 for j = 1 to 3

Table 43.20 SPEAnRjRBYP register contents

Bit position	Bit name	Function
31 to 16	SPEAnRjRB PROT[15:0]	Write protection 5963_H: Write to SPEAnRjRBYP bit is allowed. Others: Write to SPEAnRjRBYP bit is ignored. During write to the SPEAnRjRBYP bit, 5963_H must be written these bits. Reading these bits returns is always 0000_H.
15 to 1	Reserved	When read, the value after reset is returned. When written, write the value after reset.
0	SPEAn RjRBYP	Bypass mode selection 0: RLE unit j is available 1: RLE unit j is bypassed

NOTE

This register must not be changed while VDCE and VOWE accesses are ongoing.

43.6.1.8 SPEAnRCFG/SPEAnRjRCFG - RLE prefetch configuration register

This register controls the size and timing for the RLE data stream prefetching.

Access: This register can be accessed in 32-bit units.

Address: SPEAnRCFG: <SPEAn_base> + 48_H
SPEAnRjRCFG (j = 0): <SPEAn_base> + 48_H
SPEAnRjRCFG (j = 1 to 3): <SPEAn_base> + 1048_H + ((j-1) x 100_H)

Initial value: 0000 0044_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	0	0	SPEAnRLEN[2:0]			0	SPEAnRDTH[2:0]		
Initial value	0	0	0	0	0	0	0	0	0	1	0	0	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Table 43.21 SPEAnRCFG register contents

Bit position	Bit name	Function
31 to 7	Reserved	When read, the value after reset is returned. When written, write the value after reset.
6 to 4	SPEAn RLEN[2:0]	Burst size of the RLE Engine next data prefetching. RLE Engine prefetches next data every burst length x 64 bit. 0: Burst length = 1 1: Burst length = 2 2: Burst length = 4 3: Burst length = 6 4: Burst length = 8 (default) 5: Burst length = 10 6: Burst length = 12 7: Burst length = 14
3	Reserved	When read, the value after reset is returned. When written, write the value after reset.
2 to 0	SPEAn RDTH[2:0]	Prefetch timing. RLE Engine prefetches next data when remaining amount of the data in the RLE FIFO is less than threshold x 64 bit. 0: setting prohibited 1: threshold = 2 2: threshold = 4 3: threshold = 6 4: threshold = 8 (default) 5: threshold = 10 6: threshold = 12 7: threshold = 14

NOTE

The burst size SPEAnRLEN[2:0] and the prefetch timing SPEAnRDTH[2:0] must be set to values, that prevent the RLE data FIFO from overflow.
The RLE data FIFO size is 1024 bit.

43.6.2 Sprite Units registers

43.6.2.1 SPEAnSkEN - Sprite Unit k enable register

Each sprite of Sprite Unit k can be enabled by this register.
The enabled/disabled status of the sprites on Sprite Unit k can be checked by reading this register.

Disabling a sprite is done via the Sprite Unit k disable register SPEAnSkDS.

Access: This register can be accessed in 32-bit units.

Address: <SPEAn_base> + 100_H + k x 10_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 43.22 SPEAnSkEN register contents

Bit position	Bit name	Function
31 to 16	Reserved	When read, the value after reset is returned. When written, write the value after reset.
15 to 0	SPEAn SkENm	Register write: Sprite m enable 0: at write: no function 1: at write: enable sprite m Register read: Sprite m status 0: at read: sprite m is disabled 1: at read: sprite m is enabled

43.6.2.2 SPEAnSkDS - Sprite Unit k disable register

Each sprite of Sprite Unit k can be disabled by this register.

Enabling a sprite is done via the Sprite Unit k enable register SPEAnSkEN.

Access: This register can be accessed in 32-bit units.

Address: <SPEAn_base> + 104_H + k x 10_H

Initial value: Reading this register returns an undefined value.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 43.23 SPEAnSkDS register contents

Bit position	Bit name	Function
31 to 16	Reserved	When read, the value after reset is returned. When written, write the value after reset.
15 to 0	SPEAn SkDSm	Sprite m disable 0: no function 1: disable sprite m Note that reading of this register returns an undefined value. The enable/disable status of each sprite can be evaluated by reading the Sprite Unit k enable register SPEAnSkEN.

43.6.2.3 SPEAnSkUP - Sprite Unit k update request register

This register controls the update of the Sprite Unit k registers.

Access: This register can be accessed in 32-bit units.

Address: <SPEAn_base> + 108_H + k x 10_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 43.24 SPEAnSkUP register contents

Bit position	Bit name	Function
31 to 2	Reserved	When read, the value after reset is returned. When written, write the value after reset.
1	SPEAn SkUP1	Update request of all sprite definition registers of Sprite Unit k, which are assigned to VUPDATE1 0: no function 1: update VUPDATE1 assigned registers with next VUPDATE1
0	SPEAn SkUP0	Update request of all sprite definition registers of Sprite Unit k, which are assigned to VUPDATE0 0: no function 1: update VUPDATE0 assigned registers with next VUPDATE0

NOTES

1. The update request bit SPEAnSkUP0/SPEAnSkUP1 remains set, after it has been set to 1, until the update is completed. Afterwards it returns to 0 automatically.
2. All sprite definition buffer registers must not be modified while SPEAnSkUP0 = 1 or SPEAnSkUP1 = 1.
   Refer to Section 43.4.7, Sprite definition registers modification for details.
3. The sprite definition registers are assigned to VUPDATE0 or VUPDATE1 by the SPEAnSkVDm register.

43.6.2.4 SPEAnSkBYP - Sprite unit bypass mode register (D1M1A, D1M1-V2 only)

This register controls the bypass of the Sprite unit k.

Access: This register can be accessed in 32-bit units.

Address: <SPEAn_base> + $10C_H$ + k x 10_H

Initial value: for k = 0 to 2: $0000\ 0000_H$
for k = 3: $0000\ 0001_H$

Note 1. 0 for k = 0 to 2; 1 for k = 3

Table 43.25 SPEAnSkBYP register contents

Bit position	Bit name	Function
31 to 16	SPEAnSkB PROT[15:0]	Write protection 5963_H: Write to SPEAnRjBYP bit is allowed. Others: Write to SPEAnRjBYP bit is ignored. During write to the SPEAnRjBYP bit, 5963_H must be written these bits. Reading these bits returns is always 0000_H.
15 to 1	Reserved	When read, the value after reset is returned. When written, write the value after reset.
0	SPEAn SkBYP	Bypass mode selection 0: Sprite unit k is available 1: Sprite unit k is bypassed

NOTE

This register must not be changed while VDCE and VOWE accesses are ongoing.

43.6.2.5 SPEAnSkDAm - Sprite Unit k sprite m destination address register

This register defines the address of the 1st pixel's color data in the memory of the sprite m of the Sprite Unit k.

Access: This register can be accessed in 32-bit units.

Address: SPEAnSkDAm (k = 0 to 2): <SPEAn_base> + 400_H + k x 400_H + m x 20_H
SPEAnSkDAm (k = 3): <SPEAn_base> + 1400_H + m x 20_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 43.26 SPEAnSkDAm register contents

Bit position	Bit name	Function
31 to 3	SPEAn SkDAm[31:3]	Sprite Unit k sprite m color data address The address must be 64-bit aligned, so the lower 3 bits SPEAnSkDAm[2:0] of the address are always 000_B.
2 to 0	Reserved	When read, the value after reset is returned. When written, write the value after reset.

43.6.2.6 SPEAnSkVDm - Sprite Unit k sprite m VUPDATEn selection register

This register selects the VUPDATE signal for updating the Sprite Unit k sprite m definition registers.

Access: This register can be accessed in 32-bit units.

Address: SPEAnSkVDm (k = 0 to 2): <SPEAn_base> + 404_H + k x 400_H + m x 20_H
SPEAnSkVDm (k = 3): <SPEAn_base> + 1404_H + m x 20_H

Initial value: $0000\ 0000_H$

31 to 1	Reserved	When read, the value after reset is returned. When written, write the value after reset.
0	SPEAn SkVDm	VUPDATEn selection for Sprite Unit k sprite m definition registers update 0: VUPDATE0 updates registers 1: VUPDATE1 updates registers

43.6.2.7 SPEAnSkLYm - Sprite Unit k sprite m width/height register

This register defines the width and height of the Sprite Unit k sprite m.

Access: This register can be accessed in 32-bit units.

Address: SPEAnSkLYm (k = 0 to 2): <SPEAn_base> + 408_H + k x 400_H + m x 20_H
SPEAnSkLYm (k = 3): <SPEAn_base> + 1408_H + m x 20_H

Initial value: $0000\ 0000_H$

Table 43.28 SPEAnSkLYm register contents

Bit position	Bit name	Function
31 to 27	Reserved	When read, the value after reset is returned. When written, write the value after reset.
26 to 17	SPEAn SkLYWm[9:0]	Sprite Unit k sprite m width The width is defined as multiple of 64 bit and thus depends on the sprite pixel color format. • 8 bpp color formats: 64 bit / 8 = 8 pixel units – possible widths: multiple of 8 = 0, 8, 16, 32, 64, ... – SPEAnSkLYW[9:0] = width in pixel / 8 • 18/24/32 bpp color formats: 64 bit / 32 = 2 pixel units – possible X widths: multiple of 2 = 0, 2, 4, 6, 8, ... – SPEAnSkLYW[9:0] = width in pixel / 2
16	Bit16	This bit must always be written with 0.
15 to 11	Reserved	When read, the value after reset is returned. When written, write the value after reset.
10 to 0	SPEAn SkLYHm[10:0]	Sprite Unit k sprite m layer height in pixels

43.6.2.8 SPEAnSkPSm - Sprite Unit k sprite m X/Y position register

This register defines the position of the Sprite Unit k sprite m.

Access: This register can be accessed in 32-bit units.

Address: SPEAnSkPSm (k = 0 to 2): <SPEAn_base> + $40C_H$ + k x 400_H + m x 20_H
SPEAnSkPSm (k = 3): <SPEAn_base> + $140C_H$ + m x 20_H

Initial value: 0000 0000_H

Table 43.29 SPEAnSkPSm register contents

Bit position	Bit name	Function
31 to 27	Reserved	When read, the value after reset is returned. When written, write the value after reset.
26 to 17	SPEAn SkPSXm[9:0]	Sprite Unit k sprite m X position The X position is defined as multiple of 64 bit and thus depends on the sprite color format. • 8 bpp color formats: 64 bit / 8 = 8 pixel units – possible X positions at a multiple of 8 = 0, 8, 16, 32, 64 – SPEAnSkPSX[9:0] = X position in pixel / 8 • 18/24/32 bpp color formats: 64 bit / 32 = 2 pixel units – possible X positions at a multiple of 2 = 0, 2, 4, 6, 8 – SPEAnSkPSX[9:0] = X position in pixel / 2
16	Bit16	This bit must always be written with 0.
15 to 13	Reserved	When read, the value after reset is returned. When written, write the value after reset.
12 to 0	SPEAn SkPSYm[12:0]	Sprite Unit k sprite m Y position in pixels

Section 44 JPEG Codec Unit A (JCUA)

This section contains a generic description of the JPEG Codec Unit A.

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.
The subsequent sections describe the features that apply to all implementations.

44.1 Overview of the RH850/D1L/D1M JPEG Codec Unit A

44.1.1 Units

This microcontroller has the following number of units of the JPEG Codec Units A.

Table 44.1 Units

JPEG Codec Unit A	D1L1	D1L2(H)	D1M1(H) D1M1-V2 D1M1A	D1M2(H)
Units	0	0	1	1
Names	–	–	JCUA0	JCUA0

Unit index n

Throughout this section, the individual units of the JPEG Codec Units A are identified by the index “n” (n = 0), for example JCUAnJCMOD for the JCUAn mode register.

44.1.2 Register addresses

All JPEG Codec Units A register addresses are given as address offsets from the individual base addresses <JCUAn_base>.
The <JCUAn_base> addresses of each JCUAn are listed in the following table:

Table 44.2 Register base addresses <JCUAn_base>

JCUAn unit	<JCUAn_base> address
JCUA0	F200 $C000_H$

44.1.3 Clock supply

All JPEG Codec Units A provide one clock input.

Table 44.3 Clock supply

JCUAn unit	JCUAn clock	Connected to
JCUA0	Cross-connect clock XCCLK	Clock Controller C_ISO_XCCLK
	Register access clock PCLK	Clock Controller C_ISO_XCCLK/2

44.1.4 Interrupts

The JPEG Codec Units A can generate the following interrupt requests:

Table 44.4 JCUAn interrupt requests

JCUA0 signals	Function	Connected to
JEDI	Compression/decompression process interrupt request	Interrupt Controller INTJCUA0EDI
JDTI	Data transfer interrupt request	Interrupt Controller INTJCUA0DTI

44.1.5 Reset sources

The JPEG Codec Unit As and their registers are initialized by the following reset signal:

Table 44.5 Reset sources

JCUAn unit	Reset signal
JCUA0	• Reset Controller SYSRES • Reset Controller JCUA0RES • reset upon wake-up from DEEPSTOP mode

44.1.6 Bus master ID

The JPEG Codec Unit bus master interface is connected to the cross-connect system. The master interface has the following master ID:

JCUA: MSTID5

44.2 Features

The JPEG codec unit (JCUA) incorporates a JPEG codec conforming to the JPEG baseline compression and decompression standard to provide high-speed compression of image data and high-speed decoding of JPEG data.

The JPEG codec unit has the following features:

- Conforms to the JPEG baseline standard within the range described in this document.
  This module does not support the following basic features:
  Scanning with two elements
  Non-interleave scanning with multiple elements
- Operational precision: Conforming to JPEG Part 2, ISO-IEC10918-2
- Image input/output system: Block interleave method
- Pixel format:
  - Compression: YCbCr422 (H = 2:1:1, V = 1:1:1)
  - Decompression: YCbCr444 (H = 1:1:1, V = 1:1:1), YCbCr422 (H = 2:1:1, V = 1:1:1), YCbCr411 (H = 4:1:1, V = 1:1:1), YCbCr420 (H = 2:1:1, V = 2:1:1)
  - Output pixel format to the buffer: YCbCr422, ARGB8888, RGB565
- Four quantization tables provided
- Four Huffman tables provided (two tables for AC coefficients and two tables for DC coefficients)
- Markers supported: SOI (start of image), SOF0 (start of frame type 0), SOS (start of scan), DQT (define quantization tables), DHT (define Huffman tables), DRI (define restart interval), RSTm (restart marks), and EOI (end of image)
- The buffer size can be reduced by using the mode in which data transfer is temporarily stopped each time the specified number of lines or the specified amount of data is transferred during image data or coded data input/output.
- Processing unit: 8-byte address boundary units can be set
- Image sizes that can be processed: Sizes divisible by the minimum coded unit (MCU): 8 lines by 8 pixels in YCbCr444; 8 lines by 16 pixels in YCbCr422; 8 lines by 32 pixels in YCbCr411; 16 lines by 16 pixels in YCbCr420

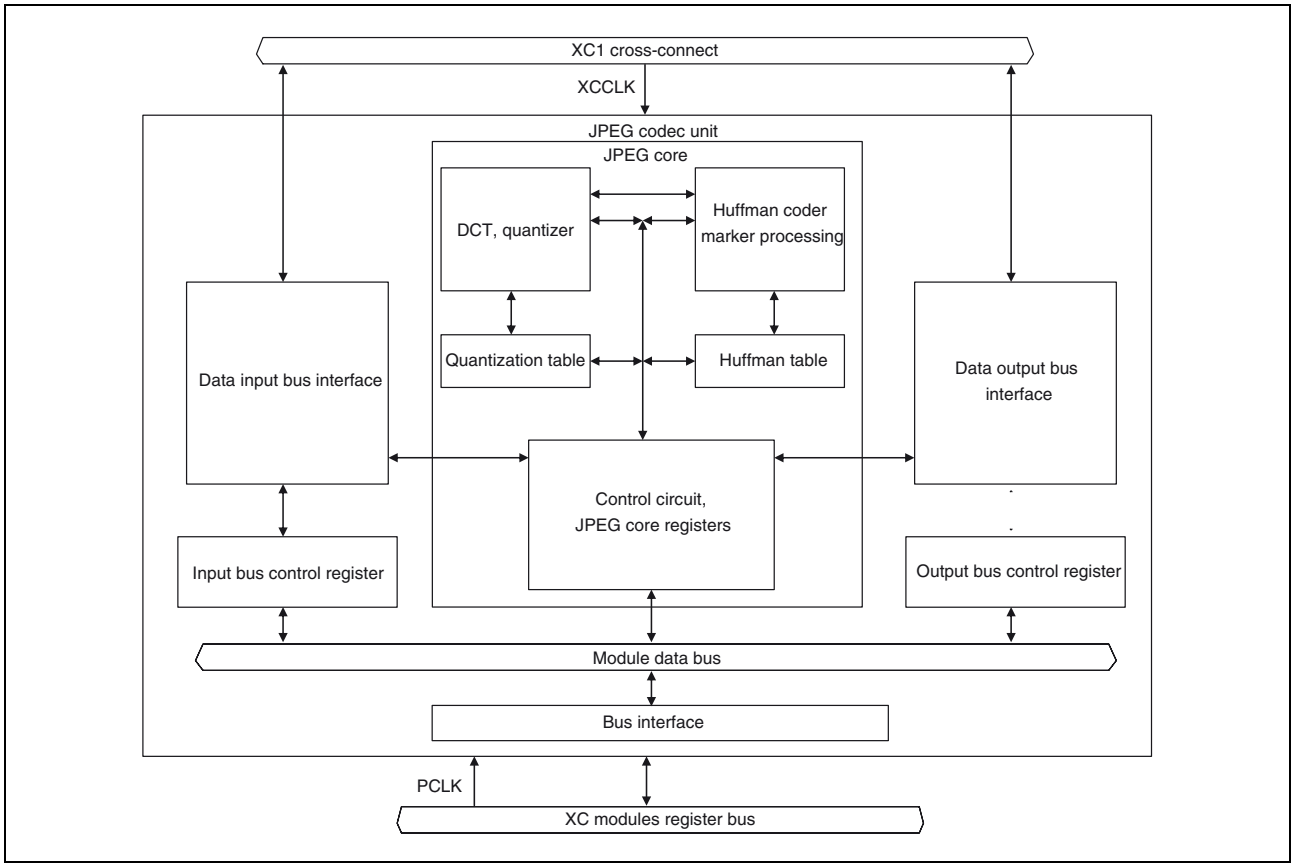

Figure 44.1 Block Diagram

44.3 Register Descriptions

The following table shows the JCUA registers.

Table 44.6 Register Configuration (1/2)

Module Name	Register Name	Symbol	R/W	Address	Access Size
JCUAn	JPEG code mode register	JCMOD	R/W	<JCUAn_base> + 000_H	8
JCUAn	JPEG code command register	JCCMD	R/W	<JCUAn_base> + 001_H	8
JCUAn	JPEG code quantization table number register	JCQTN	R/W	<JCUAn_base> + 003_H	8
JCUAn	JPEG code Huffman table number register	JCHTN	R/W	<JCUAn_base> + 004_H	8
JCUAn	JPEG code DRI upper register	JCDRIU	R/W	<JCUAn_base> + 005_H	8
JCUAn	JPEG code DRI lower register	JCDRID	R/W	<JCUAn_base> + 006_H	8
JCUAn	JPEG code vertical size upper register	JCVSZU	R/W	<JCUAn_base> + 007_H	8
JCUAn	JPEG code vertical size lower register	JCVSZD	R/W	<JCUAn_base> + 008_H	8
JCUAn	JPEG code horizontal size upper register	JCHSZU	R/W	<JCUAn_base> + 009_H	8
JCUAn	JPEG code horizontal size lower register	JCHSZD	R/W	<JCUAn_base> + $00A_H$	8
JCUAn	JPEG code data count upper register	JCDTCU	R	<JCUAn_base> + $00B_H$	8
JCUAn	JPEG code data count middle register	JCDTCM	R	<JCUAn_base> + $00C_H$	8
JCUAn	JPEG code data count lower register	JCDTCD	R	<JCUAn_base> + $00D_H$	8
JCUAn	JPEG interrupt enable register 0	JINTE0	R/W	<JCUAn_base> + $00E_H$	8
JCUAn	JPEG interrupt status register 0	JINTS0	R/W	<JCUAn_base> + $00F_H$	8
JCUAn	JPEG code decode error register	JCDERR	R/W	<JCUAn_base> + 010_H	8
JCUAn	JPEG code reset register	JCRST	R	<JCUAn_base> + 011_H	8
JCUAn	JPEG interface compression control register	JIFECNT	R/W	<JCUAn_base> + 040_H	32
JCUAn	JPEG interface compression source address register	JIFESA	R/W	<JCUAn_base> + 044_H	32
JCUAn	JPEG interface compression line offset register	JIFESOFST	R/W	<JCUAn_base> + 048_H	32
JCUAn	JPEG interface compression destination address register	JIFEDA	R/W	<JCUAn_base> + $04C_H$	32
JCUAn	JPEG interface compression source line count register	JIFESLC	R/W	<JCUAn_base> + 050_H	32
JCUAn	JPEG interface compression destination count register	JIFEDDC	R/W	<JCUAn_base> + 054_H	32
JCUAn	JPEG interface decompression control register	JIFDCNT	R/W	<JCUAn_base> + 058_H	32
JCUAn	JPEG interface decompression source address register	JIFDSA	R/W	<JCUAn_base> + $05C_H$	32
JCUAn	JPEG interface decompression line offset register	JIFDDOFST	R/W	<JCUAn_base> + 060_H	32
JCUAn	JPEG interface decompression destination address register	JIFDDA	R/W	<JCUAn_base> + 064_H	32
JCUAn	JPEG interface decompression source data count register	JIFDSDC	R/W	<JCUAn_base> + 068_H	32
JCUAn	JPEG interface decompression destination line count register	JIFDDLC	R/W	<JCUAn_base> + $06C_H$	32
JCUAn	JPEG interface decompression α set register	JIFDADT	R/W	<JCUAn_base> + 070_H	32
JCUAn	JPEG interrupt enable register 1	JINTE1	R/W	<JCUAn_base> + $08C_H$	32
JCUAn	JPEG interrupt status register 1	JINTS1	R/W	<JCUAn_base> + 090_H	32

Table 44.6 Register Configuration (2/2)

Module Name	Register Name	Symbol	R/W	Address	Access Size
JCUAn	JPEG input image data CbCr range setting register	JIFESVSZ	R/W	<JCUAn_base> + 094_H	32
JCUAn	JPEG output image data CbCr range setting register	JIFESHSZ	R/W	<JCUAn_base> + 098_H	32
JCUAn	JPEG code quantization table 0 register	JCQTBL0	R/W	<JCUAn_base> + 100_H to <JCUAn_base> + $13F_H$	8
JCUAn	JPEG code quantization table 1 register	JCQTBL1	R/W	<JCUAn_base> + 140_H to <JCUAn_base> + $17F_H$	8
JCUAn	JPEG code quantization table 2 register	JCQTBL2	R/W	<JCUAn_base> + 180_H to <JCUAn_base> + $1BF_H$	8
JCUAn	JPEG code quantization table 3 register	JCQTBL3	R/W	<JCUAn_base> + $1C0_H$ to <JCUAn_base> + $1FF_H$	8
JCUAn	JPEG code Huffman table DC0 register	JCHTBD0	W	<JCUAn_base> + 200_H to <JCUAn_base> + $21B_H$	8
JCUAn	JPEG code Huffman table AC0 register	JCHTBA0	W	<JCUAn_base> + 220_H to <JCUAn_base> + $2D1_H$	8
JCUAn	JPEG code Huffman table DC1 register	JCHTBD1	W	<JCUAn_base> + 300_H to <JCUAn_base> + $31B_H$	8
JCUAn	JPEG code Huffman table AC1 register	JCHTBA1	W	<JCUAn_base> + 320_H to <JCUAn_base> + $3D1_H$	8
SELB	JPEG Codec Unit A Software reset register	JCSWRST	R/W	FFC0 6010_H	32

NOTES

1. Register access sizes other than defined in the table above are not supported.
2. For the settings of the JPEG code quantization table and JPEG code Huffman table, see Section 44.4.1.4, Table Setting.

NOTE

In the header files the names of the above registers are defined in the following format:

<ModuleName> + <Symbol>.

<ModuleName> and <Symbol> are defined in the above table.

44.3.1 JPEG Code Mode Register (JCMOD)

JCMOD sets the operating mode before the JCUA starts operation.

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 00_H

	7	6	5	4	3	2	1	0
	–	–	–	–	DSP	REDU[2:0]		
Compress	R	R	R	R	R/W	R/W	R/W	R/W
Decompress	R	R	R	R	R/W	R	R	R

Table 44.7 JCMOD register contents

Bit position	Bit name	Function
7 to 4	Reserved	When read, the value after reset is returned. When written, write the value after reset.
3	DSP	Compression/Decompression Set 0: Compression process 1: Decompression process Note: When changing between processing for compression and for decompression, be sure to reset this module in advance by setting the JCUA0RES bit in the JCSWRST.
2 to 0	REDU[2:0]	Pixel Format [Compression] 001: YCbCr422 Other than above: Setting prohibited. [Decompression] 000: YCbCr444 001: YCbCr422 010: YCbCr420 110: YCbCr411 Other than above: Error (JCUA cannot process normally.)

44.3.2 JPEG Code Command Register (JCCMD)

JCCMD sets commands. Bits of this register need not be cleared to 0 after setting a command. Multiple commands must not be set simultaneously.

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 00_H

	7	6	5	4	3	2	1	0
	–	–	–	–	–	JEND	JRST	JSRT
Compress	R	R	R	R	R	R*1/W	undefined	R*1/W
Decompress	R	R	R	R	R	R*1/W	R*1/W	R*1/W

Note 1. Values read from these bits are undefined.

Table 44.8 JCCMD register contents

Bit position	Bit name	Function
7 to 3	Reserved	When read, the value after reset is returned. When written, write the value after reset.
2	JEND	Interrupt Request Clear Command This bit is valid only for the interrupt sources corresponding to bits INS6, INS5, and INS3 in JINTS0. To clear an interrupt request, set this bit to 1.
1	JRST	JPEG Core Process Stop Clear Command To clear the process-stopped state caused by requests to read the image size and pixel format (enabled by the INT3 bit in JINTE0), set this bit to 1.
0	JSRT	JPEG Core Process Start Command To start JPEG core processing, set this bit to 1. Do not write this bit to 1 again while the JCUA is in operation.

44.3.3 JPEG Code Quantization Table Number Register (JCQTN)

JCQTN sets the quantization table number before compression process is started.

- To use quantization table No. 0 (JCQTBL0) as the first color component, set QT1[1:0] to B'00
- To use quantization table No. 1 (JCQTBL1) as the first color component, set QT1[1:0] to B'01
- To use quantization table No. 2 (JCQTBL2) as the first color component, set QT1[1:0] to B'10
- To use quantization table No. 3 (JCQTBL3) as the first color component, set QT1[1:0] to B'11

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 00_H

	7	6	5	4	3	2	1	0
	–	–	QT3[1:0]		QT2[1:0]		QT1[1:0]	
Compress	R	R	R/W	R/W	R/W	R/W	R/W	R/W
Decompress	R	R	R	R	R	R	R	R

Table 44.9 JCQTN register contents

Bit position	Bit name	Function
7 to 6	Reserved	When read, the value after reset is returned.
5 to 4	QT3[1:0]	Quantization table number for the third color component
3 to 2	QT2[1:0]	Quantization table number for the second color component
1 to 0	QT1[1:0]	Quantization table number for the first color component

44.3.4 JPEG Code Huffman Table Number Register (JCHTN)

JCHTN sets the Huffman table number (AC/DC) before compression process is started.

- To use DC/AC Huffman table No. 0 (JCHTBD0 and JCHTBA0) as the first color component, set bits HTA1 and HTD1 to B'0
- To use DC/AC Huffman table No. 1 (JCHTBD1 and JCHTBA1) as the first color component, set bits HTA1 and HTD1 to B'1

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 00_H

	7	6	5	4	3	2	1	0
	–	–	HTA3	HTD3	HTA2	HTD2	HTA1	HTD1
Compress	R	R	R/W	R/W	R/W	R/W	R/W	R/W
Decompress	R	R	R	R	R	R	R	R

Table 44.10 JCHTN register contents

Bit position	Bit name	Function
7 to 6	Reserved	When read, the value after reset is returned. When written, write the value after reset.
5	HTA3	Huffman table number (AC) for the third color component
4	HTD3	Huffman table number (DC) for the third color component
3	HTA2	Huffman table number (AC) for the second color component
2	HTD2	Huffman table number (DC) for the second color component
1	HTA1	Huffman table number (AC) for the first color component
0	HTD1	Huffman table number (DC) for the first color component

44.3.5 JPEG Code DRI Upper Register (JCDRIU)

JCDRIU sets the upper bytes of the minimum coded units (MCUs) preceding an RST marker.

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 00_H

	7	6	5	4	3	2	1	0

Table 44.11 JCDRIU register contents

Bit position	Bit name	Function
7 to 0	DRIU[7:0]	Upper Bytes of MCUs Preceding RST Marker When both upper and lower bytes are set to H'00, neither a DRI nor an RST marker is placed.

44.3.6 JPEG Code DRI Lower Register (JCDRID)

JCDRID sets the lower bytes of MCUs preceding an RST marker.

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 00_H

	7	6	5	4	3	2	1	0
	DRID[7:0]							
Compress	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Decompress	undefined	undefined	undefined	undefined	undefined	undefined	undefined	undefined

Table 44.12 JCDRID register contents

Bit position	Bit name	Function
7 to 0	DRID[7:0]	Lower Bytes of MCUs Preceding RST Marker When both upper and lower bytes are set to H'00, neither a DRI nor an RST marker is placed.

44.3.7 JPEG Code Vertical Size Upper Register (JCVSZU)

JCVSZU sets the upper bytes of the vertical image size.

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 00_H

	7	6	5	4	3	2	1	0
	VSZU[7:0]							
Compress	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Decompress	R	R	R	R	R	R	R	R

Table 44.13 JCVSZU register contents

Bit position	Bit name	Function
7 to 0	VSZU[7:0]	Upper Bytes of Vertical Image Size In decompression process, a downloaded value from the JPEG coded data is set.

44.3.8 JPEG Code Vertical Size Lower Register (JCVSZD)

JCVSZD sets the lower bytes of the vertical image size.

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 00_H

	7	6	5	4	3	2	1	0
	VSZD[7:0]							
Compress	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Decompress	R	R	R	R	R	R	R	R

Table 44.14 JCVSZD register contents

Bit position	Bit name	Function
7 to 0	VSZD[7:0]	Lower Bytes of Vertical Image Size In decompression process, a downloaded value from the JPEG coded data is set.

44.3.9 JPEG Code Horizontal Size Upper Register (JCHSZU)

JCHSZU sets the upper bytes of the horizontal image size.

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 00_H

	7	6	5	4	3	2	1	0
	HSZU[7:0]							
Compress	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Decompress	R	R	R	R	R	R	R	R

Table 44.15 JCHSZU register contents

Bit position	Bit name	Function
7 to 0	HSZU[7:0]	Upper Bytes of Horizontal Image Size In decompression process, a downloaded value from the JPEG coded data is set.

44.3.10 JPEG Coded Horizontal Size Lower Register (JCHSZD)

JCHSZD sets the lower bytes of the horizontal image size.

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 00_H

	7	6	5	4	3	2	1	0
	HSZD[7:0]							
Compress	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Decompress	R	R	R	R	R	R	R	R

Table 44.16 JCHSZD register contents

Bit position	Bit name	Function
7 to 0	HSZD[7:0]	Lower Bytes of Horizontal Image Size In decompression process, a downloaded value from the JPEG coded data is set.

44.3.11 JPEG Code Data Count Upper Register (JCDTCU)

The upper bytes for the counted amount of data to be compressed are set to JCDTCU. The values of this register are reset before compression starts.

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 00_H

	7	6	5	4	3	2	1	0
	DCU[7:0]							
Compress	R	R	R	R	R	R	R	R

Table 44.17 JCDTCU register contents

Bit position	Bit name	Function
7 to 0	DCU[7:0]	Upper bytes of the counted amount of data to be compressed

44.3.12 JPEG Code Data Count Middle Register (JCDTCM)

The middle bytes for the counted amount of data to be compressed are set to JCDTCM. The values of this register are reset before compression starts.

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 00_H

	7	6	5	4	3	2	1	0
	DCM[7:0]							
Compress	R	R	R	R	R	R	R	R
Decompress	undefined	undefined	undefined	undefined	undefined	undefined	undefined	undefined

Bit position	Bit name	Function
7 to 0	DCM[7:0]	Middle bytes of the counted amount of data to be compressed

44.3.13 JPEG Code Data Count Lower Register (JCDTCD)

The lower bytes for the counted amount of data to be compressed are set to JCDTCD. The values of this register are reset before compression starts.

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 00_H

	7	6	5	4	3	2	1	0
	DCD[7:0]							
Compress	R	R	R	R	R	R	R	R
Decompress	undefined	undefined	undefined	undefined	undefined	undefined	undefined	undefined

Table 44.19 JCDTCD register contents

Bit position	Bit name	Function
7 to 0	DCD[7:0]	Lower bytes of the counted amount of data to be compressed

44.3.14 JPEG Interrupt Enable Register 0 (JINTE0)

JINTE0 enables interrupts.

When any of bits INT7 to INT5 is set to B'1, the INS5 bit in JINTS0 indicates B'1 as the error status upon occurrence of the compression data error, and the ERR[3:0] bit in JCDERR indicates the particular error code.

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 00_H

	7	6	5	4	3	2	1	0
	INT7	INT6	INT5	–	INT3	–	–	–
Compress	undefined	undefined	undefined	R	undefined	R	R	R
Decompress	R/W	R/W	R/W	R	R/W	R	R	R

Table 44.20 JINTE0 register contents

Bit position	Bit name	Function
7	INT7	This bit enables an interrupt to be generated when the number of data in the restart interval of the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned. Block data number error is enable by this bit. For the error code detail, please refer Table 44.44, Segment Error Codes.
6	INT6	This bit enables an interrupt to be generated when the total number of data in the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned. Block data number error is enable by this bit. For the error code detail, please refer Table 44.44, Segment Error Codes.
5	INT5	This bit enables an interrupt to be generated when the final number of MCU data in the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned. Block data number error is enable by this bit. For the error code detail, please refer Table 44.44, Segment Error Codes.
4	Reserved	When read, the value after reset is returned. When written, write the value after reset.
3	INT3	This bit enables an interrupt to be generated when it has been determined that the image size and the subsampling setting of the compressed data can be read through analyzing the data.
2 to 0	Reserved	When read, the value after reset is returned. When written, write the value after reset.

44.3.15 JPEG Interrupt Status Register 0 (JINTS0)

JINTS0 identifies the interrupt sources.

The interrupt sources of this register should be cleared by clearing the corresponding interrupt status bits to 0 and setting the relevant bit in JCCMD appropriately.

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 00_H

	7	6	5	4	3	2	1	0
	–	INS6	INS5	–	INS3	–	–	–
Compress	R	R/W*1	undefined	R	undefined	R	R	R
Decompress	R	R/W*1	R/W*1	R	R/W*1	R	R	R

Note 1. Clear this bit by writing 0 to it. Do not write 1 to this bit.

Table 44.21 JINTS0 register contents

Bit position	Bit name	Function
7	Reserved	When read, the value after reset is returned. When written, write the value after reset.
6	INS6	This bit is set to 1 when the JCUA completes compression process normally.
5	INS5	This bit is set to 1 when a compressed data error occurs.
4	Reserved	When read, the value after reset is returned. When written, write the value after reset.
3	INS3	This bit is set to 1 when the image size and pixel format can be read. When an interrupt occurs, this module stops processing and the state is indicated by the JCRST register. To make the JCUA resume processing, set the JPEG core process stop clear command bit (JRST) in JCCMD.
2 to 0	Reserved	When read, the value after reset is returned. When written, write the value after reset.

44.3.16 JPEG Code Decode Error Register (JCDERR)

JCDERR indicates the error code to identify the type of the error which has occurred in the compressed data analysis for decompression. The values of this register are reset before the JCUA starts decompression.

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: $0A_H$

	7	6	5	4	3	2	1	0
	–	–	–	–	ERR[3:0]			
Compress	R	R	R	R	undefined	undefined	undefined	undefined
Decompress	R	R	R	R	R/W	R/W	R/W	R/W

Table 44.22 JINTE0 register contents

Bit position	Bit name	Function
7 to 4	Reserved	When read, the value after reset is returned. When written, write the value after reset.
3 to 0	ERR[3:0]	Error Code (See Table 44.43, Decompression Error Codes and Table 44.44, Segment Error Codes)

44.3.17 JPEG Code Reset Register (JCRST)

JCRST indicates a processing-stopped state caused by requests to read the image size and pixel format (enabled by the INT3 bit in JINTE0). To resume processing, set the JPEG core process stop clear command bit (JRST) in JCCMD.

Access: This register can be accessed in 8-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 00_H

	7	6	5	4	3	2	1	0
	–	–	–	–	–	–	–	RST
Compress	R	R	R	R	R	R	R	undefined
Decompress	R	R	R	R	R	R	R	R

Table 44.23 JCRST register contents

Bit position	Bit name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	RST	Operating State 0: State other than below 1: Suspended state caused by interrupt sources of JINTE0

44.3.18 JPEG Interface Compression Control Register (JIFECNT)

JIFECNT controls the compression process.

Access: This register can be accessed in 32-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 0000 0000_H

	31	30	29	28	27	26	25	24
	–	–	–	–	–	–	–	–
Compress	R	R	R	R	R	R	R	R
Decompress	R	R	R	R	R	R	R	R

	–	DINRINI	DINRCMD	DINLC	–	DINSWAP[2:0]		
Compress	R	R/W	R/W	R/W	R	R/W	R/W	R/W
Decompress	R	undefined	undefined	undefined	R	undefined	undefined	undefined

Table 44.24 JIFECNT register contents (1/2)

Bit position	Bit name	Function
31 to 15	Reserved	When read, the value after reset is returned. When written, write the value after reset.
14	JOUTRINI	Address Initialization when Output Coded Data is Resumed This bit is only valid when the count mode for stopping the output of coded data is on. Set this bit before writing 1 to the data resume command bit. 0: The transfer address is not initialized when the output of coded data is restarted. 1: The transfer address is initialized when the output of coded data is restarted.
13	JOUTRCMD	Output Coded Data Resume Command This bit is only valid when the count mode for stopping the output of coded data is on. Setting this bit to 1 resumes writing output coded data. This bit is always read as 0.
12	JOUTC	Count Mode Setting for Stopping Output Coded Data 0: Count mode for stopping the output of coded data is off. 1: Count mode for stopping the output of coded data is on.
11	Reserved	When read, the value after reset is returned. When written, write the value after reset.

Table 44.24 JIFECNT register contents (2/2)

Bit position	Bit name	Function
10 to 8	JOUTSWAP [2:0]	Byte/Word/Longword Swap Output coded data in compression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]
7	Reserved	When read, the value after reset is returned. When written, write the value after reset.
6	DINRINI	Address Initialization when Resuming Input of Image Data Lines This bit is only valid when the count mode for stopping the input of image data lines is on. Set this bit before writing 1 to the dataline resume command bit. 0: The transfer address is not initialized when the input of image data lines is restarted. 1: The transfer address is initialized when the input of image data lines is restarted.
5	DINRCMD	Input Image Data Lines Resume Command This bit is valid only when the count mode for stopping the input of image data lines is on. Setting this bit to 1 resumes reading input image data. This bit is always read as 0.
4	DINLC	Count Mode Setting for Stopping Input Image Data Lines 0: Count mode for stopping the input of image data lines is off. 1: Count mode for stopping the input of image data lines is on.
3	Reserved	When read, the value after reset is returned. When written, write the value after reset.
2 to 0	DINSWAP[2:0]	Byte/Word/Longword Swap Input image data in compression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]

44.3.19 JPEG Interface Compression Source Address Register (JIFESA)

JIFESA sets the source address of the input image data. This register should be set in 8-byte units.

Access: This register can be accessed in 32-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 0000 0000_H

	31	30	29	28	27	26	25	24
	ESA[31:24]							
Compress	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 44.25 JIFESA register contents

Bit position	Bit name	Function
31 to 0	ESA[31:0]	Input Image Data Source Address (in 8-byte units) The lower three bits should be set to 0.

44.3.20 JPEG Interface Compression Line Offset Register (JIFESOFST)

JIFESOFST sets the line offset of the input image data (refer to Section 44.4.4, Storing Image Data). This register should be set in 8-byte units.

Access: This register can be accessed in 32-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 0000 0000_H

	31	30	29	28	27	26	25	24

14 to 0	ESMW[14:0]	Input Image Data Lines Offset (in 8-byte units) The lower three bits should be set to 0.

44.3.21 JPEG Interface Compression Destination Address Register (JIFEDA)

JIFEDA sets the destination address of the output coded data. This register should be set in 8-byte units.

Access: This register can be accessed in 32-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 0000 0000_H

	31	30	29	28	27	26	25	24

Bit position	Bit name	Function
31 to 0	EDA[31:0]	Output Coded Data Destination Address (in 8-byte units) The lower three bits should be set to 0.

44.3.22 JPEG Interface Compression Source Line Count Register (JIFESLC)

JIFESLC sets the number of input image data lines when the count mode for stopping the input of image data lines is on (the DINLC bit in JIFECNT is set to 1). This register should be set in 8-line units.

Access: This register can be accessed in 32-bit units.

Address: Refer to **Table 44.6**.

Initial Value: FFF8 FFF8$_H$

15 to 0	LINES[15:0]	Input Image Data Lines Offset (in 8-line units) The lower three bits should be set to 0.

44.3.23 JPEG Interface Compression Destination Count Register (JIFEDDC)

JIFEDDC sets the amount of output coded data when the count mode for stopping the output of coded data is on (the JOUTC bit in JIFECNT is set to 1). This register should be set in 8-byte units.

Access: This register can be accessed in 32-bit units.

Address: Refer to **Table 44.6**.

Table 44.30 JIFDCNT register contents (1/2)

Bit position	Bit name	Function
31 to 30	Reserved	When read, the value after reset is returned. When written, write the value after reset.
29 to 28	VINTER[1:0]	Vertical Subsampling Subsamples vertical output image data. 00: No subsampling 01: Subsamples output data into 1/2. 10: Subsamples output data into 1/4. 11: Subsamples output data into 1/8.
27 to 26	HINTER[1:0]	Horizontal Subsampling Subsamples horizontal output image data. 00: No subsampling 01: Subsamples output data into 1/2. 10: Subsamples output data into 1/4. 11: Subsamples output data into 1/8.
25 to 24	OPF[1:0]	Specifies output image data pixel format. 00: YCbCr422 01: ARGB8888 10: RGB565 11: Setting prohibited
23 to 15	Reserved	When read, the value after reset is returned. When written, write the value after reset.

Table 44.30 JIFDCNT register contents (2/2)

Bit position	Bit name	Function
14	JINRINI	Address Initialization when Input Coded Data is Resumed This bit is only valid when the count mode for stopping the input of coded data is on. Set this bit before writing 1 to the data resume command bit. 0: The transfer address is not initialized when the input of coded data is restarted. 1: The transfer address is initialized when the input of coded data is restarted.
13	JINRCMD	Input Coded Data Resume Command This bit is valid only when the count mode for stopping the input of coded data is on. Setting this bit to 1 resumes reading input coded data. This bit is always read as 0.
12	JINC	Count Mode Setting for Stopping Input Coded Data 0: Count mode for stopping the input of coded data is off. 1: Count mode for stopping the input of coded data is on.
11	Reserved	When read, the value after reset is returned. When written, write the value after reset.
10 to 8	JINSWAP[2:0]	Byte/Word/Longword Swap Input coded data in decompression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]
7	Reserved	When read, the value after reset is returned. When written, write the value after reset.
6	DOUTRINI	Address Initialization when Resuming Output of Image Data Lines This bit is only valid when the count mode for stopping the output of image data lines is on. Set this bit before writing 1 to the dataline resume command bit. 0: The transfer address is not initialized when the output of lines of image data is restarted. 1: The transfer address is initialized when the output of lines of image data is restarted.
5	DOUTRCMD	Output Image Data Lines Resume Command This bit is valid only when the count mode for stopping the output of image data lines is on. Setting this bit to 1 resumes writing image data. This bit is always read as 0.
4	DOUTLC	Count Mode for Stopping Output Image Data Lines 0: Count mode for stopping the output of image data lines is off. 1: Count mode for stopping the output of image data lines is on.
3	Reserved	When read, the value after reset is returned. When written, write the value after reset.
2 to 0	DOUTSWAP[2:0]	Byte/Word Swap Output image data in decompression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]

44.3.25 JPEG Interface Decompression Source Address Register (JIFDSA)

JIFDSA sets the source address of the input coded data. This register should be set in 8-byte units.

Access: This register can be accessed in 32-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 0000 0000_H

	31	30	29	28	27	26	25	24
	DSA[31:24]

Table 44.31 JIFDSA register contents

Bit position	Bit name	Function
31 to 0	DSA[31:0]	Input Coded Data Source Address (in 8- byte units) The lower three bits should be set to 0.

44.3.26 JPEG Interface Decompression Line Offset Register (JIFDDOFST)

JIFDDOFST sets the line offset of the output image data to be transferred to the external buffer (refer to Section 44.4.4, Storing Image Data). This register should be set in 8-byte units.

Access: This register can be accessed in 32-bit units.

Address: Refer to **Table 44.6**.

Initial Value: $0000\ 0000_H$

	31	30	29	28	27	26	25	24

14 to 0	DDMW[14:0]	Output Image Data Lines Offset (in 8-byte units) The lower three bits should be set to 0.

44.3.27 JPEG Interface Decompression Destination Address Register (JIFDDA)

JIFDDA sets the destination address of the output image data. This register should be set in 8-byte units.

Access: This register can be accessed in 32-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 0000 0000_H

	31	30	29	28	27	26	25	24

Bit position	Bit name	Function
31 to 0	DDA[31:0]	Output Image Data Destination Address (in 8-byte units) The lower three bits should be set to 0.

44.3.28 JPEG Interface Decompression Source Data Count Register (JIFDSDC)

JIFDSDC sets the amount of input coded data when the count mode for stopping the input of coded data is on (the JINC bit in JIFDCNT is set to 1). This register should be set in 8-byte units.

Access: This register can be accessed in 32-bit units.

Address: Refer to **Table 44.6**.

Initial Value: FFF8 FFF8$_H$

15 to 0	JDATAS[15:0]	Amount of Input Coded Data to be Read (in 8-byte units) The lower three bits should be set to 0.

44.3.29 JPEG Interface Decompression Destination Line Count Register (JIFDDLC)

JIFDDLC sets the number of output image data lines when the count mode for stopping the output of image data lines is on (the DOUTLC bit in JIFDCNT is set to 1). This register should be set in 8-line units.

Access: This register can be accessed in 32-bit units.

Address: Refer to **Table 44.6**.

Initial Value: FFF8 $FFF8_H$

31 to 16	Reserved	When read, the value after reset is returned. When written, write the value after reset.
15 to 0	LINES[15:0]	Set this bit to the number of lines of output image data to write (in 8-line units). The lower three bits should be set to 0.

44.3.30 JPEG Interface Decompression α Set Register (JIFDADT)

JIFDADT is used to set the α value when output is in ARGB8888 format.

Access: This register can be accessed in 32-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 0000 0000_H

Table 44.37 JINTE1 register contents (1/2)

Bit position	Bit name	Function
31 to 7	Reserved	When read, the value after reset is returned. When written, write the value after reset.
6	CBTEN	Enables or disables a data transfer processing interrupt request (JDTI) when the CBTF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
5	DINLEN	Enables or disables a data transfer processing interrupt request (JDTI) when the DINLF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
4	JOUTEN	Enables or disables a data transfer processing interrupt request (JDTI) when the JOUTF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
3	Reserved	When read, the value after reset is returned. When written, write the value after reset.
2	DBTEN	Enables or disables a data transfer processing interrupt request (JDTI) when the DBTF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
1	JINEN	Enables or disables a data transfer processing interrupt request (JDTI) when the JINF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.

Table 44.37 JINTE1 register contents (2/2)

Bit position	Bit name	Function
0	DOUTLEN	Enables or disables a data transfer processing interrupt request (JDTI) when the DOUTLF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.

44.3.32 JPEG Interrupt Status Register 1 (JINTS1)

This register shows the resons of interrupt.

Access: This register can be accessed in 32-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 0000 0000_H

	31	30	29	28	27	26	25	24

Note 1. When the bit is read as 1, write 0 to clear it. When the bit is read as 0, write 1 to it.

Table 44.38 JINTS1 register contents

Bit position	Bit name	Function
6	CBTF	This bit is set to 1 when the last output coded data is written in compression.
5	DINLF	This bit is set to 1 when the number of input image data lines indicated by JIFESLC is read in compression. This bit is valid only when the DINLC bit in JIFECNT is set to 1.
4	JOUTF	This bit is set to 1 when the amount of output coded data indicated by JIFEDDC is written in compression. This bit is valid only when the JOUTC bit in JIFECNT is set to 1.
2	DBTF	This bit is set to 1 when the last output image data is written in decompression.
1	JINF	This bit is set to 1 when the amount of input coded data indicated by JIFDSDC is read in decompression. This bit is valid only when the JINC bit in JIFDCNT is set to 1.
0	DOUTLF	In decompression, this bit is set to 1 when the number of lines of output image data indicated by JIFDDLC have been written. This bit is valid only when the DOUTLC bit in JIFDCNT is set to 1.

44.3.33 JPEG input image data CbCr range setting register (JIFESVSZ)

JIFESVSZ sets the CbCr range of input image data.

Access: This register can be accessed in 32-bit units.

Address: Refer to **Table 44.6**.

Initial Value: 0000 0000_H

7 to 0	Reserved	When read, the value after reset is returned. When written, write the value after reset.

44.4 Operation

44.4.1 Compression

44.4.1.1 Overview of Processing

The compression process flows are described below.

(1) The JPEG core is activated.
A marker is output. (After a marker is output, image data can be input.) Approximately 30,000 cycles (necessary for making SOI to SOS markers)

(2) Image data is transferred in MCUs from the external buffer to the JCUA.
If the count mode for stopping the input of image data lines is on, reading is stopped each time the number of lines set in JIFESLC is read. Reading is resumed by setting the DINRCMD bit in JIFECNT to 1.
When the DINRINI bit in JIFECNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
When the DINRINI bit is one, the address set in JIFESA is used on resumption. Reading is also stopped when one frame of image data is completely transferred.
If the count mode for stopping the input of image data lines is off, reading is continued until one frame of image data is completely transferred.

(3) Image data is input to the JPEG core.
The input data is processed in MCUs at any time in the JPEG core.

(4) Coded data is transferred from the JCUA to the external buffer.
When the count mode for stopping the output of coded data is on, writing is stopped each time the amount of coded data set in JIFEDDC is written. Writing is resumed by setting the JOUTRCMD bit in JIFECNT to 1.
When the JOUTRINI bit in JIFECNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
When the JOUTRINI bit is one, the address set in JIFEDA is used on resumption. Writing is also stopped when one frame of coded data is completely transferred.
If the count mode for stopping the output of coded data is off, writing is continued until one frame of coded data is completely transferred.

(5) Compression is completed after one frame of data is processed completely.

44.4.1.2 Flowchart (Compression)

(a) Initial Settings

After completing the JPEG core settings and input/output buffer settings and transferring image data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1. After the JCUA has been activated, the JPEG markers (SOI to SOS) are generated and output. It takes approximately 30,000 cycles to generate the markers.

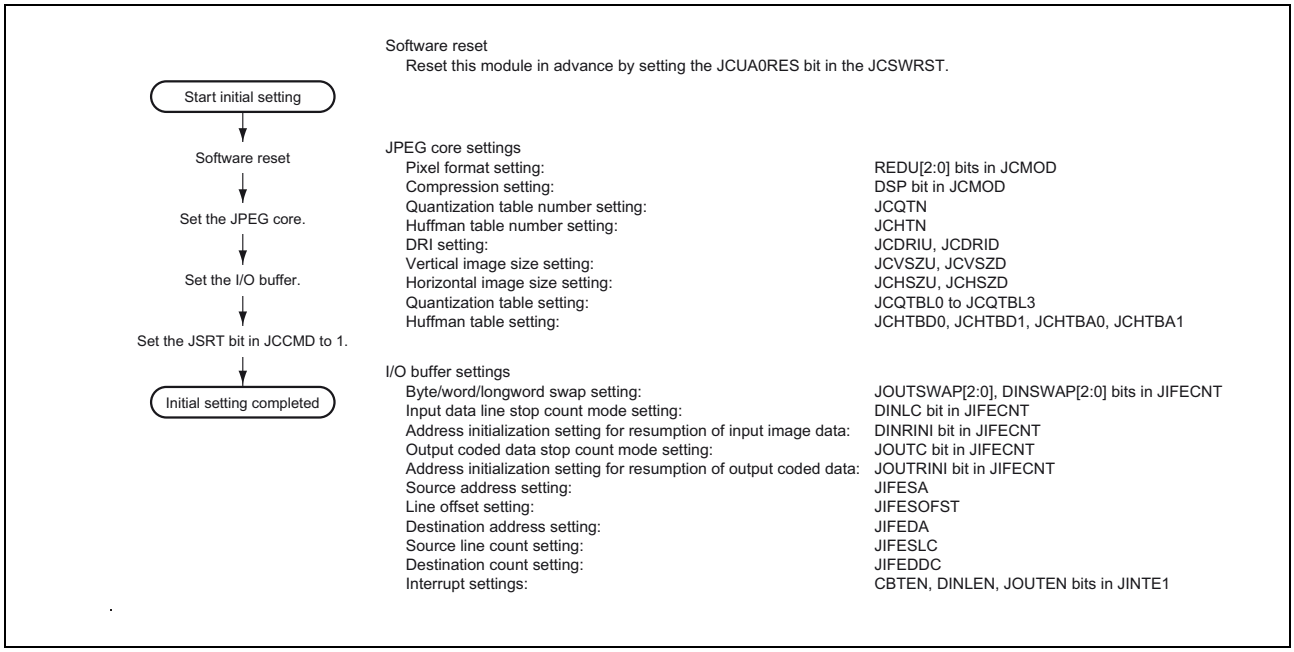

Figure 44.2 Compression Initial Setting Flow

(b) Compression Process

The compression process flows are described below.

- When JPEG compression process has been completed, the INS6 bit in JINTS0 is set to 1. However, the JCUA continues processing since the coded data remains to be transferred. The CBTF bit in JINTS1 is set to 1 when the last coded data is transferred. The interrupt source is cleared by writing 0 to the INS6 bit. However, the interrupt request asserted by this interrupt source cannot be cleared by writing 0 to the INS6 bit. Set an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request.
- When the JCUA has completed compression and all coded data has been transferred, the CBTF flag in JINTS1 is set to 1. When the CBTEN bit in JINTE1 is 1 here, an interrupt is generated. The interrupt source is cleared by writing 0 to the CBTF flag.
- If the count mode for stopping image data lines is on, when the specified number of image data lines set in JIFESLC has been read, the DINLF flag in JINTS1 is set to 1, and reading is stopped. When the DINLEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the DINLEN bit. Setting the DINRCMD bit in JIFECNT to 1 resumes reading.
  When the DINRINI bit in JIFECNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
  When the DINRINI bit is one, the address set in JIFESA is used on resumption.
- If the count mode for stopping the output of coded data is on, when the specified amount of coded data set in JIFEDDC has been written, the JOUTF flag in JINTS1 is set to 1, and writing is stopped. When the JOUTEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the JOUTF bit. Setting the JOUTRCMD bit in JIFECNT to 1 resumes writing.
  When the JOUTRINI bit in JIFECNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
  When the JOUTRINI bit is one, the address set in JIFEDA is used on resumption.

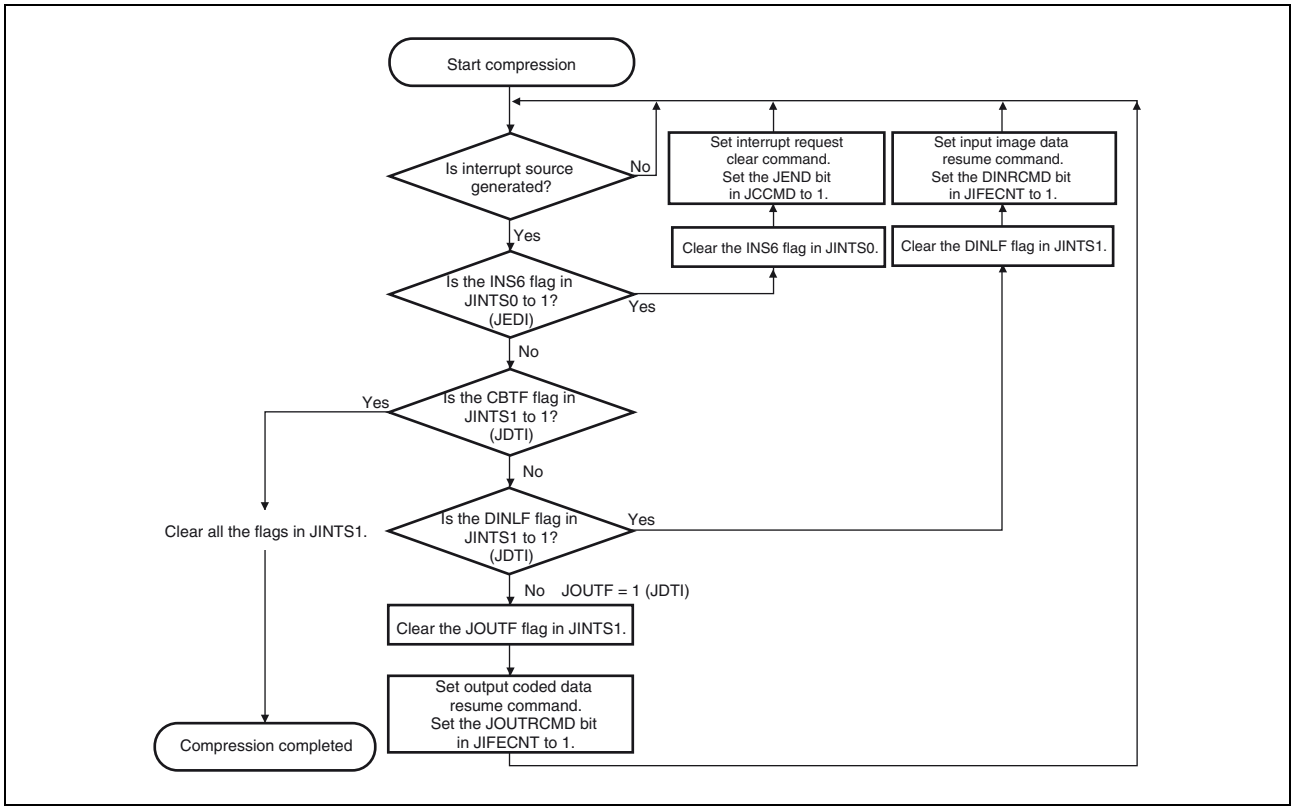

Figure 44.3 Compression Process Flow

44.4.1.3 JPEG Coded Data Format

The following figure shows the data output stream in compression. The amount of coded data from SOI to EOI is indicated by JCDTCU, JCDTCM, and JCDTCD. When both JCDRIU and JCDRID are set to H'00, the following markers are not output.

- DRI marker
- RST marker (in compressed image data)

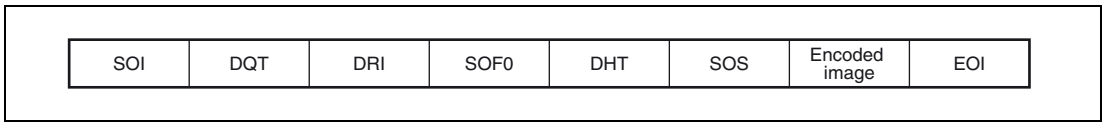

Figure 44.4 JPEG Coded Data Format

DQT: Not output for unused table.

DHT: Output in order DC0, AC0, DC1, and AC1. Not output for unused table.

SOF0: Component identifiers are C1 = first color component, C2 = second color component, and C3 = third color component.

SOS: Scan component selectors are CS1 = first color component, CS2 = second color component, and CS3 = third color component.

Header Volume (Reference):

SOI:	2 bytes (FFD8)
DQT:	134 bytes when two quantization tables are used, 199 bytes when three quantization tables are used (±65 bytes/table increase or decrease)
DRI:	6 bytes
SOF0:	19 bytes (4:2:2)
DHT:	420 bytes (two tables are used)
SOS:	14 bytes (4:2:2)
EOI:	2 bytes (FFD9)

44.4.1.4 Table Setting

(a) Quantization Table Specification

The order of addresses shown in 8 × 8 blocks corresponds to that of the register addresses. Do not access this table while the JCUA is in processing.

Table 44.42 Quantization Table

00	01	02	03	04	05	06	07
08	09	0A	0B	0C	0D	0E	0F
10	11	12	13	14	15	16	17
18	19	1A	1B	1C	1D	1E	1F
20	21	22	23	24	25	26	27
28	29	2A	2B	2C	2D	2E	2F
30	31	32	33	34	35	36	37
38	39	3A	3B	3C	3D	3E	3F

JCQTBL0 (<JCUAn_base> + H'100) = H'00

JCQTBL0 (<JCUAn_base> + H'101) = H'01

JCQTBL0 (<JCUAn_base> + H'102) = H'02

JCQTBL0 (<JCUAn_base> + H'103) = H'03

:

JCQTBL0 (<JCUAn_base> + H'13F) = H'3F

(b) Huffman Table Specification

Examples of the Huffman table specification given in the ITU-T T81 Annex K.3.3 recommended by JPEG are shown below. In compression, the following settings must be specified for all the codes so that Huffman codes can be generated for all the group numbers.

DC Huffman table:	The number of codes for each code length is 12. The group numbers in order of frequency of occurrence are 12.
AC Huffman table:	The number of codes for each code length is 162. The zero run length/the group numbers in order of frequency of occurrence are 162.

Do not access the following tables while the JCUA is in processing. In particular, read access is prohibited.

- Table K.3/T81
  JCHTBD0 (<JCUAn_base> + H'200) = H'00
  JCHTBD0 (<JCUAn_base> + H'201) = H'01
  JCHTBD0 (<JCUAn_base> + H'202) = H'05
  JCHTBD0 (<JCUAn_base> + H'203) = H'01
  :
  JCHTBD0 (<JCUAn_base> + H’21B) = H'0B

  :
  JCHTBA0 (<JCUAn_base> + H'2D1) = H'FA
- Table K.6/T81
  JCHTBA1 (<JCUAn_base> + H'320) = H'00
  JCHTBA1 (<JCUAn_base> + H'321) = H'02
  JCHTBA1 (<JCUAn_base> + H'322) = H'01
  JCHTBA1 (<JCUAn_base> + H'323) = H'02
  :
  JCHTBA1 (<JCUAn_base> + H'3D1) = H'FA

44.4.1.5 Input Pixel Format

Image data in the YCbCr422 format can be input to this module. Allocation of data in the YCbCr422 format can be changed by the DINSWAP[2:0] bits in JIFECNT as shown below.

- When the DINSWAP[2:0] bits = 000

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y0 8 bits	Cb0 8 bits	Y1 8 bits	Cr0 8 bits	Y2 8 bits	Cb1 8 bits	Y3 8 bits	Cr1 8 bits

- When the DINSWAP[2:0] bits = 001

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cb0 8 bits	Y0 8 bits	Cr0 8 bits	Y1 8 bits	Cb1 8 bits	Y2 8 bits	Cr1 8 bits	Y3 8 bits

- When the DINSWAP[2:0] bits = 010

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y1 8 bits	Cr0 8 bits	Y0 8 bits	Cb0 8 bits	Y3 8 bits	Cr1 8 bits	Y2 8 bits	Cb1 8 bits

- When the DINSWAP[2:0] bits = 011

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cr0 8 bits	Y1 8 bits	Cb0 8 bits	Y0 8 bits	Cr1 8 bits	Y3 8 bits	Cb1 8 bits	Y2 8 bits

- When the DINSWAP[2:0] bits = 100

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y2 8 bits	Cb1 8 bits	Y3 8 bits	Cr1 8 bits	Y0 8 bits	Cb0 8 bits	Y1 8 bits	Cr0 8 bits

- When the DINSWAP[2:0] bits = 101

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cb1 8 bits	Y2 8 bits	Cr1 8 bits	Y3 8 bits	Cb0 8 bits	Y0 8 bits	Cr0 8 bits	Y1 8 bits

- When the DINSWAP[2:0] bits = 110

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y3 8 bits	Cr1 8 bits	Y2 8 bits	Cb1 8 bits	Y1 8 bits	Cr0 8 bits	Y0 8 bits	Cb0 8 bits

- When the DINSWAP[2:0] bits = 111

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cr1 8 bits	Y3 8 bits	Cb1 8 bits	Y2 8 bits	Cr0 8 bits	Y1 8 bits	Cb0 8 bits	Y0 8 bits

44.4.1.6 Output Coded Data

In the case of compression, coded data are output. This module handles the output of coded data in 16-bit units. For this reason, if the coded data have an odd code length (are fractional), the final code for output will be H'D9FF.

The JOUTSWAP[2:0] bits in JIFECNT can be used to alter the arrangement of coded data in the output.

44.4.2 Decompression

44.4.2.1 Overview of Processing

The decompression process flows are described below.

1. The JPEG core is activated.
2. Coded data is transferred from the external buffer to the JCUA.
   If the count mode for stopping the input of coded data is on, reading is stopped each time the amount of coded data set in JIFDSDC is read. Reading is resumed by setting the JINRCMD bit in JIFDCNT to 1. When the JINRINI bit in JIFDCNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
   When the JINRINI bit is one, the address set in JIFDSA is used on resumption. Reading is stopped when the end of the coded data is detected.
   If the count mode for stopping the input of coded data is off, reading is continued until the end of code is detected.
   With this module, more coded data may be read than the coded data size since coded data reading is continued until the end of code is detected.
3. Coded data is input to the JPEG core.
   The input data is processed in MCUs at any time in the JPEG core.

4. Image data is transferred in MCUs from the JCUA to the external buffer.
   When the count mode for stopping the output of image data lines is on, writing is stopped each time the number of image data lines set in JIFDDLC is written. Writing is resumed by setting the DOUTRCMD bit in JIFDCNT to 1.
   When the DOUTRINI bit in JIFDCNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
   When the DOUTRINI bit is one, the address set in JIFDDA is used on resumption. Writing is stopped when one frame of image data is completely transferred.
   If the count mode for stopping the output of image data lines is off, writing is continued until one frame of image data is completely transferred.
5. Decompression is completed after one frame of data is processed completely.

(a) Initial Settings

- When the INT3 bit in JINTE0 is set to 0:
  After completing the JPEG core settings and input/output buffer settings and transferring coded data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1.
- When the INT3 bit in JINTE0 is set to 1:
  After completing the JPEG core settings and input buffer settings and transferring coded data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1.
  When the image size and pixel format become readable after the coded data has been decompressed, the INS3 bit in JINTS0 is set. At this time, decompression is temporarily stopped.
  After the image size and pixel format have been read, set the output buffer.
  Setting the JRST bit in JCCMD to 1 after interrupt handling resumes decompression.

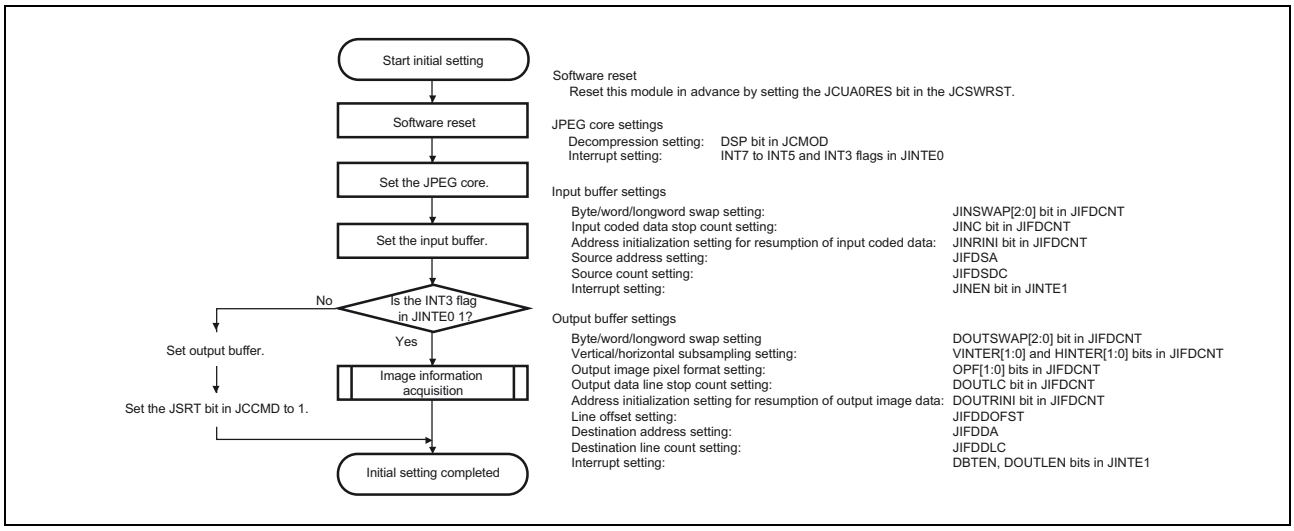

Figure 44.5 Decompression Initial Setting Flow

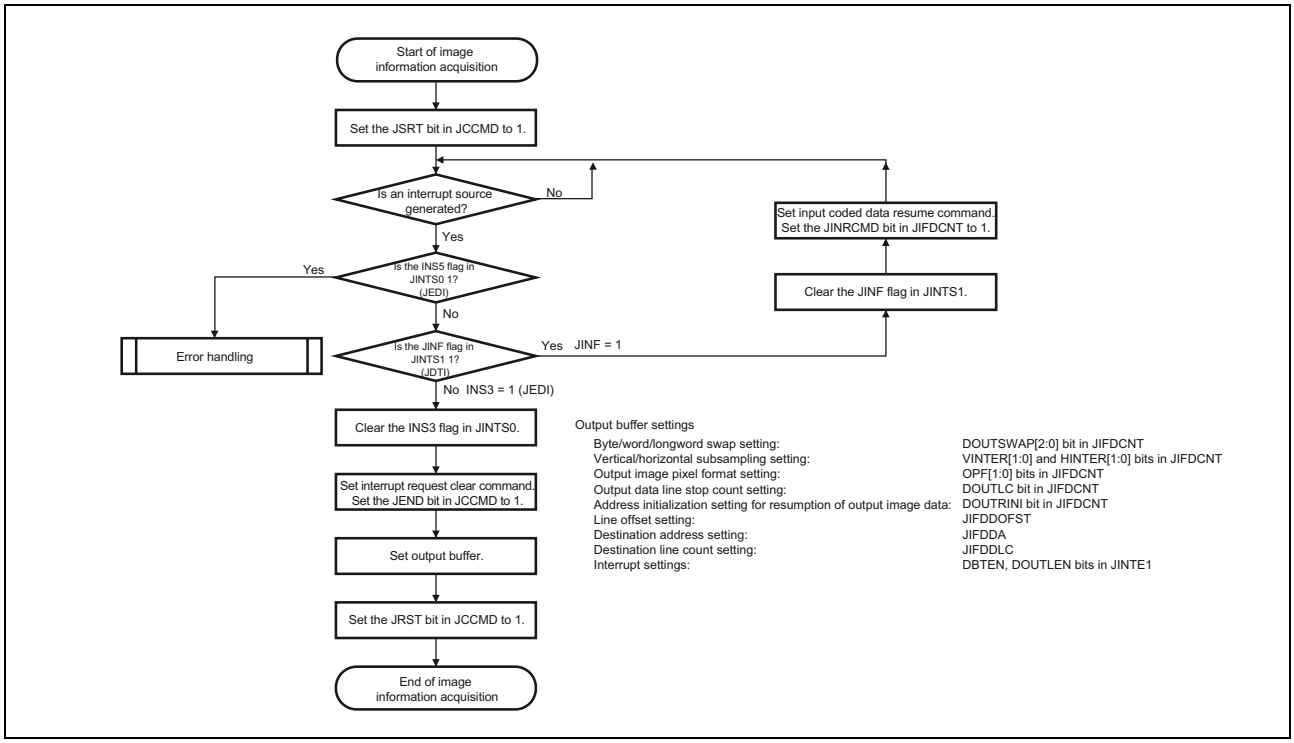

Figure 44.6 Image Information Acquisition Flow

(b) Decompression Process

The decompression process flows are described below.

- When JPEG decompression process has been completed, the INS6 bit in JINTS0 is set to 1. However, the JCUA continues processing since the image data remains to be transferred. The DBTF bit in JINTS1 is set to 1 when the last image data is transferred. The interrupt source is cleared by writing 0 to the INS6 bit. However, the interrupt request asserted by this interrupt source cannot be cleared by writing 0 to the INS6 bit. Set an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request.
- When the JCUA has completed decompression process and all image data has been transferred, the DBTF flag in JINTS1 is set to 1. When the DBTEN bit in JINTE1 is 1 here, an interrupt is generated. The interrupt source is cleared by writing 0 to the DBTF flag.
- If the count mode for stopping input coded data is on, when the specified amount of coded data set in JIFDSDC have been read, the JINF flag in JINTS1 is set to 1, and reading is stopped.
  When the JINEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the JINF bit. Setting the JINRCMD bit in JIFDCNT to 1 resumes reading.
  When the JINRINI bit in JIFDCNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
  When the JINRINI bit is one, the address set in JIFDSA is used on resumption.
- If the count mode for stopping the output image data is on, when the specified number of image data lines set in JIFDDLC have been written, the DOUTLF flag in JINTS1 is set to 1, and writing is stopped. When the DOUTLEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the DOUTLF bit. Setting the DOUTRCMD bit in JIFDCNT to 1 resumes writing.
  When the DOUTRINI bit in JIFDCNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.

- When the DOUTRINI bit is one, the address set in JIFDDA is used on resumption.

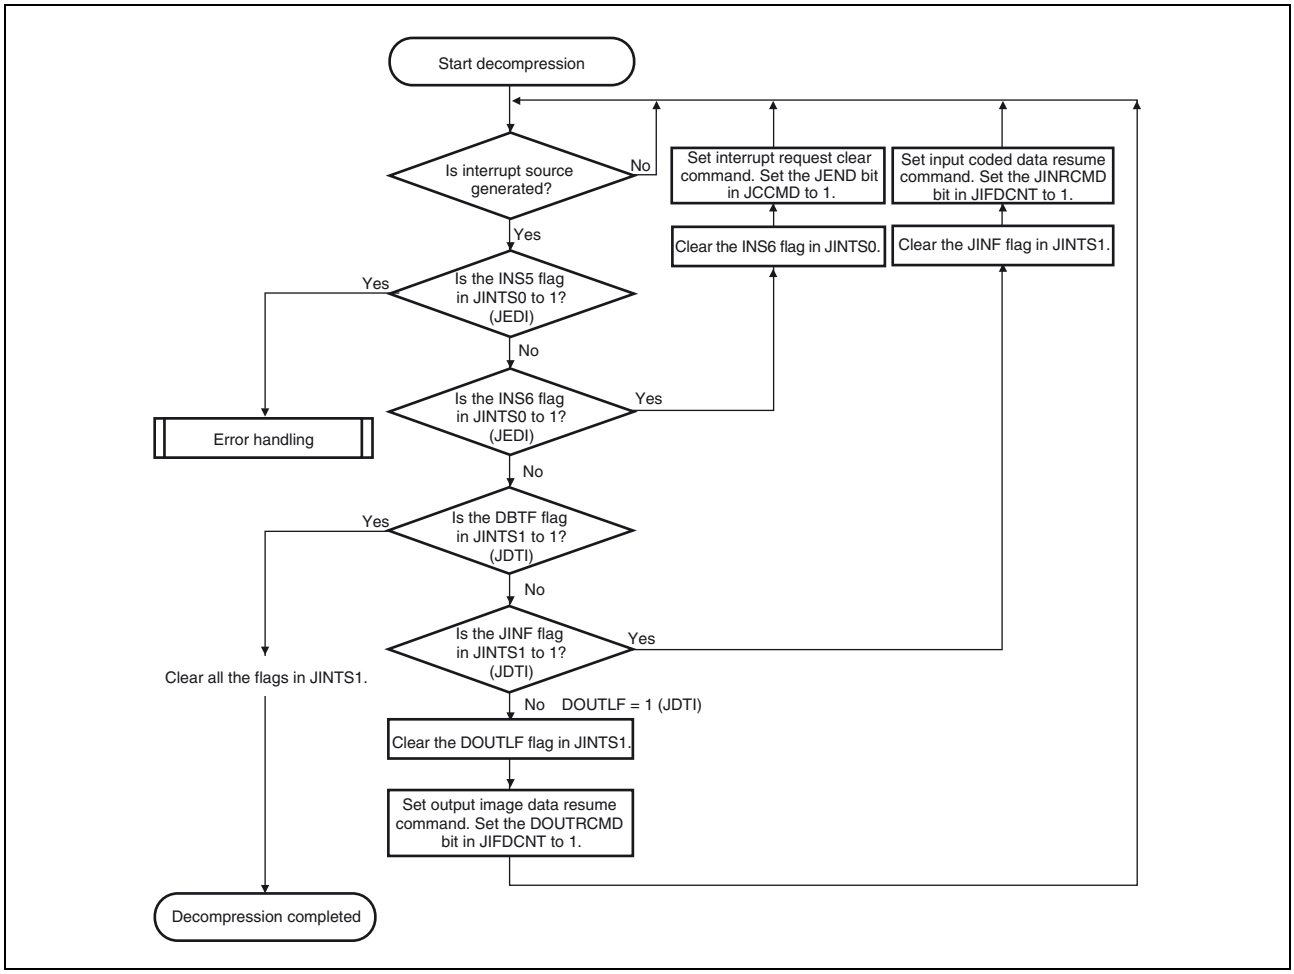

Figure 44.7 Decompression Process Flow

(c) Error Handling

If the INS5 bit in JINTS0 is 1, it indicates that there is an error in the input JPEG coded data and that the decompression process by this module has been ended. Read the ERR[3:0] bits in JCDERR to determine the cause of the error. The interrupt signal asserted due to the interrupt source indicated by the INS5 bit cannot be negated by clearing the interrupt status through 0-writing. To clear the interrupt request, set the interrupt request clear command (by setting the JEND bit in JCCMD to 1).

The JCUA module must be reset after detecting error. To ensure that JCUA register accesses are done before software reset, dummy read and SYNCM operation should be inserted. (This operation leads 30 µs waiting period and module reset can be done safely.)

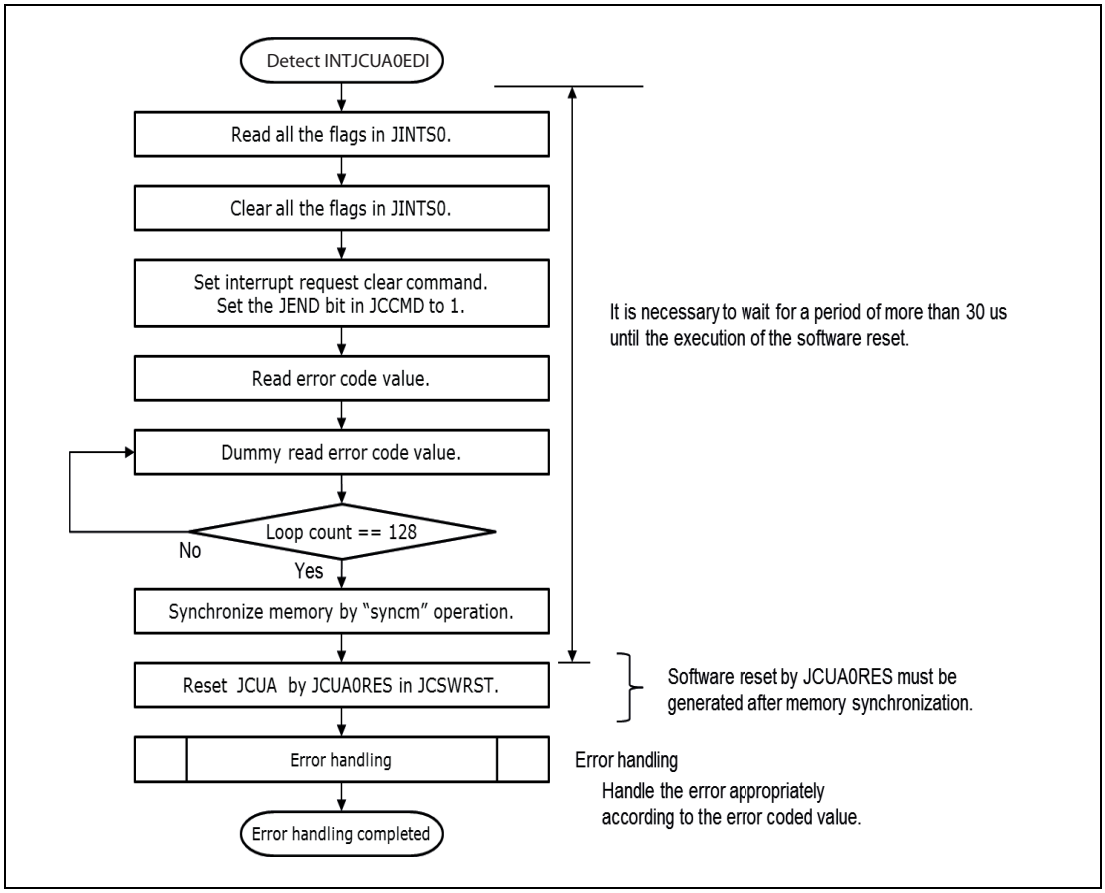

Figure 44.8 Error Handling Flow

44.4.2.2 Input JPEG Coded Data

Markers to be processed in decompression are SOI, SOF0, SOS, DQT, DHT, DRI, RSTm, and EOI. Other markers except for the error markers shown below are ignored even if they are read. The JINSWAP[2:0] bits in JIFDCNT can be used to alter the arrangement for the input of coded data.

NOTE

When JCUA ignored unknown markers, JCUA continue to read the next data until detecting valid marker.

Therefore, input data for decompressed must always include essential markers for JPEG like SOI and EOI.

44.4.2.3 JPEG Decompression Errors

(a) Error Marker

If a marker error is found while analyzing compressed data for decompression, the code to identify the error type (shown in **Table 44.43**) is set to ERR[3:0] bits in JCDERR. When an error is detected, the JCUA generates an interrupt signal and terminates decoding. The stored code value will be set to B'1010 (default value) at the start of processing of the next frame or after a bus reset.

Table 44.43 Decompression Error Codes

Code	Description
B'0000	Normal
B'0001	SOI not detected: SOI not detected until EOI detected
B'0010	SOF1 to SOFF detected
B'0011	Unprovided pixel format detected
B'0100	SOF accuracy error: Other than 8 detected
B'0101	DQT accuracy error: Other than 0 detected
B'0110	Component error 1: The number of SOF0 header components detected is other than 1, 3, or 4
B'0111	Component error 2: The number of components differs between SOF0 header and SOS
B'1000	SOF0, DQT, or DHT not detected when SOS detected
B'1001	SOS not detected: SOS not detected until EOI detected
B'1010	EOI not detected (default)
B'1011	Restart interval data number error detected
B'1100	Image size error detected
B'1101	Last MCU data number error detected
B'1110	Block data number error detected

(b) Huffman Coded Segment Error

During the compressed data analysis in decompression operation, if there is an increase or decrease in the decoded data count due to an error resulting from bit reversal or missing data in the Huffman-coded segment, determine the error type, and set the error code in the ERR[3:0] bit in JCDERR. **Table 44.44** lists the segment error codes. The error code is set, interrupt signal is issued, and the process is ended only if the bits INT7 to INT5 in JINTE0 corresponding to the detected error is set to 1. The set code value will turn to the default value (B'1010) at the start of processing of the next frame or after a reset.

However, in this error detection, if an error in the Huffman-coded segment does not result in an alteration in the decoded data count, the error will go undetected.

[Example]

The number of data in a Huffman coded segment with pixel format setting YCbCr422, DRI = 2, X = 80 pixels, and Y = 8 pixels

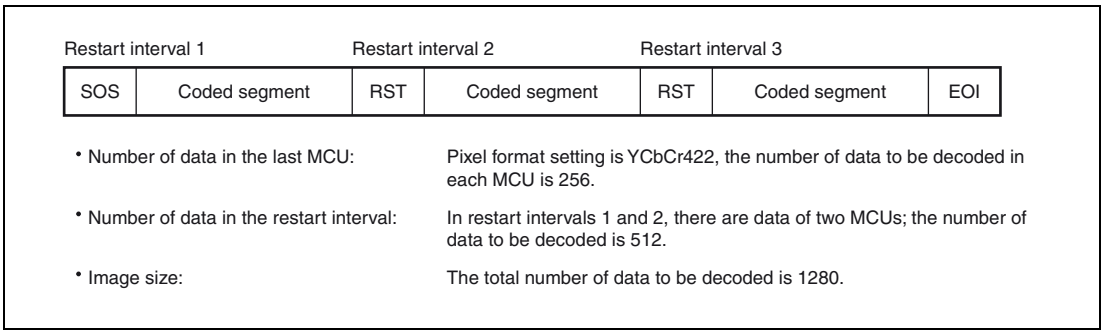

Figure 44.9 Huffman Coded Segment

Table 44.44 Segment Error Codes

Code	Description
B'0000	Normal
B'1011	Restart interval data number error: The number of data in each interval is compared with the number of data specified by the DRI marker. If an interval has more or less data that is specified by the DRI marker, the decompression error code (1011) is set. The last interval which is shorter than the restart interval is not compared. If the DRI marker segment is not placed or the specified number is 00, an error is not detected even if the RSTm marker is placed. Also an m which indicates the order of RSTm marker modulo 8 (m = 0 to 7) is exempt from the error detection analysis. When the INT7 bit in JINTE0 is set to 0, this error is not detected.
B'1100	Image size error: The data number of an image which is calculated from the number of lines specified by the frame parameter and the number of samples per line is compared with the total number of data from SOS to EOI (in pixel units). If the numbers of data do not match, the decompression error code (1100) is set. When the INT6 bit in JINTE0 is set to 0, this error is not detected. The data number of an image is shown in MCU units. Thus the number of lines and the number of samples per line for calculation need to be shown in MCU units.
B'1101	Last MCU data number error: Whether the number of data in the MCUs at the EOI detection is shown in MCU units is checked and fractions are detected. If error (1100) occurs simultaneously, error (1100) has priority. When the INT5 bit in JINTE0 is set to 0, this error is not detected.
B'1110	Block data number error: Whether a block is an 8 × 8 array is checked; the check is performed for fractions. When bits INT7 to INT5 in JINTE0 are all set to 0, this error is not detected.

44.4.3 Output Pixel Format in Decompression

This module is capable of decompressing JPEG encoded data created in the YCbCr444, YCbCr422, YCbCr411 and YCbCr420 formats. The pixel format of the output image will be YCbCr422, ARGB8888, or RGB565. The flow of conversion of decompressed data to the given output pixel format is shown below.

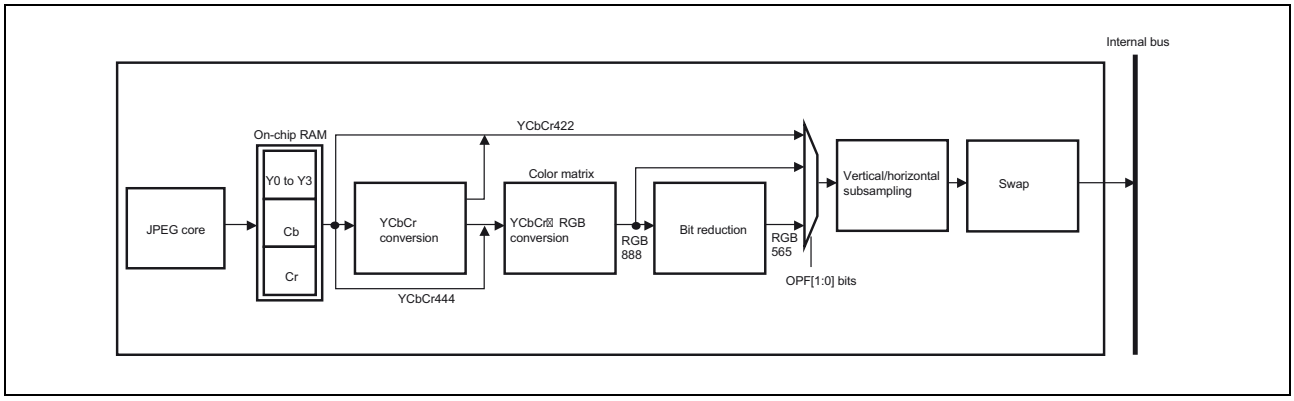

Figure 44.10 Block Diagram of Output Pixel Format Conversion in Decompression

44.4.3.1 On-chip RAM

Data decoded by the JPEG core are stored in MCUs on RAM in this module.

44.4.3.2 YCbCr Conversion

When data are to be output in the ARGB8888 or RGB565 format, data in the YCbCr422, YCbCr411or YCbCr420 format are first converted to the YCbCr444 format.

When data are to be output in the YCbCr422 format, data in the YCbCr444, YCbCr411 or YCbCr420 format are converted to the YCbCr422 format.

Conversion is performed using simple interpolation.

44.4.3.3 YCbCr → RGB Conversion

Data in the YCbCr444 format are converted to the RGB888 format. The following formulae are used.

R = 1.000Y + 1.402Cr

G = 1.000Y - 0.344Cb - 0.714Cr

B = 1.000Y + 1.772Cb

44.4.3.4 Bit Reduction

RGB888 data is reduced to RGB565 data. The lower three bits of red and blue, and lower two bits of green are removed.

44.4.3.5 Output Pixel Format Selection

The pixel format to be output is selected by the OPF[1:0] bit in JIFDCNT.

Allocation of data (while the DOUTSWAP[2:0] bits in JIFDCNT = 000) in the pixel format is shown below.

- YCbCr422 (32 bits/pixel)

b31 – b24	b23 – b16	b15 – b8	b7 – b0
Y0 8 bits	Cb 8 bits	Y1 8 bits	Cr 8 bits

- ARGB8888 (32 bits/pixel)

b31 – b24	b23 – b16	b15 – b8	b7 – b0
*1	Red 8 bits	Green 8 bits	Blue 8 bits

Note 1. This value is determined by the ALPHA[7:0] bits in JIFDADT.

- RGB565 (16 bits/pixel)

b15 – b11	b10 – b5	b4 – b0
Red 5 bits	Green 6 bits	Blue 5 bits

44.4.3.6 Vertical/Horizontal Subsampling

The output data can be horizontally and vertically subsampled according to the VINTER[1:0] and HINTER[1:0] bit setting in JIFDCNT.

Figure 44.11 to **Figure 44.13** show line subsampling modes.

For the output formats ARGB8888 and RGB565, one cell represents one pixel in the figures. For the output format YCbCr422, one cell represents one set of Y0Cb0Y1Cr0 in the figures.

As subsampling is carried out by minimum coded units (MCU), the numbers of the horizontal and vertical block units will vary according to the decompressed pixel format.

The following tables show the values of n and m in the figures.

Horizontal:

Table 44.45 Number of Horizontal Blocks

Compression Format	Output Format	n
YCbCr444	YCbCr422	1/2
YCbCr444	ARGB8888, RGB565	1
YCbCr422	YCbCr422	1
YCbCr422	ARGB8888, RGB565	2
YCbCr411	YCbCr422	2
YCbCr411	ARGB8888, RGB565	4
YCbCr420	YCbCr422	1
YCbCr420	ARGB8888, RGB565	2

Vertical:

Table 44.46 Number of Vertical Blocks

Compression Format	Output Format	m
YCbCr444	YCbCr422	1
YCbCr444	ARGB8888, RGB565	1
YCbCr422	YCbCr422	1
YCbCr422	ARGB8888, RGB565	1
YCbCr411	YCbCr422	1
YCbCr411	ARGB8888, RGB565	1
YCbCr420	YCbCr422	2

44.4.3.7 Swap

Allocation of data can be changed by the DOUTSWAP[2:0] bits in JIFDCNT.

44.4.4 Storing Image Data

The following figure shows the buffer area for storing the image data.

- Start address
  Compression: JIFESA
  Decompression: JIFDDA

- Horizontal size
  Compression, decompression: JCHSZU, JCHSZD
- Vertical size
  Compression, decompression: JCVSZU, JCVSZD
- Offset
  Compression: JIFESOFST
  Decompression: JIFDDOFST

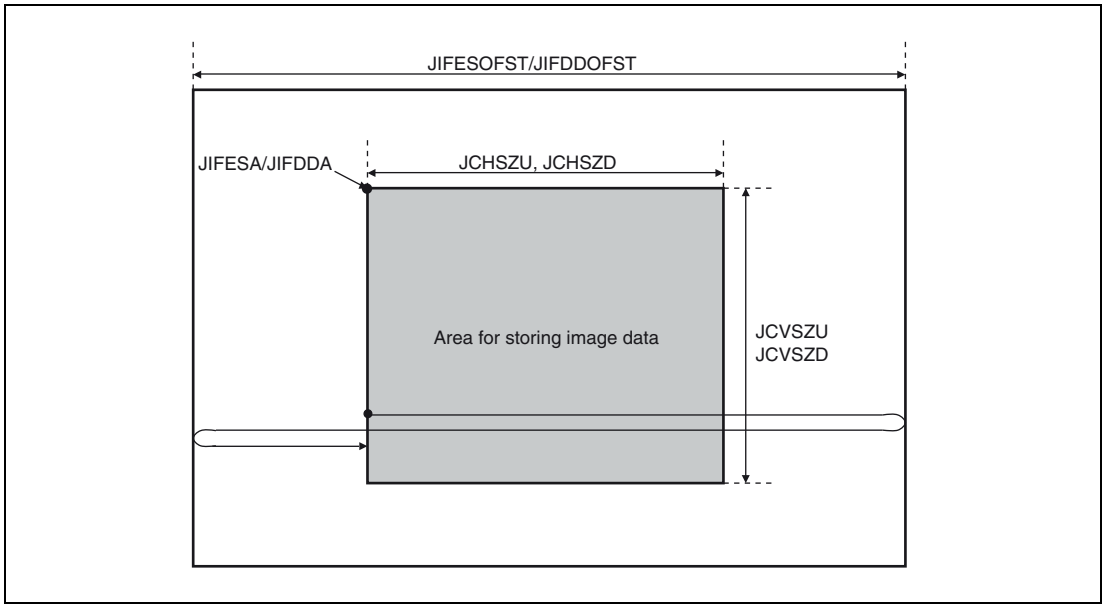

Figure 44.14 Image of Storing Image Data

44.5 Interrupts

Two types of interrupt requests, namely compression/decompression process interrupt request (JEDI) and data transfer interrupt request (JDTI), are available in this module. The two types of interrupt requests are each related to multiple sources. The interrupt request cancellation methods differ depending on the source of the interrupt request.

44.5.1 Compression/Decompression Process Interrupt Request (JEDI)

The flags in JINTS0 indicate compression/decompression-related sources. The interrupt requests asserted by these interrupt sources cannot be negated by clearing the corresponding interrupt status bits to 0. Issue an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request. When a flag in JINTS0 is set to 1, a compression/decompression process interrupt request is sent to the interrupt controller.

44.5.1.1 Compression

- JPEG compression process end
  When the INS6 bit in JINTS0 is 1, the JPEG compression process has been successfully completed. After all of the coded data is transferred, the JCUA completes compression.

44.5.1.2 Decompression

- JPEG decompression process end

When the INS6 bit in JINTS0 is 1, the JPEG decompression process has been successfully completed. After all of the image data is transferred, JCUA completes decompression.

- JPEG decompression error occurrence
  When the INS5 bit in JINTS0 is 1, the input JPEG coded data has an error and the JCUA has stopped the decompression process. Read the error code (ERR[3:0] bits in JCDERR) and identify the error source. This interrupt occurs when any of the INT7 to INT5 bits in JINTE0 is 1.
- Request for reading the image size and pixel format
  When the INS3 bit in JINTS0 is 1, JPEG coded data has been input and information regarding the image size and pixel format can be read. Since the JPEG decompression process is suspended, resume the JPEG decompression process by setting the process stop clear command after accessing the necessary registers. This interrupt occurs when the INT3 bit in JINTE0 is 1.

44.5.2 Data Transfer Interrupt Request (JDTI)

The flags in JINTS1 are the interrupt sources for transferring the image data and coded data. The interrupt requests asserted by these interrupt sources can be negated by clearing the corresponding interrupt status bits to 0.

44.5.2.1 Compression

- Interrupt request generated after the specified number of input image data lines has been read.
  When the DINLF bit in JINTS1 is 1, the number of image data lines specified by JIFESLC has been transferred; transfer the rest of the image data to the external buffer and resume transferring the data from the external buffer. A data transfer interrupt request is sent when the DINLEN bit in JINTE1 is 1.
- Interrupt request generated after the specified amount of output coded data have been written to.
  When the JOUTF bit in JINTS1 is 1, the amount of coded data specified by JIFEDDC has been transferred. Secure a space for the next coded data in the external buffer, and resume transfer process. The data transfer interrupt request is sent when the JOUTEN bit in JINTE1 is 1.
- Interrupt request generated after all processes are completed
  When the CBTF bit in JINTS1 is 1, the JCUA has completed compression and transferred all of the coded data. The data transfer interrupt request is sent when the CBTEN bit in JINTE1 is set to 1.

44.5.2.2 Decompression

- Interrupt request generated after the specified number of output image data lines has been written to.
  When the DOUTLF bit in the JINTS1 is 1, the number of image data lines specified by JIFDDLC has been transferred. Secure a space for the next coded data in the external buffer, and resume transfer process. A data transfer interrupt request is sent when the DOUTLEN bit in JINTE1 is 1.
- Interrupt request generated after the specified amount of input coded data has been read.
  The JINF bit in JINTS1 becomes 1 when the amount of coded data specified by JIFDSDC has been transferred. Secure the next coded data in the external buffer, and resume transfer process. A data transfer interrupt is also sent at this time if the JINEN bit in JINTE1 is 1.
- Interrupt request generated after all processes are completed
  The DBTF bit in JINTS1 becomes 1 when the JCUA has completed decompression and transferred all of the coded data. A data transfer interrupt request is also sent at this time if the DBTEN bit in JINTE1 is set to 1.

44.5.2.3 Procedure of checking JINTS1

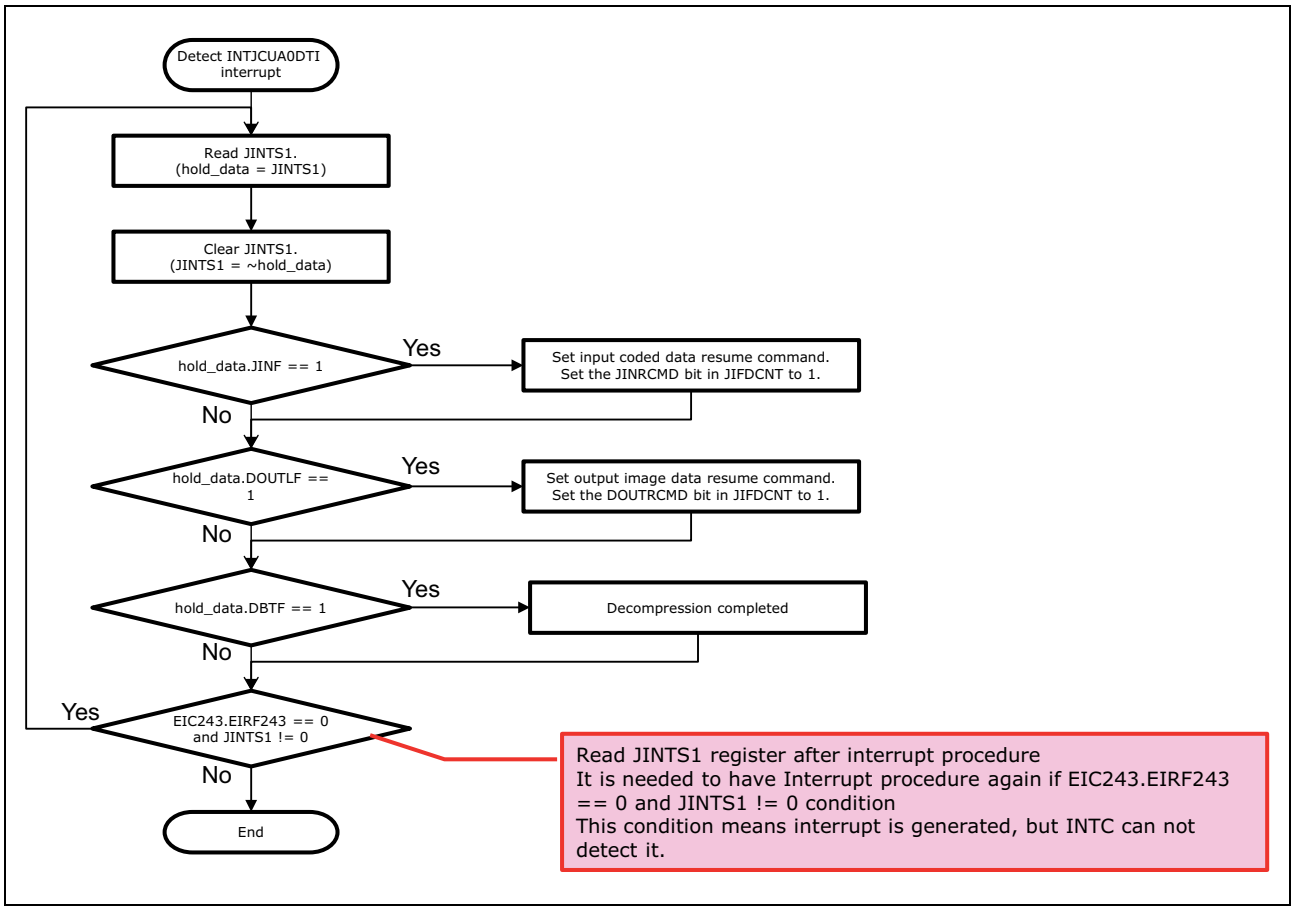

Figure 44.15 Procedure of checking JINTS1

44.6 Software Reset Processing

Setting of the JCUA0RES bit in the JCSWRST causes a software reset.

This reset is available after JCUA stop or error status.

Use the following software reset procedure to reset the JCUA unit:

1. Confirm any stop or error status is asserted in JINTS0 or JINTS1.
2. Wait for 30us.
3. Set JCSWRST.JCUA0RES bit to 1, to generate the software reset condition.
4. Read JCSWRST.JCUA0RES bit until bit is set to 1, to wait for software reset is active.
5. Set JCSWRST.JCUA0RES bit to 0, to release software reset condition.

By this sequence all JCUA registers with exception of the JCSWRST register are initialized by a software reset.

CAUTION

It is prohibit that JCSWRST.JCUA0RES is set to 1 during JPEG processing.

NOTE

A waiting time for 30 us is needed in order to wait that the remaining data from JCUA have been output to RAM. To archive this 30 µs waiting time dummy read and SYNCM operation should be inserted.

44.7 Usage Notes

44.7.1 Pixel Format YCbCr

This module treats the range from -128 to 127 as input/output values for YCbCr values in the YCbCr422 or YCbCr420 pixel format. On the other hand, video display controller treats the range from 0 to 255 as input/output values for YCbCr. Therefore, when bidirectionally transferring data in YCbCr pixel formats between this module and video display controller, correct YCbCr values by adding or subtracting 128.

Section 45 A/D Converter (ADCE)

This section contains a generic description of the A/D Converter (ADCE).

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.
The subsequent sections describe the features that apply to all implementations.

45.1 Overview of RH850/D1L/D1M A/D Converter (ADCE)

45.1.1 Units

This microcontroller has the following number of units of the A/D Converter (ADCE).

Table 45.1 Units

A/D Converter (ADCE)	
Units	1
Names	ADCE0

Units index n

Throughout this section, the individual units of an A/D Converter is identified by the index "n" (n = 0), for example ADCEnADCR for the ADCEn control register.

45.1.2 Channels and scan groups

Throughout this section, the individual physical A/D Converter channels are identified by the index “m”.
The available number of A/D Converter channels depends on the device:

Table 45.2 A/D Converter channels

ADCEn unit	D1L1	D1L2(H)	D1M1(H) D1M1-V2 D1M1A	D1M2(H)
ADCE0	m = 0 to 15	m = 0 to 15	m = 0 to 15	m = 0 to 19

Table 45.3 Index

Index	Meaning
n	Throughout this section, the individual ADCE units are identified by the index “n” (n = 0); for example, ADCEnPWDVCR indicates the PWM-Diag virtual channel register.
m	Throughout this section, the individual physical channels of ADCEn are identified by the index “m”; for example, ANInm indicates an analog input pin.
j	Throughout this section, the individual virtual channels of ADCEn are identified by the index “j” (j = 0 to 20); for example, ADCEnVCRj indicates the virtual channel register j.
x	Throughout this section, the individual general purpose scan groups (SG) of ADCEn are identified by the index “x” (x = 1 to 3); for example, ADCEnSGSTCRx indicates the scan group x start control register.

Isolated-Area supply voltage monitoring

Table 45.2, A/D Converter channels shows the number of A/D converter channels that are available as external pin.

All devices feature an additional channel (m = 20) that internally connects to the supply voltage of the Isolated-Area. This channel can be used as a consistency check measurement to confirm the A/D Converter reference voltage.

Scan groups overview

The following table gives an overview about the usage of the five scan groups.

Table 45.4 Scan groups overview

Scan group	Purpose	Hardware trigger sources		Scan group interrupts
		Internal	External*1	
0	Temperature measurement	TAUBn interrupts	–	INTADCE0SGTSN
x = 1	General purpose	TAUBn interrupts	• Trigger input ADCE0TRGI1 • Interrupts INTP0, INTP1, INTP2	INTADCE0SG1
x = 2		TAUBn interrupts	• Trigger input ADCE0TRGI2 • Interrupts INTP0, INTP1, INTP2	INTADCE0SG2
x = 3		TAUBn interrupts	• Trigger input ADCE0TRGI3 • Interrupts INTP0, INTP1, INTP2	INTADCE0SG3
4	PWM Diagnosis	Fixed for PWM Diagnosis	–	–

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, refer to Section 2.6, Noise Filter and Edge Level Detection Circuit.

45.1.3 Register addresses

All A/D Converters register addresses are given as address offsets from the individual base addresses <ADCEn_base>.
The <ADCEn_base> addresses of each ADCEn are listed in the following table:

Table 45.5 Register base addresses <ADCEn_base>

Base address name	Base address
<ADCE0_base>	FFF2 0000$_H$

45.1.4 Clock supply

All A/D Converters provide one clock input.

Table 45.6 Clock supply

ADCEn unit	ADCEn clock	Connected to
ADCE0	PCLK	Clock Controller C_ISO_PCLK
	CLKAD	Clock Controller C_ISO_ADCE

45.1.5 Interrupts and DMA

The A/D Converters can generate the following interrupt and DMA requests:

Table 45.7 ADCEn interrupt and DMA requests

ADCEn signals	Function	Connected to
ADCE0:		
INT_ADE	Error interrupt	Error Control Module INTADCE0ERR
INT_TSN	Temperature Sensor interrupt	Interrupt Controller INTADCE0TSN
INT_SG1	Scan group 1 interrupt	Interrupt Controller INTADCE0I1 DMA Controller trigger ID 123
INT_SG2	Scan group 2 interrupt	Interrupt Controller INTADCE0I2 DMA Controller trigger ID 124
INT_SG3	Scan group 3 interrupt	Interrupt Controller INTADCE0I3 DMA Controller trigger ID 125

45.1.6 Reset sources

The A/D Converters and their registers are initialized by the following reset signal:

Table 45.8 Reset sources

ADCEn unit	Reset signal
ADCE0	• Reset Controller SYSRES • Reset Controller ADCE0RES • reset upon wake-up from DEEPSTOP mode

CAUTION

By default the ADCE0RES reset is active.
Thus before accessing this module this reset must be released via the MRSTC register of the Reset Controller. Refer to Section 9, Reset Controller for details.

45.1.7 I/O signals

The following table shows the I/O signals of the A/D Converters.

Table 45.9 ADCEn I/O signals

ADCEn signals	Function	Connected to
ADCE0		
ADCE0I0 to ADCE0Im	Analog input channels 0 to m	Port ADCE0I0 to ADCE0Im
SG1_TRG*1	Hardware trigger for scan group 1	Port ADCE0TRIGI1
SG2_TRG*1	Hardware trigger for scan group 2	Port ADCE0TRIGI2
SG3_TRG*1	Hardware trigger for scan group 3	Port ADCE0TRIGI3

Note 1. These hardware trigger signals are input to the Hardware Trigger Expansion.

45.1.8 Internal signal connections

The following table shows the internal signal connections of the A/D Converters.

Table 45.10 ADCEn internal signals

ADCEn signals	Function	Connected to
ADCE0		
ADCE0I20	Analog input channel 20	Isolated-Area power supply ISOVDD
ADCE0I37	Analog input channel 37	Temperatur Sensor output

45.2 Overview

45.2.1 Functional Overview

ADCE has the following features.

- 10-bit/12-bit resolution
- Successive approximation conversion method
- Minimum A/D conversion time per channel: 1.15 µs
- A/D conversion is available for up to 20 channels
- Two scan modes
  Multi-cycle scan mode: Specified number of scans are executed.
  Continuous scan mode: Scans are executed with no limit of numbers.
- Asynchronous/synchronous suspend and resume function
  A processing for a scan group can interrupt a running processing for another scan group.
- Start trigger for each scan group
  Software, hardware, and external trigger can start processing of each scan group.
- Scan end interrupt and DMA transfer are supported.
  For each scan group, an interrupt request to INTC can be issued or DMA transfer can be started, each time a processing for the virtual channel indicated by the end virtual channel pointer ends, or a virtual channel ends.
- A/D conversion channel repeat function
  A/D conversion is performed for the same channel twice or four times sequentially, and the result is stored in the data register.
  (Note that the result data is not an additional value.)
- Abundant safety functions
  Abundant safety functions are provided, such as A/D converter self-diagnostic, pin-level self-diagnostic, wiring-break detection, upper limit/lower limit check for the A/D converter, overwrite check for data registers, read and clear function for data registers, and PWM-Diag function.

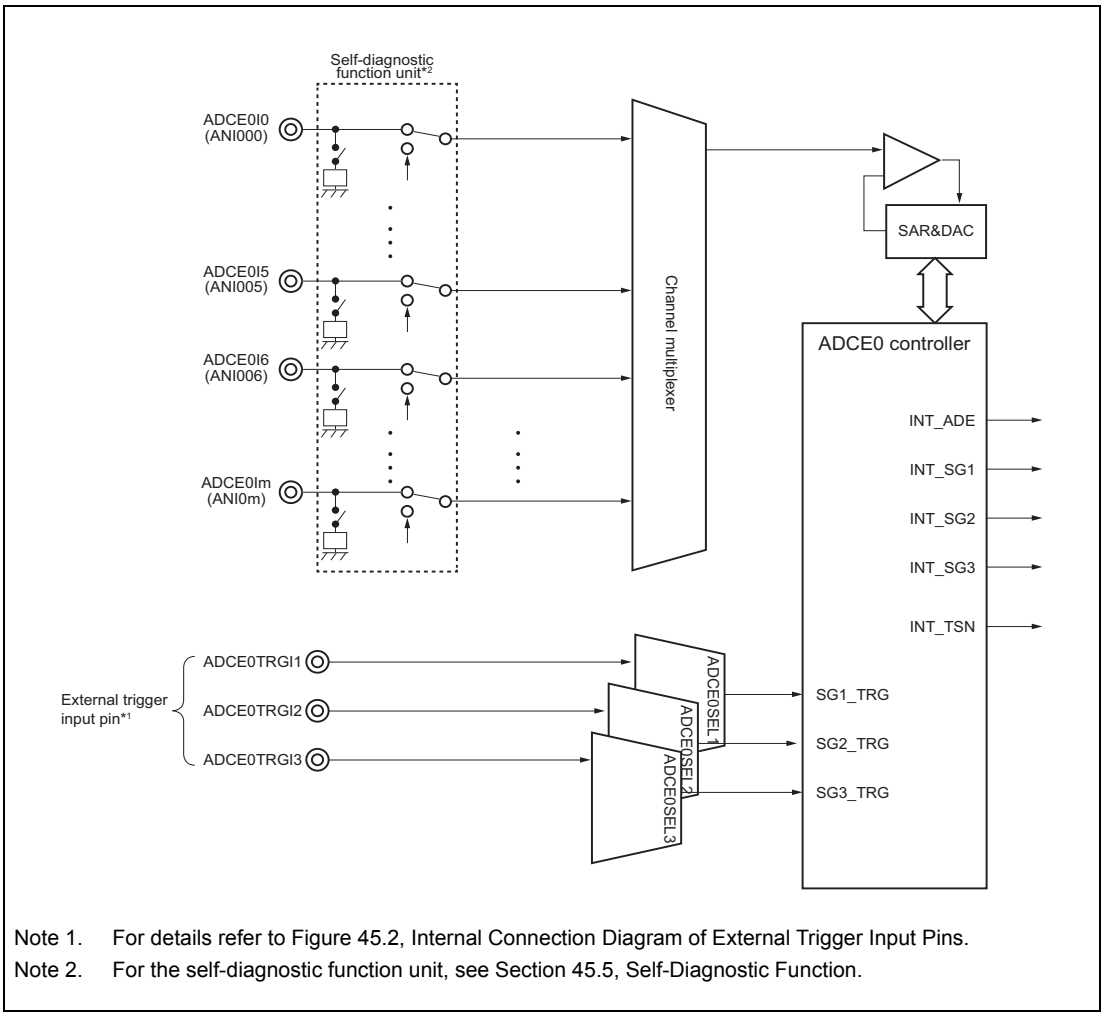
NOTE

- Physical channel (ANInm)
  Each analog input pin is assigned to a specific channel.
- Virtual channel (VCRj)
  ADCE0 has 21 virtual channels. The virtual channel specifies the physical address to be scanned.
  Scans are executed in the order from the small virtual channel number. The scan order can be arbitrarily-specified with using virtual channels. In addition, the scanned result is stored in the data register corresponding to the virtual channel.
- Scan group (SGx)
  ADCE has five scan groups:
  - SG0: dedicated scan group for temperature measurement
  - SG1, SG2, and SG3: general purpose scan group with external analog inputs
  - SG4: dedicated scan group for PWM diagnostic.

45.2.2 Block Diagram

The block diagram of ADCE0 is shown in **Figure 45.1**.

(1) Configuration of ADCE0



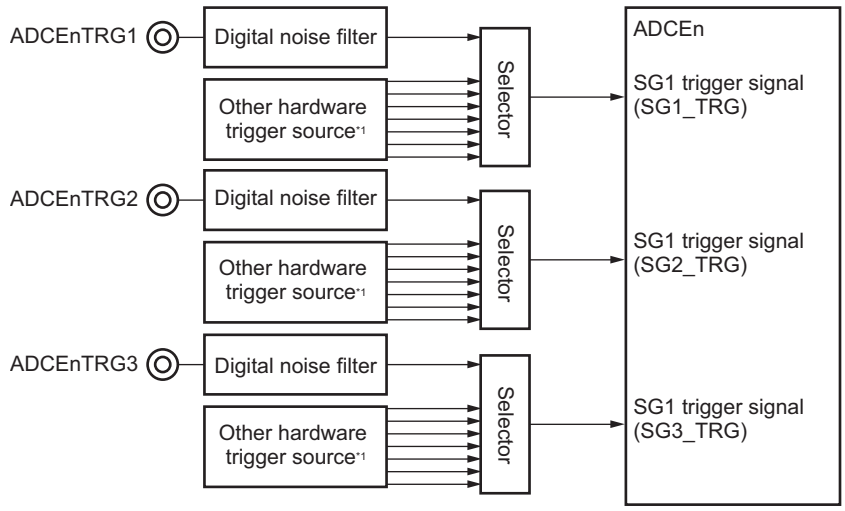
Note 1. For details refer to Figure 45.2, Internal Connection Diagram of External Trigger Input Pins.
Note 2. For the self-diagnostic function unit, see Section 45.5, Self-Diagnostic Function.

Figure 45.1 ADCE0 Block Diagram

(2) Configuration of External Trigger Input Pins

An external trigger input pin is a hardware trigger source to activate ADCEn.

The configuration of external trigger input pins is shown below.

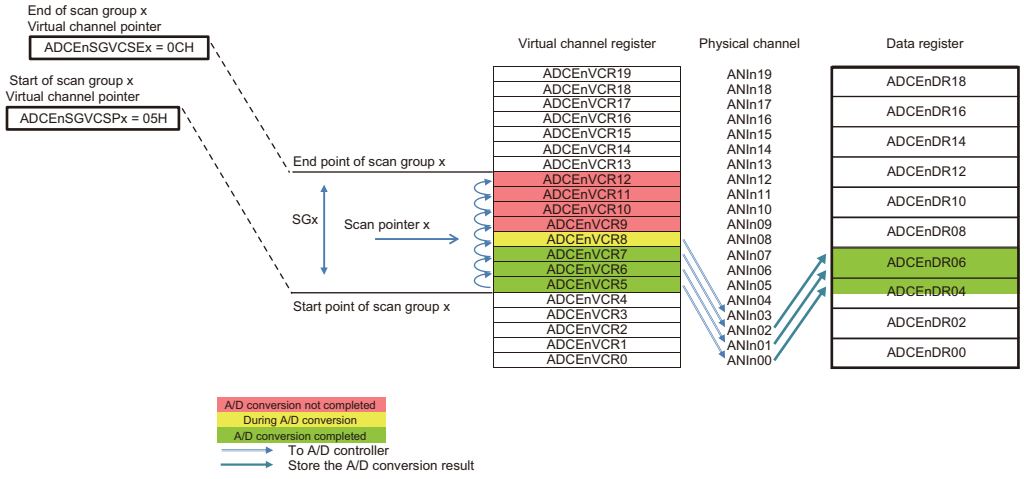


Note 1. As for the hardware trigger sources, refer to Table 45.44, List of A/D Conversion Hardware Triggers.

Figure 45.2 Internal Connection Diagram of External Trigger Input Pins

(3) Virtual Channel

The virtual channel specifies the physical address to be scanned.
The virtual channel is controlled by the ADCEnVCRj register.
A usage example of the virtual channel is shown below.



Example) When scan group x starts scanning 5th to 12th virtual channels

Note 1. The ADCEnVCRj register specifies the physical address (ANInm) to which virtual channel j executes the A/D conversion. The A/D conversion pin can be set in any order. (The figure above shows an example when ANIn0 to ANIn2 are selected.)

Note 2. The scan pointer x reads the physical address specified in the ADCEnVCRj register from “start point of scan group x” to “end point of scan group x”, and starts the A/D conversion for the read physical address.

Note 3. The scanned result of virtual channel j is stored in data register j.

Figure 45.3 Usage Example of Virtual Register

45.3 Registers

45.3.1 List of Registers

ADCE registers are listed in the following table.

Table 45.11 Register Address List (1/2)

Module Name	Register Name	Symbol	Address
• ADCE specific registers (virtual channel)			
	Virtual channel register j	ADCEnVCRj	<ADCEn_base> + j × 4_H
	PWM-Diag virtual channel register	ADCEnPWDVCR	<ADCEn_base> + $0F4_H$
	Temperature Sensor virtual channel register	ADCEnTSNVCR	<ADCEn_base> + $0F0_H$
	Data register j	ADCEnDRj	<ADCEn_base> + 100_H + j × 2_H
	Data supplementary information register j	ADCEnDIRj	<ADCEn_base> + 200_H + j × 4_H
	PWM-Diag/Temperature Sensor data register	ADCEnPWDTSNDR	<ADCEm_base> + 178_H
	PWM-Diag data supplementary information register	ADCEnPWDDIR	<ADCEn_base> + $2F4_H$
	Temperature Sensor data supplementary information register	ADCEnTSNDIR	<ADCEn_base> + $2F0_H$
• ADCE specific registers (control)			
	A/D force halt register	ADCEnADHALTR	<ADCEn_base> + 300_H
	A/D control register	ADCEnADCR	<ADCEn_base> + 304_H
	Sampling control register for SGx and PWM-Diag	ADCEnSMPCR	<ADCEn_base> + 380_H
	Sampling control register for Temperatur Sensor	ADCEnTSNSMPCR	<ADCEn_base> + 384_H
• ADCE specific registers (safety-related)			
	Safety control register	ADCEnSFTCR	<ADCEn_base> + 334_H
	Upper limit/lower limit table register 0	ADCEnULLMTBR0	<ADCEn_base> + 338_H
	Upper limit/lower limit table register 1	ADCEnULLMTBR1	<ADCEn_base> + $33C_H$
	Upper limit/lower limit table register 2	ADCEnULLMTBR2	<ADCEn_base> + 340_H
	Error clear register	ADCEnECR	<ADCEn_base> + 344_H
	Upper limit/lower limit error register	ADCEnULER	<ADCEn_base> + 348_H
	Overwrite error register	ADCEnOWER	<ADCEn_base> + $34C_H$
	Scan Groups Priority level control register	ADCEnSGPRCR	<ADCEn_base> + $38C_H$
• Scan group unique registers			
	Scan Group x start control register	ADCEnSGSTCRx	<ADCEn_base> + x × 40_H + 400_H
	Scan Group x control register	ADCEnSGCRx	<ADCEn_base> + x × 40_H + 408_H
	PWM-Diag scan group control register	ADCEnPWDSGCR	<ADCEn_base> + 508_H
	Temperature Sensor scan group control register	ADCEnTSNSGCR	<ADCEn_base> + 408_H
	Scan Group x start virtual channel pointer	ADCEnSGVCSPx	<ADCEn_base> + x × 40_H + $40C_H$
	Scan Group x end virtual channel pointer	ADCEnSGVCEPx	<ADCEn_base> + x × 40_H + 410_H
	Scan Group x multicycle register	ADCEnSGMCYCRx	<ADCEn_base> + x × 40_H + 414_H
	Scan Group x end flag clear register	ADCEnSGSEFCRx	<ADCEn_base> + x × 40_H + 418_H
	PWM-Diag scan end flag clear register	ADCEnPWDSGSEFCR	<ADCEn_base> + 518_H
	Temperature Sensor end flag clear register	ACDEnTSNSGSEFCR	<ADCEn_base> + 418_H
	Scan Group status register	ADCEnSGSTR	<ADCEn_base> + 308_H

Table 45.11 Register Address List (2/2)

Module Name	Register Name	Symbol	Address
• H/W trigger specific register			
	A/D Conversion SGx trigger select control register	ADCEnSGTSELx	<ADCEn_base> + x × 40_H + $41C_H$
SELB	External interrupts edge selection register	ADCEnINTPEDGCTL	FFC0 $603C_H$
	A/D Conversion temperature measurement trigger select control register	ADCEnTSNSGTSEL	<ADCEn_base> + $41C_H$
• Self-Diagnostic specific registers			
	Self-Diagnostic voltage level control register	ADCEnDGCTL0	<ADCEn_base> + 350_H
	Self-Diagnostic control register	ADCEnDGCTL1	<ADCEn_base> + 354_H
	Pull Down control register 2	ADCEnPDCTL2	<ADCEn_base> + $35C_H$
• Emulation specific register			
	Emulation control register	ADCEnEMU	<ADCEn_base> + 388_H

NOTE

In the header files the names of the above registers are defined in the following format:

<ModuleName> + <Symbol>.

<ModuleName> and <Symbol> are defined in the above table.

Note that index j is representing a double-digit number for this register.

45.3.2 ADCE Specific Registers (Virtual Channel)

45.3.2.1 ADCEnVCRj — Virtual Channel Register j

This register specifies the physical channel to be scanned to the virtual channel.

Access: This register can be read/written in 32/16-bit units
ADCEnVCRj can be read/written in 32-bit units
ADCEnVCRjL can be read/written in 16-bit units

Address: ADCEnVCRj:<ADCEn_base> + j × 4_H
ADCEnVCRjL:<ADCEn_base> + j × 4_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	ADIE	ULS[1:0]		GCTRL[5:0]					
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 45.12 ADCEnVCRj register contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When written, write the initial value.
8	ADIE	A/D Conversion End Interrupt Enable 0: INT_SGx is not output when A/D conversion for the virtual channel ends in SGx. 1: INT_SGx is output when A/D conversion for the virtual channel ends in SGx.
7 to 6	ULS[1:0]	Upper Limit/Lower Limit Table Select 00: Upper limit and lower limit are not checked. 01: Upper limit and lower limit are checked for ADCEnULLMTBR0. 10: Upper limit and lower limit are checked for ADCEnULLMTBR1. 11: Upper limit and lower limit are checked for ADCEnULLMTBR2.
5 to 0	GCTRL[5:0]	Physical Channel Select $0F_H$: Isolated-Area power supply ISOVDD is selected. 10_H to 23_H: Corresponding ANInm is selected. 24_H: Self-diagnostic channel is selected. 25_H: Temperature Sensor output is selected. Others: Setting prohibited **Note:** These bits shall set the physical channel which is supported. See Table 45.9, ADCEn I/O signals.

CAUTION

To prevent malfunction, ADCEnVCRj should be set when SGACT[5:0] of applicable scan groups is 0 (before scan groups are started) and TRGMD of applicable scan groups is 0.

Note that index j is representing a double-digit number for this register.

Table 45.13 Selection of Physical Channels

GCTRL5	GCTRL4	GCTRL3	GCTRL2	GCTRL1	GCTRL0	Analog Input Pin to be Selected
0	1	0	0	0	0	ADCEnI0 (Physical channel ANIn00)
0	1	0	0	0	1	ADCEnI1 (Physical channel ANIn01)
0	1	0	0	1	0	ADCEnI2 (Physical channel ANIn02)
0	1	0	0	1	1	ADCEnI3 (Physical channel ANIn03)

0	0	1	1	1	1	ADCEnI20 (Isolated-Area power supply ISOVDD)
1	0	0	1	0	1	ADCEnI37 (Temperature Sensor output)*1
1	0	0	1	0	0	Self-diagnostic channel
Other than above						Setting prohibited

Note 1. The temperature measurement uses a dedicated virtual channel, that is controlled by a separate register, refer to Section 45.3.2.3, ADCEnTSNVCR — Temperature Sensor Virtual Channel Register.

45.3.2.2 ADCEnPWDVCR — PWM-Diag Virtual Channel Register

This register controls the PWM-Diag virtual channel.

This register is written by the A/D Converter trigger control of the PWM Diagnostic module. Thus this register shows the A/D conversion parameters, sent by the PWM Diagnostic module.

Access: ADCEnPWDVCR can be read only in 32-bit units.
ADCEnPWDVCRL can be read only in 16-bit units.
ADCEnPWDVCRLL can be read only in 8-bit units.

Address: ADCEnPWDVCR: <ADCEn_base> + $0F4_H$
ADCEnPWDVCRL: <ADCEn_base> + $0F4_H$
ADCEnPWDVCRLL: <ADCEn_base> + $0F4_H$

Initial value: $0000\ 0000_H$

Table 45.14 ADCEnPWDVCR register contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, an initial value is returned. Writing is ignored.
7 to 6	ULS[1:0]	Upper Limit/Lower Limit Table selection of PWM Diagnostic A/D conversion 00: Upper limit and lower limit are not checked. 01: Upper limit and lower limit are checked for ADCEnULLMTBR0. 10: Upper limit and lower limit are checked for ADCEnULLMTBR1. 11: Upper limit and lower limit are checked for ADCEnULLMTBR2.
5 to 0	GCTRL[5:0]	Physical channel selection of PWM Diagnostic A/D conversion

CAUTION

To prevent malfunction, ADCEnPWDVCR should be set when SGACT[5:0] of applicable scan groups is 0 (before scan groups are started) and TRGMD of applicable scan groups is 0.

45.3.2.3 ADCEnTSNVCR — Temperature Sensor Virtual Channel Register

This register controls the Temperature Sensor virtual channel.

Access: ADCEnTSNVCR can be read/written in 32-bit units.
ADCEnTSNVCRL can be read/written in 16-bit units.
ADCEnTSNVCRLL can be read/written in 8-bit units.

Address: ADCEnTSNVCR: <ADCEn_base> + $0F0_H$
ADCEnTSNVCRL: <ADCEn_base> + $0F0_H$
ADCEnTSNVCRLL: <ADCEn_base> + $0F0_H$

Initial value: $0000\ 0025_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TSNULS[1:0]		TSNGCTRL[5:0]					
Initial value	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0	1
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 45.15 ADCEnTSNVCR register contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, an initial value is returned. Writing is ignored.
7 to 6	TSNULS[1:0]	Upper Limit/Lower Limit Table selection of temperature measurement A/D Converter trigger control. 00: Upper limit and lower limit are not checked. 01: Upper limit and lower limit are checked for ADCEnULLMTBR0. 10: Upper limit and lower limit are checked for ADCEnULLMTBR1. 11: Upper limit and lower limit are checked for ADCEnULLMTBR2.
5 to 0	TSNGCTRL[5:0]	Physical channel selection of Temperature Sensor. The physical channel number for the Temperature Sensor output is 37, thus set GCTRL[5:0] = 100101_B.

CAUTION

To prevent malfunction, ADCEnTSNVCR should be set when SGACT[5:0] of applicable scan groups is 0 (before scan groups are started) and TRGMD of applicable scan groups is 0.

45.3.2.4 ADCEnDRj — Data Register j

This register is a 32-bit/16-bit read-only register, which stores the A/D conversion results corresponding to ADCEnVCRj and ADCEnVCR(j+1). As the A/D conversion results, the conversion result for ADCEnVCR(j+1) is stored in the upper bits (ADCEnDR(j+1)[15:0]), and the conversion result for ADCEnVCRj is stored in the lower bits (ADCEnDRj[15:0]).

Access: ADCEnDRj can be read only in 32-bit units.
ADCEnDRjL can be read only in 16-bit units.
ADCEnDRjH can be read only in 16-bit units.

Address: ADCEnDRj : <ADCEn_base> + 100H +j × 2_H
ADCEnDRjL : <ADCEn_base> + 100H + j × 2_H
ADCEnDRjH : <ADCEn_base> + 100H + j × 2_H + 2_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DR(j+1)[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DRj[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.16 ADCEnDRj register contents

Bit Position	Bit Name	Function
31 to 16	DR(j+1)[15:0]	These bits are used to store the A/D conversion result data. (The A/D conversion result for the channel set in ADCEnVCR(j+1)are transferred.)
15 to 0	DRj[15:0]	These bits are used to store the A/D conversion result data. (The A/D conversion result for the channel set in ADCEnVCRj are transferred.)

NOTE

By controlling ADCEnADCR.CRAC and ADCEnADCR:CTYP, the data format of this register becomes as follows:

- When ADCEnADCR.CRAC = 0 and ADCEnADCR.CRAC = 0, right alignment is used.→right alignment is used.
  →The A/D conversion result for ADCEnVCR(j+1) is transferred to bits 27 to 16, and the A/D conversion result for ADCEnVCRj is transferred to bits 11 to 0.
- When ADCEnADCR.CTYP = 0 and ADCEnADCR.CRAC = 1, left alignment is used.→left alignment is used.
  →The A/D conversion result for ADCEnVCR(j+1) is transferred to bits 31 to 20, and the A/D conversion result for ADCEnVCRj is transferred to bits 15 to 4.
- When ADCEnADCR.CTYP = 1 and ADCEnADCR.CRAC = 0, right alignment is used.→right alignment is used.
  →The A/D conversion result for ADCEnVCR(j+1) is transferred to bits 25 to 16, and the A/D conversion result for ADCEnVCRj is transferred to bits 9 to 0.
- When ADCEnADCR.CTYP = 1 and ADCEnADCR.CRAC = 1, left alignment is used.→left alignment is used.
  →The A/D conversion result for ADCEnVCR(j+1) is transferred to bits 31 to 22, and the A/D conversion result for ADCEnVCRj is transferred to bits 15 to 6.

Note that index j is representing a double-digit number for this register.

45.3.2.5 ADCEnDIRj — Data Supplementary Information Register j

This register is a 32-bit read-only register, which stores the A/D conversion result for ADCEnDRj and information incidental to the A/D converted value.

As the A/D conversion result, the ADCEnDRj value is transferred. As information incidental to the A/D converted value, information about the write flag (WFLG), and the physical channel (ID[5:0]) is transferred. The data format of the A/D conversion result stored in ADCEnDIRj is the same as the one for the ADCEnDRj register.

Access: This register can be read only in 32-bit units

Address: <ADCEn_base> + 200_H + j × 4_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	WFLG	—	—	—	ID[5:0]					
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.17 ADCEnDIRj register contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When written, write the initial value.
25	WFLG	Write Flag 0: The conversion result DR[15]. has been read via the ADCEnDRj or ADCEnDIRj register. 1: A new A/D conversion result has been stored in DR[15].
24 to 20	Reserved	When written, write the initial value.
21 to 16	ID[5:0]	These bits store the physical channel number (GCTRL) corresponding to the conversion result. The physical channel number to be stored is the number corresponding to the most recent conversion result.
15 to 0	DR[15:0]	These bits are used to store the A/D conversion result.

Note that index j is representing a double-digit number for this register.

45.3.2.6 ADCEnPWDTSNDR — PWM-Diag and temperature measurement Data Register

This register is a 32-bit/16-bit read-only register, which stores the A/D conversion results corresponding to the PWM-Diag and temperature measurement.

As the A/D conversion results, the conversion result for the PWM-Diag (PWDDR[15:0]) is stored in the upper bits.

The conversion result for the temperature measurement (TSNDR[15:0]) is stored in the lower bits.

Access: ADCEnPWDTSNDR can be read only in 32-bit units
ADCEnPWDTSNDRL can be read only in 16-bit units
ADCEnPWDTSNDRH can be read only in 16-bit units

Address: ADCEnPWDTSNDR: <ADCEn_base> + 178_H
ADCEnPWDTSNDRL : <ADCEn_base> + 178_H
ADCEnPWDTSNDRH : <ADCEn_base> + $17A_H$

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PWDDR[15:0]

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSNDR[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.18 ADCEnPWDTSNDR register contents

Bit Position	Bit Name	Function
31 to 16	PWDDR[15:0]	These bits are used to store the A/D conversion result data for the PWM-Diag.
15 to 0	TSNDR[15:0]	These bits are used to store the A/D conversion result data for the temperature measurement.

NOTE

The data format of this register is controlled by ADCEnADCR.CRAC and ADCEnADCR.CTYP, as shown below.

- ADCEnADCR.CTYP = 0, ADCEnADCR.CRAC = 0; right alignment is used.→ right alignment is used.
  → The A/D conversion result for ADCEnPWDVCR is transferred to bits 27 to 16.
- ADCEnADCR.CTYP = 0, ADCEnADCR.CRAC = 1 → left alignment is used.→ left alignment is used.
  → The A/D conversion result for ADCEnPWDVCR is transferred to bits 31 to 20.
- ADCEnADCR.CTYP = 1, ADCEnADCR.CRAC = 0 → right alignment is used.→ right alignment is used.
  → The A/D conversion result for ADCEnPWDVCR is transferred to bits 25 to 16.
- ADCEnADCR.CTYP = 1, ADCEnADCR.CRAC = 1 → left alignment is used.→ left alignment is used.
  → The A/D conversion result for ADCEnPWDVCR is transferred to bits 31 to 22.

45.3.2.7 ADCEnPWDDIR — PWM-Diag Data Supplementary Information Register

This register is a 32-bit read-only register, which stores the A/D conversion result when PWM-Diag is used, and information incidental to the A/D converted value. As the A/D conversion result, the ADCEnPWDTSNDR.PWDDR[15:0] value is transferred. As supplementary information to the A/D converted value, the write flag (WFLG), and physical channel (ID[5:0]) are transferred. The format of the A/D conversion result stored in ADCEnPWDDIR is the same as that of the data in ADCEnPWDTSNDR.PWDDR[15:0].

Access: This register can be read only in 32-bit units

Address: <ADCEn_base> + $2F4_H$

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	WFLG	—	—	—	ID[5:0]					
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PWDDR[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.19 ADCEnPWDDIR Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When written, write the initial value.
25	WFLG	Write Flag 0: ADCEnPWDTSNDR or ADCEnPWDDIR is read (cleared when read). 1: The A/D converted value is stored in ADCEnPWDTSNDR (set when the value is stored).
24 to 22	Reserved	When written, write the initial value.
21 to 16	ID[5:0]	These bits store the physical channel number (GCTRL) corresponding to the conversion result. The physical channel number to be stored is the number corresponding to the most recent conversion result.
15 to 0	PWDDR[15:0]	These bits are used to store the A/D conversion result for PWM-Diag.

45.3.2.8 ADCEnTSNDIR — Temperature Measurement Data Supplementary Information Register

This register is a 32-bit read-only register, which stores the A/D conversion result when temperature measurement is used, and information incidental to the A/D converted value. As the A/D conversion result, the ADCEnPWDTSNDR.TSNDR[15:0] value is transferred. As supplementary information to the A/D converted value, the write flag (WFLG), and physical channel (ID[5:0]) are transferred. The format of the A/D conversion result stored in ADCEnTSNDIRm is the same as that of the data in ADCEnPWDTSNDR.TSNDR[15:0].

Access: This register can be read only in 32-bit units

Address: <ADCEn_base> + $2F0_H$

Initial value: $0025\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	WFLG	—	—	—	ID[5:0]					
Initial value	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSNDR[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.20 ADCEnTSNDIR Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When written, write the initial value.
25	WFLG	Write Flag 0: The conversion result TSNDR[15]. has been read via the ADCEnPWDTSNDR or ADCEnTSNDIR register. 1: A new A/D conversion result has been stored in TSNDR[15].
24 to 22	Reserved	When written, write the initial value.
21 to 16	ID[5:0]	Holds the physical channel number (GCTRL) corresponding to the conversion result. The physical channel number of the temperature measurement is 37, thus ID[5:0] = 100101_B.
15 to 0	TSNDR[15:0]	These bits are used to store the A/D conversion result for temperature measurement.

45.3.3 ADCE Specific Registers (Control)

45.3.3.1 ADCEnADHALTR — A/D Force Halt Register

This register is a 32/16/8-bit write-only register, which halts conversion for all SGs of ADCEn. The read value is always 0

Access: This register can be written only in 32/16/ 8-bit units
ADCEnADHALTR can be written only in 32-bit units
ADCEnADHALTRL can be written only in 16-bit units
ADCEnADHALTRLL can be written only in 8-bit units

Address: ADCEnADHALTR:<ADCEn_base> + 300_H
ADCEnADHALTRL:<ADCEn_base> + 300_H
ADCEnADHALTRLL:<ADCEn_base> + 300_H

Initial value: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value																
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HALT
Initial value																
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 45.21 ADCEnADHALTR register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, an undefined value is returned. The write value should be 0.
0	HALT	ADCE Force Halt Trigger All scan groups are halted and initialized, and ADCE becomes idle state. Writing of 0: No effect Writing of 1: Scan groups are halted.

45.3.3.2 ADCEnADCR — A/D Control Register

This register provides common control settings for all channels and scan groups.

Access: ADCEnADCR can be read/written in 32-bit units
ADCEnADCRL can be read/written in 16-bit units
ADCEnADCRLL can be read/written in 8-bit units

Address: ADCEnADCR: <ADCEn_base> + 304_H
ADCEnADCRL: <ADCEn_base> + 304_H
ADCEnADCRLL: <ADCEn_base> + 304_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DGON	TSN SELF DIAG	CRAC	CTYP	—	—	SUSMTD[1:0]	
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R/W	R/W

Table 45.22 ADCEnADCR Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When written, write the initial value.
7	DGON	Self-Diagnostic Voltage Standby Control 0: The self-diagnostic voltage circuit is turned off. 1: The self-diagnostic voltage circuit is turned on.
6	TSNSELFDIAG	Temperature Sensor self-diagnostic control 0: Temperature Sensor self-diagnostic is turned off. 1: Temperature Sensor self-diagnostic is turned on.
5	CRAC	Alignment Control 0: PWDDR[15:0] and ADCEnDRj are set to right align. 1: PWDDR[15:0] and ADCEnDRj are set to left align.
4	CTYP	12/10 Bit Select Mode 0: 12-bit mode 1: 10-bit mode
3, 2	Reserved	When written, write the initial value.
1, 0	SUSMTD [1:0]	Suspend Mode Select Selects the suspend method. 00_B: Synchronous suspend when a higher-priority SG or SVSTOP is generated 01_B: SG0 (TSN) and SG1 are suspended asynchronously, other scan groups are suspended synchronously. SVSTOP always interrupts synchronously. 10_B: Asynchronous suspend when a higher-priority SG or SVSTOP interrupts. 11_B: Setting prohibited

CAUTION

To prevent malfunction, perform the ADCEnADCR settings when SGACT[5:0] of all scan groups is 0 (before scan groups are started), and TRGMD of all scan groups is 0.

NOTE

Suspend Method
These bits are used to select the suspend method used when a higher-priority scan group interrupts a lower-priority scan group.

- Synchronous suspend:
  If a request from a higher-priority SG occurs while a lower-priority SG is being processed, the A/D conversion for the higher-priority SG is performed after the ongoing A/D conversion of a channel is completed. After processing for the higher-priority SG is completed, the suspended channel processing for the lower-priority SG is resumed.
- Asynchronous suspend:
  If a request from a higher-priority SG occurs while a lower-priority SG is being processed, the ongoing channel processing is suspended, and then the A/D conversion for the higher-priority SG is performed. After processing for the higher-priority SG is completed, the suspended A/D channel conversion for the lower-priority SG is resumed.

For details, see Figure 45.14, Example of Synchronous Suspend and Resume Operation and Figure 45.15, Example of Asynchronous Suspend and Resume Operation.

45.3.3.3 ADCEnSMPCR — Sampling Control Register for SGx and PWM-Diag

This register selects the sampling time of the general purpose scan groups SGx and the PWM-Diag scan group SG4.

Access: ADCEnSMPCR can be read or written in 32-bit units.
ADCEnSMPCRL can be read or written in 16-bit units.
ADCEnSMPCRLL can be read or written in 8-bit units.

Address: ADCEnSMPCR: <ADCEn_base> + 380_H
ADCEnSMPCRL: <ADCEn_base> + 380_H
ADCEnSMPCRLL: <ADCEn_base> + 380_H

Initial value: 0000 0018_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 45.23 ADCEnSMPCR register contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When written, write the initial value.
7 to 0	SMPT[7:0]	These bits are used to set the sampling time (the number of CLKAD cycles). 12_H: 18 cycles (CLKAD = 8 MHz to 32 MHz) 18_H: 24 cycles (CLKAD = 8 MHz to 40 MHz) Settings other than above are prohibited.

CAUTION

To prevent malfunction, perform ADCETLnSMPCR settings when SGACT[5:0] of all scan groups is 0 (before scan groups are started), and TRGMD of all scan groups is 0.

45.3.3.4 ADCEnTSNSMPCR — Sampling Control Register for Temperature Sensor

This register selects the sampling time of the temperature measurement.

Access: ADCEnTSNSMPCR can be read or written in 32-bit units.
ADCEnTSNSMPCRL can be read or written in 16-bit units.
ADCEnTSNSMPCRLL can be read or written in 8-bit units.

Address: ADCEnTSNSMPCR: <ADCEn_base> + 384_H
ADCEnTSNSMPCRL: <ADCEn_base> + 384_H
ADCEnTSNSMPCRLL: <ADCEn_base> + 384_H

Initial value: 0000 $00F0_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 45.24 ADCEnTSNSMPCR register contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When written, write the initial value.
7 to 0	TSNSMPT[7:0]	These bits are used to set the sampling time (the number of CLKAD cycles). The sampling time for the temperature measurement must be 6 µs. Examples: • for CLKAD = 40 MHz: 6.0 µs = 240/40 MHz, thus SMPT[7:0] = $F0_H$ • for CLKAD = 32 MHz: 6.0 µs = 192/32 MHz, thus SMPT[7:0] = $C0_H$ • C0H: 192 cycles, sampling time = 6.0 µs with CLKAD = 32 MHz

CAUTION

To prevent malfunction, perform ADCETLnTSNSMPCR settings when SGACT[5:0] of all scan groups is 0 (before scan groups are started), and TRGMD of all scan groups is 0.

45.3.4 ADCE Specific Registers (Safety-related)

45.3.4.1 ADCEnSFTCR — Safety Control Register

This register is a register regarding safety control.

Access: ADCEnSFTCR can be read or written in 32-bit units.
ADCEnSFTCRL can be read or written in 16-bit units.
ADCEnSFTCRLL can be read or written in 8-bit units.

Address: ADCEnSFTCR: <ADCEn_base> + 334_H
ADCEnSFTCRL: <ADCEn_base> + 334_H
ADCEnSFTCRLL: <ADCEn_base> + 334_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	RDCLRE	ULEIE	OWEIE	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R

Table 45.25 ADCEnSFTCR register contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When written, write the initial value.
4	RDCLRE	Read & Clear Enable When the A/D conversion result is read, this bit selects whether the A/D conversion result is cleared by hardware. 0: ADCEnPWDTSNDR/ADCEnDRj and ADCEnPWDDIR/ADCEnTSNDIR/ADCEnDIRj are not cleared when ADCEnPWDTSNDR/ADCEnDRj or ADCEnPWDDIR/ADCEnTSNDIR/ADCEnDIRj is read. 1: ADCEnPWDTSNDR/ADCEnDRj and ADCEnPWDDIR/ADCEnTSNDIR/ADCEnDIRj are cleared when ADCEnPWDTSNDR/ADCEnDRj or ADCEnPWDDIR/ADCEnTSNDIR/ADCEnDIRj is read. **CAUTION** WFLG of ADCEnDIRj is cleared when ADCEnDRj or ADCEnDIRj is read.
3	ULEIE	Upper Limit/Lower Limit Error Interrupt Enable 0: Disabled 1: Enabled
2	OWEIE	Overwrite Error Interrupt Enable 0: Disabled 1: Enabled
1, 0	Reserved	When written, write the initial value.

CAUTION

To prevent malfunction, perform the ADCEnSFTCR settings when SGACT[5:0] of all scan groups is 0 (before scan groups are started), and TRGMD of all scan groups is 0.

45.3.4.2 ADCEnULLMTBR0 to 2 — Upper Limit/Lower Limit Table Register 0 to 2

These registers are used to set the upper limit and lower limit of an A/D converted value. Any of ADCEnULLMTBR0 to ADCEnULLMTBR2 is specified by setting ADCEnPWDVCR.ULS[1:0] and ADCEnVCRj.USL[1:0] and compared with ADCEnPWDTSNDR and ADCEnDRj.

Access: This register can be read or written in 32-bit units

Address: ADCEnULLMTBR0: <ADCEn_base> + 338_H
ADCEnULLMTBR1: <ADCEn_base> + $33C_H$
ADCEnULLMTBR2: <ADCEn_base> + 340_H

Initial value: $FFF0\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ULMTB[11:0]												—	—	—	—
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LLMTB[11:0]												—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 45.26 ADCEnULLMTBR register contents

Bit Position	Bit Name	Function
31 to 20	ULMTB[11:0]	Upper Limit Table Specify the upper limit of an A/D converted value. The upper limit error (ADCEnULER.UE) is set when the following condition is met: ULMTB[11:0] < A/D converted value
19 to 16	Reserved	When written, write the initial value.
15 to 4	LLMTB[11:0]	Lower Limit Table Specify the lower limit of A/D converted value. The lower limit error (ADCEnULER.LE) is set when the following condition is met: LLMTB[11:0] > A/D converted value
3 to 0	Reserved	When written, write the initial value.

CAUTION

- When A/D conversion is executed in 10-bit mode (ADCEnADCR.CTYP=1), ULMTB[1:0] and LLMTB[1:0] should be set to 11_B and 00_B, respectively.
- To prevent malfunction, perform the settings of ADCEnULLMTBRn when SGACT[5:0] of all scan groups that use the corresponding table (n) is 0 (before the scan groups are started), and TRGMD of all this scan groups is 0.
- The upper-limit table (ULMTB[11:0]) must be greater than the lower-limit table (LLMTB[11:0]).

45.3.4.3 ADCEnECR — Error Clear Register

This register controls error clear. The read value is always 0.

Access: ADCEnECR can be written in 32-bit units.
ADCEnECRL can be written in 16-bit units.
ADCEnECRLL can be written in 8-bit units.

Address: ADCEnECR: <ADCEn_base> + 344_H
ADCEnECRL: <ADCEn_base> + 344_H
ADCEnECRLL: <ADCEn_base> + 344_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	ULEC	OWEC	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 45.27 ADCEnECR register contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, an undefined value is returned. The write value should be 0.
3	ULEC	ULEC clear the error flags. ULEC affect to following error flags. • Upper Limit Error Flag (ADCEnULER.UE) • Lower Limit Error Flag (ADCEnULER.LE) • Upper/Lower Limit Error Capture Bits (ADCEnULER.ULECAP[5:0]) • Scan Group Bits (ADCEnULE.ULSG[1:0]) Writing of 0: No effect. Writing of 1: Cleared.
2	OWEC	OWEC clear the overwrite error flags. OWEC affect to following flags. • Overwrite Error (ADCEnOWER.OWE) • Overwrite Error (ADCEnOWER.OWECAP[5:0]) Writing of 0: No effect. Writing of 1: Cleared.
1, 0	Reserved	When read, the value returned is 0.

45.3.4.4 ADCEnULER — Upper Limit/Lower Limit Error Register

This register is a 32/16-bit read-only register, which indicates the upper limit/lower limit errors.

Access: ADCEnULER can be read only in 32-bit units.
ADCEnULERL can be read only in 16-bit units.

Address: ADCEnULER: <ADCEn_base> + 348_H
ADCEnULERL: <ADCEn_base> + 348_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UE	LE	ULSG[1:0]		—	—	—	—	—	—	ULECAP[5:0]					
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.28 ADCEnULER register contents (1/2)

Bit Position	Bit Name	Function
31 to 16	Reserved	When written, write the initial value.
15	UE	Upper Limit Error Generation Flag 0: No upper limit error 1: Upper limit error. Setting condition: The A/D converted value exceeds the range of the specified upper limit table. Clearing condition: 1 is written to ADCEnECR.ULEC.
14	LE	Lower Limit Error Generation Flag 0: No lower limit error 1: Lower limit error. Setting condition: The A/D converted value exceeds the range of the specified lower limit table. Clearing condition: 1 is written to ADCEnECR.ULEC.
13, 12	ULSG[1:0]	Scan Group where an Upper Limit/Lower Limit Error Occurs 00: No upper limit/lower limit error occurred. 01: A scan group where an upper limit/lower limit error occurred is SG1 to SG3. 10: A scan group where an upper limit/lower limit error occurred is SG4 (PWM-Diag). 11: A scan group where an upper limit/lower limit error occurred is SG0 (TSN) Capturing condition: When the A/D converted value exceeds the range of the specified upper- or lower-limit table while UE = 0 and LE = 0. Clearing condition: 1 is written to ADCEnECR.ULEC.
11 to 7	Reserved	When written, write the initial value.
6	Reserved	When written, write the initial value.

Table 45.28 ADCEnULER register contents (2/2)

Bit Position	Bit Name	Function
5 to 0	ULECAP[5:0]	Upper Limit/Lower Limit Error Capture The physical channel is captured when an upper limit/lower limit error occurred. Capturing condition: When the A/D converted value exceeds the range of the specified upper- or lower-limit table while UE = 0 and LE = 0. Clearing condition: 1 is written to ADCEnECR.ULEC.

CAUTION

ADCEnULER is updated when the A/D converted value is written to ADCEnDRj or ADCEnPWDTSNDR.

45.3.4.5 ADCEnOWER — Overwrite Error Register

This register is a 32/16/8-bit read-only register, which indicates an overwrite error. The target of an overwrite error is SG0 (TSN), SG1 to SG3, and not SG4 (PWM-Diag).

Access: ADCEnOWER can be read in 32-bit units.
ADCEnOWERL can be read in 16-bit units.
ADCEnOWERLL can be read in 8-bit units.

Address: ADCEnOWER: <ADCEn_base> + $34C_H$
ADCEnOWERL: <ADCEn_base> + $34C_H$
ADCEnOWERLL: <ADCEn_base> + $34C_H$

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	OWE	—	OWECAP[5:0]					
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.29 ADCEnOWER register contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When written, write the initial value.
7	OWE	Overwrite Error Generation Flag 0: No Error 1: There is an error. Setting condition: WFLG = 1, and the A/D converted value is written to ADCEnDRj and ADCEnPWDTSNDR.TSNDR[15:0]. Clearing condition: 1 is written to OWEC.
6	Reserved	When written, write the initial value.
5 to 0	OWECAP[5:0]	Overwrite Error Capture The virtual channel is captured when an overwrite error occurs. Capturing condition: OWE = 0 and WFLG = 1, and the A/D converted value is written to ADCEnDRj and ADCEnPWDTSNDR.TSNDR[15:0]. Clearing condition: 1 is written to OWEC.

CAUTION

ADCEnOWER is updated when the A/D converted value is written to ADCEnDRj or ADCEnPWDTSNDR.TSNDR[15:0].

45.3.4.6 ADCEnSGPRCR — Scan Groups Priority Level Control Register

This register selects the priority level order of the scan groups.

Access: ADCEnSGPRCR can be read/written in 32-bit units.

Address: <ADCEn_base> + $38C_H$

Initial value: 0004 3210_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	SGPR[18:16]		
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SGPR[15:0]															
Initial value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 45.30 ADCEnOWER register contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When written, write the initial value.
18 to 0	SGPR[18:0]	Scan groups priority selection 43210_H: priority order SG4 (PWM-Diag) > SG3 > SG2 > SG1 > SG0 (temperature measurement) 32401_H: priority order SG3 > SG2 > SG4 (PWM-Diag) > SG0 (temperature measurement) > SG1 All others: Setting prohibited

45.3.5 Scan Group (SG) Unique Registers

This section describes the registers provided for each scan group.

45.3.5.1 ADCEnSGSTCRx — Scan Group x Start Control Register

This register is an 32/16/8-bit write-only register, which controls the start of scan group x. The read value is always 0.

Access: ADCEnSGSTCRx can be written in 32-bit units.
ADCEnSGSTCRxL can be rwritten in 16-bit units.
ADCEnSGSTCRxLL can be written in 8-bit units.

Address: ADCEnSGSTCRx: <ADCEn_base> + 400_H + x × 40_H
ADCEnSGSTCRxL: <ADCEn_base> + 400_H + x × 40_H
ADCEnSGSTCRxLL: <ADCEn_base> + 400_H + x × 40_H

Initial value: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value																
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SGST
Initial value																
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 45.31 ADCEnSGSTCRx register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, an undefined value is returned. The write value should be 0.
0	SGST	Scan Group Start Trigger Condition of starting scan group x: SGACT[5:0] = 0, and 1 is written to SGST.

45.3.5.2 ADCEnSGCRx — Scan Group x Control Register

This register controls scan group x.

Access: ADCEnSGCRx can be read or written in 32-bit units.
ADCEnSGCRxL can be read or written in 16-bit units.
ADCEnSGCRxLL can be read or written in 8-bit units.

Address: ADCEnSGCRx: <ADCEn_base> + x × 40_H + 408_H
ADCEnSGCRxL: <ADCEn_base> + x × 40_H + 408_H
ADCEnSGCRxLL: <ADCEn_base> + x × 40_H + 408_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	SCANMD	ADIE	SCT[1:0]		—	TRGMD
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W

Table 45.32 ADCEnSGCRx register contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When written, write the initial value.
5	SCANMD	Scan Mode 0: Multicycle scan mode 1: Continuous scan mode
4	ADIE	Scan End Interrupt Enable 0: INT_SGx is not output when the scan for SGx ends. 1: INT_SGx is output when the scan for SGx ends.
3 to 2	SCT[1:0]	Channel repeat times selection bit 00: The selected number of channel repeat times is one. 01: The selected number of channel repeat times is two. 10: The selected number of channel repeat times is four. 11: Setting prohibited
1	Reserved	When written, write the initial value.
0	TRGMD	Trigger Mode 0: Trigger input to SGx_TRG is disabled (Hardware trigger disabled). 1: SGx_TRG start trigger is selected for the trigger input to SGx. **NOTE** The software trigger is valid regardless of the TRGMD bit setting.

CAUTION

To prevent malfunction, ADCEnSGCRx should be set (except clearing TRGMD upon completion of AD conversion) when SGACT[5:0] of all scan groups are 0 (before the scan group is started) and TRGMD of all scan group is 0.

45.3.5.3 ADCEnPWDSGCR — PWM-Diag Scan Group Control Register

This register is a 32/16/8-bit read/write register, which controls PWM-Diag.

Access: ADCEnPWDSGCR can be read or written in 32-bit units.
ADCEnPWDSGCRL can be read or written in 16-bit units.
ADCEnPWDSGCRLL can be read or written in 8-bit units.

Address: ADCEnPWDSGCR: <ADCEn_base> + 508_H
ADCEnPWDSGCRL: <ADCEn_base> + 508_H
ADCEnPWDSGCRLL: <ADCEn_base> + 508_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PWDTRGMD
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 45.33 ADCEnPWDSGCR register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When written, write the initial value.
0	PWDTRGMD	PWM-Diag Trigger Mode Select 0: PVCR_TRG trigger input is disabled. 1: PVCR_TRG is selected for the trigger input to the PWM-Diag scan group.

CAUTION

To prevent malfunction, perform ADCEnPWDSGCR settings when SGACT4 of the PWM-Diag scan group (SG4) is 0 (before the scan group is started), and PWDTRGMD of the PWM-Diag scan group is 0.

45.3.5.4 ADCEnTSNSGCR — Temperature Measurement Scan Group Control Register

This register is a 32/16/8-bit read/write register, which controls the Temperatur Sensor.

Access: ADCEnPWDSGCR can be read or written in 32-bit units.
ADCEnPWDSGCRL can be read or written in 16-bit units.
ADCEnPWDSGCRLL can be read or written in 8-bit units.

Address: ADCEnPWDSGCR: <ADCEn_base> + 408_H
ADCEnPWDSGCRL: <ADCEn_base> + 408_H
ADCEnPWDSGCRLL: <ADCEn_base> + 408_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TSNTRGMD
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 45.34 ADCEnTSNSGCR register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When written, write the initial value.
0	TSNTRGMD	Temperature Sensor Trigger Mode Select 0: TVCR_TRG trigger input is disabled. 1: TVCR_TRG is selected for the trigger input to the temperature measurement scan group.

CAUTION

To prevent malfunction, perform ADCEnTSNSGCR settings when SGACT0 of the temperature measurement scan group (SG0) is 0 (before the scan group is started), and TSNTRGMD of the Temperature Sensor scan group is 0.

45.3.5.5 ADCEnSGVCSPx — Scan Group x Start Virtual Channel Pointer

This register specifies the start pointer of a virtual channel.

Access: ADCEnSGVCSPx can be read or written in 32-bit units.
ADCEnSGVCSPxL can be read or written in 16-bit units.
ADCEnSGVCSPxLL can be read or written in 8-bit units.

Address: ADCEnSGVCSPx: <ADCEn_base> + x × 40_H + $40C_H$
ADCEnSGVCSPxL: <ADCEn_base> + x × 40_H + $40C_H$
ADCEnSGVCSPxLL: <ADCEn_base> + x × 40_H + $40C_H$

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 45.35 ADCEnSGVCSPx register contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When written, write the initial value.
5 to 0	VCSP[5:0]	Start Virtual Channel Pointer These bits are used to select the virtual channel from which the scan is to be started.

CAUTION

- ADCEnSGVCSPx must be equal to or smaller than ADCEnSGVCEPx.
- When writing to the channel pointers, be sure to write in the following order: ADCEnSGVCSPx → ADCEnSGVCEPx. When SGx is started, the A/D conversion for the virtual channels within the range specified in ADCEnSGVCSPx and ADCEnSGVCEPx is executed.
- Though ADCEnSGVCSPx can be rewritten during the A/D conversion, the register is updated at the time ADCEnSGVCEPx is written. The new setting is applied when SGn is started next time.
- When the hardware trigger is used, writing to this register during operation is prohibited.

45.3.5.6 ADCEnSGVCEPx — Scan Group x End Virtual Channel Pointer

This register specifies the start pointer of a virtual channel.

Access: ADCEnSGVCEPx can be read or written in 32-bit units.
ADCEnSGVCEPxL can be read or written in 16-bit units.
ADCEnSGVCEPxLL can be read or written in 8-bit units.

Address: ADCEnSGVCEPx: <ADCEn_base> + x × 40_H + 410_H
ADCEnSGVCEPxL: <ADCEn_base> + x × 40_H + 410_H
ADCEnSGVCEPxLL: <ADCEn_base> + x × 40_H + 410_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 45.36 ADCEnSGVCEPx register contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When written, write the initial value.
5 to 0	VCEP[5:0]	End Virtual Channel Pointer These bits are used to select the virtual channel at which the scan is to be ended.

CAUTION

- ADCEnSGVCSPx must be equal to or smaller than ADCEnSGVCEPx.
- When SGx is started, processing for the virtual channels within the range specified in ADCEnSGVCSPx and ADCEnSGVCEPx is executed.
  ADCEnSGVCEPx can be rewritten even when SGx is being processed. The new setting is applied when SGx is started next time.

45.3.5.7 ADCEnSGMCYCRx — Scan Group x Multicycle Register

This register is a 32/16/8-bit read/write register, which indicates the number of times for scanning in multicycle scan mode.

Access: ADCEnSGMCYCRx can be read or written in 32-bit units.
ADCEnSGMCYCRxL can be read or written in 16-bit units.
ADCEnSGMCYCRxLL can be read or written in 8-bit units.

Address: ADCEnSGMCYCRx: <ADCEn_base> + x × 40_H + 414_H
ADCEnSGMCYCRxL: <ADCEn_base> + x × 40_H + 414_H
ADCEnSGMCYCRxLL: <ADCEn_base> + x × 40_H + 414_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 45.37 ADCEnSGMCYCRx register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When written, write the initial value.
1, 0	MCYC[1:0]	Multicycle Specification These bits are used to specify the number of times for scanning in multicycle scan mode. 00_B: Number of scans = 1 01_B: Number of scans = 2 10_B: Setting prohibited 11_B: Number of scans = 4

CAUTION

- To prevent malfunction, perform the ADCEnSGMCYCRx settings when SGACT[5:0] of scan group x is 0 (before the scan group is started), and TRGMD is 0.
- When SGx is started, the scan for the virtual channels within the range specified in ADCEnSGVCSPx and ADCEnSGVCEPx is repeatedly executed as many times as specified in ADCEnSGMCYCRx.

45.3.5.8 ADCEnSGSEFCRx — Scan Group x Scan End Flag Clear Register

This register is a write-only register, which controls the scan end flag (SEFx). The read value is always 0.

Access: ADCEnSGSEFCRx can be written in 32-bit units.
ADCEnSGSEFCRxL can be written in 16-bit units.
ADCEnSGSEFCRxLL can be written in 8-bit units.

Address: ADCEnSGSEFCRx: <ADCEn_base> + x × 40_H + 418_H
ADCEnSGSEFCRxL: <ADCEn_base> + x × 40_H + 418_H
ADCEnSGSEFCRxLL: <ADCEn_base> + x × 40_H + 418_H

Initial value: Undefined

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, an undefined value is returned. The write value should be 0.
0	SEFC	Scan End Flag Clear Trigger Writing of 0: No effect. Writing of 1: The flag is cleared.

45.3.5.9 ADCEnPWDSGSEFCR — PWM-Diag Scan End Flag Clear Register

This register is a 32/16/8-bit write-only register, which controls the clearing of PWM-Diag scan end flag (SEF4). The bits are always read as 0.

Access: ADCEnPWDSGSEFCR can be written in 32-bit units.
ADCEnPWDSGSEFCRL can be written in 16-bit units.
ADCEnPWDSGSEFCRLL can be written in 8-bit units.

Address: ADCEnPWDSGSEFCR: <ADCEn_base> + 518_H
ADCEnPWDSGSEFCRL: <ADCEn_base> + 518_H
ADCEnPWDSGSEFCRLL: <ADCEn_base> + 518_H

0	PWDSEFC	PWM-Diag Scan End Flag Clear Trigger 0: No effect. 1: The scan end flag is cleared.

45.3.5.10 ADCEnTSNSGSEFCR — Temperature Sensor Scan End Flag Clear Register

This register is a write-only register, which controls the scan end flag (SEF0). The read value is always 0.

Access: ADCEnTSNSGSEFCR can be written in 32-bit units.
ADCEnTSNSGSEFCRL can be written in 16-bit units.
ADCEnTSNSGSEFCRLL can be written in 8-bit units.

Address: ADCEnTSNSGSEFCR: <ADCEn_base> + 418_H
ADCEnTSNSGSEFCRL: <ADCEn_base> + 418_H
ADCEnTSNSGSEFCRLL: <ADCEn_base> + 418_H

31 to 1	Reserved	When read, an undefined value is returned. The write value should be 0.
0	TSNSEFC	Temperature Sensor Scan End Flag Clear Trigger Writing of 0: No effect. Writing of 1: The flag is cleared.

45.3.5.11 ADCEnSGSTR — Scan Group Status Register

This register is a 32/16-bit read-only register, which indicates the statuses of scan group SGx, and PWM-Diag scan group SG4 and the Temperature Sensor scan group SG0. It is initialized to $0000\ 0000_H$ at reset. The SGACT[5:0] bits are cleared when HALT is executed.

Access: This register can be read only in 32/16-bit units
ADCEnSGSTR can be read only in 32-bit units
ADCEnSGSTRL can be read only in 16-bit units

Address: ADCEnSGSTR:<ADCEm_base> + 308_H
ADCEnSGSTRL:<ADCEm_base> + 308_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 45.41 ADCEnSGSTR register contents (1/2)

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, an initial value is returned. Writing is ignored.
13	SGACT[5]	SVSTOP Status Flag 0: SVSTOP is canceled. 1: SVSTOP is accepted.
12	SGACT[4]	PWM-Diag Scan Group (SG4) Status Flag 0: A/D conversion for PWM-Diag (SG4) is completed. 1: A/D conversion for PWM-Diag (SG4) is in processing or suspension.
11	SGACT[3]	Scan Group 3 (SG3) Status Flag 0: A/D conversion for SG3 is completed. 1: A/D conversion for SG3 is in processing or suspension.
10	SGACT[2]	Scan Group 2 (SG2) Status Flag 0: A/D conversion for SG2 is completed. 1: A/D conversion for SG2 is in processing or suspension.
9	SGACT[1]	Scan Group 1 (SG1) Status Flag 0: A/D conversion for SG1 is completed. 1: A/D conversion for SG1 is in processing or suspension.
8	SGACT[0]	Temperature Sensor Scan Group 0 (SG0) Status Flag 0: A/D conversion for SG0 is completed. 1: A/D conversion for SG0 is in processing or suspension.
8 to 5	Reserved	When written, write the initial value.
4	SEF[4]	PWM-Diag Scan End Flag Indicates the status of the scan result data. 0: The flag is cleared when any of the following operations is performed: – ADCEnPWDTSNDR for PMW-Diag/Temperature Sensor is read. – ADCEnPWDDIR for PWM-Diag is read. – ADCEnPWDSGSEFCR.PWDSEFC is written as 1. 1: The A/D conversion result is written to ADCEnPWDTSNDR.PWDDR[15:0] for PWM-Diag.

Table 45.41 ADCEnSGSTR register contents (2/2)

Bit Position	Bit Name	Function
3	SEF[3]	SG3 Scan End Flag Indicates the status of the scan result data. 0: The flag is cleared when any of the following operations is performed: – ADCEnDRj for the virtual channel which ADCEnSGVCEP3 indicates is read. – ADCEnDIRj for the virtual channel which ADCEnSGVCEP3 indicates is read. – ADCEnSGSEFCRx.SEFC is written as 1. 1: The A/D conversion result is written to ADCEnDRj for the virtual channel which ADCEnSGVCEP3 indicates.
2	SEF[2]	SG2 Scan End Flag Indicates the status of the scan result data. 0: The flag is cleared when any of the following operations is performed: – ADCEnDRj for the virtual channel which ADCEnSGVCEP2 indicates is read. – ADCEnDIRj for the virtual channel which ADCEnSGVCEP2 indicates is read. – ADCEnSGSEFCRx.SEFC is written as 1. 1: The A/D conversion result is written to ADCEnDRj for the virtual channel which ADCEnSGVCEP2 indicates.
1	SEF[1]	SG1 Scan End Flag Indicates the status of the scan result data. 0: The flag is cleared when any of the following operations is performed: – ADCEnDRj for the virtual channel which ADCEnSGVCEP1 indicates is read. – ADCEnDIRj for the virtual channel which ADCEnSGVCEP1 indicates is read. – ADCEnSGSEFCRx.SEFC is written as 1. 1: The A/D conversion result is written to ADCEnDRj for the virtual channel which ADCEnSGVCEP1 indicates.
0	SEF[0]	Temperature Sensor Scan End Flag Indicates the status of the scan result data. 0: The flag is cleared when any of the following operations is performed: – ADCEnPWDTSNDR for PMW-Diag/Temperature Sensor is read. – ADCEnTSNDIR for temperature sensor is read. – ADCEnTSNSGSEFCR.TSNSEFC is written as 1. 1: The A/D conversion result is written to ADCEnPWDTSNDR.TSNDR[15:0] for temperature measurement.

45.3.6 Hardware Trigger Specific Register

45.3.6.1 ADCEnSGTSELx — A/D Conversion Trigger Select Control Register

This register is a 32/16-bit read/write register, which controls the A/D conversion trigger (H/W trigger) selection for SGx_TRG.

Access: ADCEnSGTSELx can be read or written in 32-bit units.
ADCEnSGTSELxL can be read or written in 16-bit units.

Address: ADCEnSGTSELx: <ADCEn_base> + x × 40_H + $41C_H$
ADCEnSGTSELxL: <ADCEn_base> + x × 40_H + $41C_H$

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 45.42 ADCEnSGTSELx Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, an undefined value is returned. The write value should be 0.
15 to 0	TxSEL[15:0]	A/D Conversion Trigger (Hardware Trigger) Select 0: Hardware trigger is disabled. 1: Hardware trigger is enabled. **CAUTION** When setting TxSELp to 1, set only one of the bits to 1 .

45.3.6.2 ADCEnINTPEDGCTL — External interrupts edge selection Register

This register is used to select the edge of the external interrupts INTP0 to INTP2, which shall trigger an A/D conversion.

Access: This register can be read or written in 32-bit units.

Address: FFC0 603C$_H$

Initial value: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CAUTION

To prevent malfunction, perform ADCEnSGTSELx settings when SGACT[5:0] of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

45.3.6.3 ADCEnTSNSGTSEL — A/D Conversion Temperature Measurement Trigger Select Control Register

This register is a 32/16-bit read/write register, which controls the A/D conversion trigger (H/W trigger) selection for the temperature measurement scan group.

Access: ADCEnTSNSGTSEL can be read or written in 32-bit units.
ADCEnTSNSGTSELL can be read or written in 16-bit units.

Address: ADCEnTSNSGTSEL: <ADCEn_base> + $41C_H$
ADCEnTSNSGTSELL: <ADCEn_base> + $41C_H$

Initial value: $0000\ 0000_H$

		TTSNSEL11	INTTAUB1I8	
		TTSNSEL12	INTTAUB2I0	TAUB2
		TTSNSEL13	INTTAUB2I1	
		TTSNSEL14	INTTAUB2I2	
		TTSNSEL15	INTTAUB2I3	

CAUTION

To prevent malfunction, perform ADCEnTSNSGTSEL settings when SGACT[5:0] of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

45.3.7 Self-Diagnostic Specific Registers

45.3.7.1 ADCEnDGCTL0 — Self-Diagnostic Voltage Level Control Register

This register controls the self-diagnostic voltage level.

Access: ADCEnDGCTL0 can be read or written in 32-bit units.
ADCEnDGCTL0L can be read or written in 16-bit units.
ADCEnDGCTL0LL can be read or written in 8-bit units.

Address: ADCEnDGCTL0: <ADCEn_base> + 350_H
ADCEnDGCTL0L: <ADCEn_base> + 350_H
ADCEnDGCTL0LL: <ADCEn_base> + 350_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

1	1	1	AnV_{REF}	$2/3AnV_{REF}$	$2/3AnV_{REF}$	$2/3AnV_{REF}$

45.3.7.2 ADCEnDGCTL1 — Self-Diagnostic Control Register

This register controls the self-diagnostic channel.

Access: ADCEnDGCTL1 can be read or written in 32-bit units.
ADCEnDGCTL1L can be read or written in 16-bit units.

Address: ADCEnDGCTL1: <ADCEn_base> + 354_H
ADCEnDGCTL1L: <ADCEn_base> + 354_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 45.48 ADCEnDGCTL1 register contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When written, write the initial value.
15,12,9,6,3, 0	CDG [15,12,9,6,3,0]	Self-Diagnostic Channel Select 0: ANInm is selected. 1: DIAGOUT0 is selected.
13,10,7,4,1	CDG [13,10,7,4,1]	Self-Diagnostic Channel Select 0: ANInm is selected. 1: DIAGOUT1 is selected.
14,11,8,5,2	CDG [14,11,8,5,2]	Self-Diagnostic Channel Select 0: ANInm is selected. 1: DIAGOUT2 is selected.

CAUTION

To prevent malfunction, perform ADCEnDGCTL1 settings when SGACT[5:0] of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

45.3.7.3 ADCEnPDCTL2 — Pull Down Control Register 2

This register specifies a channel which the pull down resistor is connected with.

For details, see Section 45.5.3, Diagnostic of Open Pins.

Access: ADCEnPDCTL2 can be read or written in 32-bit units.
ADCEnPDCTL2L can be read or written in 16-bit units.
ADCEnPDCTL2LL can be read or written in 8-bit units.

Address: ADCEnPDCTL2: <ADCEn_base> + $35C_H$
ADCEnPDCTL2L: <ADCEn_base> + $35C_H$
ADCEnPDCTL2LL: <ADCEn_base> + $35C_H$

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	PDNB[19:16]

Table 45.49 ADCEnPDCTL2 Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When written, write the initial value.
19 to 0	PDNB[19:0]	Pull Down Enable Control These bits control the on-chip pull-down resistor of the corresponding physical channel (ANI0[19:0]). 0: Pull-down enable is off 1: Pull-down enable is on

CAUTION

To prevent malfunction, perform ADCEnPDCTL2 settings when SGACT[5:0] of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

For on-chip pull-down resistor values, see the Electrical Characteristics section in the Data Sheet document.

45.3.8 Emulation Specific Register

45.3.8.1 ADCEnEMU — Emulation Control Register

This register controls the SVSTOP disable signal.

Access: This register can be read/written in 8-bit units.

Address: <ADCEn_base> + 388_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	SVSDIS	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 45.50 ADCEnEMU Register Contents

Bit Position	Bit Name	Function
7	SVSDIS	SVSTOP Disable 0: SVSTOP is enabled 1: SVSTOP is disabled
6 to 0	Reserved	When written, write the initial value.

CAUTION

To prevent malfunction, perform SVSDIS settings when SGACT[5:0] of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

45.4 Operation

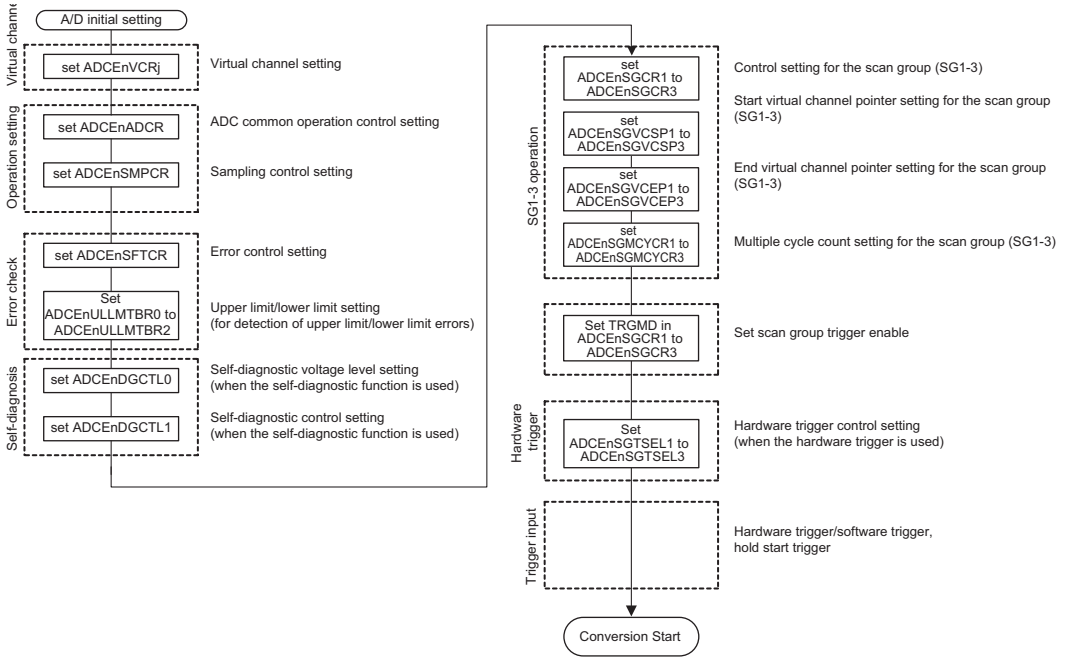
45.4.1 Priority Selection

The priority order of the scan groups can be selected from two sets via the scan groups priority level control register ADCEnSGPRCR:

- SGPR[18:0] = 43210_H: priority order
  SG4 (PWM-Diag, highest) > SG3 > SG2 > SG1 > SG0 (temperature measurement, lowest)
- SGPR[18:0] = 32401_H: priority order
  SG3 (highest) > SG2 > SG4 (PWM-Diag) > SG0 (temperature measurement) > SG1 (lowest)

45.4.2 Initial Setting

Table 45.47 shows an initial setting example of the A/D conversion. For trigger input, see **Figure 45.5** in the next section. For interrupt request signals, see Section 45.4.12, Scan End Interrupt Request.



Note: Set these registers as necessary.

Figure 45.4 Flowchart for Initial Setting

45.4.3 Trigger input

The following figure shows the flowchart for trigger input.

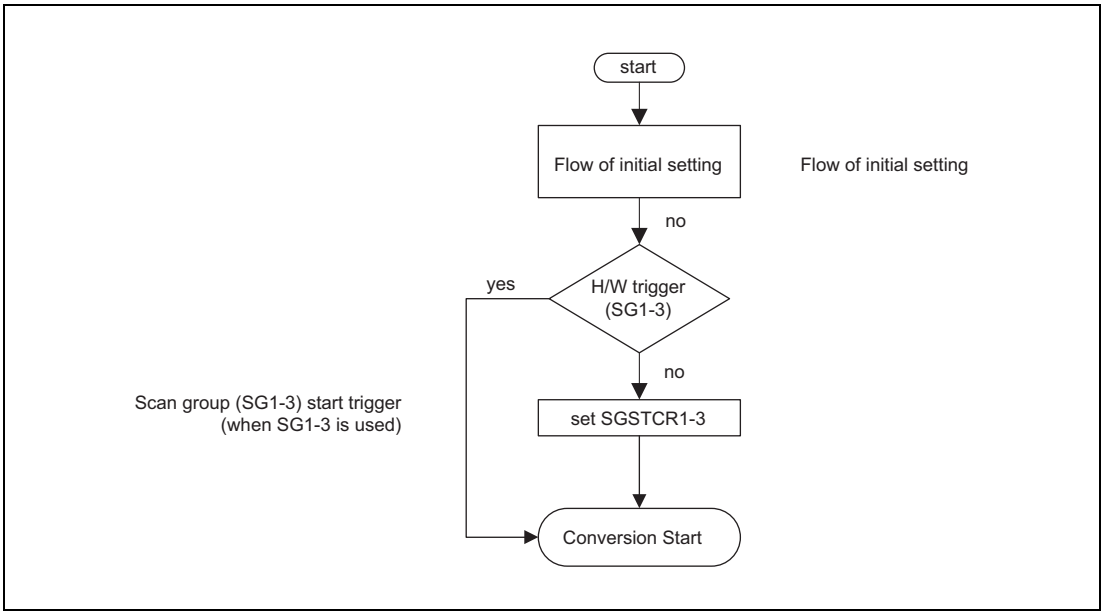


Figure 45.5 Flowchart for Trigger Input

NOTE

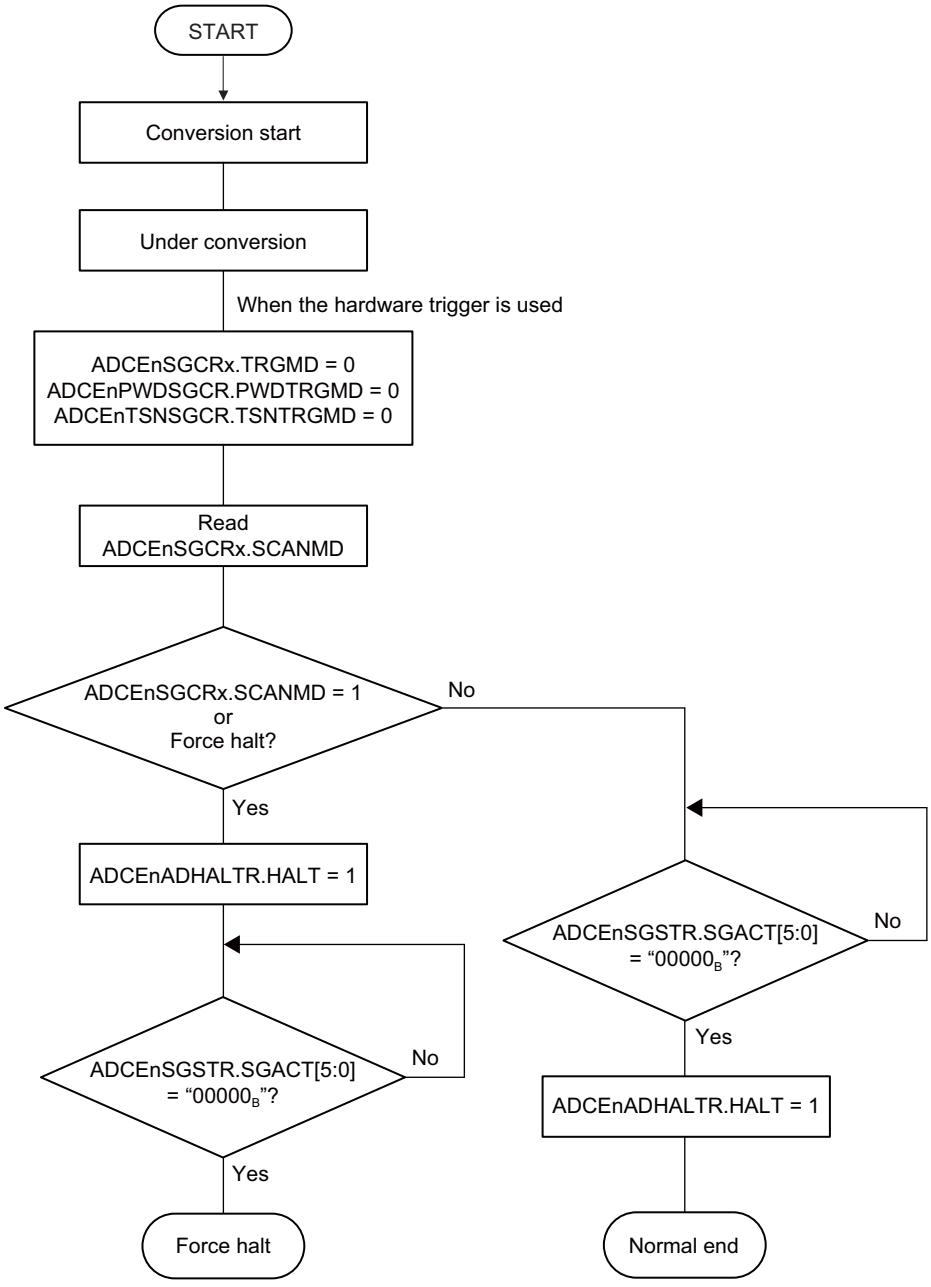
When an SG start trigger is generated during scanning, the SG start trigger is ignored.

For INTP0, INTP1 and INTP2 the scan groups SG1 to SG3 can be configured to start conversion on rising, falling or both edges of the input signal. The valid edge can be selected by the ADCEnINTPEDGCTL register.

All other HW triggers start conversion on the rising edge only.

45.4.4 Ending A/D conversion

The flow at the end of A/D conversion is shown below.



Note: The final setting of HALT when A/D conversion ends normally is done to clarify whether the status is "Conversion" or "IDLE". Whether HALT is set or not when A/D conversion ends normally does not effect the A/D conversion accuracy.

Figure 45.6 Flow at the End of A/D Conversion

45.4.5 Example of Scan Group Operation

(1) Multi cycle scan mode

The following figure illustrates an operation example where conversion is performed for four virtual channels, using the two cycle scan in multicycle scan mode as scan group 0.

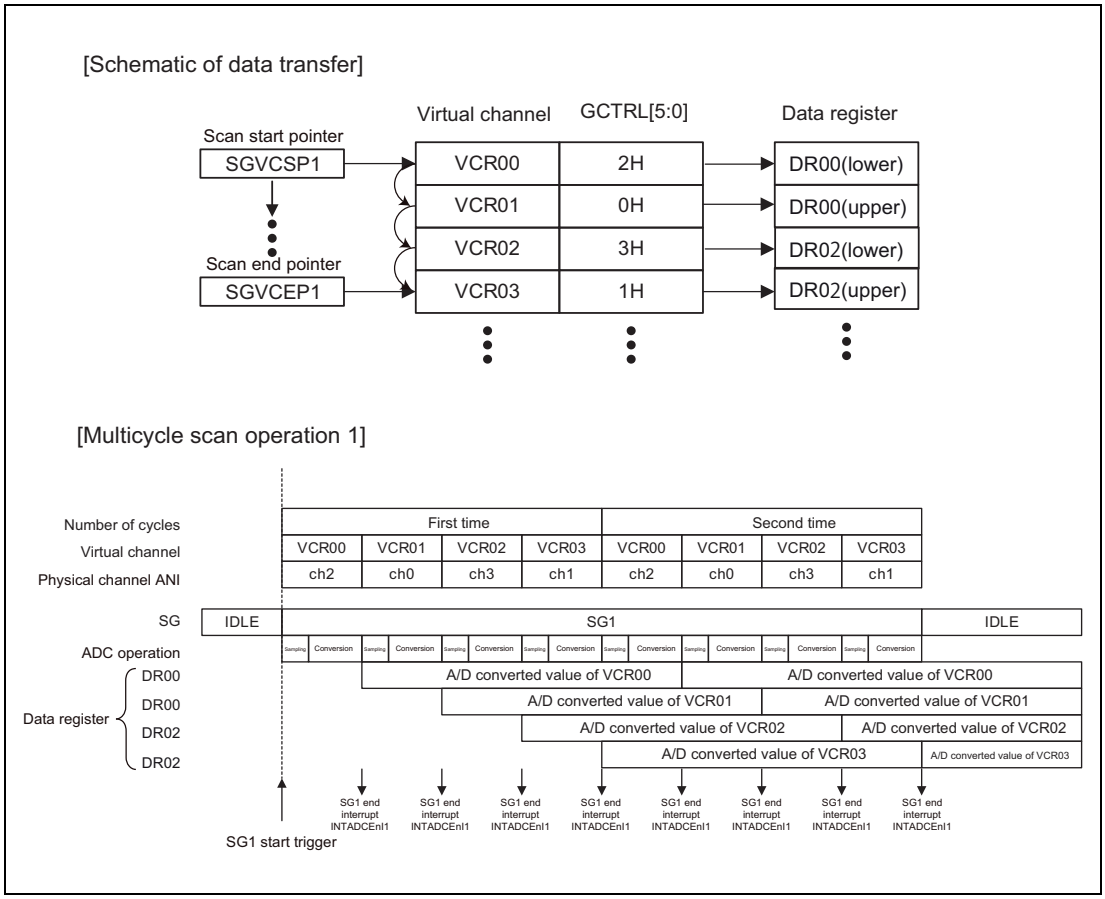


Figure 45.7 Example of Multicycle Scan Operation 1

The following figure illustrates an operation example where a pin is scanned once, using multicycle scan mode.

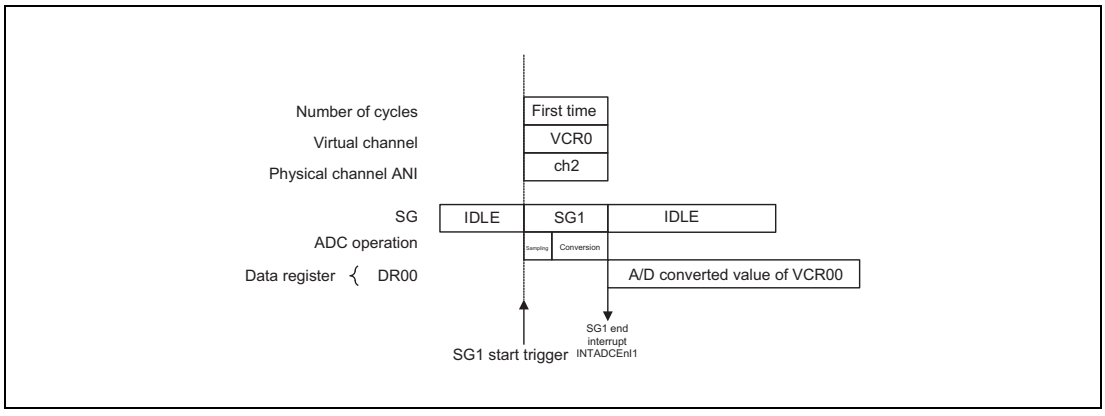

Figure 45.8 Example of Multicycle Scan Operation 2

(2) Continuous scan mode

Continuous scan mode allows A/D conversion of the SG channel indicated by the pointer specified by ADCEnSGVCSPx.VCSP[5:0] to ADCEnSGVCEPx.VCEP[5:0] (x = 1 to 3) to continue until ADCEnADHALTR: HALT is asserted. This mode operates exclusively in each SG. The following figure shows an example of operation in continuous scan mode.

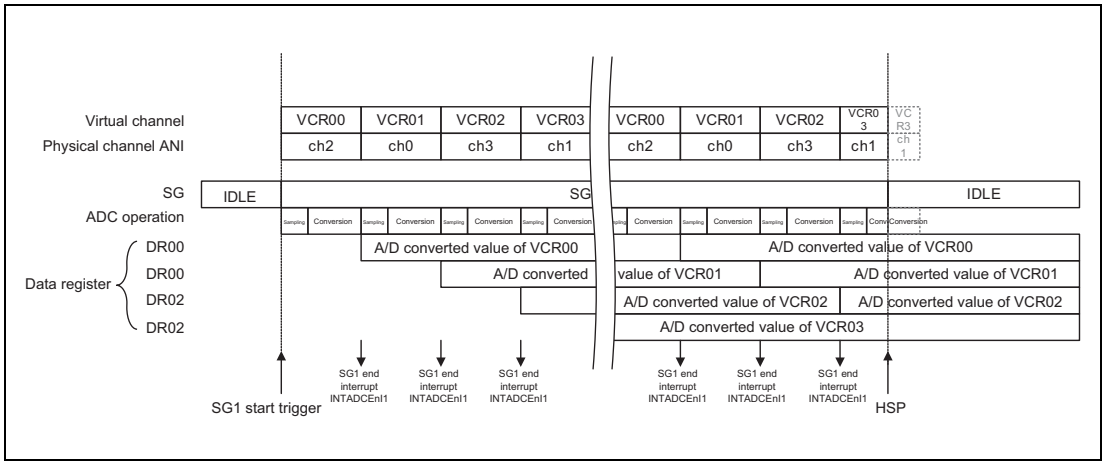

Figure 45.9 Example of Continuous Scan Operation

45.4.6 Channel repeat mode

Channel repeat mode allows A/D conversion of the SG channel indicated by the pointer specified by ADCEnSGVCSPm.VCSP[5:0] to ADCEnSGVCEPm.VCEP[5:0] to repeat number of channel repeat times specified by SGCRn (n = 1 to 3):SCTn[1:0]. This mode operates exclusively in each SG. The number of channel repeat times is selectable from 1, 2, and 4.

The following figures show examples of operation under respective conditions.

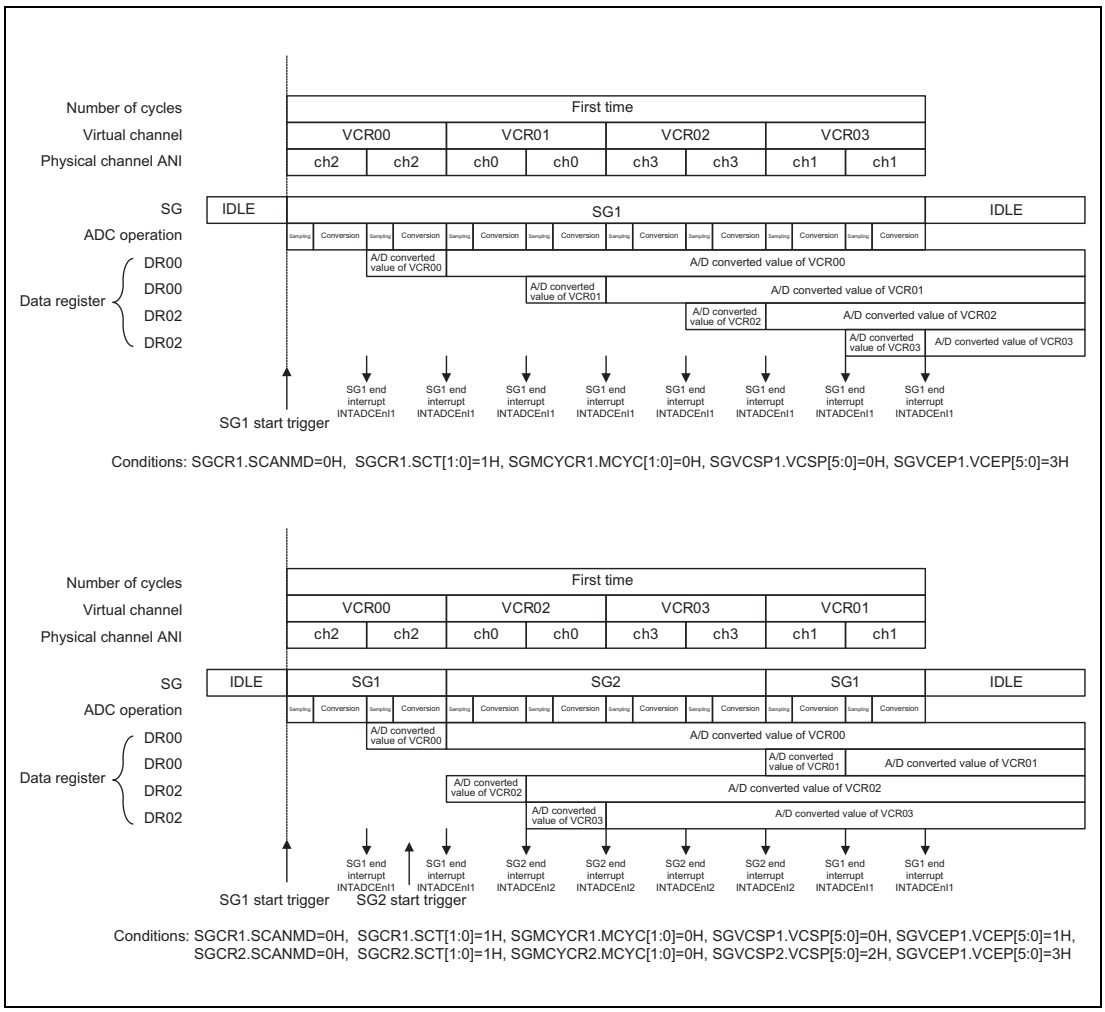

Figure 45.10 Example of Channel Repeat Operation 1

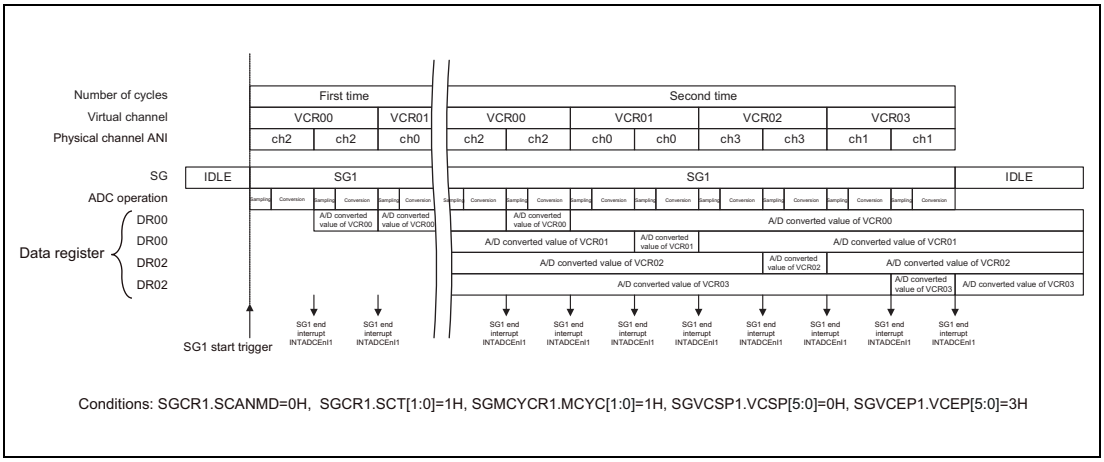
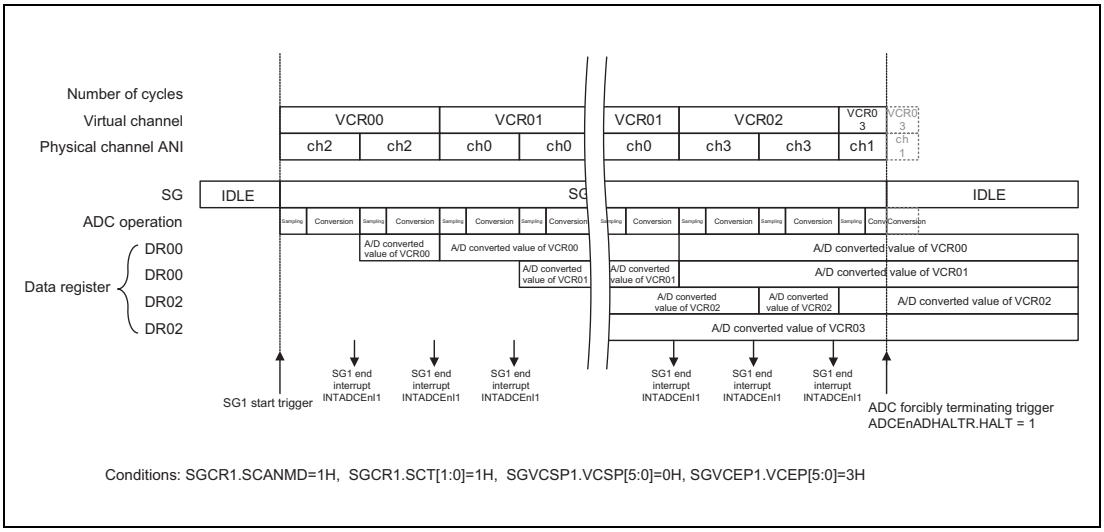


Conditions: SGCR1.SCANMD=0H, SGCR1.SCT[1:0]=1H, SGMCYCR1.MCYC[1:0]=1H, SGVCSP1.VCSP[5:0]=0H, SGVCEP1.VCEP[5:0]=3H

Figure 45.11 Example of Channel Repeat Operation 2



Conditions: SGCR1.SCANMD=1H, SGCR1.SCT[1:0]=1H, SGVCSP1.VCSP[5:0]=0H, SGVCEP1.VCEP[5:0]=3H

Figure 45.12 Example of Channel Repeat Operation 3

45.4.7 A/D Conversion with PWM-Diag Enabled

With the PWM-Diag function enabled, A/D conversion is performed by the signal from the PWM-Diag.

For details on the PWM-Diag function, refer to Section 32, PWM Generators and Diagnostic (PWM-Diag).

To control the A/D conversion, the A/D converter receives the setting information by the A/D conversion trigger select (PWSA) signal. The flow of A/D conversion with PWM-Diag is shown in the following figure.

CAUTION

If the trigger signal PVCR_TRG of PWM-Diag function has a higher-priority than SGx_TRG (x = 1 to 3), the operation of other scan groups may be kept waiting until PWM-Diag function is ended.

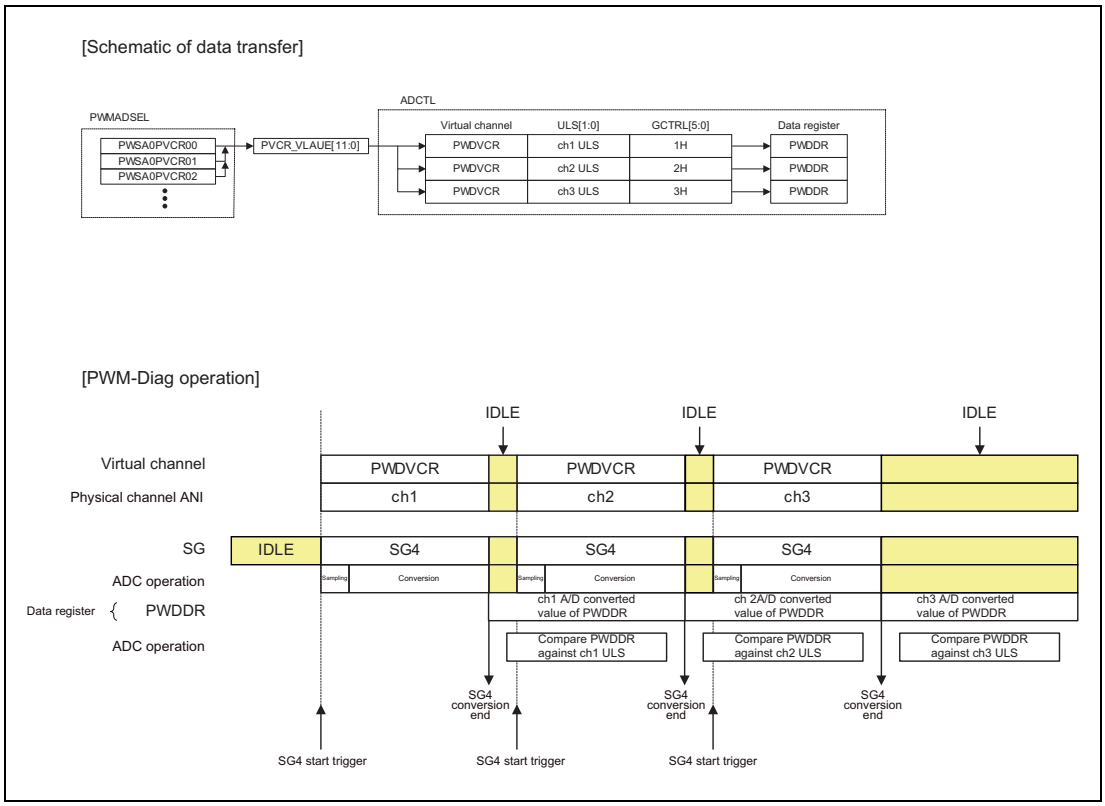


Figure 45.13 PWM-Diag Operation

45.4.8 Example of Synchronous Suspend and Resume Operation

Figure 45.14 shows an example of synchronous suspend and resume operation. In this example, a higher-priority SG interrupts a lower-priority SG.

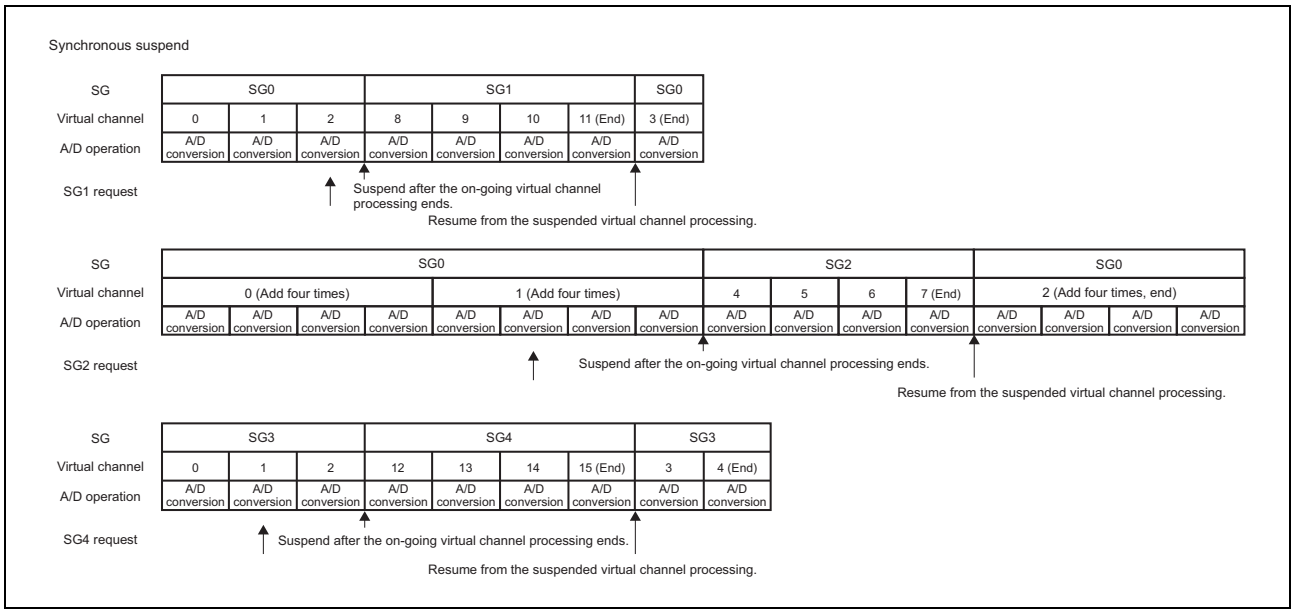

Figure 45.14 Example of Synchronous Suspend and Resume Operation

NOTE

The priority selection in the example above is ADCEnSGPRCR.SGPR[1:0] = 1, i.e.

Lower Higher

SG0 < SG1 < SG2 < SG3 < SG4

45.4.9 Example of Asynchronous Suspend and Resume Operation

Figure 45.15 shows an example of asynchronous suspend and resume operation. In this example, a higher-priority SG interrupts a lower-priority SG.

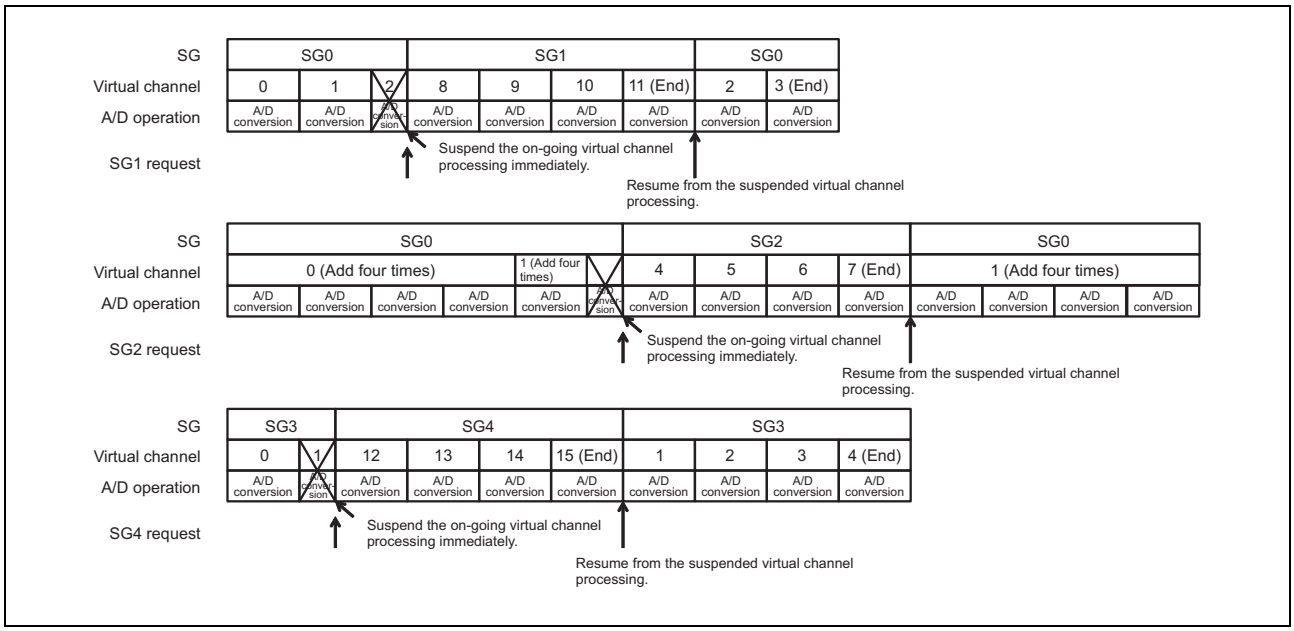

Figure 45.15 Example of Asynchronous Suspend and Resume Operation

NOTE

The priority selection in the example above is ADCEnSGPRCR.SGPR[1:0] = 1, i.e.

Lower Higher

SG0 < SG1 < SG2 < SG3 < SG4

45.4.10 Error Detecting Functions

Error detecting functions cover upper-limit error, lower-limit error, and overwrite error.

45.4.10.1 Upper-Limit/Lower-Limit Error Detecting Function

The upper-limit/lower-limit error detecting function determines whether the A/D converted data is larger than the upper-limit table ULMTB[11:0] or smaller than the lower-limit table LLMTB[11:0] at the end of A/D conversion.

45.4.10.2 Overwrite Error Detecting Function

When the ADCEnDRj (or ADCEnDIRj) of a virtual channel where A/D converted data is written and WFLG in ADCEnDIRj is 1 is not read but the next A/D converted data is written in the same ADCEnDRj, an overwrite error is detected.

45.4.10.3 SVSTOP Operation

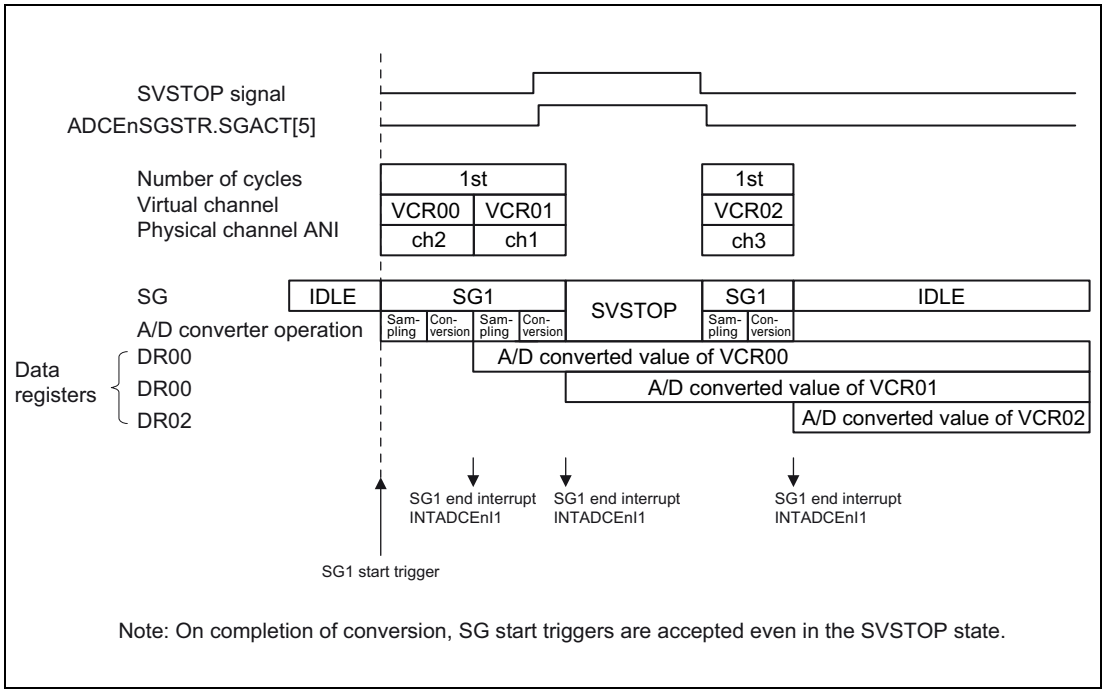
The SVSTOP function is supported by the SVSTOP signal sent from the on-chip debugger control unit.

The SVSTOP function stops conversion of the A/D converter when the SVSTOP signal is input during an emulation break. While the SVSTOP signal is high, reading registers ADCEnDRj, ADCEnDIRj, ADCEnSGSTR, ADCEnULER, and ADCEnOWER by the external access does not affect these registers.

ADCEnSGSTR.SGACT[5] is set to 1 when SVSTOP = High is input while ADCEnEMU.SVSDIS = 0 to make a transition to the SVSTOP state. Hardware triggers and software triggers are valid in the SVSTOP state. When SVSTOP = High is input while EMUCR:SVSDIS = 1’b1, the SAR-ADCE(SM) does not transition to the SVSTOP state. ADHALT (forced termination of A/D conversion) should not be performed in the SVSTOP state.

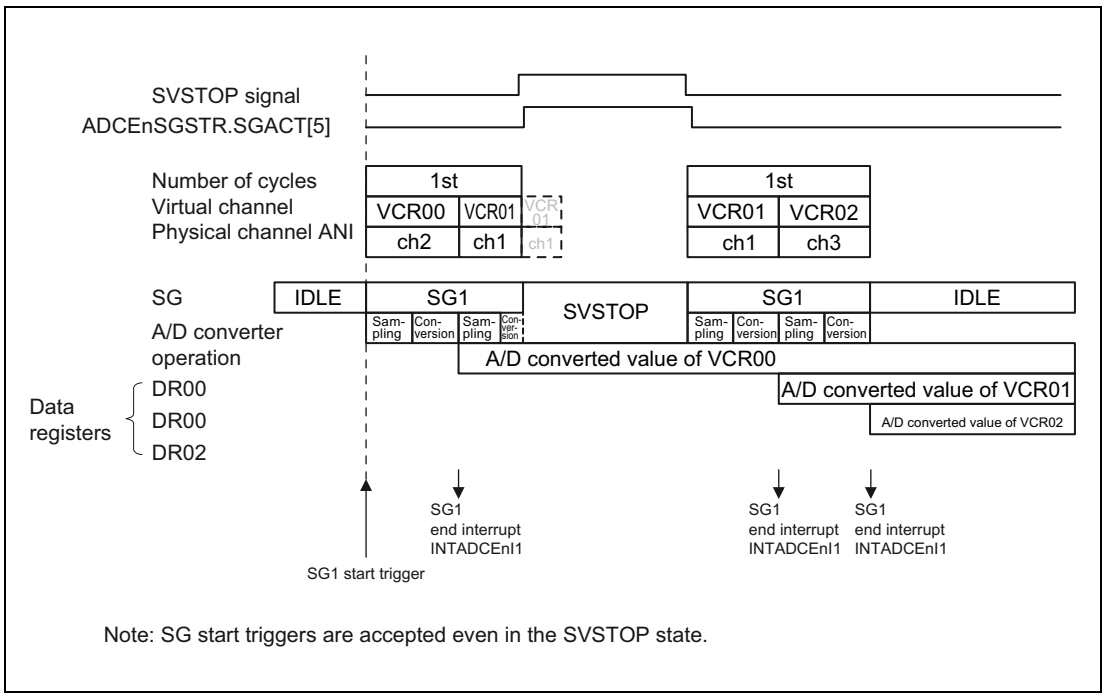
In operations for synchronous suspension, a new start trigger cannot be accepted over the time from input of the high level to SVSTOP to completion of conversion on the channel where conversion is currently proceeding. This time can be up to the time taken for one A/D conversion.

The following example illustrates a SVSTOP operation example.



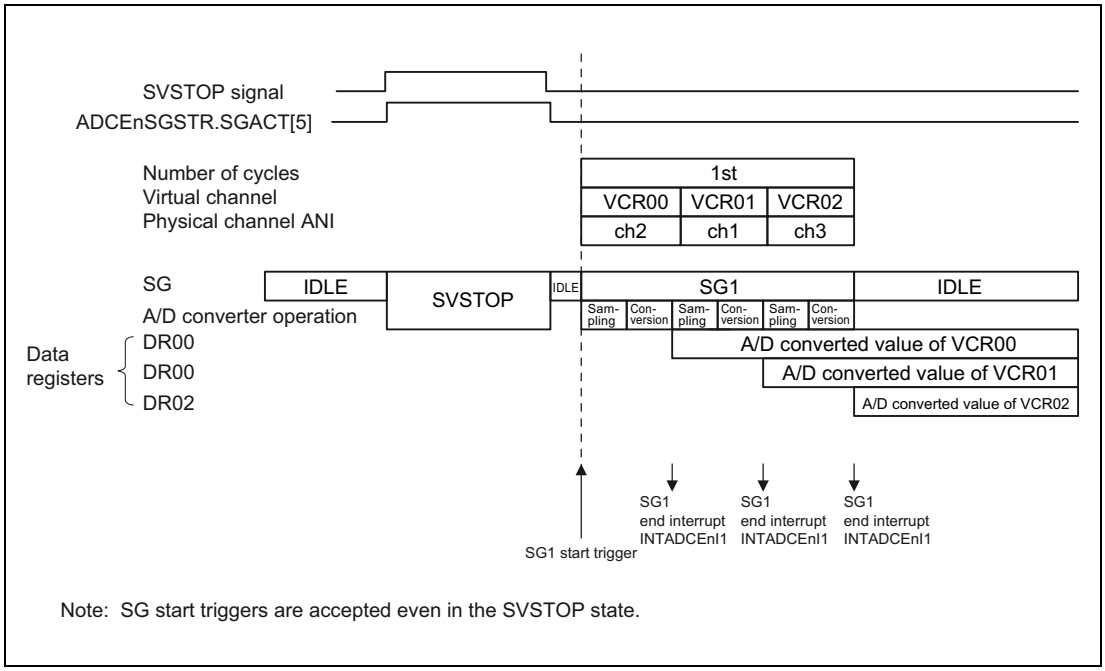
Note: On completion of conversion, SG start triggers are accepted even in the SVSTOP state.

Figure 45.16 Example of SVSTOP Operation (ADCEnADCR.SUSMTD[1:0] = 00 and ADCEnEMU.SVSDIS = 0)



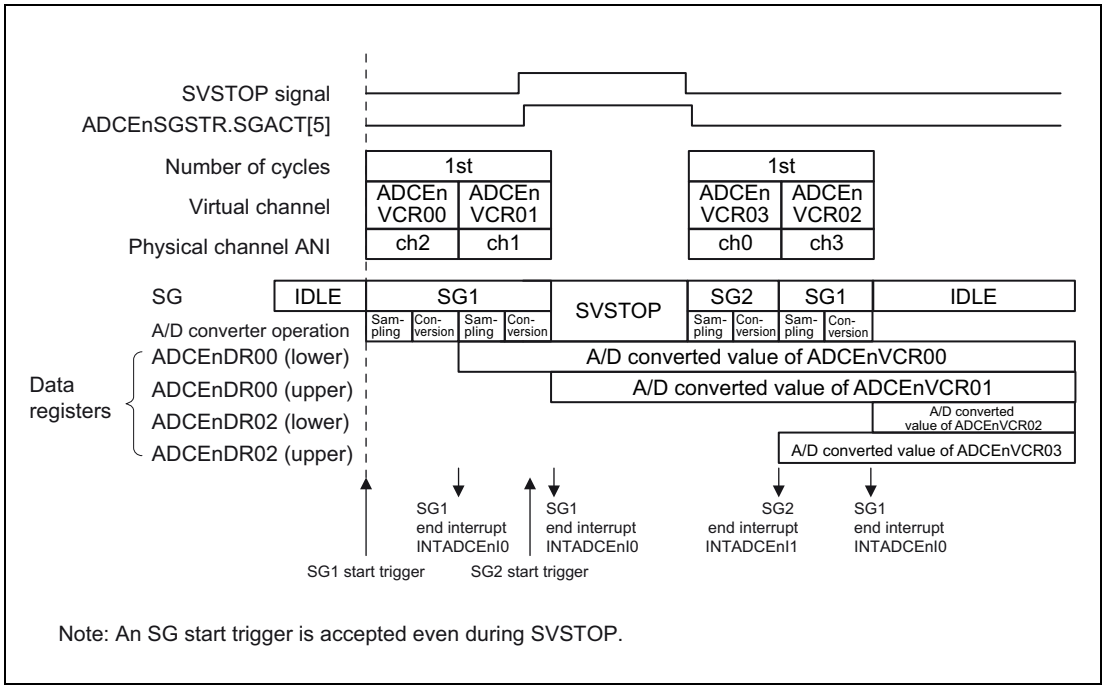
Note: SG start triggers are accepted even in the SVSTOP state.

Figure 45.17 Example of SVSTOP Operation (ADCEnADCR.SUSMTD[1:0] = 10 and ADCEnEMU.SVSDIS = 0)



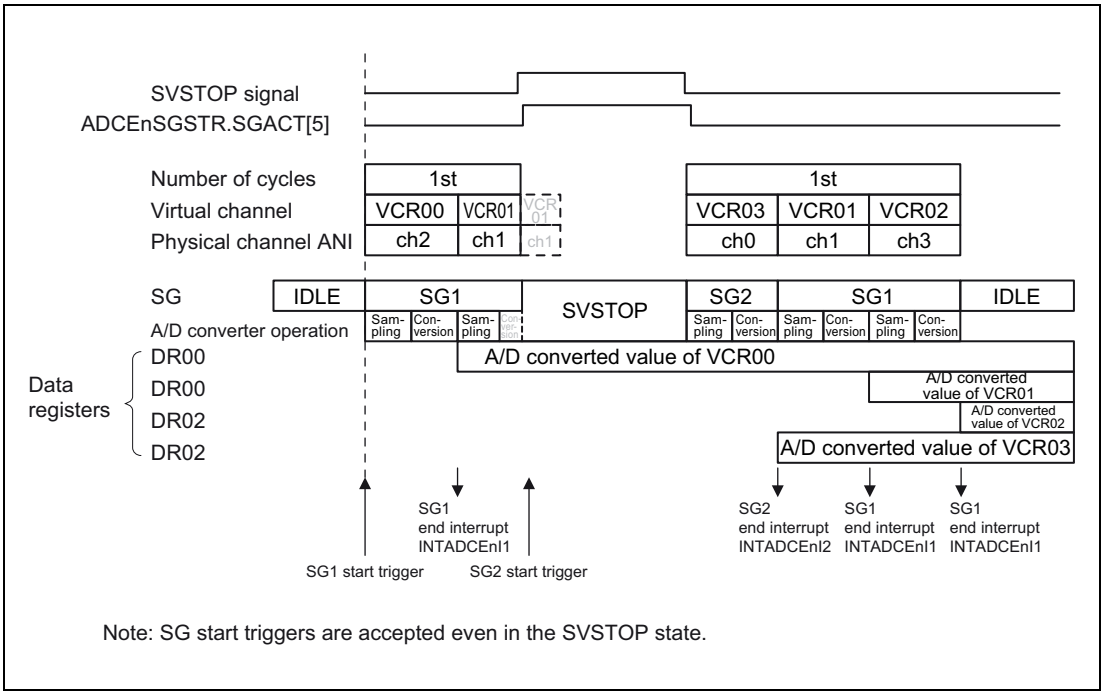
Note: SG start triggers are accepted even in the SVSTOP state.

Figure 45.18 Example of SVSTOP Operation in the IDLE State (ADCEnADCR.SUSMTD[1:0] = 00 and ADCEnEMU.SVSDIS = 0)



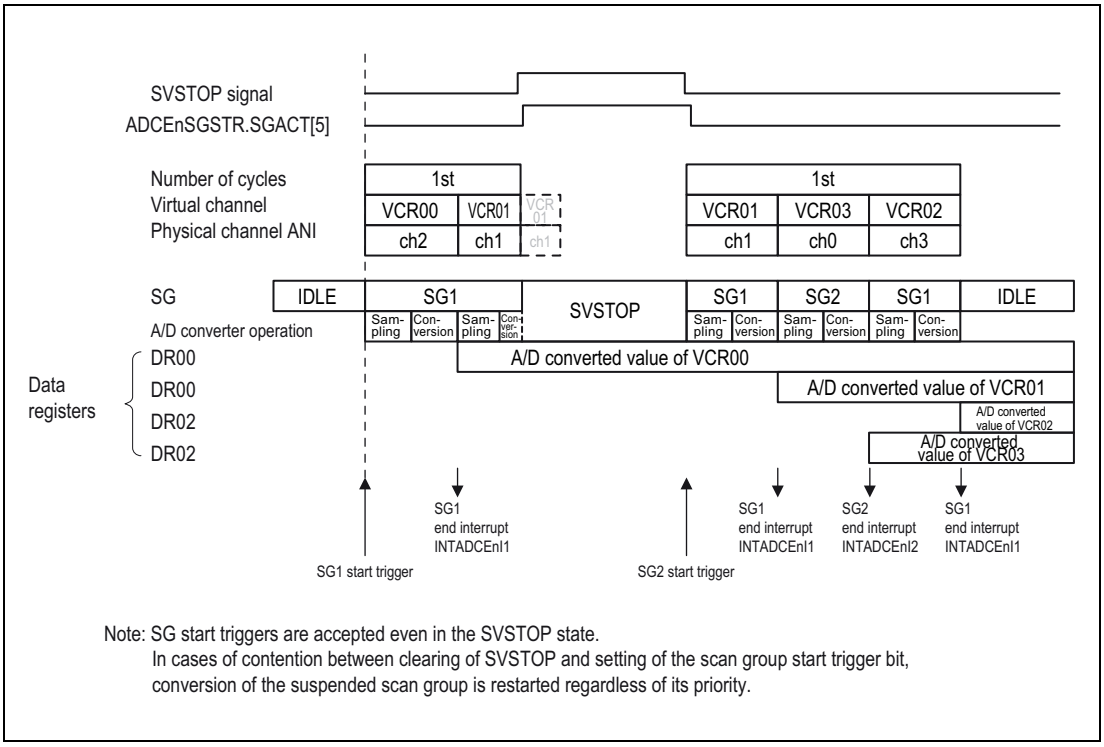
Note: An SG start trigger is accepted even during SVSTOP.

Figure 45.19 Conflict of SVSTOP Start and High-Priority SG Start Trigger (ADCEnADCR.SUSMTD[1:0] = 00, ADCEnEMU.SVSDIS = 0)



Note: SG start triggers are accepted even in the SVSTOP state.

Figure 45.20 Conflict of SVSTOP Start and High-Priority SG Start Trigger (ADCEnADCR.SUSMTD[1:0] = 10, ADCEnEMU.SVSDIS = 0)



Note: SG start triggers are accepted even in the SVSTOP state.
In cases of contention between clearing of SVSTOP and setting of the scan group start trigger bit, conversion of the suspended scan group is restarted regardless of its priority.

Figure 45.21 Conflict of SVSTOP Clear and High-Priority SG Start Trigger (ADCEnADCR.SUSMTD[1:0] = 10, ADCEnEMU.SVSDIS = 0)

45.4.11 Activating Scan Group by a Hardware Trigger

Scan group x can be activated by the hardware trigger input to SGx_TRG. As for the hardware trigger sources to be used, refer to Table 45.44, List of A/D Conversion Hardware Triggers. When activating SGx_TRG by the hardware trigger, set the peripheral function to be used by the trigger and set the start trigger in the A/D conversion trigger select control register (ADCEnSGTSELx). More than one start trigger can be specified.

45.4.11.1 Stopping Scan Group by ADHALT

Setting ADCEnADHALTR.HALT (A/D force halt trigger) to 1 forcibly halts the A/D conversion and clears the scan group x status register (ADCEnSGSTR). The error flag of ADCEnULER (upper limit/lower limit error register) is not cleared. When ADCEnADHALTR.HALT is set, make sure that ADCEnSGSTR.SGACT[5:0] has been cleared.

45.4.12 Scan End Interrupt Request

Scan group x can issue a scan end interrupt request (INT_SGx) to INTC. If ADIE of ADCEnSGCRx is set to 1, (INT_SGx) can be output after the SGx scan ends. If ADIE of ADCEnSGCRx is set to 0, the (INT_SGx) output when the SGx scan ends can be disabled. If ADIE of ADCEnVCRj is set to 1, (INT_SGx) can be output when A/D conversion for virtual channel n in SGx ends. If ADIE of ADCEnVCRj is set to 0, the (INT_SGx) output when A/D conversion for virtual channel n in SGx ends can be disabled. If ADIEs of both ADCEnSGCRx and ADCEnVCRj are set to 1 and SGx scan ending is simultaneous with A/D conversion ending for virtual channel m in SGx, the INT_SGx occurs only once.

Example 1) A scan is executed for virtual channel 0 or 1 in SG1 when ADIE of ADCEnSGCR1 is 0, ADIE of VCR0 is 1, and ADIE of VCR1 is 0.
INT_SG1 is output when A/D conversion ends for virtual channel 0.

Example 2) A scan is executed for virtual channel 0 or 1 in SG2 when ADIE of ADCEnSGCR2 is 0, ADIE of VCR0 is 1, and ADIE of VCR1 is 1.
INT_SG2 is output when A/D conversion ends for virtual channel 0 and virtual channel 1.

Example 3) A scan is executed for virtual channel 0 or 1 in SG3 when ADIE of ADCEnSGCR3 is 1, ADIE of VCR0 is 0, and ADIE of VCR1 is 0.
INT_SG3 is output when a scan ends (when A/D conversion for virtual channel 1 ends).

Furthermore, the DMAC can be started when scan ends.

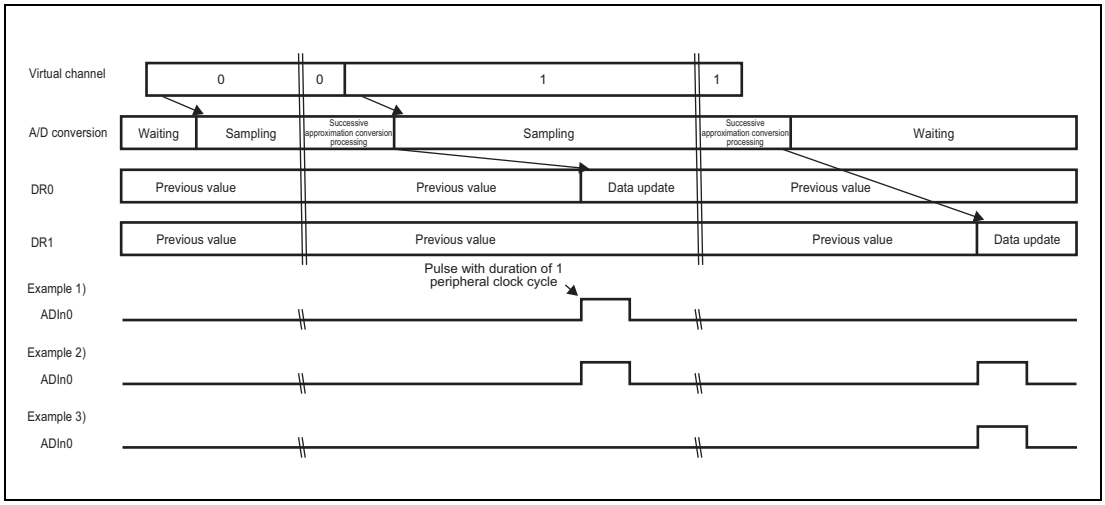


Figure 45.22 Example of a Scan Conversion End Interrupt Occurrence

NOTE

x = 1 to3

45.4.13 A/D Error Interrupt Request

ADCE can issue an A/D error interrupt request (ADEm) to ECM (Error Control Module). For an error source for which ULEIE and OWEIE of ADCEnSFTCR are set to 1, the OR condition of the error source is issued as ADEm. For an error source for which ULEIE and OWEIE of ADCEnSFTCR are set to 0, ADEm can be disabled.

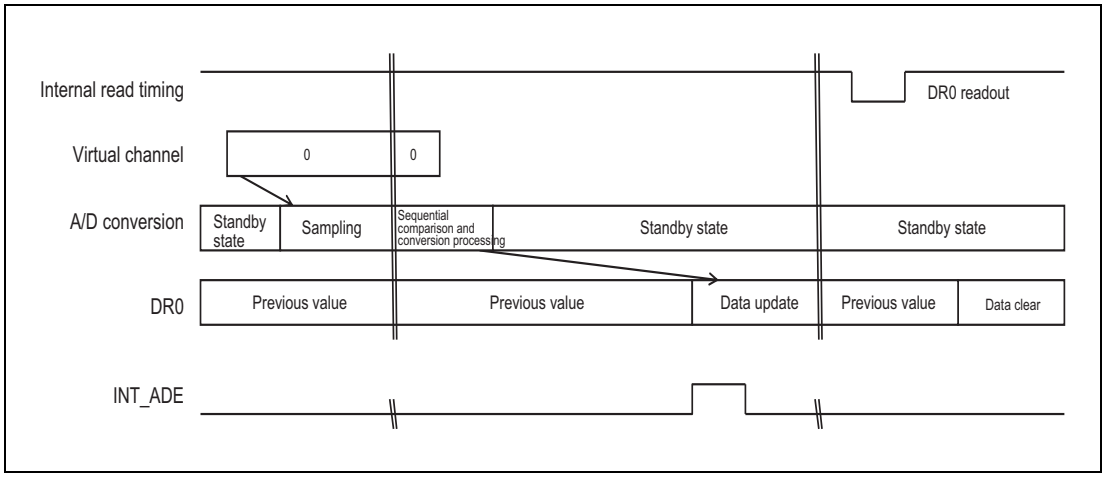

Figure 45.23 A/D Error Interrupt (Example: Overwrite Error)

45.5 Self-Diagnostic Function

To check the ADCEn function, the following self-diagnostic functions are available.

Section 45.5.1, Diagnostic of A/D Conversion Circuit

Section 45.5.2, Diagnostic of Channel Multiplexer

Section 45.5.3, Diagnostic of Open Pins

The overview of the self-diagnostic functions is shown in the figure below. The detailed description is given in the following sections.

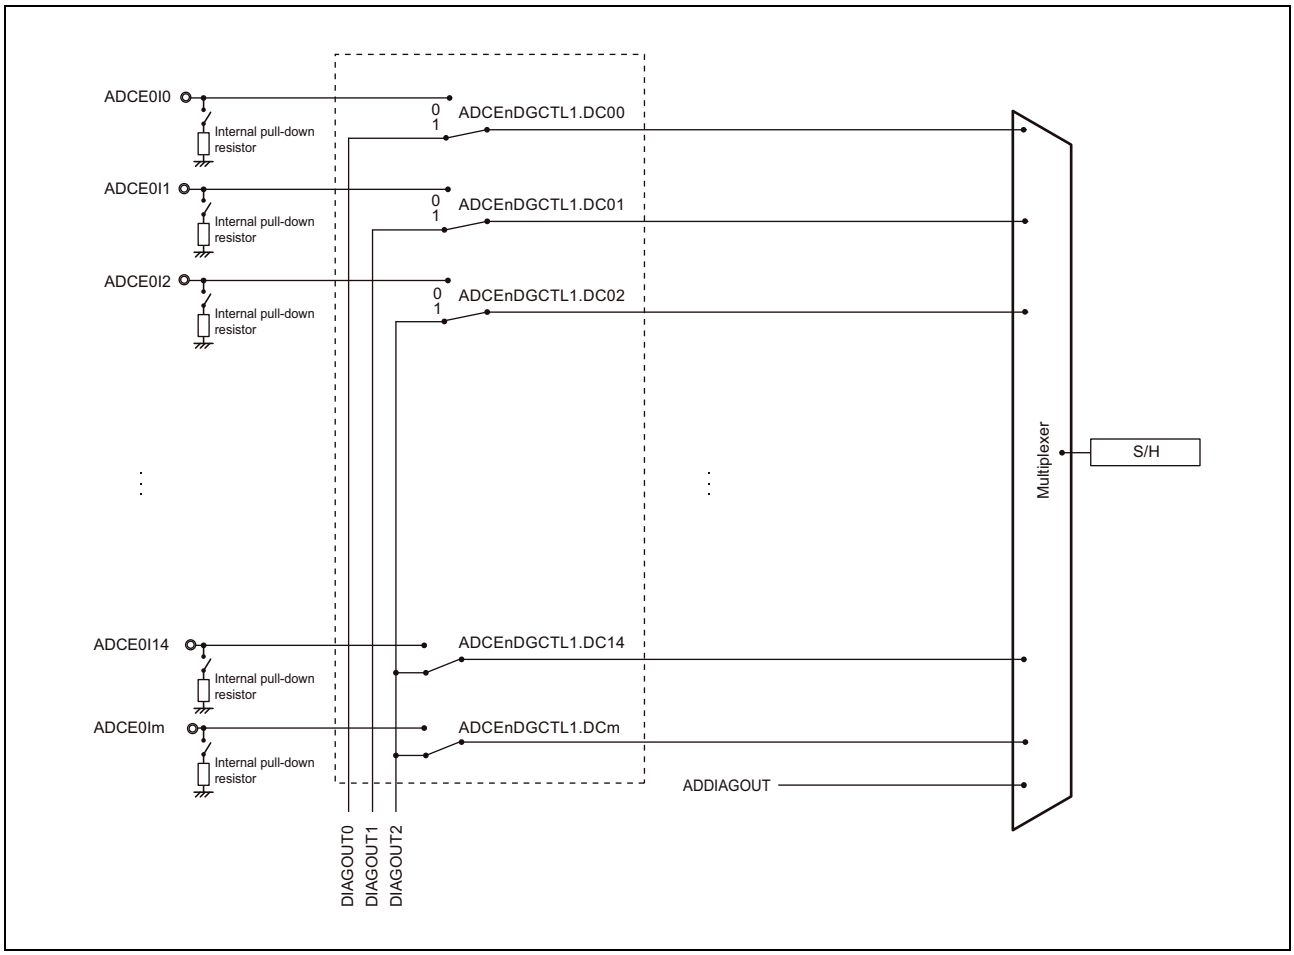

Figure 45.24 Overview of Self-Diagnostic Functions

NOTE

The functions in the dashed-line frames depend on the product.

45.5.1 Diagnostic of A/D Conversion Circuit

This function checks whether the A/D conversion is performed normally. When a voltage value is set by ADCEn.DGCTL0 and the A/D conversion result differs from an expected value, an internal circuit may be broken. The features of A/D conversion circuit self-diagnostic function is shown below.

- As the self-diagnostic voltage level, AnV_{REF}, $2/3AnV_{REF}$, $1/3AnV_{REF}$, $1/2AnV_{REF}$, and AVSS are selectable.
- The self-diagnostic of A/D conversion circuit is enabled by the A/D conversion of SG1-3.

45.5.1.1 Diagnostic procedure

1. Set ADCEnADCR.DGON = 1 to enable the self-diagnostic voltage circuit.
2. Wait for 500ns
3. Set ADCEnDGCTL0.PSEL[2:0] to select the self-diagnostic voltage level.
4. Set ADCEnADCR.DGON = 1 to update the voltage level.
5. Wait for 500ns.
6. Set arbitrary ADCEnVCRj.GCTRL[5:0] = 100100_B, to select the diagnosis channel.
7. Set ADCEnVCRj.ADIE = 1 to enable the A/D conversion end interrupt.
8. Set ADCEnSGVCSPx to specify the start pointer of virtual channel.
9. Set ADCEnSGVCEPx to specify the end Self-Diagnostic Control.
10. Generate the start trigger of scan group to perform the A/D conversion.
11. When the conversion interrupt occurs, read the result and compare it with the expected one.
12. If the result is the expected one, the A/D conversion was performed successfully.

NOTES

1. During A/D conversion, the self-diagnostic voltage level can be changed by writing to ADCEnDGCTL0.PSEL[2:0]. However, The value of ADCEnDGCTL0.PSEL[2:0] becomes effective from next A/D conversion.
2. When setting ADCEnADCR.DGON = 0, the following process needs to execute.
   1. Stop A/D conversion.
   2. Clear ADCEnDGCTL0.PSEL[2:0] bits.

45.5.2 Diagnostic of Channel Multiplexer

This function checks whether there is a problem in the route from the analog input to SAR-ADCE, by executing the A/D conversion, which is set for the different power supply, to the adjacent analog input. When the A/D conversion result is not static, an internal circuit may be broken. The different power supply is set by ADCEnDGCTL0. The features of channel multiplexer self-diagnostic function is shown below.

- Any of channels, ADCE0I0 to ADCE015, can be selected as the channel to be tested.
- As the self-diagnostic voltage level, $2/3AnV_{REF}$, $1/3AnV_{REF}$, and $1/2AnV_{REF}$ are selectable and one of the three reference voltage levels can be allocated to each channel.

Table 45.51 Selection of Channel to be Diagnosed

Connection	Select channel
DIAGOUT0	Channels 0, 3, 6, 9, 12, and 15
DIAGOUT1	Channels 1, 4, 7, 10, and 13
DIAGOUT2	Channels 2, 5, 8, 11, and 14

- Self-diagnosis of the channel multiplexer is enabled by performing A/D conversion on one of SG1 to SG3 by using multiple channels.

45.5.2.1 Diagnostic procedure

1. Set ADCEnADCR.DGON = 1 to enable the self-diagnostic voltage circuit.
2. Wait for 500ns.
3. Set ADCEnDGCTL0.PSEL[2:0] to select the self-diagnostic voltage level.
4. Set ADCEnADCR.DGON = 1 to update the voltage level.
5. Wait for 500ns.
6. Use two or more ADCEnVCRj.
   Set ADCEnVCRj.GCTRL[5:0] bits to select physical channel.
   Set ADCEnVCRj.ADIE bit to enable the A/D conversion end interrupt.
7. Set ADCEnSGVCSPx register to specify the start pointer of virtual channel.
8. Set ADCEnSGVCEPx register to specify the end pointer of virtual channel.
9. Set ADCEnDGCTL1 register to specify the Self-Diagnostic Control.
10. Generate the start trigger of scan group to perform the A/D conversion.
11. When the conversion interrupt occurs, read the result and compare it with the expected one.
12. If the result is the expected one, the A/D conversion was performed successfully.

NOTES

1. During A/D conversion, the self-diagnostic voltage level can be changed by writing to ADCEnDGCTL0.PSEL[2:0] bits. However, The value of ADCEnDGCTL0.PSEL[2:0] bits becomes effective from next A/D conversion.
2. When setting ADCEnADCR.DGON = 0, the following process needs to execute.
   1. Stop A/D conversion.
   2. Clear ADCEnDGCTL0.PSEL[2:0] bits.

45.5.3 Diagnostic of Open Pins

This function detects whether an analog input pins (ADCEnIm) is open or not by using the resistor for self-diagnostic function.

The internal pull-down resistors can be connected to diagnose the analog input pins.

Figure 45.25 Setting of On-chip Pull Down Resistor

When there is a disconnection, the conversion result is almost 0 V and it indicates an open detection.

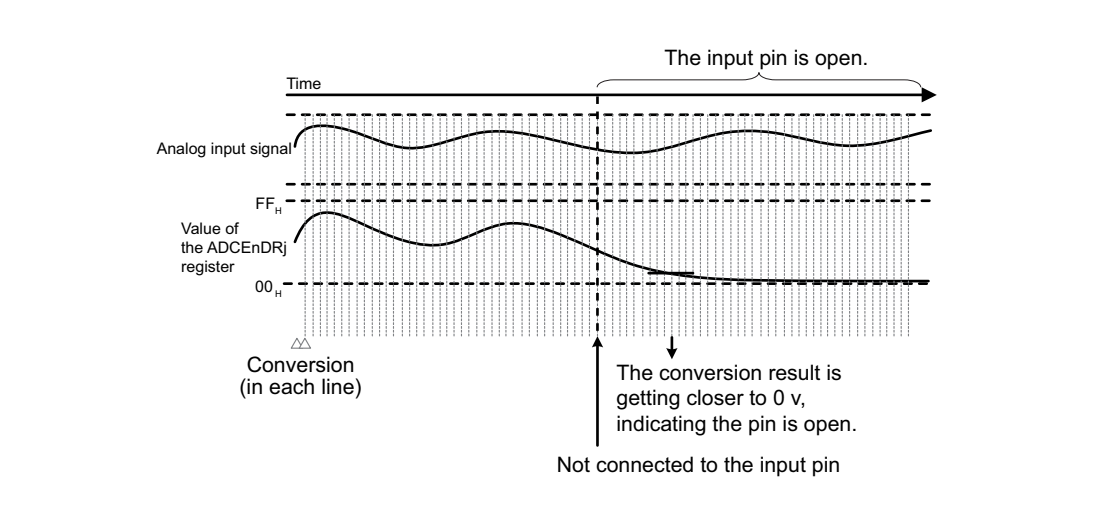

Figure 45.26 Analog Input Signal Disconnection Detection

CAUTIONS

1. **The pull-down resistors must not be connected during normal A/D conversion operation. Connected pull-down resistors may lead to a drop in the input voltage and result in erroneous A/D conversion results.**
2. **When the analog input voltage is nearly equal to the voltage level which is pulled down, a disconnection can not detected by this function.**

45.5.3.1 Diagnostic procedure

1. Set the ADCEnPDCTL2.PDNB[19:0] bits corresponding to an analog input pin (ADCEnIm) to be diagnosed to enable the pull down resistor.
2. Generate the start trigger of scan group to perform the A/D conversion.
3. Perform the A/D conversion multiple times on the same analog input.
4. Monitor the channel's A/D conversion results and check if any result declines to almost 0 V.

45.6 Definition of A/D Conversion Accuracy

A/D conversion accuracy is defined as follows:

- Resolution
  Digital output code value from the A/D converter
- Quantization error
  An error essentially contained in the A/D converter, which is assumed as 1/2 LSB (**Figure 45.27**).
- Offset error
  Deviation of the analog input voltage value from the ideal A/D conversion characteristics when the digital output changes from the minimum voltage value 000_H to 001_H. However, the quantization error is not included.
- Full scale error
  Deviation of the analog input voltage value from the ideal A/D conversion characteristics when the digital output changes from FFE_H to FFF_H. However, the quantization error is not included.
- DNL (Differential nonlinear error)
  Deviation between the ideal digital output code width (Vq) and the actual digital output code width (Va), which is assumed as (Va – Vq)/Vq. However, the offset error, the full scale error, and the quantization error are not included .
- INL (Integral nonlinear error)
  Deviation of the actual value from the ideal A/D conversion characteristics, from the zero voltage to the full scale voltage, which is assumed as an integral of DNL from 000_H to a digital output code. However, the offset error, the full scale error, and the quantization error are not included.
- Absolute accuracy
  Deviation between the digital value and the analog input value. The offset error, the full scale error, the quantization error, DNL, and INL are included .

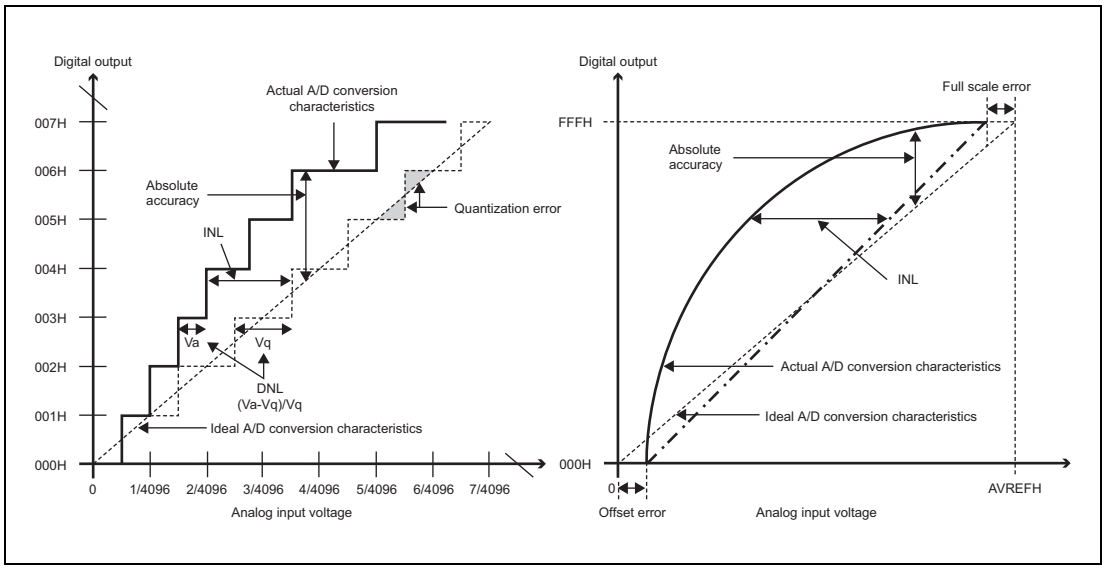

Figure 45.27 Definition of A/D Conversion Accuracy

45.7 Usage Notes

45.7.1 Range of Channel Input Voltage

CAUTION

ADCEnIm input voltage should be used within the specification range. If the channel input voltage exceeds AnVREF or falls below AVSS, the converted value of the channel is saturated and may influence electric characteristics of other channels.

When an over-voltage is applied to an ADCEnIm pin and at the same pin the ADC self-diagnosis (diagnosis of channel multiplexer) is executed, an offset voltage to the diagnosis voltage can be measured. According to the diagnosis setting, adjacent pins are affected from the pin which has over-voltaged. There are two advices for avoiding the problem. The group which have no injected current can be measured with no influence.

Case 1: Injected current is applied at one pin where the ADC self-diagnosis is executed

First ADC self-diagnosis conversion cycle:

→ only ADCE0I0 is selected (CDG0=1, CDG1-15 = 0) ← injected current

Second ADC self-diagnosis conversion cycle:

→ ADCE0I1-15 are selected (CDG0=0, CDG1-15 = 1) ← no injected current

Case2: Injected current is applied at multiple pins where the ADC self-diagnosis is executed

First ADC self-diagnosis conversion cycle:

→ only ADCE0I0 is selected (CDG0 = 1, CDG1-15 = 0) ← injected current

Second ADC self-diagnosis conversion cycle:

→ only ADCE0I1 is selected (CDG0 = 0, CDG1 = 1, CDG2-15 = 0) ← injected current

Third ADC self-diagnosis conversion cycle:

→ only ADCE0I2 is selected (CDG0 = 0, CDG1 = 0, CDG2 = 1, CDG3-15 = 0) ← injected current

n ADC self-diagnosis conversion cycle:

→ ADCE0In-15 are selected (CDGn-1 = 0, CDGn to CDG15 = 1) ← no injected current

45.7.2 Usage Notes for Analog Input Pins

- The write access to the PWM-Diag related registers is prohibited unless the PWM-Diag is used. If read, the read value is undefined.
- If digital input through the pin is not essential, disable digital input.
- If a digital signal is input to such a pin, the signal should not include overshot or undershot. Such overload condition may lead injected current.
- Set the digital input voltage to A0VCC.
  Operation of input voltages outside the range of -0.3 V < A0VCC < +0.3 V may negatively affect the reliability of the chip.
- If digital signal is output to such a pin, reduce the output load capacitance as much as possible. Such increased discharge currents from digital output pin load capacitance, may decrease the ADC accuracy.

45.7.3 Relationship between analog input voltage and A/D conversion result

The relationship between the analog input voltage input to the analog input pin(ADCEnIm) and the A/D conversion results (ADCEnDRj[31:16], ADCEnDRj[15:0], ADCEnDIRj[15:0]) is expressed as follows.

$$A/D\ conversion\ result\ value = INT\left(\frac{VIAN - A0GND}{A0VREF0 - A0GND} \times 2^k + 0.5\right)$$

INT( ): Function that returns the integer part of the value in parentheses

VIAN: Analog input voltage

A0VREF: A0VREF pin voltage

A0GND: A0GND pin voltage

k: Resolution

Section 46 Intelligent Stepper Motor Driver (ISM)

This section contains a generic description of the Intelligent Stepper Motor Driver (ISM).

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.
The subsequent sections describe the features that apply to all implementations.

46.1 Overview of RH850/D1L/D1M Intelligent Stepper Motor Driver (ISM)

46.1.1 Units

This microcontroller has the following number of units of the Intelligent Stepper Motor Driver (ISM).

Table 46.1 Number of Units

Product Name	All products
Units	1
Names	ISM0

Units index n

Throughout this section, the individual units of an Intelligent Stepper Motor Driver is identified by the index "n" (n = 0), for example ISMnCCMRm for the ISMn channel control register.

46.1.2 Channel index m

Throughout this section, the individual motor channels are identified by the index “m”, for example ISMnCCMRm for the ISM channel control register.

The number of channels for each device is given in the following table:

Table 46.2 Motor control channels

	D1L1	D1L2(H)	D1M1(H) D1M1-V2 D1M1A	D1M2	D1M2H
Number of channels	6	6	6	4	6
Indices	m = 0 to 5	m = 0 to 5	m = 0 to 5	m = 0, 1, 4, 5	m = 0 to 5

46.1.3 Register addresses

All Intelligent Stepper Motor Drivers register addresses are given as address offsets from the individual base addresses <ISMn_base>.
The <ISMn_base> addresses of each ISMn are listed in the following table:

Table 46.3 Register base addresses <ISMn_base>

ISMn unit	<ISMn_base> address
ISM0	$FFF0\ 0000_H$

46.1.4 Clock supply

All Intelligent Stepper Motor Drivers provide one clock input.

Table 46.4 Clock supply

ISMn unit	ISMn clock	Connected to
ISM0	PCLK	Clock Controller C_ISO_ISM

46.1.5 Interrupts

The Intelligent Stepper Motor Drivers can generate the following interrupt requests:

Table 46.5 ISMn interrupt requests

ISMn signals	Function	Connected to
ISM0:		
IRQ_REACHED	Indicates that a motor has reached its target/zero position	Interrupt Controller INTISM0REACHED
IRQ_DONE	Indicates that the sequencer has returned into idle state for the current channel data update interval	Interrupt Controller INTISM0DONE
IRQ_ZPDAD	Indicates the actual start of ZPD measurements	Interrupt Controller INTISM0ZPDAD
IRQ_ZPD	Indicates that a motor has *not* reached its zero position.	Error Control Module

46.1.6 Reset sources

The Intelligent Stepper Motor Drivers and their registers are initialized by the following reset signal:

Table 46.6 Reset sources

ISMn unit	Reset signal
ISMn	• Reset Controller SYSRES • Reset Controller ISM0RES • reset upon wake-up from DEEPSTOP mode

CAUTION

By default the ISM0RES reset is active.
Thus before accessing this module this reset must be released via the MRSTC register of the Reset Controller. Refer to Section 9, Reset Controller for details.

46.1.7 I/O signals

The following table shows the I/O signals of the Intelligent Stepper Motor Drivers.

Table 46.7 ISMn I/O signals

ISM0 signals	Function	Connected to
Motor Driver 0:		
SINP0	Plus side of vertical coil	Port ISM11
SINM0	Minus side of vertical coil	Port ISM12
COSP0	Plus side of horizontal coil	Port ISM13
COSM0	Minus side of horizontal coil	Port ISM14
Motor Driver 1:		
SINP1	Plus side of vertical coil	Port ISM21
SINM1	Minus side of vertical coil	Port ISM22
COSP1	Plus side of horizontal coil	Port ISM23
COSM1	Minus side of horizontal coil	Port ISM24
Motor Driver 2 (not available in D1M2 devices):		
SINP2	Plus side of vertical coil	Port ISM31
SINM2	Minus side of vertical coil	Port ISM32
COSP2	Plus side of horizontal coil	Port ISM33
COSM2	Minus side of horizontal coil	Port ISM34
Motor Driver 3 (not available in D1M2 devices):		
SINP3	Plus side of vertical coil	Port ISM41
SINM3	Minus side of vertical coil	Port ISM42
COSP3	Plus side of horizontal coil	Port ISM43
COSM3	Minus side of horizontal coil	Port ISM44
Motor Driver 4		
SINP4	Plus side of vertical coil	Port ISM51
SINM4	Minus side of vertical coil	Port ISM52
COSP4	Plus side of horizontal coil	Port ISM53
COSM4	Minus side of horizontal coil	Port ISM54
Motor Driver 5		
SINP5	Plus side of vertical coil	Port ISM61
SINM5	Minus side of vertical coil	Port ISM62
COSP5	Plus side of horizontal coil	Port ISM63
COSM5	Minus side of horizontal coil	Port ISM64

NOTE

If the zero point detection (ZPD) function is used, the ports, used for the ZPD input signals have to be configured for that purpose. Refer to Section 46.2, ZPD I/O buffer setting register ISMCHNCFG for details.

46.2 ZPD I/O buffer setting register ISMCHNCFG

This register configures the port I/O buffers to be used by the ZPD function.

Access: This register can be read/written in 32-bit units.

Address: FFC0 6028_H

Initial Value: 0000 0000_H

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 46.8 ISMCHNCFG register contents

Bit position	Bit name	Function
31 to 12	Reserved	When written, write the initial value.
11	PRMR06SSW	Usage of P17_11 to P17_8 for ZPD function 0: ports are not used for ZPD input 1: ports are used for ZPD input
10	Reserved	When written, write the initial value.
9	PRMR05SSW	Usage of P17_7 to P17_4 for ZPD function 0: ports are not used for ZPD input 1: ports are used for ZPD input
8	Reserved	When written, write the initial value.
7	PRMR04SSW	Usage of P17_3 to P17_0 for ZPD function 0: ports are not used for ZPD input 1: ports are used for ZPD input
6	Reserved	When written, write the initial value.
5	PRMR03SSW	Usage of P16_11 to P16_8 for ZPD function 0: ports are not used for ZPD input 1: ports are used for ZPD input
4	Reserved	When written, write the initial value.
3	PRMR02SSW	Usage of P16_7 to P16_4 for ZPD function 0: ports are not used for ZPD input 1: ports are used for ZPD input
2	Reserved	When written, write the initial value.
1	PRMR01SSW	Usage of P16_3 to P16_0 for ZPD function 0: ports are not used for ZPD input 1: ports are used for ZPD input
0	Reserved	When written, write the initial value.

NOTE

In the header files the module name of the above register is defined as:
SELB.

46.3 Functional Overview

The Intelligent Stepper Motor Driver provides up to 6 drivers for stepper motors that are connected to external meters. Calibration of the meters is supported by the built-in zero point detection (ZPD) function.

Channel management feature, together with predetermined RAM tables, can be used in motor driving operation mode and in ZPD operation mode to carry out calculations with predefined parameters.

NOTE

The number of stepper motor drivers is defined in the first section of this chapter under the key word *"Channel index m"*.

Features summary

General features of the Intelligent Stepper Motor Driver:

- Control of up to 6 individual stepper motors
- Generation of pulse width modulated (PWM) output signals with the following characteristics:
  - Configurable PWM frequency
  - Pulse width with a precision of 10 bits
  - Configurable delay of PWM output signals for reducing fluctuation of power supply and for reducing the susceptibility to electromagnetic interference

Features for driving stepper motors:

- Generation of four output signals to drive a stepper motor's coils
- Half-bridge circuit or full-bridge circuit configuration compatibility (see I/O characteristics of device)
- Recirculation function to reduce the inductive load in the stepper motor's coils
- Advanced features of channel management:
  - Automatic calculation of intermediate positions from a target position
    Appropriate PWM signal information is taken from configurable PWM value look-up tables.
  - Storage of the stepper motor's characteristics in movement parameters
  - Configurable data update intervals
  - Interrupt request generation when a motor has reached its target position

Features for ZPD:

- Generation of four output signals to drive the stepper motor, with selectable signal generation method:
  - PWM signal generation as for motor driving
  - Direct control
- ZPD measurements with the following features:
  - Adjustable measurement clock and measurement delays to adjust ZPD measurement speed and window
  - Selection of the input to be measured
  - Comparison of input voltage with one of two configurable reference voltages
  - Digital noise filtering of comparison results with configurable filter parameters
  - Status flags and interrupt request to evaluate ZPD measurement results
- Power save mode
- Advanced features of channel management:
  - Automatic control of driving and measurements until zero point is detected
  - Configurable update intervals
  - Interrupt request generation when the zero position is reached

46.4 Functional Description

The Intelligent Stepper Motor Driver (ISMn) can control up to 6 independent stepper motors via motor channels.

Each of the six motor channels can be used to drive a stepper motor or for zero point detection.

46.4.1 Functional description stepper motor driving

Typically, a stepper motor has a horizontal and a vertical coil, each with two poles that are arranged opposite each other. Applying current to the coils in a specific pattern forces the rotor to move.

The Intelligent Stepper Motor Driver generates PWM signals to supply the horizontal and vertical coil with current. The vertical PWM signal comprises the sine value and the horizontal PWM signal comprises the cosine value of the desired rotor position (angle).

Since the PWM signals do not inherit a sign, quadrant information indicates whether the sine or cosine side is negative or positive.

Block diagram

Each stepper motor is driven individually. The following figure illustrates how ISMn drives *one* stepper motor.

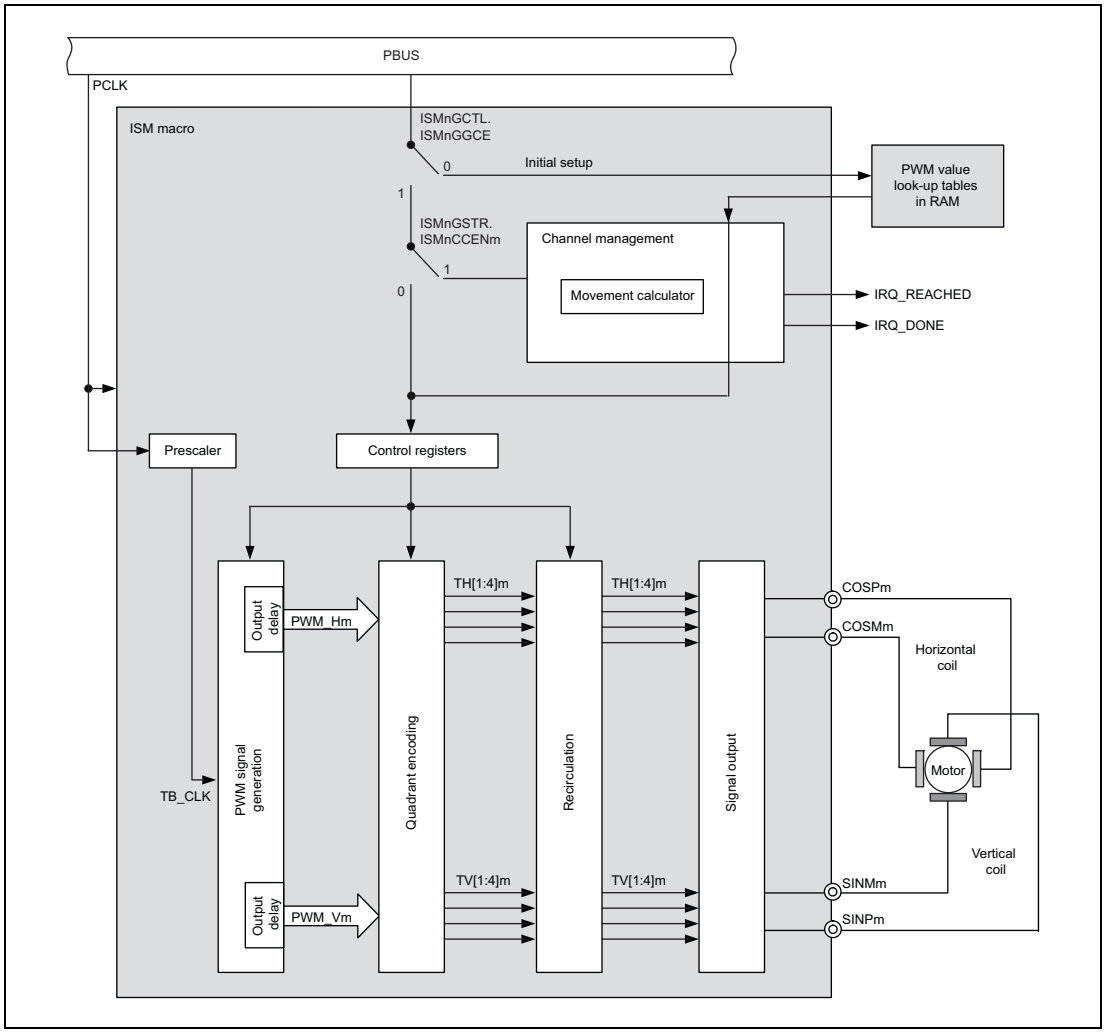

Figure 46.1 Block diagram of stepper motor driving of motor channel m

PWM signal generation

ISMn generates PWM signals. The PWM signal information (e.g. pulse width and quadrant information) can be applied in two different ways: with or without channel management.

- *With* channel management, only the desired target position of the motor needs to be supplied to ISMn. The rotor is moved step-wise to the target position whereby ISMn calculates intermediate positions using pre-determined movement parameters. Appropriate PWM signal information is taken from configurable PWM value look-up tables.

  An interrupt request and status flags indicate when a motor has reached its target position.
- *Without* channel management, the application software provides the PWM signal information.

Output delay

To reduce electromagnetic interferences (EMI noise), the PWM output can be delayed so that, for example, only one PWM edge can be seen at one time.

Quadrant encoding

Each PWM signal is encoded to 4 signals according to its quadrant. This allows the sides of both coils to be driven as required.

Recirculation

Recirculation can be used to prevent the generation of inductive voltage when a PWM signal is low and cuts-off the motor coil from current.

Signal output

The signals are output as required by the type of bridge circuit provided in the I/O buffers of the device. In a full-bridge circuit configuration, for example, the signal level is automatically adapted according to the P and N-channel FET types.

The bridge circuit of the port I/O structures then supplies the sides of the coils with current in the required manner.

46.4.2 Functional description zero point detection

A motor typically needs to be positioned at the “home” or zero position during power-up or after a position fault (e.g. after the motor power has been cut off).

Zero point detection

When the motor stops rotating, for example because the meter hits a mechanical stop, the back electromotive force (back EMF) of the motor declines to zero.

This principle can be used to bring a motor into its zero position: the rotor is rotated step-wise while the voltage is measured at an open end of an un-driven coil at specified times. The measured voltage is compared to a pre-determined reference voltage. When the measured voltage is below the threshold, the motor has reached its zero position.

Block diagram

Each stepper motor is driven individually. The following figure illustrates how ZPD is performed for *one* stepper motor.

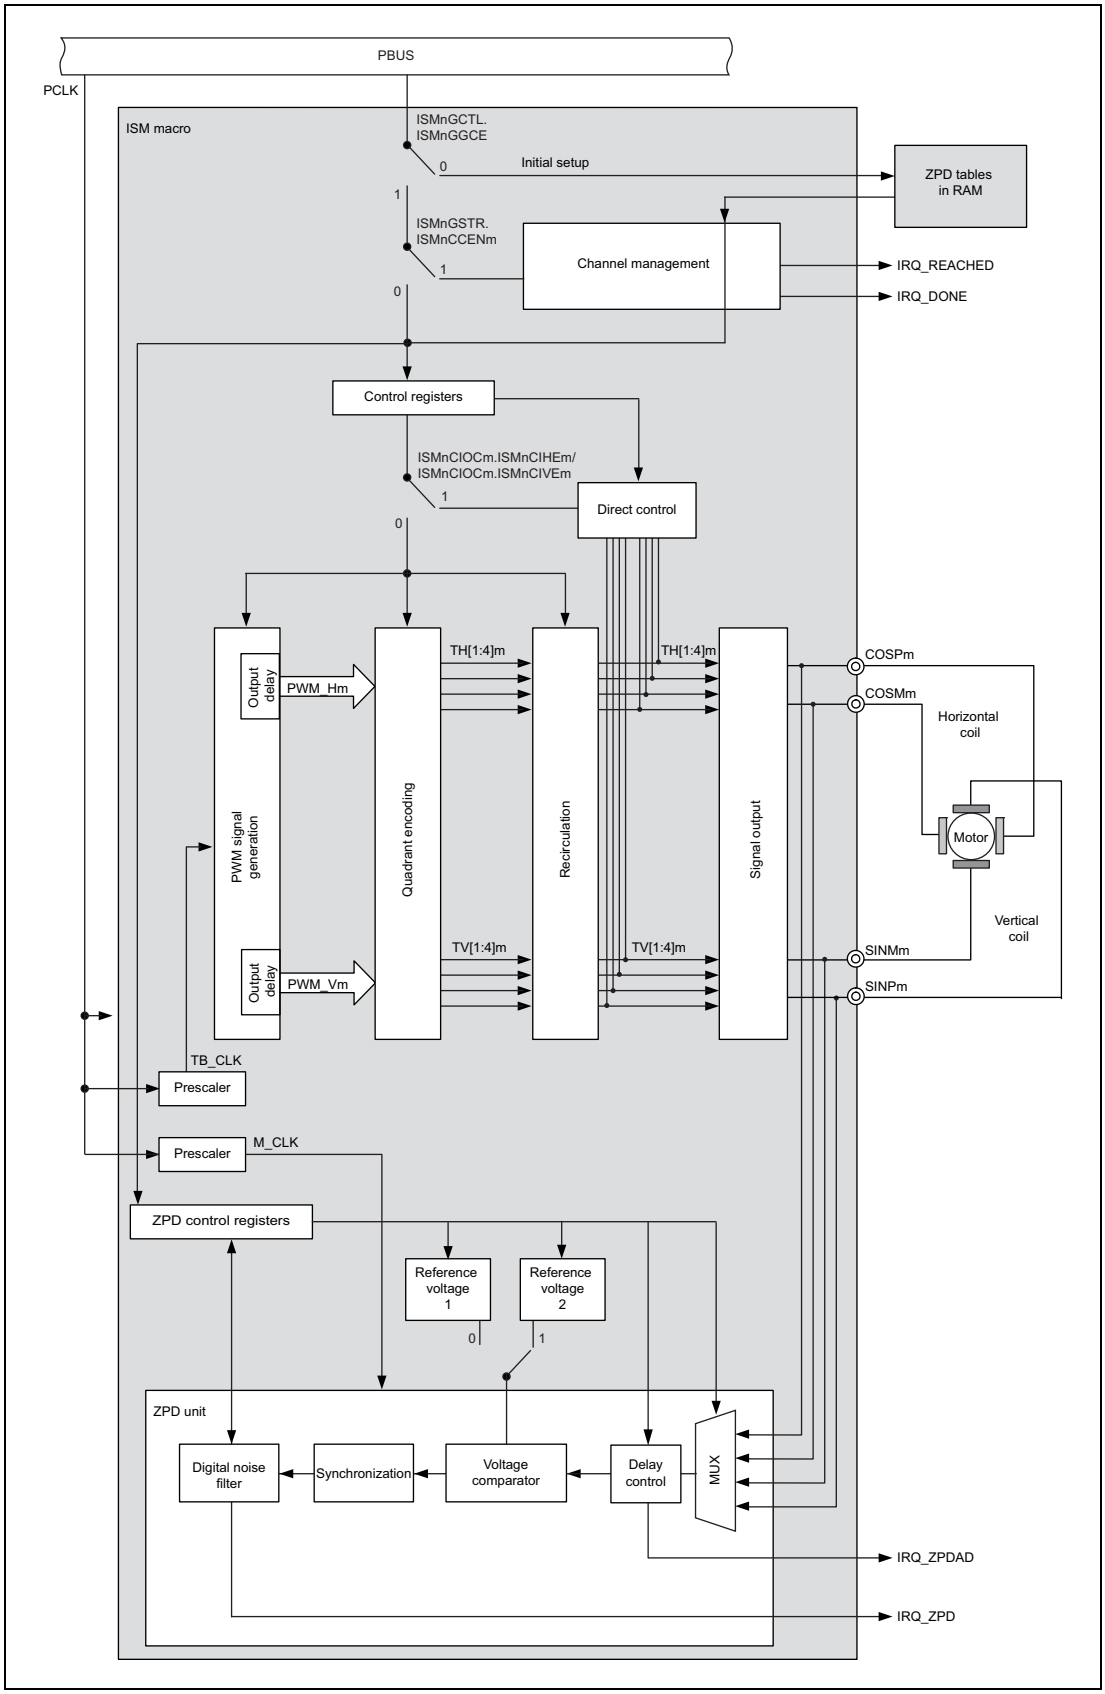

Figure 46.2 Block diagram of zero point detection of channel m

Zero point detection can be performed in two different ways: with or without channel management.

- *With* channel management, a pre-determined zero point detection procedure is started only once.

  ISMn moves the rotor and performs voltage measurements according to the step and measurement procedure stored in a RAM table.
  An interrupt request indicates that the motor has reached its zero position.
- *Without* channel management, the application provides all control necessary for motor driving and voltage measurements.

46.4.2.1 Motor driving

As in motor driving mode, PWM signals can be used to move the rotor.

Direct control

ISMn also allows the bridges to be driven directly. Direct control can be enabled/disabled for every motor channel individually.

46.4.2.2 ZPD measurements for position verification (ZPD unit)

Both ends of the horizontal and vertical coils can be measured (plus side and minus side).

The ZPD measurement frequency is configurable.

Blanking delay and measurement delay

Additionally, ZPD measurements can be delayed allowing a very precise timing of ZPD measurements, for example to start measuring at times that best suit a motor's characteristics.

Both a blanking delay at the start of a ZPD measurement and a measurement delay between measurement sequences are configurable.

Voltage comparator & synchronization

The voltage measured for a motor channel is compared to one of two pre-determined reference voltages.

The output of the voltage comparator is synchronized with the measurement clock M_CLK and forwarded to the digital noise filter.

Digital noise filtering

For reliable results, voltage measurements of a short pulse and spikes can be filtered out using digital noise filtering.

The interrupt IRQ_ZPD indicates when the zero position has not been reached during a measurement sequence.

Power save mode

To reduce power consumption, the comparators and reference voltage dividers can be disabled during that time, the ZPD operation mode is not used.

46.4.3 Clocking

The timebase for all channel operations is TB_CLK.

The PCLK prescaler for TB_CLK is configured in ISMnGCFG.ISMnGGTB[3:0].

TB_CLK = PCLK/N

where N = ISMnGCFG.ISMnGGTB[3:0] + 1

NOTE

TB_CLK can only be modified when channel management is switched off (ISMnGCTL.ISMnGGCE = 0).

46.4.4 Channel management

As already stated in the functional descriptions, channel management can be used in motor driving and ZPD operation modes.

No matter whether channel management is used by a motor channel or not, the PWM signals that drive the stepper motor are generated and processed in the same way. ZPD measurements are also performed regardless.

The procedures differ in how or “by whom”, and how often the position, movement, and measurement parameters need to be supplied to ISMn.

- Without channel management, the application software provides all information necessary for every single motor step and voltage measurement.
  PWM signal and ZPD measurement information are read from designated registers and become effective immediately.
  An interrupt request and status flags can indicate that a motor has not reached its zero position yet and further steps must be taken.
- When channel management is set for a motor channel that is operated in motor driving mode, only the desired target position of the motor needs to be supplied to ISMn.
  ISMn automatically controls the movement of the rotor until the rotor has reached the desired target position. Substeps are calculated using configurable PWM value look-up tables and movement parameters. Depending on a motor’s configured precision, a full rotation is divided into 512 or 128 steps. An interrupt request and status flags indicate when a rotor has reached its target position.
- When channel management is set for a motor channel that is operated in ZPD operation mode, the pre-determined zero point detection procedure only needs to be started.
  ISMn moves the rotor and performs voltage measurements according to the step and measurement procedure stored in a RAM table.
  When a motor has reached its zero position, channel management automatically disables ZPD operation mode for the respective channel. Additionally an interrupt request can be generated.

Advantages

Channel management reduces the number of calculations and the amount of configuration the application has to perform:

- Typically, most of the configuration needs to be done only once (after enabling/resetting ISMn).
- Multiple motors with the same or similar design and characteristics can share a PWM value look-

up table and/or a ZPD control sequence.

46.4.4.1 Channel management start/stop

The use of channel management can be enabled/disabled for every motor channel individually in ISMnGSTR.ISMnCCENm. Channel management itself is switched on/off by ISMnGCTL.ISMnGGCE.

- When ISMnGCTL.ISMnGGCE = 1, channel management is switched on.
  All motor channels where ISMnGSTR.ISMnCCENm = 1 are supplied by channel management.
- When ISMnGCTL.ISMnGGCE = 0, channel management is switched off for *all* channels although ISMnGSTR.ISMnCCENm = 1.
  For example, the rotors hold their position unless the pulse width, quadrant information, etc. are updated by the application.

The following table shows when a motor channel is supplied by channel management and when not.

Table 46.9 Channel management

ISMnGCTL.ISMnGGCE	ISMnGSTR.ISMnCCENm	Supplied by channel management?
1	1	Yes
	0	No
0	1	No
	0	No

NOTE

Modifying general configuration data requires channel management to be switched off. This includes the general settings and the RAM tables.
Modifying a channel's specific settings, usually only requires the usage of channel management to be disabled for that channel.

For details about the recommended procedures refer to

- Section 46.4.12.2, Basic procedures: Motor driving with channel management
- Section 46.4.12.4, Basic procedures: ZPD with channel management.

46.4.4.2 Channel data update interval

The data of motor channels for which channel management is set, is automatically updated in a configurable interval.

The so-called channel data update interval is a multiple of PWM cycles. It is therefore related to the PWM frequency f_{PWM}. The update is triggered by a START event which is issued at the beginning of every channel data update interval.

The new values take effect at the beginning of the next PWM cycle (see Section 46.4.5.1, PWM cycle time and PWM frequency for details).

The following figure illustrates the relation between the PWM cycle time (1) and the channel data update interval (2).

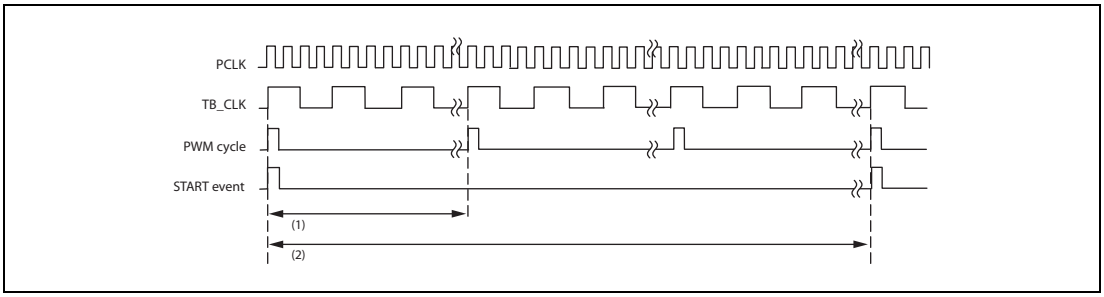

Figure 46.3 PWM cycle time and channel data update interval

NOTE

Values for channels where channel management is not set can be modified at any time. The new values take effect at the beginning of the next PWM cycle also – independent of START events.

Configuration of update interval

The channel data update interval can be calculated by the following formula:

$$\text{Update interval} = M / f_{PWM}$$

$$M = \text{Update interval} \times f_{PWM}$$

$$= (\text{Update interval} \times \text{TB\_CLK}) / (2^{10} - 1)$$

M = ISMnGCFG.ISMnGGUD[7:0] + 1.

Examples

The channel data update interval should be about 1.1 ms while TB_CLK is 8 MHz.

$$M = 1.1\ \text{ms} \times 8{,}000\ \text{kHz} / 1{,}023$$

$$= 8.602$$

The channel data update interval is 1.125 ms when M = 9 (ISMnGCFG.ISMnGGUD[7:0] = 8_H).

The following table provides M values for a channel data update interval of approximately 1.1 ms for recommended f_{PWM}.

Table 46.10 Recommended settings

f_{PWM}	M (ISMnGCFG.ISMnGGUD[7:0] + 1)	Update interval
8 kHz	9	1.125 ms
16 kHz	18	1.125 ms
32 kHz	35	1.093 ms
64 kHz	70	1.093 ms

Refer to Section 46.4.9.1, Channel data update timing to see when new values are applied.

46.4.5 Generation and processing of PWM signals to drive a motor

To drive a stepper motor, two synchronized PWM signals are generated according to the desired rotor position's sine and cosine values.

Provision of PWM signal information

The PWM signal information is supplied differently depending on whether channel management is set for a motor channel or not, and the channel's operation mode.

Exception

Direct control in ZPD operation mode allows the transistors that supply the horizontal and vertical coil with current to be activated directly. Refer to Section 46.4.7.1, Motor driving for details.

46.4.5.1 PWM cycle time and PWM frequency

The PWM cycle time and PWM frequency take effect for all channels:

- The PWM cycle time is 2^{10}-1 (1,023) cycles of the scalable timebase TB_CLK.
  All channels are processed once within *one* PWM cycle – at the beginning of a new PWM cycle.
- The PWM frequency f_{PWM} is given by the following formula:
  f_{PWM} = TB_CLK / (2^{10} - 1)
  Reasonable f_{PWM} values are 8 kHz, 16 kHz, 32 kHz, and 64 kHz.

Refer to Section 46.4.3, Clocking for details about configuring TB_CLK.

46.4.5.2 Duty cycle time and duty factor of PWM signals

The 10-bit free running up counter ISMnGCNT.ISMnGGTR[9:0] counts TB_CLK. The counter's maximum value is 2^{10} - 2.

The horizontal and vertical PWM signals are set to high at the beginning of a PWM cycle and are reset to low when the counter matches the configured duty cycle time.

Configuration of duty cycle time

The duty cycle times for the horizontal and vertical PWM signals can be set individually, each to a value between 0 and 2^{10} - 1 cycles of TB_CLK.

- ISMnCCMPm.ISMnCCVPm[9:0] defines the value for a channel's *vertical* PWM signal (corresponds to the sine value of the rotor's position).
- ISMnCCMPm.ISMnCCHPm[9:0] defines the value for a channel's *horizontal* PWM signal (corresponds to the cosine value of the rotor's position).

ISMnCCMPm.ISMnCCVPm[9:0] and ISMnCCMPm.ISMnCCHPm[9:0] are supplied differently depending on whether channel management is set for a motor channel or not, and the channel's operation mode.

NOTES

1. The output of a PWM signal is switched off when the configured value is "0".

2. The PWM signal is steady high when the maximum value "2^{10} - 1" is configured. With this value set, the counter never matches the configured duty cycle time and the PWM is not reset to low.

Duty cycle

The duty cycle of the PWM can be calculated by the following formula:

Duty cycle % = [D / (2^{10} - 1)] x 100 %

where D = ISMnCCMPm.ISMnCCHPm[9:0] or D = ISMnCCMPm.ISMnCCVPm[9:0].

Examples

The following figure illustrates some examples of horizontal PWM signals with different duty cycles.

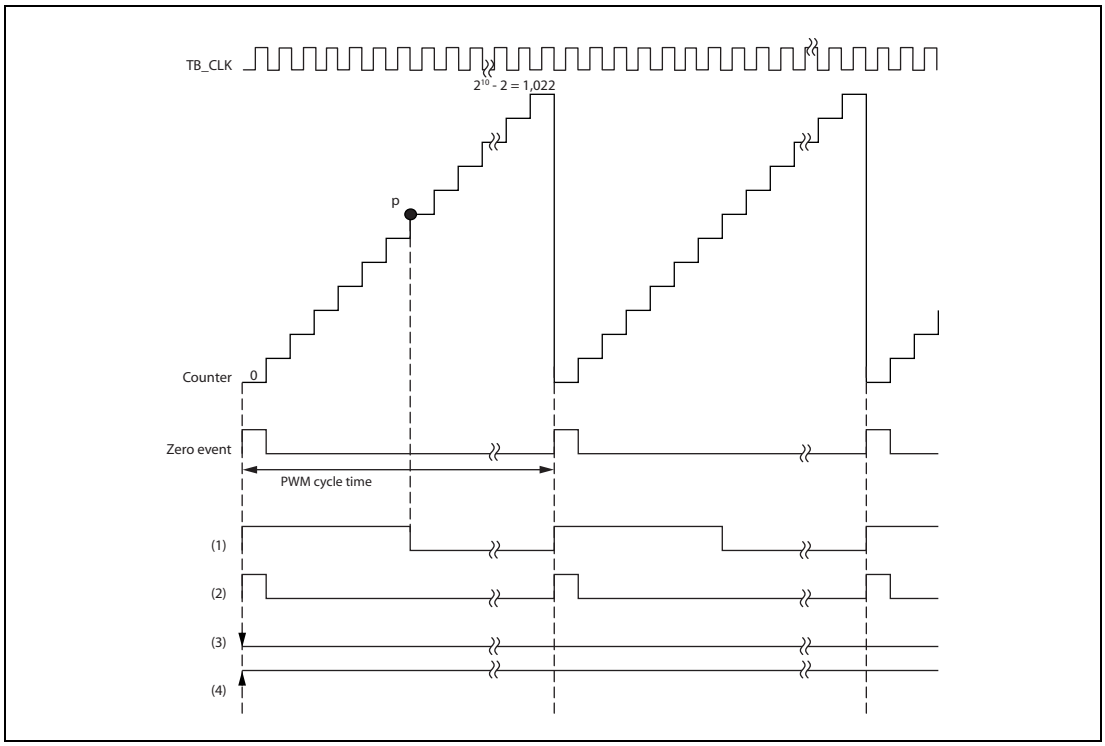

Figure 46.4 Examples of different PWM signals

The following settings are valid in the figure above:

	ISMnCCMPm.ISMnCCHPm[9:0]	Duty cycle
(1)	p	[p / (2^{10} - 1)] x 100 %
(2)	1	[1 / (2^{10} - 1)] x 100 % = 0,097 %
(3)	0 (min.)	0 %
(4)	2^{10} - 1 (max.)	100 %

The PWM signal is output without delay in all cases (ISMnCCMRm.ISMnCCDHm[3:0] = 0).

46.4.5.3 Output delay

Simultaneous switching of sine and cosine output can increase the susceptibility to electromagnetic interference (EMI noise).

To reduce EMI noise, the output of PWM signals can be delayed so that, for example, only one PWM signal edge can be seen at one time.

The output can be delayed by 1 to 15 clock cycles of TB_CLK.

- ISMnCCMRm.ISMnCCDHm[3:0] specifies the output delay for the *horizontal* PWM signal (corresponds to the cosine value of the rotor's position).
- ISMnCCMRm.ISMnCCDVm[3:0] specifies the output delay for the *vertical* PWM signal (corresponds to the sine value of the rotor's position).

46.4.5.4 Encoding of PWM signals according to quadrant

The PWM signals are encoded into 4 signals each as required by the type of bridge circuit implemented in the port structure.

- The *horizontal* (cosine) PWM signal is encoded to TH[1:4]m.
- The *vertical* (sine) PWM signal is encoded to TV[1:4]m.

Encoding

Since the PWM signals do not inherit a sign, the encoding depends on the quadrant information in ISMnCCMPm.ISMnCCQIm[1:0] and follows the logic in the following table:

Table 46.11 Encoding of PWM signals according to quadrant

			Output Result							
Quadrant information			Encoding of horizontal PWM signal				Encoding of vertical PWM signal			
ISMn CCQIm[1:0]	Quadrant	Angle	TH1m	TH2m	TH3m	TH4m	TV1m	TV2m	TV3m	TV4m
00_B	0	0° - 90°	PWM_H	0	0	1	PWM_V	0	0	1
01_B	1	90° - 180°	0	1	PWM_H	0	PWM_V	0	0	1
10_B	2	180° - 270°	0	1	PWM_H	0	0	1	PWM_V	0
11_B	3	270° - 360°	PWM_H	0	0	1	0	1	PWM_V	0

ISMnCCMPm.ISMnCCQIm[1:0] is supplied differently depending on whether channel management is set for a motor channel or not, and the channel's operation mode.

NOTE

The encoding is the same in a half-bridge or full-bridge circuit implementation. Depending on the implementation, the resulting signals are reshaped.

Refer to Section 46.4.5.6, Signal output for details.

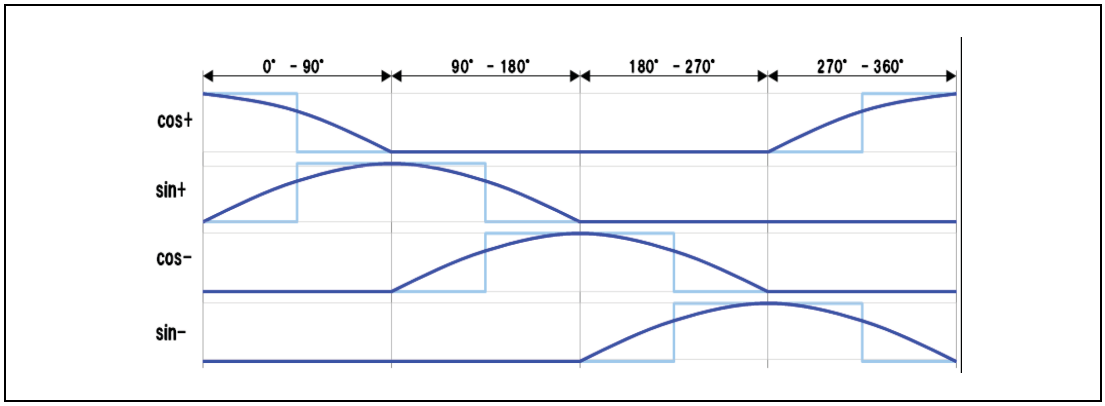

Figure 46.5 Reshaping of motor signals by microstep movement

46.4.5.5 Recirculation

Current flowing through a coil creates a magnetic field which crashes at the instant the current is switched off, for example because the corresponding PWM signal is in its low phase. The crash of the magnetic field induces a high load across the coil for a short time which can damage the transistors of the bridge.

Recirculation discharges inductive load when the horizontal and/or vertical PWM signals are low. The magnetic field dies away rather than crashing instantly. This prevents the induced load becoming too high.

CAUTION

Recirculation must be enabled (ISMnCIVRm and ISMnCIHRm set) when using the ISMn with inductive loads (such as the coils of the stepper motors).
Otherwise, severe damage to the output stages of the I/O ports may result.

Redirection to ground connection or power supply

The current is redirected reducing the effect of flyback voltage caused by switching the inductive load.

- The current is directed via the ground connection $ISMV_{SS}$ when ISMnCOPT.ISMnCIRSm = 0 (default).
- The current is directed via the power supply $ISMV_{CC}$ when ISMnCOPT.ISMnCIRSm = 1.

NOTE

ISMnCOPT.ISMnCIRSm can only be modified when channel management is switched off (ISMnGCTL.ISMnGGCE = 0).

Enabling/disabling recirculation

Recirculation can be enabled/disabled for each channel individually:

- ISMnCIOCm.ISMnCIHRm enables/disables the recirculation of a channel's *horizontal* (cosine) PWM signal.
- ISMnCIOCm.ISMnCIVRm enables/disables the recirculation of a channel's *vertical* (sine) PWM signal.

ISMnCIOCm.ISMnCIHRm and ISMnCIOCm.ISMnCIVRm are supplied differently depending on whether channel management is set for a motor channel or not, and the channel's operation mode.

46.4.5.6 Signal output

Bridge circuits supply current to the positive and negative sides of the horizontal and vertical coils. ISMn supports a half-bridge and a full-bridge circuit implementation.

Depending on the bridge type implemented, different signals are used to drive the transistors of the bridges.

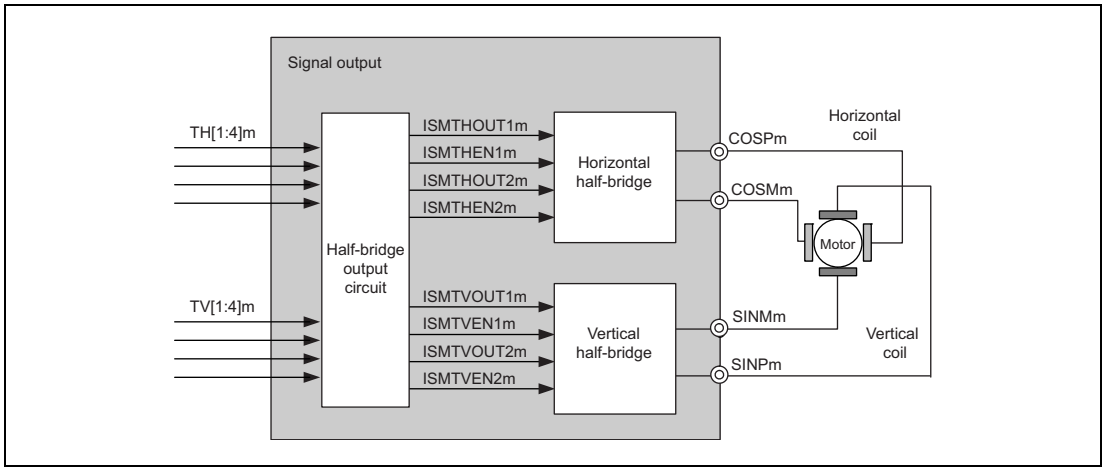

Figure 46.6 Signal output in half-bridge circuit configuration

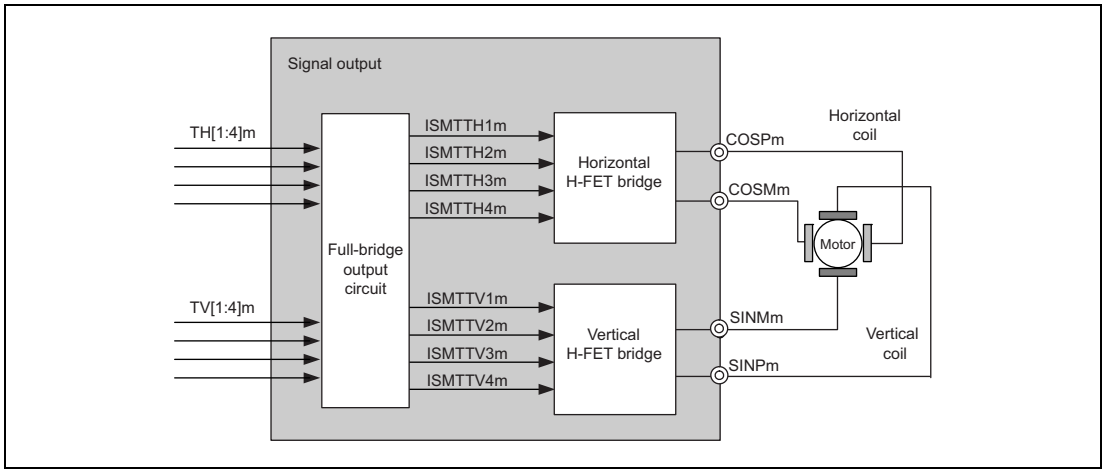

Figure 46.7 Signal output in full-bridge circuit configuration

Half-bridge circuit configuration

To match with a half-bridge circuit structure, the signals TH[1:4]m and TV[1:4]m are output according to the table below.

Table 46.12 Output signals in a half-bridge circuit configuration

Input conditions*1					Output to bridge circuit				Output to coil	
Horizontal coil	**TH1m**	**TH2m**	**TH3m**	**TH4m**	**ISMTHOUT1m**	**ISMTHEN1m**	**ISMTHOUT2m**	**ISMTHEN2m**	**COSPm**	**COSMm**
Vertical coil	**TV1m**	**TV2m**	**TV3m**	**TV4m**	**ISMTVOUT1m**	**ISMTVEN1m**	**ISMTVOUT2m**	**ISMTVEN2m**	**SINPm**	**SINMm**
	PWM low*2		0	1	0	Recirculation: - Off: 0 - On: 1	0	1	PWM	0
	PWM high*2		0	1	1	1	0	1		
	0	1	PWM low*2		0	1	0	Recirculation: - Off: 0 - On: 1	0	PWM
	0	1	PWM high*2		0	1	1	1		

Note 1. To prevent the bridge circuit from being damaged, neither TH1m & TH2m, TV1m & TV2m, TH3m & TH4m, nor TV3m & TV4m can be high at the same time. Quadrant encoding blocks all input conditions that are not given in this table.

Note 2. The shape of “PWM low” is (0,0), if recirculation is disabled, and (0,1), if recirculation is enabled. The shape of “PWM high” is always (1,0).

I/O signals to half-bridge circuits

The I/O signals to the half-bridge circuits are listed in the table below:

Table 46.13 Half-bridge circuits I/O signals

Signal name	I/O	Function
Half-bridge circuit configuration		
ISMTHOUT1m	O	Channel m horizontal output 1
ISMTHEN1m	O	Channel m horizontal enable 1
ISMTHOUT2m	O	Channel m horizontal output 2
ISMTHEN2m	O	Channel m horizontal enable 2
ISMTVOUT1m	O	Channel m vertical output 1
ISMTVEN1m	O	Channel m vertical enable 1
ISMTVOUT2m	O	Channel m vertical output 2
ISMTVEN2m	O	Channel m vertical enable 2

Full-bridge circuit configuration

In a full-bridge circuit configuration, the signals TH[1:4]m and TV[1:4]m are output according to the following table:

Table 46.14 Output signals in a full-bridge circuit configuration

	Input conditions*1				Output to bridge circuit				Output to coil	
Horizontal coil	TH1m	TH2m	TH3m	TH4m	ISMTTH1m	ISMTTH2m	ISMTTH3m	ISMTTH4m	COSPm	COSMm
Vertical coil	TV1m	TV2m	TV3m	TV4m	ISMTTV1m	ISMTTV2m	ISMTTV3m	ISMTTV4m	SINPm	SINMm
	PWM	Recirculation: - Off: 0 - On: PWM	0	1	PWM	Recirculation: - Off: 0 - On: $\overline{\text{PWM}}$	1	1	PWM	0
	0	1	PWM	Recirculation: - Off: 0 - On: PWM	1	1	PWM	Recirculation: - Off: 0 - On: $\overline{\text{PWM}}$	0	PWM

Note 1. To prevent the bridge circuit from being damaged, neither TH1m & TH2m, TV1m & TV2m, TH3m & TH4m, nor TV3m & TV4m can be high at the same time. Quadrant encoding blocks all input conditions that are not given in this table.

The signals TH[1:4]m and TV[1:4]m are passed through to the H-FET bridges but the level of the PWM signals is inverted to serve the P-channel type transistors that require a low-level PWM signal.

The following figure illustrates how the signals ISMTTH[1:4]m/ISMTTV[1:4]m relate to the transistors of an H-FET bridge.

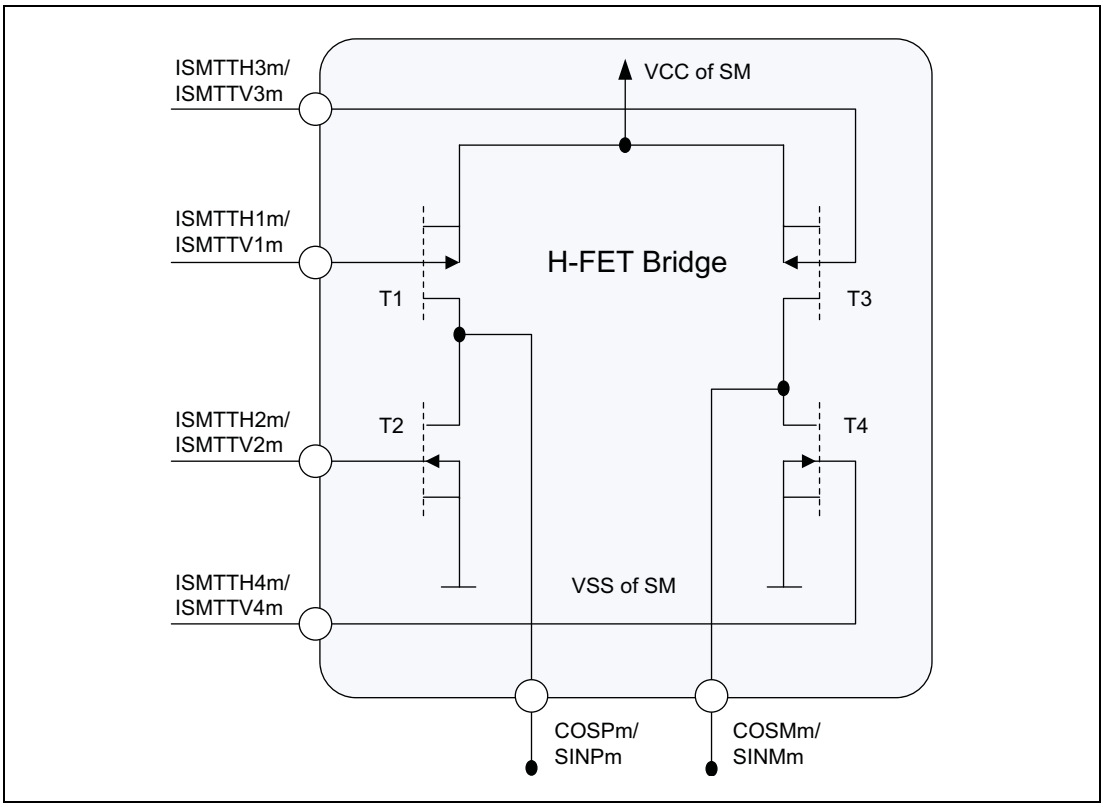

Figure 46.8 Structure of an H-FET full-bridge

I/O signals to full-bridge circuits

The I/O signals to the full-bridge circuits are listed in the table below:

Table 46.15 Full-bridge circuits I/O signals

Signal name	I/O	Function
Full-bridge circuit configuration		
ISMTTH1m	O	Channel m horizontal drive 1
ISMTTH2m	O	Channel m horizontal drive 2
ISMTTH3m	O	Channel m horizontal drive 3
ISMTTH4m	O	Channel m horizontal drive 4
ISMTTV1m	O	Channel m vertical drive 1
ISMTTV2m	O	Channel m vertical drive 2
ISMTTV3m	O	Channel m vertical drive 3
ISMTTV4m	O	Channel m vertical drive 4

46.4.6 Stepper motor driving

The Intelligent Stepper Motor Driver can drive up to 6 independent stepper motors by generating PWM signals.

A motor channel is operated in motor driving operation mode, when ISMnCCMRm.ISMnCCZPm = 0.

A basic description of the generation and processing of PWM signals can be found in **Section 46.4.5, Generation and processing of PWM signals to drive a motor**.

The following sections provide the details that are essential for using ISMn for motor driving with and without channel management.

46.4.6.1 Stepper motor driving with channel management

The following describes the details for motor driving *with* channel management.

The basic procedure is described in Section 46.4.12.2, Basic procedures: Motor driving with channel management.

(1) Provision of PWM signal information

With channel management, only the desired target position of the motor needs to be supplied to ISMn after the motor channel's parameters have been configured.

ISMn automatically moves the motor step by step until it has reached the desired target position (ISMnPAR0CFGm):

- The required intermediate positions, speed, and direction of rotation are calculated using the configured movement parameters ISMnPAR[9:1]CFGm (e.g., damping factor, acceleration limit, speed limit, etc.) and the saved variable parameters ISMnVAR[6:1]CFGm (e.g. actual position and speed).
- The PWM signal information of the calculated positions (such as pulse width, quadrant information, and recirculation enable flag) is taken from the assigned PWM value look-up table (ISMnCCMRm.ISMnCCCTm[2:0]) and fed into the corresponding registers (see Section 46.4.8.1, PWM value look-up tables for motor driving).
- The output delay for the horizontal and vertical PWM signal can be specified in

ISMnCCMRm.ISMnCCDHm[3:0] and ISMnCCMRm.ISMnCCDVm[3:0].

- ISMn can issue the interrupt request IRQ_REACHED, when a motor has reached its target position.

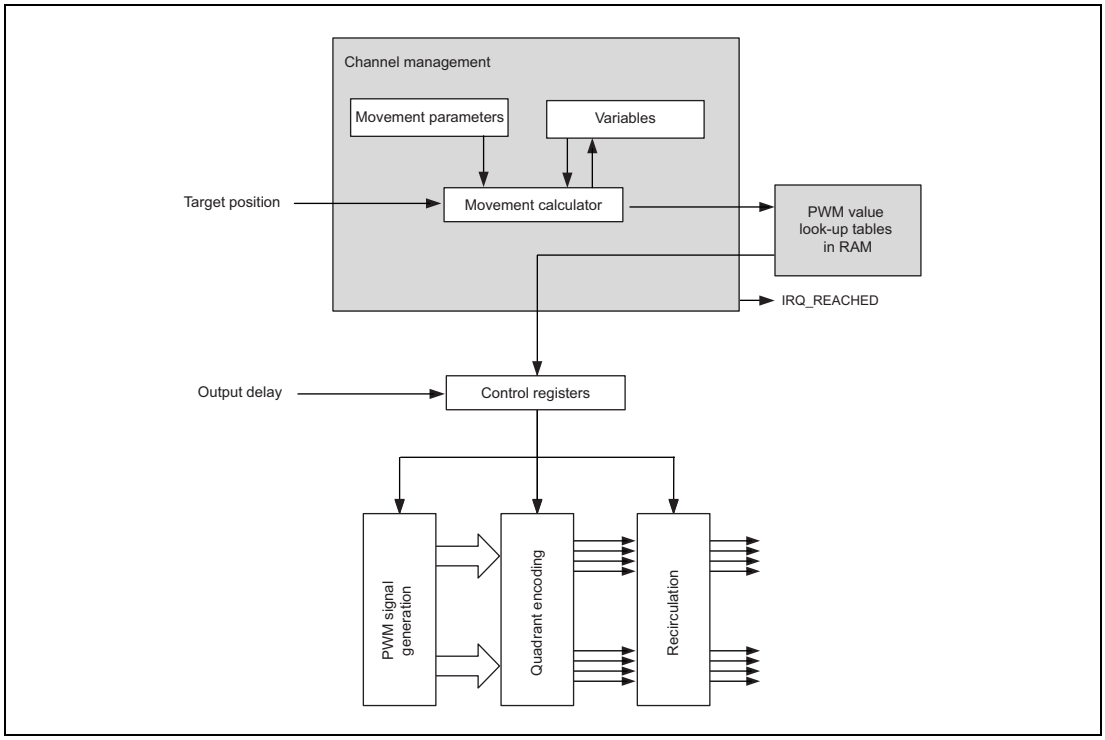

Figure 46.9 Provision of PWM signal information by channel management

(2) Modification of motor channel data

- The target position ISMnPAR0CFGm can be modified at any time.

  The new value takes effect after the next START event which is issued in a configurable interval (see Section 46.4.4.2, Channel data update interval).

- The modification of the movement parameters ISMnPAR[9:1]CFGm or the variable parameters ISMnVAR[6:1]CFGm requires the usage of channel management to be disabled for the dedicated channel (ISMnGSTR.ISMnCCENm = 0) or channel management to be switched off (ISMnGCTL.ISMnGGCE = 0).
  The new values take effect when channel management is enabled/switched on again (after the next START event).

- The modification of all other settings (including the PWM value look-up tables in the RAM) require channel management to be switched off (ISMnGCTL.ISMnGGCE = 0).
  The new values take effect when channel management is switched on again (after the next START event).

(3) Algorithm of the movement calculator

The movement calculator uses the given parameter sets and variables to calculate positions of the ISM channels. Each calculated position is an intermediate step of the movement from the current position towards the specified target position of ISMnPAR0CFGm.

Within one movement step of each channel, the movement calculator performs the calculation of the next following intermediate position, by using the algorithm below. Within this algorithm, the values are having the correspondences of the associated registers, as specified in **Table 46.32, ISMnPARiCFGm parameter registers overview**.

VPT:	ISMnVAR3CFGm	Temporary calculator register for PT1
PMP:	ISMnPAR0CFGm	Target motor position CHm
PDF:	ISMnPAR1CFGm	Damping factor CHm
VAS:	ISMnVAR1CFGm	Actual speed CHm
VAP:	ISMnVAR4CFGm	Actual position, current result CHm
VAX:	ISMnVAR0CFGm	Actual acceleration/deceleration CHm
VPS:	ISMnVAR2CFGm	Previous iteration speed CHm

```
/* Calculation of new acceleration and speed */

VPT       =    VPT + ( ( PMP - VPT) >> PDF )
VAS       =    ( VPT - VAP ) >> PDF
VAX       =    VAS - VPS

/* Limitation of the acceleration and speed */

if ( VPS > 0 )
{
     if ( VAX > PAL )
     {
          VAS = VPS + PAL
     }

     if ( VAX < ( - PDL ) )
     {
          VAS = VPS - PDL
     }
}
else
{
     if ( VAX < ( - PAL ) )
     {
          VAS = VPS - PAL
     }

     if ( VAX > PDL )
     {
          VAS = VPS + PDL
     }
}

if ( VAS >= 0 )
{
     if ( VAS > PMS )
    {
          VAS = PMS
     }
}
else
{
     if ( ( -VAS ) > PMS )
    {
          VAS = ( - PMS )
     }
}

/* Result output for Microstep & store old speed */
```

```
VAP       =    VAP + VAS
VPS       =    VAS

/* Calculate SW displayed position */

if ( ( VAP - VVP ) > PHC )
{
     VVP = VAP - PHC
}

if ( ( VAP - VVP ) < ( - PHC ) )
{
     VVP = VAP + PHC
}

/* Select Table according to speed and direction */

if ( VAS > 0 )
{
     VDR = 0

     if ( ( VAS <= PS1 ) or ( VAS >= PS2 ) )
     {
          VSP = 0
     }

     else
     {
          VSP = VSP
     }

     if( ( VAS >= PS3 ) and( VAS <= PS4 ) )
     {
          VSP = 1
     }

     else
     {
          VSP = VSP
     }
}
else
{
     if ( VAS < 0 )
     {

          VDR = 1

          if ( ( ( -VAS ) <= PS1 ) or ( ( -VAS ) >= PS2 ) )
          {
               VSP = 0
          }

          else
          {
               VSP = VSP
          }

          if ( ( ( -VAS ) >= PS3 ) and( ( -VAS ) <= PS4 ) )
          {
               VSP = 1
          }

          else
          {
               VSP = VSP
          }
     }
}
```

```
if ( VAS == 0 )
{
     VSP = 0
}

/* Negative Position suppression */

if ( VAP < 0 )
{
     VAP = 0
}
```

(4) Interrupt requests and status flags

IRQ_REACHED

If configured (ISMnGCTL.ISMnGIEREm = 1), ISMn generates the interrupt request IRQ_REACHED, when the rotor has reached its target position.

IRQ_REACHED is a general interrupt and is generated when any motor with ISMnGCTL.ISMnGIEREm = 1 has reached its target or zero position.

The status flags in ISMnGIP allow to verify the interrupt status at any time as well as which motor has caused the interrupt.

Refer to Section 46.4.10.1, IRQ_REACHED: Target/zero position reached for details.

IRQ_DONE

If configured (ISMnGCTL.ISMnGIEDO = 1), ISMn generates the interrupt request IRQ_DONE, when the sequencer has returned to the idle state (until the next START event) after all channels' data has been updated.

Refer to Section 46.4.10.2, IRQ_DONE: Sequencer idle interrupt for details.

46.4.6.2 Stepper motor driving without channel management

The following describes the details for motor driving *without* channel management are described.

The basic procedure is described in Section 46.4.12.3, Basic procedures: Motor driving without channel management.

(1) Provision of PWM signal information

Without channel management, the application needs to supply the following information for every step of the rotor:

- PWM signal information in ISMnCCMPm including the pulse width for the horizontal and vertical PWM signal and the quadrant information.
- Specification whether recirculation should be used for the horizontal and/or vertical PWM signals (ISMnCIOCm.ISMnCIHRm and ISMnCIOCm.ISMnCIVRm).

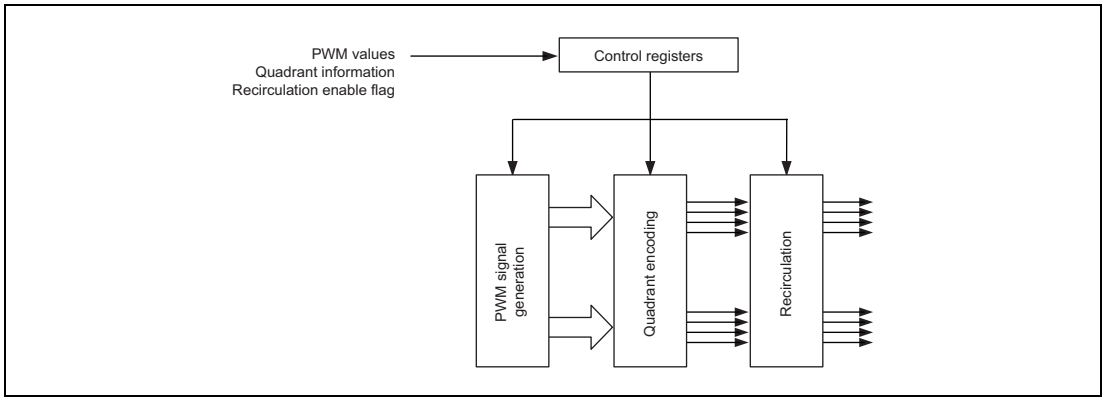

Figure 46.10 Provision of PWM signal information by the application

(2) Modification of motor channel data

- The PWM signal information can be modified at any time. The new values take effect at the beginning of the next PWM cycle.
- The output delays and the recirculation side (ISMnCOPT) can only be modified when channel management is switched off (ISMnGCTL.ISMnGGCE = 0).

46.4.7 Zero Point Detection (ZPD)

For zero point detection, the motor is driven while the voltage is measured on one selectable end of an un-driven coil at specified times.

With ISMn, up to 6 stepper motors can perform zero point detection at the same time. Furthermore, mixed operation of ZPD with regular motor driving is possible.

ZPD measurements require the zero point detection unit to be enabled (ISMnGZPDCTL.ISMnGGZE = 1). A channel is operated in ZPD operation mode, when ISMnCCMRm.ISMnCCZPm = 1.

46.4.7.1 Motor driving

A motor where ZPD operation mode is set can be driven by PWM signals (as in motor driving operation mode) and directly by using direct control.

(1) Motor driving by PWM signals

In ZPD operation mode, a motor can be driven by PWM signals as in motor driving operation mode. The PWM signal information must be applied by the application for every step of the motor.

A basic description of the generation and processing of PWM signals for motor driving can be found in Section 46.4.5, Generation and processing of PWM signals to drive a motor.

(2) Direct control

In ZPD operation mode, direct control can be used to directly define how the horizontal and vertical coils are applied with current.

Direct control can be enabled/disabled for the horizontal and vertical coils individually. When direct control is enabled for a coil, the PWM signal information for that coil is ignored (including recirculation settings). Instead the level of the signals TH[1:4]m and TV[1:4]m is set as defined in ISMnCIOCm.

- When ISMnCIOCm.ISMnCIHEm = 1, bits ISMnCIHDm[3:0] specify how the *horizontal* coil is to be activated.
- When ISMnCIOCm.ISMnCIVEm = 1, bits ISMnCIVDm[3:0] specify how the *vertical* coil is to be activated.

Table 46.16 Signal levels depending on direct control settings

ISMnCIOCm.ISMnCIHDm[3:0]	TH1m	TH2m	TH3m	TH4m
ISMnCIOCm.ISMnCIVDm[3:0]	TV1m	TV2m	TV3m	TV4m
0000_B	0	0	0	0
0001_B	0	0	0	1
0010_B	0	0	1	0
0100_B	0	1	0	0
0101_B	0	1	0	1
0110_B	0	1	1	0
1000_B	1	0	0	0
1001_B	1	0	0	1
1010_B	1	0	1	0

NOTE

To prevent the bridge circuit from being damaged, neither TH1m & TH2m, TV1m & TV2m, TH3m & TH4m nor TV3m & TV4m can be high at the same time. Therefore, direct control blocks all input conditions that are not given in this table: dangerous conditions are avoided in these cases by setting some of TH[1:4]m/TV[1:4]m to low.

When channel management is set, ISMnCIOCm.ISMnCIVEm, ISMnCIOCm.ISMnCIHEm, ISMn CIVDm[3:0], and ISMnCIHDm[3:0] are taken from the assigned ZPD table. Otherwise, they need to be supplied by the application.

The signals TH[1:4]m and TV[1:4]m are output to the bridges according to the tables in Section 46.4.5.6, Signal output.

46.4.7.2 Input selection for ZPD measurement

For zero point detection, one pin of a motor channel is used as input pin to measure the induced voltage. Both ends of the horizontal and vertical coils can be measured (plus side and minus side).

The valid input signal is specified in ISMnZPDCTL.ISMnCZISm[1:0].

When channel management is set, ISMnZPDCTL.ISMnCZISm[1:0] is taken from the assigned ZPD table. Otherwise, ISMnZPDCTL.ISMnCZISm[1:0] needs to be supplied by the application.

46.4.7.3 Set of measurement sequences

The motor channels are considered for ZPD measurement where the following conditions are true:

- Motor channel is operated in ZPD operation mode (ISMnCCMRm.ISMnCCZPm = 1)
- ZPD measurement trigger is set (ISMnZPDCTL.ISMnCZMTm = 1)

The input signals of all channels to be considered are measured concurrently.

For each channel, one measurement sequence is repeated endlessly until the ZPD measurement trigger ISMnZPDCTL.ISMnCZMTm is reset to 0.

When channel management is set, ISMnZPDCTL.ISMnCZMTm is taken from the assigned ZPD table. Otherwise, ISMnZPDCTL.ISMnCZMTm needs to be supplied by the application.

The following chapters describe how ISMn allows a very precise timing of ZPD measurements. To simplify matters a set of measurement sequences for one motor channel is described.

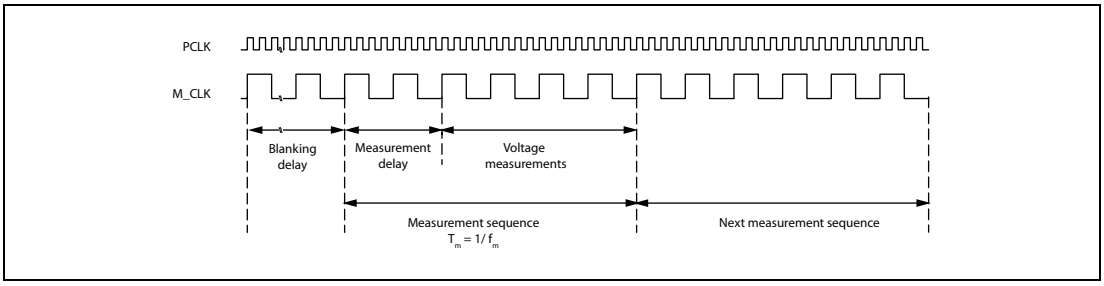

Figure 46.11 Set of measurement sequences

(1) ZPD measurement clock M_CLK

ZPD measurements are synchronized with the ZPD measurement clock M_CLK. M_CLK is a divided clock of PCLK and can therefore be used to slow down ZPD measurements.

$$M\_CLK = PCLK / N$$

The division factor N can be configured in ISMnGZPDCTL.ISMnGGZF[3:0].

(2) ZPD measurement frequency

The measurement frequency can be calculated using the following formula:

$$f_M = M\_CLK / (O + P)$$

O = Measurement delay specified in ISMnGZPDCTL.ISMnGGCS[2:0]

P = Number of times, the voltage is measured during one measurement sequence as specified in ISMnGZPDCTL.ISMnGGFD[3:0]

NOTE

ISMnGZPDCTL can only be modified when channel management is switched off (ISMnGCTL.ISMnGGCE = 0).

(3) Blanking delay

When the ZPD measurement is triggered by writing 1 to ISMnZPDCTL.ISMnCZMTm the first measurement sequence starts after the configured blanking delay (ISMnZPDCMPm.ISMnCZBTm[15:0]) which is defined as a multiple of measurement sequences T_m.

NOTE

ISMn can generate the interrupt request IRQ_ZPDAD at the beginning of the first measurement sequence.

(4) Measurement delay

A measurement sequence comprises a measurement delay and a period of time of actual voltage measurements.

- The measurement delay is defined in ISMnGZPDCTL.ISMnGGCS[2:0] as a number of clock cycles of M_CLK.
- The period of time for actual voltage measurements depends on the noise filter settings (see Section (6), Noise filtering).

ISMnGZPDCTL.ISMnGGCS[2:0] needs to be supplied by the application.

(5) Reference voltages

ISMn provides 3 different reference voltages:

- 2 internal reference voltage
- 1 external reference voltage is generated out of the voltage supplied by the ZPD external reference voltage port pin (ZPDVREF):

to be used by every channel: ISMnGZPDCTL.ISMnGGRV1[3:0] and ISMnGZPDCTL.ISMnGGRV2[3:0]. Possible reference voltages are between 100 mV and 850 mV.

The voltages measured for a channel are compared to the reference voltage selected for that channel in ISMnZPDOPT.ISMnCZRSm.

(6) Noise filtering

For reliable results, voltage measurements of a short pulse and spikes can be filtered out using digital noise filtering.

In the course of one measurement sequence, the voltage is measured during ISMnGZPDCTL.ISMnGGFD[3:0] clock cycles of M_CLK. When the voltage is above the channel's reference voltage for greater or equal ISMnGZPDCTL.ISMnGGFL[3:0] clock cycles of M_CLK, the motor is assumed to still not having reached its zero position. Subsequent measurement sequences can be appended to define the measurement time window.

Method

The voltage of the selected input channel is measured a number of consecutive times which is defined in ISMnGZPDCTL.ISMnGGFD[3:0].

Every voltage measured is compared against the channel's reference voltage:

- When a configured number of singular measurement results (ISMnGZPDCTL.ISMnGGFL[3:0]) is *above* the channel's reference voltage, ISMnZPDSTR.ISMnCZDRm is set to 1 (no zero point is detected).

- When less measurement results than configured are above the channel's reference voltage ISMnZPDSTR.ISMnCZDRm is set to 0 accordingly (zero point detection is yet unconfirmed).

(7) Noise filtering result

ISMnZPDSTR.ISMnCZDRm indicates whether – according to noise filtering – the level of the input signal is above or below the level of the reference voltage.

When ISMnZPDSTR.ISMnCZDRm = 1

The input signal level is *above* the reference voltage when ISMnZPDSTR.ISMnCZDRm = 1:

- The corresponding ZPD detection flag ISMnZPDIP.ISMnCZIPm is set to 1.
- The interrupt request IRQ_ZPD is generated only once per channel since ISMnZPDIP.ISMnCZIPm has last been cleared.

NOTES

1. IRQ_ZPD is a general interrupt that is issued for any motor channel that is operated in ZPD operation mode where the motor's zero position has not been reached yet. ISMnZPDSTR.ISMnCZDRm can be used to verify which channels motors did not reach their zero position so that appropriate steps can be taken.
2. ISMn automatically clears the ZPD detection flags (ISMnZPDSTR.ISMnCZDRm and ISMnZPDIP.ISMnCZIPm) when a motor channel is switched from motor driving to ZPD operation mode.
3. The application can clear the ZPD detection flag by writing 1 to ISMnZPDSTC.ISMnCCLZPm. For motor channels that do not use channel management, this should be done in regular intervals.

When ISMnZPDSTR.ISMnCZDRm = 0

The input signal level is *below* the reference voltage when ISMnZPDSTR.ISMnCZDRm = 0.

ISMnZPDIP.ISMnCZIPm is not altered thus indicating the ZPD measurement status since ISMnZPDIP.ISMnCZIPm has last been cleared.

(8) Example of set of measurement sequences

The following example illustrates one set of measurement sequences for motor channel m.

1. The ZPD measurement is triggered by writing 1 to ISMnZPDCTL.ISMnCZMTm.
2. The first measurement sequence starts after the blanking delay has passed. The blanking is a multiple of the measurement sequence T_m, defined by ISMnZPDCMPm.ISMnCZBTm[15:0].
3. The first actual voltage measurement is delayed by the number of clock cycles of M_CLK specified in ISMnGZPDCTL.ISMnGGCS[2:0] which is 01_H in this example.
4. The voltage level of the selected input signal then is measured 4 consecutive times (ISMnGZPDCTL.ISMnGGFD[3:0] = 3_H).

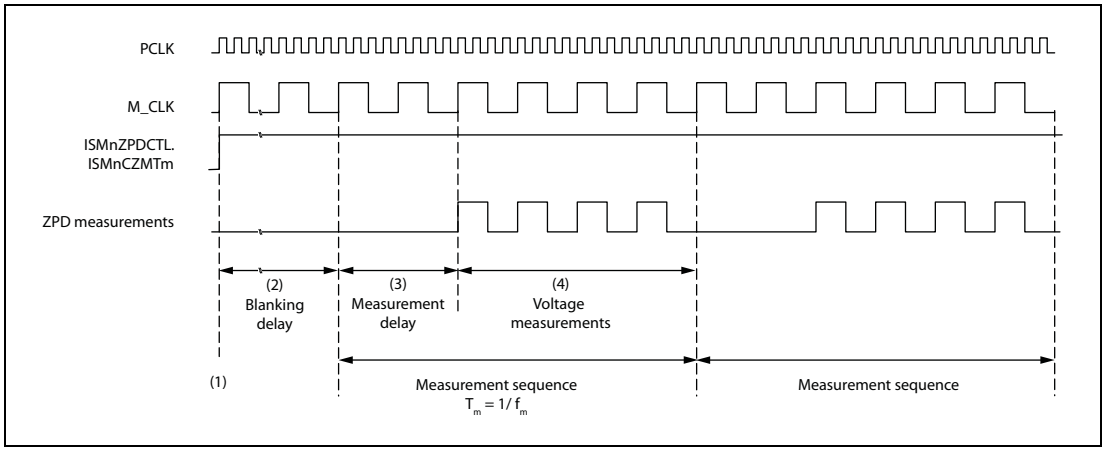

Figure 46.12 Example of set of measurement sequences

The measurement sequence is repeated until ISMnZPDCTL.ISMnCZMTm is reset to zero.

(9) Example for digital noise filtering

The following example illustrates digital noise filtering where the following settings are made:

- During one measurement sequence, 4 voltage measurements are performed (ISMnGZPDCTL.ISMnGGFD[3:0] = 3_H).
- If 3 or more measurements are *above* the reference voltage, ISMnZPDSTR.ISMnCZDRm is set to 1.
  If less than 3 measurements are *below* the reference voltage, ISMnZPDSTR.ISMnCZDRm is set to 0.
  (ISMnGZPDCTL.ISMnGGFL[3:0] = 2_H)

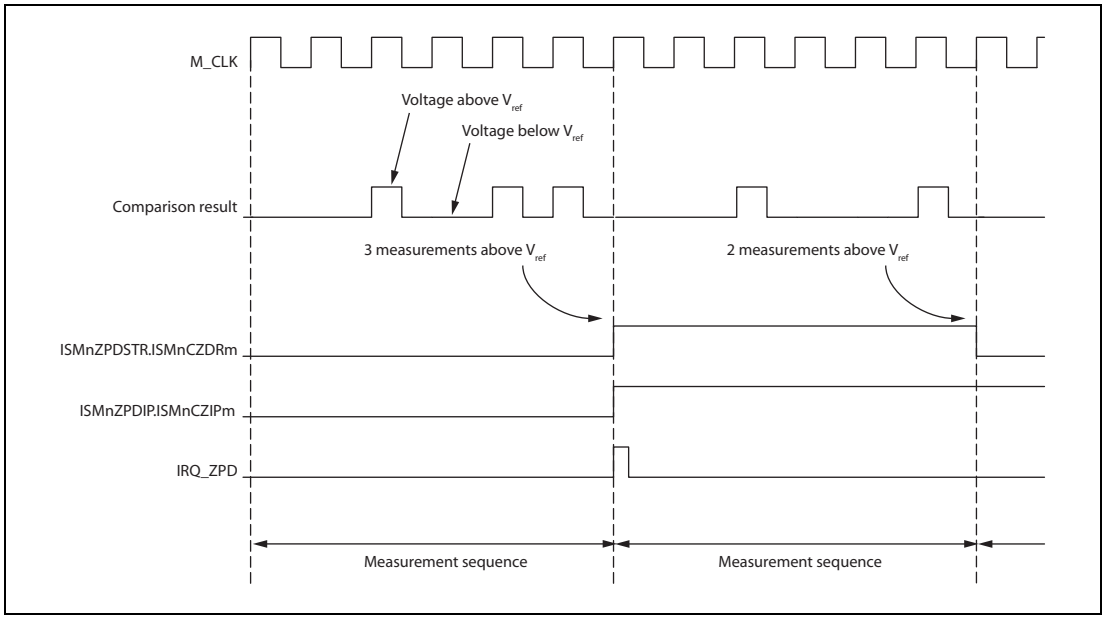

Figure 46.13 Example of noise filtering

During the first measurement sequence, 3 measurements exceed the reference voltage. This is more than the specified threshold of 2 measurements. Therefore, ISMnZPDSTR.ISMnCZDRm is set to 1.

When ISMnZPDSTR.ISMnCZDRm is set for the first time:

- The interrupt request IRQ_ZPD is generated.
- ISMnZPDIP.ISMnCZIPm is set and remains set until it is cleared (either by the application or by ISMn when the measurement start trigger ISMnZPDCTL.ISMnCZMTm changes from 0 to 1 to start a new set of measurement sequences).

During the second measurement sequence, 2 measurements exceed the reference voltage. This is less than the specified threshold. Therefore, ISMnZPDSTR.ISMnCZDRm is reset.

(10) ZPD vibration damping

If during a measurement sequence, it is detected that the motor has not reached its zero position yet (voltage has been above the reference voltage for ISMnGZPDCTL.ISMnGGFL[3:0] clock cycles of M_CLK), ISMn can short-circuit the coil which attenuates motor vibrations. The coils are shortcircuited until the ZPD measurement trigger is reset (ISMnZPDCTL.ISMnCZMTm = 0).

ISMnZPDCMPm.ISMnCZSSm can be used to enable/disable the ZPD vibration damping feature.

46.4.7.4 ZPD with channel management

The following describes the details for zero point detection *with* channel management.

The basic procedure is described in Section 46.4.12.4, Basic procedures: ZPD with channel management.

Configuration of ZPD unit

No matter whether or not channel management is used for ZPD, the ZPD unit needs to be set up in ISMnGZPDCTL. These general settings include the ZPD measurement clock M_CLK, the level of the reference voltages, the digital noise filter settings, the usage of the A/D converter etc. Most of them are described in Section 46.4.7.3, Set of measurement sequences.

NOTE

To perform ZPD measurements, the ZPD unit must be enabled (bit ISMnGGZE = 1) and power saving mode must be disabled (bit ISMnGGZP = 0).

(1) Processing of ZPD table

ZPD tables that are stored in the RAM contain a control sequence that shall bring the motors to their zero position (see Section 46.4.8.2, ZPD tables in RAM).

ISMnCCMRm.ISMnCCCTm[2:0] specifies the ZPD table to be used for channel m. The assigned ZPD table is processed row by row in recurring loops.

When a channel's operation mode changes from motor driving to ZPD operation mode, the ZPD table index counter (ISMnCCNT.ISMnCCZCm[6:0]) is reset and the values of the first row are fed into the corresponding registers. The values are applied at the beginning of the next PWM cycle.

From now on, every time channel management updates the channels' data (indicated by START events), ISMn checks whether the next row has to be fetched from the table or not:

- When the channel data update delay ISMnCZCFGm.ISMnCCZDm[4:0] > 0, the delay is

decreased by 1 and the old values stay effective.

This way, ISMnCZCFGm.ISMnCCZDm[4:0] allows the values of one row to be applied for multiple channel data update times, for example to expand ZPD measurement over a longer period of time.

- When ISMnCZCFGm.ISMnCCZDm[4:0] = 0, the table index counter is increased by 1 and the values of the next row are fed into the corresponding registers.
- When the last row to be considered (ISMnCCMRm.ISMnCCTLm[6:0]) has been processed, the ZPD table index counter is reset and the processing of the ZPD table restarts from the beginning.

The ZPD measurement procedure stops when any of the following conditions are true:

- ZPD measurement indicates that motor has reached its zero position
- Channel management is switched off
- The usage of channel management is disabled for that motor channel
- Operation mode is reset to motor driving operation mode

Example

In the following example, the table limit ISMnCCMRm.ISMnCCTLm[6:0] is set to 2 (3 rows). In the second table row of the ZPD table (table row number 1), a channel data update delay of 4 channel update times is configured (ISMnCZCFGm.ISMnCCZDm[4:0] = 3). The settings of this table row are applied at 4 consecutive START events.

Note that the table index counter ISMnCCNT.ISMnCCZCm[6:0] does not show the row number of the current table row but the number of the *next* row.

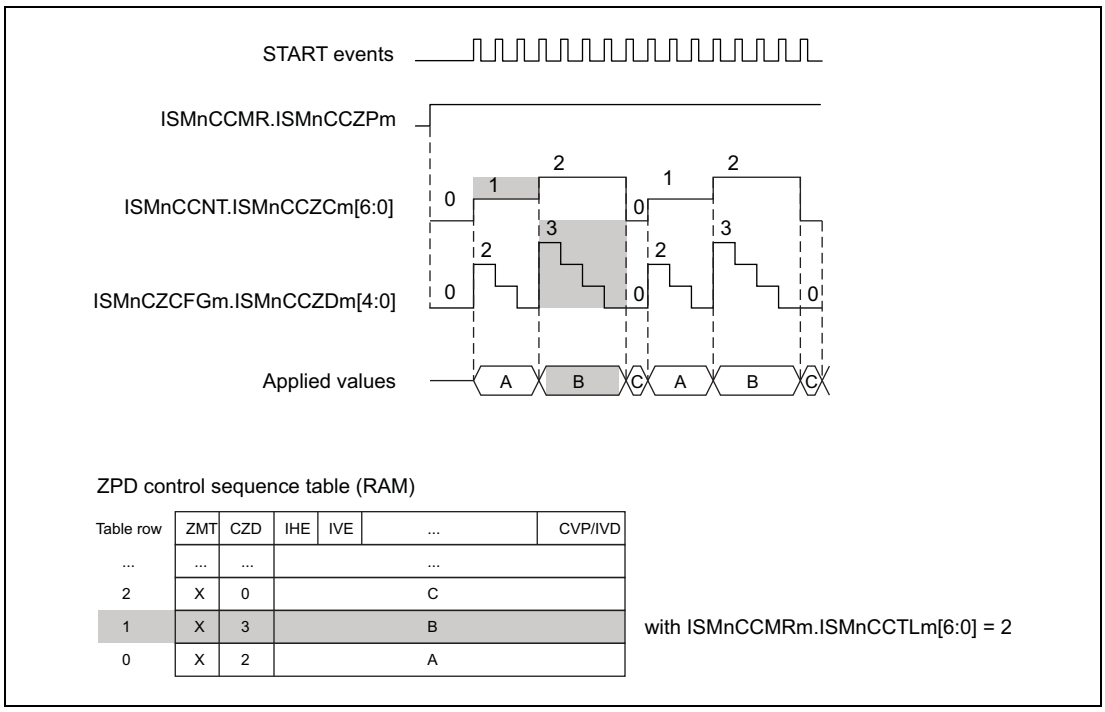

Figure 46.14 Processing of ZPD table

(2) Result evaluation when ZPD measurement is switched off

When the ZPD measurement trigger is reset (ISMnZPDCTL.ISMnCZMTm = 0), ISMn checks ISMnZPDIP.ISMnCZIPm to check whether or not the motor has reached its zero position during the last set of measurement sequences.

Motor has not reached zero position

ISMnZPDIP.ISMnCZIPm = 1 indicates that during at least one measurement sequence, the measured voltages were above the channel's reference voltage. Therefore the motor is assumed *not* to be at its zero position.

- The ZPD detection flag ISMnZPDIP.ISMnCZIPm is cleared.
- ISMn proceeds the ZPD measurement control sequence as defined by the assigned ZPD table.

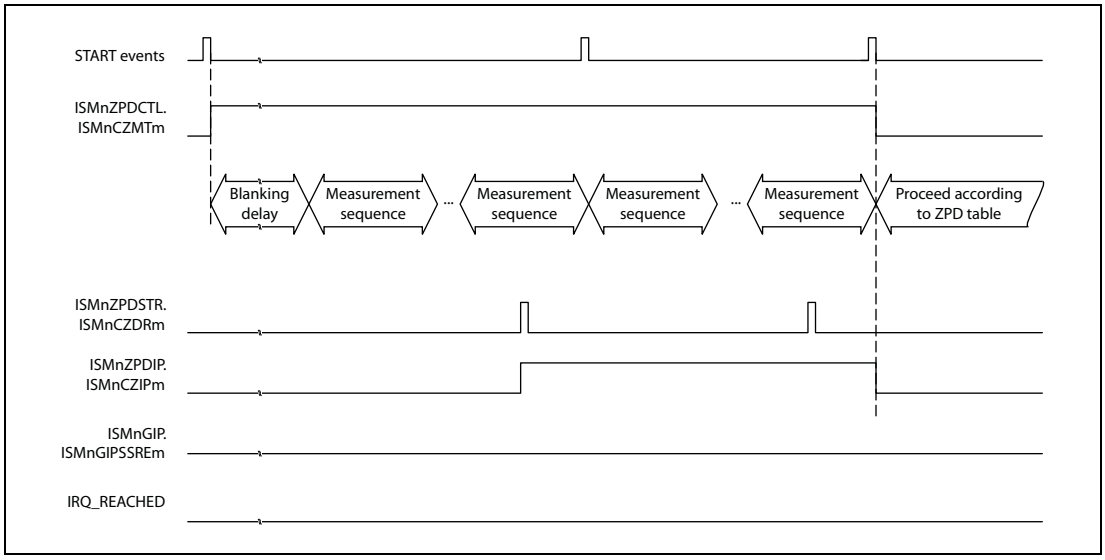

Figure 46.15 No zero point detected

Motor has reached zero position

ISMnZPDIP.ISMnCZIPm = 0 indicates that – according to digital noise filtering – the measured voltages were never above the channel's reference voltages. Therefore the motor is assumed to be at its zero position.

- The interrupt status flag of the respective channel ISMnGIP.ISMnGIPSSREm is set to 1.
- When ISMnGCTL.ISMnGIEREm = 1, ISMn additionally generates the interrupt request IRQ_REACHED as in motor driving mode.
  Refer to Section 46.4.10.1, IRQ_REACHED: Target/zero position reached for details.
- Channel management also resets the motor channel to motor driving operation mode so that the respective channel is no longer considered for ZPD.
- Also, the usage of channel management is disabled for that channel.
- ZPD table index counter ISMnCCNTm.ISMnCCZCm[6:0] and channel data update delay ISMnCZCFGm.ISMnCCZDm[4:0] are reset to zero.

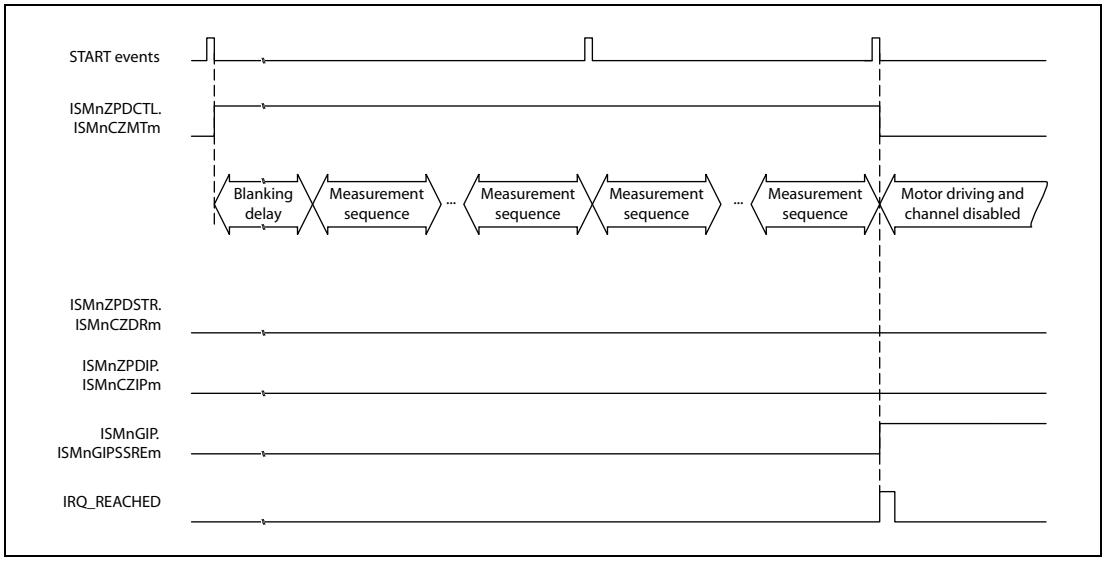

Figure 46.16 Zero position detected

46.4.7.5 ZPD without channel management

The following describes the details for zero point detection *without* channel management.

The basic procedure is described in Section 46.4.12.5, Basic procedures: ZPD without channel management.

Configuration of ZPD unit

No matter whether or not channel management is used for ZPD, the ZPD unit needs to be set up in ISMnGZPDCTL. These general settings include the ZPD measurement clock M_CLK, the level of the reference voltages, the digital noise filter settings, etc. Most of them are described in Section 46.4.7.3, Set of measurement sequences.

NOTE

To perform ZPD measurements, the ZPD unit must be enabled (bit ISMnGGZE = 1) and power saving mode must be disabled (bit ISMnGGZP = 0).

(1) Provision of channel data for motor driving

Without channel management, the application needs to supply the following information for every step of the rotor:

Generation of PWM signals

For motor driving by PWM signals:

- PWM signal information in ISMnCCMPm including the pulse width for the horizontal and vertical PWM signal and the quadrant information.
- Output delay for the horizontal and vertical PWM signal in ISMnCCMRm.ISMnCCDHm[3:0] and ISMnCCMRm.ISMnCCDVm[3:0].
- Specification whether recirculation should be used for the horizontal and/or vertical PWM signals (ISMnCIOCm.ISMnCIHRm and ISMnCIOCm.ISMnCIVRm).

Direct control

For motor driving by direct control:

- Specification whether direct control is used for the horizontal and/or vertical coil (ISMnCIOCm.ISMnCIHEm and/or ISMnCIOCm.ISMnCIVEm)
- Specification how the horizontaland/or vertical coil is to be activated (ISMnCIOCm.ISMn CIHDm[3:0] and/or ISMnCIOCm.ISMn CIVDm[3:0])

NOTE

New values take effect at the beginning of the next PWM cycle. When direct control is used to activate a coil, the registers that specify the PWM signal information for that coil are ignored.

(2) Provision of channel data for ZPD measurements

Without channel management, the application needs to supply the following information to perform ZPD measurements:

- Blanking time in ISMnZPDCMPm.ISMnCZBTm[15:0]
- Reference voltage to be used in ISMnZPDOPT.ISMnCZRSm
- Specification whether the ZPD vibration damping feature is used (ISMnZPDCMPm.ISMnCZSSm).
- Valid input signal in ISMnZPDCTL.ISMnCZISm[1:0]

NOTE

When the start trigger ISMnZPDCTL.ISMnCZMTm is set to 1, the values take effect at the beginning of the next PWM cycle.

(3) Evaluation of ZPD measurements

The measurement sequence is repeated until the ZPD measurement trigger ISMnZPDCTL.ISMnCZMTm is reset to 0.

ISMnZPDSTR.ISMnCZDRm stores the result of the last measurement sequence. It indicates whether – according to noise filtering – the level of the input signal is above or below the level of the reference voltage.

For a higher certainty whether or not the motor has reached its zero position, further measurement sequences can be evaluated.

The ZPD detection flag ISMnZPDIP.ISMnCZIPm stores the result of all measurement sequences since the detection flag has last been cleared. Therefore, it is recommended to verify ISMnZPDIP.ISMnCZIPm in regular intervals. For a certain result, the interval must allow enough measurement sequences to have passed.

- When ISMnZPDIP.ISMnCZIPm = 0, the measured voltage was not above the reference voltage during the last interval. When the zero position is assumed to be reached, ZPD measurements can be stopped by resetting the ZPD measurement trigger ISMnZPDCTL.ISMnCZMTm.
- When ISMnZPDIP.ISMnCZIPm = 1, at least one measured voltage was above the reference voltage during the last interval.

In this case, the motor has not reached its zero position and further steps must be taken.
To prepare for the next ZPD measurement phase, ISMnZPDIP.ISMnCZIPm needs to be cleared by writing 1 to ISMnZPDSTC.ISMnCCLZPm.

NOTE

The interrupt request IRQ_ZPD indicates the first time the measured voltage is above the reference voltage (see Section 46.4.10.4, IRQ_ZPD: Zero point not detected).

(4) Modification of motor channel data

- The direct control settings, the PWM signal information, and the input signal to be measured can be modified at any time. The new values take effect at the beginning of the next PWM cycle.
- The ZPD unit's general configuration can only be modified when the ZPD unit is disabled (ISMnGZPDCTL.ISMnGGZE = 0). This stops ZPD measurements.
- The output delays and the recirculation side (ISMnCOPT) for the PWM signals can only be modified when channel management is switched off.

46.4.7.6 Power save mode

To reduce power consumption, the comparators and reference voltage dividers can be disabled when the ZPD operation mode is not required by any motor channel.

The ZPD unit is disabled when ISMnGZPDCTL.ISMnGGZP = 1.

NOTE

When the ZPD operation mode is configured for a motor channel while the ZPD unit is disabled, ZPD measurement and motor driving operations may fail or result in unreliable outcomes.

46.4.8 PWM value look-up tables and ZPD tables in RAM

When channel management is used for motor driving or zero point detection, appropriate value tables need to be set up in the RAM.

NOTE

This has to be done after enabling/resetting the Intelligent Stepper Motor Driver but before switching on channel management.

When channel management is switched on (ISMnGCTL.ISMnGGCE = 1), the RAM tables are controlled by channel management. Access to the tables by the application is restricted: zero is read back and write accesses are ignored.

Required RAM space

The following RAM space is reserved for the tables for motor driving and zero point detection:

unused	<ISMn_base> + $7FFF_H$
	<ISMn_base> + $7C00_H$
ZPD	<ISMn_base> + $7BFF_H$
	<ISMn_base> + 7000_H
Motor driving	<ISMn_base> + $6FFF_H$
	<ISMn_base> + 4000_H

NOTE

Unused RAM space, and unused ZPD and motor driving table space can be used by the application for any other purpose.

Basic procedure

To set-up the tables in the RAM:

1. Ensure that channel management is switched off (ISMnGCTL.ISMnGGCE = 0).
2. Write the required data to the RAM according to the address and format requirements stated in the following chapters.

46.4.8.1 PWM value look-up tables for motor driving

PWM value look-up table(s) with a 32-bit PWM signal information for every position of the stepper motor need to be set up in the RAM.

- Stepper motors that should be driven with *high precision* (ISMnCCMRm.ISMnCCCPm = 1) require a PWM value look-up table that comprises PWM signal information for the 512 rotor positions possible.
- Stepper motors that should be driven with *standard precision* (ISMnCCMRm.ISMnCCCPm = 0) require the PWM signal information for 128 rotor positions – but for two different rotation directions and speeds. Therefore, a PWM value look-up table for motor driving with standard precision must comprise 4 sets of PWM signal information.

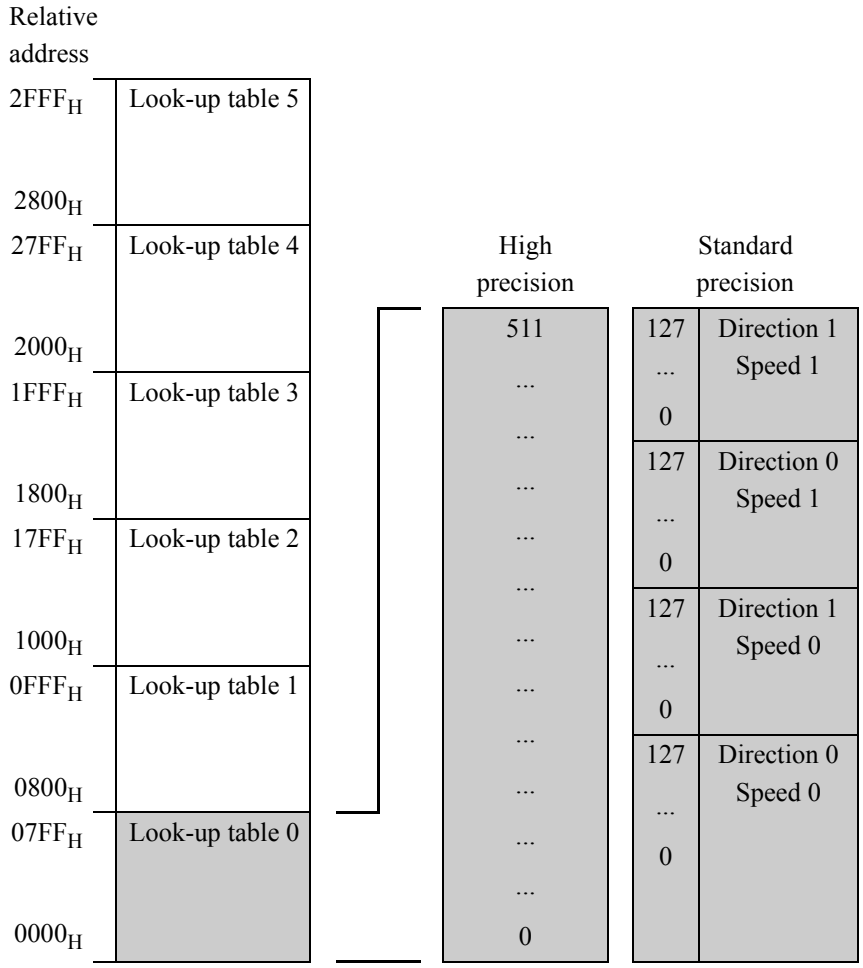
Up to 6 different PWM value look-up tables can be stored in the RAM.

ISMnCCMRm.ISMnCCCTm[2:0] specifies which look-up table is used for channel m. Multiple motors can share a look-up table provided that the same precision is configured.

RAM addresses

A 15-bit address is used to identify RAM locations:

- The base address for the PWM value look-up tables is <ISMn_base> + 4000_H.
- The relative addresses are given in the figure below.



Standard precision requires 4 sets of PWM values:

Direction:

0 = Movement to a higher position

1 = Movement to a lower position

Speed:

0 = Slow rotation

1 = Fast rotation

Storage order: bottom-up

Within a look-up table, the PWM signal information must be stored bottom-up. For example, to use look-up table 0 to drive a motor with high precision, the PWM signal information must be stored at the following relative addresses: step 0 at 0000_H and step 511 at $07FF_H$.

Table row format

For every rotor position, the PWM signal information must be stored in the following 32-bit format:

31 ... 24	23	22	21 20	19 ... 10	9 ... 0
Not used	RF-H	RF-V	CQI[1:0]	PWM-H[9:0]	PWM-V[9:0]

Table 46.17 Contents of PWM value look-up table row

Bit position	Name	Function	Applied to register
23	RF-H	Enables/disables recirculation for the *horizontal* PWM signal: 0: Recirculation disabled 1: Recirculation enabled	ISMnCIOCm. ISMnCIHRm
22	RF-V	Enables/disables recirculation for the *vertical* PWM signal: 0: Recirculation disabled 1: Recirculation enabled	ISMnCIOCm. ISMnCIVRm
21 to 20	CQI[1:0]	Specifies the quadrant: 00_B: Quadrant 1 (0° - 90° angle) 01_B: Quadrant 2 (90° - 180° angle) 10_B: Quadrant 3 (180° - 270° angle) 11_B: Quadrant 4 (270° - 360° angle)	ISMnCCMPm. ISMnCCQIm[1:0]
19 to 10	PWM-H[9:0]	Specifies the duty cycle time of the *horizontal* PWM signal as a number of cycles of TB_CLK The value range is from 0 (PWM signal switched off) to 2^{10} - 1 (duty cycle = 100%).	ISMnCCMPm. ISMnCCHPm[9:0]
9 to 0	PWM-V[9:0]	Specifies the duty cycle time of the *vertical* PWM signal	ISMnCCMPm. ISMnCCVPm[9:0]

46.4.8.2 ZPD tables in RAM

ISMn allows up to 6 different ZPD tables to be stored in the RAM. One ZPD table can be used by multiple motors.

As described in Section 46.4.7.4, ZPD with channel management, **(1) Processing of ZPD table**, ZPD tables are processed row by row in recurring loops. Each table can store up to 128 rows of PWM signals and ZPD measurement information. The end of a table is configurable in ISMnCCMRm.ISMnCCTLm[6:0] so that not all rows have to be filled.

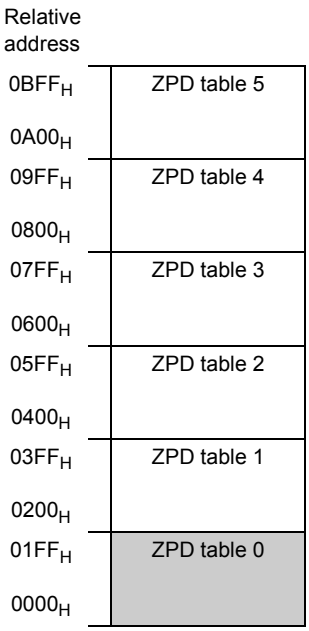
NOTE

The ZPD control sequence stored in one table must perform at least one full rotation of the motor. Otherwise it is not possible to ensure that the motor reaches its zero position from any start position.

RAM addresses

A 15-bit address is used to identify RAM locations:

- The base address for the ZPD tables is <ISMn_base> + 7000_H.
- The relative addresses are given in the figure below.



Storage order: bottom-up

Within a ZPD table, the ZPD control sequence must be stored bottom-up. For example, to use ZPD table 0, the values stored at the relative address 0000_H are used first and the values stored at the relative address $01FF_H$ are taken when the index counter (ISMnCCNTm.ISMnCCZCm[6:0]) and the table index limit (ISMnCCMRm.ISMnCCTLm[6:0]) are at their maximum value of $7F_H$.

Table row format

Each table row must be stored in the following 32-bit format. The bit allocation depends on the measurement trigger ZMT, and the direct control enable flags DC-H and DC-V.

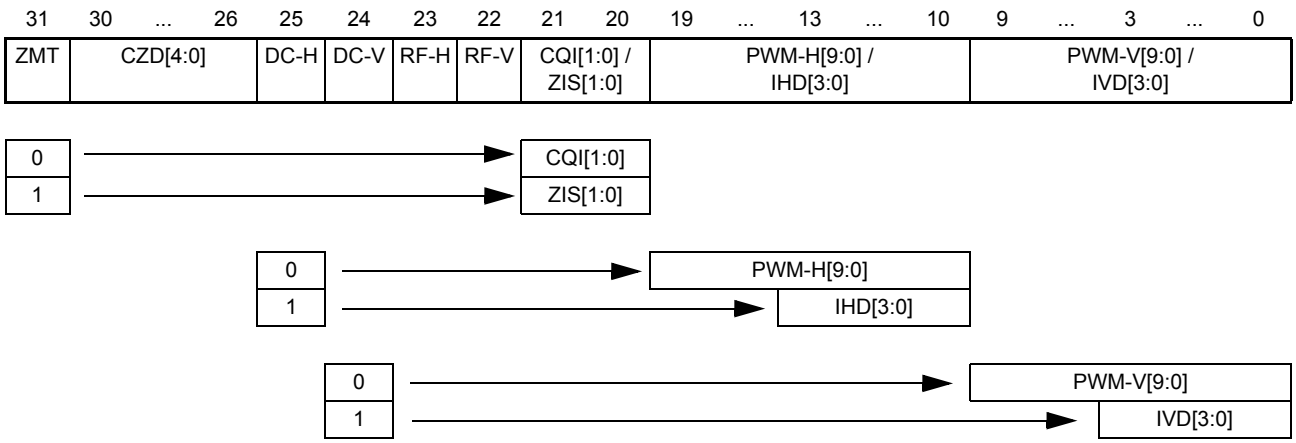


Table 46.18 Contents of ZPD value table row (1/2)

Bit position	Name	Function	Applied to register
31	ZMT	ZPD measurement trigger for channel m: 0: Do not perform ZPD measurements 1: Perform ZPD measurements	ISMnZPDCTL. ISMnCZMTm
30 to 26	CZD[4:0]	Number of START events that are waited for before the next table row is fetched (= delay). CZD therefore can be used to specify when new data is applied to the motor channel. The minimum value is 00_H and the maximum value is $1F_H$ = 31. An additional table row must be used when a longer delay is required. Refer to Section 46.4.7.4, ZPD with channel management, **(1) Processing of ZPD table** for details.	ISMnCZCFGm. ISMnCCZDm[4:0]
25	DC-H	Enables/disables direct control for the *horizontal* PWM signal: 0: Direct control disabled Bits 19 to 10 define the duty cycle time of the *horizontal* PWM signal. 1: Direct control enabled Bits 13 to 10 define which transistors will be activated to supply the *horizontal* coil with current. Refer to Section 46.4.2.1, Motor driving for details.	ISMnCIOCm. ISMnCIHEm
24	DC-V	Enables/disables direct control for the *vertical* PWM signal: 0: Direct control disabled Bits 9 to 0 define the duty cycle time of the *vertical* PWM signal. 1: Direct control enabled Bits 3 to 0 define which transistors will be activated to supply the *vertical* coil with current.	ISMnCIOCm. ISMnCIVEm
23	RF-H	Enables/disables recirculation for the *horizontal* PWM signal: 0: Recirculation disabled 1: Recirculation enabled Refer to Section 46.4.5.5, Recirculation for details.	ISMnCIOCm. ISMnCIHRm
22	RF-V	Enables/disables recirculation for the *vertical* PWM signal: 0: Recirculation disabled 1: Recirculation enabled	ISMnCIOCm. ISMnCIVRm
21 to 20	CQI[1:0]	The allocation of bits 21 and 20 depends on ZMT: ZMT = 0: Specifies the quadrant: 00_B: Quadrant 1 (0° - 90° angle) 01_B: Quadrant 2 (90° - 180° angle) 10_B: Quadrant 3 (180° - 270° angle) 11_B: Quadrant 4 (270° - 360° angle) Refer to Section 46.4.5.4, Encoding of PWM signals according to quadrant for details.	ISMnCCMPm. ISMnCCQIm[1:0]
	ZIS[1:0]	ZMT = 1: Specifies the input signal to be measured for ZPD: 00_B: SINPm 01_B: COSPm 10_B: SINMm 11_B: COSMm Refer to Section 46.4.7.2, Input selection for ZPD measurement for details.	ISMnZPDCTL. ISMnCZISm[1:0]

Table 46.18 Contents of ZPD value table row (2/2)

Bit position	Name	Function	Applied to register
19 to 10	PWM-H[9:0]	The allocation of bits 19 to 10 depends on DC-H: DC-H = 0: Bits 19 to 10 specify the duty cycle time of the *horizontal* PWM signal as a number of cycles of TB_CLK. The value range is from 0 (PWM signal switched off) to 2^{10} - 1 (duty factor = 100%). Refer to Section 46.4.5.2, Duty cycle time and duty factor of PWM signals for details.	ISMnCCMPm. ISMnCCHPm[9:0]
	IHD[3:0]	DC-H = 1: Bits 19 to 14 are ignored. Bits 13 to 10 define which transistors are activated to supply the *horizontal* coil with current. Refer to Section 46.4.7.1, Motor driving for details.	ISMnCIOCm. ISMnCIHDm[3:0]
9 to 0	PWM-V[9:0]	The allocation of bits 9 to 0 depend on DC-V: DC-V = 0: Bits 9 to 0 specify the duty cycle time of the *vertical* PWM signal as a number of cycles of TB_CLK The value range is from 0 (PWM signal switched off) to 2^{10} - 1 (duty factor = 100%).	ISMnCCMPm. ISMnCCVPm[9:0]
	IVD[3:0]	DC-H = 1: Bits 9 to 4 are ignored. Bits 3 to 0 define which transistors are activated to supply the *vertical* coil with current.	ISMnCIOCm. ISMnCIVDm[3:0]

NOTES

1. When ZMT = 1 and the PWM signal information is changed (while direct control is disabled), the last set quadrant information CQI[1:0] is used for the quadrant encoding of the PWM signals. Therefore, in this case the PWM signals may lack the correct quadrant information.
   However, for reliable results, it is not advisable to perform ZPD measurements while PWM signals are applied concurrently.
2. When direct control is enabled (DC-H and/or DC-V = 1), the quadrant information CQI[1:0] is ignored because IHD[3:0] and IVD[3:0] imply the quadrant information.
3. To perform ZPD measurements over a longer time, ZMT can be set to 1 in successive rows. ISMn evaluates the overall result at the time ZMT is reset. Refer to **Section (2), Result evaluation when ZPD measurement is switched off** for details.

CAUTION

The ZPD tables in the RAM must be defined by the application such that the discharge of any inductive load is performed before using direct control to change to a high-impedance state (at least three transistors off).
Otherwise, severe damage to the output stages of the I/O ports may result.

PWM table example

Typically, a PWM table contains sine/cosine value pattern sets as PWM duty cycle definitions, in conjunction with the associated quadrants. Mathematically, the PWM duty cycle values are the sine and cosine values of the angle of motor position, and the quadrants are those in the mathematical definiton within the X-Y coordinate system.

For each “microstep” of the motor (i.e. one of 128 or 512 entries), an angle is assigned, and for this angle, a horizontal and vertical PWM shall be applied, whose duty cycles are according to the sine and cosine values of the angle.

The sequence of quadrants within the table depends on the desired rotation direction of the motor. For a rotation in positive direction in the mathematical sense, the quadrant sequence must be 3, 2, 1, 0; in negative direction, the sequence would be 0, 1, 2, 3. In any case, the number of the first quadrant and the offset of the sine and cosine values depends on the initial position of the motor at position zero.

Like this, a PWM table of normal precision (128 steps), positive (right) turning when moving to higher positions, motor zero position at 0°, will look like this (excerpt):

```
/*  CVP     CHP     CQI   IVR IHR */

  { 0x187L, 0x3B1L, 0x0L, 1L, 1L, 0L },
  { 0x158L, 0x3C3L, 0x0L, 1L, 1L, 0L },
  { 0x128L, 0x3D2L, 0x0L, 1L, 1L, 0L },
  { 0x0F8L, 0x3E0L, 0x0L, 1L, 1L, 0L },
  { 0x0C7L, 0x3EBL, 0x0L, 1L, 1L, 0L },
  { 0x096L, 0x3F3L, 0x0L, 1L, 1L, 0L },
  { 0x064L, 0x3FAL, 0x0L, 1L, 1L, 0L },
  { 0x032L, 0x3FDL, 0x0L, 1L, 1L, 0L } }

(to be continued for other directions and speeds)
```

Due to manufactural tolerances of the motor, dedicated values may diverge from the sine or cosine values, so that an optimized (more smooth) rotation of the motor can be achieved.

In an overview, the table can have the following content as a graphical representation:

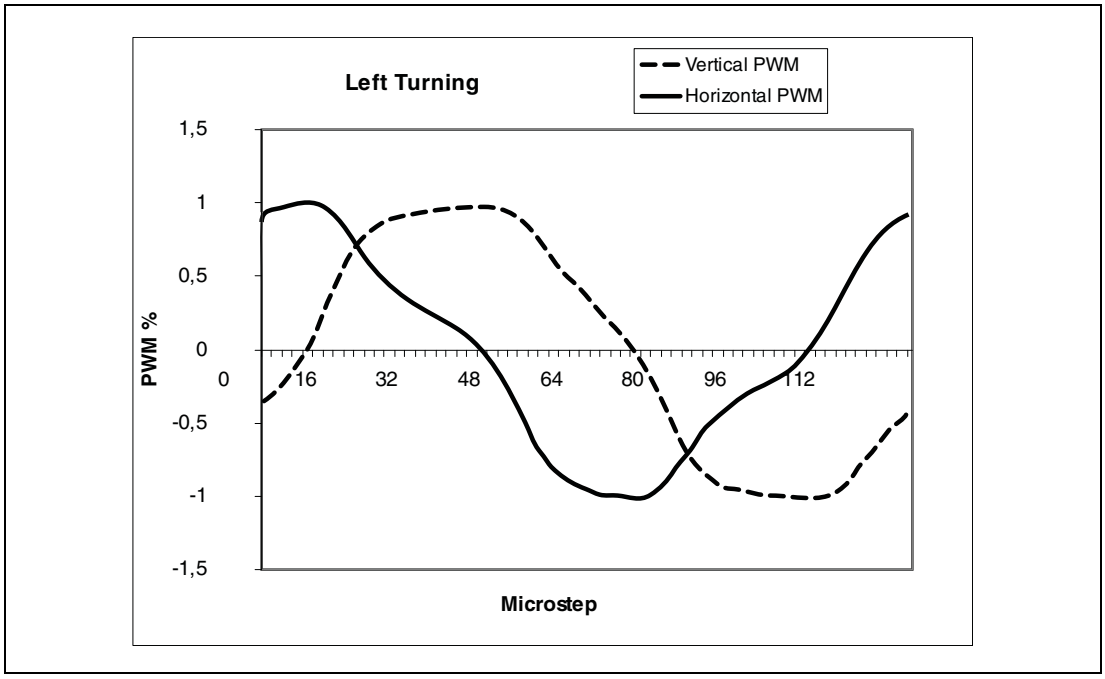

Figure 46.17 PWM table graphical representation example

46.4.9 Timing

46.4.9.1 Channel data update timing

All channels are updated within one PWM cycle. The channel data is buffered ensuring that all channels are updated synchronously.

Application supplies new data

The data of motor channels where channel management is not set can be modified at any time. The new register values take effect immediately and are applied at the beginning of the next PWM cycle.

Channel management supplies new data

The data of motor channels where channel management is set is automatically updated in regular intervals which are a multiple of PWM cycles (indicated by a START event; see **Section 46.4.4.2, Channel data update interval**).

- The ISMn sequencer feeds the required PWM signal or ZPD information from the assigned RAM table into the corresponding registers.
- The registers values are applied at the beginning of the next PWM cycle.

Example

The following example illustrates the value buffering and channel data update timing.

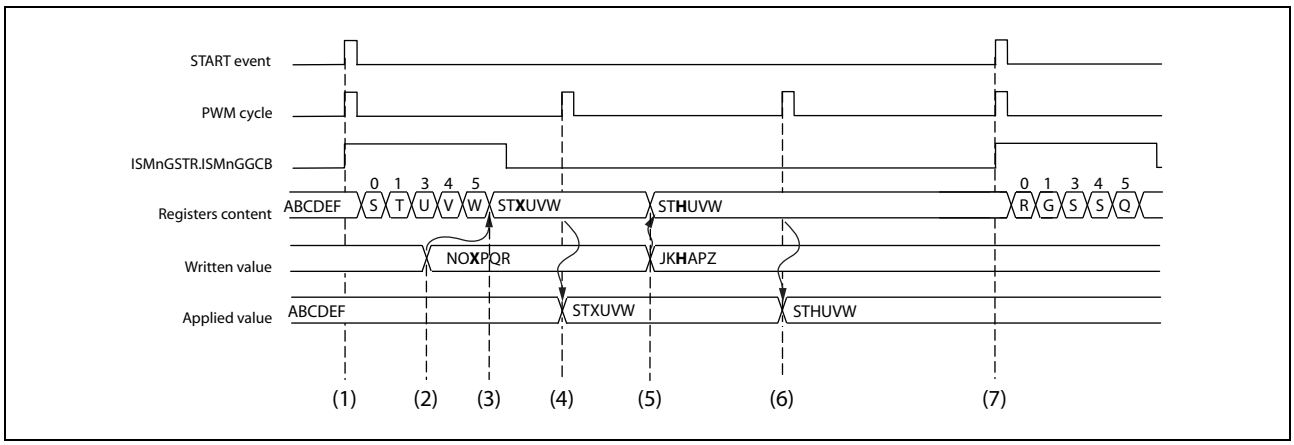

Figure 46.18 Channel data update timing

Channel management is set for all motor channels except for motor channel 2:

ISMnGSTR.ISMnCCENm = 1 for m = 0, 1, 3, 4, 5, and

ISMnGSTR.ISMnCCEN2 = 0

1. The sequencer is enabled at the beginning of a START event (ISMnGSTR.ISMnGGCB = 1) and feeds the values from the assigned RAM table into the corresponding registers (except for channel 2).
   – In motor driving mode this is the PWM signal information of the calculated rotor position.
   – In ZPD operation mode this is the data of the ZPD table.

Channel	0	1	2	3	4	5
Register values	S	T	–	U	V	W

   Afterwards, the sequencer returns into idle state (ISMnGSTR.ISMnGGCB = 0) and stays idle until the next START event.

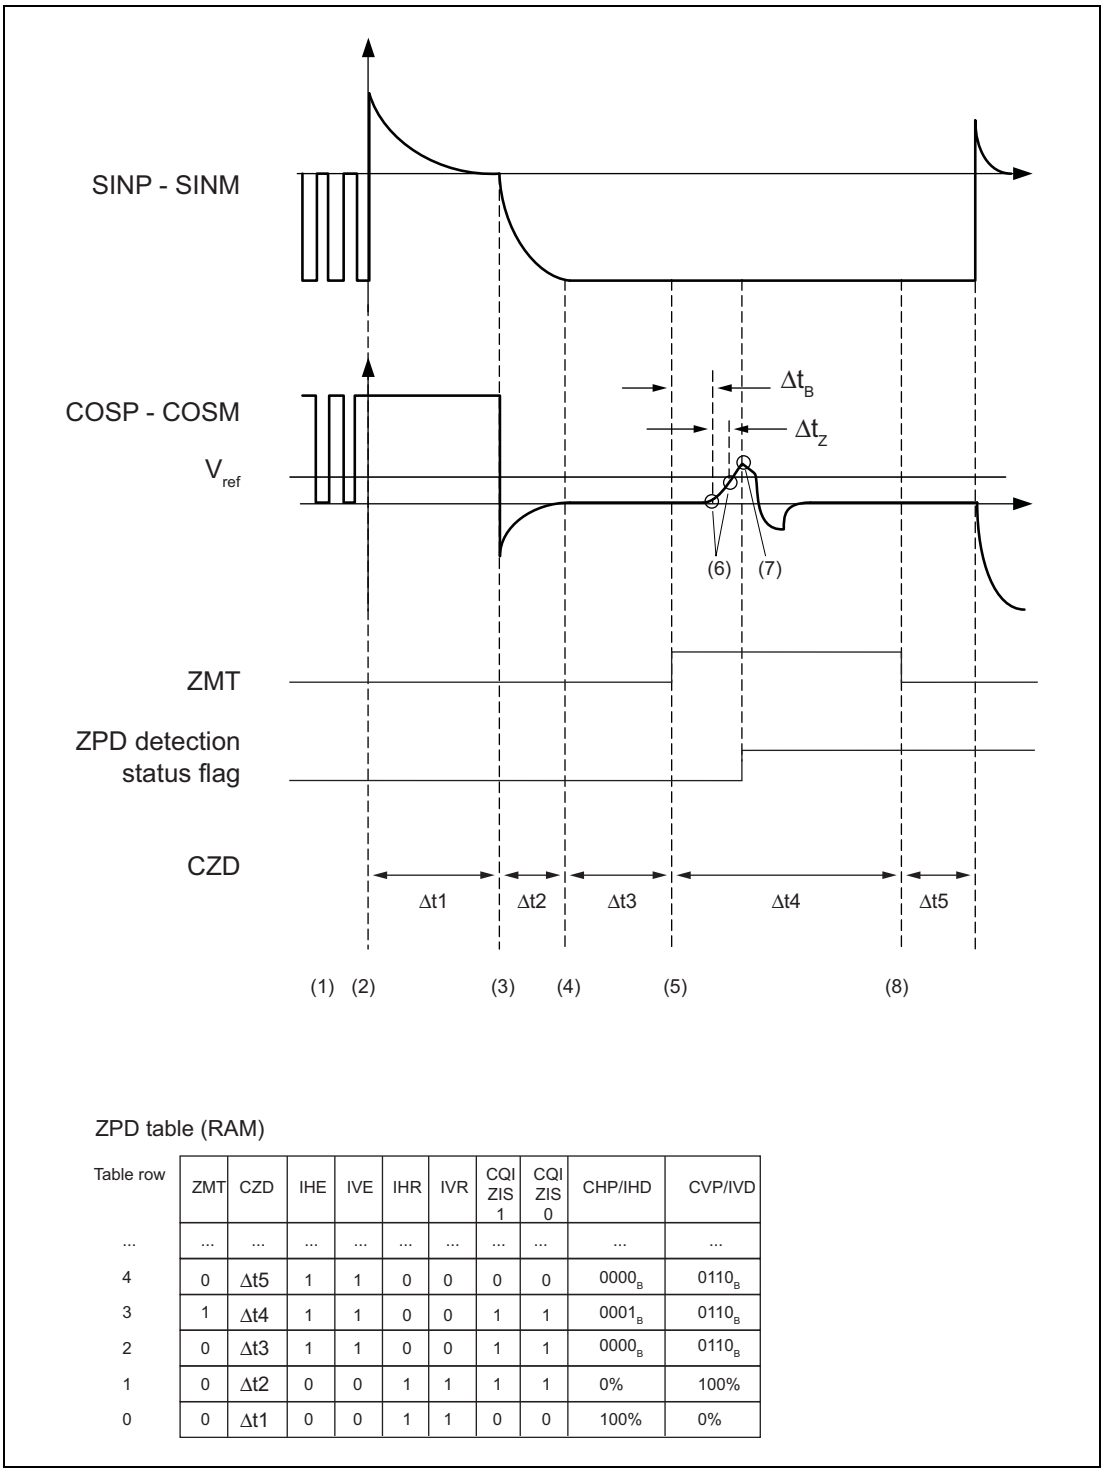
2. Meanwhile the following values are written by the application:

Channel	0	1	2	3	4	5
Written values	N	O	X	P	Q	R

3. Only the register contents of motor channel 2 are updated, because channel 2 is the only channel where channel management is not set.
4. The values take effect at the beginning of the next PWM cycle.
5. The application can update the values of motor channel 2 at any time.
6. New values take effect the next PWM cycle.
7. The values for channels 0, 1, 3, 4, and 5 are recalculated and updated when the next START event occurs.

46.4.9.2 Timing of ZPD measurements with channel management

The following example illustrates the timing of ZPD measurements with channel management.



ZPD table (RAM)

Table row	ZMT	CZD	IHE	IVE	IHR	IVR	CQI ZIS 1	CQI ZIS 0	CHP/IHD	CVP/IVD
...	...	...	...	...	...	...	...	...	...	...
4	0	Δt5	1	1	0	0	0	0	0000_B	0110_B
3	1	Δt4	1	1	0	0	1	1	0001_B	0110_B
2	0	Δt3	1	1	0	0	1	1	0000_B	0110_B
1	0	Δt2	0	0	1	1	1	1	0%	100%
0	0	Δt1	0	0	1	1	0	0	100%	0%

Figure 46.19 Timing of ZPD measurements with channel management

ZMT	CZD	IHE	IVE	IHR	IVR	CQI ZIS 1	CQI ZIS 0	CHP/IHD	CVP/IVP	Function
–										1. The channel is operated in motor driving mode. PWM signals are output.
0	Δt1	0	0	1	1	0	0	100%	0%	2. When ZPD operation mode is set: The table index counter is reset and the values of table row 0 are fed into the corresponding registers. These values are applied at the beginning of the next PWM cycle. Direct control is not set. Therefore, according to the set PWM signal information: – The horizontal coil is supplied with current. – The vertical coil is disconnected from the current. Induced voltages are reduced using recirculation.
0	Δt2	0	0	1	1	1	1	0%	100%	3. When Δt1 has elapsed, the registers are updated with the values of table row 1. According to the set PWM signal information, the coils are supplied with currents in turn: – The horizontal coil is disconnected from the current. Induced voltages are reduced using recirculation. – The vertical coil is supplied with current.
0	Δt3	1	1	0	0	1	1	0000_B	0110_B	4. When Δt2 has elapsed, the registers are updated with the values of table row 2. Direct control is set for both coils. The coils are supplied with currents according to the settings made: – The horizontal coil is disconnected from the current. – The vertical coil is supplied with current.

ZMT	CZD	IHE	IVE	IHR	IVR	CQI ZIS 1	CQI ZIS 0	CHP/IHD	CVP/IVP	Function
1	Δt4	1	1	0	0	1	1	0001_B	0110_B	5. When Δt3 has elapsed, the registers are updated with the values of table row 3. As before, direct control is used to supply the coils with current. The start measurement trigger ZMT is set. Therefore, after the configured blanking delay Δt_B, ISMn starts measuring the induced voltage at input pin COSPm. The voltages measured are compared with the reference voltage V_{ref}.
										6. After each measurement sequence (Δt_Z) the ZPD detection status flag is updated: When – according to digital noise filtering – the measured voltage is lower than the reference voltage, the ZPD detection status flag remains 0. Otherwise it is set to 1.
										7. If it is detected that the motor has not reached its zero position yet (number of measurements above threshold), ISMn short-circuits the coil until the ZPD measurement trigger ISMnZPDCTL.ISMnCZMTm is reset to 0 (ZPD vibration damping).
0	Δt5	1	1	0	0	0	0	0000_B	0110_B	8. When Δt4 has elapsed, the registers are updated with the values of table row 4. As before, direct control is used to supply the coils with current. ZPD measurements are stopped because the start measurement trigger ZMT has been reset. ISMn checks the ZPD detection status flag, whether the motor has reached its zero position. This is not the case in this example. Therefore ISMn proceeds processing the ZPD table when Δt5 has elapsed. For example, ZPD measurements might be started again after one turn of the motor.

46.4.10 Interrupt requests and status flags

Interrupts and status flags indicate certain states:

- Depending on the operation mode, a rotor has reached its target or zero position.
- The sequencer is in idle state.
- The ZPD measurements have started after the configured blanking delay.
- A motor did not reach its zero position.

Interrupt requests

The generation of interrupt requests can be enabled/disabled in the global control register ISMnGCTL (except for IRQ_ZPD).

By default, the generation of interrupt requests is disabled.

Status flags

In the ISMnGIP register, status flags are set according to interrupt conditions – no matter whether the generation of the interrupt request is disabled.
The setting of interrupt status flags can not be masked. Status flags need to be cleared by writing 1 to the corresponding bits in ISMnGSTC.

46.4.10.1 IRQ_REACHED: Target/zero position reached

IRQ_REACHED indicates that a motor has reached its target/zero position.

- In motor driving operation mode, this is the case when the motor's actual position (ISMnVAR4CFGm) and the configured target position (ISMnPAR0CFGm) do match and the actual speed (ISMnVAR1CFGm) is zero.
- In ZPD operation mode, this is the case when the ZPD measurement status flag ISMnZPDIP.ISMnCZIPm = 0 at the end of a set of measurement sequences (measurement start trigger ISMnZPDCTL.ISMnCZMTm = 0).

As result, the interrupt status flag of the respective channel ISMnGIP.ISMnGIPSSREm is set to 1. When ISMnGCTL.ISMnGIEREm = 1, ISMn additionally generates the interrupt request IRQ_REACHED.

NOTES

1. IRQ_REACHED is generated only once per channel since the last time the status flag ISMnGIPSSREm was cleared by writing 1 to ISMnGSTC.ISMnGIPCLREm.
2. IRQ_REACHED is a general interrupt that is issued for any motor channel where ISMnGCTL.ISMnGIEREm = 1 that has reached its target/zero position.

46.4.10.2 IRQ_DONE: Sequencer idle interrupt

The usage of channel management can only be enabled/disabled (ISMnGSTR.ISMnCCENm), when the sequencer is idle.

IRQ_DONE indicates that the sequencer has returned to the idle state (until the next START event) after all channels' data has been updated.

The status flag ISMnGIP.ISMnGIPSSDO is set to 1 when the sequencer is in idle state and can be cleared by writing 1 to ISMnGSTC.ISMnGIPCLDO.

The generation of the respective interrupt request can be enabled/disabled in ISMnGCTL.ISMnGIEDO.

Refer to Section 46.4.4.2, Channel data update interval for details.

46.4.10.3 IRQ_ZPDAD: Start of ZPD measurements

IRQ_ZPDAD indicates when the actual ZPD measurements start after the configured blanking delay:

- The status flag ISMnGIP.ISMnGIPSSAD is set to 1.
- The respective interrupt request is issued when ISMnGCTL.ISMnGIEAD = 1.

The status flag ISMnGIP.ISMnGIPSSAD can be cleared by writing 1 to ISMnGSTC.ISMnGIPCLAD.

46.4.10.4 IRQ_ZPD: Zero point not detected

In ZPD operation mode, IRQ_ZPD indicates that a motor has not reached its zero position yet (refer to Section 46.4.7.3, Set of measurement sequences for details):

- The channel's interrupt status flag ISMnZPDIP.ISMnCZIPm is set to 1.
- The respective interrupt request is additionally issued.

NOTES

1. IRQ_ZPD is generated only once per channel since the last time, the status flag ISMnZPDIP.ISMnCZIPm has been cleared.
   When channel management is not set, the status flag ISMnZPDIP.ISMnCZIPm can be cleared by writing 1 to ISMnZPDSTC.ISMnCCLZPm. This is helpful, for example, to verify the ZPD detection status in a regular interval.
   When channel management is set, ISMnZPDIP.ISMnCZIPm is automatically cleared when a new set of measurement sequences is started (measurement start trigger ISMnZPDCTL.ISMnCZMTm changes from 0 to 1).
2. IRQ_ZPD is a general interrupt that is issued for any motor channel that is operated in ZPD operation mode where the motor's zero position has not been reached yet.

46.4.11 Soft reset

ISMn can be reset by software. A soft reset has the following effects:

- PWM signal output is stopped and all output signals are forced to reset level
- Internal state machines are stopped
- The following data is *not* initialized, it can be modified while the soft reset is active:
  - Register contents
  - Movement calculator variables
  - Movement parameters and measurement parameters
  - RAM data (PWM value look-up tables and ZPD tables)

The soft reset is carried out by setting ISMnGCTL.ISMnGGEN = 0.

46.4.12 Procedures

46.4.12.1 Initialization of Intelligent Stepper Motor Driver

The Intelligent Stepper Motor Driver must be initialized before it can be used for motor driving or zero point detection:

1. Specify the time base clock TB_CLK and the channel data update interval by setting the prescalers in ISMnGCFG.
   Refer to Section 46.4.3, Clocking and Section 46.4.4.2, Channel data update interval for details.

NOTE

The channel data update interval is relevant only when channel management is used.

2. Specify the recirculation side in ISMnCOPT.
3. When using channel management, set up the PWM value look-up tables and the ZPD tables according to the address and format specifications described in Section 46.4.8, PWM value look-up tables and ZPD tables in RAM.
4. When using ZPD operation mode, the following general features must be set up in the ZPD control register ISMnGZPDCTL:
   - ZPD measurement clock M_CLK
   - The reference voltages available
   - The digital noise filter settings
   - The usage of the ZPD unit
   - The usage of the ZPD measurement start interrupt IRQ_ZPDAD (ISMnGCTL.ISMnGIEAD = 1).

Now the motor channels can be configured as required. Follow the basic procedures contained in the following chapters:

- Section 46.4.12.2, Basic procedures: Motor driving with channel management
- Section 46.4.12.3, Basic procedures: Motor driving without channel management
- Section 46.4.12.4, Basic procedures: ZPD with channel management
- Section 46.4.12.5, Basic procedures: ZPD without channel management

46.4.12.2 Basic procedures: Motor driving with channel management

To use channel management for driving a motor, initialize ISMn if not done yet (see Section 46.4.12.1, Initialization of Intelligent Stepper Motor Driver), then configure the channel specific settings, and finally supply the desired target position:

Motor channel configuration

Each motor channel is configured individually:

1. Write 0 to ISMnCCMRm.ISMnCCZPm to specify the operation mode “motor driving” for motor channel m.
2. Configure the motor’s movement parameters in ISMnPAR[9:0]CFGm and initialize the variable parameters ISMnVAR[6:0]CFGm.
3. In ISMnCCMRm, specify the following:
   – The look-up table to be used for PWM signal generation (bits ISMnCCCTm[2:0]).
   – The number of microsteps within one 360° turn (defined by the movement precision in bit ISMnCCCPm).
   – The output delays for the PWM signals (bits ISMnCCDHm[3:0] and ISMnCCDVm[3:0]).
4. In ISMnGCTL.ISMnGIEREm, specify whether or not the interrupt IRQ_REACHED is generated when the target position is reached.
5. Write 1 to ISMnGSTR.ISMnCCENm to specify that motor channel m is controlled by channel management.
6. When all motor channels are set up as required, write 1 to ISMnGCTL.ISMnGGCE to switch on channel management.
7. Write the target position for the rotor to ISMnPAR0CFGm.

The settings take effect after the next START event (see Section 46.4.4.2, Channel data update interval).

ISMn automatically moves the rotor step by step to its target position. The target position is indicated by the interrupt IRQ_REACHED (when configured) and the status flag ISMnGIP.ISMnGIPSSREm.

NOTES

1. The parameters that are used to calculate intermediate rotor positions (ISMnPAR[9:1]CFGm and ISMnVAR[6:1]CFGm) can be read at any time. Note that old values may be read while the sequencer is busy updating the channels’ data (ISMnGSTR.ISMnGGCB = 1). When ISMnGCTL.ISMnGIEDO = 1, the interrupt IRQ_DONE is generated whenever the sequencer returns to its idle state and valid data can be read.
2. Only positive or zero values for target positions are allowed. Negative target positions will cause the algorithm of the channel management to stop immediately, if the current position becomes negative.

Update of target position

To move the rotor to a new target position:

1. Clear the IRQ_REACHED status flag of channel m by writing 1 to ISMnGSTC.ISMnGIPCLREm.
2. Update the target position of the respective rotor in ISMnPAR0CFGm.

The new value takes effect after the next START event.

Update of configuration

Except for the target position, a motor channel's settings and the PWM value look-up tables can only be modified when channel management is not enabled (either for that channel and/or for all channels).

Refer to Section 46.4.12.6, Disabling/re-enabling channel management for details.

Example

A senseful set of parameters is given by the following:

PMP	=	0x00000000 (initial position assumed to be zero)
PDF	=	0x06
PAL	=	0x20
PDL	=	0x20
PMS	=	0x000009C0
PHC	=	0x00000700
PS1	=	0x0000010E
PS2	=	0x00000620
PS3	=	0x000001C3
PS4	=	0x0000056B

All variable registers shall be cleared to zero content before starting the channel management.

46.4.12.3 Basic procedures: Motor driving without channel management

To drive a motor without using channel management, initialize ISMn if not done yet (see Section 46.4.12.1, Initialization of Intelligent Stepper Motor Driver), then configure the channel specific settings, and finally apply the PWM signal information whenever the rotor is required to be moved.

Motor channel configuration

Each motor channel is configured individually:

1. Write 0 to ISMnGSTR.ISMnCCENm to specify that all parameters for motor channel m are input by the application (no channel management).
2. Write 0 to ISMnCCMRm.ISMnCCZPm to specify the operation mode "motor driving" for motor channel m.
3. In ISMnCCMRm, specify the output delays for the PWM signals (bits ISMnCCDHm[3:0] and ISMnCCDVm[3:0]).
4. In ISMnCCMPm, specify the quadrant information and the PWM signal pulse widths for the sine and cosine side of the desired position.
5. In ISMnCIOCm, enable/disable recirculation for the horizontal and/or vertical PWM signal.

The settings take effect at the beginning of the next PWM cycle.

Update of rotor position

To move a rotor one step further:

1. Update the quadrant information and the PWM signal pulse widths in ISMnCCMPm.
2. If required, alter the recirculation enable flags in ISMnCIOCm.

The settings take effect at the beginning of the next PWM cycle.

Update of configuration

PWM signal information and the recirculation enable flags can be modified anytime, for a channel which is not under channel management control.

Refer to Section 46.4.12.6, Disabling/re-enabling channel management for details.

46.4.12.4 Basic procedures: ZPD with channel management

For ZPD using channel management, initialize ISMn if not done yet (see **Section 46.4.12.1, Initialization of Intelligent Stepper Motor Driver**), then configure the motor channel's specific ZPD settings, and finally enable channel management to start the ZPD procedure.

Motor channel configuration

Each motor channel is configured individually:

1. Write 1 to ISMnCCMRm.ISMnCCZPm to specify the operation mode "ZPD" for motor channel m.
2. In ISMnCCMRm, also specify the following:
   - The ZPD table to be used (ISMnCCCTm[2:0])
   - Last table row to be considered (ISMnCCTLm[6:0])
   - When using PWM signals to drive the motor:
     Output delays for the horizontal and/or vertical PWM signals (ISMnCCDHm[3:0] and ISMnCCDVm[3:0]).
     The number of microsteps within one 360° turn (defined by the movement precision in bit ISMnCCCPm)
3. In ISMnGCTL.ISMnGIEREm, specify whether the interrupt request IRQ_REACHED is generated when the motor reaches its zero position.
4. In ISMnZPDCMPm.ISMnCZBTm[15:0], specify the blanking time.
5. In ISMnZPDCMPm.ISMnCZSSm, specify whether the ZPD vibration damping feature is used.
6. In ISMnZPDOPT.ISMnCZRSm, specify the reference voltage.
7. Write 1 to ISMnGSTR.ISMnCCENm to specify that motor channel m is controlled by channel management.
8. When all motor channels are set up as required, write 1 to ISMnGCTL.ISMnGGCE to switch on channel management.

The settings take effect after the next START event (see Section 46.4.4.2, Channel data update interval).

ISMn automatically processes the control sequence stored in the assigned ZPD table. The zero position is indicated by the interrupt IRQ_REACHED (when configured) and the status flag ISMnGIP.ISMnGIPSSREm.

When the zero position is reached, channel management and ZPD operation mode are automatically disabled for this channel.

NOTE

The registers that are filled from the ZPD table can be read at any time. Note that old values may be read while the sequencer is busy updating the channels' data (ISMnGSTR.ISMnGGCB = 1). When ISMnGCTL.ISMnGIEDO = 1, the interrupt IRQ_DONE is generated whenever the sequencer returns to its idle state.

Update of configuration

A motor channel's settings can only be modified when channel management is disabled for this channel. ZPD tables can only be modified, when channel management is switched-off.

Refer to Section 46.4.12.6, Disabling/re-enabling channel management for details.

46.4.12.5 Basic procedures: ZPD without channel management

Without channel management, zero point detection can be controlled using the ZPD registers. The motor can be driven by PWM signals or direct control concurrently.

NOTE

Zero point detection without channel management requires a detailed knowledge of the relationships between the various settings.

Due to the large number of possible combinations, zero point detection without channel management is not covered in this documentation.

46.4.12.6 Disabling/re-enabling channel management

Channel management can be switched off for all channels or disabled for individual motor channels.

In both operation modes, the rotor holds its position – unless the pulse width, quadrant information etc. are updated by the application (see Section (1), Provision of PWM signal information).

Switching off channel management

All settings can be modified when channel management is switched off. This includes the general settings, a channel's specific settings, and the RAM tables:

1. Write 0 to ISMnGCTL.ISMnGGCE.
   Channel management is switched off no matter whether ISMnGSTR.ISMnCCENm = 1.
   When the sequencer is currently busy updating channels' data (ISMnGSTR.ISMnGGCB = 1), channel management stops as soon as the sequencer returns into idle state (ISMnGSTR.ISMnGGCB = 0).
2. If required, modify the settings and/or the RAM tables as desired.

When all motor channels are configured as required, write 1 to ISMnGCTL.ISMnGGCE to switch on channel management again.

Disabling channel management for one motor channel

To disable the usage of channel management for a certain channel it is not mandatory to switch off channel management for all channels:

- Wait until the sequencer is in idle state (ISMnGSTR.ISMnGGCB = 0), and then set ISMnGSTR.ISMnCCENm = 0.

When ISMnGCTL.ISMnGIEDO = 1, the interrupt request IRQ_DONE indicates when the sequencer has finished updating the channels and has returned to its idle state until the next START event.

When the motor channel is set up as required, wait until the sequencer is in idle state again and then write 1 to ISMnGSTR.ISMnCCENm to switch on channel management for that channel again.

46.5 Intelligent Stepper Motor Driver Registers

This section contains a description of all the registers of the Intelligent Stepper Motor.

46.5.1 Intelligent Stepper Motor Driver registers overview

The Intelligent Stepper Motor is controlled and operated by the following registers.

In the table “CHm” is an abbreviation for “motor channel m”.

Table 46.19 Intelligent Stepper Motor Driver registers overview (1/2)

Register name	Symbol	Address
Common control registers		
Global control	ISMnGCTL	<ISMn_base> + 0000_H
Global status	ISMnGSTR	<ISMn_base> + 0004_H
Global timebase control	ISMnGCFG	<ISMn_base> + 0008_H
Channel timebase reading	ISMnGCNT	<ISMn_base> + $000C_H$
Global interrupt pending	ISMnGIP	<ISMn_base> + 0014_H
Global interrupt pending clear	ISMnGSTC	<ISMn_base> + 0018_H
Channel control	ISMnCCMRm	<ISMn_base> + $001C_H$ + m x 4_H
Channel PWM setting	ISMnCCMPm	<ISMn_base> + $004C_H$ + m x 4_H
Channel I/O control setting	ISMnCIOCm	<ISMn_base> + $007C_H$ + m x 4_H
Channels recirculation side setting	ISMnCOPT	<ISMn_base> + 0094_H
ISMn movement calculator parameters		
Target motor position CHm	ISMnPAR0CFGm	<ISMn_base> + $00C8_H$ + m x 28_H
Damping factor CHm	ISMnPAR1CFGm	<ISMn_base> + $00CC_H$ + m x 28_H
Acceleration limit CHm	ISMnPAR2CFGm	<ISMn_base> + $00D0_H$ + m x 28_H
Deceleration limit CHm	ISMnPAR3CFGm	<ISMn_base> + $00D4_H$ + m x 28_H
Maximum speed CHm	ISMnPAR4CFGm	<ISMn_base> + $00D8_H$ + m x 28_H
Hysteresis correction CHm	ISMnPAR5CFGm	<ISMn_base> + $00DC_H$ + m x 28_H
Speed threshold 1 CHm	ISMnPAR6CFGm	<ISMn_base> + $00E0_H$ + m x 28_H
Speed threshold 2 CHm	ISMnPAR7CFGm	<ISMn_base> + $00E4_H$ + m x 28_H
Speed threshold 3 CHm	ISMnPAR8CFGm	<ISMn_base> + $00E8_H$ + m x 28_H
Speed threshold 4 CHm	ISMnPAR9CFGm	<ISMn_base> + $00EC_H$ + m x 28_H
ISMn movement calculator variables		
Actual acceleration/deceleration CHm	ISMnVAR0CFGm	<ISMn_base> + $01B8_H$ + m x $1C_H$
Actual speed CHm	ISMnVAR1CFGm	<ISMn_base> + $01BC_H$ + m x $1C_H$
Previous iteration speed CHm	ISMnVAR2CFGm	<ISMn_base> + $01C0_H$ + m x $1C_H$
Temporary calculator register PT1 CHm	ISMnVAR3CFGm	<ISMn_base> + $01C4_H$ + m x $1C_H$
Actual position, current result CHm	ISMnVAR4CFGm	<ISMn_base> + $01C8_H$ + m x $1C_H$
Virtually displayed position CHm	ISMnVAR5CFGm	<ISMn_base> + $01CC_H$ + m x $1C_H$
Direction/speed flag CHm	ISMnVAR6CFGm	<ISMn_base> + $01D0_H$ + m x $1C_H$
ZPD registers		
Global ZPD control	ISMnGZPDCTL	<ISMn_base> + 0010_H

ZPD measurement activity status	ISMnZPDCSTR	<ISMn_base> + $00C4_H$
Emulation mode register		
Emulation register	ISMnEMU	<ISMn_base> + 0260_H

<ISMn_base>

The base addresses <ISMn_base> of the ISMn is defined in the first section of this chapter under the key word “Register addresses”.

46.5.2 Common control registers

46.5.2.1 ISMnGCTL – ISM global control register

This register is used to switch channel management on/off and to enable/disable the generation of interrupt requests. Additionally, it allows ISMn to be reset.

For details, refer to the following sections:

- Section 46.4.10, Interrupt requests and status flags
- Section 46.4.12.6, Disabling/re-enabling channel management
- Section 46.4.11, Soft reset

Access: This register can be read/written in 32-bit units.

Address: <ISMn_base> + 0000_H

Initial Value: 0001 0000_H

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ISMn GIEAD	ISMn GIEDO	ISMnGIERE[5:0]						0	0	0	0	0	0	0	ISMn GGEN
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	ISMn GGCE	0	0	0	0	0	0	0	ISMn ZPDU*1
R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Note 1. Bit 0 has to be changed to “1” when the ZPD function is used.

CAUTION

The default value of bit 0 has to be changed to “1” when the ZPD function is used.

Table 46.20 ISMnGCTL register contents (1/2)

Bit position	Bit name	Function
31	ISMnGIEAD	Enables/disables the generation of the interrupt request IRQ_ZPDAD that indicates the actual beginning of ZPD measurements: 0: Do not generate IRQ_ZPDAD 1: Generate IRQ_ZPDAD The status flag ISMnGIP.ISMnGIPSSAD is set no matter whether the interrupt request is masked by this register.
30	ISMnGIEDO	Enables/disables the generation of the interrupt request IRQ_DONE that indicates that the sequencer has returned to idle state for the current PWM cycle: 0: Do not generate IRQ_DONE 1: Generate IRQ_DONE The status flag ISMnGIP.ISMnGIPSSDO is set no matter whether the interrupt request is masked by this register.
29 to 24	ISMnGIEREm	Enables/disables the generation of the interrupt request IRQ_REACHED that indicates that a motor has reached its target position. IRQ_REACHED can be enabled/disabled for every channel individually: 0: Do not generate IRQ_REACHED 1: Generate IRQ_REACHED The corresponding channel specific status flag in ISMnGIP.ISMnGIPSSREm is set no matter whether the interrupt request is masked by this register.
23 to 17	Reserved	When read, the value after reset is returned. When written, write the value after reset.

Table 46.20 ISMnGCTL register contents (2/2)

Bit position	Bit name	Function
16	ISMnGGEN	Enables/disables the soft reset: 0: Resets ISMn 1: Releases the soft reset **CAUTION** Before release of the soft reset by setting ISMnGGEN = 1, the ZPD measurement for all channels m have to be disabled by setting ISMnZPDCTL.ISMnCZMTm = 0.
15 to 9	Reserved	When read, the value after reset is returned. When written, write the value after reset.
8	ISMnGGCE	Specifies whether channel management is switched on/off: 0: Switched off (disabled for all channels no matter whether ISMnGSTR.ISMnCCENm = 1) 1: Switched on Channel management supplies motor channels where ISMnGSTR.ISMnCCENm = 1.
7 to 1	Reserved	When read, the value after reset is returned. When written, write the value after reset.
0	ISMnZPDU	**CAUTION** The default value of bit 0 has to be changed to “1” when the ZPD function is used.

46.5.2.2 ISMnGSTR – ISM global status register

This register is used to specify whether channel management is used for motor channel m or not. It also indicates the status of the ISMn sequencer because the usage of channel management can only be enabled/disabled when the sequencer is idle (or when channel management is switched off).

Refer to Section 46.4.9.1, Channel data update timing and Section 46.4.12.6, Disabling/re-enabling channel management for details.

Access: This register can be read/written in 32-bit units.

Address: <ISMn_base> + 0004_H

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 46.21 ISMnGSTR register contents

Bit position	Bit name	Function
31 to 8	Reserved	When read, the value after reset is returned. When written, write the value after reset.
7	ISMnGGCB	Indicates the status of the sequencer: 0: Sequencer is idle 1: Sequencer is updating channels' data This bit is read-only.
6	Reserved	When read, the value after reset is returned. When written, write the value after reset.
5 to 0	ISMnCCENm	Enables/disables the usage of channel management for motor channel m: 0: Do not use channel management 1: Use channel management

NOTE

When reading parameters that are used to calculate intermediate rotor positions (ISMnPAR[9:1]CFGm and ISMnVAR[6:1]CFGm) while the sequencer is busy (ISMnGSTR.ISMnGGCB = 1), old values may be read.

46.5.2.3 ISMnGCFG – ISM global timebase control register

This register specifies the timebase clock TB_CLK and the channel data update interval.

CAUTION

If the values in this register are changed during PWM output, the PWM output may become disturbed intermediately. Thus make sure to suppress any PWM output when changing this register by, for instance,

- **keeping the ISMn module in software reset (ISMnGCTL.ISMnGGEN = 0) or**
- **setting the PWM duty cycle to 0% or 100 %**

or any other appropriate means.

Access: This register can be read/written in 32-bit units when channel management is switched off (ISMnGCTL.ISMnGGCE = 0).
This register is read-only when channel management is switched on (ISMnGCTL.ISMnGGCE = 1).

Address: <ISMn_base> + 0008_H

Initial Value: $000F\ 00FF_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 46.22 ISMnGCFG register contents (1/2)

Bit position	Bit name	Function
31 to 20	Reserved	When read, the value after reset is returned. When written, write the value after reset.
19 to 16	ISMn GGTB[3:0]	Specifies the timebase clock TB_CLK which is PCLK / (ISMnGGTB[3:0] + 1)
15 to 8	Reserved	When read, the value after reset is returned. When written, write the value after reset.

ISMn GGTB[3:0]	Timebase clock
0000	PCLK / 1
0001	PCLK / 2
...	...
1111	PCLK / 16

Table 46.22 ISMnGCFG register contents (2/2)

Bit position	Bit name	Function
7 to 0	ISMn GGUD[7:0]	Specifies the channel data update interval which is (ISMnGGUD[7:0] + 1) / f_{PWM}:

ISMn GGUD[7:0]	Channel data update interval
0000 0000	1 / f_{PWM}
0000 0001	2 / f_{PWM}
...	...
1111 1111	256 / f_{PWM}

Refer to Section 46.4.4.2, Channel data update interval for details.

46.5.2.4 ISMnGCNT – ISM channel timebase reading register

This register can be used to read the current value of the TB_CLK counter.

Refer to Section 46.4.5.2, Duty cycle time and duty factor of PWM signals for details.

Access: This register can be read in 32-bit units.

Address: <ISMn_base> + $000C_H$

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 46.23 ISMnGCNT register contents

Bit position	Bit name	Function
31 to 10	Reserved	When read, the value after reset is returned.
9 to 0	ISMn GGTR[9:0]	10-bit counter value

46.5.2.5 ISMnGIP – ISM global interrupt pending register

This register indicates the interrupt status. The status flags are set no matter whether the generation of the interrupt requests are masked in ISMnGCTL or not.

Refer to Section 46.4.10, Interrupt requests and status flags for details.

Access: This register can be read in 32-bit units.

Address: <ISMn_base> + 0014_H

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 46.24 ISMnGIP register contents

Bit position	Bit name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	ISMn GIPSSAD	Indicates whether ZPD measurements have actually begun: 0: ZPD measurements have not begun yet 1: ZPD measurements have been started When configured the interrupt request IRQ_ZPDAD has additionally been issued. This bit is cleared when ISMnGSTC.ISMnGIPCLAD is set to 1.
6	ISMn GIPSSDO	Indicates that the sequencer has returned to idle state for the current channel data update interval: 0: Sequencer busy 1: Sequencer returned to idle state When configured, the interrupt request IRQ_DONE has additionally been issued. This bit is cleared when ISMnGSTC.ISMnGIPCLDO is set to 1.
5 to 0	ISMn GIPSSREm	Indicates whether the motor of channel m has reached its target/zero position: 0: Target/zero position has not been reached 1: Target/zero position has been reached When configured, the interrupt request IRQ_REACHED has additionally been issued. IRQ_REACHED is generated for any motor that has reached its target/zero position. This bit is cleared when ISMnGSTC.ISMnGIPCLREm is set to 1.

46.5.2.6 ISMnGSTC – ISM global interrupt pending clear register

This register is the clear control register of ISMnGIP.

Refer to Section 46.4.10, Interrupt requests and status flags and Section 46.5.2.5, ISMnGIP – ISM global interrupt pending register for details.

Access: This register can be written in 32-bit units.
Reading this register returns 0000 0000_H.

Address: <ISMn_base> + 0018_H

Initial Value: 0000 0000_H

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 46.25 ISMnGSTC register contents

Bit position	Bit name	Function
31 to 8	Reserved	When read, the value after reset is returned. When written, write the value after reset.
7	ISMn GIPCLAD	0: No function 1: Clears the status flag ISMnGIP.ISMnGIPSSAD
6	ISMn GIPCLDO	0: No function 1: Clears the status flag ISMnGIP.ISMnGIPSSDO
5 to 0	ISMn GIPCLREm	0: No function 1: Clears the status flag ISMnGIP.ISMnGIPSSREm

46.5.2.7 ISMnCCMRm – ISM channel control register

This register specifies the operation mode for motor channel m.

- In motor driving operation mode, it is used to specify the delay for the PWM signal output. When channel management is set for motor channel m, this register is also used to specify the PWM value look-up table to be used and the motor channel's precision.
  Refer to Section 46.4.5.3, Output delay and Section 46.4.6.1, Stepper motor driving with channel management for details
- In ZPD operation mode, it is used to specify the following:
  - The delay for the PWM signal output when direct control is not used
  - The ZPD table to be used and the maximum table row number to be considered when channel management is set for motor channel m.

  Refer to Section (1), Processing of ZPD table for details.

Access: This register can be
- read/written in 32-bit units when channel management is switched off (ISMnGCTL.ISMnGGCE = 0).
- read only in 32-bit units when channel management is switched on (ISMnGCTL.ISMnGGCE = 1).

Address: <ISMn_base> + $001C_H$ + m x 4_H

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 46.26 ISMnCCMRm register contents (1/2)

Bit position	Bit name	Function
31 to 23	Reserved	When read, the value after reset is returned. When written, write the value after reset.
22 to 16	ISMn CCTLm[6:0]	Specifies the number of rows of the assigned ZPD table to be considered:

ISMnCCTL[6:0]	Number of valid rows in ZPD table
0	1
1	2
...	...
127	128

Table 46.26 ISMnCCMRm register contents (2/2)

Bit position	Bit name	Function
15 to 12	ISMn CCDVm[3:0]	Specifies the output delay for the *vertical* PWM signal of channel m: ISMn CCDV[3:0] / Output delay 0 / No output delay 1 / 1 cycle of TB_CLK ... / ... 15 / 15 cycles of TB_CLK
11 to 8	ISMn CCDHm[3:0]	Specifies the output delay for the *horizontal* PWM signal of channel m: ISMn CCDH[3:0] / Output delay 0 / No output delay 1 / 1 cycle of TB_CLK ... / ... 15 / 15 cycles of TB_CLK
7	Reserved	When read, the value after reset is returned. When written, write the value after reset.
6	ISMn CCZPm	Specifies the channel's operation mode: 0: Motor driving mode (generation of PWM signal) 1: ZPD mode
5	ISMnCCCPm	Specifies the motor channel's precision: 0: Standard precision (128 microsteps within a 360° turn) 1: High precision (512 microsteps within a 360° turn)
4 to 3	Reserved	When read, the value after reset is returned. When written, write the value after reset.
2 to 0	ISMn CCCTm[2:0]	Specifies which ZPD/PWM value look-up table is used for channel m: ISMn CCCTm[2:0] / RAM table 000 / 0 001 / 1 ... / ... 101 / 5 Other values than 0 to 5 are not allowed.

46.5.2.8 ISMnCCMPm – ISM channel PWM setting register

This register specifies the quadrant information and the PWM signal pulse widths for the sine and cosine side of the desired rotor position.

Refer to Section 46.4.5.2, Duty cycle time and duty factor of PWM signals and Section 46.4.5.4, Encoding of PWM signals according to quadrant for details.

Access: This register can be read/written in 32-bit units.
When channel management is set for a motor channel and channel management is switched on (ISMnGSTR.ISMnCCENm = 1 and ISMnGCTL.ISMnGGCE = 1), the values written by the application are ignored. Channel management supplies the channel's values from the assigned RAM table (ISMnCCMRm.ISMnCCCTm[2:0]).

Address: <ISMn_base> + $004C_H$ + m x 4_H

Initial Value: $0000\ 0000_H$

Table 46.27 ISMnCCMPm register contents

Bit position	Bit name	Function
31 to 22	Reserved	When read, the value after reset is returned. When written, write the value after reset.
21 to 20	ISMn CCQIm[1:0]	Specifies the quadrant 00_B: Quadrant 1 (0° - 90° angle) 01_B: Quadrant 2 (90° - 180° angle) 10_B: Quadrant 3 (180° - 270° angle) 11_B: Quadrant 4 (270° - 360° angle)
19 to 10	ISMn CCHPm[9:0]	Specifies the duty cycle time of the channel's *horizontal* PWM signal as a number of cycles of TB_CLK. The value range is from 0 (PWM signal switched off) to 2^{10} - 1 (duty factor = 100%).
9 to 0	ISMn CCVPm[9:0]	Specifies the duty cycle time of the channel's *vertical* PWM signal as a number of cycles of TB_CLK. The value range is from 0 (PWM signal switched off) to 2^{10} - 1 (duty factor = 100%).

46.5.2.9 ISMnCIOCm – ISM channel I/O control setting register

This register is used to enable/disable the recirculation of PWM signals and to configure direct control (which is only possible in ZPD operation mode).

Refer to Section 46.4.5.5, Recirculation and Section (2), Direct control for details.

Access: This register can be read/written in 32-bit units.
When channel management is set for a motor channel and channel management is switched on (ISMnGSTR.ISMnCCENm = 1 and ISMnGCTL.ISMnGGCE = 1), the values written by the application are ignored. Channel management supplies the channel's values from the assigned RAM table (ISMnCCMRm.ISMnCCCTm[2:0]).

Address: <ISMn_base> + $007C_H$ + m x 4_H

Initial Value: 0000 0000_H

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	ISMn CIHEm	ISMn CIVEm	ISMn CIHRm	ISMn CIVRm	0	0	0	0	0	0

0	0	ISMnCIHDm[3:0]				0	0	0	0	0	0	ISMnCIVDm[3:0]			
R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 46.28 ISMnCIOCm register contents

Bit position	Bit name	Function
31 to 26	Reserved	When read, the value after reset is returned. When written, write the value after reset.
25	ISMnCIHEm	Enables/disables direct control for the *horizontal* PWM signal: 0: Direct control disabled 1: Direct control enabled ISMnCIHDm[3:0] defines which transistors will be activated to supply the *horizontal* coil with current.
24	ISMnCIVEm	Enables/disables direct control for the *vertical* PWM signal: 0: Direct control disabled 1: Direct control enabled ISMnCIVDm[3:0] defines which transistors will be activated to supply the *vertical* coil with current.
23	ISMnCIHRm	Enables/disables recirculation for the *horizontal* PWM signal: 0: Recirculation disabled 1: Recirculation enabled
22	ISMnCIVRm	Enables/disables recirculation for the *vertical* PWM signal: 0: Recirculation disabled 1: Recirculation enabled
21 to 14	Reserved	When read, the value after reset is returned. When written, write the value after reset.
13 to 10	ISMn CIHDm[3:0]	Defines which transistors will be activated to supply the *horizontal* coil with current when direct control is enabled (ISMnCIHEm = 1).
9 to 4	Reserved	When read, the value after reset is returned. When written, write the value after reset.
3 to 0	ISMn CIVDm[3:0]	Defines which transistors will be activated to supply the *vertical* coil with current when direct control is enabled (ISMnCIVEm = 1).

NOTE

Direct control is bound to ZPD operation mode (ISMnCCMR.ISMnCCZPm = 1).

CAUTION

Using the ISMn with inductive loads (such as the coils of the stepper motors) the following must be considered:

- **Recirculation must be enabled (ISMnCIVRm and ISMnCIHRm set). Otherwise, severe damage to the output stages of the I/O ports may result.**
- **The ZPD tables in the RAM must be defined by the application such that the discharge of any inductive load is performed, before using direct control to change to a high-impedance state (at least three transistors off). Otherwise, severe damage to the output stages of the I/O ports may result.**

46.5.2.10 ISMnCOPT – ISM channels recirculation side setting register

This register specifies the connection to which the current is directed for recirculation.

Refer to Section 46.4.5.5, Recirculation for details.

Access: This register can be read/written in 32-bit units when channel management is switched off (ISMnGCTL.ISMnGGCE = 0).

Address: <ISMn_base> + 0094_H

Initial Value: $0000\ 0000_H$

Table 46.29 ISMnCOPT register contents

Bit position	Bit name	Function
31 to 6	Reserved	When read, the value after reset is returned. When written, write the value after reset.
5 to 0	ISMnCIRSm	Specifies the connection to which the current is directed for recirculation: 0: Redirection to the ground connection $ISMV_{SS}$ 1: Redirection to the power supply $ISMV_{CC}$

46.5.3 ISMn movement calculator parameters

The movement calculator parameters are defined via a set of 10 registers: ISMnPARiCFGm with i = 0 to 9.

The bit names of these registers include an indicator “Pxx”, that points to the purpose of the parameter.

46.5.3.1 ISMnPAR0CFGm – Target motor position CHm

This register specifies the target motor position when motor channel m is operated in motor driving operation mode and all values for intermediate motor steps are supplied by channel management (ISMnGSTR.ISMnCCENm = 1 and ISMnGCTL.ISMnGGCE = 1).

Refer to Section 46.4.6.1, Stepper motor driving with channel management for details.

Bit name indicator

Pxx = PMP

Access: This register can be read/written in 32-bit units.

Address: <ISMn_base> + $00C8_H$ +m x 28_H

Initial Value: 0000 0000_H

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. ISMFPMPm[7:0] must be set to FF_H.

Table 46.30 ISMnPAR0CFGm register contents

Bit position	Bit name	Function
31 to 25	Reserved	When read, the value after reset is returned. When written, write the value after reset.
24	ISMn SPMPm	Sign of parameter
23 to 8	ISMn IPMPm[15:0]	Integer part of parameter
7 to 0	ISMn FPMPm[7:0]	Fractional part of parameter **CAUTION** The fractional part must be set to FF_H.

46.5.3.2 ISMnPAR1CFGm – Damping factor CHm

This register specifies the damping factor of the movement calculation algorithm.

Bit name indicator

Pxx = PDF

Access: This register can be read/written in 32-bit units when channel management is disabled for that channel (ISMnGSTR.ISMnCCENm = 0).
This register is read-only when channel management is enabled (ISMnGSTR.ISMnCCENm = 1 and ISMnGCTL.ISMnGGCE = 1).

Address: <ISMn_base> + $00CC_H$ +m x 28_H

Initial Value: $0000\ 0000_H$

Table 46.31 ISMnPAR1CFGm register contents

Bit position	Bit name	Function
31 to 3	Reserved	When read, the value after reset is returned. When written, write the value after reset.
2 to 0	ISMn FPDFm[2:0]	Represents the inertia PDF of the algorithm. 2^{PDF} divides the theoretical maximum speed required to reach the target position within only one algorithm pass.

46.5.3.3 ISMnPARiCFGm for i = 2 to 9 – Movement parameters CHm

ISMnPARiCFGm specify the movement parameters for the automatic calculation of rotor positions for channel m.

The values in this register are required when motor channel m is operated in motor driving operation mode and all values for intermediate motor steps are supplied by channel management (ISMnGSTR.ISMnCCENm = 1 and ISMnGCTL.ISMnGGCE = 1).

All registers have the same binary-fixed-point storage format and are therefore described together in this section.

Table 46.32 ISMnPARiCFGm parameter registers overview

Register	Parameter	Indicator in bit name (Pxx)	Address
ISMnPAR2CFGm	Acceleration limit CHm	PAL	<ISMn_base> + $00D0_H$ + m x 28_H
ISMnPAR3CFGm	Deceleration limit CHm	PDL	<ISMn_base> + $00D4_H$ + m x 28_H
ISMnPAR4CFGm	Maximum speed CHm	PMS	<ISMn_base> + $00D8_H$ + m x 28_H
ISMnPAR5CFGm	Hysteresis correction CHm	PHC	<ISMn_base> + $00DC_H$ + m x 28_H
ISMnPAR6CFGm	Speed threshold 1 CHm	PS1	<ISMn_base> + $00E0_H$ + m x 28_H
ISMnPAR7CFGm	Speed threshold 2 CHm	PS2	<ISMn_base> + $00E4_H$ + m x 28_H
ISMnPAR8CFGm	Speed threshold 3 CHm	PS3	<ISMn_base> + $00E8_H$ + m x 28_H
ISMnPAR9CFGm	Speed threshold 4 CHm	PS4	<ISMn_base> + $00EC_H$ + m x 28_H

Bit name indicator

See Table 46.32, ISMnPARiCFGm parameter registers overview.

Access: These registers can be read/written in 32-bit units when channel management is disabled for that channel (ISMnGSTR.ISMnCCENm = 0).
These register are read-only when channel management is enabled (ISMnGSTR.ISMnCCENm = 1 and ISMnGCTL.ISMnGGCE = 1).

Address: See Table 46.32, ISMnPARiCFGm parameter registers overview.

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

46.5.4 ISMn movement calculator variables

46.5.4.1 ISMnVARjCFGm for j = 0 to 5 – Movement variables CHm

ISMn stores the movement variables for the automatic calculation of rotor positions for channel m (when ISMnGSTR.ISMnCCENm = 1 and ISMnGCTL.ISMnGGCE = 1) in ISMnVARjCFGm.

These registers are used when motor channel m is operated in motor driving operation mode and all values for intermediate motor steps are supplied by channel management (ISMnGSTR.ISMnCCENm = 1 and ISMnGCTL.ISMnGGCE = 1).

All registers have the same binary-fixed-point storage format and are therefore described together in this section.

NOTE

These registers should not be modified during normal operation of ISMn. The values can be modified for test purposes in debug mode (ISMnEMU.ISMnSVDIS = 1).

Table 46.34 ISMnVARjCFGm variable registers overview

Register	Variable	Indicator in bit name (Vxx)	Address
ISMnVAR0CFGm	Actual acceleration/deceleration CHm	VAX	<ISMn_base> + $01B8_H$ + m x $1C_H$
ISMnVAR1CFGm	Actual speed CHm	VAS	<ISMn_base> + $01BC_H$ + m x $1C_H$
ISMnVAR2CFGm	Previous iteration speed CHm	VPS	<ISMn_base> + $01C0_H$ + m x $1C_H$
ISMnVAR3CFGm	Temporary calculator register PT1	VPT	<ISMn_base> + $01C4_H$ + m x $1C_H$

46.5.4.2 ISMnVAR6CFGm – Flag variables CHm

ISMn stores speed and direction flags in ISMnVAR6CFGm when the rotor's movements are controlled by channel management (ISMnGSTR.ISMnCCENm = 1 and ISMnGCTL.ISMnGGCE = 1) and standard precision is configured (ISMnCCMRm.ISMnCCCPm = 0).

Refer to Section 46.4.8.1, PWM value look-up tables for motor driving for details.

NOTE

This register should not be modified during normal operation of ISMn. The values can be modified for test purposes in debug mode (ISMnEMU.ISMnSVDIS = 1).

Access: This register can be read/written in 32-bit units when channel management is disabled for that channel (ISMnGSTR.ISMnCCENm = 0).
This register is read-only when channel management is enabled (ISMnGSTR.ISMnCCENm = 1 and ISMnGCTL.ISMnGGCE = 1). Note that old values may be read while the sequencer is busy updating channels' data (ISMnGSTR.ISMnGGCB = 1).

1	ISMnVVDRm	0: Channel management is using part for speed 0 on the PWM value look-up table. 1: Channel management is using part for speed 1 on the PWM value look-up table.
0	ISMnVVSPm	0: Channel management is using part for direction 0 on the PWM value look-up table. 1: Channel management is using part for direction 1 on the PWM value look-up table.

46.5.5 ZPD registers

46.5.5.1 ISMnGZPDCTL – ISM global ZPD control register

This register is used to enable zero point detection and to specify the general settings for ZPD (such as measurement clock M_CLK, reference voltages, digital noise filtering, etc.).

Access: This register can be read/written in 32-bit units when channel management is disabled (ISMnGSTR.ISMnCCENm = 0 or ISMnGCTL.ISMnGGCE = 0).
This register is read-only when channel management is enabled (ISMnGSTR.ISMnCCENm = 1 and ISMnGCTL.ISMnGGCE = 1).

Address: <ISMn_base> + 0010_H

Initial Value: $4033\ FF7F_H$

R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 46.38 ISMnCCNTm register contents

Bit position	Bit name	Function
31 to 7	Reserved	When read, the value after reset is returned.
6 to 0	ISMn CCZCm[6:0]	ZPD table index counter 0_H: Beginning of ZPD table $7F_H$: End of ZPD table The table index counter does not show the row number of the current table row but the number of the *next* row. Counting restarts from 0 when the counter reaches the limit specified in ISMnCCMR.ISMnCCTLm[6:0].

46.5.5.3 ISMnCZCFGm – ISM channel ZPD configuration register

This register can be used to read when the next table row will be fetched from the ZPD table that is assigned to channel m.

Refer to Section (4), Measurement delay for details.

Access: This register can be read in 32-bit units.

Address: <ISMn_base> + 0064_H + m x 4_H

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 46.39 ISMnCZCFGm register contents

Bit position	Bit name	Function
31 to 5	Reserved	When read, the value after reset is returned.
4 to 0	ISMn CCZDm[4:0]	Number of START events that occur before the next table row is fetched from the assigned ZPD table. The value is decremented periodically when a START event occurs. The minimum value is 0 and the maximum value is 31.

46.5.5.4 ISMnZPDCTL – ISM channels ZPD info bus settings register

This register is used to start ZPD measurements. It also specifies the input signal to be measured.

Access: This register can be read/written in 32-bit units when channel management is switched off (ISMnGCTL.ISMnGGCE = 0).
This register is read-only when channel management is switched on (ISMnGCTL.ISMnGGCE = 1).

Address: <ISMn_base> + 0098_H

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

00_B	SINPm
01_B	COSPm
10_B	SINMm
11_B	COSMm

5 to 0	ISMnCZMTm	ZPD measurement trigger for channel m: 0: Do not perform ZPD measurement 1: Perform ZPD measurement First measurement starts after the blanking delay defined in ISMnZPDCMP.ISMnCZBTm[15:0].

NOTE

When channel management is set, ISMnZPDCTL.ISMnCZISm[1:0] and ISMnCZMTm are taken from the assigned ZPD table. Otherwise, ISMnZPDCTL.ISMnCZISm[1:0] and ISMnCZMTm need to be supplied by the application.

46.5.5.5 ISMnZPDOPT – ISM channels ZPD options setting register

This register specifies which of the two reference voltages the level of a channel's input signal is compared with. For each channel, one of the two reference voltages can be selected.

Refer to Section (5), Reference voltages for details.

Access: This register can be read/written in 32-bit units when channel management is switched off (ISMnGCTL.ISMnGGCE = 0).
This register is read-only when channel management is switched on (ISMnGCTL.ISMnGGCE = 1).

Address: <ISMn_base> + $009C_H$

Initial Value: $0000\ 0000_H$

Bit position	Bit name	Function
31 to 6	Reserved	When read, the value after reset is returned. When written, write the value after reset.
5 to 0	ISMnCZRSm	Specifies which of the two reference voltages is used for channel m: 0: Use reference voltage defined by ISMnGZPDCTL.ISMnGGRV1[3:0] 1: Use reference voltage defined by ISMnGZPDCTL.ISMnGGRV2[3:0]

46.5.5.6 ISMnZPDSTR – ISM channels ZPD status register

This register can be used to verify the last noise filtering result for all channels.

Refer to Section (6), Noise filtering and Section (7), Noise filtering result for details.

Access: This register can be read in 32-bit units.

Address: <ISMn_base> + $00A0_H$

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 46.42 ISMnZPDSTR register contents

Bit position	Bit name	Function
31 to 6	Reserved	When read, the value after reset is returned.
5 to 0	ISMnCZDRm	Indicates whether – according to noise filtering – the level of the input signal is above or below the level of the reference voltage: 0: Voltage is *below* reference voltage (yet unconfirmed zero position) 1: Voltage is *above* reference voltage (no zero point detected so far)

46.5.5.7 ISMnZPDIP – ISM channels ZPD detection flag register

This register indicates for all channels whether their motors have reached their zero positions since the detection flag in this register was last cleared.

Refer to Section (7), Noise filtering result for details.

Access: This register can be read in 32-bit units.

Address: <ISMn_base> + $00A4_H$

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 46.43 ISMnZPDIP register contents

Bit position	Bit name	Function
31 to 6	Reserved	When read, the value after reset is returned.
5 to 0	ISMnCZIPm	Indicates the status of the interrupt IRQ_ZPD that indicates whether a motor has reached its zero position or not: 0: No IRQ_ZPD pending (voltage has not been above the configured reference voltage since this bit was last cleared) 1: IRQ_ZPD has been generated (voltage was at least once above the configured reference voltage) This bit is automatically cleared, when a new set of ZPD measurements is started (ZPD measurement trigger ISMnZPDCTL.ISMnCZMTm changes from 0 to 1. This bit can be cleared by the application by writing 1 to ISMnZPDSTC.ISMnCCLZPm.

46.5.5.8 ISMnZPDSTC – ISM channels ZPD detection flag clear register

This register is the clear control register of ISMnZPDIP.

Access: This register can be written in 32-bit units.

Address: <ISMn_base> + $00A8_H$

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 46.44 ISMnZPDSTC register contents

Bit position	Bit name	Function
31 to 6	Reserved	When read, the value after reset is returned.
5 to 0	ISMnCCLZPm	0: No function 1: Clears the status flag ISMnZPDIP.ISMnCZIPm that indicates a pending IRQ_ZPD interrupt.

46.5.5.9 ISMnZPDCMPm – ISM channel ZPD blanking and vibration damping setting register

This register specifies the blanking delay of ZPD measurements and whether the ZPD vibration damping feature is used.

Refer to Section (3), Blanking delay and Section (10), ZPD vibration damping for details.

Access: This register can be read/written in 32-bit units when channel management is switched off (ISMnGCTL.ISMnGGCE = 0).
This register is read-only when channel management is switched on (ISMnGCTL.ISMnGGCE = 1).

Address: <ISMn_base> + $00AC_H$ + m x 4_H

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 46.45 ISMnZPDCMPm register contents

Bit position	Bit name	Function
31	ISMn CZSSm	Specifies whether the ZPD vibration damping feature is used or not. 0: ZPD vibration damping disabled 1: ZPD vibration damping enabled If during a measurement sequence, it is detected that the motor has not reached its zero position yet, the coil is short-circuited for the rest of the measurement sequence.
30 to 16	Reserved	When read, the value after reset is returned. When written, write the value after reset.
15 to 0	ISMn CZBTm[15:0]	Specifies the blanking delay as a number of measurement sequences T_m. The minimum value is 0 and the maximum value is $FFFF_H$.

46.5.5.10 ISMnZPDCSTR – ISM channels ZPD measurement activity status register

This register contains the ZPD current measurement activity status.

Access: This register can be read in 32-bit units.

Address: <ISMn_base> + $00C4_H$

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 46.46 ISMnZPDCSTR register contents

Bit position	Bit name	Function
31 to 6	Reserved	When read, the value after reset is returned.
5	ISMnCZAF5	ZPD current measurement activity status for channel 5. 0: ZPD measurement inactive. 1: ZPD measurement active.
4	ISMnCZAF4	ZPD current measurement activity status for channel 4. 0: ZPD measurement inactive. 1: ZPD measurement active.
3	ISMnCZAF3	ZPD current measurement activity status for channel 3. 0: ZPD measurement inactive. 1: ZPD measurement active.
2	ISMnCZAF2	ZPD current measurement activity status for channel 2. 0: ZPD measurement inactive. 1: ZPD measurement active.
1	ISMnCZAF1	ZPD current measurement activity status for channel 1. 0: ZPD measurement inactive. 1: ZPD measurement active.
0	ISMnCZAF0	ZPD current measurement activity status for channel 0. 0: ZPD measurement inactive. 1: ZPD measurement active.

46.5.6 ISMn emulation mode register

46.5.6.1 ISMnEMU – Emulation register

This register controls whether the ISMn module can be stopped during emulation, for instance when a breakpoint is reached.

Access: This register can be read/written in 32-bit units.

Address: <ISMn_base> + 0260_H

Initial Value: $0000\ 0000_H$

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R

Table 46.47 ISMnEMU register contents

Bit position	Bit name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	ISMnSVDIS	Emulation control: 0: ISMn module can be stopped during emulation When the EPC.SVSTOP bit is set to 1: – The ISM sequencer continues with an already started processing of all enabled channels. A new trigger (START) is ignored. – PWM generation continues (no stop of PWM generation). – Changing of channel parameters by APB interface is still possible. When the EPC.SVSTOP bit is set to 0: – The ISM continues execution. 1: ISMn module operates continuously during emulation The ISM continues execution on a debug break. (EPC.SVSTOP is ignored).
6 to 0	Reserved	When read, the value after reset is returned.

46.6 Detection and Correction of Errors in ISM RAM

46.6.1 ECC for the ISM RAM

Table 46.48 gives an outline of the ECC functions for the ISM RAM.

Table 46.48 List of the ECC Functions for the ISM RAM

Item	Outline of Functions
ECC error detection/correction	The RAM is checked for ECC errors. The following options are selectable. • 2-bit error detection and 1-bit error detection/correction • 2-bit error detection and 1-bit error detection The ECC error detection/correction can be disabled by using through mode. With the initial settings, error detection/correction is enabled. The 7-bit ECC value is calculated for each 32-bit transfer.
Error notification	When an ECC 2-bit error is generated, the error is notified. • Error notification can be enabled or disabled when an ECC 2-bit error is detected. In the initial setting, 2-bit error notification is enabled.
Error status	Monitoring for the detection of two-bit ECC errors and for the detection of one-bit ECC errors is available. A register for clearing the error status is provided.
Address capture	• Only one address at which an ECC error has occurred can be captured. • A signal is generated upon detection of a 2-bit or ECC 1-bit error, and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared).

CAUTION

When ECC error detection/correction is performed, initialize the ISM RAM by the ISM module before it is used.

46.6.2 Interrupt Request

Table 46.49 lists the ECC interrupt request of ISM RAM.

Table 46.49 Interrupt Requests

Unit Interrupt Signal	Outline	Connected to
—	ISM RAM ECC 2 bit error interrupt	Error Control Module INTECCDPERIRAM
—	ISM RAM ECC 1 bit error interrupt	Error Control Module INTECCSPERIRAM

46.6.3 ECCISMnCTL — ISMn RAM ECC Control Register

The ECCISMnCTL register controls the mode of the ECC and the status for ISMn.

Bits 7, 5 and 4 should be set (written) while the ISMn operation is stopped.

In addition, when writing to bit 7, EMCA1 and EMCA0 need to be 01_B.

Access: This register can be read/written in 16-bit units.

Address: FFC7 8000_H

Value after reset: Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA1	EMCA0	—	—	—	EC ER2C	EC ER1C	—	EC THM	ECERV F	EC 1ECP	EC 2EDIC	EC1EDI C	EC ER2F	EC ER1F	EC EMF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	Undefined
R/W	R/W*1	R/W*1	R	R	R	R/W*1	R/W*1	R	R/W	R/W	R/W	R/W	R/W	R	R	R

Note 1. These bits are always read as 0.

Table 46.50 ECCISMnCTL Register Contents (1/2)

Bit position	Bit Name	Function
15	EMCA1	Access control bits 1 and 0 to ECC mode selection bit These bits specify whether modifying the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 01_B, writing to bit 7 is enabled.
14	EMCA0	
13 to 11	Reserved	When read, the value after reset is returned. Writing to these bits, write the value after reset.
10	ECER2C	2-bit ECC error detection flag clear bit This bit is used to clear the 2 bit error detection flag of ECER2F (bit 2). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority.
9	ECER1C	1-bit ECC error correction accumulation flag clear bit This bit is used to clear the 1 bit error detection/correction flag of ECER1F (bit 1). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority.
8	Reserved	When read, the value after reset is returned. Writing to these bits, write the value after reset.
7	ECTHM	ECC function through mode selection bit This bit is used to set enabling and disabling of ECC. Setting this bit to 1 disables ECC function. When writing to this bit, (0, 1) must be written to (EMCA1, EMCA0) at the same time. 0: Through mode is disabled (normal operation mode). 1: Through mode is enabled. (ECC function disable)
6	ECERVF	ECC error judgment enable 0: error judgement disabled 1: error judgement enabled Error judgement is only effective in normal operation mode, i.e. if ECCISMnCTL.ECTHM = 0. If error judgement is disabled no interrupts are asserted in case of a single or double bit error detection. However detected single bit errors are corrected. Modification of this bit is only possible, if EMCA[1:0] = 01_B. Otherwise any write to this bit is ignored.

Table 46.50 ECCISMnCTL Register Contents (2/2)

Bit position	Bit Name	Function
5	EC1ECP	1-bit error correction enable bit This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled. 0: When 1-bit error is detected, the error will be corrected. 1: When 1-bit error is detected, the error will not be corrected.
4	EC2EDIC	2-bit error detection interrupt control bit This bit controls whether to generate an interrupt when 2-bit error is detected. 0: When 2-bit error is detected, a INTECCDPERIRAM interrupt will not be generated. 1: When 2-bit error is detected, a INTECCDPERIRAM interrupt will be generated. (initial value)
3	EC1EDIC	1-bit error detection interrupt control bit This bit controls whether to generate an interrupt when 1-bit error is detected. 0: When 1-bit error is detected, a INTECCSPERIRAM interrupt will not be generated. 1: When 1-bit error is detected, a INTECCSPERIRAM interrupt will be generated.
2	ECER2F	2-bit error detection flag bit This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). When 2-bit error interrupt is enabled (EC2EDIC = 1) and this flag is set, an ECC 2-bit error interrupt (INTECCDPERIRAM) is output. Write 1 to the ECER2C bit (bit 10) to clear the flag. This bit is cleared at the time of through mode enable selection (ECTHM = 1). If 2-bit error is detected again while this bit is set, an interrupt signal will not be generated. 0: 2-bit error has not occurred since this bit was cleared. 1: 2-bit error has occurred.
1	ECER1F	1-bit error detection/correction flag bit This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). Write 1 to the ECER1C bit (bit 9) to clear the flag. This bit is cleared at the time of through mode enable selection (ECTHM = 1). 0: 1-bit error has not occurred since this bit was cleared. 1: 1-bit error has occurred.
0	ECEMF	ECC error message flag This flag indicates whether an error exists in the current read data. This bit is updated whenever the RAM reads data. This bit might be set if it is read before initialization of the RAM. This bit is cleared at the time of through mode enable selection (ECTHM = 1) and when there is no 1 bit error in the decode circuit input data. 0: The currently-read RAM data does not have bit errors. 1: The currently-read RAM data have bit errors.

CAUTION

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

We recommend initializing the RAM before clearing bits 2 and 1.

46.6.4 ECCISMnTMC — ISM RAM ECC Test Mode Control Register

The ECCISMnTMC register switches to and controls the test mode.

This register can be used when ISM is not accessed to RAM.

Access: This register can be read/written in 16-bit units.

Address: FFC7 8004_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ETMA1	ETMA0	—	—	—	—	—	—	ECTMCE	—	—	ECTRRS	ECREOS	ECENS	ECDCS	ECREIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W*1	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Note 1. These bits are always read as 0.

Table 46.51 ECCISMnTMC Register Contents (1/2)

Bit position	Bit Name	Function
15	ETMA1	Access control bits 1 and 0 to ECC test mode bit These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 10_B, writing to bit 7 is enabled.
14	ETMA0	
13 to 8	Reserved	When read, the value after reset is returned. Writing to these bits, write the value after reset.
7	ECTMCE	ECC test mode enable bit This bit specifies whether to enable access to the test registers and test control bits. When writing to this bit, (1, 0) should be written to (ETMA1, ETMA0) at the same time. 0: Access to the test mode registers and bits is disabled. 1: Access to the test mode registers and bits is enabled. Test registers: ECCISMnTED, ECCISMnTRC, ECCISMnSYND, ECCISMnHORD, ECCISMnECRD, ECCISMnERDB Register test control bit: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS
6, 5	Reserved	When read, the value after reset is returned. Writing to these bits, write the value after reset.
4	ECTRRS	ECC RAM read test mode selection bit Select reading destination when reading ECCISMnTED register and reading destination when reading ECCISMnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0:The read value of the ECCISMnTED register is the write value of the ECCISMnTED register. The read value of the ECCISMnERDB register is the write value of the ECCISMnERDB register. 1: The read value of the ECCISMnTED register can read RAM data. The read value of the ECCISMnERDB register is the ECC data to be written to RAM.
3	ECREOS	ECC redundant bit output data selection bit This bit is used to identify and select the ECC data to be stored in RAM as ECC data generated for write data or the value of the ECCISMnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Store ECC data generated for write data to RAM. 1: Store the value of ECCISMnERDB register to RAM.

Table 46.51 ECCISMnTMC Register Contents (2/2)

Bit position	Bit Name	Function
2	ECENS	ECC encoder input selection bit This bit is used to identify the targeted data for ECC data generation as write data to RAM or the value of the ECCISMnTED register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate ECC data from the write data to RAM. 1: Generate ECC data from the value of the ECCISMnTED register.
1	ECDCS	ECC decoder input selection bit This bit is used to indentify and select the targeted data for syndrome code generation and error detection as RAM data or the value of the ECCISMnTED register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate syndrome code from RAM data and detect errors. 1: Generate syndrome code from the value of the ECCISMnTED register and detect errors.
0	ECREIS	ECC redundant bit input data selection bit This bit is used to indetify and select the targeted data for syndrome code generation and error detection as RAM data or the value of the ECCISMnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate syndrome code from ECC data stored in RAM and detect errors. 1: Generate syndrome code from the value of the ECCISMnERDB register and detect errors.

46.6.5 ECCISMnTED — ISMn RAM ECC Encode/Decode Input/Output Replacement Test Register

In ECC test mode, this register handles test data.

The value of the register can be used to generate ECC data or syndrome code.

When ECC test mode is enabled (ECCISMnTMC.ECTMCE = 1), it is accessible. When ECCISMnTMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when ISM is not accessed to RAM.

Access: This register can be read/written in 32-bit units.

Address: FFC7 $800C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEDB[31:16]

Table 46.52 ECCISMnTED Register Contents

Bit position	Bit Name	Function
31 to 0	ECEDB[31:0]	When ECCISMnTMC.ECENS = 1, the value of this register is used to generate ECC data and the value this register to RAM is stored to RAM. When ECCISMnTMC.ECDCS = 1, the value of this register is used to generate syndrome code and the value of this register is stored in ECC decode syndrome data register (ECCISMnSYND). In addition, when ECCISMnTMC.ECTRRS = 1, RAM data [31:0], instead of written data, is read for the value of this register.

46.6.6 ECCISMnTRC — ISMn RAM ECC Redundant Bit Data Control Test Register

In ECC test mode, this test register, for ECC data, consists of four 8-bit registers, ECCISMnSYND, ECCISMnHORD, ECCISMnECRD, and ECCISMnERDB.

When ECC test mode is enabled (ECCISMnTMC.ECTMCE = 1), this register can be accessed. When ECCISMnTMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when ISM is not accessed to RAM.

Access: This register can be read/written in 32-bit units.

Address: FFC7 8008_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECCISMnSYND (See **Section 46.6.7**)								ECCISMnHORD (See **Section 46.6.8**)

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

46.6.7 ECCISMnSYND — ISMn RAM ECC Decode Syndrome Data Register

In ECC test mode, this is a read-only register for storing generated syndrome code.

Writing to this register is ignored.

When ECC test mode is enabled (ECCISMnTMC.ECTMCE = 1), this register can be accessed. When ECC test mode is disabled (ECCISMnTMC.ECTMCE = 0), 00_H is read.

Access: This register can be read in 8-bit units.

Address: FFC7 $800B_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	SYND6	SYND5	SYND4	SYND3	SYND2	SYND1	SYND0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 46.53 ECCISMnSYND Register Contents

Bit position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	SYND[6:0]	The generated syndrome code is stored as needed.

46.6.8 ECCISMnHORD — ISMn RAM ECC 7-Bit Redundant Bit Data Hold Test Register

In ECC test mode, this register is used to store ECC data for read RAM data.

Writing to this register is ignored.

When ECC test mode is enabled (ECCISMnTMC.ECTMCE = 1), this register can be accessed. When ECC test mode is disabled (ECCISMnTMC.ECTMCE = 0), 00_H is read.

Access: This register can be read in 8-bit units.

Address: FFC7 $800A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	HORD6	HORD5	HORD4	HORD3	HORD2	HORD1	HORD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 46.54 ECCISMnHORD Register Contents

Bit position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	HORD[6:0]	ECC code for read RAM data is stored as needed. When ECCISMnTMC.ECTRRS = 1 and ECCISMnTED register is read, ECC code is stored.

46.6.9 ECCISMnECRD — ISMn RAM ECC Encode Test Register

In ECC test mode, this is a read-only register for storing ECC data generated for write RAM data.

Writing to this register is ignored.

When ECC test mode is enabled (ECCISMnTMC.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (ECCISMnTMC.ECTMCE = 0), 00_H is read.

Access: This register can be read in 8-bit units.

Address: FFC7 8009_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ECRD6	ECRD5	ECRD4	ECRD3	ECRD2	ECRD1	ECRD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 46.55 ECCISMnECRD Register Contents

Bit position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	ECRD[6:0]	These bits can read ECC data generated at the time of RAM data writing, and can read ECC data for the data written to the ECCISMnTED register when ECCISMnTMC.ECENS = 1.

46.6.10 ECCISMnERDB — ISMn RAM ECC Redundant Bit Input/Output Replacement Register

In ECC test mode, this register handles ECC data.

The value of this register can be used as ECC data generated at the time of RAM writing or ECC data read at the time of RAM data reading.

When ECC test mode is enabled (ECCISMnTMC.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (ECCISMnTMC.ECTMCE = 0), 00_H is read.

Access: This register can be read/written in 8-bit units.

Address: FFC7 8008_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ERDB6	ERDB5	ERDB4	ERDB3	ERDB2	ERDB1	ERDB0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 46.56 ECCISMnERDB Register Contents

Bit position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
6 to 0	ERDB[6:0]	When ECCISMnTMC.ECREOS = 1, these bits store the value of this register as ECC data to RAM. When ECCISMnTMC.ECREIS = 1, the value of this register is read as ECC data read from RAM. When ECCISMnTMC.ECTRRS = 1, ECC data to be stored in RAM is read instead of the write data for the read value of this register.

46.6.11 ECCISMnEAD0 — ISMn ECC Error Address Register

ECCISMnEAD0 is a read-only register to hold the address at which an ECC error has occurred.

Access: This register can be read/written in 32-bit units.

Address: FFC7 8010$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEAD[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEAD[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 46.57 ECCISMnEAD0 Register Contents

Bit position	Bit Name	Function
31 to 0	ECEAD[31:0]	ECCISMnEAD0 is a read-only register to hold the address at which an ECC error has occurred. If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in ECCISMnEAD0 as the address at which the ECC error has occurred. The address is stored upon detection of the first ECC error while no error status is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored. Only one address can be held in ECCISMnEAD0.

Section 47 Functional Safety

The RH850/D1L/D1M series microcontrollers are designed under the premiss that correct functionality of all safety relevant components can be proven. Therefore it features several modules, which ensure respectively support continuous verification of the microcontroller's functionality.

All devices of the RH850/D1L/D1M series are developed as Safety Element out of Context (SEooC) in accordance to ISO26262 targeting ASIL B.
For details about safety work products, "RH850/D1L/D1M Group Safety Application Note" and etc., please contact our sales representatives.

The following table summarizes which microcontroller components are considered as safety relevant and how their functionality can be proven.

Table 47.1 Safety features overview (1/2)

Hardware function	Test concept
Memory Protection Unit (MPU)	Cyclic test by application software. MPU functionality can be tested by provoking protection violations.
Interrupt Controller (INTC)	Cyclic test by application software INTC functionality can be tested by asserting interrupt requests by software. Refer to Section 7, Interrupt for details.
Bus access protections	Bus guards for single- and multi-master busses to prevent prohibited accesses to certain resources. Refer to Section 14.6, Bus Guards for details.
Flash memories and RAM	• Memory -DMA-CRC check Checksum calculation to secure content of data blocks. This test is supported by the DMA Controller and Data CRC (DCRA) function. The target data can be copied from the memory to DCRA by the DMA Controller (Memory-DMA-CRC check). Refer to Section 49, Data CRC (DCRA) for details. • Local RAM and flash memories are protected by Error Correction Coding (ECC) circuits ECC circuits can also be tested provoking memory errors. Refer to the description of the Error Correction Coding circuits in the respective sections for details. • Video RAM can be ECC protected by a special access mode of the RAM wrapper. Refer to Section 54, Video RAM and Video RAM Wrapper (VRAM) for details.
Functional modules	Functionality of most modules can be verified by software controlled tests on application level. RAMs of the modules are protected by Error Correction Coding (ECC) circuits.
Window Watchdog (WDTA)	Watchdog modules to escape from a system deadlock or program runaway. Refer to Section 26, Window Watchdog Timer (WDTA) the for details.
Clock generators	Supervision of the oscillators and PLL circuits by Clock Monitors (CLMA). Clock Monitors can be tested by provoking clock generators fails. Refer to Section 12.7, Clock Monitor A (CLMA) for details.
Temperature control	Temperature measurement circuit warns about out-of-range temperature. Refer to Section 11, Temperature Measurement for details.
Supply voltage	Power-On-Clear (POC) circuit ensures microcontroller reset if voltage supply below minimum. Refer to Section 10, Power Supply and Power Domains and Section 9, Reset Controller for details. For external voltage supervision the A/D Converter (ADCE) with built-in comparator function can be utilized. Refer to Section 45, A/D Converter (ADCE) for details.
Reset	Redundant Reset Controller ensures reset functionality. Refer to Section 9, Reset Controller for details.
Clocked serial interfaces (CSIG, CSIH), CAN interface (RS-CAN), CANFD Interface (RS-CANFD)	These communication interfaces feature loop back mode function for self tests. Refer to Section 18, Clocked Serial Interface G (CSIG), Section 19, Clocked Serial Interface H (CSIH) and Section 22, CAN Interface (RSCAN), Section 23, CANFD Interface (RS-CANFD) for details.
A/D Converter (ADCE)	The ADCE features a self diagnosis function to test correct functionality. Refer to Section 45, A/D Converter (ADCE) for details.

Table 47.1 Safety features overview (2/2)

Hardware function	Test concept
PWM diagnosis and port check functions	Verification of correct operation of safety relevant notification signals, e.g. warning lights and sound output. Refer to Section 32, PWM Generators and Diagnostic (PWM-Diag) and Section 2.4, Output ports check functions for details.
Video input pixel clock supervision	Verification of live view from external video sources. Refer to Section 37.5.8, Video Input Pixel Clock Monitoring for details.
Video output data check	Verification of correct video output content. Refer to Section 40, Video Output Checker A (VOCA) and Section 41, Display Output Comparator (DISCOM) for details.
2D Graphics Processing Unit (GPU2D)	Checksum verification of drawing command lists to ensure correct graphic drawings. Refer to Section 42, 2D Graphics Processing Unit (GPU2D) for details.
Capture-compare timers, Zero Point Detection	Verification of correct position of dialers and gauge needles.
Error Control Module (ECM)	Collection of all exception that are asserted from various modules in one entity. Depending on the safety use-case it can be configured whether a reset, non-maskable or maskable interrupt is asserted. Refer to Section 48, Error Control Module (ECM) for details.
Data CRC (DCRA)	Hardware CRC module that can be utilized e.g. to ensure end-to-end protection of communication interfaces or regular y check memory areas.

Section 48 Error Control Module (ECM)

48.0.1 ECM Master and Checkers

Following table summarizes which devices feature an ECM Master and ECM Checker module.

Table 48.1 ECM Master and Checkers ("√": module available, –": module not available)

ECM module	D1L1	D1L2(H)	D1M1(H)	D1M1-V2 D1M1A	D1M2(H)
Master	√	√	√	√	√
Checker	√	√	√	–	√

Refer to Section 48.1.11, ECM Master - Checker operation for details about ECM Master and Checker.

48.1 Overview

48.1.1 Specification Overview

ECM (Error Control Module) collects error signals coming from different error sources and monitoring circuits. It also outputs error signals from the error pin ($\overline{\text{ERROROUT}}$) and generates interrupts and internal reset signals. **Table 48.2** shows the specification overview of ECM.

Table 48.2 Specification Overview (1/2)

Item	Description
Safety processing	ECM can handle the following processing in response to error signal inputs from individual modules. • Error flag set • FE level maskable interrupt generation FE level maskable interrupt generation can be controlled (enabled/disabled) for individual errors. • FE level non-maskable interrupt generation FE level non-maskable interrupt generation can be controlled (enabled/disabled) for individual errors. • Internal reset generation Internal reset generation can be controlled (enabled/disabled) for individual errors. • Error pin output Pin output mask can be controlled (enabled/disabled) for individual errors. Output can be toggled in response to a timer input or made at a fixed level.
Error status	ECM incorporates the error status register, which can be used to confirm the error status from the error flag. The error flags are only cleared by the ECMSTATRES reset. Refer to **Section 9, Reset Controller** for details about the ECMSTATRES.
Debug, self-diagnosis	• Pseudo errors can be generated for debug and self-diagnosis. The operation during injection of pseudo errors is identical to that for the occurrence of real errors. All configurations for the mask to the error pin output, interrupt, or internal reset apply in the same way. • ECM incorporates a loop-back function of the error pin output that is used to diagnose the path to the error output pin. The status of the error output pin is reflected to an internal register and can be confirmed by reading the register.
Timeout function	ECM incorporates a function that generates an error signal output or internal reset when the count value of the delay timer matches with the delay timer compare register because the delay timer was not stopped during the interrupt processing after being started simultaneously with the occurrence of an interrupt request.

Table 48.2 Specification Overview (2/2)

Item	Description
Register protection	A write-protection with a special sequence is incorporated to protect registers from inadvertent write access.
Others	ECM is duplexed. ECM incorporates the error output pin.

48.1.2 Error Input

Table 48.3 shows the error input to ECM of RH850/D1L/D1M.

Table 48.3 List of Error Inputs (1/3)

No	Error Source	Unit	Initial Settings

45	Reserved	—	—	—	—	—	—	—
46	Reserved	—	—	—	—	—	—	—
47	Reserved	—	—	—	—	—	—	—

Note 1. If the port filter of the external non-maskable interrupt NMI is configured for level detection, the NMI must not be used to generate an FE level non-maskable interrupt.

Note 2. The error output signal of the Clock Monitor, that monitors the source clock of the CPU Subsystem clock C_ISO_CPUCLK must not be used to generate an FE level maskable or non-maskable interrupt, but an internal reset.
That means:
If PLL0CLK is the source clock of C_ISO_CPUCLK, the CLMA3 error output can only be used to generate an internal reset.
If PLL1CLK is the source clock of C_ISO_CPUCLK, the CLMA4 error output can only be used to generate an internal reset.

Note 3. If the error mask of INTVOCAERR is released an unintended error signal may be generated after DEEPSTOP mode. Refer to Section 40.5.1, Procedure for entering and resuming DEEPSTOP for detail.

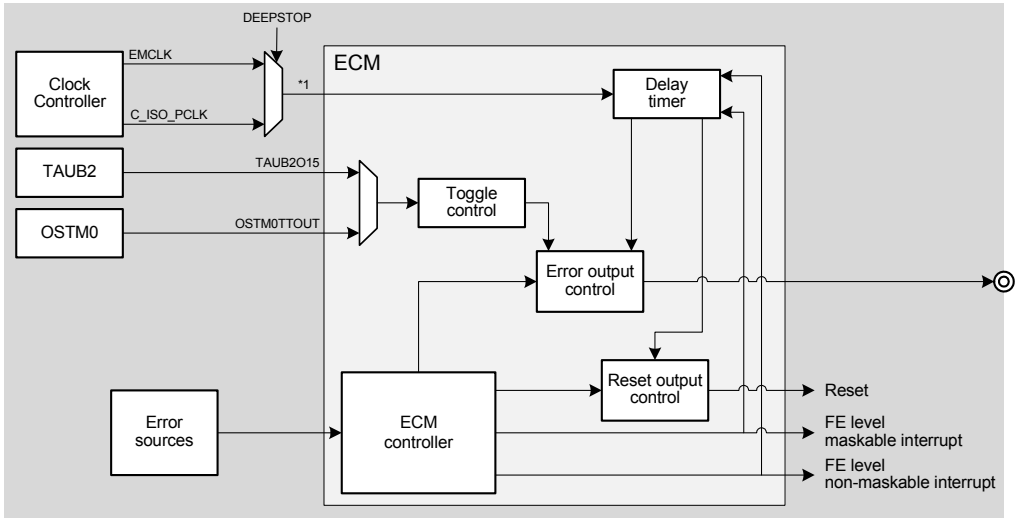
Note 4. If the error mask of INTCLMATIn (n = 1 to 6) is released an unintended error signal may be generated after DEEPSTOP mode. Refer to Section 12.7.7.1, ECM detects false error signals from CLMA at resuming DEEPSTOP for detail.

NOTE

OFF: This indicates that when an error occurs, an FE level maskable interrupt, FE level non-maskable interrupt, internal reset, or delay timer start is not generated, and the error mask is disabled.

ON: This indicates that when an error occurs, an FE level maskable interrupt, FE level non-maskable interrupt, internal reset, or delay timer start is generated, and the error mask is enabled.

48.1.3 Error Control Module Block Diagram



Note 1. In normal operation mode the delay time is supplied with the C_ISO_PCLK clock. In DEEPSTOP mode, the delay timer clock changes automatically to EMCLK.

Figure 48.1 Error Control Module block diagram

48.1.4 Operations for Error Output

All error sources can be configured to assert the external error output signal $\overline{\text{ERROROUT}}$, which is used to alert externally connected device.

The behaviour of the external error signal upon an error occurrence can be selected:

- Non-dynamic mode
  The error signal is asserted and keeps this level.
- Dynamic mode
  The error signal level toggles, i.e. a pulse signal is generated. The toggle frequency is determined by the Timer Array Unit B TAUB2 channel 15 or the OS Timer OSTM0 output.
- Error output signal set/reset by software
  The error output signal can be set active/inactive by the software.

After reset release, the $\overline{\text{ERROROUT}}$ pin outputs the low (error) level. Follow the procedure described in Section 48.2.3, ECM Master/Checker Error Clear Trigger Register (ECMmECLR, m = M/C), to clear the error before using ECM.

The error output can be configured for two different modes of operation, non-dynamic or dynamic.

Error Status ECMmSSE031 to ECMmSSE000 ECMmSSE115 to ECMmSSE100	Operating Mode ECMSL0 Bit	Error Output Operating Mode	Error Output Level	Error Status
0	0	Non-dynamic	H	No error
	1	Dynamic	Toggles (according to timer input)	No error
1	0	Non-dynamic	L	Error
	1	Dynamic	L	Error

48.1.4.1 Dynamic Mode Enable

1. Select the timer output by the ECMEPCTL register (see Section 48.2.29, ECM Error Pulse Control Register (ECMEPCTL).
2. Initialize OSTM0/TAUB2 channel 15.
3. Set the error output to high level by setting the ECMmECT (m = M/C) bit in the ECM master/checker error clear trigger register to 1.
4. Set the ECMSL0 bit in the ECM error pulse configuration register to 1 to specify dynamic mode.
5. Start up OSTM0/TAUB2 channel 15.

48.1.4.2 Dynamic Mode Disable

1. Set the error output to low level by setting the ECMmEST bit (m = M/C) in the ECM master/checker error clear trigger register to 1.
2. Stop OSTM0/TAUB2 channel 15.
3. Clear the ECMSL0 bit in the ECM error pulse configuration register to 0 to specify non-dynamic mode.

48.1.5 Delay timer

By use of a delay timer the assertion of the error output and reset signals can be delayed after the occurrence of an error event has generated a maskable or non-maskable interrupt.

After overflow of the programmable delay time the error output and the reset signals are asserted and stays active until it is de-asserted by the software.

This way the software has some time to recover from the error without notifying the error to external.

48.1.6 Loop-Back Function

ECM incorporates a loop-back function that is used to check the path to the error output pin. The output level of the error output pin can be checked with the ECMmSSE131 bit (m = M/C) in the ECM master/checker error source status register 1.

48.1.7 Pseudo Error Generation

ECM incorporates a function that can generate pseudo errors for test or debug purposes. The operation of the ECM during injection of pseudo errors is identical to that for the occurrence of real errors. All configurations for error masks, interrupt, internal reset, or delay timer apply in the same way.

48.1.8 Error Status

The error status is indicated by ECM master/checker error source status register 0 and ECM master/checker error source status register 1.
The error status is only cleared by the application program (write to ECMESSTC0 and ECMESSTC1 register) or by the ECMSTATRES signal (see Section 9, Reset Controller).
In case of any other reset, the error status is kept and the error of the reset source can be confirmed by reading the ECM master/checker error source status register 0 and ECM master/checker error source status register 1 after reset release.

48.1.9 Writing to Protected Registers

Write protected registers are protected from inadvertent write access due to erroneous program execution, etc.

48.1.9.1 Protection Unlock Sequence

Write access to a write protected register is only possible within the following sequence.

1. Write the fixed value 0000 $00A5_H$ to the ECM protection command register or ECM master/checker protection command register.
2. Write the desired value to the ECM register.
3. Write the inversion of desired value to the ECM register.
4. Write the desired value to the ECM register.
5. Check successful write of the desired value to the protected register by checking that the ECMPRERR bit of the ECM protection status register is 0.

In case of any access to another register between step 1 to step 4 of the above sequence, the protection mechanism behaves as follows.

- If that register belongs to ECM, the write to the protected register fails (the ECMPRERR bit of the ECM protection status register becomes 1). The sequence has to be reexecuted from step 1.
- If that register does not belong to ECM, the sequence is not disrupted and the write to the protected register is conducted successfully.

For details, refer to Section 4, Write-Protected Registers.

48.1.10 Timeout Function for Interrupt Processing

The delay timer incorporated to ECM can be started simultaneously with the occurrence of an interrupt request. ECM incorporates a function that generates an error signal output or internal reset when the count value of the delay timer matches with the value of the delay timer compare register because the delay timer was not stopped during the interrupt processing. The timer counting is not stopped when a break occurs.

The counting of the delay timer always starts from 0. Configure the duration until an internal reset or error output is generated with the settings of the delay timer compare register.

The clock supply of the delay timer depends on the operation mode:

- in normal operation mode: C_ISO_PCLK
- in DEEPSTOP mode: EMCLK

48.1.11 ECM Master - Checker operation

The figure below shows, how the separate output signals of the ECM Master and Checker are generating the ECM output signals.

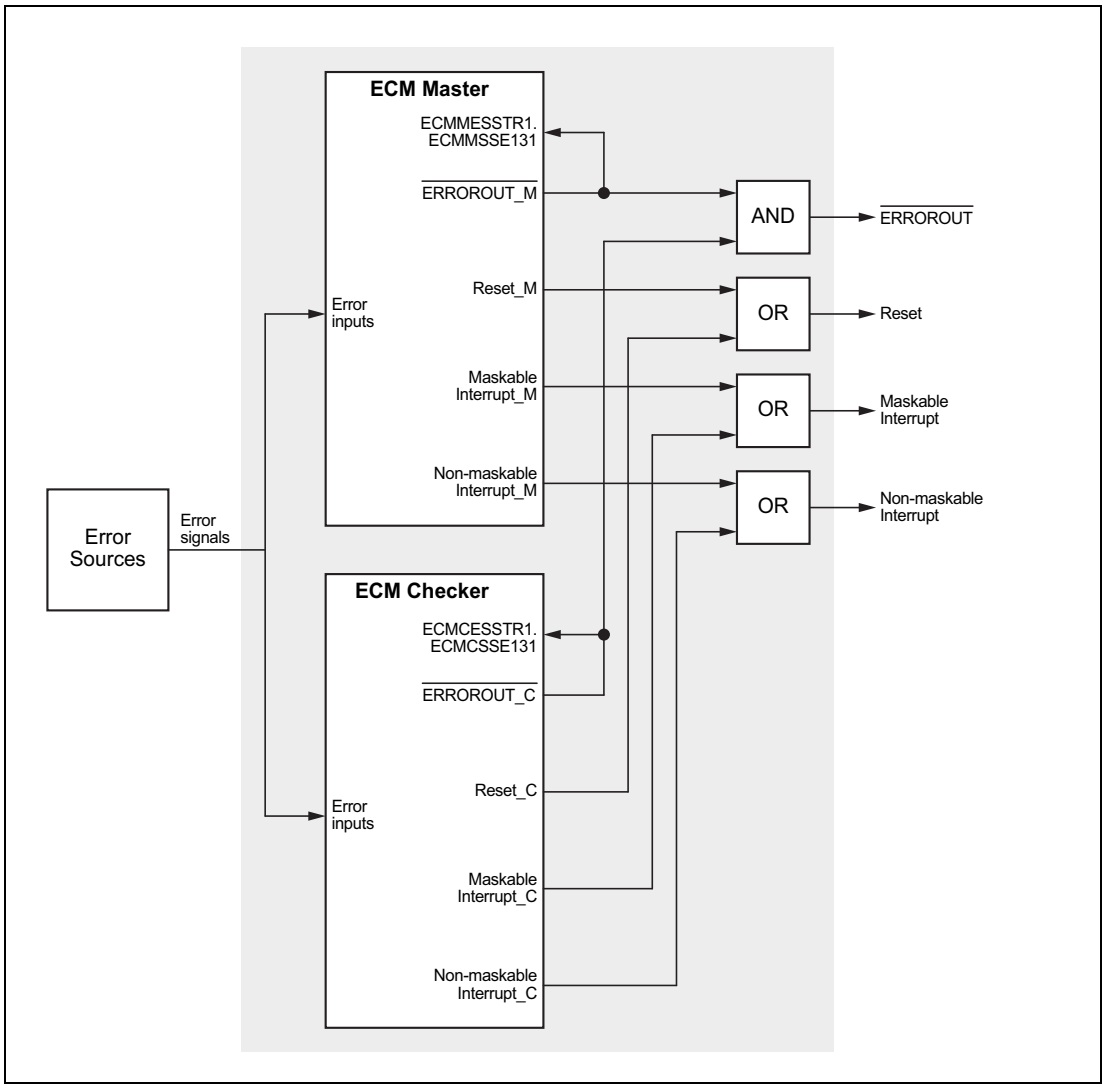


Figure 48.2 ECM Master - Checker operation

48.2 Register Specification

NOTE

The bits in registers, which refer to certain error input signals, may not all be available.

Refer to the “No” column in Table 48.3, List of Error Inputs to check which bits in those registers are available.

48.2.1 List of Registers

ECM consists of three address areas: common part, ECM master, and ECM checker.

The following shows the register map of the ECM master registers.

Table 48.4 Address List of ECM Master Registers

<ECMM_base: FFCB 0000$_H$>

Register Symbol	Register Name	R/W	Initial Value	Protection by Sequence	Address
ECMMESET	ECM master error set trigger register	W	00_H	Protected	<ECMM_base>
ECMMECLR	ECM master error clear trigger register	W	00_H	Protected	<ECMM_base> + 04_H
ECMMESSTR0	ECM master error source status register 0	R	0000 0000_H	Not protected	<ECMM_base> + 08_H
ECMMESSTR1	ECM master error source status register 1	R	0000 0000_H	Not protected	<ECMM_base> + $0C_H$
ECMMPCMD0	ECM master protection command register	W	Undefined	Not protected	<ECMM_base> + 10_H

The following shows the register map of the ECM checker registers.

Table 48.5 Address List of ECM Checker Registers

<ECMC_base: FFCB 1000$_H$>

Register Symbol	Register Name	R/W	Initial Value	Protection by Sequence	Address
ECMCESET	ECM checker error set trigger register	W	00_H	Protected	<ECMC_base>
ECMCECLR	ECM checker error clear trigger register	W	00_H	Protected	<ECMC_base> + 04_H
ECMCESSTR0	ECM checker error source status register 0	R	0000 0000_H	Not protected	<ECMC_base> + 08_H
ECMCESSTR1	ECM checker error source status register 1	R	0000 0000_H	Not protected	<ECMC_base> + $0C_H$
ECMCPCMD0	ECM checker protection command register	W	Undefined	Not protected	<ECMC_base> + 10_H

The following shows the register map of the ECM common part.

Table 48.6 Address List of ECM Registers

<ECM_base: FFCB 2000$_H$>

Register Symbol	Register Name	R/W	Initial Value	Protection by Sequence	Address
ECMEPCFG	ECM error pulse configuration register	R/W	00_H	Protected	<ECM_base>
ECMMICFG0	ECM maskable interrupt configuration register 0	R/W	$0000\ 0000_H$	Protected	<ECM_base> + 04_H
ECMMICFG1	ECM maskable interrupt configuration register 1	R/W	$0000\ 0000_H$	Protected	<ECM_base> + 08_H

ECMEPCTL	ECM error pulse control register	R/W	00_H	Not protected	FFC0 $600C_H$

The ECM registers are the register areas common to the redundancy area to be implemented. Writes to the common register areas are conducted simultaneously. The common area for ECM master is read by reading access to the common area. The ECM master register and the ECM checker register represent the address areas which can be written separately.

48.2.2 ECM Master/Checker Error Set Trigger Register (ECMmESET, m = M/C)

The ECM master/checker error set trigger register is for setting the error signal from the error pin to the low level. When the ECMmEST bit is set to 1, the error pin immediately outputs the low level. The output cannot be masked. You have to follow a predetermined sequence for writing data to this register. Refer to Section 48.1.9, Writing to Protected Registers, for the details of the write protection sequence. This register is always read as 00_H.

Access: This register can be written in 8-bit units.

Address: <ECMM_base>
<ECMC_base>

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECMmEST
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 48.7 ECMmESET register contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When written, write the value after reset.
0	ECMmEST	Error set trigger bit 0: Writing 0 is invalid 1: Set the output level from the error pin to the active (low) level.

CAUTIONS

Setting or clearing the error output from the error pin via the ECMmESET or ECMmECLR register will set the ECMmSSE105 bit of the ECMmESSTR1 register (ECM compare error). Therefore, the ECMmESET or ECMmECLR register has to be set following the sequence below.

1. Set the ECMEMK105 bit of the ECMEMK1 register to “masked”.
2. Prevent the generation of interrupts by setting the ECMNMIE105 bit of the ECMNMICFG1 and the ECMMIE105 bit of the ECMMICFG1 register to “prohibited”.
3. Prevent generation of an internal reset by setting the ECMIRE105 bit of the ECMIRCFG1 register to “prohibited”.
4. Set or clear the error output bit in the ECMmESET or ECMmECLR register.
5. Clear error flags by setting the ECMCLSSE105 bit of the ECMESSTC1 register.
6. Make the following settings in accord with the condition of usage for the ECM compare error.
   - If an error is being output from the error pin, set the ECMEMK105 bit of the ECMEMK1 register to “not masked”.
   - If an interrupt is being enabled, set the ECMMIE105 bit of the ECMMICFG1 and the ECMNMIE105 bit of the ECMNMICFG1 register to “enabled”.
   - If an internal reset is being enabled, set the ECMIRE105 bit of the ECMIRCFG1 register to “enabled”.

48.2.3 ECM Master/Checker Error Clear Trigger Register (ECMmECLR, m = M/C)

The ECM master/checker error clear trigger register is for setting the error signal from the error pin to the high level (toggle). When the ECMmECT bit is set to 1, the error pin immediately outputs the high level (toggle) as long as there are no other sources that set the error pin to the low level. You have to follow a predetermined sequence for writing data to this register. Refer to Section 48.1.9, Writing to Protected Registers, for the details of the write protection sequence. This register is always read as 00_H.

Access: This register can be written in 8-bit units.

Address: <ECMM_base> + 04_H
<ECMC_base> + 04_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECMmECT
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 48.8 ECMmECLR register contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When written, write the value after reset.
0	ECMmECT	Error clear trigger bit 0: Writing 0 is invalid 1: Set the output level from the error pin to the inactive (high) level.

CAUTIONS

Clearing of the error pin is only possible if all errors, not masked by ECMEMK0/1, are cleared beforehand.

Setting or clearing the error output via the ECMmECLR or ECMmESET register will generate the error. Therefore, the following has to be set in advance.

1. Set the ECMEMK105 (ECM compare error) bit of the ECMEMK1 register to “masked”.
2. Disable interrupts by setting the ECMMIE105 bit of the ECMMICFG1 and the ECMNMIE105 bit of the ECMNMICFG1 register to “disabled”.
3. Disable an internal reset by setting the ECMIRE105 bit of the ECMIRCFG1 register to “disabled”.
4. Set or clear error flags by setting the ECMmECLR or ECMmESET (m = M/C) register.
5. Clear error flags by setting the ECMCLSSE105 bit of the ECMESSTC1 register.

48.2.4 ECM Master/Checker Error Source Status Register 0 (ECMmESSTR0, m = M/C)

The ECM master/checker error source status register 0 is a read-only register.

The error status is only cleared by the application program (write to ECMESSTC0 and ECMESSTC1 register) or by the ECMSTATRES signal (see Section 9, Reset Controller).
In case of any other reset, the error status is kept and the error of the reset source can be confirmed by reading the ECM master/checker error source status register 0 and ECM master/checker error source status register 1 after reset release.

Access: This register can be read in 32-bit units.

Address: <ECMM_base> + 08_H
<ECMC_base> + 08_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 0	ECMmSSE031 to ECMmSSE000	Error source status bit ECMmSSE031 to ECMmSSE000 correspond to error sources 31 to 0. 0: Error not occurred 1: Error occurred

48.2.5 ECM Master/Checker Error Source Status Register 1 (ECMmESSTR1, m = M/C)

The ECM master/checker error source status register 1 is a read-only register.

This register represents the status of individual internal error sources, which is irrelevant to the setting of the error mask. The status can be cleared only by software and a pin reset. An internal reset will not affect this register.

Access: This register can be read in 32-bit units.

Address: <ECMM_base> + $0C_H$
<ECMC_base> + $0C_H$

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 48.10 ECMmESSTR1 register contents

Bit Position	Bit Name	Function
31	ECMmSSE131	Indicates the error output loopback status. 0: Error output ($\overline{\text{ERROROUT}}$) is the low level. 1: Error output ($\overline{\text{ERROROUT}}$) is the high level.
30	ECMmSSE130	Indicates the ECMmESET write status. 0: No error 1: Error is set by the ECMmEST bit of the ECMmESET register
29	ECMmSSE129	Indicates whether delay timer overflow has occurred. 0: Delay timer overflow not occurred 1: Delay timer overflow occurred
28 to 16	Reserved	When read, the value after reset is read.
15 to 0	ECMmSSE115 to ECMmSSE100	Error source status bit ECMmSSE115 to ECMmSSE100 correspond to error sources 47 to 32. 0: Error not occurred 1: Error occurred

48.2.6 ECM Master/Checker Protection Command Register (ECMmPCMD0, m = M/C)

The ECM master/checker protection command register is a write-only register and can be written in 32-bit units. Refer to Section 48.2.1, List of Registers, for the protected registers.

Refer to Section 48.1.9, Writing to Protected Registers, for the details of the write protection sequence. The initial value is undefined.

Access: This register can be written in 32-bit units.

Address: <ECMM_base> + 10_H
<ECMC_base> + 10_H

Initial value: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 48.11 ECMmPCMD0 register contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When written, write the value after reset.
7 to 0	ECMmREG0[7:0]	Protection command that enables writing to write protected ECMm registers.

48.2.7 ECM Error Pulse Configuration Register (ECMEPCFG)

The ECM error pulse configuration register is a read/write register.

You have to follow a predetermined sequence for writing data to this register. Refer to Section 48.1.9, Writing to Protected Registers for the details of the write protection sequence.

Access: This register can be read/written in 8-bit units.

Address: <ECM_base>

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECMSL0
Initial value	0	0	0	0	0	0	0	0

7 to 1	Reserved	When read, the value after reset is read. When written, write the value after reset.
0	ECMSL0	Error pin operation configuration bit Error output operation setting for the error pin 0: Non-dynamic mode 1: Dynamic mode

48.2.8 ECM FE level maskable Interrupt Configuration Register 0 (ECMMICFG0)

The ECM FE level maskable interrupt configuration register 0 is used to set the generation of the ECMTI interrupts (FEINT: FE level maskable interrupts). The generation of FE level maskable interrupts in response to errors is selectable.

You have to follow a predetermined sequence for writing data to this register. Refer to Section 48.1.9, Writing to Protected Registers for the details of the write protection sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 04_H

Initial value: $0000\ 0000_H$

Table 48.17 ECMIRCFG0 register contents

Bit Position	Bit Name	Function
31 to 0	ECMIRE031 to ECMIRE000	ECM internal reset generation control bit ECMIRE031 to ECMIRE000 correspond to error sources 31 to 0. 0: Internal reset generation disabled 1: Internal reset generation enabled

48.2.13 ECM Internal Reset Configuration Register 1 (ECMIRCFG1)

The ECM internal reset configuration register 1 is used to set the generation of internal resets in response to internal errors.

You have to follow a predetermined sequence for writing data to this register. Refer to Section 48.1.9, Writing to Protected Registers for the details of the write protection sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 18_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 48.18 ECMIRCFG1 register contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is read. When written, write the value after reset.
29	ECMIRE129	ECM internal reset control bit Corresponds to delay timer overflow. 0: Internal reset generation disabled 1: Internal reset generation enabled
28 to 16	Reserved	When read, the value after reset is read. When written, write the value after reset.
15 to 0	ECMIRE115 to ECMIRE100	ECM internal reset generation control bit ECMIRE115 to ECMIRE100 correspond to error sources 47 to 32. 0: Internal reset generation disabled 1: Internal reset generation enabled

48.2.14 ECM Error Mask Register 0 (ECMEMK0)

The ECM error mask register 0 is used to mask the individual error sources of the error pin output.

You have to follow a predetermined sequence for writing data to this register. Refer to Section 48.1.9, Writing to Protected Registers for the details of the write protection sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + $1C_H$

Initial value: $0000\ 0000_H$

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is read. When written, write the value after reset.
29	ECMEMK129	ECM error output signal mask control bit. 0: Error signal output not masked 1: Error signal output masked
28 to 16	Reserved	When read, the value after reset is read. When written, write the value after reset.
15 to 0	ECMEMK115 to ECMEMK100	ECM error output signal mask control bit ECMEMK115 to ECMEMK100 correspond to error sources 47 to 32. 0: Error signal output not masked 1: Error signal output masked

48.2.16 ECM Error Source Status Clear Trigger Register 0 (ECMESSTC0)

The ECM error source status clear trigger register 0 is a write-only register and can be written in 32-bit units. This register is used to clear the individual error source status of the ECM master/checker error source status register 0. Both the error status of the ECM master and the ECM checker are cleared simultaneously.

You have to follow a predetermined sequence for writing data to this register. Refer to Section 48.1.9, Writing to Protected Registers for the details of the write protection sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + 24_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

48.2.17 ECM Error Source Status Clear Trigger Register 1 (ECMESSTC1)

The ECM error source status clear trigger register 1 is a write-only register and can be written in 32-bit units. This register is used to clear the individual error source status of the ECM master/checker error source status register 1. Both the error status of the ECM master and the ECM checker are cleared simultaneously.

You have to follow a predetermined sequence for writing data to this register. Refer to Section 48.1.9, Writing to Protected Registers for the details of the write protection sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + 28_H

Initial value: $0000\ 0000_H$

Table 48.22 ECMESSTC1 register contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is read. When written, write the value after reset.
30, 29	ECMCLSSE130, ECMCLSSE129	ECM error status clear bit ECMCLSSE130, ECMCLSSE129 corresponds to ECMmSSE130, ECMmSSE129. 0: Error status unchanged 1: Error status cleared
28 to 16	Reserved	When read, the value after reset is read. When written, write the value after reset.
15 to 0	ECMCLSSE115 to ECMCLSSE100	ECM error status clear bit ECMCLSSE115 to ECMCLSSE100 correspond to ECMMSSE115 to ECMMSSE100. 0: Corresponding error status unchanged 1: Corresponding error status cleared

48.2.18 ECM Protection Command Register (ECMPCMD1)

The ECM protection command register is a write-only register and can be written in 32-bit units. Refer to Section 48.2.1, List of Registers, for the protected registers. Refer to Section 48.1.9, Writing to Protected Registers, for the details of the write protection sequence. The initial value is undefined.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + $2C_H$

Initial value: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value	Undefined															
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 48.23 ECMPCMD1 register contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When written, write the value after reset.
7 to 0	ECMREG1[7:0]	Protection command that enables writing to write protected ECM registers.

48.2.19 ECM Protection Status Register (ECMPS)

The ECM protection status register is a read-only register. This register is used to verify the write protected register has been written successfully or not. Refer to Section 48.1.9, Writing to Protected Registers.

Access: This register can be read in 8-bit units.

Address: <ECM_base> + 30_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECMPRERR
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 48.24 ECMPS register contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When written, write the value after reset.
0	ECMPRERR	ECM protection status bit Indicates whether writing to a write protected register failed or was successful. 0: Writing was successfully completed. 1: Writing failed

48.2.20 ECM Pseudo Error Trigger Register 0 (ECMPE0)

The ECM pseudo error trigger register 0 is a write-only register. This register is used to generate a pseudo error for test purposes. The ECM operation in response to the generation of a pseudo error is identical to that in response to a real error source.

You have to follow a predetermined sequence for writing data to this register. Refer to Section 48.1.9, Writing to Protected Registers for the details of the write protection sequence.

Access: This register can be written in 8-, 16-, or 32-bit units.

Address: <ECM_base> + 34_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 48.25 ECMPE0 register contents

Bit Position	Bit Name	Function
31 to 0	ECMPE031 to ECMPE000	ECM pseudo error trigger bit ECMPE031 to ECMPE000 correspond to error sources 31 to 0. 0: Pseudo error not generated 1: Generates corresponding pseudo error generated

48.2.21 ECM Pseudo Error Trigger Register 1 (ECMPE1)

The ECM pseudo error trigger register 1 is a write-only register. This register is used to generate a pseudo error for test purposes. The ECM operation in response to the generation of a pseudo error is identical to that in response to a real error source.

You have to follow a predetermined sequence for writing data to this register. Refer to Section 48.1.9, Writing to Protected Registers for the details of the write protection sequence.

Access: This register can be written in 8-, 16-, or 32-bit units.

Address: <ECM_base> + 38_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	ECMPE129	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 48.26 ECMPE1 register contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is read. When written, write the value after reset.
29	ECMPE129	ECM pseudo error trigger bit Corresponds to delay timer overflow. 0: Pseudo error not generated 1: Generates corresponding pseudo error
28 to 16	Reserved	When read, the value after reset is read. When written, write the value after reset.
15 to 0	ECMPE115 to ECMPE100	ECM pseudo error trigger bit ECMPE115 to ECMPE100 correspond to error sources 47 to 32. 0: Pseudo error not generated 1: Generates corresponding pseudo error

48.2.22 ECM Delay Timer Control Register (ECMDTMCTL)

The ECM delay timer control register is a read/write register. This register is used to control the delay timer.

You have to follow a predetermined sequence for writing data to this register. Refer to Section 48.1.9, Writing to Protected Registers for the details of the write protection sequence.

Access: This register can be read/written in 8-bit units.

Address: <ECM_base> + $3C_H$

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ECMSTP	ECMSTA
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	R/W

Table 48.27 ECMDTMCTL register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When written, write the value after reset.
1	ECMSTP	Delay timer stop bit Writing 1 to this bit initializes the ECM delay timer register, causing the delay timer to stop. Simultaneously, the ECMSTA bit is set to 0.
0	ECMSTA	Delay timer start bit Specifies the operation of the overflow timer when an interrupt is occurred. 0: Timer stops 1: Timer in operation

48.2.23 ECM Delay Timer Register (ECMDTMR)

The ECM delay timer register is a read-only register. The ECM delay timer register is initialized by setting the ECMSTA bit of the ECM delay timer control register from 1 (timer in operation) to 0 (timer stops). ECMDTMR register indicates the current count value of the ECM delay timer.

Access: This register can be read in 16-bit units.

Address: <ECM_base> + 40_H

Initial value: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECMDTMR[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

48.2.24 ECM Delay Timer Compare Register (ECMDTMCMP)

The ECM delay timer compare register is a read/write register. The ECMmSSE129 bit is set when this register matches with the value of the ECM delay timer register. Writing data to this register has to be conducted while the delay timer is stopped.

You have to follow a predetermined sequence for writing data to this register. Refer to Section 48.1.9, Writing to Protected Registers for the details of the write protection sequence.

Access: This register can be read/written in 16-bit units.

Address: <ECM_base> + 44_H

Initial value: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECMDTMCMP[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

48.2.25 ECM Delay Timer Configuration Register 0 (ECMDTMCFG0)

The ECM delay timer configuration register 0 is used to set enable/disable of the delay timer start caused by FE level maskable interrupts in response to errors.

You have to follow a predetermined sequence for writing data to this register. Refer to Section 48.1.9, Writing to Protected Registers for the details of the write protection sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 48_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 48.28 ECMDTMCFG0 register contents

Bit Position	Bit Name	Function
31 to 0	ECMTE031 to ECMTE000	ECM delay timer start control bit ECMTE031 to ECMTE000 correspond to FE level maskable interrupts generated by error sources 31 to 0. 0: Delay timer start disabled 1: Delay timer start enabled

48.2.26 ECM Delay Timer Configuration Register 1 (ECMDTMCFG1)

The ECM delay timer configuration register 1 is used to set enable/disable of the delay timer start caused by FE level maskable interrupts in response to errors.

You have to follow a predetermined sequence for writing data to this register. Refer to Section 48.1.9, Writing to Protected Registers for the details of the write protection sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + $4C_H$

Initial value: $0000\ 0000_H$

48.2.27 ECM Delay Timer Configuration Register 2 (ECMDTMCFG2)

The ECM delay timer configuration register 2 is used to set enable/disable of the delay timer start caused by FE level non-maskable interrupts in response to errors.

You have to follow a predetermined sequence for writing data to this register. Refer to Section 48.1.9, Writing to Protected Registers for the details of the write protection sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 50_H

Initial value: 0000 0000_H

48.2.28 ECM Delay Timer Configuration Register 3 (ECMDTMCFG3)

The ECM delay timer configuration register 3 is a read/write register and can be written in 8-bit units. This register is used to set enable/disable of the delay timer start caused by FE level non-maskable interrupts in response to errors.

You have to follow a predetermined sequence for writing data to this register. Refer to Section 48.1.9, Writing to Protected Registers for the details of the write protection sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 54_H

Initial value: $0000\ 0000_H$

Section 49 Data CRC (DCRA)

This section contains a generic description of the data CRC function A (DCRA).

The first part in this section describes the RH850/D1L/D1Mspecific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of the DCRA.

49.1 Features of RH850/D1L/D1M DCRA

49.1.1 Number of Units

This microcontroller has the following number of DCRA units.

Table 49.1 Number of Units

Product Name	All products
Number of Units	1
Name	DCRAn (n = 0)

49.1.2 Register Base Address

DCRAn base addresses are listed in the following table.

DCRAn register addresses are given as offsets from the base addresses.

Table 49.2 Register Base Address

Base Address Name	Base Address
<DCRA0_base>	FFF7 0000_H

49.1.3 Clock Supply

The DCRAn clock supply is shown in the following table.

Table 49.3 Clock Supply

Unit Name	Unit Clock Name	Clock Supply Name
DCRAn	PCLK	C_ISO_PCLK

49.1.4 Reset Sources

DCRAn reset sources are listed in the following table. DCRAn is initialized by these reset sources.

Table 49.4 Reset Sources

Unit Name	Reset Source
DCRAn	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

49.2 Overview

49.2.1 Functional Overview

The data CRC function A can be used to verify or generate CRC protected data streams of arbitrary length and different bit widths.

- 32-bit Ethernet CRC
  $(X^{32}+X^{26}+X^{23}+X^{22}+X^{16}+X^{12}+X^{11}+X^{10}+X^{8}+X^{7}+X^{5}+X^{4}+X^{2}+X^{1}+1)$
- 16-bit CCITT CRC
  $(X^{16}+X^{12}+X^{5}+1)$
- CRC of an arbitrary data block length can be generated.
- After initialization of the CRC data register, every write access to the CRC input register generates a new CRC according to the selected polynomial, and the result is stored in the CRC data register.
- DCRA calculates CRC from least significant byte (LSB) to most significant byte (MSB).

49.2.2 Block Diagram

The following picture shows the block diagram of the data CRC function A.

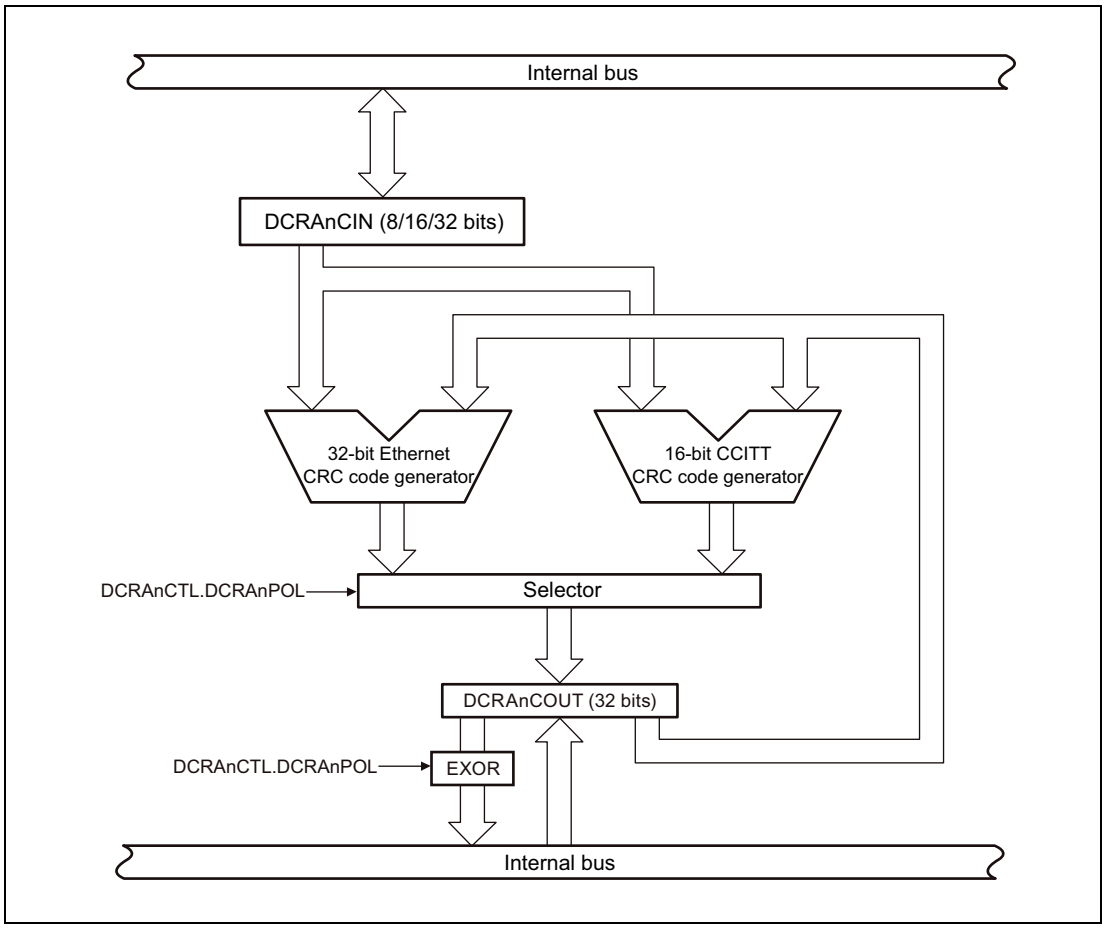

Figure 49.1 Block Diagram of Data CRC Function A

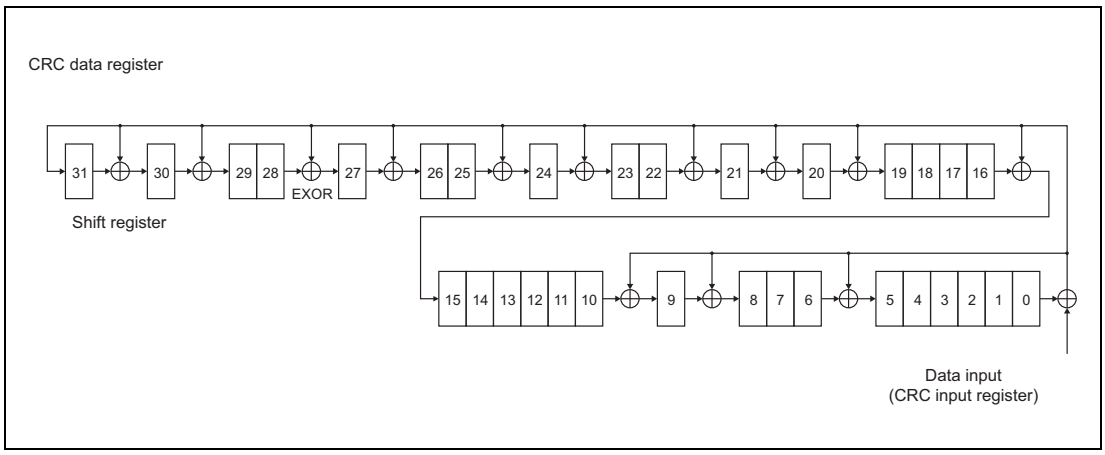
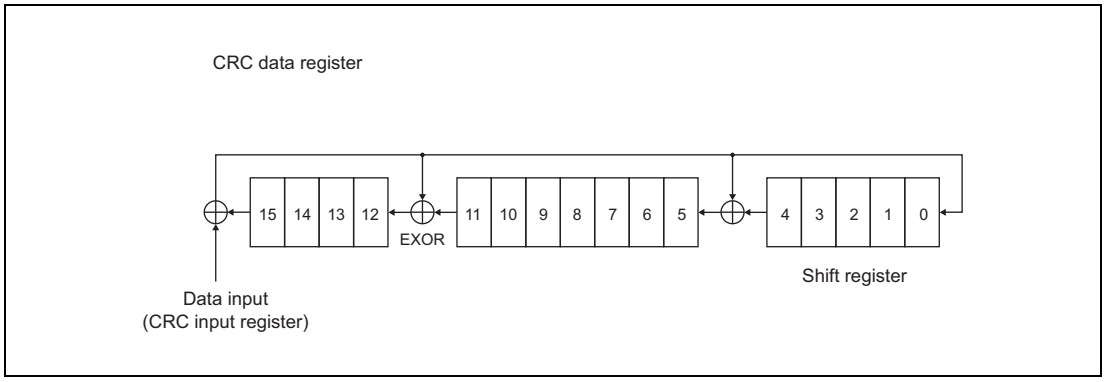
49.2.3 Operational Circuit

- 32-bit Ethernet



- 16-bit CCITT



49.3 Registers

49.3.1 List of Registers

DCRA registers are listed in the following table.

Table 49.5 List of Registers

Module Name	Register Name	Symbol	Address
DCRAn	CRC input register	DCRAnCIN	<DCRAn_base> + 00_H
DCRAn	CRC data register	DCRAnCOUT	<DCRAn_base> + 04_H
DCRAn	CRC control register	DCRAnCTL	<DCRAn_base> + 20_H

49.3.2 DCRAnCIN — CRC Input Register

This register holds the input data for CRC calculation. The effective bit width used for CRC calculation must be set by DCRAnCTL.DCRAnISZ[1:0].

When data is written to this register, the CRC code is generated.

The CRC calculation is immediately started after the DCRAnCIN register is written. The DCRAnCOUT register must be initialized with the initial starting value, before the first data of the data block is written to DCRAnCIN register.

Access: This register can be read/written in 32-bit units.

Address: <DCRAn_base>

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCRAnCIN[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCRAnCIN[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 49.6 DCRAnCIN Register Contents

Bit Position	Bit Name	Function
31 to 0	DCRAnCIN [31:0]	Input Data for CRC Calculation The valid bits are: • For 32 bit effective bit width: DCRAnCIN[31:0] • For 16 bit effective bit width: DCRAnCIN[15:0] • For 8 bit effective bit width: DCRAnCIN[7:0]

49.3.3 DCRAnCOUT — CRC Data Register

This register stores the result of the CRC code generated by the 32-bit Ethernet polynomial or the 16-bit CCITT polynomial.

Access: This register can be read/written in 32-bit units.

Address: <DCRAn_base> + 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCRAnCOUT[31:16]															
Value after reset *1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCRAnCOUT[15:0]															
Value after reset *1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The read value after reset is 0000 0000_H since the 32-bit Ethernet CRC polynomial is selected as the CRC generating function after reset.

Table 49.7 DCRAnCOUT Register Contents

Bit Position	Bit Name	Function
31 to 0	DCRAnCOUT [31:0]	Result of the CRC Code Generation When the 16-bit CCITT polynomial is enabled, the bits 15 to 0 show the CRC result. The bits 31 to 16 are undefined. The read value of this register is a value obtained by performing EXOR calculation for the following value: • For 32-bit Ethernet polynomial: FFFF $FFFF_H$ • For 16-bit CCITT polynomial: 0000_H For example, when DCRAnCOUT = 5555 5555_H for the 32-bit Ethernet polynomial, AAAA $AAAA_H$ is read.

CAUTION

This register must initialized by setting the initial start value before the first data of the data block is written to DCRAnCIN register.

49.3.4 DCRAnCTL — CRC Control Register

This register controls the CRC generation process.

Access: This register can be read/written in 8-bit units.

Address: <DCRAn_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	DCRAnISZ[1:0]		DCRAnPOL
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 49.8 DCRAnCTL Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2, 1	DCRAnISZ[1:0]	Specifies the CRC input bit width: 00: 32 bits (DCRAnCIN[31:0]) 01: 16 bits (DCRAnCIN[15:0]) 10: 8 bits (DCRAnCIN[7:0]) 11: Setting prohibited
0	DCRAnPOL	Specifies the CRC generation method: 0: 32-bit Ethernet CRC polynomial generation. The byte order of the DCRAnCIN register is LSB (least significant bit) first. This means that, if the input bit width is 8 bits (DCRAnISZ[1:0] = 10_B), bit positions 7 to 0 of the DCRAnCIN register contain the input data and bit position 0 (LSB) is the start bit of the input data. 1: 16-bit CCITT CRC polynomial generation. The byte order of the DCRAnCIN register is MSB (most significant bit) first. This means that, if the input bit width is 8 bits (DCRAnISZ[1:0] = 10_B), bit positions 7 to 0 of the DCRAnCIN register contain the input data and bit position 7 (MSB) is the start bit of the input data.

CAUTION

- If the CRC generation method (DCRAnCTL.DCRAnPOL) is changed, the DCRAnCOUT register must be initialized by setting the initial start value.
- The CRC bit width (DCRAnCTL.DCRAnISZ[1:0]) must be set according to the data block bit width. Changing the CRC bit width is not allowed during processing of a data block (a data block consists of N bytes, half-words or one word). After the final CRC result is read from DCRAnCOUT register, the bit width can be changed. In that case, the DCRAnCOUT register must be initialized with the initial start value.

49.4 Operation

The data CRC function A generates a CRC (cyclic redundancy check) of an arbitrary data block length. The data is forwarded to the data CRC function in 8-, 16- or 32-bit units. The CRC polynomial can either be selected for 32-bit Ethernet or 16-bit CCITT. The initial starting value must be set at the DCRAnCOUT register before the first write access to the CRC input register (DCRAnCIN) is performed.

The flowchart below shows the CRC generating procedure.

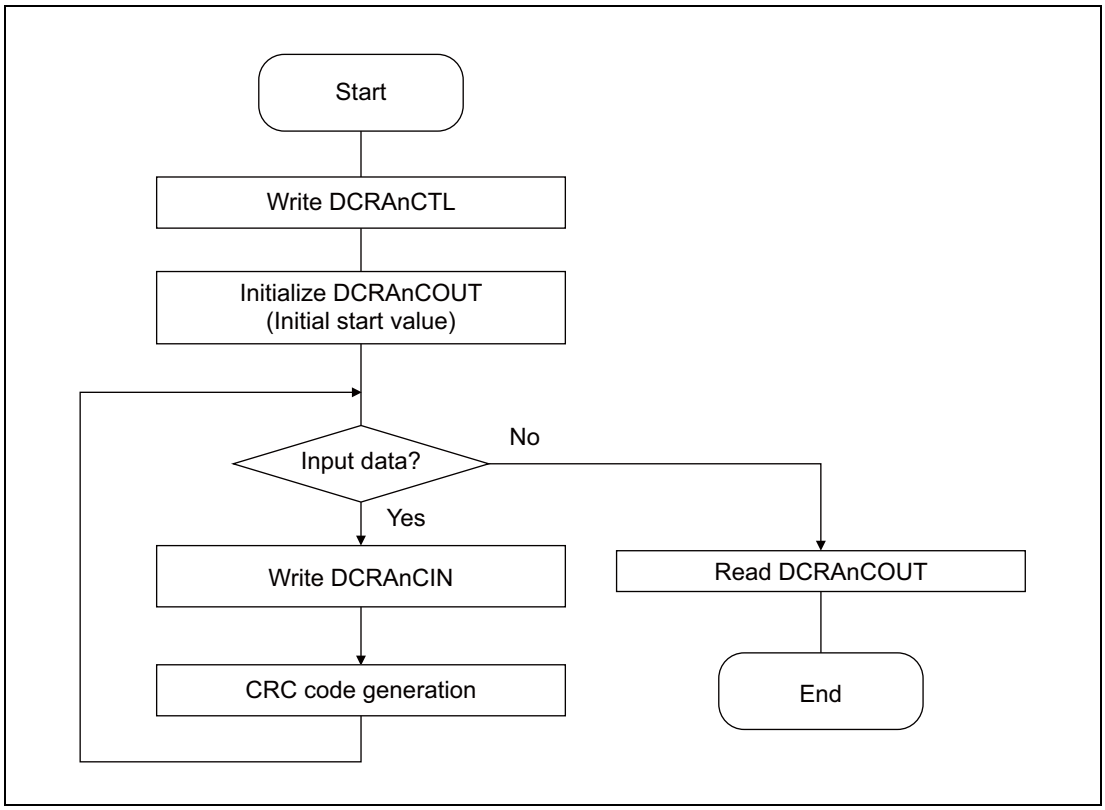


Figure 49.2 Flowchart of Data CRC Function A

NOTES

1. Before writing the first data to DCRAnCIN, the CRC output register DCRAnCOUT must be initialized with the initial start value.
2. DCRAnCOUT must be re-initialized by setting the initial start value when the polynomial is changed by changing DCRAnCTL.DCRAnPOL.
3. Setting example of the initial start values of the respective polynomials
   The following is the example of setting values.

Table 49.9 Setting Example of Initial Start Values (When Read at a Reset)

	Initial Start Value	EXOR Value	DCRAnCOUT Read Value
16-bit CCITT	XXXX $FFFF_H$	XXXX 0000_H	XXXX $FFFF_H$
32-bit Ethernet	$FFFF\ FFFF_H$	$FFFF\ FFFF_H$	$0000\ 0000_H$

Note: X: undefined

Section 50 Intelligent Cryptographic Unit (ICU-S2)

The contents of this section is available upon non-disclosure agreement.

For details, contact your local sales representatives.

Section 51 On-Chip Debug Unit (OCD)

This microcontroller has an on-chip debug function. By using the on-chip debug emulator, programs can be debugged with the microcontroller mounted in the target system.

The debug functions incorporated in this microcontroller conform to IEEE-ISTO 5001™-2003 Class 1, a Nexus debug interface standard.

CAUTION

The debug functions described in this section are supported by the microcontroller but whether they are usable depends on the debugger. For details on debugging, see the user's manual of the debugger.

51.1 Overview of RH850/D1L/D1M OCD

51.1.1 Channels

This microcontroller has the following number of channels of the OCD.

Table 51.1 Channels of OCD

	OCD
Number of channels	1
Name	OCD0

51.1.2 Interrupts

The On-Chip Debug Unit can generate the following interrupt request:

Table 51.2 OSTMn interrupt requests

OCDn signals	Connected to
Hot-attach interrupt	Interrupt Controller INTDCUTDI

51.2 Overview

The on-chip debug functions described below are supported by the microcontroller.

Whether they are usable depends on the specifications of the debugger being used.

For details on on-chip debug functions, see the user's manual of the debugger.

(1) Debug interface

This microcontroller supports as debug interfaces: NEXUS Interface, Low Pin Debug Interface (1-pin) - hereinafter called “LPD (1-pin)”, and Low Pin Debug Interface (4-pin) - hereinafter called “LPD (4-pin)”.

On-chip debug can be performed using these debug interfaces.

(2) Debug monitoring function

Debug-dedicated monitor program space is mounted and is used during debugging.

The basic debug functions below can be used by running a monitoring program.

- downloading the user-created program
- reading and writing the memory and registers
- running the user-created program starting at any address

(3) On-chip break

A maximum of 12 breakpoints can be specified to any execution address. Of the 12 breakpoints, a maximum of four breakpoints can be specified to any access (access address, access data).

(4) Software break

Software break points can be specified at any execution address.
Up to 2000 software break points can be added to any execution address in the code flash.
Note that the usage of software break points in the code flash area leads to re-programming.

(5) Peripheral Break

Peripheral Break is a function that stops peripheral modules when a debugger has stopped operation of the microcontroller.

During peripheral break, internal modules operate as follows.

a. Modules that stop unconditionally

Table 51.3 Modules with unconditional peripheral break

Module
Window Watchdog Timer A (WDTAn)

b. Modules that optionally support functions to stop or to continue

Table 51.4 Modules with optional peripheral break

Module	Control register bit	n
A/D Converter (ADCE)	ADCEnEMU.SVSDIS 0: STOP during break 1: continue during break	0
PWM Generators and Diagnostic (PWM-Diag)	PWBAnEMU.PWBAnSVSDIS 0: STOP during break 1: continue during break	0
OS Timer (OSTM)	OSTMnEMU.OSTMnSVSDIS 0: STOP during break 1: continue during break	0, 1
Always-On-Area Timer (AWOT)	AWOTnEMU.AWOTnSVSDIS 0: STOP during break 1: continue during break	0
Timer Array Unit B (TAUB)	TAUBnEMU.TAUBnSVSDIS 0: STOP during break 1: continue during break	0 to 2
Timer Array Unit J (TAUJ)	TAUJnEMU.TAUJnSVSDIS 0: STOP during break 1: continue during break	0
Real-Time Clock (RTCA)	RTCAnEMU.RTCAnSVSDIS 0: STOP during break 1: continue during break	0
Clocked Serial Interface G (CSIG)	CSIGnEMU.CSIGnSVSDIS 0: STOP during break 1: continue during break	0 to 3
Clocked Serial Interface H (CSIH)	CSIHnEMU.CSIHnSVSDIS 0: STOP during break 1: continue during break	4, 5
Sound Generator (SG)	SGnEMU.SGnSVSDIS 0: STOP during break 1: continue during break	0 to 4
PCM-PWM Converter (PCMP)	PCMPnEMU.PCMPnSVSDIS 0: STOP during break 1: continue during break	0
A/D Converter E (ADCE)	ADCEnEMU.ADCEnSVSDIS 0: STOP during break 1: continue during break	0
LCD Bus Interface (LCBI)	LCBInEMU.LCBInSVSDIS 0: STOP during break 1: continue during break	0
Stepper Motor Driver (ISM)	ISMnEMU.ISMnSVDIS 0: STOP during break 1: continue during break	0

CAUTION

For details on the registers, see the register description of the corresponding section.

c. Modules that stop when EPC.SVSTOP = 1

Table 51.5 Modules that stop when EPC.SVSTOP = 1

Module
LIN / UART Interface (RLIN3)
Serial Sound Interface (SSIF)

(6) Forced break

Execution of the user-created program can be interrupted forcibly.

(7) Forced reset

This device can be forcibly reset.

(8) Real time RAM monitoring (RRM)

The memory can be read during program execution. Because this read access uses debug-dedicated DMA, it has minimal effect on program execution.

(9) Dynamic memory modification (DMM)

The memory can be written during program execution. Because this write access uses debug-dedicated DMA, it has minimal effect on program execution.

(10) Timer function

Using a 32-bit counter, the time for running the user-created program can be measured based on the clock for debug.

For the measurement accuracy, see the user's manual of the debugger.

(11) Mask function

Masking the following factors are possible.

- All reset factors except for a POC reset and a wake-up reset

(12) Hot plug-in function

Debugging can be started in normal operating mode without external reset input.

NOTE

When the hot plug-in function is used in power save mode, the INTDCUTDI interrupt is required to return from power save mode as the wake-up handling.

(13) Security function

To prevent the contents of the flash memory from being read by an unauthorized person, a 128-bit ID code can be written to the microcontroller. If the code the user inputs when starting a debugger does not match the ID code written to the microcontroller, the flash memory cannot be accessed.

For details on how to set the ID code, see the user's manual of the debugger.

51.3 Registers

51.3.1 Peripheral Break Control

The peripheral break function generates a stop request to the peripheral modules of the microcontroller if the user-created program is stopped, for unit upon a breakpoint hit.

The peripheral modules stop their operation if all of the following conditions are met:

- Peripheral modules support the peripheral break function.
  (For the list of peripheral modules that support peripheral break, see **51.2** (5) Peripheral Break.)
- Peripheral break function is enabled in the peripheral modules.
  (For the setting of emulation registers each peripheral module has, see **51.2** (5) Peripheral Break.)
- Peripheral break function itself is enabled by setting EPC.SVSTOP = 1.
  (Refer to the EPC register description below.)

51.3.1.1 EPC — Emulation Peripheral Control Register

This register stops macros (timer, serial interface, and A/D converter) in debug mode (SVSTOP).

Access: Accessing from the user program is prohibited.

Address: —

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	SVSTOP	—	—	—	—	—	—
Initial value	0*1	0	0	0	0	0	0	0
R/W	—	—	—	—	—	—	—	—

Note 1. When accessed from debugger, this bit is read as 1.

Table 51.6 EPC register contents

Bit Position	Bit Name	Function
7	Reserved	—
6	SVSTOP	Stops operation of macros (timer, serial interface, and A/D converter) during debugging. 0: Does not stop operation 1: Stops operation
5 to 0	Reserved	—

NOTES

1. EPC is set by the debugger. Setting by the user program is prohibited. For the setting of the debugger, see the user's manual of the debugger.
2. In the header files the module name of the above register is defined as: SYSCTRL.

51.3.2 Temporary On-Chip Debug enable

On-Chip debugging can be temporarily enabled in normal operation mode, i.e. by the user's software.

51.3.2.1 IDMODI — On-Chip Debug Control Register

This register allows to enable/disable On-Chip Debugging in normal operation mode.

Access: This register can be written in 32-bit units.
Writing to this register is protected by a special sequence of instructions by using the protection command register PROTCMDIDMODI. For details, refer to Section 4, Write-Protected Registers.

Address: FFC0 6030_H

Initial value: 0000 0000_H

1	IDEN	Enable/disable On-Chip debugging
0	IDDATA	

IDEN	IDDATA	Function
0	X	OCD ID authentication change not possible
1	0	OCD ID authentication disabled
	1	OCD ID authentication enabled

NOTE

In the header files the module name of the above register is defined as:

SELB.

51.4 Caution on Using On-Chip Debugging

51.4.1 Treatment of devices using debugging

Do not use a device that was used for system debugging on a mass-produced product, because the flash memory was rewritten during system debugging and thus the write/erase endurance of the flash memory cannot be guaranteed.

51.4.2 Cautions when Shifting to DEEPSTOP Mode or Setting reset during Debugger use

When using a debugger, executing a program that causes the transition to DEEPSTOP mode (see Section 13, Stand-by Controller (STBC)) or the setting of any reset (see Section 9, Reset Controller) immediately after the program is started may cause improper communication between the OCD emulator and microcontroller because the microcontroller will enter DEEPSTOP mode or initialized before the preparations for communication between the OCD emulator and microcontroller are completed.

The communication preparation period depends on the OCD emulator's host PC environment and the operating frequency of microcontroller, so when performing debugging that causes the program to enter DEEPSTOP mode or to set any reset immediately after the program starts, insert waits in the interval between debugger reset release ($\overline{\text{DBRES}}$) and these execution instruction so that the debugger starts normally.

NOTES

1. The recommended interval is 50 ms for the RH850/D1L/D1M.
2. The resets related to this issue are all of described in 9.1, Overview.
3. In DEEPSTOP mode, the debugging controller stops. For return from DEEPSTOP mode by the debugger, see Section 13.1.2.1, Wake-up factors.

Section 52 Flash Memory

The RH850/D1L/D1M incorporates code flash memory and data flash memory.

Series Name	Product Name	Code Flash Memory	Data Flash Memory
D1L1	R7F701401, R7F701421	2 Mbytes	64 Kbytes
D1L2	R7F701402, R7F701422	4 Mbytes	64 Kbytes
D1L2H	R7F701403, R7F701423		
D1M1_3.75MB	R7F701404	3.75 Mbyte	64 Kbytes
D1M1H_3.75MB	R7F701406		
D1M2_3.75MB	R7F701408, R7F701428		
D1M2H_3.75MB	R7F701411, R7F701431		
D1M1-V2	R7F701442, R7F701462	4 MB	64 Kbytes
D1M1A	R7F701441, R7F701461		
D1M1_5MB	R7F701405	5 Mbyte	64 Kbytes
D1M1H_5MB	R7F701407		
D1M2_5MB	R7F701410, R7F701430		
D1M2H_5MB	R7F701412, R7F701432		

52.1 Features

- Code flash memory capacity: Up to 5 Mbytes of user area and up to an additional 32 Kbytes of extended user area
- Data flash memory capacity: 64 Kbytes for data area
- Methods of programming
  - Programming by communicating with the dedicated flash memory programmer via the serial interface (serial programming)
  - Flash memory programming by a user program (self-programming)
- Support for security functions to protect against illicit tampering with or reading out of data in flash memory
- Support for protection functions to protect against erroneous overwriting of the flash memory
- Support for the detection and correction of errors in the flash memory
- Support for the BGO (Back Ground Operation) function
  - Code flash memory can be read while data flash memory is being programmed
- The initial settings of RH850/D1L/D1M can be configured in the extended area (option bytes) of flash memory

52.2 Memory Configuration

User area in code flash memory of RH850/D1L/D1M is divided into 8 Kbytes or 32 Kbytes blocks, which can be erased individually.

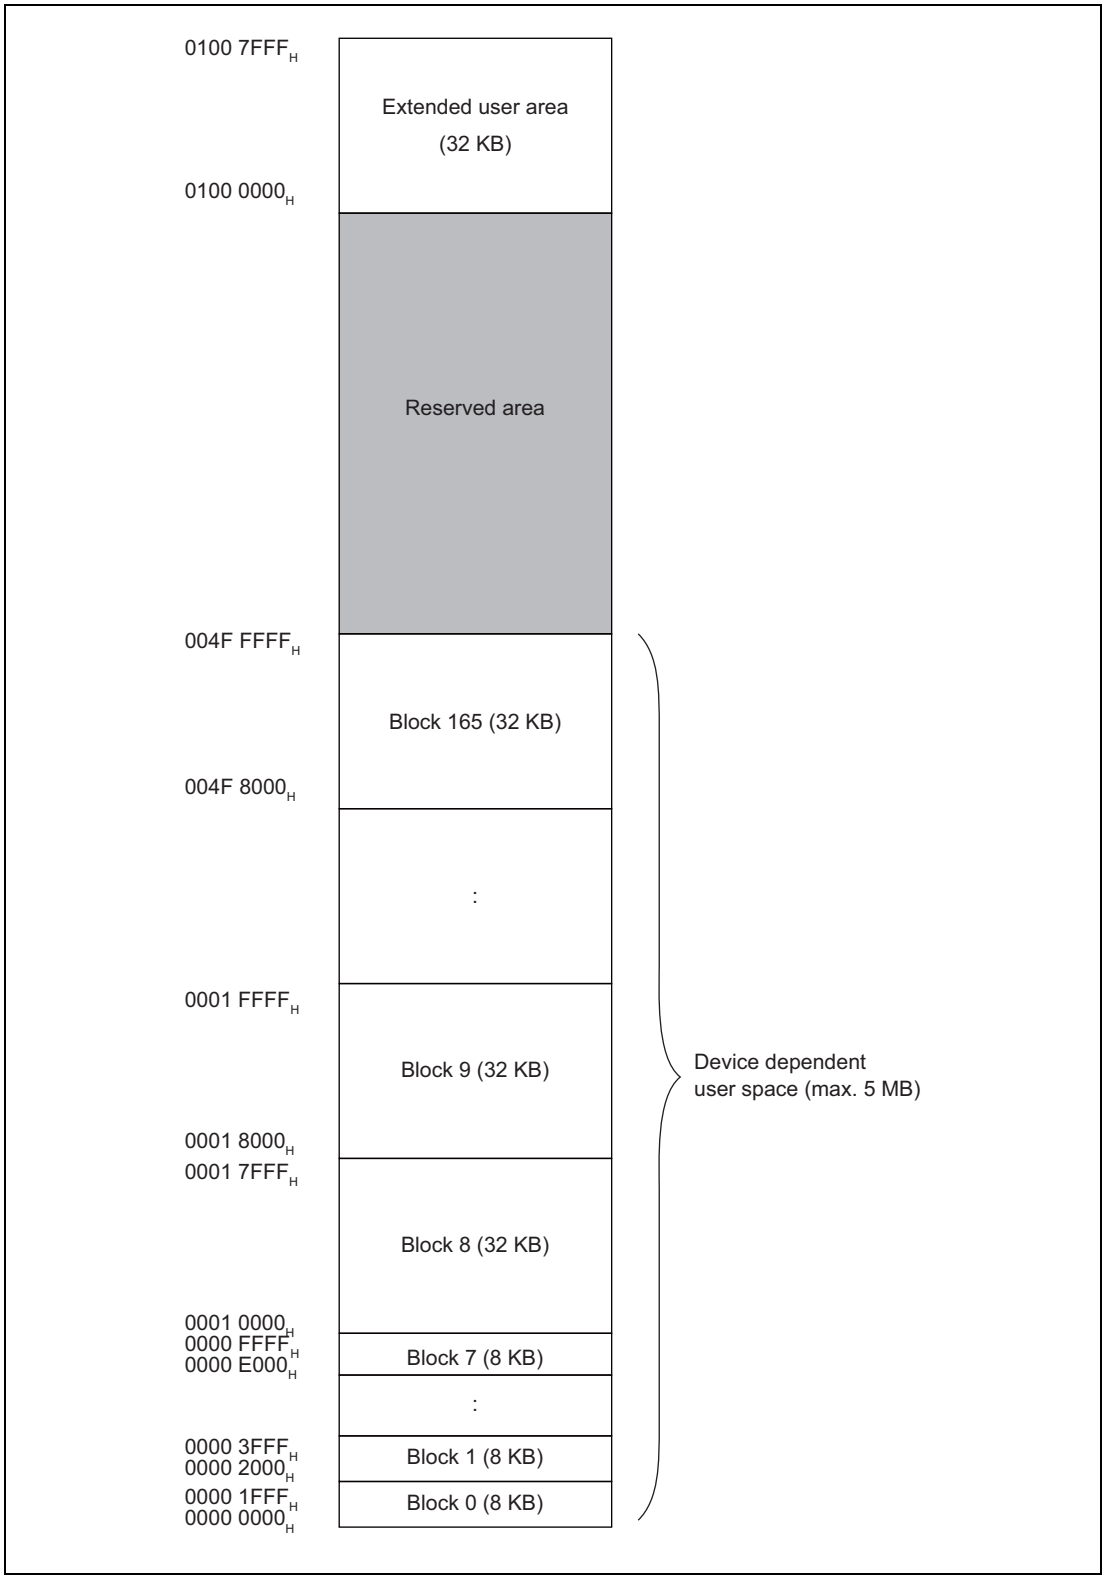

Figure 52.1 Code Flash Memory Mapping

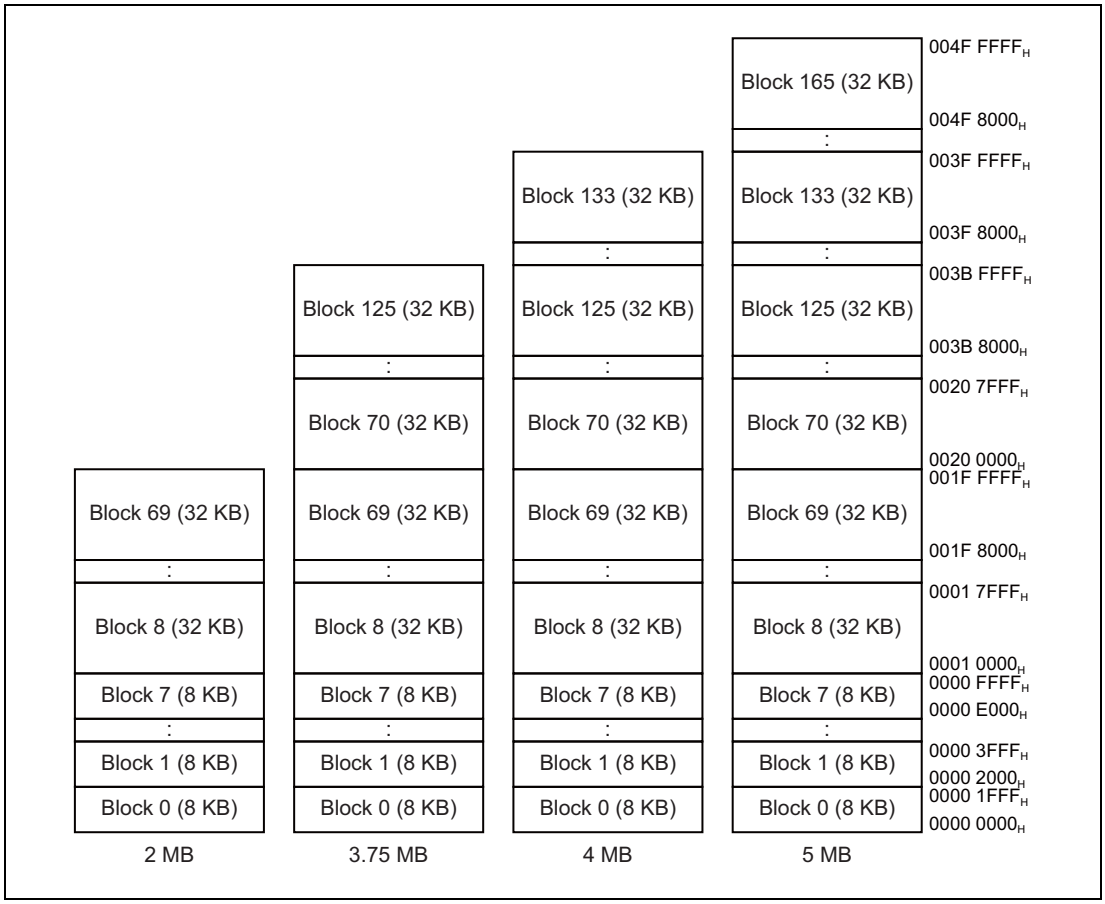

Figure 52.2 Relation between Memory Capacity and Blocks of the User Space

Data area in data flash memory of RH850/D1L/D1M is divided into 64 bytes blocks, which can be erased individually.

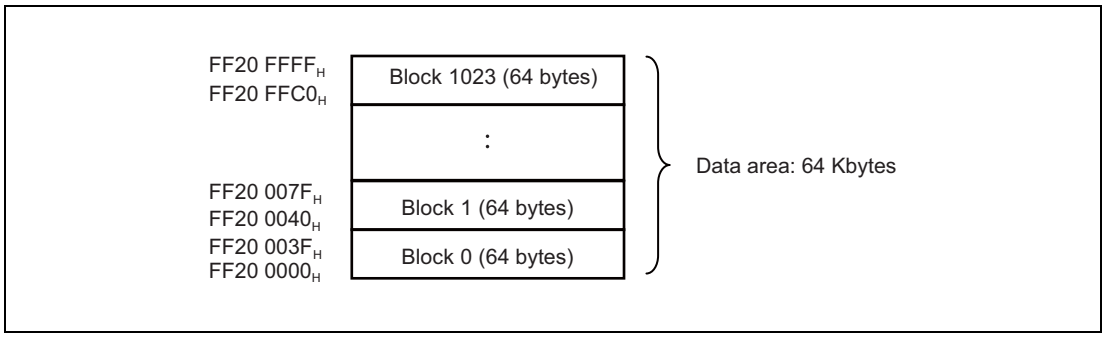

Figure 52.3 Data Flash Memory Mapping

52.3 Operating Modes Associated with Flash Memory

Figure 52.4 is a diagram of the mode transitions associated with the flash memory. For the procedures for setting the modes, refer to Section 6, Operating Modes.

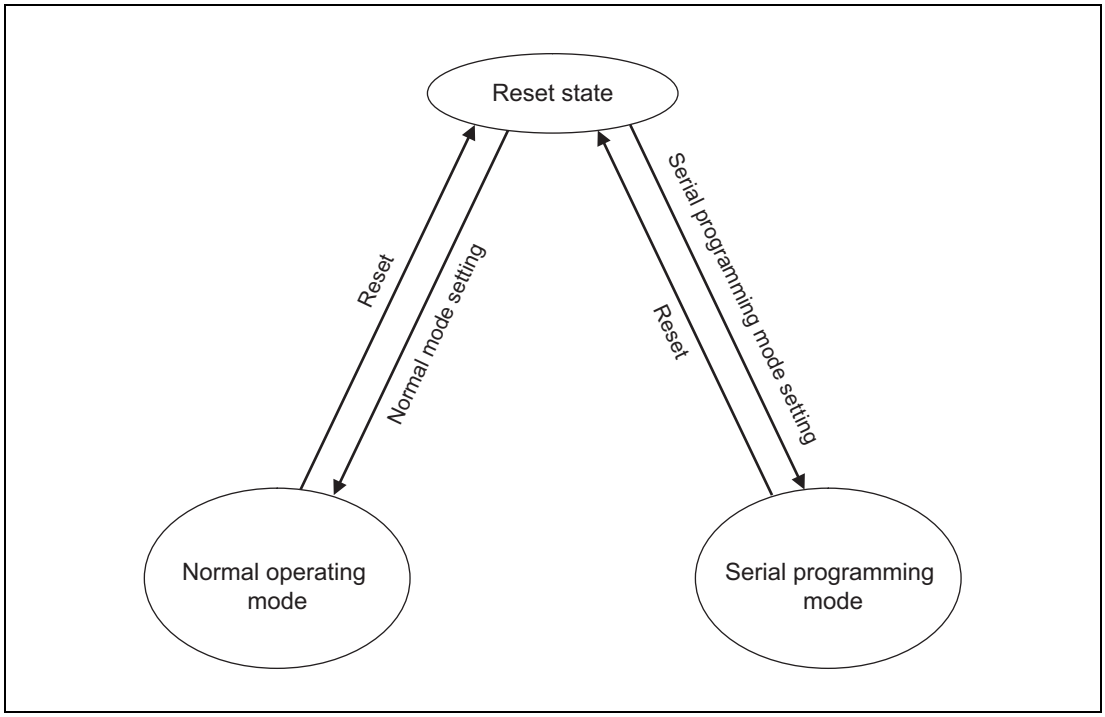

Figure 52.4 Mode Transition Associated with Flash Memory

The flash memory areas which are programmable and erasable and the boot program after a reset depend on the selected mode. The differences between modes are indicated in **Table 52.1**.

Table 52.1 Differences between Modes

Item	Normal Operating Mode	Serial Programming Mode
Programmable and erasable area	• User area • Extended user area • Data area	• User area • Extended user area • Data area
Boot program at a reset	Program in user area or extended user area	Firmware program for serial programming

52.4 Functional Overview

On-chip flash memory of RH850/D1L/D1M can be programmed regardless of before and after the mounting to the target system with the programming function that employs the dedicated flash memory programmer (serial programming).

In addition, a security function that prohibits the programming of a user program written in on-chip flash memory is supported to address the protection against falsification of programs by outsiders.

The programming function using a user program (self-programming) is the method suitable for applications where modifying the program after the production or shipment of the target system is expected. A protection function for secure programming to flash memory area is also supported. Furthermore, programming can be conducted under various conditions, such as in parallel with communicating with outside, by utilizing the support for interrupt processing during self-programming. **Table 52.2** gives an overview of the methods of programming and the corresponding operating modes.

Table 52.2 Programming Methods

Programming Method	Functional Overview	Operating mode
Serial programming	A dedicated flash-memory programmer is capable of on-board programming the flash memory after the device is mounted on the target system.	Serial programming mode
	A dedicated flash memory programmer and dedicated programming adapter board allow off-board programming of the flash memory, i.e. programming of the device before it is mounted on the target system.	
Self-programming	Flash memory can be programmed by executing a user program preprogrammed in code flash memory with serial programming. When data flash memory is being programmed with self-programming, the BGO function enables instruction fetch and data read from code flash memory. Thus, data flash memory can be programmed by executing a program on code flash memory prepared for flash programming. When code flash memory is being programmed with self-programming, instruction fetch and data read from code flash memory are prohibited. This programming needs to be carried out by executing a program prepared for flash programming that has been transferred to Local RAM in advance.	Normal operating mode

Table 52.3 lists the functions of the on-chip flash memory. Serial programmer commands realize serial programming, while reading of the on-chip flash memory by a library function or the user program realizes self-programming.

Table 52.3 Basic Functions at a Glance

Function	Description in Overview	Level of Support (√: Supported, △: Conditionally Supported, ×: Not Supported)	
		Serial programming	Self-programming
Blank checking	This is used to check a specified block to ensure that writing to it has not already proceeded. Results of reading from code flash memory and data flash memory to which nothing has been written after erasure are not guaranteed, so use blank checking to confirm that writing to memory has not proceeded after erasure.	√	√
Block erasure	This is for erasing the contents of a specified block of memory.	√	√
Programming	This is for writing to a specified address.	√	√
Verification and checksum	Data that are read out from flash memory are compared with data transferred from the flash memory programmer.	√	× (reading of data by the user program is possible)
Reading	Data that have been written to the flash memory are read out.	√	√
Setting for OTP (one-time programming)	A specified block of code flash memory is set for OTP (OTP can only be set, that is, it is not possible to release a block's OTP setting).	√	√
Setting an ID	An ID setting is made for use in controlling the connection of a serial programmer for serial programming, and programming of the code flash memory by self-programming.	√	√
Security settings	Security settings are for use in serial programming.	√	△ (only when setting is prohibited after being permitted)
Protection settings	Lock bits for all blocks of code flash memory are provided.	√	√
Setting of option bytes	Option bytes are set to change them from the initial values for the RH850/D1L/D1M	√	√
Clearing the configuration	ID setting, security settings, protection settings, and option byte settings are initialized.	√	×

For details on serial programming, refer to "*PG-FP5 Flash Memory Programmer Users' Manual*" and "*Renesas Flash Programmer Flash Programming Software User's Manual"*.

For details on self-programming, refer to the user's manuals for the code flash library and data flash library which this device targets.

The OTP setting and authentication of the ID code are security functions for use with serial programming and self-programming.

In serial programming, authentication of the ID code, prohibiting connection of a serial programmer, and prohibition of commands (for block erasure, programming, and reading) are available for use as security functions.

Table 52.4 Summary of Security Functions

Function	Description
OTP	OTP can be individually set for each block of the user area and the extended user area of code flash memory. When the OTP setting is made for an area, programming by serial programming and by self programming is prohibited. Once set, the OTP setting cannot be released. Furthermore, since execution of the configuration clearing command is prohibited for any area for which OTP has been set, changing a security setting from "prohibited" to "permitted" is not possible in D1M1A and D1M1-V2. For the RH850/D1L/D1M products except D1M1A and D1M1-V2, execution of the configuration clearing command is not prohibited. Thus, changing a security setting from "prohibited" to "permitted" is possible.
ID authentication	The result of ID authentication can be used to control the connection of a serial programmer for serial programming. The result of ID authentication is also used for enabling/disabling of code flash self-programming. Re-programing of the data flash in self-programming is always possible without any authentication.
Prohibition of connection of a serial programmer	The connection of a serial programmer for serial programming is prohibited. Since execution of the configuration clearing command is also prohibited when the connection of a serial programmer is prohibited, changing a security setting from "prohibited" to "permitted" is not possible.
Prohibition of block erasure commands	Block erasure commands at the time of serial programming are prohibited. Since execution of the configuration clearing command is also prohibited when block erasure commands are prohibited, changing a security setting from "prohibited" to "permitted" is not possible.
Prohibition of programming commands	Block erasure commands and programming commands at the time of serial programming are prohibited. Only through execution of the configuration clearing command can the prohibition be lifted.
Prohibition of read commands	Read commands at the time of serial programming are prohibited. Only through execution of the configuration clearing command can the prohibition be lifted.

Table 52.5 Available Operations and Security Settings

Function	All Security Settings and Erasure, Programming, and Read Operations (√: Executable, ×: Not Executable, —: Not Supported)		Point for Caution Regarding the Security Setting	
	Serial programming	Self programming	Serial programming	Self programming
OTP	• Areas for which OTP is set – Block erasure commands: × – Programming commands: × – Read commands: √ • Areas for which OTP is not set – Block erasure commands: √ – Programming commands: √ – Read commands: √	• Areas for which OTP is set – Block erasure: × – Programming: × – Reading: √ • Areas for which OTP is not set – Block erasure: √ – Programming: √ – Reading: √	• The OTP setting cannot be released. • D1M1A, D1M1-V2: Execution of the configuration clearing command is not possible. • Other products: Execution of the configuration clearing command is possible.	The OTP setting cannot be released.
ID authentication	• When the ID codes do not match – Block erasure commands: × – Programming commands: × – Read commands: × • When the ID codes match – Block erasure commands: √ – Programming commands: √ – Read commands: √	• When the ID codes do not match – Code flash memory - Block erasure: × - Programming: × - Reading: √ – Data flash memory - Block erasure: √ - Programming: √ - Reading: √ • When the ID codes match – Block erasure: √ – Programming: √ – Reading: √	• The configuration clearing command can initialize the setting for prohibition. • The setting for prohibition of block erasure commands is not available. • The setting for prohibition of programming commands is not available. • The setting for prohibition of read commands is not available.	ID authentication is always in effect.
Prohibition of the connection of a serial programmer	• Block erasure commands: × • Programming commands: × • Read commands: ×	• Block erasure: √ • Programming: √ • Reading: √	Since execution of the configuration clearing command is prohibited, initialization of the setting for prohibition is not possible.	Initialization of the settings prohibited is impossible because the configuration clearing command is not supported.
Prohibition of block erasure commands	• Block erasure commands: × • Programming commands: √ • Read commands: √	• Block erasure: √ • Programming: √ • Reading: √	• Since execution of the configuration clearing command is prohibited, initialization of the setting for prohibition is not possible. • The setting for ID authentication to be effective for serial programming is not available.	Initialization of the settings prohibited is impossible because the configuration clearing command is not supported.
Prohibition of programming commands	• Block erasure commands: ×*1 • Programming commands: × • Read commands: √	• Block erasure: √ • Programming: √ • Reading: √	• Executing the configuration clearing command only can initialize the settings prohibited. • The setting for ID authentication to be effective for serial programming is not available.	Initialization of the settings prohibited is impossible because the configuration clearing command is not supported.
Prohibition of read commands	• Block erasure commands: √ • Programming commands: √ • Read commands: ×	• Block erasure: √ • Programming: √ • Reading: √		

Note 1. Block erase command can be used only in ascending order.
Code Flash (block 0→ 1→ 2... 165)
→ Extended user area
→ Data Flash (block 0→ 1→ 2... 1023)

Table 52.6 Summary of Protection Functions

Function	Description
Block protection	Block protection can be individually made to enable or disable programming and erasure of each block of the user area and the extended user area of code flash memory. Programming and erasure by self programming of an area for which the lock bit is set and the lock bit function is enabled are prohibited. Programming or erasure can proceed again when the lock bit function is disabled after having been enabled. When a block erasure command is executed, the lock bit for that block is also erased.
Hardware protection	The level on the FLMD pin can be set to prohibit programming and erasure of the code flash memory in self programming mode. - FLMD0 = 0: Programming prohibited - FLMD0 = 1: Programming permitted
Variable reset vector	The protection settings include control of the reset vector. As shown in **Figure 52.5**, after programming of a new boot program while leaving the existing boot program in place, changing the reset vector is a safe way to change to the area holding the new boot program.

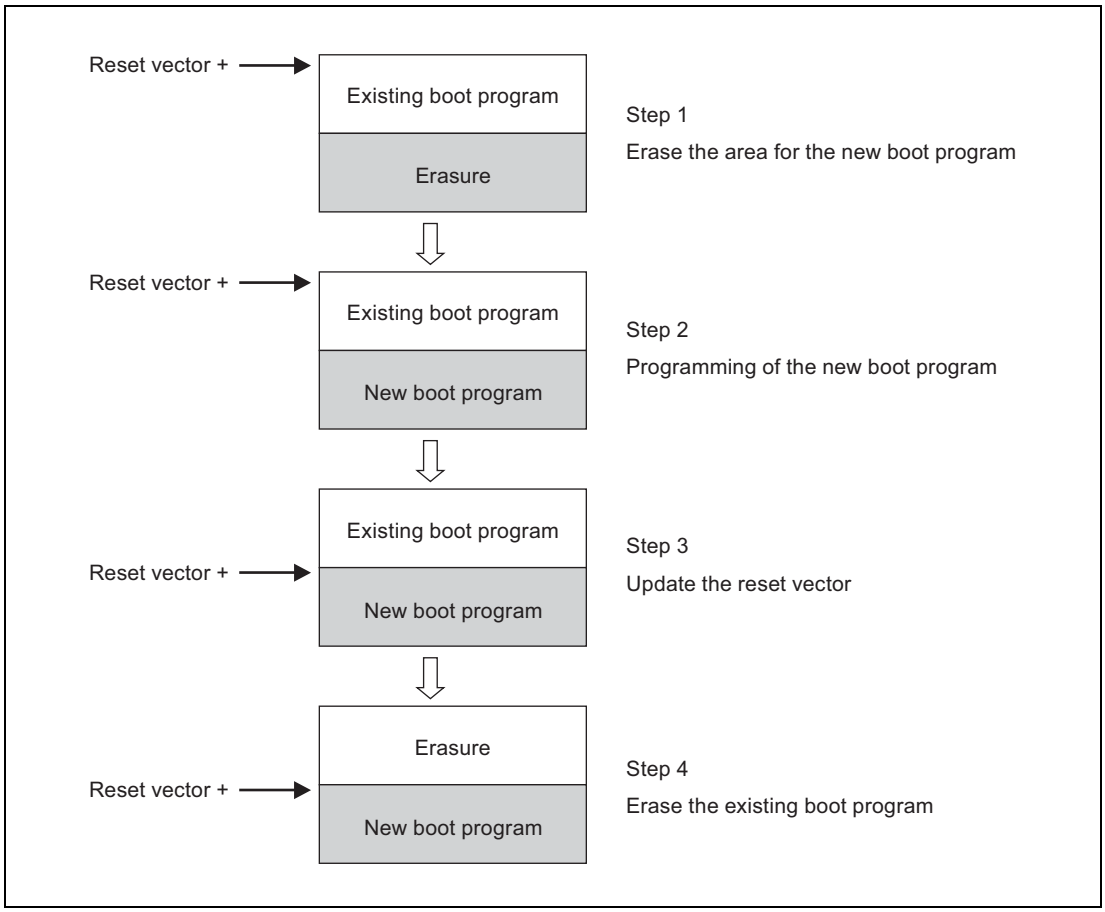

Figure 52.5 Utilizing the variable reset vector function to update the boot program

52.5 Communications for Serial Programming Mode

52.5.1 One-wire UART as an Asynchronous Flash Programming Interface

To use a 1-wire UART as a single-wire asynchronous serial programming interface, connect the following pins and the flash memory programmer.

- FLSCI3RXD, FLSCI3TXD(FPDR)/JP0_0: Receive data input/transmit data output

52.5.2 Two-wire UART as an Asynchronous Flash Programming Interface

To use a 2-wire UART as a double-wire asynchronous serial programming interface, connect the following pins and the flash memory programmer.

- FLSCI3RXD(FPDR)/JP0_0: Receive data input
- FLSCI3TXD(FPDT)/JP0_1: Transmit data output

52.5.3 CSI as a Synchronous Flash Programming Interface

To use a CSI as a synchronous serial programming interface, connect the following pins and the flash memory programmer.

- FLSCI3RXD (FPDR)/JP0_0: Receive data input
- FLSCI3TXD (FPDT)/JP0_1: Transmit data output
- FLSCI3SCKI (FPCK)/JP0_2: Serial clock input

The flash memory programmer outputs the serial data clock signal (SCK) and the microcontroller operates as a slave.

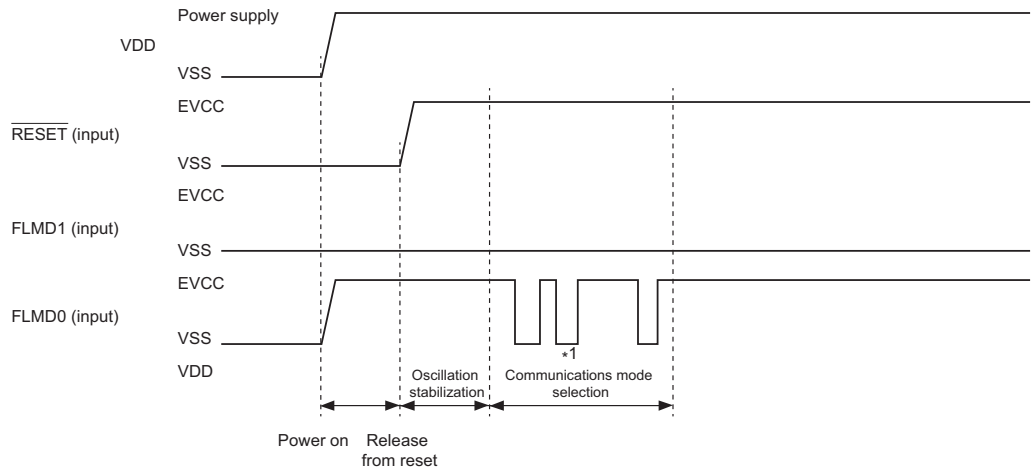
NOTE

For details on the flash programming software (Renesas Flash Programmer), refer to the "*Renesas Flash Programmer Flash Programming Software User's Manual*".

52.5.4 Selecting the Communications System

In the RH850/D1L/D1M, the communications system is selected by the input of pulses (up to 7) to the FLMD0 pin after the chip shifts to the flash memory programming mode. These pulses are generated by the dedicated flash memory programmer.

The relationship between the communications system and the number of pulses is shown below.



Note 1. The number of input clocks depends on the communications system as shown below.

Pulses on FLMD0	Communications System	Notes
0	2 wire UART	
7	1 wire UART	
3	CSI	
	Others	Setting prohibited

Figure 52.6 Selecting the Communications Mode

52.6 Programming with Serial Programmer

Flash memory can be programmed in serial programming mode with the dedicated flash memory programmer.

Serial Programming

In serial programming, the microcontroller is mounted on the board. Mounting the connecter on the board allows the flash memory programmer to program the target microcontroller.

52.6.1 Programming Environment

The figure below shows the environment recommended for programming data to flash memory in the microcontroller.

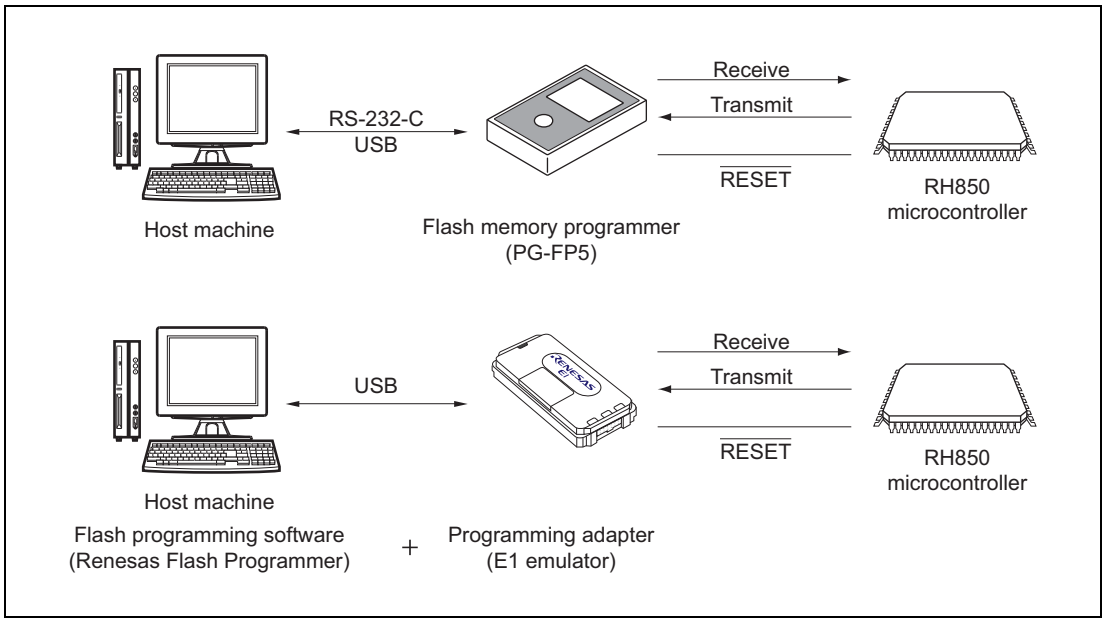


Figure 52.7 Environment for Programming Flash Memory

Using PG-FP5 flash memory programmer or Renesas Flash Programmer flash programming software (running on the host machine) in combination with E1 emulator used as the programming adaptor, you can easily conduct programming operations, such as erasure, programming, and verification, to Renesas Electronics' microcontroller with on-chip flash memory mounted on the user's board without the need for unmounting it.

PG-FP5 flash memory programmer supports programming from the host machine or programming in the standalone mode. The flash programming software (Renesas Flash Programmer) supports programming from the host machine.

NOTE

Refer to *PG-FP5 flash memory programmer user's manual* for the details of PG-FP5, and *Renesas Flash Programmer flash programming software user's manual* for the details of Renesas Flash Programmer flash programming software.

52.7 Programming with Self-programming

52.7.1 Overview

RH850/D1L/D1M supports the flash memory programming of user program itself.

When programming data flash memory, you can execute a program on code flash memory prepared for flash programming using the BGO function to program data flash memory. Instead, you can also execute a program prepared for flash programming that has been transferred to Local RAM in advance to program data flash memory.

In addition, you can execute a program prepared for flash programming that has been transferred to Local RAM in advance to program code flash memory.

52.7.2 BGO Function

When the combination of the flash memory to be programmed and the flash memory to be read meets the conditions in the following list, the BGO function can be used.

Table 52.7 Conditions Required to Use BGO Function

Area to Be Programmed	Area to Be Read
Data flash memory	Code flash memory

52.7.3 Enabling of Self-Programming

The self-programming function can be activated in normal operating mode.

Erasure and programming of the flash memory by the self-programming function is enabled by making the FLMD0 pin high level.

Having FLMD0 pin low level prevents unnecessary overwriting of the program if the device operates incorrectly.

The FLMD0 pin is made high level by using one of the following methods.

- The FLMD0 pin is externally pulled up.
- The FLMD0 pin is pulled up by the FLMDCNT register.

The outline of the FLMDCNT register is described in Section 52.7.3.1, FLMDCNT Register.

52.7.3.1 FLMDCNT Register

This register specifies the internal pull-up or pull-down of the FLMD0 pin.

Access: This register can be read/written in 32-bit units.
Writing to this register is protected by a special sequence of instructions by using the protection command register FLMDPCMD. For details, see Section 4, Write-Protected Registers.

Address: FFA0 0000$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FLMDPUP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 52.8 FLMDCNT Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	FLMDPUP	FLMD0 Pin Software Control 0: Pull-down selected 1: Pull-up selected

NOTE

In the header files the module name of the above register is defined as "FLMD", and the register name as "CNT".

52.8 Flash Memory Read

52.8.1 Code Flash Memory Read

Special settings are not required to read code flash memory in normal mode. Data can simply be read out through access to addresses in the code flash memory.

Reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception. Furthermore, since the values of data cannot be guaranteed when an ECC error has been generated, use blank checking when you need to confirm that an area is in the non-programmed state.

52.8.2 Data Flash Memory Read

Configure the number of read cycles in the EEPRDCYCL register prior to reading data from data flash memory in normal mode. Once this register is properly configured, data can be read by simply accessing addresses in the data flash memory. Once the setting for the number of cycles is made, data can simply be read out through access to addresses in the data flash memory.

Values read from data flash memory that has been erased but not yet been programming again are undefined. Use blank checking when you need to confirm that an area is in the non-programmed state.

52.9 Description of Registers

52.9.1 Registers Related to Data Flash Memory

Table 52.9 shows the list of registers related to data flash memory.

Table 52.9 List of Registers Related to Data Flash Memory

Register Name	Symbol	R/W	Initial Value	Address	Access Size
Data flash memory read cycle setting register	EEPRDCYCL	R/W	$0F_H$	FFC5 9810_H	8

52.9.1.1 Data Flash Memory Read Cycle Setting Register (EEPRDCYCL)

This register sets the read cycle of data flash memory.

Access: This register can be read/written in 8-bit units.

Address: FFC5 9810_H

Initial value: $0F_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FRDCYCLD[3:0]			
Initial value	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 52.10 EEPRDCYCL register contents

Bit Position	Bit Name	Function
7 to 4	Reserved	
3 to 0	FRDCYCLD[3:0]	Number of data flash memory read cycles Data flash memory is read in setting value + 1 cycles. 0x0 to 0x6: Setting prohibited 0x7: Read cycle 8 0x8: Read cycle 9 0x9 to 0xF: Read cycle 10

NOTE

In the header files the module name of the above register is defined as:
DCIB.

52.9.2 Registers Related to Product Information

The following tables show the list of registers related to product information.

Table 52.11 List of Registers Related to Product Information (1/4)

Register Name	Symbol	R/W	Initial Value					
			R7F701401	R7F701402	R7F701403	R7F701404	R7F701405	R7F701406

52.9.2.1 Product Name Storage Register (PRDNAMEn, n = 1 to 4)

This register stores the product name. The product model name is stored in 16-byte ASCII code, and PRDNAME1, PRDNAME2, PRDNAME3, and PRDNAME4 correspond to the fourth to first bytes, eighth to fifth bytes, twelfth to ninth bytes, and sixteenth to thirteenth bytes of the product model name respectively.

Access: This register can be read in 32-bit units.

Address: PRDNAME1: FFCD 00D0$_H$
PRDNAME2: FFCD 00D4$_H$
PRDNAME3: FFCD 00D8$_H$
PRDNAME4: FFCD 00DC$_H$

Initial value: See Table 52.15, Contents of Product Name Storage Register.

SCDS0	CHIPID1HH	FFCD 00EC$_H$	R	32 bit	Unique code
SCDS0	CHIPID2LL	FFCD 00F0$_H$	R	32 bit	Unique code
SCDS0	CHIPID2LH	FFCD 00F4$_H$	R	32 bit	Unique code
SCDS0	CHIPID2HL	FFCD 00F8$_H$	R	32 bit	Unique code
SCDS0	CHIPID2HH	FFCD 00FC$_H$	R	32 bit	Unique code

NOTE

In the header files the module name of the above register is defined as:

SCDS0.

52.10 Option Bytes

The flash memory has the extended area (option bytes) to store data specified by the user for various purposes.

52.10.1 Option Byte 0 Register (OPBT0)

Changes in settings such as initial setting of peripheral functions using Option Byte 0 become effective after release from the reset state.

Access: This register can be read in 32-bit units.
This register can only be written in serial programming mode and self-programming mode.

Address: FFCD 0030_H

Initial value: Specified by the user

7 to 0	SDRTRC[39:32]	DDR2-SDRAM Memory Controller (SDRB) trimming code upper bits

NOTE

In the header files the module name of the above register is defined as:
SCDS0.

52.11 Code Flash ECC

The ECC of the Code Flash generates an interrupt request listed in the following table:

Table 52.20 Interrupt Request by ECC of Code Flash

Function	Connected to
ECC 1-bit error interrupt during access by the CPU	These interrupts are logically OR combined and input to the Error Control Module INTECCSFLI.
ECC 1-bit error interrupt during access by a GVCI master	
ECC 2-bit error interrupt during access by the CPU	These interrupts are logically OR combined and input to the Error Control Module INTECCDFLI.
ECC 2-bit error interrupt during access by a GVCI master	

The 9-bit ECC value is calculated for each 128-bit transfer.

The ECC of the Code Flash and its registers are initialized by the following reset signal:

Table 52.21 Reset sources

ECC unit	Reset signal
Code Flash ECC	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

52.11.1 Overview

The code flash ECC is summarized in the table below.

Item	Description
ECC error detection and correction	ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. • ECC error detection and correction are carried out (2-bit error detection and 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. In the initial state, this function is enabled, and 1-bit error detection, correction and notification and 2-bit error detection and notification are carried out.
Error notification	Upon occurrence of an ECC error, it is notified to the Error Control Module. **ECC Error:** • Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. • Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. In the initial state, error notification is enabled upon detection of an ECC 2-bit error, and error notification is disabled upon detection of an ECC 1-bit error. The error notification signal is issued to the ECM.
Error status	A status register is provided, which indicates the statuses of ECC 2-bit error detection and ECC 1-bit error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register.
Address capture	If an ECC error occurs while no error status is set, the address at which the associated error has occurred is captured. The address is captured when an ECC 2-bit error or an ECC 1-bit error is detected. The error status serves as the enable bit of the capture address.

52.11.2 List of Registers

Registers with "_VCI2CFB_OS" appendix are for code flash access from GVCI masters.

Registers with "_PE1_OS" appendix are for code flash access from CPU(PE1).

Table 52.22 List of Registers

Module Name	Register Name	Symbol	Address
ECCFLI	Code flash ECC control register (VCI)	CFECCCTL_VCI2CFB_OS	FFC6 2200_H
ECCFLI	Code flash error information control register (VCI)	CFERRINT_VCI2CFB_OS	FFC6 2204_H
ECCFLI	Code flash status clear register (VCI)	CFSTCLR_VCI2CFB_OS	FFC6 2208_H
ECCFLI	Code flash error count overflow status register (VCI)	CFOVFSTR_VCI2CFB_OS	FFC6 $220C_H$
ECCFLI	Code flash 1st error status register (VCI)	CF1STERSTR_VCI2CFB_OS	FFC6 2210_H
ECCFLI	Code flash 1st error address register (VCI)	CF1STEADR0_VCI2CFB_OS	FFC6 2250_H
ECCFLI	Code Flash sub-test control register (VCI)	CFSTSTCTL_VCI2CFB_OS	FFC6 2350_H
ECCFLI	Code flash ECC control register (PE1)	CFECCCTL_PE1_OS	FFC6 2400_H
ECCFLI	Code flash error information control register (PE1)	CFERRINT_PE1_OS	FFC6 2404_H
ECCFLI	Code flash status clear register (PE1)	CFSTCLR_PE1_OS	FFC6 2408_H
ECCFLI	Code flash error count overflow status register (PE1)	CFOVFSTR_PE1_OS	FFC6 $240C_H$
ECCFLI	Code flash 1st error status register (PE1)	CF1STERSTR_PE1_OS	FFC6 2410_H
ECCFLI	Code flash 1st error address register (PE1)	CF1STEADR0_PE1_OS	FFC6 2450_H
ECCFLI	Code Flash sub-test control register (PE1)	CFSTSTCTL_PE1_OS	FFC6 2550_H

NOTE

In the header files the names of the above registers are defined in the following format:

<ModuleName> + <Symbol>.

<ModuleName> and <Symbol> are defined in the above table.

52.11.3 Details of Registers

52.11.3.1 CFECCCTL_VCI2CFB/PE1_OS — Code flash ECC control register

CFECCCTL enables or disables ECC error detection and correction and 1-bit error correction. Set PROT[1:0] bits to 01_B when writing to CFECCCTL.

Access: This register can be read/written in 32-bit units.

Address: CFECCCTL_VCI2CFB_OS: FFC6 2200_H
CFECCCTL_PE1_OS: FFC6 2400_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	SEC DIS	ECC DIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 52.23 CFECCCTL_VCI2CFB/PE1_OS register contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, these bits are always read as 0. When writing, always write 0.
15 to 14	PROT[1:0]	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set PROT[1:0] = 01_B when writing to CFECCCTL.
13 to 2	Reserved	When read, these bits are always read as 0. When writing, always write 0.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with setting PROT[1:0] = 01_B. 0: Enables correction of the 1-bit error detected. 1: Disables correction of the 1-bit error detected.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with setting PROT[1:0] = 01_B. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

52.11.3.2 CFERRINT_VCI2CFB/PE1_OS — Code flash error information control register

CFERRINT enables or disables generation of the error notification signal to the ECM upon detection of an ECC 2-bit error or ECC 1-bit error.

Access: This register can be read/written in 32-bit units.

Address: CFERRINT_VCI2CFB_OS: FFC6 2204_H
CFERRINT_PE1_OS: FFC6 2404_H

Value after reset: 0000 0006_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 52.24 CFERRINT_VCI2CFB/PE1_OS register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	This bit should not be modified. When writing, always write initial value.
1	DEDIE	ECC 2-bit error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-bit error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

52.11.3.3 CFSTCLR_VCI2CFB/PE1_OS — Code flash status clear register

CFSTCLR clears the error flags in the error status register (CF1STERSTR), the overflow flag in the error overflow status register (CFOVFSTR), and the error address register (CF1STEADR).

Access: This register can be written only in 32-bit units.

Address: CFSTCLR_VCI2CFB_OS: FFC6 2208_H
CFSTCLR_PE1_OS: FFC6 2408_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ST CLR0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 52.25 CFSTCLR_VCI2CFB/PE1_OS register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, these bits are always read as 0. When writing, always write 0.
0	STCLR0	Error Overflow Flag Clear 0: No effect (Setting 0 does not affect the DEDF0 and SEDF0 flags in CF1STERSTR; ERROVF0 flag in CFOVFSTR; and CF1STEADR0.) 1: Writing 1 to this bit clears the DEDF0 and SEDF0 flags in CF1STERSTR; ERROVF0 flag in CFOVFSTR; and CF1STEADR0.

52.11.3.4 CFOVFSTR_VCI2CFB/PE1_OS — Code flash error count overflow status register

CFOVFSTR monitors occurrence of error overflow. If the second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

Access: This register can be read in 32-bit units.

Address: CFOVFSTR_VCI2CFB_OS: FFC6 220C$_H$
CFOVFSTR_PE1_OS: FFC6 240C$_H$

Value after reset: 0000 0000$_H$

Table 52.26 CFOVFSTR_VCI2CFB/PE1_OS register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, these bits are always read as 0. When writing, always write 0.
0	ERROVF0	Error Overflow Flag ERROVF0 is set if the second error occurs while any of the error flags (DEDF0 and SEDF0) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error. 0: Not occurred 1: Occurred Clearing condition: Set the STCLR0 bit in CFSTCLR to 1.

52.11.3.5 CF1STERSTR_VCI2CFB/PE1_OS — Code flash 1st error status register

CF1STERSTR monitors occurrence of the first error. The error status is set if an error occurs while the error flag is 0. The error flag is overwritten if an ECC 2-bit error occurs while the ECC 1-bit error monitor flag is set.

Access: This register can be read in 32-bit units.

Address: CF1STERSTR_VCI2CFB_OS: FFC6 2210_H
CF1STERSTR_PE1_OS: FFC6 2410_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 52.27 CF1STERSTR_VCI2CFB/PE1_OS register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, these bits are always read as 0. When writing, always write 0.
1	DEDF0	ECC 2-bit error Monitor Flag 0: Indicates that an ECC 2-bit error has not occurred. 1: Indicates that an ECC 2-bit error has occurred while the error flag DEDF0 is 0. Clearing condition: Set the STCLR0 bit in CFSTCLR to 1.
0	SEDF0	ECC 1-bit error Monitor Flag 0: Indicates that an ECC 1-bit error has not occurred. 1: Indicates that an ECC 1-bit error has occurred while the error flags DEDF0 and SEDF0 are 0. Clearing condition: Set the STCLR0 bit in CFSTCLR to 1.

52.11.3.6 CF1STEADR0_VCI2CFB/PE1_OS — Code flash 1st error address register

CF1STEADR0 holds the address at which an error has occurred.

The error address is set if an error occurs while all the error flags are 0 in CF1STERSTR. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated.

Access: This register can be read in 32-bit units.

Address: CF1STEADR0_VCI2CFB_OS: FFC6 2250$_H$
CF1STEADR0_PE1_OS: FFC6 2450$_H$

Value after reset: 0000 0000$_H$

	EADR[15:4]												—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 52.28 CF1STEADR0_VCI2CFB/PE1_OS register contents

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, these bits are always read as 0. When writing, always write 0.
24 to 4	EADR[24:4]	1st Error Address Monitors the address of the first error. The error address is set if an error occurs while all the error flags are 0 in CF1STERSTR. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated. Clearing condition: Set the STCLR0 bit in CFSTCLR to 1.
3 to 0	Reserved	When read, these bits are always read as 0. When writing, always write 0.

52.11.3.7 CFSTSTCTL_VCI2CFB/PE1_OS — Code flash sub-test control register

The CFSTSTCTL register is used for the ECC test (self-diagnosis). This register is dedicated to code flash. After ECC test mode is enabled by setting ECCTST to 1, the ECC bits and address parity bit can be read directly.

Set PROT1 to 0 and PROT0 to 1 when writing to this register.

Access: This register can be read/written in 32-bit units.

Address: CFSTSTCTL_VCI2CFB_OS: FFC6 2350$_H$
CFSTSTCTL_PE1_OS: FFC6 2550$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	PROT[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	—	ECC TST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 52.29 CFSTSTCTL_VCI2CFB/PE1_OS register contents

Bit Position	Bit Name	Function
31 to16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 14	PROT[1:0]	Enables or disables modification of the ECCTST bit. The value written is not retained. These bits are always red as 0. Set PROT1 to 0 and PROT0 to 1 when writing to this register.
13 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
o	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST to 1, the data in the ECC bits and the address parity bit can be read directly.

Correctly reading instructions from the code flash access port is not possible while ECC test mode is selected (ECCTST = 1). While the access port for the CPU is set to test mode (including during changes to the value of the ECCTST bit), the CPU must run a program from the local RAM or retention RAM and must not fetch instructions from the code flash memory.

The CPU has a small data buffer. If an old value remains in this buffer, the correct value cannot be read even when the ECCTST bit is switched. When switching the ECCTST bit, be sure to clear the data buffer. For how to clear the data buffer, see “RH850G3M User’s Manual Software Edition”.

From the code flash access port with ECC test mode selected, access must be made by reading 4 bytes aligned to 16n address. The results of reading code flash are as follows:

Table 52.30 Results of Reading Code Flash

Bit number	Description
31 to 10	These bits are always 0.
9	Address parity bit
8 to 0	ECC bits

52.12 Data Flash ECC

The ECC of the Data Flash generates an interrupt request listed in the following table:

Table 52.31 Data Flash ECC Interrupt Request

Function	Connected to
2 bit error detection interrupt	Error Control Module INTECCDEDEEP
1 bit error detection interrupt	Error Control Module INTECCSEDEEP

The 7-bit ECC value is calculated for each 32-bit transfer.

The ECC of the Data Flash and its registers are initialized by the following reset signal:

Table 52.32 Reset sources

ECC unit	Reset signal
Data Flash ECC	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

52.12.1 Overview

The data flash ECC is summarized in the table below.

Item	Description
ECC error detection and correction	ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. • ECC error detection and correction are carried out (2-bit error detection and 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. In the initial state, this function is enabled, and 1-bit error detection and correction and 2-bit error detection and notification are carried out.
Error notification	Upon occurrence of an ECC error, it is notified to the Error Control Module. **ECC Error:** • Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. • Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. In the initial state, error notification is enabled upon detection of an ECC 2-bit error, and error notification is disabled upon detection of an ECC 1-bit error. The error notification signal is output, where an ECC 2-bit error is handled as one source, and an ECC 1-bit error is handled as one source.
Error status	A status register is provided, which indicates the statuses of ECC 2-bit error detection and ECC 1-bit error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register.

52.12.2 List of Registers

Table 52.33 List of Registers

Module Name	Register Name	Symbol	Address
ECCEEP	Data Flash ECC control register	DFECCCTL	FFC6 2C00$_H$
ECCEEP	Data Flash error status register	DFERSTR	FFC6 2C04$_H$
ECCEEP	Data Flash error status clear register	DFERSTC	FFC6 2C08$_H$
ECCEEP	Data Flash error notification control register	DFERRINT	FFC6 2C14$_H$
ECCEEP	Data flash test control register	DFTSTCTL	FFC6 2C1C$_H$

NOTE

In the header files the names of the above registers are defined in the following format:

<ModuleName> + <Symbol>.

<ModuleName> and <Symbol> are defined in the above table.

52.12.3 Details of Registers

52.12.3.1 DFECCCTL — Data flash ECC control register

DFECCCTL enables or disables ECC error detection and 1-bit error correction for read access.

Set PROT[1:0] = 01_B when writing to the DFECCCTL register.

Access This register can be read/written in 32-bit units.

Address FFC6 2C00$_H$

Initial value 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 52.34 DFECCCTL register contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the initial value is read. When written, write the initial value.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to DFECCCTLn.
14	PROT0	
13 to 2	Reserved	When read, the initial value is read. When written, write the initial value.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with setting (PROT1, PROT0) = (0, 1). 0: Enables correction of the 1-bit error detected. 1: Disables correction of the 1-bit error detected.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with setting (PROT1, PROT0) = (0, 1). In the initial state, ECC error detection and correction are enabled. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

52.12.3.2 DFERSTR — Data flash error status register

DFERSTR monitors occurrence of errors.

The SEDF bit is set if an ECC 1-bit error is detected while ECC error detection and correction are enabled, and the DEDF bit is set if an ECC 2-bit error is detected.

Access This register can be read only in 32-bit units.

Address FFC6 2C04$_H$

Initial value 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDF	SEDF
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 52.35 DFERSTR register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the initial value is read. When written, write the initial value.
1	DEDF	ECC 2-Bit Error Monitor Flag 0: An ECC 2-bit error is not generated. 1: An ECC 2-bit error is generated. Clearing condition: ERRCLR bit is set in Data Flash error status clear register. Setting condition: ECC 2-bit error is generated with both SEDF and DEDF being 0.
0	SEDF	ECC 1-bit error Monitor Flag 0: An ECC 1-bit error is not generated. 1: An ECC 1-bit error is generated. Clearing condition: ERRCLR bit is set in Data Flash error status clear register. Setting condition: ECC 1-bit error is generated with both SEDF and DEDF being 0.

52.12.3.3 DFERSTC — Data flash error status clear register

DFERSTC clears the error flags in the Data Flash error status register.

Access This register can be written only in 32-bit units.

Address FFC6 2C08$_H$

Initial value 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 52.36 DFERSTC register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the initial value is read. When written, write the initial value.
0	ERRCLR	SEDF/DEDF Flag Clear 0: No effect (Setting the ERRCLR bit to 0 does not affect the DEDF0 and SEDF flags in DFERSTR.) 1: The SEDF/DEDF flag in DFERSTR is cleared.

52.12.3.4 DFERRINT — Data flash error notification control register

DFERRINT enables or disables generation of the error notification signal upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access This register can be read/written in 32-bit units.

Address FFC6 2C14$_H$

Initial value 0000 0002$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDIE	SEDIE
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 52.37 DFERRINT register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the initial value is read. When written, write the initial value.
1	DEDIE	ECC 2-bit error Notification Control Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-bit error Notification Control Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

52.12.3.5 DFTSTCTL — Data flash test control register

DFTSTCTL is used for ECC testing.

The data of the ECC bit can be read after setting the ECC test mode (ECCTST = 1).

Set PROT[1:0] = 01_B when writing to the DFTSTCTL register.

Access This register can be read/written in 32-bit units.

Address FFC6 2C1C$_H$

Initial value 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	—	ECC TST
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 52.38 DFTSTCTL register contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the initial value is read. When written, write the initial value.
15	PROT1	Enables or disables modification of the ECCTST bit. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to DFECCCTL.
14	PROT0	
13 to 1	Reserved	When read, the initial value is read. When written, write the initial value.
0	ECCTST	ECC Test By setting ECC test mode bit to “1” (ECCTST=1), CPU can read ECC bit. Write a value to this bit simultaneously with setting (PROT1, PROT0) = (0, 1).

52.13 Usage Notes

1. Reading areas where programming or erasure was interrupted
   When programming or erasure of an area of flash memory is interrupted, the data stored in the area become undefined. To avoid undefined data that are read out becoming the source of faulty operation, take care not to fetch instructions or read data from areas where programming or erasure was interrupted.
2. Reading the code flash memory that has been erased but not yet been programming again
   Note that reading from an area of code flash memory that has been erased but not yet been programming again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception. Use blank checking when you need to confirm that an area is in the non-programmed state.
3. Prohibition of additional writing
   Writing to a given area twice is not possible. If you want to overwrite data in an area of flash memory after writing to the area has been completed, erase the area first.
4. Resets during programming and erasure
   In the case of a reset due to the signal on the $\overline{\text{RESET}}$ pin during programming and erasure, wait for at least 20 µs once the operating voltage is within the range stipulated in the electrical characteristics after assertion of the reset signal before releasing the device from the reset state.
5. Allocation of vectors for interrupts and other exceptions during programming and erasure
   Generation of an interrupt or other exception during programming or erasure may lead to fetching of the vector from the code flash memory. If this does not satisfy the conditions for using background operation, set the address for vector fetching to an address that is not in the code flash memory.
6. Abnormal termination of programming and erasure (1)
   Even if programming/erasure ends abnormally due to reset input or power off, the programming/erasure state of the flash memory with undefined data cannot be verified or checked. Therefore, before using the area where programming/erasure has ended abnormally, erase the area again to prove that the corresponding area is completely erased.
7. Abnormal termination of programming and erasure (2)
   If programming and erasure of code flash memory are not completed normally, the lock bit for the target area may be enabled. In such cases, erase the block to erase the lock bit while the lock bit is in the disabled state.
8. Items prohibited during programming, erasure and blank check
   Do not perform the following operations during programming, erasure and blank check.
   - Have the operating voltage from the power supply go beyond the allowed range.
   - Change the frequency of the peripheral clock.

Section 53 RAM

The RH850/D1L/D1M incorporates following on-chip RAM:

Series Name	Product Name	Local RAM	Retention RAM	Video RAM
D1L1	R7F701401, R7F701421	256 Kbytes	16 Kbytes	–
D1L2	R7F701402, R7F701422	512 Kbytes		144 Kbytes
D1L2H	R7F701403, R7F701423			
D1M1_3.75MB	R7F701404			1.55 Mbytes
D1M1_5MB	R7F701405			
D1M1H_3.75MB	R7F701406			
D1M1H_5MB	R7F701407			
D1M1-V2	R7F701442, R7F701462			
D1M1A	R7F701441, R7F701461			2.4 Mbytes
D1M2_3.75MB	R7F701408, R7F701428			3.1 Mbytes
D1M2_5MB	R7F701410, R7F701430			
D1M2H_3.75MB	R7F701411, R7F701431			
D1M2H_5MB	R7F701412, R7F701432			

53.1 Local CPU RAM (LRAM)

The Local RAM is a RAM area that can be accessed immediately, without requiring the system to wait. Values are not retained in this area in DEEPSTOP mode.

53.1.1 Local RAM banks

The Local RAM consists of 4 banks of 32-bit wide RAM and an 7-bit wide ECC RAM.

- Bank 0: 32-bit RAM data at addresses xxxx $xxx0_H$
- Bank 1: 32-bit RAM data at addresses xxxx $xxx4_H$
- Bank 2: 32-bit RAM data at addresses xxxx $xxx8_H$
- Bank 3: 32-bit RAM data at addresses xxxx $xxxC_H$

Each access to the Local RAM writes or reads four 32-bit words, i.e. is performed via the 128-bit RAM bus.

The 7-bit ECC value is calculated for each 32-bit transfer.

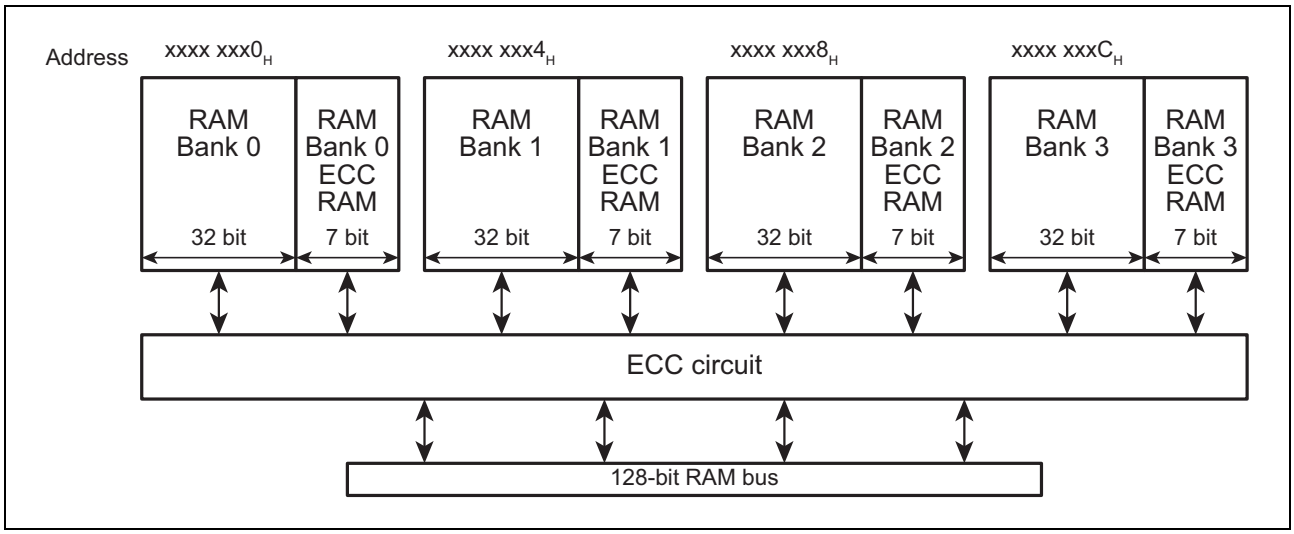

Figure 53.1 Local RAM block diagram

53.1.2 Local RAM initialization

Before reading from the Local RAM, while the ECC error detection and correction is enabled, the entire Local RAM must be initialized.

CAUTIONS

1. **RAM initialization must be performed by 32-bit write accesses in order to ensure that all RAM data is initialized and the respective ECC value fits to the RAM content.**
2. **Reading from un-initialized Local RAM may lead to the detection of ECC errors.**

53.1.3 ECC of Local RAM

The ECC of the Local RAM generates an interrupt request listed in the following table:

Table 53.1 Interrupt Request by ECC of Local RAM

Function	Connected to
ECC 1-bit error interrupt of Local RAM	Error Control Module INTECCSLRAM
ECC 2-bit error interrupt of Local RAM	Error Control Module INTECCDLRAM

The ECC of the Local RAM and its registers are initialized by the following reset signal:

Table 53.2 Reset sources

ECCn unit	Reset signal
Local RAM ECC	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

The following table gives an outline of the ECC functions for the Local RAM.

Table 53.3 Local RAM ECC functions

Item	Description
ECC error detection and correction	ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. • ECC error detection and correction are carried out (2-bit error detection and 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. In the initial state, the ECC function is enabled; 1-bit error detection and correction and 2-bit error detection and notification are carried out.
Error notification	Upon occurrence of an ECC error, it is notified to the Error Control Module. • Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. • Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. In the initial state, notification of the 2-bit error is enabled and notification of the 1-bit error is disabled.
Error status	A status register is provided, which indicates the statuses of ECC 2-bit error detection and ECC 1-bit error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register.
Address capture	If an ECC error occurs while no error status is set, the address at which the associated error has occurred is captured. The address is captured when an ECC 2-bit error or an ECC 1-bit error is detected. The error status serves as the enable bit of the capture address.

53.1.4 Registers

This section describes all registers relating to the Local RAM ECC.

Table 53.4 List of LRAM ECC Registers

Module Name	Address	Symbol	Register Name	R/W	Initial Value	Access Size
ECCCPU1	FFC65400	LRECCCTL	Local RAM ECC control register	R/W	0000 0000$_H$	16/32
ECCCPU1	FFC65404	LRERRINT	Local RAM error information control register	R/W	0000 0006$_H$	8/16/32
ECCCPU1	FFC65408	LRSTCLR	Local RAM status clear register	W	0000 0000$_H$	8/16/32
ECCCPU1	FFC6540C	LROVFSTR	Local RAM error count overflow status register	R	0000 0000$_H$	8/16/32
ECCCPU1	FFC65410	LR1STERSTR	Local RAM 1st error status register	R	0000 0000$_H$	8/16/32
ECCCPU1	FFC65450	LR1STEADR0	Local RAM 1st error address register 0	R	0000 0000$_H$	8/16/32
ECCCPU1	FFC65454	LR1STEADR1	Local RAM 1st error address register 1	R	0000 0000$_H$	8/16/32
ECCCPU1	FFC65458	LR1STEADR2	Local RAM 1st error address register 2	R	0000 0000$_H$	8/16/32
ECCCPU1	FFC6545C	LR1STEADR3	Local RAM 1st error address register 3	R	0000 0000$_H$	8/16/32
ECCCPU1	FFC65004	LRTSTCTL	Local RAM test control register	R/W	0000 0000$_H$	16/32
ECCCPU1	FFC65008	LRTDATBF0	Local RAM test data read buffer 0	R	0000 0000$_H$	32
ECCCPU1	FFC6500C	LRTDATBF1	Local RAM test data read buffer 1	R	0000 0000$_H$	32

NOTE

In the header files the names of the above registers are defined in the following format:

<ModuleName> + <Symbol>.

<ModuleName> and <Symbol> are defined in the above table.

53.1.4.1 LRECCCTL — Local RAM ECC control register

LRECCCTL enables or disables ECC error detection and correction and 1-bit error correction. Set the PROT1 and PROT0 bits to 01_B when writing to LRECCCTL.

Access: This register can be accessed in 16-bit and 32-bit units.

Address: FFC6 5400_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 53.5 LRECCCTL register contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved. These bits are always read as 0. The write value should also be 0.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to LRECCCTL.
14	PROT0	
13 to 2	—	Reserved. These bits are always read as 0. The write value should also be 0.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with setting (PROT1, PROT0) = (0, 1). 0: Enables correction of the 1-bit error detected. 1: Disables correction of the 1-bit error detected.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with setting (PROT1, PROT0) = (0, 1). 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

53.1.4.2 LRERRINT — Local RAM error information control

LRERRINT enables or disables generation of the error notification signal to the ECM upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access: This register can be accessed in 8-bit, 16-bit and 32-bit units.

Address: FFC6 5404$_H$

Initial value: 0000 0006$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDIE	SEDIE
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 53.6 LRERRINT register contents

Bit Position	Bit Name	Function
31 to 3	—	Reserved. These bits are always read as 0 or 1, respectively. The write value should also be the initial value.
2	—	Reserved. This bit is always read as 1. The write value should also be 1.
1	DEDIE	ECC 2-bit error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-bit error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

53.1.4.3 LRSTCLR — Local RAM status clear register

LRSTCLR clears the error flags in the error status register (LR1STERSTR), the overflow flag in the error overflow status register (LROVFSTR), and the error address register (LR1STEADR).

Access: This register can be accessed in 8-bit, 16-bit and 32-bit units.

Address: FFC6 5408$_H$

Initial value: Reading this register returns always 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	STCLR3	STCLR2	STCLR1	STCLR0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	W	W	W	W

Table 53.7 LRSTCLR register contents

Bit Position	Bit Name	Function
31 to 4	—	Reserved. These bits are always read as 0. The write value should also be 0.
3	STCLR3	Error Status / Error Overflow Flag Clear (for bank 3) Writing 1 to this bit clears the DEDF3 and SEDF3 flags in LR1STERSTR; ERROVF3 flag in LROVFSTR; and LR1STEADR3.
2	STCLR2	Error Status / Error Overflow Flag Clear (for bank 2) Writing 1 to this bit clears the DEDF2 and SEDF2 flags in LR1STERSTR; ERROVF2 flag in LROVFSTR; and LR1STEADR2.
1	STCLR1	Error Status / Error Overflow Flag Clear (for bank 1) Writing 1 to this bit clears the DEDF1 and SEDF1 flags in LR1STERSTR; ERROVF1 flag in LROVFSTR; and LR1STEADR1.
0	STCLR0	Error Status / Error Overflow Flag Clear (for bank 0) Writing 1 to this bit clears the DEDF0 and SEDF0 flags in LR1STERSTR; ERROVF0 flag in LROVFSTR; and LR1STEADR0.

53.1.4.4 LROVFSTR — Local RAM error count overflow status register

LROVFSTR monitors occurrence of error overflow. If the second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

An ERROVF is cleared by setting the STCLR bit to 1 in LRSTCLR.

Access: This register can be accessed in 8-bit, 16-bit and 32-bit units.

Address: FFC6 540C$_H$

Initial value: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	ERROVF3	ERROVF2	ERROVF1	ERROVF0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 53.8 LROVFSTR register contents

Bit Position	Bit Name	Function
31 to 4	—	Reserved. These bits are always read as 0. The write value should also be 0.
3	ERROVF3	Error Overflow Flag (for bank 3) ERROVF3 is set if the second error occurs while any of the error flags (DEDF3 and SEDF3) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.
2	ERROVF2	Error Overflow Flag (for bank 2) ERROVF2 is set if the second error occurs while any of the error flags (DEDF2 and SEDF2) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.
1	ERROVF1	Error Overflow Flag (for bank 1) ERROVF1 is set if the second error occurs while any of the error flags (DEDF1 and SEDF1) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.
0	ERROVF0	Error Overflow Flag (for bank 0) ERROVF0 is set if the second error occurs while any of the error flags (DEDF0 and SEDF0) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.

53.1.4.5 LR1STERSTR — Local RAM 1st error status register

LR1STERSTR monitors occurrence of the first error. The error status is set if an error occurs while the error flag is 0. The error flag is overwritten if an ECC 2-bit error occurs while the ECC 1-bit error flag is set.

An error status bit is cleared by setting 1 to the STCLR bit in LRSTCLR.

Access: This register can be accessed in 8-bit, 16-bit and 32-bit units.

Address: FFC6 5410$_H$

Initial value: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	DEDF3	SEDF3	—	—	—	—	—	—	DEDF2	SEDF2
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DEDF1	SEDF1	—	—	—	—	—	—	DEDF0	SEDF0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 53.9 LR1STERSTR register contents

Bit Position	Bit Name	Function
7+8n:4+8n	—	Reserved. These bits are always read as 0. The write value should also be 0.
1+8n	DEDFn	ECC 2-bit error Monitor Flag 0: Cleared to 0 by setting 1 to the STCLRn bit in LRSTCLR. 1: Indicates that an ECC 2-bit error has occurred while the error flags DEDFn are 0.
0+8n	SEDFn	ECC 1-bit error Monitor Flag 0: Cleared to 0 by setting 1 to the STCLRn bit in LRSTCLR. 1: Indicates that an ECC 1-bit error has occurred while all the error flags DEDFn and SEDFn are 0.

Note: n = 0 to 3

53.1.4.6 LR1STEADRn — Local RAM 1st error address register n (n = 0 to 3)

LR1STEADRn holds the address at which an error has occurred.

The error address is set if an error occurs while all the error flags are 0 in LR1STERSTR. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set in LR1STERSTR. Once an ECC 2-bit error occurs, the address is not updated.

This register stores the actual address [18:4]. Align the bit position with the base address (FED8 0000_H for all devices) and add n * 4 when transform the internal address to the actual address.

LR1STEADRn is also cleared by setting the STCLR bit to 1 in LRSTCLR.

Access: This register can be accessed in 8-bit, 16-bit and 32-bit units.

Address: FFC6 5450_H + n x 4_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	EADR[14:0]														
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 53.10 LR1STEADRn register contents

Bit Position	Bit Name	Function
31 to 15	—	Reserved. These bits are always read as 0. The write value should also be 0.
14 to 0	EADR[14:0]	1st Error Address (for bank n) Monitors the address of the first error. The error address is set if an error occurs while all the error flags for bank n are 0 in LR1STERSTR. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated.

53.1.4.7 LRTSTCTL — Local RAM Test Control Register

This register is used for the ECC test (self-diagnosis).
After ECC test mode is enabled by setting ECCTST = 1, desired data can be written to the ECC bits.
The DATSEL bit is used to select RAM data or the ECC bits.

Access: This register can be accessed in 16-bit and 32-bit units.

Address: FFC6 5004_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	ECC TST	DATSEL
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 53.11 LRTSTCTL register contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved. These bits are always read as 0. The write value should also be 0.
15, 14	PROT[1:0]	These bits are used to enable or disable rewriting ECCTST, and DATSEL bits. The value written is not retained. These bits are always read as 0. Set PROT[1:0] = (0,1) when writing to LRTSTCTL.
13 to 2	—	Reserved. These bits are always read as 0. The write value should also be 0.
1	ECCTST	ECC Test When ECC test mode is set (ECCTST = 1), reading through LRTDATBFn is enabled, and direct writing is enabled by setting DATSEL = 1.
0	DATSEL	This bit is valid when ECCTST = 1. This bit selects the RAM bit which can be accessed when writing. When this bit is set to 1, bits [6:0] in the 32-bit write data are written to the ECC bits. 0: RAM data is selected. 1: The ECC bits are selected.

CAUTION

When ECC test mode for the local RAM is enabled (ECCTST = 1), the local RAM should be accessed in 4-byte units.

53.1.4.8 LRTDATBFn — Local RAM Test Data Read Buffer n (n = 0, 1)

In ECC test mode (self-diagnosis), the ECC bits can be read. If the local RAM is read while ECCTST = 1 in the local RAM test control register LRTSTCTL, reading from the local RAM reads out the ECC bits, and these bits are stored in this buffer.

Access: This register can be accessed in 32-bit units.

Address: LRTDATBF0: FFC6 5008_H
LRTDATBF1: FFC6 $500C_H$

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	LRDATBF[24:16]								
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LRDATBF[8:0]								
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 53.12 LRTDATBFn register contents

Bit Position	Bit Name	Function
31 to 25	—	Reserved. These bits are always read as 0. The write value should also be 0.
24 to 16	LRDATBF (2n + 1) [24:16]	These bits are valid when ECCTST = 1 (selecting test mode) in the local RAM test control register. When reading from the corresponding bank in the local RAM, the ECC bits for the local RAM (bank (2n + 1)) are stored in LRDATBF(2n + 1)[22:16] and LRDATBF(2n + 1)[24:23].
31 to 25	—	Reserved. These bits are always read as 0. The write value should also be 0.
15 to 9	LRDATBF (2n) [8:0]	These bits are valid when ECCTST = 1 (selecting test mode) in the local RAM test control register. When reading from the corresponding bank in the local RAM, the ECC bits for the local RAM (bank (2n)) are stored in LRDATBF(2n)[6:0] and LRDATBF (2n)[8:7].

NOTE

When n is 1, the bit name of bank 2 becomes LRDATBF2[8:0].

53.1.5 Usage Notes

On path between Local RAM and CPU, buffers are implemented to realize fast Local RAM access.

Therefore, when a load instruction is executed for the same address after a store instruction to Local RAM, the load instruction may read out data from buffers instead of data on Local RAM. If stored data on Local RAM is needed, execute either of following procedures.

1. Read out data in the order written address after writing more than 32 byte data into Local RAM.
2. Execute SYNCM instruction before a load instruction is executed for the same address after a store instruction to Local RAM.

NOTE

DMAC or other bus masters also read data from buffers, when data have not been stored to Local RAM yet.

53.2 Retention RAM (RRAM)

The retention RAM is a RAM area in which values are retained in this area in DEEPSTOP mode.

53.2.1 Retention RAM Error Correction Coding (RRAMECC)

53.2.2 Units

This microcontroller has the following number of units of the Retention RAM ECC module.

Table 53.13 Units

Retention RAM ECC	D1L1	D1L2(H)	D1M1(H) D1M1-V2 D1M1A	D1M2(H)
Units	1	1	1	1
Names	RRAMECC0	RRAMECC0	RRAMECC0	RRAMECC0

Unit index n

Throughout this section, the individual units of the Retention RAM is identified by the index “n” (n = 0), for example RRAMECCnCTL for the BRMn control register.

Error detection stage index m

Throughout this section, the individual number of an error detection stage is identified by the index “m” (m = 7), for example the register RRAMECCnEADm holds the address of the m^{th} error detection.

53.2.2.1 Register base addresses <RRAMECCn_base>

All Retention RAM ECC module register addresses are given as address offsets from the individual base address <RRAMECCn_base>.
The <RRAMECCn_base> address of the retention RAM ECC module is listed in the following table:

Table 53.14 Register base addresses <RRAMECC_base>

RRAMECCn unit	<RRAMECCn_base> address
RRAMECC0	FFC7 9000_H

53.2.2.2 Retention RAM ECC interrupts

The ECC of the Retention RAM generates interrupt requests listed in the following table:

Table 53.15 Interrupt Request by ECC of Retention RAM

Function	Connected to
ECC 1-bit error interrupt of Retention RAM	Error Control Module INTECCSEDRRAM
ECC 2-bit error interrupt of Retention RAM	Error Control Module INTECCDEDRRAM

53.2.2.3 Retention RAM initialization

Before reading from the Retention RAM, while the ECC error detection and correction is enabled, the entire Retention RAM must be initialized.

CAUTIONS

1. **RRAM initialization must be performed by 64-bit write accesses in order to ensure that all RRAM data is initialized and the respective ECC value fits to the RRAM content.**
2. **Reading from un-initialized Retention RAM may lead to the detection of ECC errors.**

53.2.2.4 Retention RAM ECC reset sources

The ECC of the Retention RAM and its registers are initialized by the following reset signal:

Table 53.16 Reset sources

RRAMECCn unit	Reset signal
RRAMECC0	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

53.2.2.5 Retention RAM ECC functions

The Retention RAM Error Correction Coding (RRAMECC) module generates and tests Error Correction Coding (ECC) information for Retention RAM data.

8 bit ECC information is calculated and added to each 64-bit data unit, that is written to the Retention RAM.

During read-back of the data the ECC information is checked against the read data.

Upon detection of a single erroneous bit in a 64-bit data unit

- the erroneous bit of the read data is corrected (but the erroneous memory data is retained)
- a Single Error Detection (SED) flag RRAMECCnCTL.ECSEDFm is set
- the read access address is stored in the RRAMECCnEADm register
- an INTECCSEDRRAM interrupt is generated

Upon detection of two erroneous bits in a 64-bit data unit

- a Double Error Detection (DED) flag RRAMECCnCTL.ECDEDFm is set
- the read access address is stored in the RRAMECCnEADm register
- an INTECCDEDRRAM interrupt is generated

ECC process during data write with less than 64 bit

If data with less than 64 bit is written (e.g. 32 bit, 16 bit and 8 bit) through the direct 32-bit access with ECC area, the respective 64-bit data unit is read and the ECC is checked.

If this ECC check detects a single erroneous bit in the read 64-bit data unit

- the erroneous bit is corrected in the RAM
- the Single Error Detection (SED) flag RRAMECCnCTL.ECSEDFm is set

- the read access address is stored in a RRAMECCnEADm register
- the INTECCSEDRRAM interrupt is generated
- a new (and now correct) ECC value with the correct data is calculated.

If this ECC check detects two erroneous bits in the read 64-bit data unit

- the Double Error Detection (DED) flag RRAMECCnCTL.ECDEDFm is set
- the read access address is stored in a RRAMECCnEADm register
- the INTECCDEDRRAM interrupt is generated

A one bit error in the target 64-bit data unit is corrected in the RAM during write.

A two bit error in the target 64-bit data unit is not corrected during the write and a new ECC value will be calculated with the uncorrected data.

CAUTION

Under the above conditions an ECC error interrupt can occur during a write access.

53.2.2.6 Error detection

(1) Error detection stage

Information about up to eight error detections are stored, i.e.

- up to eight read addresses with errors are stored in the error address registers RRAMECCnEADm, with m = 0 to 7
- single or double error detection indication is stored in the ECSEDFm and ECDEDFm of the ECC control register RRAMECCnCTL.

The error detection flags ECSEDFm and ECDEDFm are related to the error address stored in RRAMECCnEADm. I.e. each error detection address has separate assigned error flags.

The address of the detected errors are stored in ascending order of m, starting from RRAMECCnEAD0.

RRAMECCnEADm is set to its default value $0000\ 0000_H$ by clearing the error detection flag ECER1F or ECER2F in the ECC control register RRAMECCnCTL.

1. If only single bit errors are present ECER1F clears all single bit errors.
   ECER2F does not clear single bit errors in this case.
2. If only double bit errors are present ECER2F clears all double bit errors.
   ECER1F does not clear double bit errors in this case.
3. If the detected errors are a mixture of single and double bit errors, ECER2F or ECER1F clears all of them. It is not possible to clear only one or the other.
4. In each case all RRAMECCnEADm registers are cleared by ECER1F if a single bit error was detected.
5. In each case all RRAMECCnEADm registers are cleared by ECER2F if a double bit error was detected.

(2) Error detection stages overflow

An error detection while all error detection stages hold valid error indications (i.e. any of the error flags ECSEDFm or ECDEDFm of stage m is active), are treated as follows:

- If the current error detection reveals a single bit error, all error flags ECSEDFm or ECDEDFm and error addresses RRAMECCnEADm are not changed.
- If the current error detection reveals a double bit error and
  - all error detection stages m = 0 to 7 indicate single bit errors (i.e. ECSEDF[7:0] = 1 and ECDEDF[7:0] = 0),
    - the current error address overwrites the previous error address in RRAMECCnEAD7
    - the double bit error flag is set, i.e. ECDEDF7 = 1. The double bit error interrupt INTECCDEDRRAM is asserted, provide this is permitted by RRAMECCnCTL.EC2EDIC = 1.
  - if any of the error detection stages m = 0 to 7 indicate a double bit errors (i.e. any ECDEDF[7:0] = 1) all error flags ECSEDFm or ECDEDFm and error addresses RRAMECCnEADm are not changed.

In any of the above cases the overflow flag RRAMECCnCTL.ECOVFF is set.

(3) Additional error flags

- RRAMECCnCTL.ECER2F: Double bit error detection flag
  This flag is set with the 1st occurrence of a double bit error. It is only cleared by setting RRAMECCnCTL.ECER2C = 1.
- RRAMECCnCTL.ECER1F: Single bit error detection flag
  This flag is set with the 1st occurrence of a single bit error. It is only cleared by setting RRAMECCnCTL.ECER1C = 1.
- RRAMECCnCTL.ECEMF: ECC error has occurred during the last read
  This bit is cleared by the next read if the ECC value is correct.

(4) Error interrupt control

The generation of error detection interrupts can be controlled by control bits of the RRAMECCnCTL register:

- EC2EDIC = 0/1 disables/enables generation of the double error detection interrupt INTECCDEDRRAM
- EC1EDIC = 0/1 disables/enables generation of the single error detection interrupt INTECCSEDRRAM

53.2.2.7 ECC mode control

The ECC module can be set in two different modes:

- RRAMECCnCTL.ECTHM = 0: normal operation mode
  Error judgement can be enabled/disabled by RRAMECCnCTL.ECERVF
- RRAMECCnCTL.ECTHM = 1: pass through mode
  ECC calculation and storage of the ECC bits in the RAM is performed even in pass through mode. ECC decoding upon RAM data read is not executed.

The following table gives an overview about the different modes:

Generation of the 8-bit ECC data during write of data to the Retention RAM is not affected by RRAMECCnCTL.ECTHM.

Table 53.17 ECC modes overview

ECC mode setting		Error correction	Error address storage	Interrupts assertion	Error flags settings
ECTHM*1	ECERVF*1	Single bit errors	RRAMECCnEADm *2, ECDEDFm*1, ECSEDFm*1	INTECCDED RRAM, INTECCSED RRAM	ECER2F, ECER1F, ECEMF*1
0: normal operation	0: error judgement disabled	yes	no	no	no
	1: error judgement enabled	yes	yes	yes	yes
1: pass through	x	no	no	no	no

Note 1. Bits in the ECC control register RRAMECCnCTL.
Note 2. ECC error address registers.

ECC mode setting protection

Modification of the ECC mode control bits ECTHM and ECERVF in the RRAMECCnCTL register is depends on two protection bits in the RRAMECCnCTL register:

- ECMA[1:0] = 01_B: modification of ECTHM and ECERVF is possible
- All other ECMA[1:0] settings: modification of ECTHM and ECERVF is not possible

CAUTION

Since an 8-bit ECC code is first calculated during the write to the respective 64-bit data, the ECC code does most likely not fit to the data unit after power-up of the Retention RAM.

Consequently a read of un-initialized Retention RAM content will most likely lead to ECC error detections.

53.2.3 Registers

This section contains a description of all registers of the Retention RAM ECC.

Table 53.18 Retention RAM ECC registers overview

Register Name	Shortcut	Address
ECC control register	RRAMECCnCTL	<RRAMECCn_base> + 00_H
ECC error address register 0	RRAMECCnEAD0	<RRAMECCn_base> + 14_H
ECC error address register 1	RRAMECCnEAD1	<RRAMECCn_base> + 18_H
ECC error address register 2	RRAMECCnEAD2	<RRAMECCn_base> + $1C_H$
ECC error address register 3	RRAMECCnEAD3	<RRAMECCn_base> + 20_H
ECC error address register 4	RRAMECCnEAD4	<RRAMECCn_base> + 24_H
ECC error address register 5	RRAMECCnEAD5	<RRAMECCn_base> + 28_H
ECC error address register 6	RRAMECCnEAD6	<RRAMECCn_base> + $2C_H$
ECC error address register 7	RRAMECCnEAD7	<RRAMECCn_base> + 30_H
ECC test mode control register	RRAMECCnTMC	<RRAMECCn_base> + 04_H
ECC encode/decode input/output substitution register 1	RRAMECCnTED1	<RRAMECCn_base> + 08_H
ECC encode/decode input/output substitution register 2	RRAMECCnTED2	<RRAMECCn_base> + $0C_H$
ECC test redundant bit data control register	RRAMECCnTRC	<RRAMECCn_base> + 10_H

<RRAMECCn_base>

The base addresses <RRAMECCn_base> of the Retention RAM is defined in “Register base addresses <RRAMECCn_base>” in the section above.

NOTE

Memory access right after register access has possibility to cause the racing between two accesses via different routes.
Therefore, the last accessed register value must be confirmed at least before memory access. Refer to Section 3.4.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation for details.

53.2.3.1 RRAMECCnCTL – ECC control register

This register holds various status and control bits.

Access: This register can be accessed in 32-bit units.

Address: <RRAMECCn_base> + 00_H

Initial value: 0000 0000 0001 $000x_B$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECDEDF7	ECSEDF7	ECDEDF6	ECSEDF6	ECDEDF5	ECSEDF5	ECDEDF4	ECSEDF4	ECDEDF3	ECSEDF3	ECDEDF2	ECSEDF2	ECDEDF1	ECSEDF1	ECDEDF0	ECSEDF0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA[1:0]		0	0	ECOVF	ECER2C	ECER1C	0	ECTHM	ECERVF	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Initial value	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	x
R/W	R/W	R/W	R	R	R	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R

Table 53.19 RRAMECCnCTL register contents (1/3)

Bit position	Bit name	Function
31 to 16	ECDEDFm ECSEDFm	These bits indicate the type of error, that is related to the stored error address of stage m in the RRAMECCnEADm register. • ECDEDFm = 0 and ECSEDFm = 0 No error address stored in RRAMECCnEADm. • ECDEDFm = 1 and ECSEDFm = 0 RRAMECCnEADm address of double error detection • ECDEDFm = 0 and ECSEDFm = 1 RRAMECCnEADm address of single error detection • ECDEDFm = 1 and ECSEDFm = 1 Does not occur. These bits are cleared under following conditions: • While ECER2F bit is set, writing RRAMECCnCTL.ECER2C = 1 clears ECDEDF7-0 and ECSEDF7-0 While ECER1F bit is set, writing RRAMECCnCTL.ECER1C = 1 clears ECDEDF7-0 and ECSEDF7-0 • ECC pass through mode (RRAMECCnCTL.ECTHM = 1) • ECC error judgment disabled (RRAMECCnCTL.ECERVF = 0)
15 to 14	EMCA[1:0]	ECC mode protection • EMCA[1:0] = 01_B: modification of the ECC mode control bits ECTHM and ECERVF is permitted • All other EMCA[1:0] setting: modification of the ECC mode control bits ECTHM and ECERVF is not possible
13 to 12	Reserved	When read, the value after reset is read. When written, write the value after reset.

Table 53.19 RRAMECCnCTL register contents (2/3)

Bit position	Bit name	Function
11	ECOVFF	Overflow detection flag In case of an error detection, while all error address registers RRAMECCnEADm hold already a valid error address, this overflow flag is set. 0: no overflow detected 1: overflow detected Writing to this bit has no effect. These bits are cleared under following conditions: • Writing RRAMECCnCTL.ECER2C = 1 while ECER2F bit is set • Writing RRAMECCnCTL.ECER1C = 1 while ECER1F bit is set • ECC pass through mode (RRAMECCnCTL.ECTHM = 1) • ECC error judgment disabled (RRAMECCnCTL.ECERVF = 0)
10	ECER2C	Clear double bit error detection flag ECER2F 0: no function 1: clears ECER2F Reading this bit returns always 0.
9	ECER1C	Clear single bit error detection flag ECER1F 0: no function 1: clears ECER1F Reading this bit returns always 0.
8	Reserved	When read, the value after reset is read. When written, write the value after reset.
7	ECTHM	Pass through mode enable bit. 0: Normal operation mode 1: Pass through mode enable. ECC decoding upon RAM data read is not executed, i.e. no error judgment or the bit correction is performed. ECC calculation and storage of the ECC bits in the RAM is performed even in pass through mode. Modification of this bit is only possible, if EMCA[1:0] = 01_B. Otherwise any write to this bit is ignored.
6	ECERVF	ECC error judgment enable 0: error judgement disabled 1: error judgement enabled Error judgement is only effective in normal operation mode, i.e. if RRAMECCnCTL.ECTHM = 0. If error judgement is disabled no interrupts are asserted in case of a single or double bit error detection. However detected single bit errors are corrected. Modification of this bit is only possible, if EMCA[1:0] = 01_B. Otherwise any write to this bit is ignored.
5	EC1ECP	Single bit error correction permission 0: Single bit error is corrected 1: Single bit error is not corrected
4	EC2EDIC	Double bit error detection interrupt INTRRAMECCnDED control 0: INTRRAMECCnDED is not generated 1: INTRRAMECCnDED is generated upon double bit error detection
3	EC1EDIC	Single bit error detection interrupt INTRRAMECCnSED control 0: INTRRAMECCnSED is not generated 1: INTRRAMECCnSED is generated upon single bit error detection
2	ECER2F	Double bit error detection flag 0: no double bit error detected 1: double bit error detected Writing to this bit has no affect. This bit is cleared under following conditions: • writing RRAMECCnCTL.ECER2C = 1 • ECC pass through mode (RRAMECCnCTL.ECTHM = 1) • ECC error judgment disabled (RRAMECCnCTL.ECERVF = 0)

Table 53.19 RRAMECCnCTL register contents (3/3)

Bit position	Bit name	Function
1	ECER1F	Single bit error detection flag 0: no single bit error detected 1: single bit error detected and corrected Writing to this bit has no affect. This bit is cleared under following conditions: • writing RRAMECCnCTL.ECER1C = 1 • ECC pass through mode (RRAMECCnCTL.ECTHM = 1) • ECC error judgment disabled (RRAMECCnCTL.ECERVF = 0)
0	ECEMF	ECC error indication of current Retention RAM data read 0: no ECC error detected at current read 1: ECC error detected at current read This bit is updated by every RAM output data. This bit is cleared under following conditions: • current Retention RAM data read without ECC error • ECC pass through mode (RRAMECCnCTL.ECTHM = 1) • ECC error judgment disabled (RRAMECCnCTL.ECERVF = 0)

53.2.3.2 RRAMECCnEADm – ECC error address register m (m = 0 to 7)

These registers store the read address, when an ECC error was detected.

Access: This register can be accessed in 32-bit units.

Address: <RRAMECCn_base> + 14_H + m x 04_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEAD[31:16]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEAD[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 53.20 RRAMECCnEADm register contents

Bit position	Bit name	Function
31 to 0	ECEAD[31:0]	Address of read access, when an ECC error was detected. The type of error, i.e. single or double bit error, is indicated by RRAMECCnCTL.ECDEDm and RRAMECCnCTL.ECSEDm. ECEAD[31:0] is the address of the erroneous 64-bit data unit. Base address is not included. The complete read address is calculated by use of this formula: read address = 3FCE 4000_H + ECEAD[31:0] * 8 Under certain conditions the address of the RRAMECCnEAD7 register is overwritten upon detection of an ECC error. Refer to Section (2), Error detection stages overflow for details. RRAMECCnEADm is set to its default value by clearing the error detection flag ECER1C or ECER2C in the ECC control register RRAMECCnCTL.

53.2.3.3 RRAMECCnTMC – ECC test mode control register

The RRAMECCnTMC register switches to and controls the test mode.

This register can be used when RRAM is not accessed.

Access: This register can be accessed in 16-bit units.

Address: <RRAMECCn_base> + 04_H

Initial value: $0000\ 0000_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ETMA[1:0]		0	0	0	0	0	0	EC TMCE	0	0	EC TRRS	EC REOS	EC ENS	EC DCS	EC REIS
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Table 53.21 RRAMECCnTMC register contents (1/2)

Bit position	Bit name	Function
15, 14	ETMA[1:0]	Access control bits 1 and 0 to ECC test mode bit These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 10_B, writing to bit 7 is enabled.
7	ECTMCE	ECC test mode enable bit This bit specifies whether to enable access to the test registers and test control bits. When writing to this bit, 10_B should be written to ETMA[1:0] at the same time. 0: Access to the test mode registers and bits is disabled. 1: Access to the test mode registers and bits is enabled. Test registers: RRAMECCnTED, RRAMECCnTRC, RRAMECCnHORD, RRAMECCnECRD, RRAMECCnERDB Register test control bit: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS
4	ECTRRS	ECC RAM read test mode selection bit Select reading destination when reading RRAMECCnTED register and reading destination when reading RRAMECCnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: The read value of the RRAMECCnTED register is the write value of the RRAMECCnTED register. The read value of the RRAMECCnERDB register is the write value of the RRAMECCnERDB register. 1: The read value of the RRAMECCnTED register can read RAM data. The read value of the RRAMECCnERDB register is the ECC data to be written to RAM.
3	ECREOS	ECC redundant bit output data selection bit This bit is used to identify and select the ECC data to be stored in RAM as ECC data generated for write data or the value of the RRAMECCnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Store ECC data generated for write data to RAM. 1: Store the value of RRAMECCnERDB register to RAM.

Table 53.21 RRAMECCnTMC register contents (2/2)

Bit position	Bit name	Function
2	ECENS	ECC encoder input selection bit This bit is used to identify the targeted data for ECC data generation as write data to RAM or the value of the RRAMECCnTED register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate ECC data from the write data to RAM. 1: Generate ECC data from the value of the RRAMECCnTED register.
1	ECDCS	ECC decoder input selection bit This bit is used to identify and select the targeted data for syndrome code generation and error detection as RAM data or the value of the RRAMECCnTED register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate syndrome code from RAM data and detect errors. 1: Generate syndrome code from the value of the RRAMECCnTED register and detect errors.
0	ECREIS	ECC redundant bit input data selection bit This bit is used to identify and select the targeted data for syndrome code generation and error detection as RAM data or the value of the RRAMECCnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate syndrome code from ECC data stored in RAM and detect errors. 1: Generate syndrome code from the value of the RRAMECCnERDB register and detect errors.

53.2.3.4 RRAMECCnTED1 – ECC encode/decode input/output substitution register 1

In ECC test mode, this register handles upper 32 bit data of ECC test data.
The value of the register can be used to generate ECC data or syndrome code.
It is accessible when ECC test mode is enabled (RRAMECCnTMC.ECTMCE = 1)
When RRAMECCnTMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when RRAM is not accessed.

Access: This register can be accessed in 32-bit units.

Address: <RRAMECCn_base> + 08_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 53.22 RRAMECCnTED1 register contents

Bit position	Bit name	Function
31 to 0	ECEDB[63:32]	When RRAMECCnTMC.ECENS = 1, the value of this register is used to generate ECC data and the value this register to RAM is stored to RAM. When RRAMECCnTMC.ECDCS = 1, the value of this register is used to generate syndrome code. In addition, when RRAMECCnTMC.ECTRRS = 1, RAM data [63:32], instead of written data, is read for the value of this register.

53.2.3.5 RRAMECCnTED2 – ECC encode/decode input/output substitution register 2

In ECC test mode, this register handles lower32 bit data of ECC test data.
The value of the register can be used to generate ECC data or syndrome code.
It is accessible when ECC test mode is enabled (RRAMECCnTMC.ECTMCE = 1).
When RRAMECCnTMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when RRAM is not accessed.

Access: This register can be accessed in 32-bit units.

Address: <RRAMECCn_base> + $0C_H$

Initial value: 0000 0000_H

Bit position	Bit name	Function
31 to 0	ECEDB[31:0]	When RRAMECCnTMC.ECENS = 1, the value of this register is used to generate ECC data and the value this register to RAM is stored to RAM. When RRAMECCnTMC.ECDCS = 1, the value of this register is used to generate syndrome code. In addition, when RRAMECCnTMC.ECTRRS = 1, RAM data [31:0], instead of written data, is read for the value of this register.

53.2.3.6 RRAMECCnTRC – ECC test redundant bit data control register

In ECC test mode, this test register, for ECC data, consists of three 8-bit registers, RRAMECCnHORD, RRAMECCnECRD, and RRAMECCnERDB.
It is accessible when ECC test mode is enabled (RRAMECCnTMC.ECTMCE = 1).
When RRAMECCnTMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when RRAM is not accessed.

Access: This register can be accessed in 32-bit units.

Address: <RRAMECCn_base> + 10_H

Initial value: 0000 0000_H

Table 53.24 RRAMECCnTRC register contents (1/2)

Bit position	Bit name	Function
31 to 24	Reserved	Writing to this register is ignored. When ECC test mode is enabled (RRAMECCnTMC.ECTMCE = 1), the read values of these bits are undefined. When ECC test mode is disabled (RRAMECCnTMC.ECTMCE = 0), 00_H is read.
23 to 16	HORD[7:0]	In ECC test mode, this register is used to store ECC data for read RAM data. Writing to this register is ignored. When ECC test mode is enabled (RRAMECCnTMC.ECTMCE = 1), this register can be accessed. When ECC test mode is disabled (RRAMECCnTMC.ECTMCE = 0), 00_H is read. HORD[7:0] ECC code for read RAM data is stored as needed. When RRAMECCnTMC.ECTRRS = 1 and RRAMECCnTED register is read, ECC code is stored.
15 to 8	ECRD[7:0]	In ECC test mode, this is a read-only register for storing ECC data generated for write RAM data. Writing to this register is ignored. When ECC test mode is enabled (RRAMECCnTMC.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (RRAMECCnTMC.ECTMCE = 0), 00_H is read. ECRD[7:0] These bits can read ECC data generated at the time of RAM data writing, and can read ECC data for the data written to the RRAMECCnTED register when RRAMECCnTMC.ECENS = 1.

Table 53.24 RRAMECCnTRC register contents (2/2)

Bit position	Bit name	Function
7 to 0	ERDB[7:0]	In ECC test mode, this register handles ECC data. The value of this register can be used as ECC data generated at the time of RAM writing or ECC data read at the time of RAM data reading. When ECC test mode is enabled (RRAMECCnTMC.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (RRAMECCnTMC.ECTMCE = 0), 00_H is read. ERDB[7:0] When RRAMECCnTMC.ECREOS = 1, these bits store the value of this register as ECC data to RAM. When RRAMECCnTMC.ECREIS = 1, the value of this register is read as ECC data read from RAM. When RRAMECCnTMC.ECTRRS = 1, ECC data to be stored in RAM is read instead of the write data for the read value of this register.

53.3 Video RAM (VRAM)

Refer to Section 54, Video RAM and Video RAM Wrapper (VRAM) for a detailed description about the Video RAM.

Section 54 Video RAM and Video RAM Wrapper (VRAM)

54.1 Overview of the Video RAM and Video RAM Wrapper (VRAM)

54.1.1 Units

This microcontroller has the following number of units of the Video RAM and VRAM Wrapper.

Table 54.1 Video RAM and Wrapper overview Units

Video RAM and Wrapper	D1L1	D1L2(H)	D1M1(H) D1M1-V2	D1M1A	D1M2(H)
Video RAM	–	144 KB	1.55 MB	2 x 1.195 MB	2 x 1.55 MB
VRAM Wrapper	–	yes	yes	yes	yes
Names	–	VRAM0	VRAM0	VRAM0, VRAM1	VRAM0, VRAM1

Unit index n

Throughout this section, the individual units of the Video RAM and Wrapper is identified by the index “n” (n = 0, 1), for example VRAMnCTL for the VRAMn control register.

Error detection stage index m

Throughout this section, the individual number of an error detection stage is identified by the index “m” (m = 7), for example the register VRAMnEADm holds the address of the m^{th} error detection.

54.1.1.1 Register addresses <VRAMn_base>

All Video RAM and Wrapper module register addresses are given as address offsets from the individual base addresses <VRAMn_base>.
The <VRAMn_base> addresses of the VRAMn is listed in the following table:

Table 54.2 Register base addresses <VRAMn_base>

VRAMn unit	<VRAMn_base> address
VRAM0	FFFD 1000_H
VRAM1	FFFD 2000_H

54.1.1.2 Interrupts

The Video RAM and Wrapper modules can generate the following interrupt requests:

Table 54.3 VRAMn interrupt requests

VRAMn signals	Function	Connected to
VRAM0:		
INTECCSED	Single bit error detection interrupt	Error Control Module INTECCSEDVRAM*1
INTECCDED	Double bit error detection interrupt	Error Control Module INTECCDEDVRAM*2
INTECCOVF	Overflow detection interrupt	not connected
VRAM1:		
INTECCSED	Single bit error detection interrupt	Error Control Module INTECCSEDVRAM*1*3
INTECCDED	Double bit error detection interrupt	Error Control Module INTECCDEDVRAM*2
INTECCOVF	Overflow detection interrupt	not connected

Note 1. This Error Control Module input signal INTECCSEDVRAM is a logical OR combination of both single bit error detection interrupts.
Refer to Section 48, Error Control Module (ECM) for details.

Note 2. This Error Control Module input signal INTECCDEDVRAM is a logical OR combination of both double bit error detection interrupts.
Refer to Section 48, Error Control Module (ECM) for details.

Note 3. In D1M2(H), INTECCSEDVRAM of VRAM1 has possibility to be lost. To detect single bit error with certainty, read VRAM1CTL register periodically or allocate ranges, which need to generate interrupt, to VRAM0.

54.1.1.3 Reset sources

The VRAM Error Correction Coding modules and their registers are initialized by the following reset signal:

Table 54.4 Reset sources

VRAMn unit	Reset signal
VRAMn	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

54.2 Video RAM Wrapper function overview

The Video RAM Wrapper takes care for densely packing different color format data in the video memory in order to minimize unused memory gaps. It also unwraps the data when it is read, so the data wrapping/unwrapping is transparent to the master, that writes and reads the data.
This way the on-chip Video RAM is virtually enlarged for storing color data formats, which does not occupy an entire 32-bit word.

Video RAM Wrapper features

- Generation and tests of Error Correction Coding (ECC) information for non-wrapped internal 32-bit video RAM data. Refer to Section 54.6, VRAM Error Correction Coding (VRMECC) for details.
  Hence the 32-bit mode - with and without ECC - is suitable for storage of any kind of data, not just color data.
- Several access modes of 32 bit Video RAM accesses from masters:
  - direct 32-bit access without Error Correction Coding (ECC)
  - direct 32-bit access with Error Correction Coding (ECC)
  - wrap/unwrap of 24 bpp RGB888 color data
  - wrap/unwrap of 24 bpp αRGB6666 color data
  - wrap/unwrap of 18 bpp RGB666 color data

  All modes can be used in parallel by using dedicated areas in the memory map, which determine the used data/color mode, refer to Section 54.5, Video RAM and SDRAM memory map.
- Memory bandwidth impact:
  - No impact for packing/unpacking, correct ECC data,
  - Slight decrease with non-64-bit non-burst single accesses

Video RAM organization and VRAM Wrapper color conversion

One VRAM word consists of 72 bit. Within four 72-bit words an integer number of pixel color data of each color format can be stored. Thus the storage of the data is aligned to 4 x 72 bit = 288 bit block.

NOTE

The 288-bit block alignment does not impact the data write/read by the application program, i.e. the user does not need to take care.

54.3 VRAM Transaction Restrictor

The VRAM transaction restrictor can be used to serve cross-connect masters read request with higher priority than write request or vice versa.

It allows to contiguously process a programmable number of read (or write) transactions, while suspending any write (or read, respectively) request.

Transaction restrictor features overview

- The transaction restrictor can control the ratio between read and write transactions
- Three transaction restrictor modes:
  - write transaction restriction mode: gives priority to read requests
  - read transaction restriction mode: gives priority to write requests
  - normal mode: read and write requests are handled with same priority
- Special read transaction restrictor to control read requests issued by the 2D Graphics Processing Unit (GPU2D)

54.3.1 Write transaction restriction mode (VRMTRCTL.RCTL[1:0] = 01_B)

This mode gives priority to read transaction requests by securing a selectable number of read transactions before a write transaction can take place.

The following diagram shows the state transitions, when the write transaction restrictor is enabled.

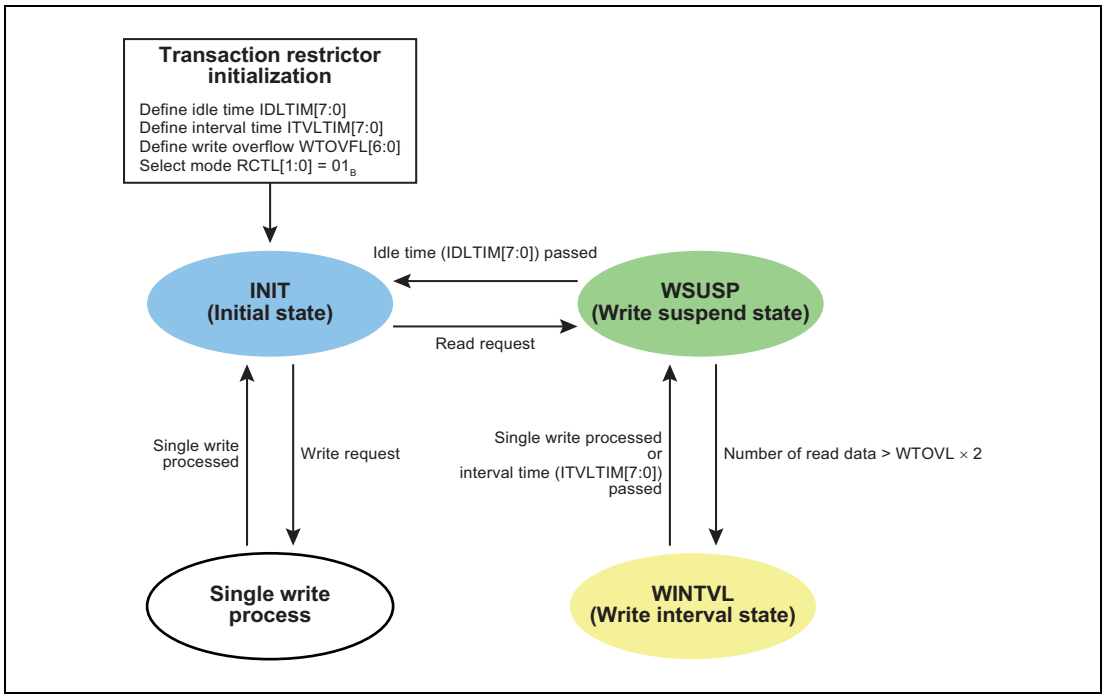

Figure 54.1 State transitions during write transaction restriction (VRMTRCTL.RCTL[1:0] = 01_B)

Initial state (INIT)

After the reset release the INIT state is entered.
Upon a write request a single write transaction is process and the INIT state is re-entered.
Upon a read request transition to the write suspend request state (WSUSP) takes place.

Write suspend state (WSUSP)

In the WSUP state any write request is not served (i.e. write is suspended), until either of the following events occurs:

- The number of read data, determined by VRAMnVRMTRCTL.WTOVFL[6:0], have been processed and the write interval state (WINTVL) is entered.
  The number of read data is WTOVFL[6:0] × 2.
- The idle time has passed without any read request and the INIT state is re-entered.
  The idle time is determined by the number of C_ISO_XCCLK clock cycles defined in VRAMnVRMTRCTL.IDLTIM[7:0].

Write interval state (WINTVL)

In the WINTVL state a single write transaction can take place, if a write request has occurred during WSUSP state.
Completion of a single write transaction causes an immediate return to the WSUSP state.
If no write request has occurred during WSUSP state the WINTVL state is left after the interval time has passed and the WSUSP state is entered again.
The interval time is determined by the number of C_ISO_XCCLK clock cycles defined in VRAMnVRMTRINTVL.ITVLTIM[7:0].
After return to the WSUSP state the next read requests can be served.

54.3.2 Read transaction restriction mode (VRMTRCTL.RCTL[1:0] = 10_B)

This mode gives priority to write transaction requests by securing a selectable number of write transactions before a read transaction can take place.

The following diagram shows the state transitions, when the read transaction restrictor is enabled.

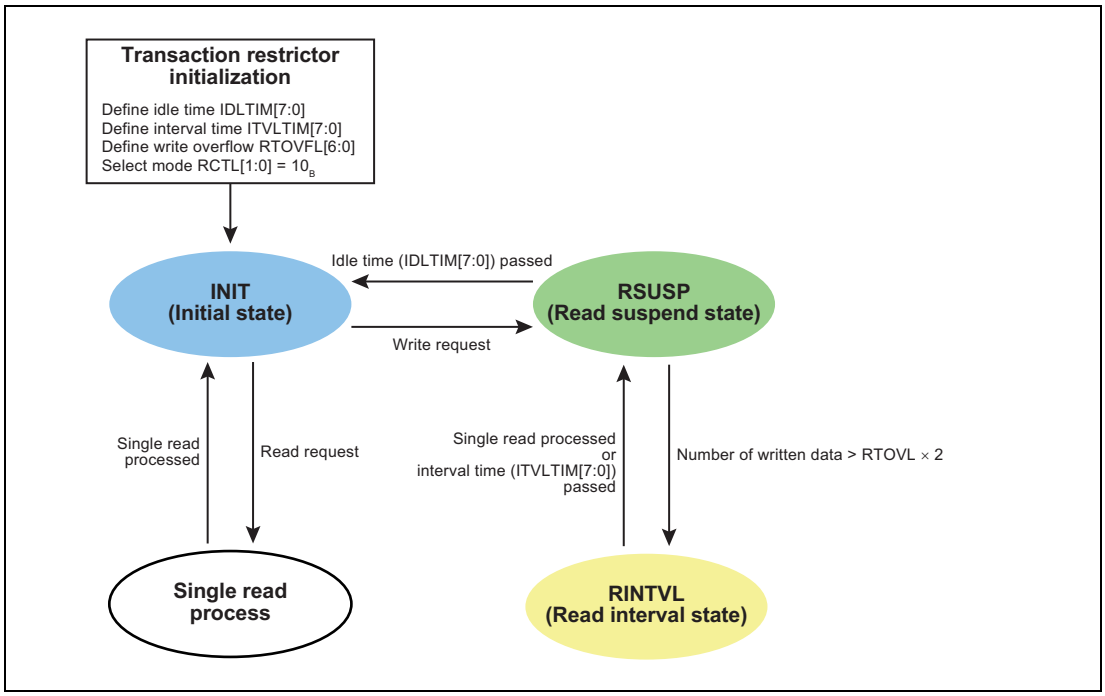

Figure 54.2 State transitions during read transaction restriction (VRMTRCTL.RCTL[1:0] = 10_B)

Initial state (INIT)

After the reset release the initial state (INIT) is entered.
Upon a read request a single read transaction is process and the INIT state is re-entered.
Upon a write request transition to the read suspend request state (RSUSP) takes place.

Read suspend state (RSUSP)

In the RSUSP state any read request is not served (i.e. read is suspended), until either of the following events occurs:

- The number of written data, determined in VRAMnVRMTRCTL.RTOVFL[6:0], have been processed and the read interval state (RINTVL) is entered.
  The number of written data is RTOVFL[6:0] × 2.
- The idle time has passed without any write request and the INIT state is re-entered.
  The idle time is determined by the number of C_ISO_XCCLK clock cycles defined in VRAMnVRMTRCTL.IDLTIM[7:0].

Read interval state (RINTVL)

In the RINTVL state a single read transaction can take place, if a read request has occurred during RSUSP state.
Completion of a single read transaction causes an immediate return to the RSUSP state.
If no read request has occurred during RSUSP state the RINTVL state is left after the interval time has

passed and the RSUSP state is entered again.
The interval time is determined by the number of C_ISO_XCCLK clock cycles defined in VRAMnVRMTRINTVL.ITVLTIM[7:0].
After return to the RSUSP state the next write requests can be served.

54.3.3 Normal mode (VRMTRCTL.RCTL[1:0] = 00_B)

In normal mode all read and write requests are handled with same priority.

54.3.4 VRAM Transaction Restrictor Registers

The VRAM transaction restrictor is controlled and operated by means of the following registers

Table 54.5 VRAM transaction restrictor registers overview

Register Name	Shortcut	Address
VRAMn transaction restrictor control register	VRAMnVRMTRCTL	<VRAMn_base> + 40_H
VRAMn transaction restrictor interval time register	VRAMnVRMTRINTVL	<VRAMn_base> + 44_H

<VRAMn_base>

The base addresses <VRAMn_base> of the VRAMn is defined in “Register base addresses <VRAMn_base>” in the section above.

54.3.4.1 VRAMnVRMTRCTL – VRAMn transaction restrictor control register

These registers control the transaction restrictor operation mode for VRAMn.

CAUTION

This register must not be changed while a VRAM access is ongoing.

Access: This register can be accessed in 32-bit units.

Address: <VRAMn_base> + 40_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IDLTIM[7:0]								0	0	0	0	0	0	RCTL[1:0]	
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RTOVFL[6:0]							DHDTREN*1	WTOVFL[6:0]							0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Note 1. The GPU2D read transaction restrictor control bit DHDTREN is only available in the VRAM0VRMTRCTL register.

Table 54.6 VRAMnVRMTRCTL register contents

Bit position	Bit name	Function
31 to 24	IDLTIM[7:0]	IDLTIM[7:0] defines the idle time in number of C_ISO_XCCLK clock cycles. The idle time is the time to change from write suspend (WSUSP) or read suspend (RSUSP) state to initial state (INIT).
23 to 18	Reserved	When read, the value after reset is read. When written, write the value after reset.
17 to 16	RCTL[1:0]	Transaction restrictor mode 00_B: normal mode (transaction restrictor disabled) 01_B: write transaction restrictor mode 10_B: read transaction restrictor mode 11_B: setting prohibited
15 to 9	RTOVFL[6:0]	Read overflow count RTOVFL[6:0] determines the number of written data in read suspend state (RSUSP) before changing to read interval state (RINTVL). The actual number of written data is RTOVFL[6:0] × 2. RTOVFL[6:0] is only valid in read transaction restrictor mode, i.e. RTCL[1:0] = 10_B.
8	DHDTREN	2D Graphics Processing Unit (GPU2D) read transaction restrictor control 0 : GPU2D read transaction restrictor disable 1 : GPU2D read transaction restrictor enable **Note:** DHDTREN is only available in the VRAM0VRMTRCTL register.
7 to 1	WTOVFL[6:0]	Write overflow count WTOVFL[6:0] determines the number of read data in write suspend state (WSUSP) before changing to write interval state (WINTVL). The actual number of read data is WTOVFL[6:0] × 2. WTOVFL[6:0] is only valid in write transaction restrictor mode, i.e. RTCL[1:0] = 01_B.
0	Reserved	When read, the value after reset is read. When written, write the value after reset.

54.3.4.2 VRAMnVRMTRINTVL – VRAMn transaction restrictor interval time register

These registers define the state change timing of from interval states to suspend states.

CAUTION

This register must not be changed while a VRAM access is ongoing.

Access: This register can be accessed in 32-bit units.

Address: <VRAMn_base> + 44_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	0	ITVLTIM[7:0]							
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 54.7 VRAMnVRMTRINTVL register contents

Bit position	Bit name	Function
7 to 0	ITVLTIM[7:0]	ITVLTIM[7:0] defines the interval time in number of C_ISO_XCCLK clock cycles. The interval time is the time to change from write or read interval state (WINTVL or RINTVL) to write or read suspend state (WSUSP or RSUSP). ITVLTIM[7:0] is only valid in write or read transaction restrictor mode, i.e. RTCL[1:0] = 01_B or 10_B.

54.3.5 2D Graphics Processing Unit (GPU2D) read transaction restrictor

The GPU2D read transaction restrictor restricts read transactions, requested by the GPU2D.

By enabling this restrictor more transfer bandwidth is granted to other masters, which are accessing the Video RAMs.

NOTES

1. In particular, when the Video Output Interfaces require more bandwidth to sustain a continuous video output data flow, enable the GPU2D read transaction restrictor.
2. The GPU2D transaction restrictor does not affect GPU2D write transactions.

The GPU2D read transaction restrictor operation is controlled via the VRAM0 transaction restrictor control register VRAM0VRMTRCTL:

- DHDTREN = 0: GPU2D read transaction restrictor disabled
- DHDTREN = 1: GPU2D read transaction restrictor enabled
  GPU2D read transactions are limited to a single read process in order to write accesses.

NOTE

VRAM0VRMTRCTL.DHDTREN controls the GPU2D read transaction restrictor for both Video RAMs VRAM0 and VRAM1.

In D1M1(H), D1M1-V2 and D1M1A the GPU2D read transaction restrictor effects the read transaction to all XC Memory slaves.

54.3.6 2D Graphics Processing Unit (GPU2D) write transaction restrictor (D1M1-V2, D1M1A only)

The GPU2D write transaction restrictor restricts write transactions, requested by the GPU2D.
By enabling this restrictor more transfer bandwidth is granted to other masters, which are accessing the Video RAMs.

NOTES

1. In particular, when the Video Output Interfaces require more bandwidth to sustain a continuous video output data flow, enable the GPU2D write transaction restrictor.
2. The GPU2D write transaction restrictor does not affect GPU2D read transactions.

The GPU2D write transaction restrictor operation is controlled via the GPU2D transaction restrictor control register GPU2DTRCTL:

- DHDTREN = 0: GPU2D write transaction restrictor disabled
- DHDTREN = 1: GPU2D write transaction restrictor enabled
  GPU2D write transactions are limited to a single write process in order to read accesses.

NOTE

GPU2DTRCTL.DHDTREN controls the GPU2D write transaction restrictor for all XC Memory slaves.

54.3.6.1 GPU2DTRCTL – GPU2D transaction restrictor control register

This register controls the transaction restrictor operation mode for GPU2D.

CAUTION

This register must not be changed while a GPU2D access is ongoing.

Access: This register can be accessed in 32-bit units.

Address: FFC0 605C$_H$

Initial value: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	DHD TREN	0	0	0	0	0	0	0	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Table 54.8 GPU2DTRCTL register contents

Bit position	Bit name	Function
8	DHDTREN	2D Graphics Processing Unit (GPU2D) write transaction restrictor control 0: GPU2D write transaction restrictor disable 1: GPU2D write transaction restrictor enable

NOTE

In the header files the module name of the above register is defined as:

SELB.

54.4 VRAM Wrapper data handling

54.4.1 Direct modes

The direct modes do not manipulate the data and thus can be used for storage of any kind of data, not just for 32 bpp αRGB8888 color data.

64-, 32,-, 16- and 8-bit access modes are supported.

54.4.1.1 Direct 32-bit mode without ECC

9 32-bit words / 288-bit block

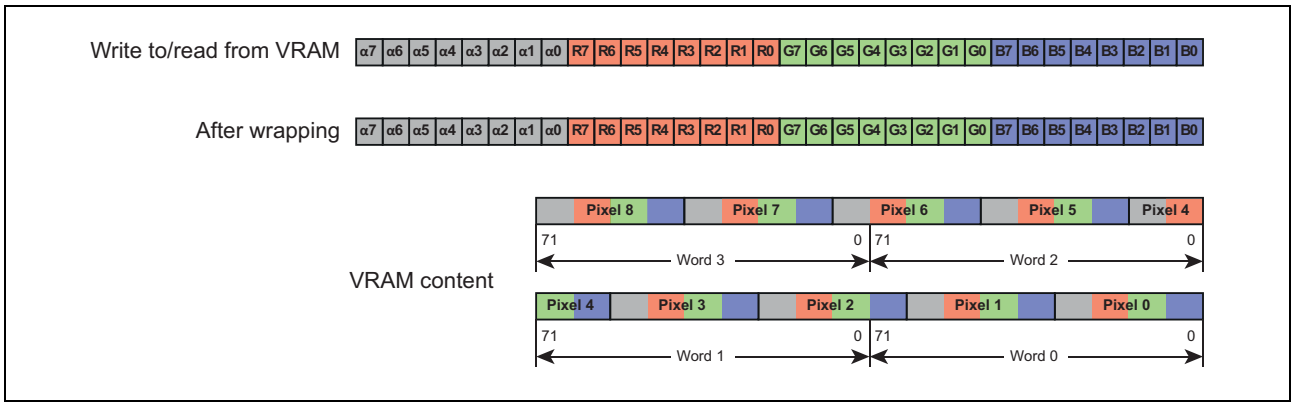

Figure 54.3 Direct 32-bit mode without ECC

54.4.1.2 Direct 32-bit mode with ECC

8 32-bit words/ 288-bit block

Due to ECC secured data storage this mode can also be used to store safety relevant data, e.g. used by the CPU.

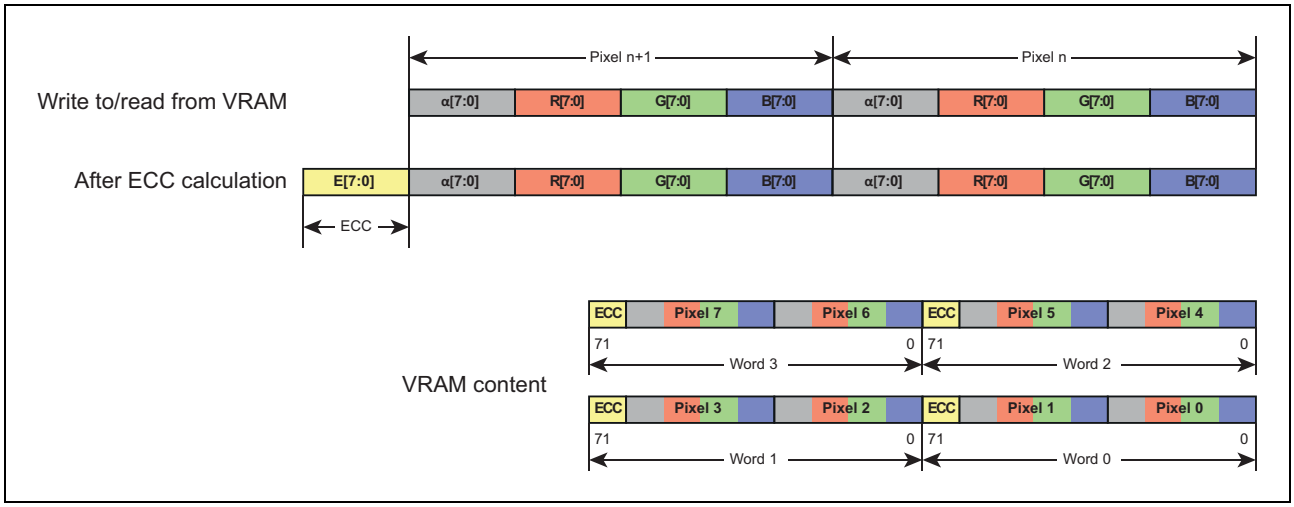

Figure 54.4 Direct 32-bit mode with ECC

54.4.2 Modes with color conversion

The color conversion modes wrap and unwrap the color data in order to utilize the video RAM capacity efficiently.

54.4.2.1 Wrapped 24 bpp RGB888

3 pixel / 72-bit word, 12 pixel / 288-bit

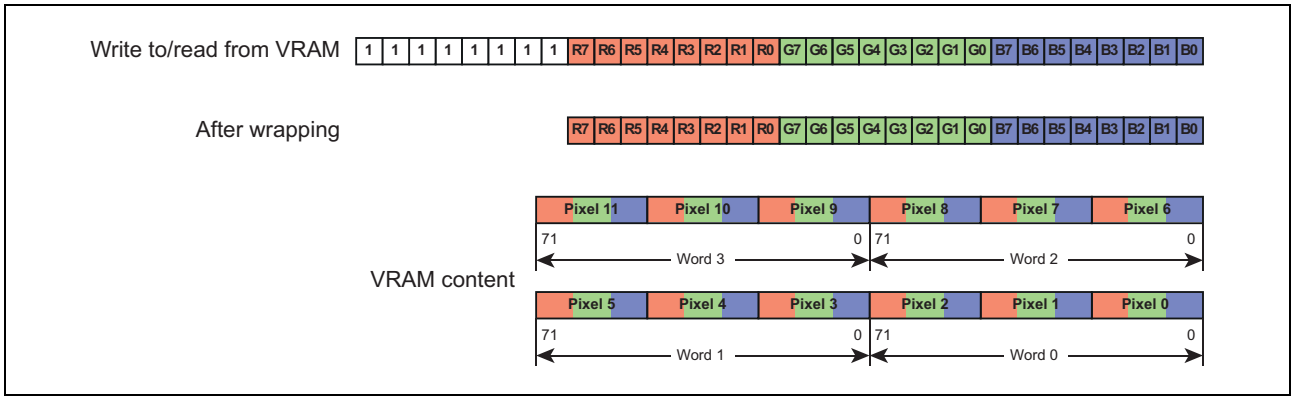

Figure 54.5 Wrapped 24 bpp RGB888

NOTE

The upper 8 bit of the 32-bit word, written to the VRAM, are ignored.
At read these bits are set to FF_H, which can be interpreted as α = 1.

54.4.2.2 Wrapped 24 bpp αRGB6666

3 pixel / 72-bit word, 12 pixel / 288-bit block

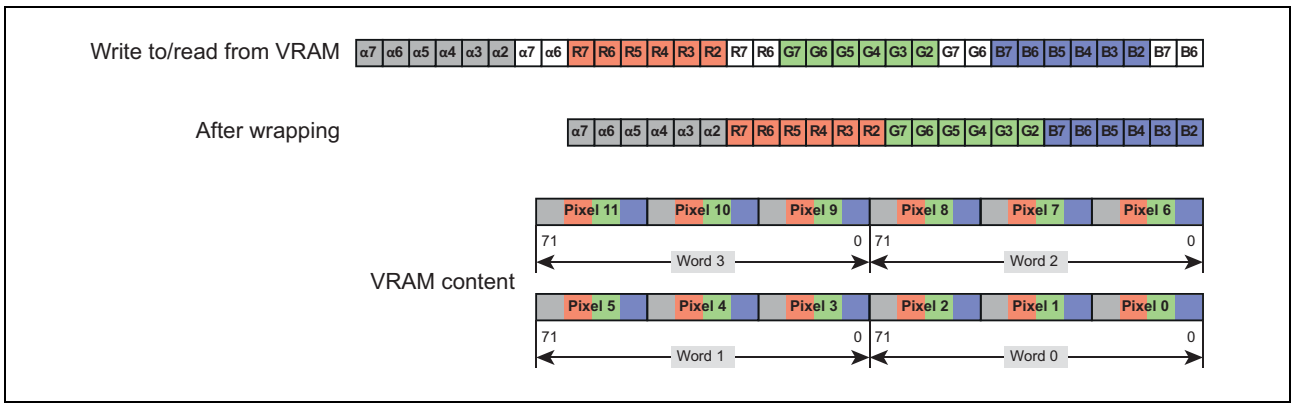

Figure 54.6 Wrapped 18 bpp αRGB6666

54.4.2.3 Wrapped 18 bpp RGB666

4 pixel / 72-bit word, 16 pixel / 288-bit block

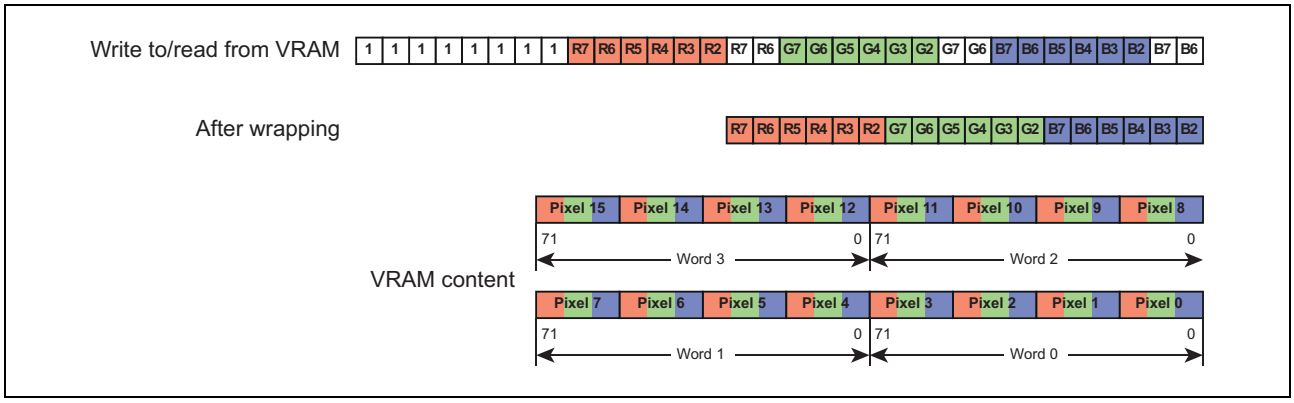

Figure 54.7 Wrapped 24 bpp RGB666

NOTES

1. The upper 8 bit of the 32-bit word, written to the VRAM, are ignored.
   At read these bits are set to FF_H, which can be interpreted as α = 1.
2. The LSBs of the R, G and B value of the 32-bit word, written to the VRAM, are ignored.
   At read these bits are stuffed with the two MSBs [7:6] of the respective color value.

54.5 Video RAM and SDRAM memory map

The direct and wrap/unwrap modes for different color formats are selected by accessing the Video RAM via different address areas through the Mirror/VRAM Wrapper window in the cross-connect address space.

When using the VRAM in wrap mode the lower 128 MB portion of the external SDRAM and the 512 MB Serial Flash Memory area is mirrored contiguously mapped above the VRAM, so a larger continuous address space can be utilized without any address gaps.

54.5.1 D1L2(H) Mirror/VRAM Wrapper window memory map

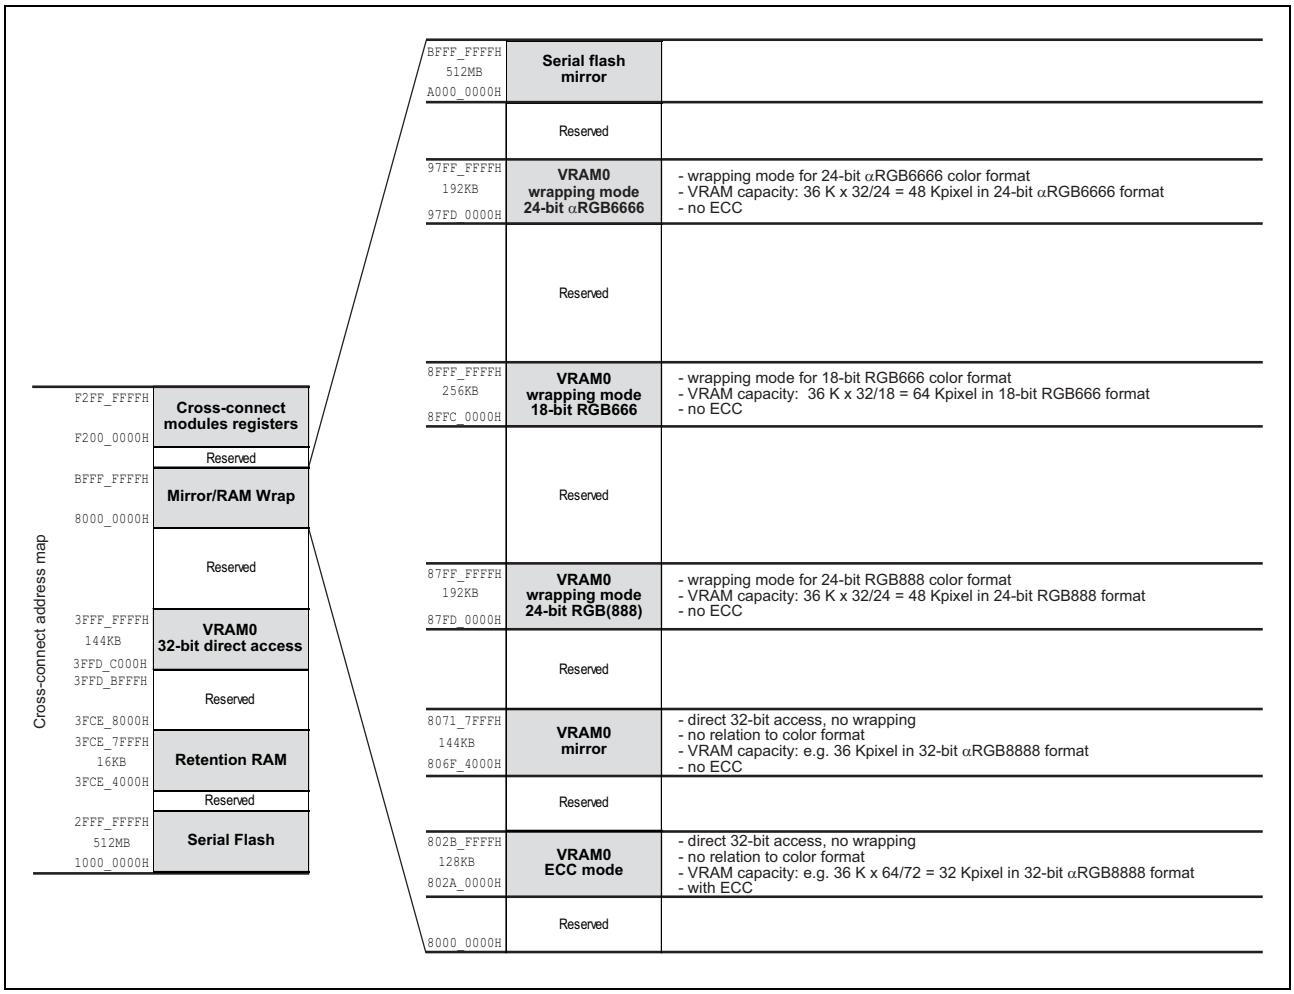

Figure 54.8 D1L2(H) Mirror/RAM Wrap mapping

54.5.2 D1M1(H) Mirror/VRAM Wrapper window memory map

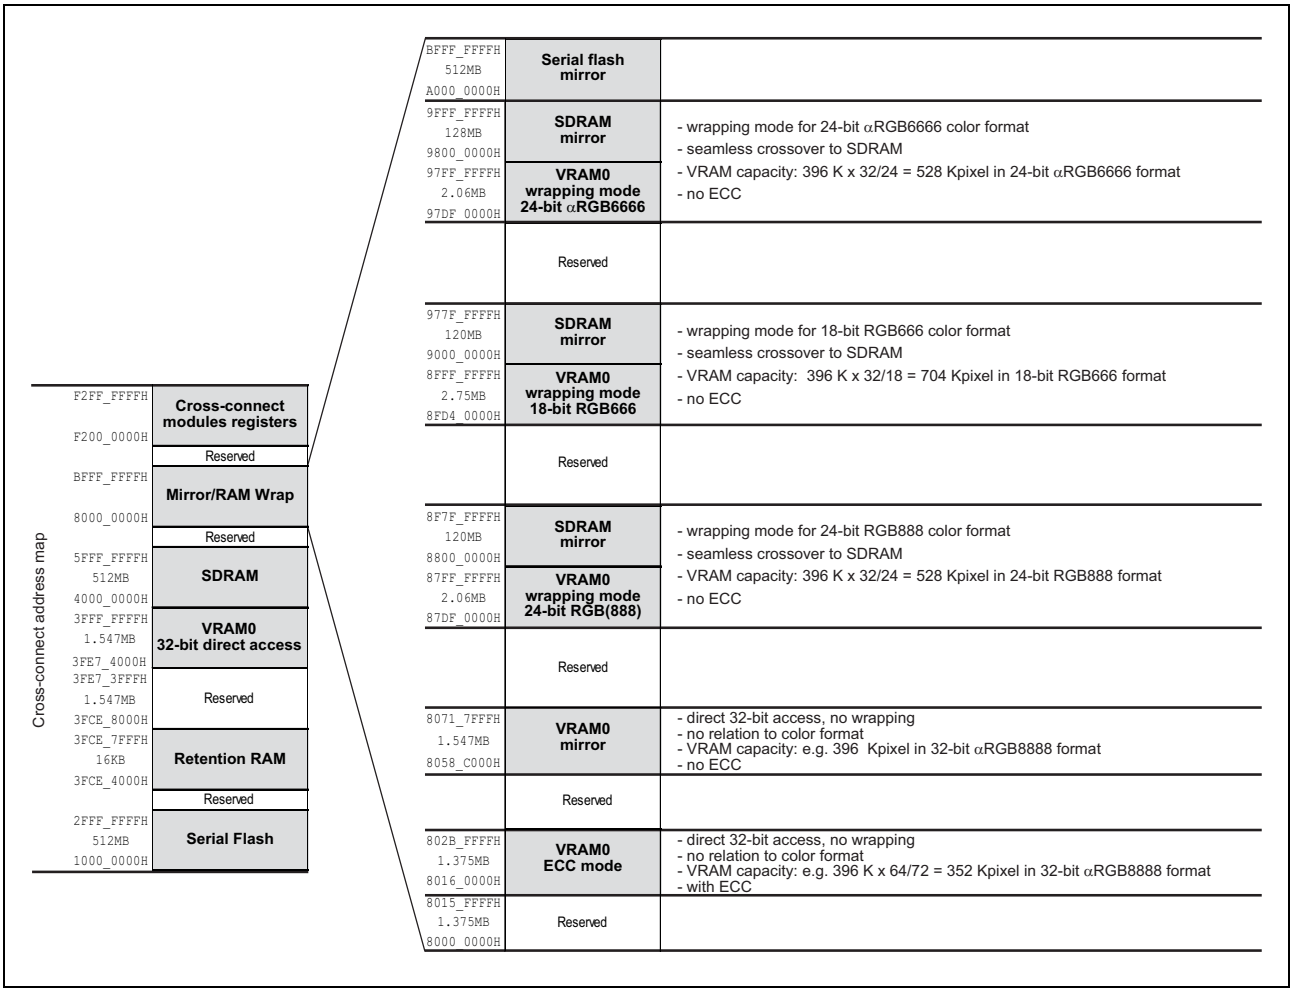

Figure 54.9 D1M1(H) Mirror/RAM Wrap mapping

54.5.3 D1M1-V2 Mirror/VRAM Wrapper window memory map

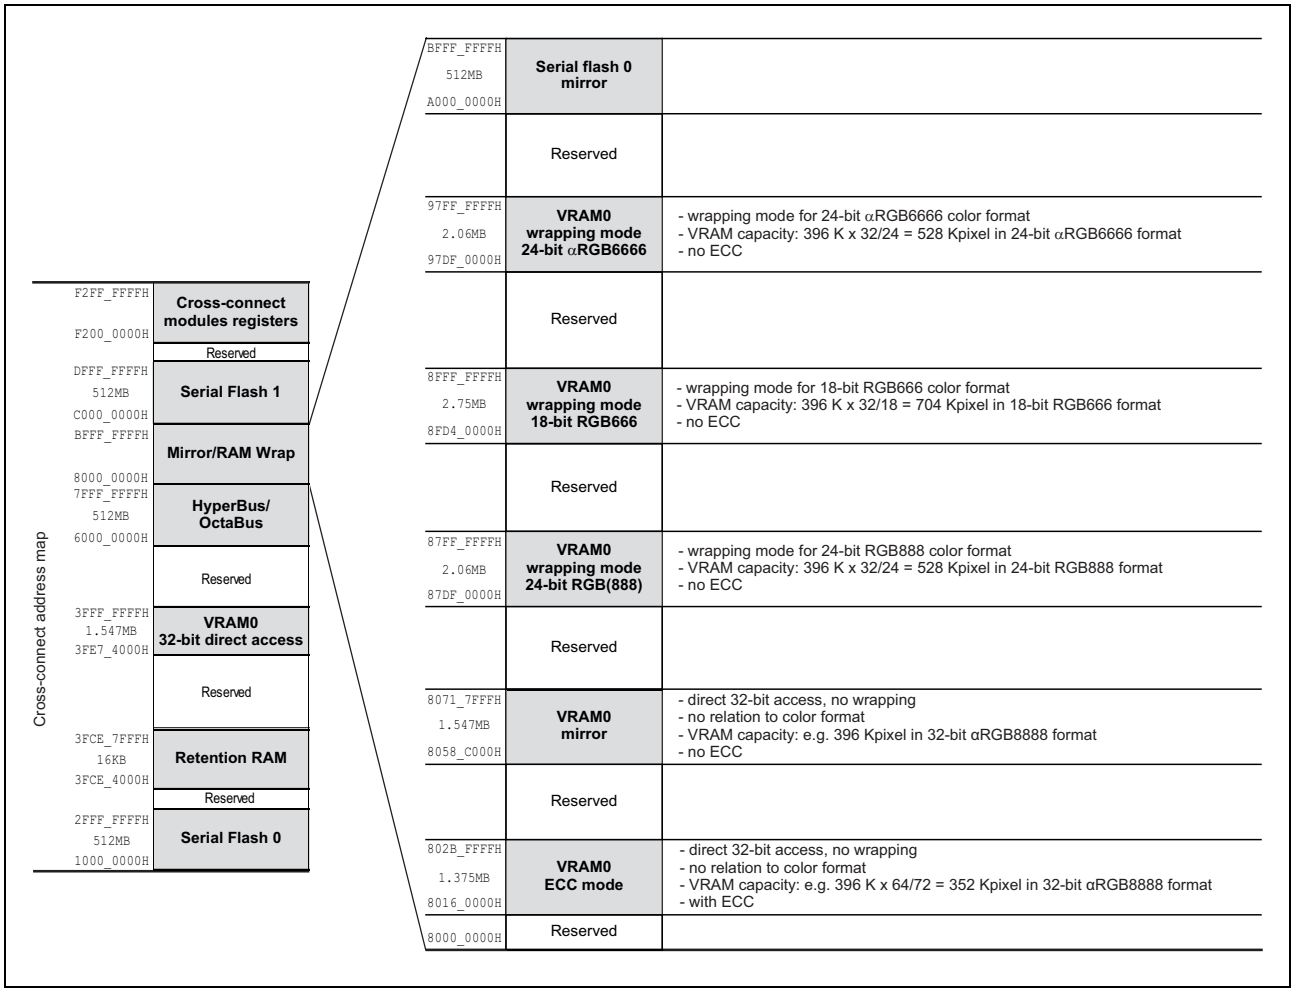

Figure 54.10 D1M1-V2 Mirror/RAM Wrap mapping

54.5.4 D1M1A Mirror/VRAM Wrapper window memory map

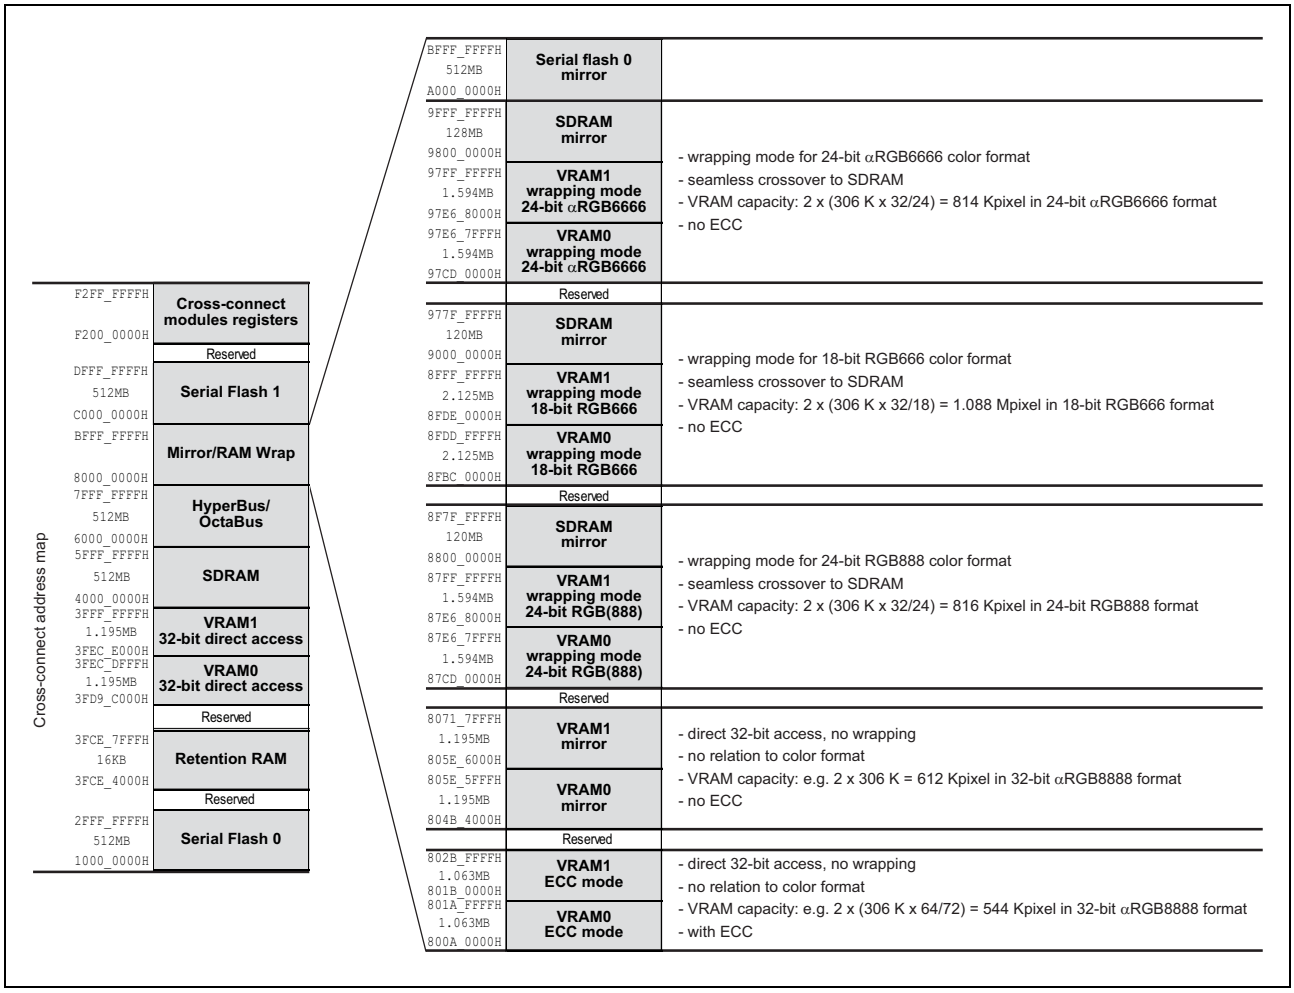

Figure 54.11 D1M1A Mirror/RAM Wrap mapping

54.5.5 D1M2(H) Mirror/RAM Wrapper window memory map

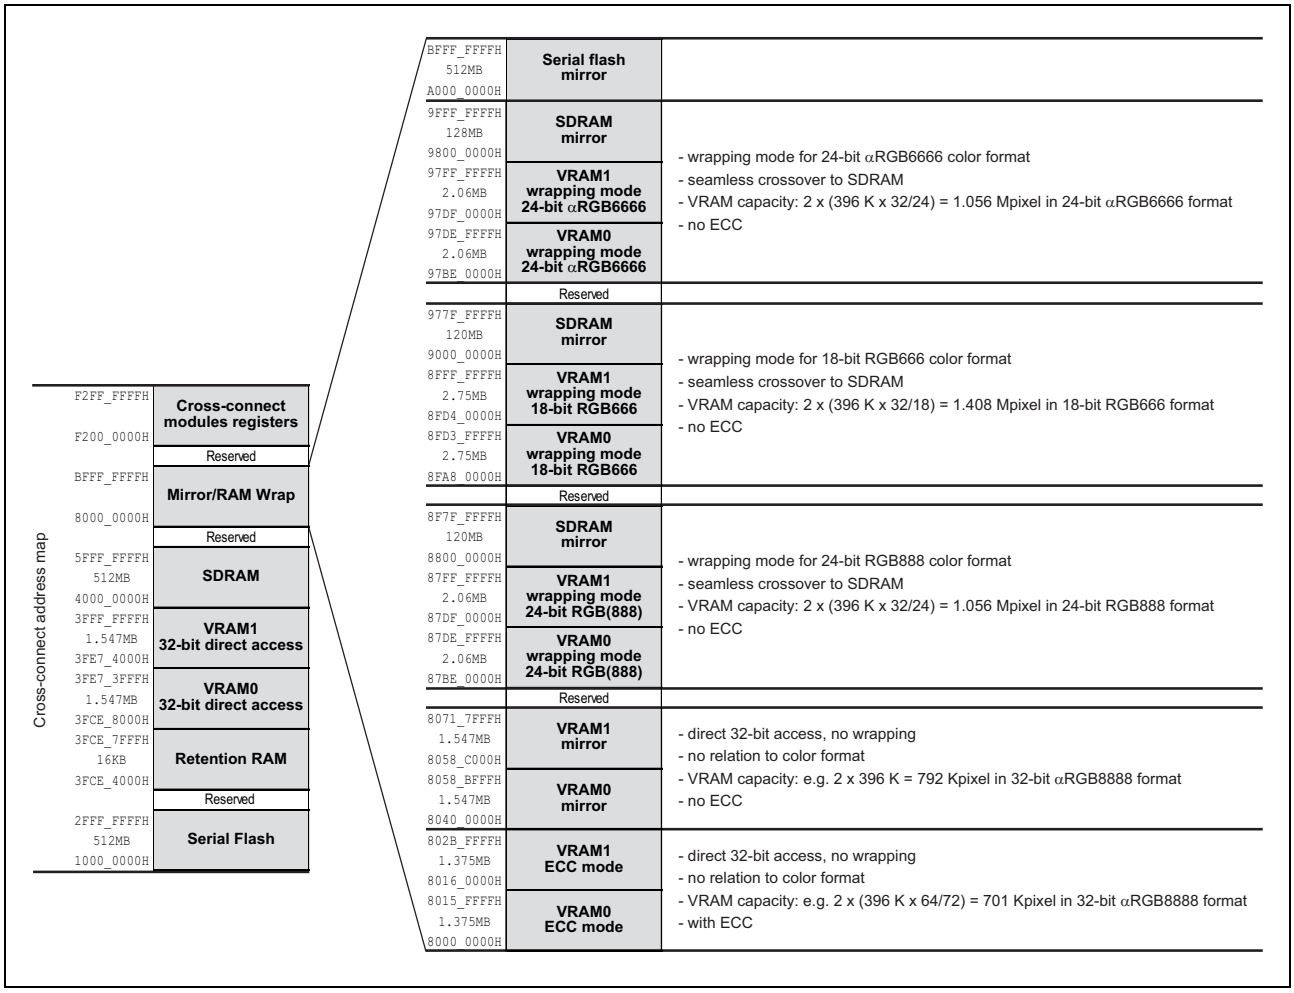

Figure 54.12 D1M2(H) Mirror/RAM Wrap mapping

NOTE

If D1M2(H) uses the DDR2-SDRAM bigger than 128 Mbyte, the D1M2(H) mirror address is offset as follows:

- 256 Mbyte of DDR2-SDRAM
  - D1M2(H) address = 8800 0000_H to 8F7F $FFFF_H$ →
    DDR2-SDRAM memory address = 0800 0000H to 0F7F FFFFH
  - D1M2(H) address = 9000_0000_H to 977F $FFFF_H$ →
    DDR2-SDRAM memory address = 0000 0000_HH to 077F $FFFF_H$
  - D1M2(H) address = 9800 0000_H to 9FFF $FFFF_H$ →
    DDR2-SDRAM memory address = 0800 0000_H to 0FFF $FFFF_H$

- 512 Mbyte of DDR2-SDRAM
  - D1M2(H) address = 8800 0000_H to 8F7F $FFFF_H$ →
    DDR2-SDRAM memory address = 0800 0000_H to 0F7F $FFFF_H$
  - D1M2(H) address = 9000 0000_H to 977F $FFFF_H$ →
    DDR2-SDRAM memory address = 1000 0000_H to 177F $FFFF_H$
  - D1M2(H) address = 9800 0000_H to 9FFF $FFFF_H$ →
    DDR2-SDRAM memory address = 1800 0000_H to 1FFF $FFFF_H$

54.6 VRAM Error Correction Coding (VRMECC)

54.6.1 Functional Description

The VRAM Error Correction Coding (VRMECC) module generates and tests Error Correction Coding (ECC) information for 32-bit Video RAM data.

8 bit ECC information is calculated and added to each 64-bit data unit, that is written to the Video RAM through the area for direct 32-bit access with ECC.

During read-back of the data through this area the ECC information is checked against the read data.

Upon detection of a single erroneous bit in a 64-bit data unit

- the erroneous bit of the read data is corrected (but the erroneous memory data is retained)
- a Single Error Detection (SED) flag VRAMnCTL.ECSEDFm is set
- the read access address is stored in the VRAMnEADm register
- an INTECCSED interrupt is generated

Upon detection of two erroneous bits in a 64-bit data unit

- a Double Error Detection (DED) flag VRAMnCTL.ECDEDFm is set
- the read access address is stored in the VRAMnEADm register
- an INTECCDED interrupt is generated

NOTE

The write access with less than 64 bit to the ECC area is prohibited.

For ECC support in case of access size other than 64 bit it is mandatory to use cached or buffered access to the VRAM.

54.6.1.1 VRAM initialization

Before reading from the VRAM, while the ECC error detection and correction is enabled, the entire VRAM must be initialized.

CAUTIONS

1. **VRAM initialization must be performed by 64-bit write accesses in order to ensure that all VRAM data is initialized and the respective ECC value fits to the VRAM content.**
2. **Reading from un-initialized VRAM may lead to the detection of ECC errors**

54.6.1.2 Error detection

(1) Error detection stage

Information about up to eight error detections are stored, i.e.

- up to eight read addresses with errors are stored in the error address registers VRAMnEADm, with m = 0 to 7
- single or double error detection indication is stored in the ECSEDFm and ECDEDFm of the ECC control register VRAMnCTL.

The error detection flags ECSEDFm and ECDEDFm are related to the error address stored in VRAMnEADm. I.e. each error detection address has separate assigned error flags.

The address of the detected errors are stored in ascending order of m, starting from VRAMnEAD0.

(2) Error information clear

Setting either VRAMnCTL.ECER1C = 1 or VRAMnCTL.ECER2C = 1 clears all error detection flags ECER1F and ECER2F in the ECC control register VRAMnCTL.

Additionally all ECC error address registers VRAMnEADm are set to their default value $0000\ 0000_H$.

(3) Error detection stages overflow

An error detection while all error detection stages hold valid error indications (i.e. any of the error flags ECSEDFm or ECDEDFm of stage m is active), are treated as follows:

- If the current error detection reveals a single bit error, all error flags ECSEDFm or ECDEDFm and error addresses VRAMnEADm are not changed.
- If the current error detection reveals a double bit error and
  - all error detection stages m = 0 to 7 indicate single bit errors (i.e. ECSEDF[7:0] = 1 and ECDEDF[7:0] = 0),
    - the current error address overwrites the previous error address in VRAMnEAD7
    - the double bit error flag is set, i.e. ECDEDF7 = 1. The double bit error interrupt INTECCDEDVRAM is asserted, provide this is permitted by VRAMnCTL.EC2EDIC = 1.
  - if any of the error detection stages m = 0 to 7 indicate a double bit errors (i.e. any ECDEDF[7:0] = 1) all error flags ECSEDFm or ECDEDFm and error addresses VRAMnEADm are not changed.

In any of the above cases the overflow flag VRAMnCTL.ECOVFF is set.

(4) Additional error flags

- VRAMnCTL.ECER2F: Double bit error detection flag
  This flag is set with the 1st occurrence of a double bit error. It is cleared by setting VRAMnCTL.ECER2C = 1.
- VRAMnCTL.ECER1F: Single bit error detection flag
  This flag is set with the 1st occurrence of a single bit error. It is cleared by setting VRAMnCTL.ECER1C = 1.
- VRAMnCTL.ECEMF: ECC error has occurred during the last read
  This bit is cleared by the next read if the ECC value is correct.

The detailed description is given in Section 54.6.2.1, VRAMnCTL – ECC control register.

(5) Error interrupt control

The generation of error detection interrupts can be controlled by control bits of the VRAMnCTL register:

- EC2EDIC = 0/1 disables/enables generation of the double error detection interrupt INTECCDED
- EC1EDIC = 0/1 disables/enables generation of the single error detection interrupt INTECCSED

54.6.1.3 ECC mode control

The ECC module can be set in two different modes:

- VRAMnCTL.ECTHM = 0: normal operation mode
  Error judgement can be enabled/disabled by VRAMnCTL.ECERVF
- VRAMnCTL.ECTHM = 1: pass through mode
  ECC calculation and storage of the ECC bits in the RAM is performed even in pass through mode. ECC decoding upon RAM data read is not executed.

The following table gives an overview about the different modes:

Generation of the 8-bit ECC data during write of data to the VRAM through the direct access 32-bit window with ECC check is not affected by VRAMnCTL.ECTHM.

Table 54.9 ECC modes overview

ECC mode setting		Error correction	Error address storage	Interrupts assertion	Error flags settings
ECTHM*1	ECERVF*1	Single bit errors	VRAMnEADm*2, ECDEDFm*1, ECSEDFm*1	INTECCDED, INTECCSED	ECER2F, ECER1F, ECEMF*1
0: normal operation	0: error judgement disabled	yes	no	no	no
	1: error judgement enabled	yes	yes	yes	yes
1: pass through	x	no	no	no	no

Note 1. Bits in the ECC control register VRAMnCTL.
Note 2. ECC error address registers.

ECC mode setting protection

Modification of the ECC mode control bits ECTHM and ECERVF in the VRAMnCTL register is depends on two protection bits in the VRAMnCTL register:

- ECMA[1:0] = 01_B: modification of ECTHM and ECERVF is possible
- All other ECMA[1:0] settings: modification of ECTHM and ECERVF is not possible

CAUTION

Since an 8-bit ECC code is first calculated during the write to the respective 64-bit data, the ECC code does most likely not fit to the data unit after power-up of the VRAM.

Consequently a read of uninitialized VRAM content will most likely lead to ECC error detections.

54.6.1.4 ECC module test

The functionality of the ECC module can be tested by provoking ECC errors:

1. Write data to the VRAM through the direct 32-bit access window without ECC coding.
2. Read the data through the direct 32-bit access window with ECC coding.

Step 2 will result in an ECC error detection, if the 8 bit, treated as ECC code in the next step, do not hold a correct ECC code to the respective 64-bit data unit.

54.6.2 Registers

This section contains a description of all registers of the VRAM ECC.

Table 54.10 VRAM ECC registers overview

Register Name	Shortcut	Address
ECC control register	VRAMnCTL	<VRAMn_base> + 00_H
ECC error address register 0	VRAMnEAD0	<VRAMn_base> + 14_H
ECC error address register 1	VRAMnEAD1	<VRAMn_base> + 18_H
ECC error address register 2	VRAMnEAD2	<VRAMn_base> + $1C_H$
ECC error address register 3	VRAMnEAD3	<VRAMn_base> + 20_H
ECC error address register 4	VRAMnEAD4	<VRAMn_base> + 24_H
ECC error address register 5	VRAMnEAD5	<VRAMn_base> + 28_H
ECC error address register 6	VRAMnEAD6	<VRAMn_base> + $2C_H$
ECC error address register 7	VRAMnEAD7	<VRAMn_base> + 30_H
ECC test mode control register	VRAMnTMC	<VRAMn_base> + 04_H
ECC encode/decode input/output substitution register 1	VRAMnTED1	<VRAMn_base> + 08_H
ECC encode/decode input/output substitution register 2	VRAMnTED2	<VRAMn_base> + $0C_H$
ECC test redundant bit data control register	VRAMnTRC	<VRAMn_base> + 10_H

<VRAMn_base>

The base addresses <VRAMn_base> of the VRAMn is defined in “Register base addresses <VRAMn_base>” in the section above.

NOTE

Memory access right after register access has possibility to cause the racing between two accesses via different routes.
Therefore, the last accessed register value must be confirmed at least before memory access. Refer to Section 3.4.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation for details.

54.6.2.1 VRAMnCTL – ECC control register

This register holds various status and control bits.

Access: This register can be accessed in 32-bit units.

Address: <VRAMn_base> + 00_H

Initial value: 0000 0000 0000 0000 0000 0000 0001 $000x_B$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECDED F7	ECSED F7	ECDED F6	ECSED F6	ECDED F5	ECSED F5	ECDED F4	ECSED F4	ECDED F3	ECSED F3	ECDED F2	ECSED F2	ECDED F1	ECSED F1	ECDED F0	ECSED F0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	EMCA[1:0]		0	0	EC OVFF	EC ER2C	EC ER1C	0	EC THM	EC ERVF	EC 1ECP	EC 2EDIC	EC 1EDIC	EC ER2F	EC ER1F	EC EMF
Initial value	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	x
R/W	R/W	R/W	R	R	R	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R

Table 54.11 VRAMnCTL register contents (1/3)

Bit position	Bit name	Function
31 to 16	ECDEDFm ECSEDFm	These bits indicate the type of error, that is related to the stored error address of stage m in the VRAMnEADm register. • ECDEDFm = 0 and ECSEDFm = 0 No error address stored in VRAMnEADm. • ECDEDFm = 1 and ECSEDFm = 0 VRAMnEADm address of double error detection • ECDEDFm = 0 and ECSEDFm = 1 VRAMnEADm address of single error detection • ECDEDFm = 1 and ECSEDFm = 1 Does not occur. These bits are cleared under following conditions: • While ECER2F bit is set, writing VRAMnCTL.ECER2C = 1 clears ECDEDF7-0 and ECSEDF7-0 While ECER1F bit is set, writing VRAMnCTL.ECER1C = 1 clears ECDEDF7-0 and ECSEDF7-0 • ECC pass through mode (VRAMnCTL.ECTHM = 1) • ECC error judgment disabled (VRAMnCTL.ECERVF = 0)
15 to 14	EMCA[1:0]	ECC mode protection • EMCA[1:0] = 01_B: modification of the ECC mode control bits ECTHM and ECERVF is permitted • All other EMCA[1:0] setting: modification of the ECC mode control bits ECTHM and ECERVF is not possible
13 to 12	Reserved	When read, the value after reset is read. When written, write the value after reset.

Table 54.11 VRAMnCTL register contents (2/3)

Bit position	Bit name	Function
11	ECOVFF	Overflow detection flag In case of an error detection, while all error address registers VRAMnEADm hold already a valid error address, this overflow flag is set. 0: no overflow detected 1: overflow detected Writing to this bit has no effect. These bits are cleared under following conditions: • Writing VRAMnCTL.ECER2C = 1 while ECER2F bit is set • Writing VRAMnCTL.ECER1C = 1 while ECER1F bit is set • ECC pass through mode (VRAMnCTL.ECTHM = 1) • ECC error judgment disabled (VRAMnCTL.ECERVF = 0)
10	ECER2C	Clear double bit error detection flag ECER2F 0: no function 1: clears ECER2F Reading this bits returns always 0.
9	ECER1C	Clear single bit error detection flag ECER1F 0: no function 1: clears ECER1F Reading this bits returns always 0.
8	Reserved	When read, the value after reset is read. When written, write the value after reset.
7	ECTHM	Pass through mode enable bit. 0: Normal operation mode 1: Pass through mode enable. ECC decoding upon RAM data read is not executed, i.e. no error judgment or the bit correction is performed. ECC calculation and storage of the ECC bits in the RAM is performed even in pass through mode. Modification of this bit is only possible, if EMCA[1:0] = 01_B. Otherwise any write to this bit is ignored.
6	ECERVF	ECC error judgment enable 0: error judgement disabled 1: error judgement enabled Error judgement is only effective in normal operation mode, i.e. if VRAMnCTL.ECTHM = 0. If error judgement is disabled no interrupts are asserted in case of a single or double bit error detection. However detected single bit errors are corrected. Modification of this bit is only possible, if EMCA[1:0] = 01_B. Otherwise any write to this bit is ignored.
5	EC1ECP	Single bit error correction permission 0: Single bit error is corrected 1: Single bit error is not corrected
4	EC2EDIC	Double bit error detection interrupt INTVRAMnDED control 0: INTVRAMnDED is not generated 1: INTVRAMnDED is generated upon double bit error detection
3	EC1EDIC	Single bit error detection interrupt INTVRAMnSED control 0: INTVRAMnSED is not generated 1: INTVRAMnSED is generated upon single bit error detection
2	ECER2F	Double bit error detection flag 0: no double bit error detected 1: double bit error detected Writing to this bit has no affect. This bit is cleared under following conditions: • writing VRAMnCTL.ECER2C = 1 • ECC pass through mode (VRAMnCTL.ECTHM = 1) • ECC error judgment disabled (VRAMnCTL.ECERVF = 0)

Table 54.11 VRAMnCTL register contents (3/3)

Bit position	Bit name	Function
1	ECER1F	Single bit error detection flag 0: no single bit error detected 1: single bit error detected and corrected Writing to this bit has no affect. This bit is cleared under following conditions: • writing VRAMnCTL.ECER1C = 1 • ECC pass through mode (VRAMnCTL.ECTHM = 1) • ECC error judgment disabled (VRAMnCTL.ECERVF = 0)
0	ECEMF	ECC error indication of current VRAM data read 0: no ECC error detected at current read 1: ECC error detected at current read This bit is updated by every RAM output data. This bit is cleared under following conditions: • current VRAM data read without ECC error • ECC pass through mode (VRAMnCTL.ECTHM = 1) • ECC error judgment disabled (VRAMnCTL.ECERVF = 0)

54.6.2.2 VRAMnEADm – ECC error address register m (m = 0 to 7)

These registers store the read address, when an ECC error was detected.

Access: This register can be accessed in 32-bit units.

Address: <VRAMn_base> + 14_H + m x 04_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEAD[31:16]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEAD[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 54.12 VRAMnEADm register contents

Bit position	Bit name	Function
31 to 0	ECEAD[31:0]	Address of read access, when an ECC error was detected. The type of error, i.e. single or double bit error, is indicated by VRAMnCTL.ECDEDm and VRAMnCTL.ECSEDm. ECEAD[31:0] is the address of the erroneous 64-bit data unit. Base address is not included. The complete read address is calculated by use of this formula: read address = VRAMn ECC mode start address + ECEAD[31:0] * 8 Under certain conditions the address of the VRAMnEAD7 register is overwritten upon detection of an ECC error. Refer to Section (3), Error detection stages overflow for details. VRAMnEADm is set to its default value by clearing the error detection flag ECER1C or ECER2C in the ECC control register VRAMnCTL. For VRAMn ECC mode start address of each product, refer to **Section 54.5, Video RAM and SDRAM memory map**.

54.6.2.3 VRAMnTMC – ECC test mode control register

The VRAMnTMC register switches to and controls the test mode.

This register can be used when VRAM is not accessed.

Access: This register can be accessed in 16-bit units.

Address: <VRAMn_base> + 04_H

Initial value: 0000 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ETMA[1:0]		0	0	0	0	0	0	EC TMCE	0	0	EC TRRS	EC REOS	EC ENS	EC DCS	EC REIS
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Table 54.13 VRAMnTMC register contents (1/2)

Bit position	Bit name	Function
15, 14	ETMA[1:0]	Access control bits 1 and 0 to ECC test mode bit These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 10_B, writing to bit 7 is enabled.
13 to 8	Reserved	When read, the value after reset is read. When written, write the value after reset.
7	ECTMCE	ECC test mode enable bit This bit specifies whether to enable access to the test registers and test control bits. When writing to this bit, 10_B should be written to ETMA[1:0] at the same time. 0: Access to the test mode registers and bits is disabled. 1: Access to the test mode registers and bits is enabled. Test registers: VRAMnTED, VRAMnTRC, VRAMnHORD, VRAMnECRD, VRAMnERDB Register test control bit: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS
6 to 5	Reserved	When read, the value after reset is read. When written, write the value after reset.
4	ECTRRS	ECC RAM read test mode selection bit Select reading destination when reading VRAMnTED register and reading destination when reading VRAMnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: The read value of the VRAMnTED register is the write value of the VRAMnTED register. The read value of the VRAMnERDB register is the write value of the VRAMnERDB register. 1: The read value of the VRAMnTED register can read RAM data. The read value of the VRAMnERDB register is the ECC data to be written to RAM.
3	ECREOS	ECC redundant bit output data selection bit This bit is used to identify and select the ECC data to be stored in RAM as ECC data generated for write data or the value of the VRAMnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Store ECC data generated for write data to RAM. 1: Store the value of VRAMnERDB register to RAM.

Table 54.13 VRAMnTMC register contents (2/2)

Bit position	Bit name	Function
2	ECENS	ECC encoder input selection bit This bit is used to identify the targeted data for ECC data generation as write data to RAM or the value of the VRAMnTED register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate ECC data from the write data to RAM. 1: Generate ECC data from the value of the VRAMnTED register.
1	ECDCS	ECC decoder input selection bit This bit is used to identify and select the targeted data for syndrome code generation and error detection as RAM data or the value of the VRAMnTED register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate syndrome code from RAM data and detect errors. 1: Generate syndrome code from the value of the VRAMnTED register and detect errors.
0	ECREIS	ECC redundant bit input data selection bit This bit is used to identify and select the targeted data for syndrome code generation and error detection as RAM data or the value of the VRAMnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate syndrome code from ECC data stored in RAM and detect errors. 1: Generate syndrome code from the value of the VRAMnERDB register and detect errors.

54.6.2.4 VRAMnTED1 – ECC encode/decode input/output substitution register 1

In ECC test mode, this register handles upper 32 bit data of ECC test data.
The value of the register can be used to generate ECC data or syndrome code.
It is accessible when ECC test mode is enabled (VRAMnTMC.ECTMCE = 1)
When VRAMnTMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when VRAM is not accessed.

Access: This register can be accessed in 32-bit units.

Address: <VRAMn_base> + 08_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 54.14 VRAMnTED1 register contents

Bit position	Bit name	Function
31 to 0	ECEDB[63:32]	When VRAMnTMC.ECENS = 1, the value of this register is used to generate ECC data and the value this register to RAM is stored to RAM. When VRAMnTMC.ECDCS = 1, the value of this register is used to generate syndrome code. In addition, when VRAMnTMC.ECTRRS = 1, RAM data [63:32], instead of written data, is read for the value of this register.

54.6.2.5 VRAMnTED2 – ECC encode/decode input/output substitution register 2

In ECC test mode, this register handles lower 32 bit data of ECC test data.
The value of the register can be used to generate ECC data or syndrome code.
It is accessible when ECC test mode is enabled (VRAMnTMC.ECTMCE = 1).
When VRAMnTMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when VRAM is not accessed.

Access: This register can be accessed in 32-bit units.

Address: <VRAMn_base> + $0C_H$

Initial value: 0000 0000_H

Table 54.15 VRAMnTED2 register contents

Bit position	Bit name	Function
31 to 0	ECEDB[31:0]	When VRAMnTMC.ECENS = 1, the value of this register is used to generate ECC data and the value this register to RAM is stored to RAM. When VRAMnTMC.ECDCS = 1, the value of this register is used to generate syndrome code. In addition, when VRAMnTMC.ECTRRS = 1, RAM data [31:0], instead of written data, is read for the value of this register.

54.6.2.6 VRAMnTRC – ECC test redundant bit data control register

In ECC test mode, this test register, for ECC data, consists of three 8-bit registers, VRAMnHORD, VRAMnECRD, and VRAMnERDB.
It is accessible when ECC test mode is enabled (VRAMnTMC.ECTMCE = 1).
When VRAMnTMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when VRAM is not accessed.

Access: This register can be accessed in 32-bit units.

Address: <VRAMn_base> + 10_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 54.16 VRAMnTRC register contents (1/2)

Bit position	Bit name	Function
31 to 24	Reserved	Writing to this register is ignored. When ECC test mode is enabled (VRAMnTMC.ECTMCE = 1), the read values of these bits are undefined. When ECC test mode is disabled (VRAMnTMC.ECTMCE = 0), 00_H is read.
23 to 16	HORD[7:0]	In ECC test mode, this register is used to store ECC data for read RAM data. Writing to this register is ignored. When ECC test mode is enabled (VRAMnTMC.ECTMCE = 1), this register can be accessed. When ECC test mode is disabled (VRAMnTMC.ECTMCE = 0), 00_H is read. HORD[7:0] ECC code for read RAM data is stored as needed. When VRAMnTMC.ECTRRS = 1 and VRAMnTED register is read, ECC code is stored.
15 to 8	ECRD[7:0]	In ECC test mode, this is a read-only register for storing ECC data generated for write RAM data. Writing to this register is ignored. When ECC test mode is enabled (VRAMnTMC.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (VRAMnTMC.ECTMCE = 0), 00_H is read. ECRD[7:0] These bits can read ECC data generated at the time of RAM data writing, and can read ECC data for the data written to the VRAMnTED register when VRAMnTMC.ECENS = 1.

Table 54.16 VRAMnTRC register contents (2/2)

Bit position	Bit name	Function
7 to 0	ERDB[7:0]	In ECC test mode, this register handles ECC data. The value of this register can be used as ECC data generated at the time of RAM writing or ECC data read at the time of RAM data reading. When ECC test mode is enabled (VRAMnTMC.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (VRAMnTMC.ECTMCE = 0), 00_H is read. ERDB[7:0] When VRAMnTMC.ECREOS = 1, these bits store the value of this register as ECC data to RAM. When VRAMnTMC.ECREIS = 1, the value of this register is read as ECC data read from RAM. When VRAMnTMC.ECTRRS = 1, ECC data to be stored in RAM is read instead of the write data for the read value of this register.

Section 55 Boundary Scan

55.1 Outline

Boundary Scan is a test method defined by IEEE Std 1149.1.

It is used for testing interconnections between devices mounted on printed circuits boards.

RH850/D1L/D1M complies with the IEEE Std 1149.1-2001.

NOTE

Boundary Scan generic issues (e.g. explanation of each instruction, state transition diagram of TAP controller, etc.) are not described in this document.

55.2 JTAG interface

Communication with a Boundary Scan host test system is executed via the JTAG interface, as described in the following table:

Table 55.1 JTAG interface

Port	Signal name	Recommendation if unused
JP0_0	DCUTDI	Open (if $\overline{\text{DCUTRST}}$ at low level)
JP0_1	DCUTDO	Open
JP0_2	DCUTCK	Open
JP0_3	DCUTMS	Open
JP0_4	$\overline{\text{DCUTRST}}$	Connect to VSS via an appropriate resistor

55.3 Entering Boundary Scan mode

Boundary Scan mode is entered by setting following pins at reset release:

- FLMD0 = VCC
- FLMD1 (P0_1) = VCC
- MODE0 (P0_0) = VSS
- MODE1 (P0_2) = VCC

Refer also to Section 6, Operating Modes for details.

55.4 Boundary scan features

The table below shows the IEEE1149.1-2001 instructions and instruction codes for RH850/D1L/D1M.

Table 55.2 Boundary scan instructions

Instruction code								Description
0	0	0	0	0	0	0	0	JTAG EXTEST
0	1	0	0	0	0	0	0	JTAG SAMPLE/PRELOAD
0	1	0	1	0	1	0	1	JTAG IDCODE (initial value)
1	1	1	1	1	1	1	1	JTAG BYPASS
Other than above								Reserved

55.5 Boundary Scan applicable pins

NOTE

The ports of the Boundary Scan applicable pins don't need to be configured by use of any port configuration register during Boundary Scan.

Boundary Scan (EXTEST) is applicable to all pins except pins indicated in the following table.

Table 55.3 Boundary Scan inapplicable pins

Type	Pin name
Reset	$\overline{\text{RESET}}$
MODE	FLMD0
JTAG interface	JP0_0 to JP0-4
External power supply control	PWRGD, PWRCTL
Voltage references	A0VREF, ZPDVREF
Clock inputs/outputs	X1, X2, XT1, XT2
Power supply	all power supply pins
Ground	all ground pins

Following pins are shared with analog buffer, differential buffer, etc. So, boundary scan is applied only to general purpose I/O part.

Table 55.4 Boundary Scan (only general purpose I/O part) applicable pins

Type	Pin name
ADCE0 inputs	P10_0 to P10_12, P11_0 to P11_7
MIPI video input I/F	P40_0 to P40_5
RSDS video output	P44_0 to P44_11, P45_0 to P45_13

55.6 Device ID register (DID)

The RH850/D1L/D1M specific ID code is provide by the device identification register DID. The value of DID is read with IDCODE instruction and cannot be accessed by CPU.

55.6.1 DID - Boundary scan ID register

This register stores the boundary scan ID.

Access: This register can not be read by the CPU.

Address: –

Initial value:
- D1L1: 0822 $C447_H$
- D1L2(H): 0822 $B447_H$
- D1M1(H): 0822 $A447_H$
- D1M1-V2: 1835 1447H
- D1M1A: 1835 0447_H
- D1M2(H): 0822 9447_H

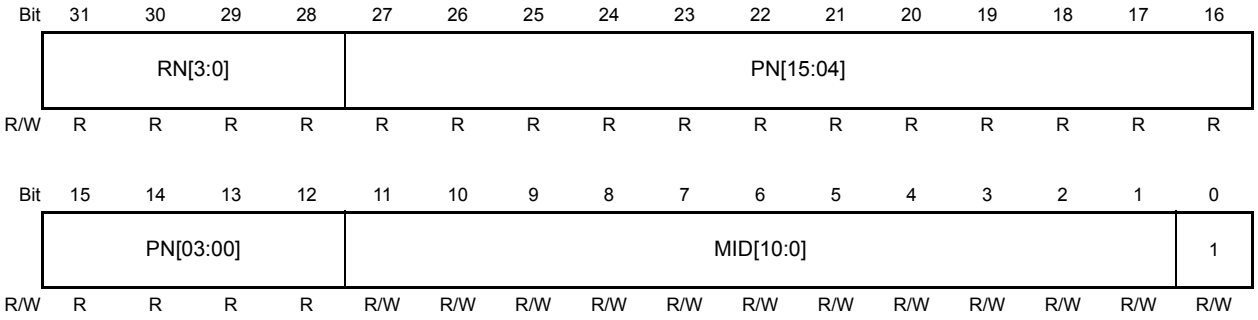

Table 55.5 DID register contents

Bit position	Bit name	Function
31 to 28	RN[3:0]	Revision number
27 to 12	PN[15:00]	Product number: D1L1: $822C_H$ D1L2(H): $822B_H$ D1M1(H): $822A_H$ D1M1-V2: 8351_H D1M1A: 8350_H D1M2(H): 8229_H
11 to 1	MID[10:0]	Manufacturer ID: 447_H = {MID[10:0], 1}

Section 56 HyperBus Controller (HYPB)

This section contains a generic description of the HyperBus Controller.

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.
The subsequent sections describe the features that apply to all implementations.

56.1 Overview of RH850/D1L/D1M HyperBus Controller

56.1.1 Units

This microcontroller has the following number of units of the HyperBus Controller.

Table 56.1 Units

HyperBus Controller	D1L1	D1L2(H)	D1M1	D1M1H	D1M1-V2 D1M1A	D1M2(H)
Units	–	–	–	–	1	–
Names	–	–	–	–	HYPB0	–

56.1.2 Indices

Following indices are used in this section:

Table 56.2 Indices

Index	Meaning
n	The individual HYPB units are generically indicated by the index “n”.

56.1.3 Register addresses

All HyperBus Controller register addresses are given as address offsets from the individual base addresses <HYPBn_base>.
The <HYPBn_base> addresses of each HYPBn are listed in the following table:

Table 56.3 Register base addresses <HYPBn_base>

HYPBn unit	<HYPBn_base> address
HYPB0	F2FF 8000_H

56.1.4 Clock supply

All HyperBus Controller provide two clock inputs.

Table 56.4 Clock supply

HYPBn unit	HYPBn clock	Connected to
HYPB0	RPC_CLK	Clock Controller CKSC_ISFMAD_CTL clock divider output
	RPC_CLK2	Clock Controller CKSC_ISFMAD_CTL clock divider output divided by 2

56.1.5 Reset sources

The HyperBus Controller and their registers are initialized by the following reset signal:

Table 56.5 Reset sources

HYPBn unit	Reset signal
HYPBn	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

56.1.6 I/O signals

The following table shows the I/O signals of the HyperBus Controller.

Table 56.6 HYPBn I/O signals

HYPBn signals	Function	Connected to
HYPB0		
MCLK	Clock output	Port MCK
MCS	Chip select	Port MCS
MDQ[7:0]	Data[7:0]	Port MDQI[7:0] / MDQO[7:0]
MDQS	Read data strobe / write data mask	Port MDQS

CAUTION

The HyperBus and the OctaBus interface share the same ports P21_[9:0] and P22_10. The HyperBus or OctaBus selection via the bus switch control bit XCRAMCFG0.HYPBSEL must be done before the XC0 cross-connect is released from reset, i.e. before MRSTC.XC0RES = 1 is set.

Refer to Section 14.4, Bus Switch for external memory interfaces (D1M1-V2, D1M1A only) for details.

56.2 Overview

The HyperBus controller enables direct connection of the HyperRAM or HyperFlash memory to this LSI.

56.2.1 Features

This module allows the HyperRAM or HyperFlash memory connected to the MCU to be accessed by reading the external address space, or using manual mode to transmit and receive data.

HyperBus Interface

- One HyperFlash or one HyperRAM can be connected.
- Maximum flash/RAM size is 16 Mbyte.
- The data bus size is fixed to 8 bits.
- HyperRAM can be used with fixed latency (variable latency is not supported)
- 3.3 V Interface voltage level (1.8 V I/O connection is not supported)
- The burst type support "linear mode" only.

NOTE

Although D1M1A supports flash/RAM sizes up to 16 Mbytes, it does not support access to dual-die HyperFlash/RAM devices.

External Address Space Read/Write Mode

- A read access from an MCU on-chip module to the HyperBus memory area is automatically converted into a read command to the device and the read data is returned to the on-chip module.
- Efficient data reception is possible by utilizing the on-chip read cache memory (64-bit line × 32 entries) during burst read operation.
- A write access from an MCU on-chip module to the HyperRAM memory area is automatically converted into a write command to the device and the write data is stored to the device.

Manual Mode

- Desired command and read accesses to the HyperRAM or HyperFlash memory are possible. Manual mode does not support write access to HyperRAM.
- Efficient data writing is possible by using write buffer for HyperFlash programming.

NOTE

If the HyperBus Controller is operated in Manual Mode, access of the HyperBus memory area by other modules is not possible.

56.3 Block Diagram

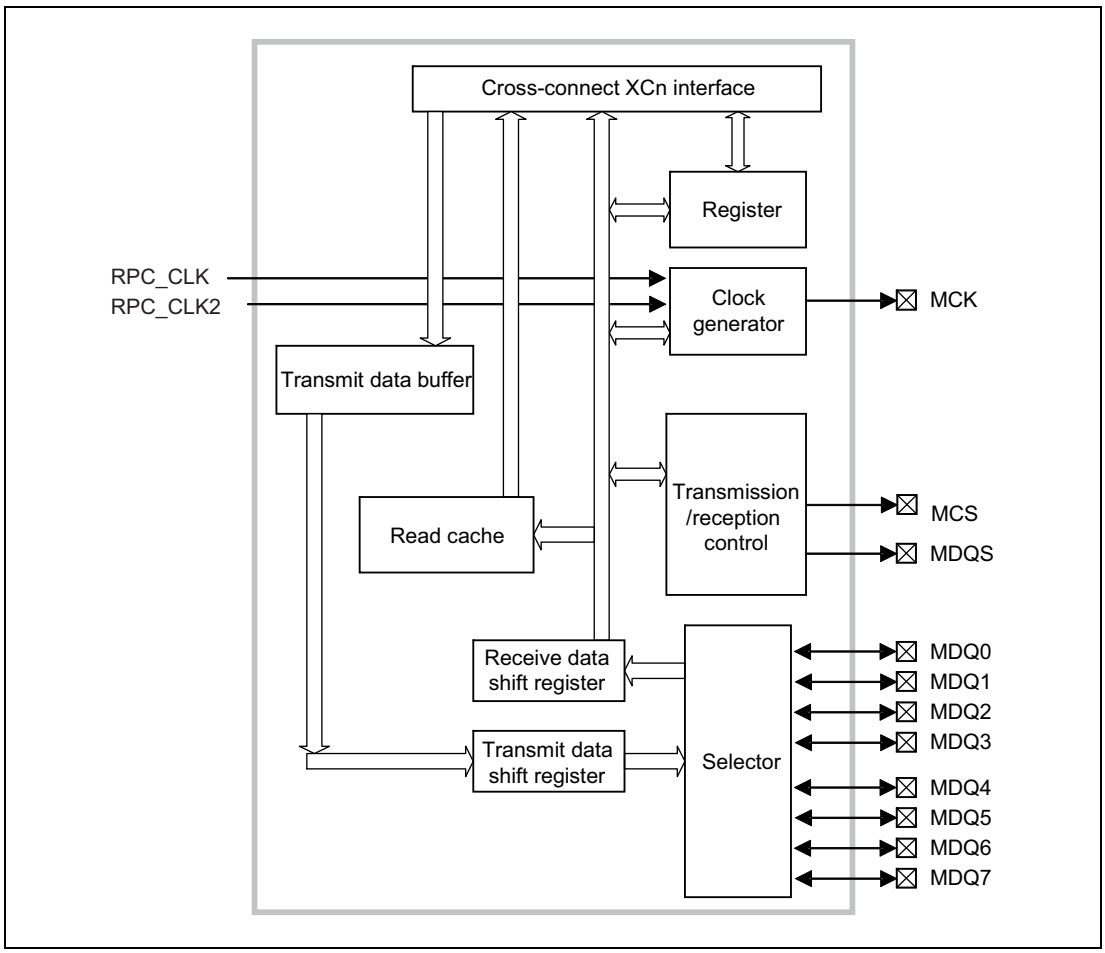

Figure 56.1 HyperBus Controller block diagram

56.4 Register Configurations

The following table shows the register configuration of the HyperBus Controller.

Table 56.7 Register configuration

Register name	Symbol	Address
Common control register	CMNCR	<HYPBn_base> + 00_H
SSL delay register	SSLDR	<HYPBn_base> + 04_H
Data read control register	DRCR	<HYPBn_base> + $0C_H$
Data read command setting register	DRCMR	<HYPBn_base> + 10_H
Data read option setting register	DROPR	<HYPBn_base> + 18_H
Data read enable setting register	DRENR	<HYPBn_base> + $1C_H$
Manual mode control register	SMCR	<HYPBn_base> + 20_H
Manual mode command setting register	SMCMR	<HYPBn_base> + 24_H
Manual mode address setting register	SMADR	<HYPBn_base> + 28_H
Manual mode option setting register	SMOPR	<HYPBn_base> + $2C_H$
Manual mode enable setting register	SMENR	<HYPBn_base> + 30_H
Manual mode read data register 0	SMRDR0	<HYPBn_base> + 38_H
Manual mode read data register 1	SMRDR1	<HYPBn_base> + $3C_H$
Manual mode write data register 0	SMWDR0	<HYPBn_base> + 40_H
Manual mode write data register 1	SMWDR1	<HYPBn_base> + 44_H
Common status register	CMNSR	<HYPBn_base> + 48_H
Data read dummy cycle setting register	DRDMCR	<HYPBn_base> + 58_H
Manual mode dummy cycle setting register	SMDMCR	<HYPBn_base> + 60_H
Manual mode DDR enable register	SMDRENR	<HYPBn_base> + 64_H
PHY control register	PHYCNT	<HYPBn_base> + $7C_H$

<HYPBn_base>

The base addresses <HYPBn_base> of the HYPBn is defined in the first subsection of this section under the key word “Register addresses”.

NOTES

1. In the header files the names of the above registers are defined in the following format: <ModuleName> + <Symbol>.
   <ModuleName> and <Symbol> are defined in the above table.
2. Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

56.5 Register Descriptions

The registers of the HyperBus are assigned to and located in the address space of the internal bus.

[Legend for Register Descriptions]

Initial value: Register value after a reset.

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be 0.

—/WB: Write-only. The read value is undefined.

56.5.1 Common Control Register (CMNCR)

CMNCR is a 32-bit register that controls the HyperBus controller. The settings of this register are reflected both in external address space read mode and manual operating mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MD	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1

Initial value	1	1	1	1	0	0	1	1	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 56.8 CMNCR register contents

Bit Position	Bit Name	Function
31	MD	Operating Mode Switch 0: External address space read mode 1: Manual mode
30 to 0	Reserved	Reading these bits returns always the initial value. The write value should always be the initial value.

56.5.2 SSL Delay Register (SSLDR)

SSLDR is a 32-bit register that adjusts the timing between the MCS signal and the MCK signal.

The settings of this register are reflected both in external address space read mode and manual operating mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	SPNDL[2:0]		
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 56.9 SSLDR register contents

Bit Position	Bit Name	Function
31 to 19	Reserved	These bits are always read as 0. The write value should always be 0.
18 to 16	SPNDL[2:0]	Next Access Delay Sets the period from transfer end to next transfer start (next access). 000: 1 cycle of MCK 001: 2 cycles of MCK 010: 3 cycles of MCK 011: 4 cycles of MCK 100: 5 cycles of MCK 101: 6 cycles of MCK 110: 7 cycles of MCK 111: 8 cycles of MCK
15 to 11	Reserved	These bits are always read as 0. The write value should always be 0.
10 to 8	SLNDL[2:0]	MCS Negation Delay Sets the period from the time the last MCK edge is sent of a transfer to MCS pin negation (MCS negation delay). 000: 1 cycle of MCK 001: 2 cycles of MCK 010: 3 cycles of MCK 011: 4 cycles of MCK 100: 5 cycles of MCK 101: 6 cycles of MCK 110: 7 cycles of MCK 111: 8 cycles of MCK
7 to 3	Reserved	These bits are always read as 0. The write value should always be 0.
2 to 0	SCKDL[2:0]	Clock Delay Sets the period from MCS pin assertion to MCK oscillation (clock delay). 000: 1.5 cycles of MCK 001: 2.5 cycles of MCK 010: 3.5 cycles of MCK 011: 4.5 cycles of MCK 100: 5.5 cycles of MCK 101: 6.5 cycles of MCK 110: 7.5 cycles of MCK 111: 8.5 cycles of MCK

56.5.3 Data Read Control Register (DRCR)

DRCR is a 32-bit register that sets the operation in the external address space read mode.

For other than SSLN bit, the settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	SSLN	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	W	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RCF	BST[3:0]				—	—	—	—	SSLE
Initial value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	W	R/W	R/W	R/W	R/W	R	R	R	R	R/W

Table 56.10 DRCR register contents

Bit Position	Bit Name	Function
31 to 25	Reserved	These bits are always read as 0. The write value should always be 0.
24	SSLN	MCS Negation This bit is always read as 0. To start next access after MCS negation using this bit, read SSLF in CMNSR = 0 to confirm that the MCS has been negated.
23 to 10	Reserved	Reading these bits returns always the initial value. The write value should always be the initial value.
9	RCF	Read Cache Flush When 1 is written to this bit, all the entries in the read cache are cleared. This bit is always read as 0. After flushing the read cache by writing 1 to the RCF bit, read the DRCR before proceeding to read from the external address space.
8 to 5	BST[3:0]	Burst Control 1111:Enable burst read/write HyperBus read/write transfer length according to Cross-connect XCn access transfer length. Other: prohibit
4 to 1	Reserved	These bits are always read as 0. The write value should always be 0.
0	SSLE	MCS Negation Setting Sets the conditions for MCS negation during read burst. MCS is negated for each access during normal read. 0: MCS is negated after transfer of data set in burst length. 1: MCS is negated when the accessed address is not continuous with the previously transferred address. **Note:** For HyperFlash/HyperRAM SSLE must be set to 0.

56.5.4 Data Read Command Setting Register (DRCMR)

DRCMR is a 32-bit register that sets the commands issued in external address space read mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CMD[7:0]							
Initial value	0	0	0	0	0	0	0	0	1	0	1	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	OCMD[7:0]							
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 56.11 DRCMR register contents

Bit Position	Bit Name	Function
31 to 24	Reserved	These bits are always read as 0. The write value should always be 0.
23 to 16	CMD[7:0]	Command Sets the command.
15 to 8	Reserved	These bits are always read as 0. The write value should always be 0.
7 to 0	OCMD[7:0]	Optional Command Sets the optional command.

56.5.5 Data Read Option Setting Register (DROPR)

DROPR is a 32-bit register that sets the option data in external address space read mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OPD3[7:0]								OPD2[7:0]							
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OPD1[7:0]								OPD0[7:0]							
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 56.12 DROPR register contents

Bit Position	Bit Name	Function
31 to 24	OPD3[7:0]	Option Data 3 Sets the option data 3.
23 to 16	OPD2[7:0]	Option Data 2 Sets the option data 2.
15 to 8	OPD1[7:0]	Option Data 1 Sets the option data 1.
7 to 0	OPD0[7:0]	Option Data 0 Sets the option data 0.

NOTE

OPD3[7:0], OPD2[7:0], OPD1[7:0], and OPD0[7:0] are output in this order.

56.5.6 Data Read Enable Setting Register (DRENR)

DRENR is a 32-bit register that sets the read data in external address space read mode and enables output of data other than read data.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	1	0	1	0	0	0	1	0	0	0	1	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DME	CDE	—	OCDE	—	—	—	—	OPDE[3:0]				—	—	—	—
Initial value	1	1	0	1	0	1	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R

Table 56.13 DRENR register contents

Bit Position	Bit Name	Function
31 to 16	Reserved	Reading these bits returns always the initial value. The write value should always be the initial value.
15	DME	Dummy Cycle Enable Enables or disables insertion of a dummy cycle. The dummy cycle is inserted before the read data. Setting of a transfer starting with a dummy cycle is prohibited. 0: Insertion of a dummy cycle is disabled. 1: Insertion of a dummy cycle is enabled.
14	CDE	Command Enable Enables or disables output of commands. 0: Output disabled 1: Output enabled
13	Reserved	This bit is always read as 0. The write value should always be 0.
12	OCDE	Optional Command Enable Sets the optional command to be output. 0: Output disabled 1: Optional command output enabled
11 to 8	Reserved	Reading these bits returns always the initial value. The write value should always be the initial value.
7 to 4	OPDE[3:0]	Option Data Enable Sets the option data to be output. Be sure to use the following setting. Otherwise, the operation is not guaranteed. 0000: Output disabled 1000: OPD3[7:0] is output. 1100: OPD3[7:0] and OPD2[7:0] are output. 1110: OPD3[7:0], OPD2[7:0], and OPD1[7:0] are output. 1111: OPD3[7:0], OPD2[7:0], OPD1[7:0], and OPD0[7:0] are output. All others: Setting prohibited
3 to 0	Reserved	These bits are always read as 0. The write value should always be 0.

56.5.7 Manual Mode Control Register (SMCR)

SMCR is a 32-bit register that sets the operation in manual mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SSLKP	—	—	—	—	—	SPIRE	SPIWE	SPIE
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R/W	R/W	W

Table 56.14 SMCR register contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are always read as 0. The write value should always be 0.
8	SSLKP	MCS Signal Level Determines the MCS status after the end of transfer. 0: MCS signal is negated at the end of transfer. 1: MCS signal level is maintained from the end of transfer to the start of next access.
7 to 3	Reserved	These bits are always read as 0. The write value should always be 0.
2	SPIRE	Data Read Enable Enables reading in manual mode. 0: Data reading disabled 1: Data reading enabled The SPIRE and SPIWE bits should not be set to 1 at the same time.
1	SPIWE	Data Write Enable Enables writing in manual mode. 0: Data writing disabled 1: Data writing enabled The SPIRE and SPIWE bits should not be set to 1 at the same time.
0	SPIE	SPI Data Transfer Enable Data is transferred by setting this bit to 1. This bit is enabled only when the TEND bit in CMNSR is set to 1. The operation cannot be guaranteed when this bit is set to 1 with the TEND bit set to 0. This bit is always read as 0. **Note:** When the MCS pin is negated, the command, optional command, address, and option data that are output enabled are output even if the SPIRE and SPIWE bits are set to 0.

56.5.8 Manual Mode Command Setting Register (SMCMR)

SMCMR is a 32-bit register that sets the commands issued in manual mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CMD[7:0]							
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 56.15 SMCMR register contents

Bit Position	Bit Name	Function
31 to 24	Reserved	These bits are always read as 0. The write value should always be 0.
23 to 16	CMD[7:0]	Command Sets the command.
15 to 8	Reserved	These bits are always read as 0. The write value should always be 0.
7 to 0	OCMD[7:0]	Optional Command Sets the optional command.

56.5.9 Manual Mode Address Setting Register (SMADR)

SMADR is a 32-bit register that sets the addresses in manual mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADR[31:16]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 56.16 SMADR register contents

Bit Position	Bit Name	Function
31 to 0	ADR[31:0]	Address Sets the address.

56.5.10 Manual Mode Option Setting Register (SMOPR)

SMOPR is a 32-bit register that sets the option data in manual mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OPD3[7:0]								OPD2[7:0]							
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OPD1[7:0]								OPD0[7:0]							
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 56.17 SMOPR register contents

Bit Position	Bit Name	Function
31 to 24	OPD3[7:0]	Option Data 3 Sets the option data 3.
23 to 16	OPD2[7:0]	Option Data 2 Sets the option data 2.
15 to 8	OPD1[7:0]	Option Data 1 Sets the option data 1.
7 to 0	OPD0[7:0]	Option Data 0 Sets the option data 0.

NOTE

OPD3[7:0], OPD2[7:0], OPD1[7:0], and OPD0[7:0] are output in this order.

56.5.11 Manual Mode Enable Setting Register (SMENR)

SMENR is a 32-bit register that sets the bit size of the command, optional command, address, option data, and transfer data in manual mode and enables their output. SMENR also enables dummy cycle insertion. Disabling all of the command, optional command, address, option data, dummy cycle, and transfer data is prohibited. At least one of them except dummy cycle must be enabled.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Table 56.18 SMENR register contents (1/2)

Bit Position	Bit Name	Function
31, 30	CDB[1:0]	Command Bit Size Sets the command size in bit units. 00_B: reserved 01_B: reserved 10_B: 8 bits 11_B: Setting prohibited
29, 28	OCDB[1:0]	Optional Command Bit Size Sets the optional command size in bit units. 00_B: reserved 01_B: reserved 10_B: 8 bits 11_B: Setting prohibited
27, 26	Reserved	This bit is always read as 0. The write value should always be 0.
25, 24	ADB[1:0]	Address Bit Size Sets the address size in bit units. 00_B: reserved 01_B: reserved 10_B: 8 bits 11_B: Setting prohibited
23, 22	Reserved	This bit is always read as 0. The write value should always be 0.
21, 20	OPDB[1:0]	Option Data Bit Size Sets the option data size in bit units. 00_B: reserved 01_B: reserved 10_B: 8 bits 11_B: Setting prohibited
19, 18	Reserved	This bit is always read as 0. The write value should always be 0.
17, 16	SPIDB[1:0]	Transfer Data Bit Size Sets the transfer data size in bit units. 00_B: reserved 01_B: reserved 10_B: 8 bits 11_B: Setting prohibited

Table 56.18 SMENR register contents (2/2)

Bit Position	Bit Name	Function
15	DME	Dummy Cycle Enable Enables or disables insertion of the dummy cycle before the read data. **Note:** Dummy cycle insertion is prohibited for write in manual mode, including the case in which a transfer ends with a dummy cycle. A setting is prohibited for a transfer starting with a dummy cycle. 0: Dummy cycle insertion disabled 1: Dummy cycle insertion enabled
14	CDE	Command Enable Sets the command to be output. 0: Output disabled 1: Output enabled
13	Reserved	This bit is always read as 0. The write value should always be 0.
12	OCDE	Optional Command Enable Sets the optional command to be output. 0: Optional command output disabled 1: Optional command output enabled
11 to 8	ADE[3:0]	Address Enable Sets the address to be output. The following settings must be used. Otherwise, the operation cannot be guaranteed. 0000_B: Output disabled 0100_B: ADR[31:0] is output All others: Setting prohibited
7 to 4	OPDE[3:0]	Option Data Enable Sets the option data to be output. The following settings must be used. Otherwise, the operation cannot be guaranteed. 0000_B: Output disabled 1000_B: OPD3[7:0] is output. 1100_B: OPD3[7:0] and OPD2[7:0] are output. 1110_B: OPD3[7:0], OPD2[7:0], and OPD1[7:0] are output. 1111_B: OPD3[7:0], OPD2[7:0], OPD1[7:0], and OPD0[7:0] are output. All others: Setting prohibited
3 to 0	SPIDE[3:0]	Transfer Data Enable Sets valid transfer data. The following settings must be used. Otherwise, the operation cannot be guaranteed. 0000_B: Not transferred 1000_B: 16 bits transferred (enables data at addresses 0 to 1 of the manual mode read/write data registers 0) 1100_B: 32 bits transferred (enables data at addresses 0 to 3 of the manual mode read/write data registers 0) 1111_B: 64 bits transferred (enables data at addresses 0 to 3 of the manual mode read/write data registers 0 and data at addresses 0 to 3 of the manual mode read/write data registers 1) All others: Setting prohibited

56.5.12 Manual Mode Read Data Register 0 (SMRDR0)

SMRDR1 is a 32-bit register that holds the read data in manual mode.

Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the manual mode enable setting register (SMENR). Be sure to access from LSB.

The data should be read when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

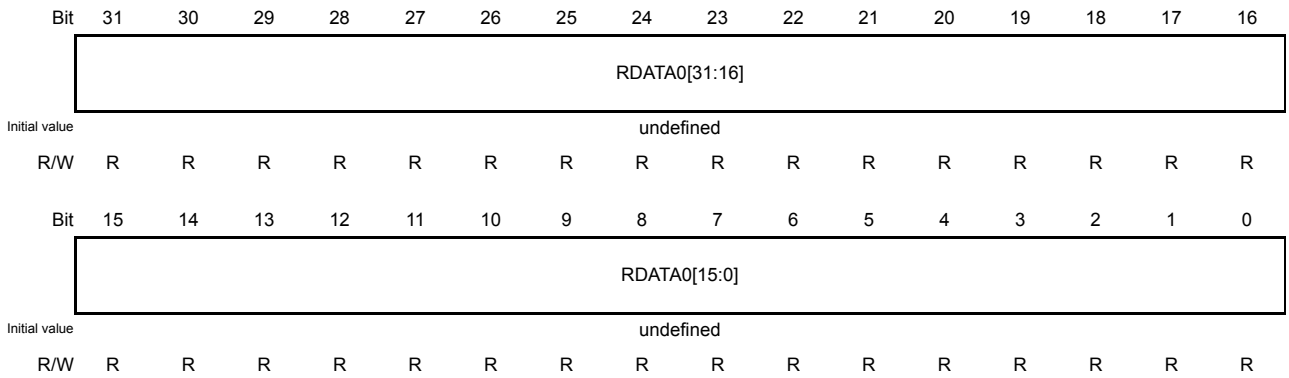

Table 56.19 SMRDR0 register contents

Bit Position	Bit Name	Function
31 to 0	RDATA0[31:0]	Read Data Holds the data read in manual mode. Read data[63:32] is stored to this register.

NOTE

The contents of this register and SMRDR1 are modified upon completion of reception in manual mode. Be sure to read data when reception in manual mode is completed.

56.5.13 Manual Mode Read Data Register 1 (SMRDR1)

SMRDR1 is a 32-bit register that holds the read data in manual mode.

Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the manual mode enable setting register (SMENR). Be sure to access from LSB.

The data should be read when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

56.5.14 Manual Mode Write Data Register 0 (SMWDR0)

SMWDR0 is a 32-bit register that sets the write data in manual mode.

Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the manual mode enable setting register (SMENR). Be sure to access from address 0.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit Position	Bit Name	Function
31 to 0	WDATA0[31:0]	Write Data Holds the data to be written in manual mode. This register is assigned to Write data[63:32].

56.5.15 Manual Mode Write Data Register 1 (SMWDR1)

SMWDR1 is a 32-bit register that sets the write data in manual mode.

Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the manual mode enable setting register (SMENR). Be sure to access from address 0.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit Position	Bit Name	Function
31 to 0	WDATA1[31:0]	Write Data Holds the data to be written in manual mode. This register is assigned to Write data[31:0].

56.5.16 Common Status Register (CMNSR)

CMNSR is a 32-bit register that holds flags indicating the operating state.

The settings of this register are reflected both in external address space read mode and manual operating mode.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SSLF	TEND
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 56.23 CMNSR register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	These bits are always read as 0. The write value should always be 0.
1	SSLF	MCS Pin State Monitor 0: MCS pin is negated. 1: MCS pin is asserted.
2	TEND	Transfer End Flag Indicates whether the data transfer has ended. 0: Indicates that data transfer is in progress. 1: Indicates that data transfer has ended.

56.5.17 Data Read Dummy Cycle Setting Register (DRDMCR)

DRDMCR is a 32-bit register that sets the size and number of dummy cycles to be inserted in external address space read mode.

The settings of this register are enabled when the DME bit in the data read enable setting register (DRENR) is 1.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R

Table 56.24 DRDMCR register contents

Bit Position	Bit Name	Function
31 to 4	Reserved	These bits are always read as 0. The write value should always be 0.
3 to 1	DMCYC[2:0]	Number of Dummy Cycles Setting Sets the number of dummy cycles to be inserted when the DME bit in the data read enable setting register (DRENR) is 1. 011: 8 cycles 100: 10 cycles 101: 12 cycles 110: 14 cycles 111: 16 cycles All others: Setting prohibited
0	Reserved	These bits are always read as 0. The write value should always be 0.

56.5.18 Manual Mode Dummy Cycle Setting Register (SMDMCR)

SMDMCR is a 32-bit register that sets the size and number of dummy cycles to be inserted in manual mode.

The settings of this register are enabled when the DME bit in the manual mode enable setting register (SMENR) is 1.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 56.25 SMDMCR register contents

Bit Position	Bit Name	Function
31 to 4	Reserved	These bits are always read as 0. The write value should always be 0.
3 to 0	DMCYC[3:0]	Number of Dummy Cycles Sets the number of dummy cycles to be inserted when the DME bit in the manual mode enable setting register (SMENR) is 1. 0000: 1 cycle 0001: 2 cycles 0010: 3 cycles .... 1110: 15 cycles 1111: 16 cycles All others: Setting prohibited

56.5.19 Manual Mode DDR Enable Register (SMDRENR)

SMDRENR is a 32-bit register that specifies the SDR or DDR transfer of the address, option data, and data for transfer in manual mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Table 56.26 SMDRENR register contents

Bit Position	Bit Name	Function
31 to 15	Reserved	These bits are always read as 0. The write value should always be 0.
14 to 12	HYPE[2:0]	HyperFlash or HyperRAM in DDR mode enable 101: HyperFlash or HyperRAM in DDR mode All others: Setting prohibited
11 to 9	Reserved	These bits are always read as 0. The write value should always be 0.
8	ADDRE	Address DDR enable Specifies the SDR or DDR transfer of the address. 0: SDR transfer 1: DDR transfer **Note:** When HyperFlash/HyperRAM is connected, please specify 1 in this bit
7 to 5	Reserved	These bits are always read as 0. The write value should always be 0.
4	OPDRE	Option Data DDR enable Specifies the SDR or DDR transfer of the option data. 0: SDR transfer 1: DDR transfer **Note:** When HyperFlash/HyperRAM is connected, please specify 1 in this bit
3 to 1	Reserved	These bits are always read as 0. The write value should always be 0.
0	SPIDRE	Transfer Data DDR enable Specifies the SDR or DDR transfer of the data for transfer. 0: SDR transfer 1: DDR transfer **Note:** When HyperFlash/HyperRAM is connected, please specify 1 in this bit

56.5.20 PHY Control Register (PHYCNT)

PHYCNT is a 32-bit register that sets the PHY operating mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CAL	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value	0	0	0	0	0	0	1	0	0	1	1	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Table 56.27 PHYCNT register contents

Bit Position	Bit Name	Function
31	CAL	PHY Calibration Executes calibration of the PHY. Be sure to execute calibration before access in manual mode. 1: Calibration is executed. 0: Calibration is not executed
30 to 5	Reserved	These bits are always read as 0. The write value should always be 0.
4	WBUF2	Write Buffer Enable2 The write buffer is used when the flash memory is written to. Refer to Section 56.6.9, Write Buffer Operation for usage of the write buffer. 1: The write buffer is used to write data to the flash memory. 0: The write buffer is not used.
3	Reserved	This bit is always read as 0. The write value should always be 0.
2	WBUF	Write Buffer Enable The write buffer is used when the flash memory is written to. Refer to Section 56.6.9, Write Buffer Operation for usage of the write buffer. 1: The write buffer is used to write data to the flash memory. 0: The write buffer is not used.
1, 0	PHYMEM[1:0]	Device Selection Selects a device to connect. 11: HyperFlash All others: Setting prohibited

56.6 Operation

56.6.1 System Configuration

With this module, one HyperFlash/HyperBus memory device can be connected.

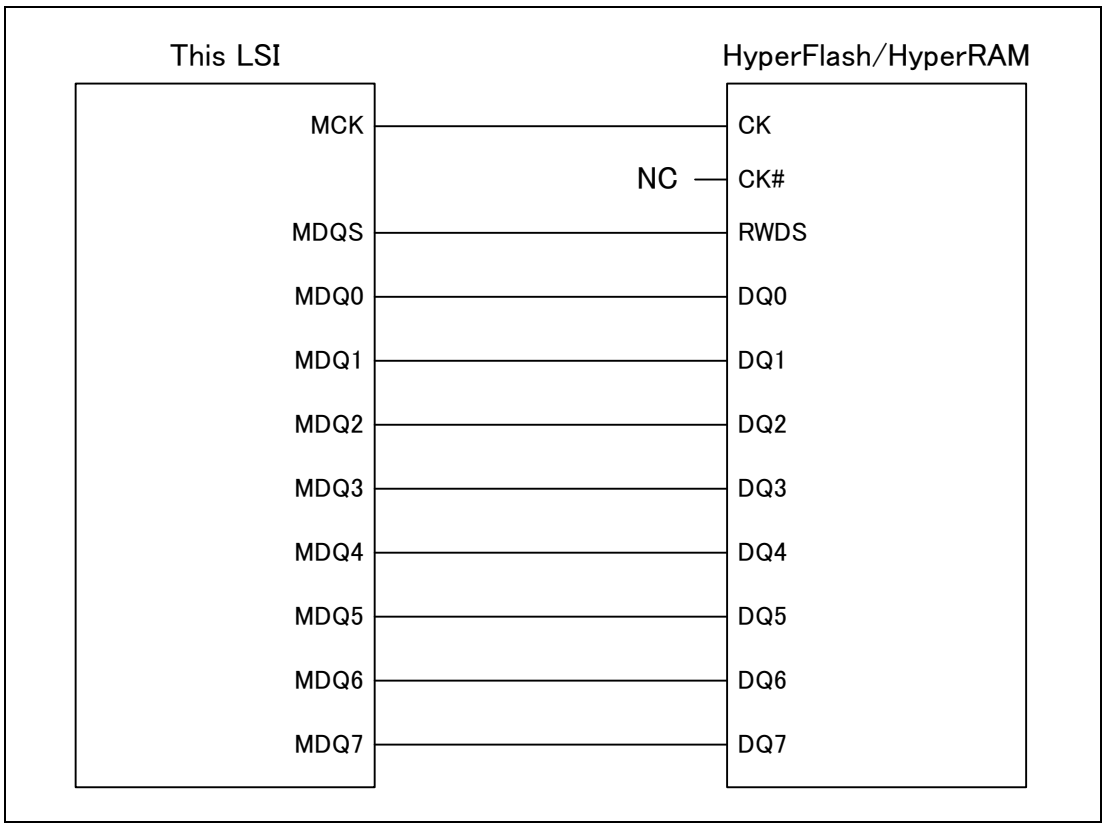

Figure 56.2 Example of system configuration with connected HyperFlash

56.6.2 Address Map

In external address space read mode, the HyperBus to be connected are assigned in the multi I/O bus space. The maximum accessible address space differs depending on the number of HyperBus memory devices connected.

Table 56.28 Address Map

Internal Address	Maximum Access Area
6000 0000$_H$ to 7FFF FFFF	HyperFlash x 1: 512 Mbytes

56.6.3 Operating Modes

This module has two operating modes: external address space read/write mode and manual mode.

In external address space read/write mode, a read access to the HyperBus space is converted into the data read protocol and data is received from the external device. After data acquisition from the external device, data is returned to the bus master that is the issuing source of read access. A write access to the HyperBus space is converted into the write protocol and data is transferred to the external device. HYPB generates write command automatically from DRCMR register value. For details,see Section 56.6.4, External Address Space Read/Write Mode.

The manual mode carries out an arbitrary protocol by using the register settings. For details,see Section 56.6.6, Manual Mode.

56.6.4 External Address Space Read/Write Mode

By external address space read/write mode, a read/write access to the HyperBus space is converted into the data read protocol. Further, the commands, optional commands, option data, and dummy cycle issued for reading external device can be modified using registers.

(1) Initial Setting Flow

An example of an initial setting flow in external address space read/write mode is shown in figure below.

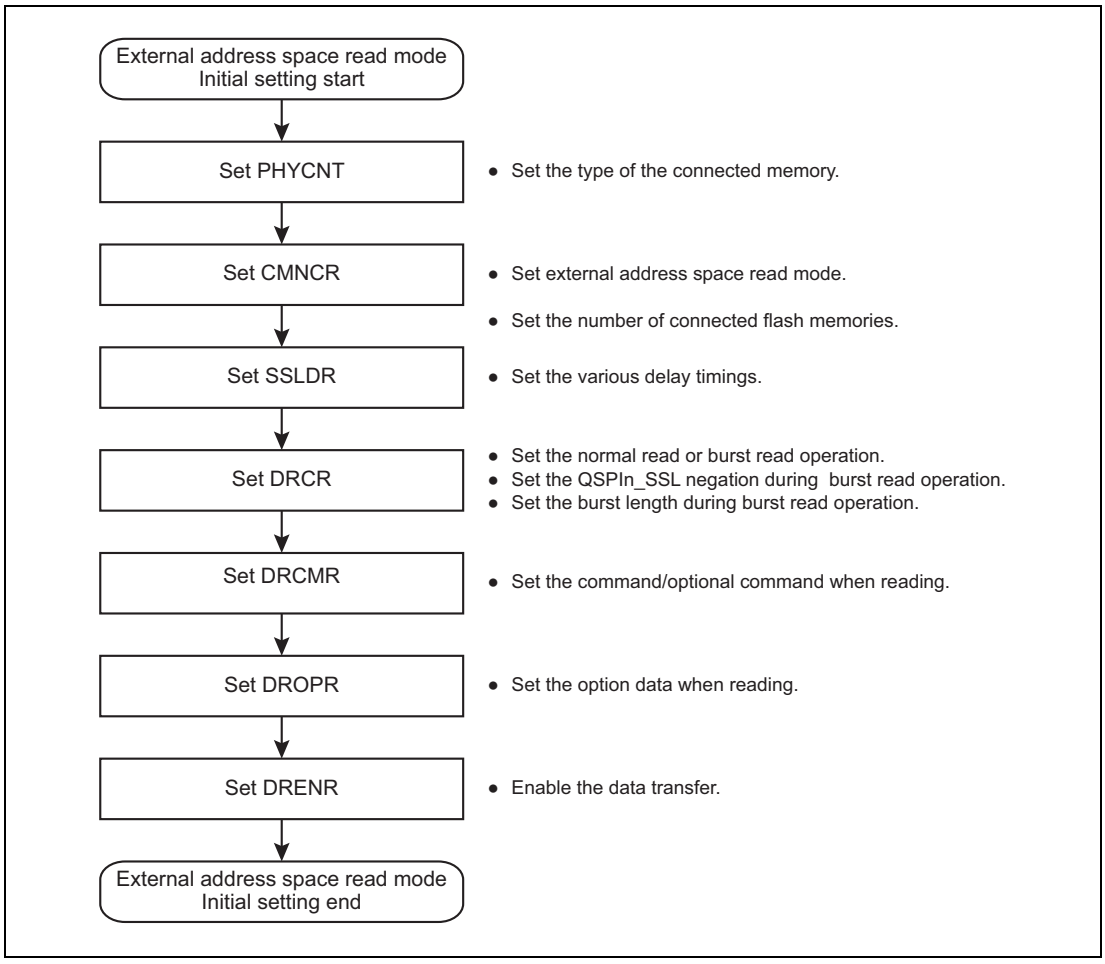

Figure 56.3 Example of initial setting flow in external address space read mode

(2) Initial sequence example for HyperFlash

This example sets latency 8 to the HyperFlash device (S26KLxxxx)

1. Set the configuration register access1 data
   - CMNCR = 0x81ff_f301
   - SSLDR = 0x0000_0000
   - SMCMR = 0x0020_0000
   - SMADR = 0x0000_0555
   - SMOPR = 0x0000_0000
   - SMENR = 0xa222_5408
   - SMWDR0 = 0xaa00_0000
   - SMDRENR = 0x0000_5111
2. Issue the configuration register access1
   - SMCR = 0x0000_0003
3. wait TEND assert 1.
   - wait CMNSR = 0x0000_0001
4. Set the configuration register access2 data
   - SMADR = 0x0000_02aa
   - SMWDR0 = 0x5500_0000
5. Issue the configuration register access2
   - SMCR = 0x0000_0003
6. wait TEND assert 1.
   - wait CMNSR = 0x0000_0001
7. Set the configuration register access3 data
   - SMADR = 0x0000_0555
   - SMWDR0 = 0x3800_0000
8. Issue the configuration register access3
   - SMCR = 0x0000_0003
9. wait TEND assert 1.
   - wait CMNSR = 0x0000_0001
10. Set the non-volatime configuration register data
    - SMADR = 0x0000_0555
    - SMWDR0 = 0x398f_0000
11. Issue the non-volatime configuration register access
    - SMCR = 0x0000_0003
12. wait TEND assert 1.

- wait CMNSR = 0x0000_0001

13. setting internal register
    - CMNCR = 0x01ff_f301
    - DRCMR = 0x00a0_0000
    - DRDMCR = 0x0000_0006
    - DRCR = 0x000f_03e1
14. Start external address space read to HyperFlash

(3) Initial sequence example for HyperRAM

This example sets latency 4 (fixed latency) to the HyperRAM device (S27KLxxxx)

1. Set configuration register access data
    - CMNCR = 0x81ff_f301
    - SSLDR = 0x0000_0000
    - SMCMR = 0x0060_0000
    - SMADR = 0x0000_0800
    - SMOPR = 0x0000_0000
    - SMENR = 0xa222_5408
    - SMWDR0 = 0xff8f_0000
    - SMDRENR = 0x0000_5111
2. Issue the configuration register access1
    - SMCR = 0x0000_0003
3. wait TEND assert 1.
    - wait CMNSR = 0x0000_0001
4. setting internal register
    - CMNCR = 0x01ff_f301
    - DRCMR = 0x00a0_0000
    - DRDMCR = 0x0000_0006
    - DRCR = 0x000f_03e0
5. Start external address space read/write to HyperRAM

56.6.5 Read Cache

This module has a simple built-in read (write-through) cache. The read cache can be used during external address space operation. The read cache is configured with a line size of 64 bits and 32 entries. If this module receives less than 8 bytes data read request from Bus master, it reads 32 bytes data from HyperBus.

Read cache configuration is shown in the figure below.

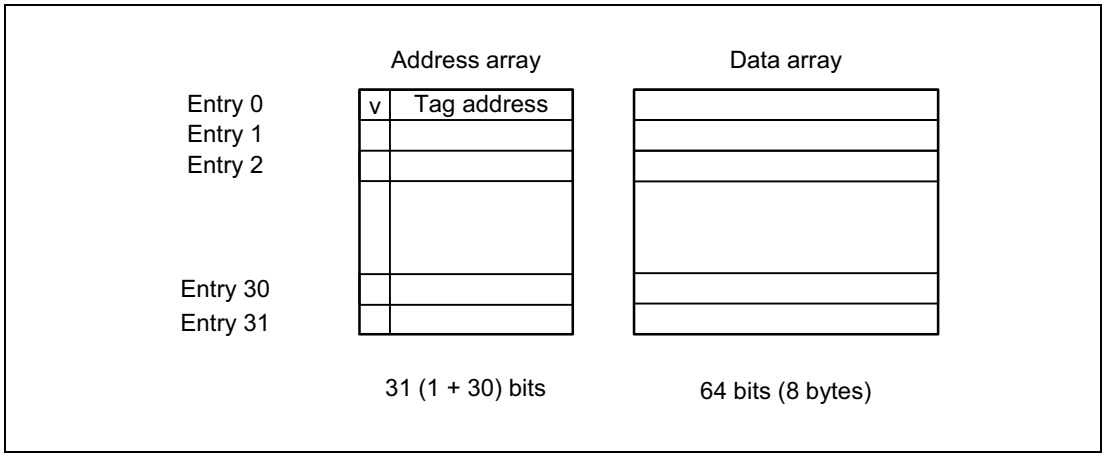

Figure 56.4 Read cache configuration

Address Array

The V bit indicates whether the entry data is valid. When the V bit is 1, the data is valid and when V bit is 0, the data is invalid.

The tag address bits hold the address used for the HyperFlash/HyperRAM memory. Address bits 32 to 3 are used for the purpose.

Data Array

It retains the 64-bit read data. Registration in the read cache is performed in line units.

Read Operation

In case of read-hit, data is read from the read cache. In case of read-miss, after the 64 bits × 4 data is read from the HyperBus memory and the read cache is updated, the data is returned to the bus master.

Data Replacement

The write pointer is used to update data. In case of read-miss, the data is replaced starting at the entry specified by the write pointer. In other words, the data is replaced in the storage order of the data. Whether data is referred to or not will not affect the replacement order of data.

Invalidate Data

In case of a write address hit to cache tag address in side of 1 Kbyte boundary, this module clears the V flag and invalidate cache content.

56.6.6 Manual Mode

This module can carry out an arbitrary serial transfer operation by using the register settings.

Manual mode can be used for reading the status of the HyperBus memory and writing to the HyperBus memory.

In this mode, one transfer refers to the operation from when the SPIE bit in SMCR is set to 1 to when the TEND bit is set to 1.

Initial Setting Flow

An example of an initial setting flow in manual mode is shown in the figure below.

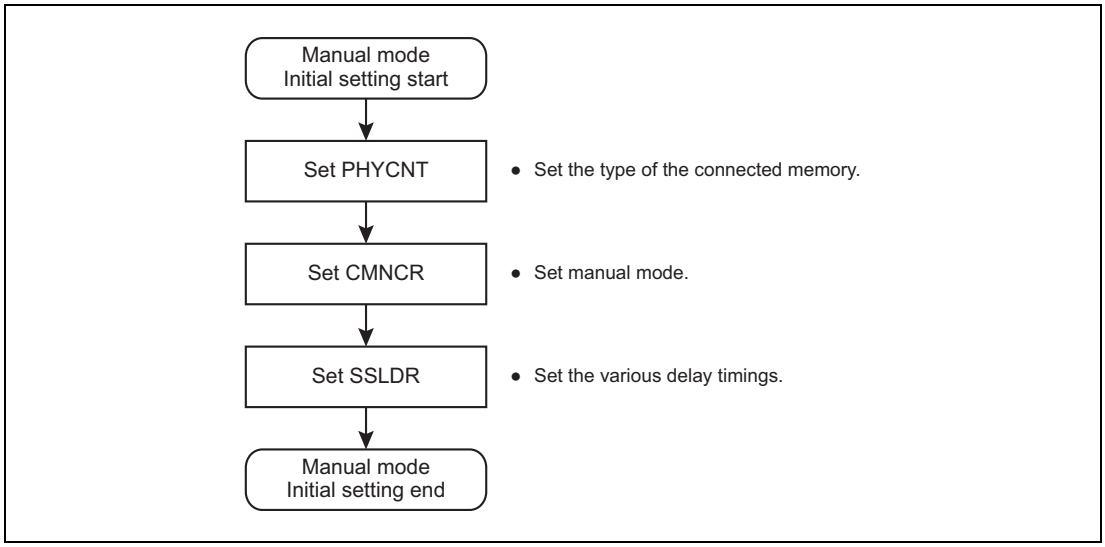

Figure 56.5 Example of initial setting flow in manual operating mode

Data Transfer Setting Flow

An example of a data transfer setting flow in manual mode is shown in the figure below.

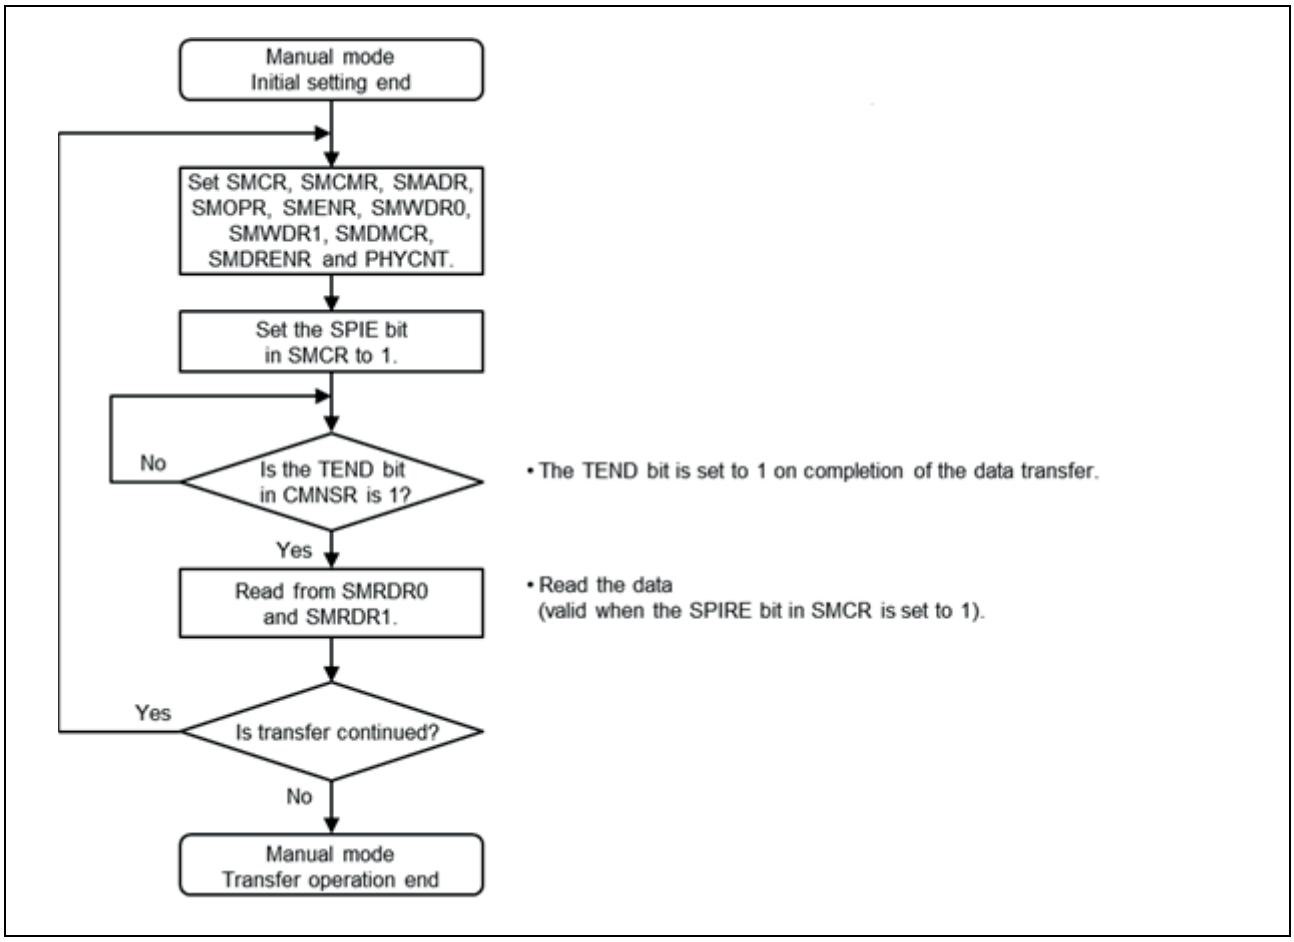

Figure 56.6 Example of data transfer setting flow in manual operating mode

56.6.7 Command Sequence

This module handles input and output data in the order of command, optional command, address, option data, dummy cycle, and data.

(a) 4-bit size (Hyperflash)

The following figures show examples of the transfer format.

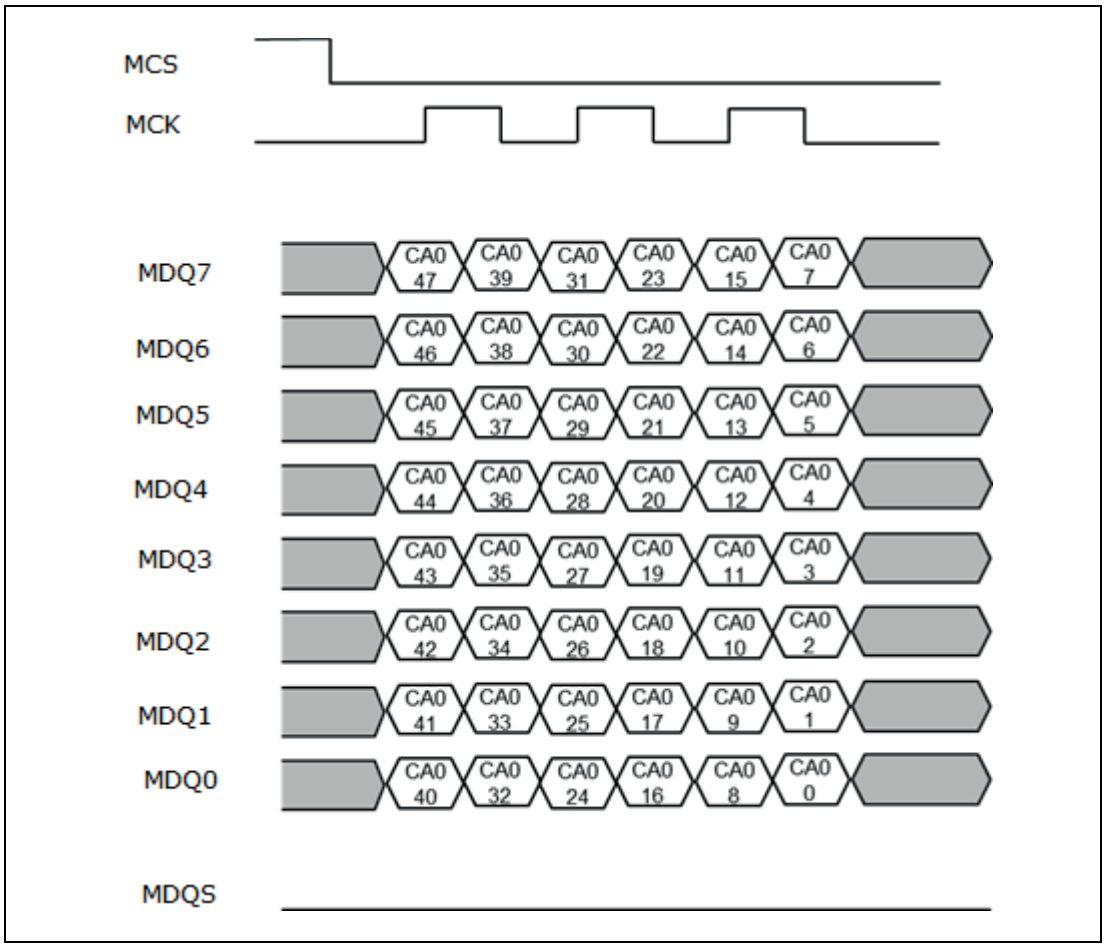

Figure 56.7 Example of transfer format in command/address phase with HyperFlash

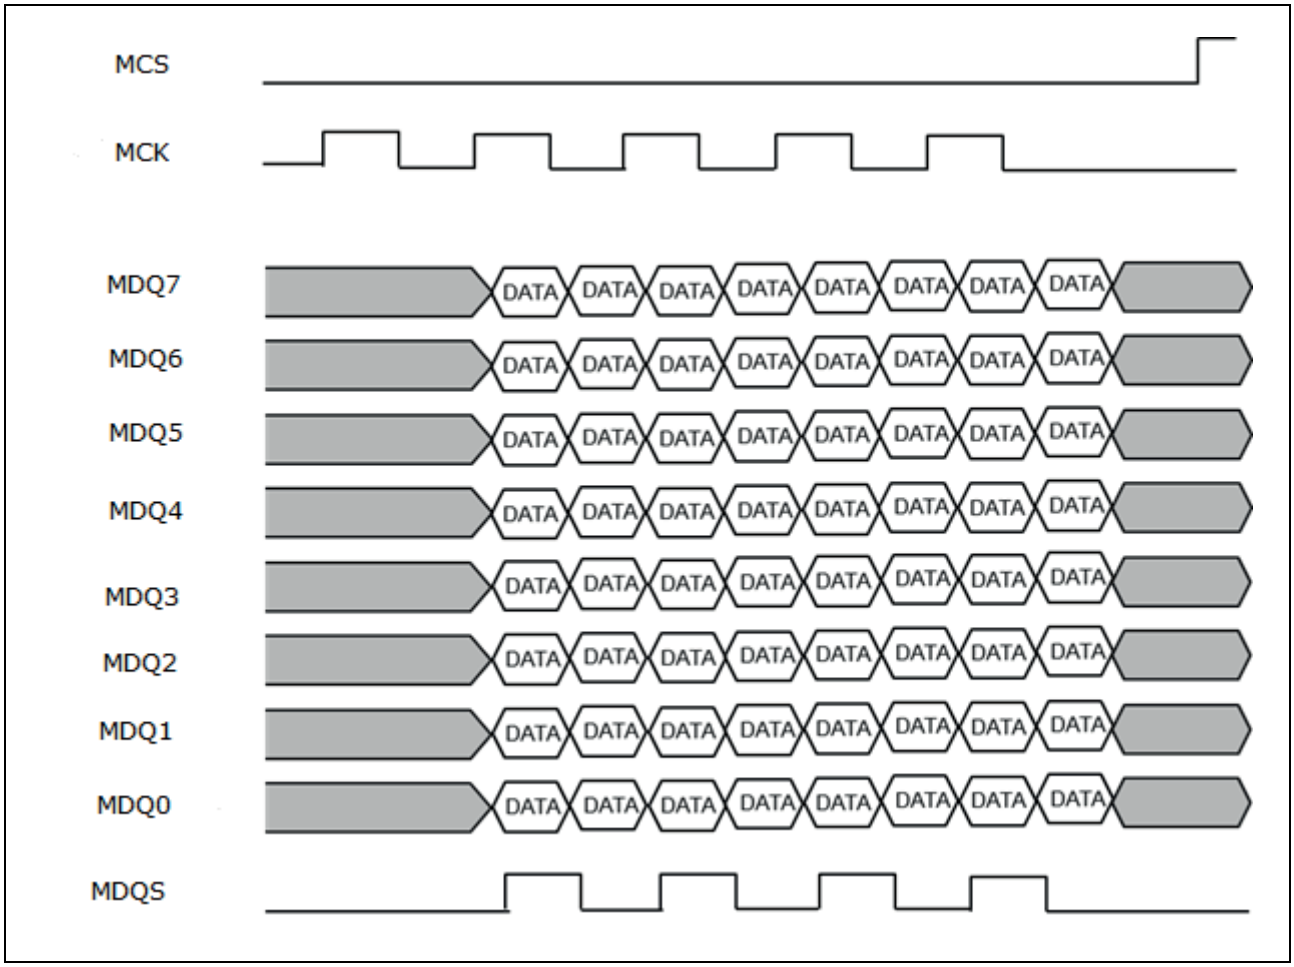

Figure 56.8 Example of transfer format in read phase with HyperFlash

Table 56.29 Command/Address bit assignment of HyperBus

Data	External address space read operation	Manual operation
CA0 (47-40)	CMD[7:5] bits in DRCMR + [31:27] bits of the read address	CMD[7:5] bits in SMCMR + ADR[31:27] bits in SMADR
CA0 (39-32)	[26:19] bits of the read address	ADR[26:19] bits in SMADR
CA1 (31-24)	[18:11] bits of the read address	ADR[18:11] bits in SMADR
CA1 (23-16)	[10:3] bits of the read address	ADR[10:3] bits in SMADR
CA2 (15-8)	DROPR[15:8]	SMOPR[15:8]
CA2 (7-0)	DROPR[7:3] + [2:0] bits of the read address	SMOPR[7:3] + ADR[2:0] bits in SMADR
Dummy cycle	DRDMCR register	SMDMCR register
Transfer data	Normal read: 8, 16, and 32 bits, Burst read: 64 x RBURST bits	Read: SMRDR0 and SMRDR1 Write: SMWDR0 and SMWDR1

56.6.8 Flags

This module has two flag bits SSLF and TEND in CMNSR. These bits are read-only bits.

SSLF Bit

This bit indicates the MCS pin status. The status is 1 when the MCS is asserted, and the status is 0 when the MCS is negated.

TEND Bit

This bit indicates whether transfer of data is in progress or the transfer of data has ended.

During waiting for read access by burst read and MCS automatic negation, the TEND bit is read as 0 to indicate that the transfer of data is in progress.

When other than the above, the TEND bit is read as 1 to indicate that transfer of data has ended.

Register Re-writing Timing

The status of the TEND bit determines the rewritable registers.

The registers which can be written to, except the SSLN bit in DRCR, should be modified when TEND = 1.

The data should be read when the TEND flag in SMRDR0 or SMRDR1 is 1; CMNSR can always be read.

56.6.9 Write Buffer Operation

This module uses the read cache as write buffer in programming operation. This write buffer improves the programming performance.

Table 56.30 Write Buffer Area

Address	Access Size
F2FF 8800_H to F2FF $88FF_H$	8 Byte

NOTE

This area should be accessed sequentially from the start address and transfer size to the device is 8-byte unit.

When accessing non-sequentially or at random, the operation is not guaranteed.

The following figure shows the sequence to use write buffer. About the initial setting of Manual mode, refer to **Figure 56.5**.

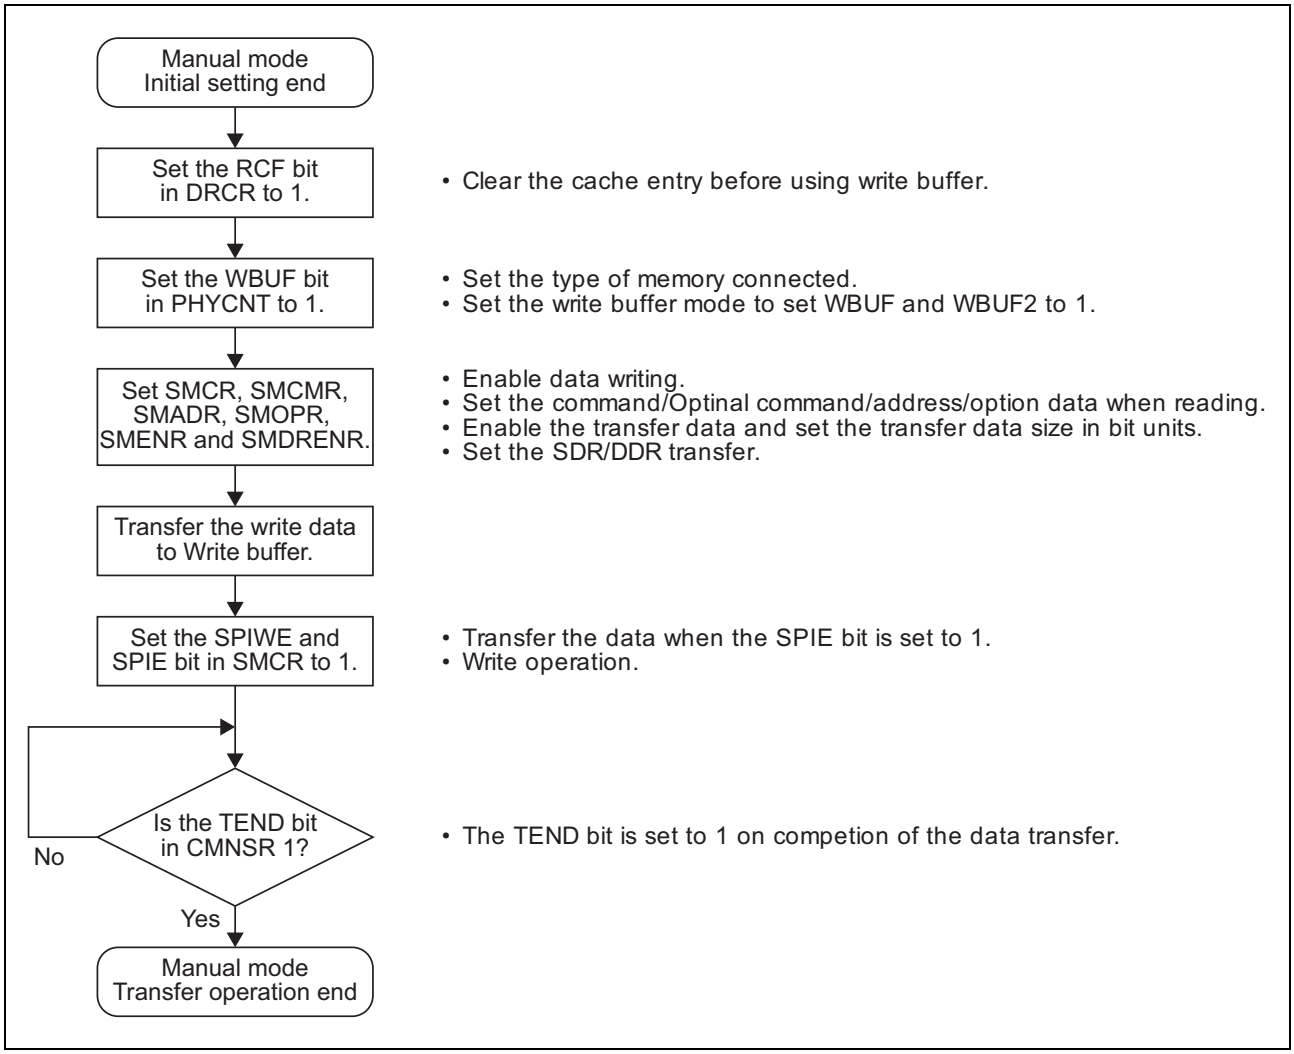

Figure 56.9 Write buffer usage sequence

Section 57 OctaBus Controller (OCTA)

This section contains a generic description of the OctaBus Controller.

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.
The subsequent sections describe the features that apply to all implementations.

57.1 Overview of RH850/D1L/D1M OctaBus Controller

57.1.1 Units

This microcontroller has the following number of units of the OctaBus Controller.

Table 57.1 Units

OctaBus Controller	D1L1	D1L2(H)	D1M1	D1M1H	D1M1-V2	D1M1-V2 D1M1A	D1M2(H)
Units	–	–	–	–	–	1	–
Names	–	–	–	–	–	OCTA0	–

57.1.2 Indices

Following indices are used in this section:

Table 57.2 Indices

Index	Meaning
n	The individual OCTA units are generically indicated by the index “n”.

57.1.3 Register addresses

All OctaBus Controller register addresses are given as address offsets from the individual base addresses <OCTAn_base>.
The <OCTAn_base> addresses of each OCTAn are listed in the following table:

Table 57.3 Register base addresses <OCTAn_base>

OCTAn unit	<OCTAn_base> address
OCTA0	F2FF 8000$_H$

57.1.4 Clock supply

All OctaBus Controllers provide two clock inputs.

Table 57.4 Clock supply

OCTAn unit	OCTAn clock	Connected to
OCTA0	SCLK	Clock Controller C_ISFMAD_CTL clock divider output
	BUS_CLK	Clock Controller C_ISO_XCCLK

57.1.5 Reset sources

The OctaBus Controllers and their registers are initialized by the following reset signal:

Table 57.5 Reset sources

OCTAn unit	Reset signal
OCTAn	• Reset Controller SYSRES • reset upon wake-up from DEEPSTOP mode

57.1.6 I/O signals

The following table shows the I/O signals of the OctaBus Controller.

Table 57.6 OCTAn I/O signals

OCTAn signals	Function	Connected to
OCTA0		
CLK_O	Clock output	Port MCK
CS_0	Chip select	Port MCS
CS_1*[1]	Chip select 1	Port MCS1
SIO[7:0]_IN / SIO[7:0]_OUT	Data[7:0]	Port MDQI[7:0] / MDQO[7:0]
DQS_IN / DQS_OUT	Read data strobe / write data mask	Port MDQS

Note 1. The OctaBus has a second chip select pin on P45_13. This pin is shared with the SFMA2 interface. To configure this pin, please check the register bit XCRAMCFG0.CSSEL as described in Section 14.4, Bus Switch for external memory interfaces (D1M1-V2, D1M1A only).

CAUTION

The OctaBus and the HyperBus interface share the same ports P21_[9:0] and P22_10. The HyperBus or OctaBus selection via the bus switch control bit XCRAMCFG0.HYPBSEL must be done before the XC0 cross-connect is released from reset, i.e. before MRSTC.XC0RES = 1 is set.

Refer to Section 14.4, Bus Switch for external memory interfaces (D1M1-V2, D1M1A only) for details.

57.2 Features

- Support Macronix Serial Multi I/O (MXSMIO®) Octa Peripheral Interface (OPI) interface for high-end consumer applications
- Compatible with Macronix OctaFlash/OctaRAM family
- Support 3-byte/4-byte OctaFlash address command
- Support 4-byte OctaRAM address command
- Support memory-mapped read/write feature with independent Flash(RW)/RAM(RW) address space
- Configurable address space of configuration/flash/RAM address
- Two device channel can configured as Flash only, RAM only, Flash/Flash, Flash/RAM, RAM/RAM
- Shared bus architecture with only split CS pin could reduce system pin counts
- Support Read-While-Write function (RWW) (please reference OctaRAM data sheet)
- Support 1LC/2LC OctaRAM (Please reference Macronix OctaFlash Automotive data sheet)

57.3 General Description

The reference design introduces an Octa NOR Flash/RAM controller for Macronix Octa NOR Flash/RAM products.
Octa I/O read/program mode is supported for high performance applications. The controller supports several types of I/O mode of OctaFlash memory products, OctaRAM only support DTOIO mode:

- SIO (OctaFlash, Single I/O STR, 1 bit per cycle)
- OIO (OctaFlash, Octa I/O STR, 8 bit per cycle)
- DTOIO (OctaFlash/OctaRAM, Octa I/O DTR, 16 bit per cycle)

STR (Single Transfer Rate) is basic flash access mode for flash device access. The data are triggered on single edge of clock as shown in Figure 57.1, STR Read Sequence (Flash Only).
The DTR (Double Transfer Rate) mode is for doubling the frequency of reading data. The data are triggered on both rising and falling edge of clock, as shown in Figure 57.2, DTR Read Sequence (Flash/RAM).

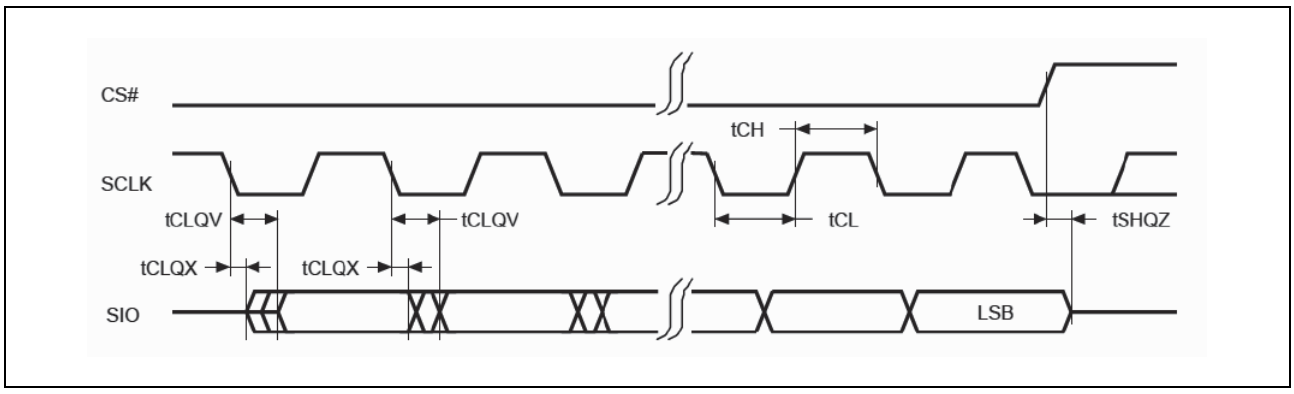

Figure 57.1 STR Read Sequence (Flash Only)

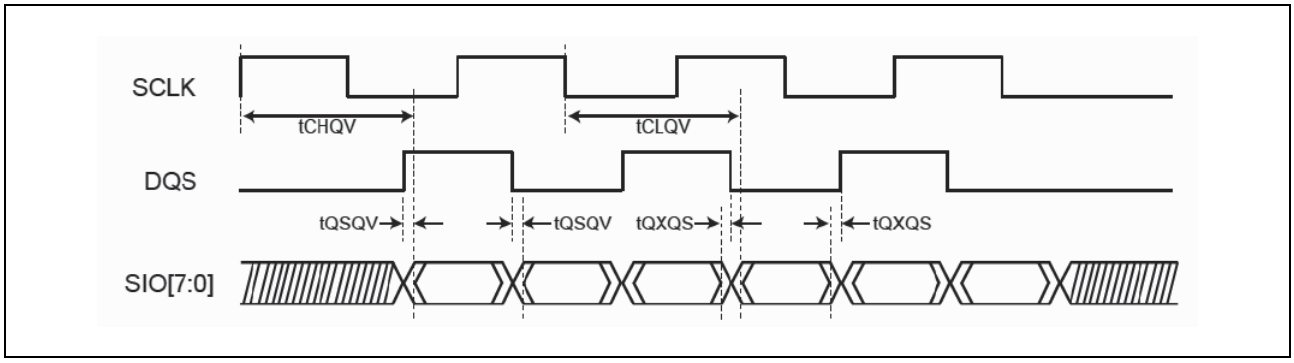

Figure 57.2 DTR Read Sequence (Flash/RAM)

57.4 Configuration Registers

57.4.1 Register configuration overview

The following table shows the register configuration of the OctaBus Controller.

Table 57.7 Register configuration (1/2)

Register name	Shortcut	Address
Device command register	DCR	<OCATn_base> + 00_H
Device address register	DAR	<OCATn_base> + 04
Device command setting register	DCSR	<OCATn_base> + 08
Device size register 0	DSR0	<OCATn_base> + 0C
Device size register 1	DSR1	<OCATn_base> + 10
Memory delay trim register	MDTR	<OCATn_base> + 14
Auto-calibration timer register	ACTR	<OCATn_base> + 18
Auto-Calibration Address Register 0	ACAR0	<OCATn_base> + 1C
Auto-Calibration Address Register 1	ACAR1	<OCATn_base> + 20
Device Memory Map Read chip select timing setting register	DRCSTR	<OCATn_base> + 34
Device Memory Map Write chip select timing setting register	DWCSTR	<OCATn_base> + 38
Device chip select timing setting register	DCSTR	<OCATn_base> + 3C
Controller and device setting register	CDSR	<OCATn_base> + 40
Memory Map dummy length register	MDLR	<OCATn_base> + 44
Memory Map read/write command register 0	MRWCR0	<OCATn_base> + 48
Memory Map read/write command register 1	MRWCR1	<OCATn_base> + 4C
Memory Map read/write command setting register	MRWCSR	<OCATn_base> + 50
Error Status Register	ESR	<OCATn_base> + 54
Configure write without data register	CWNDR	<OCATn_base> + 58
Configure write data register	CWDR	<OCATn_base> + 5C
Configure read register	CRR	<OCATn_base> + 60
Auto-calibration status register	ACSR	<OCATn_base> + 64
Auto-calibration result register 0	ACRR0	<OCATn_base> + 68

Table 57.7 Register configuration (2/2)

Register name	Shortcut	Address
Auto-calibration result register 1	ACRR1	<OCATn_base> + 6C
Auto-calibration all scan result register 0	ACASRR0	<OCATn_base> + 70
Auto-calibration all scan result register 1	ACASRR1	<OCATn_base> + 74

<OCTAn_base>

The base addresses <OCTAn_base> of the OCTAn is defined in the first subsection of this section under the key word “Register addresses”.

57.4.1.1 Device command register (DCR)

The device command register is used to set the device commands for controller operation.

Access: This register can be read/written in 32-bit units.

Address: <OCTAn_base> + 00_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DVC3[7:0]								DVC2[7:0]							
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 57.8 DCR Register Contents

Bit Position	Bit Name	Function
31 to 24	DVC3[7:0]	Set device command After determine the command length (DCSR[23:20]), the controller will send the corresponding device command to devices. • If DCSR[22:20] = 1, the controller will send DCR[7:0] to memory. • If DCSR[22:20] = 2, the controller will send DCR[15:8] as the 1st byte, and DCR[7:0] as the 2nd byte to memory.
23 to 16	DVC2[7:0]	
15 to 8	DVC1[7:0]	
7 to 0	DVC0[7:0]	

57.4.1.2 Device address register (DAR)

The device address register is used to set the device address for controller operation.

Access: This register can be read/written in 32-bit units.

Address: <OCTAn_base> + 04_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DVA3[7:0]								DVA2[7:0]							
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 57.9 DAR Register Contents

Bit Position	Bit Name	Function
31 to 24	DVA3[7:0]	Set device address After determine the address length (DCSR[27:24]), the controller will send the corresponding device address to devices. • If DCSR[27:24] == 3, the controller will send DAR[23:16] as the 1st byte, DAR[15:8] as the 2nd byte, and DAR[7:0] as the 3rd byte to memory. • If DCSR[27:24] == 4, the controller will send DAR[31:24] as the 1st byte, DAR[23:16] as the 2nd byte, DAR[15:8] as the 3rd byte, and DAR[7:0] as the 4th byte to memory.
23 to 16	DVA2[7:0]	
15 to 8	DVA1[7:0]	
7 to 0	DVA0[7:0]	

57.4.1.3 Device command setting register (DCSR)

The device command setting register is used to set the command setting.

Access: This register can be read/written in 32-bit units.

Address: <OCTAn_base> + 08_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	PRBE	ACMA	DOPI SB	ADL[2:0]			DTO	CML[2:0]			ACD	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 57.10 DCSR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 30	Reserved	Reading these bits return the initial value.
29	PRBE	Preamble bit enable for configuration read
28	ACMA	Access Memory Array 1: access memory array 0: configuration command • When ACMA = 1, (1) In DOPI mode, the address bit0 will be forced to 0. (2) In DOPI mode, if a read type command's DAR[0] is 1, the byte0 from device will be dropped. (3) The AXI RDATA will be arranged according to DAR. For example, when DAR[1:0]=1, the 1st valid data will be put at RDATA[15:8]. (4) In DOPI mode, the AXI WDATA will be used according to DAR. For example: when the target device is flash, and when DAR[1:0] = 1, the 1st byte sent to flash will be forced to 0xff. when the target device is RAM and when DAR[1:0] = 1, the 1st byte sent to ram will be masked by DQSM. (6) When the target device is RAM, the address sent to memory will be rearranged according to RAM spec. • When ACMA = 0, the address will be sent to memory without any modification, and the output data from memory will be sent out without any modification.
27	DOPISB	DOPI Single Byte is used to indicate that although the memory is in DOPI mode, the read out data has only 1 byte in each cycle. For example, the RDID, RDSR command of OctaFlash. 0: normal DOPI mode (each cycle has 2 bytes data, one at positive edge, the other one at negative edge.) 1: single byte mode (each cycle has only one byte data; the positive edge and negative edge data is the same)
26 to 24	ADL[2:0]	Address Length is used to set the transferring address bytes for current command. Its unit is byte.

Table 57.10 DCSR Register Contents (2/2)

Bit Position	Bit Name	Function
23	DTO	Data Order is used to set the read/write data transfer from/to memory in DOPI mode. In SOPI/SPI mode, Data Order is don't care. 0: byte0, byte1, byte2, byte3 1: byte1, byte0, byte3, byte2 If user sets the DTO to 1, the data length should be set greater than 2 while executing WRCR, WRCR2, WRSR, WRLR, and WRDPB commands in DOPI mode.
22 to 20	CML[2:0]	Command Length is used to set the transferring command bytes for current command. Its unit is byte. Command Length equals to 0 means no command will be transferred.
19	ACD	Access Device 0: Send commands to device 0 1: Send commands to device 1
18 to 16	Reserved	Reading these bits return the initial value.
15 to 8	DML[7:0]	Dummy Length – set the dummy length of the command. Its unit is SCLK cycle.
7 to 0	DTL[7:0]	Data Length – set the data length of the command. Its unit is byte. If DCSR[7:0] is 0, there will be no data for sending to memory or receiving from memory.

57.4.1.4 Device size register 0 (DSR0)

The device size register 0 is used to set the device type and size (can be flash or RAM) to access for device 0.

Access: This register can be read/written in 32-bit units.

Address: <OCTAn_base> + $0C_H$

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 57.11 DSR0 Register Contents

Bit Position	Bit Name	Function
31 to 30	DV0T[1:0]	Set device info 00_B: flash on device 0 01_B: RAM on device 0 10_B: no connection on device 0 11_B: forbidden
29 to 0	DV0S[29:0]	Set 30-bit device size mounted on system. Default size is 256 MByte. For example: 0x1000 0000: 256 MByte Flash 0x0800 0000: 128 MByte Flash 0x4100 0000: 16 MByte RAM 0x4080 0000: 8 MByte RAM The actual address window for device 0 is 0x6000_0000 to 0x6000_0000 + DSR0. Note that address window of device 0 and device 1 can't be overlapping. If they are overlapping, they will be set abutted.

57.4.1.5 Device size register 1 (DSR1)

The device size register 1 is used to set the device type and size (can be flash or RAM) to access for device 1.

Access: This register can be read/written in 32-bit units.

Address: <OCTAn_base> + 10_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DV1T[1:0]		DV1S[29:16]

Table 57.12 DSR1 Register Contents

Bit Position	Bit Name	Function
31 to 30	DV1T[1:0]	Set device info 00_B: flash on device 1 01_B: RAM on device 1 10_B: no connection on device 1 11_B: forbidden
29 to 0	DV1S[29:0]	Set 30-bit device size mounted on system. Default size is 256 MByte. For example: 0x1000 0000: 256 MByte Flash 0x0800 0000: 128 MByte Flash 0x4100 0000: 16 MByte RAM 0x4080 0000: 8 MByte RAM The actual address window for device 1 is 0x7000_0000 to 0x7000_0000 + DSR1. Note that address window of device 0 and device 1 can't be overlapping. If they are overlapping, they will be set abutted.

57.4.1.6 Memory delay trim register (MDTR)

Set the delay line control value for device 0 and device 1.

Access: This register can be read/written in 32-bit units.

Address: <OCTAn_base> + 14_H

Initial value: 0600 9400_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	DQED[3:0]				DV1D[7:0]							
Initial value	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DQES[3:0]				DQER[3:0]				DV0D[7:0]							
Initial value	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 57.13 MDTR Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	Reading these bits return the initial value.
27 to 24	DQED[3:0]	DQS enable counter in DOPI mode During read operation with DQS clock input (RAM/SOPI/DOPI mode), DQS clock will transition from high-impedance to zero after command/address phase is finished. To prevent using such invalid DQS clock, user can adjust these configuration to guarantee data correctness. Configuration: 0000_B: Enable DQS clock input at 1st SCLK 0001_B: Enable DQS clock input at 2nd SCLK 0010_B: Enable DQS clock input at 3rd SCLK 0011_B: Enable DQS clock input at 4th SCLK ... 1111_B: Enable DQS clock input at 16th SCLK Reference DQS enable counter settings (when SCLK frequency < 120 MHz)

DQS delay [SCLK]	RAM		Flash SOPI	Flash DOPI	
	Pre-cycle On	Pre-cycle Off	Pre-cycle On	Pre-cycle On	Pre-cycle Off
0 - 0.5	3	3 - 4	7 - 8	5	5 - 6
0.5 - 1.5	4	5	8	6	6 - 7
1.5 - 2.5	5	5 - 6	9	7	7 - 8

		DQS delay value: Delay value = SCLK output pad delay + SCLK wire bonding + DQS wire bonding + DQS input pad delay (Memory device delay has considered in this table, maximum 2 SCLK cycle)
23 to 16	DV1D[7:0]	Device 1 delay (refer to DQED[3:0] description)
15 to 12	DQES[3:0]	DQS enable counter in SOPI mode (refer to DQED[3:0] description)
11 to 8	DQER[3:0]	DQS enable counter in RAM mode (refer to DQED[3:0] description)
7 to 0	DV0D[7:0]	Device 0 delay (refer to DQED[3:0] description)

57.4.1.7 Auto-calibration timer register (ACTR)

The auto-calibration timer register sets the time period of the DQS delay-line for auto-calibration. The unit of timer is bus clock period.

Access: This register can be read/written in 32-bit units.

Address: <OCTAn_base> + 18_H

Initial value: $1000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMPD[31:16]

Table 57.17 DRCSTR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 30	DCSLFC1[1:0]	Device chip select low for command setting 1 For device 1, set the period for issuing command when the device chip select pull down. Its unit is MCLK cycle.
29 to 27	DCSHAC1[2:0]	Device chip select high after command setting 1 For device 1, set the period for the device chip select pull up after the command is finished. Its unit is MCLK cycle.
26 to 24	DCSBC1[2:0]	Device chip select between commands setting 1 For device 1, set the period between two commands. Its unit is MCLK cycle.
23	CRWE1	Continuous Read Waiting Enable 1 For device 1, set continuous read waiting enable. When it is set to 1, the continuous read waiting cycle will be used. The purpose of this function is designed for improve continuous read operation of OctaFlash DOPI mode. Please make sure the memory is OctaFlash and under DOPI-mode before running continuous read using this option 0: disable continuous read waiting 1: enable continuous read waiting
22 to 16	CRWC1[6:0]	Continuous Read Waiting Cycles 1 For device 1, set the waiting cycles for continuous read command. It will keep chip select of device low for waiting next continuous read transaction after finishing a continuous read transaction until the waiting cycle exceeds CRWC1[6:0]. Note that the waiting cycle is CRWC1[6:0] * 2, unit is MCLK cycle.
15 to 14	DCSLFC0[1:0]	Device chip select low for command setting 0 For device 0, set the period for issuing command when the device chip select pull down. Its unit is MCLK cycle.
13 to 11	DCSHAC0[2:0]	Device chip select high after command setting 0 For device 0, set the period for the device chip select pull up after the command is finished. Its unit is MCLK cycle.
10 to 8	DCSBC0[2:0]	Device chip select between commands setting 0 For device 0, set the period between two commands. Its unit is MCLK cycle.

Table 57.17 DRCSTR Register Contents (2/2)

Bit Position	Bit Name	Function
7	CRWE0	Continuous Read Waiting Enable 0 For device 0, set continuous read waiting enable. When it is set to 1, the continuous read waiting cycle will be used. The purpose of this function is designed for improve continuous read operation of OctaFlash DOPI mode. Please make sure the memory is OctaFlash and under DOPI-mode before running continuous read using this option 0: disable continuous read waiting 1: enable continuous read waiting
6 to 0	CRWC0[6:0]	Continuous Read Waiting Cycles 0 For device 0, set the waiting cycles for continuous read command. It will keep chip select of device low for waiting next continuous read transaction after finishing a continuous read transaction until the waiting cycle exceeds CRWC0[6:0]. Note that the waiting cycle is CRWC0[6:0] * 2, unit is MCLK cycle.

Timing definitions (x = 0, 1)

Table 57.18 Chip select low timing definition (from CS low to the first SCLK high)

DCSLFCx[3:0]	DOPI mode	Other modes

Table 57.29 CDSTR Register Contents (1/2)

Bit Position	Bit Name	Function
31	DLFTE	Deadlock-free timer enable enable timer to prevent deadlock case of controller. After time out occurred, controller will response BUSERR to XC connect bus. 0: Enable timer (default) 1: Disable timer
30 to 14	Reserved	Reading these bits return the initial value.
13 to 12	ACMD[1:0]	ac_mode ac_mode can't be enabled before finishing programing flash. 00_B: auto-calibration is not enable 01_B: enable executing auto-calibration periodically by timer and modify MDTR automatically 10_B: execute auto-calibration once for all trim code scan immediately, but it will not modify MDTR. It will clear to 00_B automatically after finishing auto-calibration. 11_B: forbidden
11 to 10	ACME[1:0]	ac_mem_en memory enable auto-calibration Auto-calibration only supports DOPI mode. If exiting DOPI mode, please turn-off auto-calibration.
9 to 6	Reserved	Reading these bits return the initial value.
5	D1PC	Device 1 pre-cycle D1PC is used to set the pre-cycle mode of memory 0: pre-cycle mode off 1: pre-cycle mode on
4	D0PC	Device 0 pre-cycle D0PC is used to set the pre-cycle mode of memory 0: pre-cycle mode off 1: pre-cycle mode on
3 to 2	D1TT[1:0]	Device 1 transfer type D1TT[1:0] is used to set the transfer type of device 1 00_B: SPI mode 01_B: SOPI mode 10_B: DOPI mode 11_B: forbidden

Table 57.29 CDSTR Register Contents (2/2)

Bit Position	Bit Name	Function
1 to 0	D0TT[1:0]	Device 0 transfer type D1TT[1:0] is used to set the transfer type of device 0 00_B: SPI mode 01_B: SOPI mode 10_B: DOPI mode 11_B: forbidden

57.4.1.14 Memory map dummy length register (MDLR)

Set the dummy length for memory map read/write.

Access: This register can be read/written in 32-bit units.

Address: <OCTAn_base> + 44_H

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 57.30 MDLR Register Contents

Bit Position	Bit Name	Function
31 to 24	D1WDL[7:0]	Device 1 write dummy length Set the dummy length to device 1 (unit = SCLK cycle)
23 to 16	D1RDL[7:0]	Device 1 read dummy length Set the dummy length to device 1 (unit = SCLK cycle)
15 to 8	D0WDL[7:0]	Device 0 write dummy length Set the dummy length to device 1 (unit = SCLK cycle)
7 to 0	D0RDL[7:0]	Device 0 read dummy length Set the dummy length to device 1 (unit = SCLK cycle)

57.4.1.15 Memory map read write command register 0 (MRWCR0)

Set memory map read/write command for device 0.

Access: This register can be read/written in 32-bit units.

Address: <OCTAn_base> + 48_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MMWC1[7:0]								MMWC0[7:0]

Table 57.31 MRWCR0 Register Contents

Bit Position	Bit Name	Function
31 to 24	MMWC1[7:0]	Set the memory map write command for device 0
23 to 16	MMWC0[7:0]	
15 to 8	MMRC1[7:0]	Set the memory map read command for device 0
7 to 0	MMRC0[7:0]	

According to flash memory specification, there are SPI, SOPI, and DOPI mode.

In SPI mode, controller will send only command 0 to memory.

In SOPI and DOPI mode, controller will send command 1 first and then send command 0 to memory.

The mode will be defined in CDSR[1:0] for device0, Controller will send the commands to device0 according to CDSR[1:0] (device0_transfer_type).

57.4.1.16 Memory map read write command register 1 (MRWCR1)

Set memory map read/write command for device 1.

Access: This register can be read/written in 32-bit units.

Address: <OCTAn_base> + $4C_H$

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 57.33 MRWCSR Register Contents

Bit Position	Bit Name	Function
31	Reserved	Reading these bits return the initial value.
30	WDO1	Device 1 write data order for memory map write in DOPI mode. In SOPI/SPI mode, write data order WDO1 is don't care. 0: data order receive from/send to device 1 is byte0, byte1, byte2, byte3 1: data order receive from/send to device 1 is byte1, byte0, byte3, byte2
29 to 27	MMWCL1[2:0]	Set the memory map write command length for device 1
26 to 24	MMWAL1[2:0]	Set the memory map write address length for device 1
23	PRBE1	Preamble bit enable for mem1 memory-map read
22	RDO1	Device 1 read data order for memory map read in DOPI mode. It also determines the device 1 auto-calibration read data order. In SOPI/SPI mode, read data order RDO1 is don't care. 0: data order receive from/send to device 1 is byte0, byte1, byte2, byte3 1: data order receive from/send to device 1 is byte1, byte0, byte3, byte2
21 to 19	MMRCL1[2:0]	Set the memory map read command length for device 1
18 to 16	MMRAL1[2:0]	Set the memory map read address length for device 1
15	Reserved	Reading these bits return the initial value.
14	WDO0	Device 0 write data order for memory map write in DOPI mode. In SOPI/SPI mode, write data order WDO0 is don't care. 0: data order receive from/send to device 1 is byte0, byte1, byte2, byte3 1: data order receive from/send to device 1 is byte1, byte0, byte3, byte2
13 to 11	MMWCL0[2:0]	Set the memory map write command length for device 0
10 to 8	MMWAL0[2:0]	Set the memory map write address length for device 0
7	PRBE0	Preamble bit enable for mem1 memory-map read
6	RDO0	Device 0 read data order for memory map read in DOPI mode. It also determines the device 0 auto-calibration read data order. In SOPI/SPI mode, read data order RDO0 is don't care. 0: data order receive from/send to device 1 is byte0, byte1, byte2, byte3 1: data order receive from/send to device 1 is byte1, byte0, byte3, byte2
5 to 3	MMRCL0[2:0]	Set the memory map read command length for device 0
2 to 0	MMRAL0[2:0]	Set the memory map read address length for device 0

57.4.1.18 Error status register (ESR)

Show the memory-map write and memory-map read error status if there is any error while executing memory-map write or memory-map read command.

Access: This register can be read in 32-bit units.

Address: <OCTAn_base> + 54_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 57.37 CRR Register Contents

Bit Position	Bit Name	Function
31 to 24	DB3[7:0]	When user “read” this address, controller will issue a read command to memory and response the data to user. The issued command bytes are defined in DCR. The issued address bytes are defined in DAR. The command settings are defined in DCSR. According to CDSR[8] (Device 0 data order) and CDSR[9] (Device 1 data order), controller will decide the byte order received from memory. User needs to check the read data length configuration greater than zero. (DCSR[7:0]). If the read data length (DCSR[7:0]) equals to zero, controller will return BUSERR.
23 to 16	DB2[7:0]	
15 to 8	DB1[7:0]	
7 to 0	DB0[7:0]	

57.4.1.22 Auto-calibration status register (ACSR)

The auto-calibration status register provides the calibration status until next auto-calibration.

Access: This register can be read in 32-bit units.

Address: <OCTAn_base> + 64_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	ACSD1[2:0]			ACSD0[2:0]		
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 57.38 ACSR Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	Reading these bits return the initial value.
5 to 3	ACSD1[2:0]	Keep information of auto-calibration status of device 1. This information is the status of last auto-calibration.
2 to 0	ACSD0[2:0]	Keep information of auto-calibration status of device 0. This information is the status of last auto-calibration.

Status information:

- 000_B: Fine normal ⇒ ACRR[15:0] represent fine tune result
- 001_B: Fine low bound ⇒ ACRR [31:0]: fine tune result for two fine tune code (Original, Low bound)
- 010_B: Fine high bound ⇒ ACRR [31:0]: fine tune result for two fine tune code (High bound, Original)
- 011_B: Coarse tune plus fine tune search ⇒ ACRR [15:0]: fine tune result, ACRR [31:16]: coarse tune result
- 100_B: No result ⇒ ACRR [31:0]: all zero or don't care

57.4.1.23 Auto-calibration result register 0 (ACRR0)

The auto-calibration result register provides the calibration result of device 0 with latest calibration. If user disables auto-calibration, this value also keeps unchanged until next auto-calibration.

Access: This register can be read in 32-bit units.

Address: <OCTAn_base> + 68_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CCRD0[31:16]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CFRD0[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 57.39 ACRR0 Register Contents

Bit Position	Bit Name	Function
31 to 16	CCRD0[31:16]	Auto-calibration fine result of device 0
15 to 0	CFRD0[15:0]	Auto-calibration coarse result of device 0. Coarse result only update if the fine calibration stage got all failed. (0000_H)

During auto-calibration, this register will be updated if any periodically auto-calibration sequence is finished. (CDSR[13:12] = 01_B)

Example:
When auto-calibration fine result is ACRR[15:0] = $3FFC_H$ = 0011 1111 1111 1100_B, user can know:

- ACRR[1:0] are 0: When set delay line configuration to 0/1, read result are failed.
- ACRR[13:2] are 1: When set delay line configuration to 2~13, read result are passed
- ACRR[15:14] are 0: When set delay line configuration to 14/15, read result are failed.

Therefore, the best configuration will be 7 ((2+13)/2 = 7, middle of passed range).
This configuration will also update to MDTR[7:0] after auto-calibration is finished.

When delay-line setting to stage 0/1, read result is failed. Stage 2~14, read passed and stage 15/16 is failed.

The best configuration will be stage 8 (middle of passed range)

57.4.1.24 Auto-calibration result register 1 (ACRR1)

The auto-calibration result register provides the calibration result of device 1 with latest calibration. If user disables auto-calibration, this value also keeps unchanged until next auto-calibration.

Access: This register can be read in 32-bit units.

Address: <OCTAn_base> + $6C_H$

Initial value: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CCRD1[31:16]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CFRD1[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 57.40 ACRR1 Register Contents

Bit Position	Bit Name	Function
31 to 16	CCRD1[31:16]	Auto-calibration fine result of device 1
15 to 0	CFRD1[15:0]	Auto-calibration coarse result of device 1. Coarse result only update if the fine calibration stage got all failed. (0000_H)

During auto-calibration, this register will be updated if any periodically auto-calibration sequence is finished. (CDSR[13:12] = 01_B)

Example

When auto-calibration fine result is ACRR[15:0] = $3FFC_H$ = 0011 1111 1111 1100-, user can know:

- ACRR[1:0] are 0: When set delay line configuration to 0/1, read result are failed.
- ACRR[13:2] are 1: When set delay line configuration to 2~13, read result are passed
- ACRR[15:14] are 0: When set delay line configuration to 14/15, read result are failed.

Therefore, the best configuration will be 7 ((2+13)/2 = 7, middle of passed range).
This configuration will also update to MDTR[7:0] after auto-calibration is finished.

When delay-line setting to stage 0/1, read result is failed. Stage 2~14, read passed and stage 15/16 is failed.

The best configuration will be stage 8 (middle of passed range)

57.4.1.25 Auto-calibration all scan result register 0 (ACASRR0)

The auto-calibration all scan result register 0 provides the auto-calibration scan result of device 0. Before reading ACASRR0, user should set the CDSR[13:12] to 10_B and wait for the CDSR[13:12] change to 00_B.

Access: This register can be read in 32-bit units.

Address: <OCTAn_base> + 70_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 57.41 ACASRR0 Register Contents

Bit Position	Bit Name	Function
31 to 24	LPTCSD0[7:0]	After finishing auto-calibration scan (CDSR[13:12] = 10_B), the passed trim code period could be break into two parts. In this case, The last passed trim code of second consecutive passed trim code period will be stored in ACASRR0[31:24]. If the passed trim code period only have one part, ACASRR0[31:24] will be set to 0.
23 to 16	FPTCSD0[7:0]	After finishing auto-calibration scan (CDSR[13:12] = 10_B), the passed trim code period could be break into two parts. In this case, The first passed trim code of second consecutive passed trim code period will be stored in ACASRR0[23:16]. If the passed trim code period only have one part, ACASRR0[23:16] will be set to 0.
15 to 8	LPTCD0[7:0]	After finishing auto-calibration scan (CDSR[13:12] = 10_B), the passed trim code period could be break into two parts. In this case, The last passed trim code of first consecutive passed trim code period will be stored in ACASRR0[15:8]. If the passed trim code period only have one part, the last passed trim code will be stored in ACASRR0[15:8].
15 to 0	FPTCD0[7:0]	After finishing auto-calibration scan (CDSR[13:12] = 10_B), the passed trim code period could be break into two parts. In this case, The first passed trim code of first consecutive passed trim code period will be stored in ACASRR0[7:0]. If the passed trim code period only have one part, the first passed trim code will be stored in ACASRR0[7:0].

57.4.1.26 Auto-calibration all scan result register 1 (ACASRR1)

The auto-calibration all scan result register 1 provides the auto-calibration scan result of device 1. Before reading ACASRR0, user should set the CDSR[13:12] to 10_B and wait for the CDSR[13:12] change to 00_B.

Access: This register can be read in 32-bit units.

Address: <OCTAn_base> + 74_H

Initial value: 0000 0000_H

Bit Position	Bit Name	Function
31 to 24	LPTCSD1[7:0]	After finishing auto-calibration scan (CDSR[13:12] = 10_B), the passed trim code period could be break into two parts. In this case, The last passed trim code of second consecutive passed trim code period will be stored in ACASRR1[31:24]. If the passed trim code period only have one part, ACASRR1[31:24] will be set to 0.
23 to 16	FPTCSD1[7:0]	After finishing auto-calibration scan (CDSR[13:12] = 10_B), the passed trim code period could be break into two parts. In this case, The first passed trim code of second consecutive passed trim code period will be stored in ACASRR1[23:16]. If the passed trim code period only have one part, ACASRR1[23:16] will be set to 0.
15 to 8	LPTCD1[7:0]	After finishing auto-calibration scan (CDSR[13:12] = 10_B), the passed trim code period could be break into two parts. In this case, The last passed trim code of first consecutive passed trim code period will be stored in ACASRR1[15:8]. If the passed trim code period only have one part, the last passed trim code will be stored in ACASRR1[15:8].
15 to 0	FPTCD1[7:0]	After finishing auto-calibration scan (CDSR[13:12] = 10_B), the passed trim code period could be break into two parts. In this case, The first passed trim code of first consecutive passed trim code period will be stored in ACASRR1[7:0]. If the passed trim code period only have one part, the first passed trim code will be stored in ACASRR1[7:0].

57.5 Reference operation flow

In the following content shows the reference operation flow for different purposes.

We set the following settings for the examples stated in this chapter.

- memory connection is device 0: flash; device 1: RAM.

57.5.1 Controller initialization

Step#	Read / Write	Address (Register)	Data	Data Length (byte)	Description
1	Write	DSR0	0x08000000	4	Set Device 0 Size
2	Write	DSR1	0x40800000	4	Set Device 1 Size
3	Write	MDTR	0x00320032	4	Set DQS delay trim value
4	Write	DRCSTR	0x11201120	4	Set CS pin timing for mem-map read
5	Write	DWCSTR	0x1a001a00	4	Set CS pin timing for mem-map write
6	Write	DCSTR	0x00001a00	4	Set CS pin timing
7	Write	CDSR	0x00000008	4	Set Controller Mode (1) Pre-cycle on/off (2) Transfer type selection SPI/STR/DTR
8	Write	MDLR	0x05050000	4	Set dummy cycle length
9	Write	MRWCR0	0x12edec13	4	Set command byte content for device0
10	Write	MRWCR1	0x2000a000	4	Set command byte content for device1
11	Write	MRWCSR	0x54545454	4	Set mem-map command mode (1) Command length (2) Address length (3) Data byte order

57.5.2 Basic operations

The following shows some basic operations which will be used later several times

57.5.2.1 For OctaFlash

(1) Turn on write enable (SPI)

Step#	Read / Write	Register	Data	Data Length (byte)	Description
1	Write	DCR	0x00000006	4	
2	Write	DCSR	0x00100000	4	
3	Write	CWNDR	xx	4	

(2) Turn on write enable (OPI)

Step#	Read / Write	Register	Data	Data Length (byte)	Description
1	Write	DCR	0x000006f9	4	
2	Write	DCSR	0x00200000	4	
3	Write	CWNDR	xx	4	

(3) Read status register (SPI)

Step#	Read / Write	Register	Data	Data Length (byte)	Description
1	Write	DCR	0x00000005	4	
2	Write	DCSR	0x00100001	4	
3	Read	CRR	{23'b0, SR}	1	

(4) Read status register (OPI)

Step#	Read / Write	Register	Data	Data Length (byte)	Description
1	Write	DCR	0x000005fa	4	
2	Write	DAR	0x00000000	4	
3	Write	DCSR	0x0c200401	4	
4	Read	CRR	{23'b0, SR}	1	

(5) Read configuration register (SPI)

Step#	Read / Write	Register	Data	Data Length (byte)	Description
1	Write	DCR	0x00000015	4	
2	Write	DCSR	0x00100001	4	
3	Read	CRR	{23'b0, CR}	1	

(6) Read configuration register (OPI)

Step#	Read / Write	Register	Data	Data Length (byte)	Description
1	Write	DCR	0x000015ea	4	
2	Write	DAR	0x00000001	4	
3	Write	DCSR	0x0c200401	4	
4	Read	CRR	{23'b0, CR}	1	

(7) Write configuration register (OPI)

Step#	Read / Write	Register	Data	Data Length (byte)	Description
1	Write	DCR	0x000001fe	4	
2	Write	DAR	0x00000001	4	
3	Write	DCSR	0x04200401	4	
4	Write	CWDR	{23'b0, CR}	1	

(8) Read configuration register 2 (SPI)

Step#	Read / Write	Register	Data	Data Length (byte)	Description
1	Write	DCR	0x00000071	4	
2	Write	DAR	Address to flash	4	
3	Write	DCSR	0x04100001	4	
4	Read	CRR	{23'b0, CR2}	1	

(9) Read configuration register 2 (OPI)

Step#	Read / Write	Register	Data	Data Length (byte)	Description
1	Write	DCR	0x0000718e	4	
2	Write	DAR	Address to flash	4	
3	Write	DCSR	0x0c200401	4	
4	Read	CRR	{23'b0, CR2}	1	

(10) Write configuration register 2 (SPI)

Step#	Read / Write	Register	Data	Data Length (byte)	Description
1	Write	DCR	0x00000072	4	
2	Write	DAR	Address to flash	4	
3	Write	DCSR	0x04100001	4	
4	Write	CWDR	{23'b0, CR2}	1	

(11) Write configuration register 2 (OPI)

Step#	Read / Write	Register	Data	Data Length (byte)	Description
1	Write	DCR	0x0000728d	4	
2	Write	DAR	Address to flash	4	
3	Write	DCSR	0x04200001	4	
4	Write	CWDR	{23'b0, CR2}	1	

57.5.2.2 For OctaRAM

(1) Read configuration register

Step#	Read / Write	Register	Data	Data Length (byte)	Description
1	Write	DCR	0x0000c000	4	
2	Write	DAR	0x00040000	4	
3	Write	DCSR	0x04a80502	4	
4	Read	CRR	{16'b0, CR}	2	

(2) Write configuration register

Step#	Read / Write	Register	Data	Data Length (byte)	Description
1	Write	DCR	0x00004000	4	
2	Write	DAR	0x00040000	4	
3	Write	DCSR	0x04a80002	4	
4	Write	CWDR	{16'b0, CR}	2	

57.5.3 Set dummy cycle

57.5.3.1 For OctaFlash

1. Read Configuration Register 2 (SPI/OPI)
   (Step 1 can be ignored if you don't care about the original data in CR2. Therefore, you should read the content of CR2 first.)
2. Turn on Write Enable (SPI/OPI)
3. Read Status Register (repeat until SR[1]=1)
4. Write Configuration Register 2 (SPI/OPI): addr = 0x00000300, CR2[2:0] = 0x05
   (dummy_cycle = 10, CR2[2:0] = 20-dummy_cycle*2)
5. Read Status Register (repeat until SR[0 = 0)
6. Set MDLR accordingly

57.5.3.2 For OctaRAM

1. Read Configuration Register
   (Step 1 can be ignored if you don't care about the original data in CR. Therefore, you should read the content of CR first.)
2. Write Configuration Register: CR[7:4] = 0x02 (dummy_cycle = 5, CR[7:4] = dummy_cycle-3)
3. Set MDLR accordingly

57.5.4 Set Flash Transfer Type

1. Read Configuration Register 2 (SPI/OPI)
   (Step 0 can be ignored if you don't care about the original data in CR2. Therefore, you should read the content of CR2 first.)
2. Turn on Write Enable (SPI/OPI)
3. Read Status Register (repeat until SR[1] = 1)
4. Write Configuration Register 2 (SPI/OPI): addr = 0000 0000_H, CR2[1:0] = 02_H
   (00_H: SPI; 01_H: ST; 02_H: DTR)
5. Read Status Register (repeat until SR[0] = 0)
6. Set CDSR accordingly

57.5.5 Auto-calibration setting

1. Set ACTR (timer for controlling auto-calibration period)
2. Set ACAR0 (ac address for device0)
3. Set ACAR1 (ac address for device1)

57.5.5.1 For OctaFlash

1. Turn on Write Enable (SPI/OPI)
2. Read Status Register (repeat until SR[1] = 1)
3. write preamble pattern to addr = ACAR0

4. Read Status Register (repeat until SR[0] = 0)
5. Set CDSR accordingly

57.5.5.2 For OctaRAM

1. write preamble pattern to addr = ACAR1
2. Set CDSR accordingly

If CDSR[23] equals 1, the default preamble pattern is 0xFFFF0000 000800FF 00FFF700 F700F708 (Order: Byte[15] … Byte[0]).

57.5.6 Manual calibration

This section introduces manual calibration sequence in the beginning stage.

The steps for manual calibration are shown in the table below.

Table 57.43 Manual calibration steps

Manual Calibration Sequence			1st boot time		Every boot time (after 1st boot)	
			OctaFlash*1	OctaRAM*2	OctaFlash*3	OctaRAM*4
Prepare for calibration	1.	User programs calibration data to specified address area in OCTA device	V (in SPI Mode)	V	Optional (in SPI Mode)	V
	2.	User uses software to read the specified address area from OCTA device, and check the correctness				
Manual calibration	1.	User uses software to read the specified address area from OCAT device, and check the correctness on DQS delay set to 0 (MDTR[7:0])	V	V	V	V
	2.	Increment 1 to MDTR[7:0] value and perform read access from OCTA device (specified address area). It continue to until MDTR[7:0]=0xFF.				
	3.	User uses software to check the correctness of read data for each MDTR[7:0] value.				
	4.	User uses software to confirm the consecutive pass area for MDTR[7:0] value.				
	5.	User uses software to choose biggest pass window and select min pass value and max pass value.				
	6.	User uses software to calculate the average value from min / max pass value ((min value + max value) / 2)				
	7.	User uses software to set this average value to MDTR[7:0] register.				

Note 1. For the detailed sequence please refer to **Table 57.44**.
Note 2. For the detailed sequence please refer to **Table 57.47**.
Note 3. For the detailed sequence please refer to **Table 57.45**.
Note 4. For the detailed sequence please refer to **Table 57.48**.

For above steps, there are related registers need to be used as below:

(1) Set the DSR0 and DSR1 registers for the mounted devices.

(2) Set the ACAR0 and ACAR1 for programming the pattern.

(3) Set the ACAR0 and ACAR1 for the start address of calibration 16-byte data.

(4) Set the MDTR[23:16] for device 1 and MDTR[7:0] for device 0 to control DQS delay line and enable DQS delay.

Manual Calibration Algorithm Description:

While doing manual calibration, the manual calibration flow can be divided into two parts, coarse part and fine part.

The example of setting MDTR[7:0] for manual calibration is shown in the below. User can reference the following steps to set MDTR[23:16]. In coarse part, users need to read calibration data 16 times at first and choose the maximum and minimum in the longest consecutive successful read interval for the delay line control as shown in **Figure 57.3**. The numbers in **Figure 57.3** represent the DQS delay line control (MDTR[7:4]) from 0 to 7 in coarse part. Yellow represents successfully read the calibration data. Red represents fail to read the calibration data. If there are more than one interval and their lengths are equal, users just select one of them for the delay line control and set the delay line control (Maximum + Minimum)/2. Here, the Maximum and Minimum are the maximal and minimal DQS delay line control of the selected interval. After deciding the highest 4 bit of DQS delay line control, users utilize the same way to determine the lowest 4 bit (MDTR[3:0]) of DQS delay line control as shown in **Figure 57.3**.

If all the combinations of 8-bit DQS delay line control are failed, user should enter error handle flow to handle this condition. For example, reset memory controller and memory devices, check whether the settings of controller registers are correct and re-run manual calibration again.

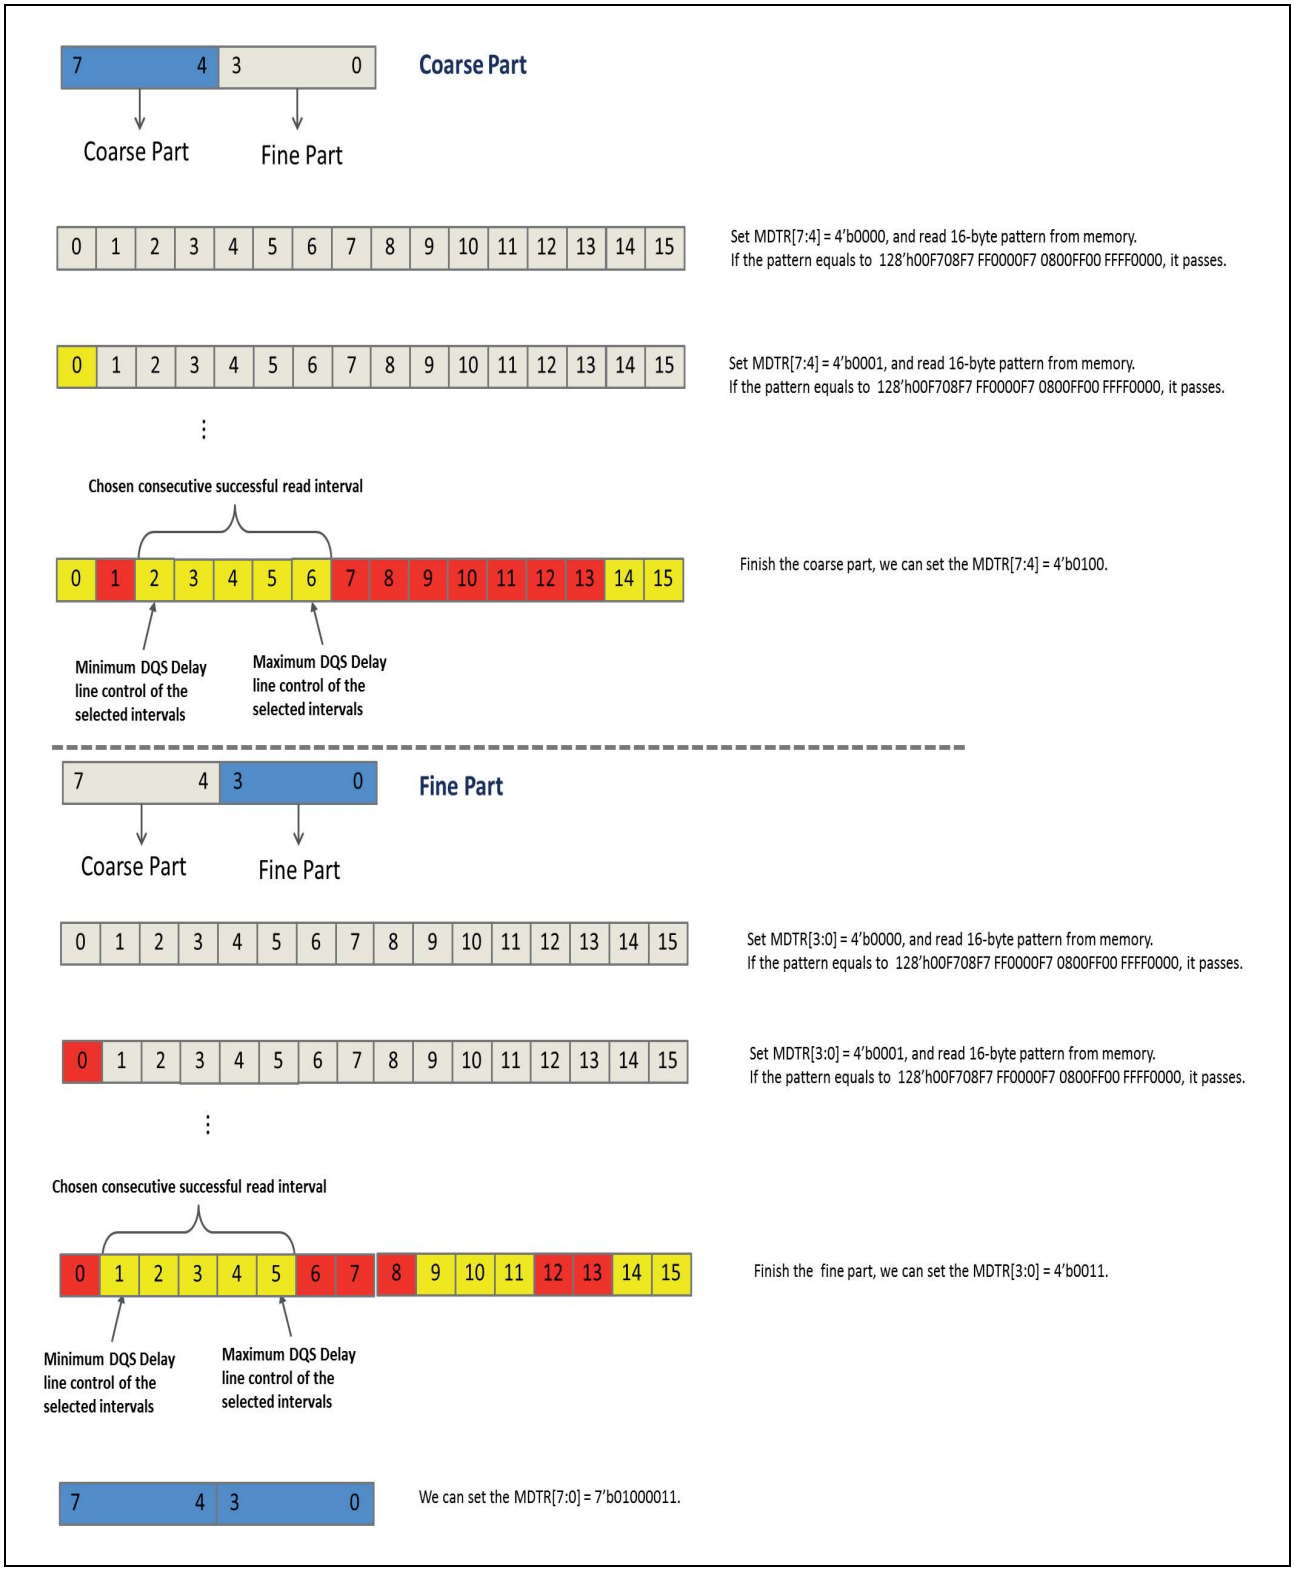

Figure 57.3 An example for setting delay line control value of MDTR[7:0] for device 0

Table 57.44 Preparation for manual calibration sequences on 1st boot time of OctaFlash (when device 0 connected flash)

Read / Write	Register	Data	Data Length (byte)	Description
N/A	N/A	N/A	N/A	Wait tVSL (3000 µs) before OctaFlash is ready to access
Do controller initialization, please reference Section 57.5.1, Controller initialization. (User should set the initial setting according to the actual situation.)				
Set the flash device in SPI mode, please reference Section 57.5.4, Set Flash Transfer Type.				
Set the Memory-Map Related Command and Timing, please reference Section 57.5.1, Controller initialization.				
Write	ACAR0	address	4	Set the start address of manual calibration pattern
Memory-Map Read	0x6000_0000 + ACAR0	N/A	16	Read the data from address
1. Compare whether the 16 bytes *data* == 0xFFFF FFFF FFFF FFFF? 2. If no, erase the data in the *address* and do the following steps.				
Memory-Map Write	0x6000_0000 + ACAR0	preamble pattern	16	Program the preamble pattern for manual/auto calibration
1. Wait tPP for flash programming data. (Please reference the Flash data sheet for tPP). 2. Repeat reading the status register (SR) of OctaFlash until SR[0] == 0.				
Write	DCR	0x00000005	4	
Write	DCSR	0x00100001	4	
Read	CRR	{23'b0, SR}	1	
Program Ready				
Memory-Map Read	0x6000_0000 + ACAR0	N/A	16	Read the data from address
Software compares the preamble patterns and the data read from flash. If they are not the same, repeat above actions again.				

Table 57.45 Manual calibration sequences on boot time of OctaFlash (1st or every time chosen by users; when device 0 connected flash)

Read / Write	Register	Data	Data Length (byte)	Description
N/A	N/A	N/A	N/A	Wait tVSL(3000us) before OctaFlash is ready to access
Do controller initialization, please reference Section 57.5.1, Controller initialization. (User should set the initial setting according to the actual situation.)				
Set the flash device in DOPI mode, please reference Section 57.5.4, Set Flash Transfer Type.				
Determine the highest 4-bit of DQS delay line control. Start: 1. Repeat the following actions 16 times 2. The *delay* = 0x0 ~ 0xF				
Write	MDTR	[31:8] = 0x0 [7:4] = *delay* [3:0] = 0x0	4	Set the memory delay trim register
Memory-Map Read	0x6000_0000 + ACAR0	N/A	16	Read the preamble pattern
Software compare the preamble patterns read from OctaFlash.				
End: Software confirms the consecutive pass area of MDTR value and does 1. Fetch the maximum delay and minimum delay in the longest consecutive successful read interval. 2. Let the *d_coarse* = (maximum+minimum)/2, and set the MDTR[7:4] = *d_coarse.* 3. Software sets the *d_coarse* to MDTR[7:4]. Else Determine the 8-bit DQS delay line in the following steps, please skip to ***Table 57.46***				
Write	MDTR	[31:8] = 0x0 [7:4] = *d_coarse* [3:0] = 0x0	4	Set the memory delay trim register
Determine the lowest 4-bit of DQS delay line control. Start: 1. Repeat the following actions 16 times 2. The *delay* = 0x0 ~ 0xF				
Write	MDTR	[31:8] = 0x0 [7:4] = *d_coarse* [3:0] = *delay*	4	Set the memory delay trim register
Memory-Map Read	0x6000_0000 + ACAR0	N/A	16	Read the preamble pattern
Software compare the preamble patterns read from OctaFlash.				
End: Software confirms the consecutive pass area of MDTR value and does 1. Fetch the maximum delay and minimum delay in the longest consecutive successful read interval. 2. Let the *d_fine* = (maximum+minimum)/2, and set the MDTR[3:0] = *d_fine.* 3. Software sets the *d_fine* to MDTR[3:0].				
Write	MDTR	[31:8] = 0x0 [7:4] = *d_coarse* [3:0] = *d_fine*	4	Set the memory delay trim register
Reference Auto-calibration setting in Section 57.5.5, Auto-calibration setting.				

Table 57.46 Manual calibration sequences of OctaFlash (When there is no suitable highest 4-bit of delay line control)

Read / Write	Register	Data	Data Length (byte)	Description
Start: 1. Repeat the following actions 256 times 2. The *delay* = 0x00 ~ 0xFF				
Write	MDTR	[31:8] = 0x0 [7:0] = *delay*	4	Set the memory delay trim register
Memory-Map Read	0x6000_0000 + ACAR0	N/A	16	Read the preamble pattern
Software compare the preamble patterns read from OctaFlash.				
End: Software confirms the consecutive pass area of MDTR value and does 1. Fetch the maximum delay and minimum delay in the longest consecutive successful read interval. 2. Let the *dqs_delay* = (maximum+minimum)/2, and set the MDTR[7:0] = *dqs_delay.* 3. Software sets the *dqs_delay* to MDTR[7:0].				
Write	MDTR	[31:8] = 0x0 [7:0] = *dqs_delay*	4	Set the memory delay trim register
Reference Auto-calibration setting in Section 57.5.5, Auto-calibration setting.				

Table 57.47 Preparation for Manual calibration sequences on 1st boot time of OctaRAM (when device 0 connected RAM)

Read / Write	Register	Data	Data Length (byte)	Description
N/A	N/A	N/A	N/A	Wait tPU (150 µs) before RAM is ready to access
Do controller initialization, please reference Section 57.5.1, Controller initialization. (User should set the initial setting according to the actual situation.)				
Write	ACAR0	address	4	Set the start address of manual calibration pattern
Memory-Map Read	0x6000_0000 + ACAR0	N/A	16	Read the data from address
1. Compare whether the 16 bytes *data* == 0xFFFF FFFF FFFF FFFF? 2. If no, erase the data in the *address* and do the following steps.				
Memory-Map Write	0x6000_0000 + ACAR0	preamble pattern	16	Program the preamble pattern for manual/auto calibration
Memory-Map Read	0x6000_0000 + ACAR0	N/A	16	Read the data from address
Software compares the preamble patterns and the data read from flash. If they are not the same, repeat above actions again.				

Table 57.48 Manual calibration sequences on boot time of OctaRAM (1st or every time chosen by users; when device 0 connected RAM)

Read / Write	Register	Data	Data Length (byte)	Description
N/A	N/A	N/A	N/A	Wait tPU(150us) before RAM is ready to access
Do controller initialization, please reference Section 57.5.1, Controller initialization. (User should set the initial setting according to the actual situation.)				
Determine the highest 4-bit of DQS delay line control. Start: 1. Repeat the following actions 16 times 2. The *delay* = 0x0 ~ 0xF				
Write	MDTR	[31:8] = 0x0 [7:4] = *delay* [3:0] = 0x0	4	Set the memory delay trim register
Memory-Map Read	0x6000_0000 + ACAR0	N/A	16	Read the preamble pattern
Software compare the preamble patterns read from OctaRAM				
End: Software confirms the consecutive pass area of MDTR value and does 1. Fetch the maximum delay and minimum delay in the longest consecutive successful read interval. 2. Let the *d_coarse* = (maximum+minimum)/2, and set the MDTR[7:4] = *d_coarse.* 3. Software sets the *d_coarse* to MDTR[7:4]. Else Determine the 8-bit DQS delay line in the following steps, please skip to **Table 57.49**.				
Write	MDTR	[31:8] = 0x0 [7:4] = *d_coarse* [3:0] = 0x0	4	Set the memory delay trim register
Determine the lowest 4-bit of DQS delay line control. Start: 1. Repeat the following actions 16 times 2. The *delay* = 0x0 ~ 0xF				
Write	MDTR	[31:8] = 0x0 [7:4] = *d_coarse* [3:0] = *delay*	4	Set the memory delay trim register

Software compare the preamble patterns read from OctaRAM.				
End: Software confirms the consecutive pass area of MDTR value and does 1. Fetch the maximum delay and minimum delay in the longest consecutive successful read interval. 2. Let the *d_fine* = (maximum+minimum)/2, and set the MDTR[3:0] = *d_fine.* 3. Software sets the *d_fine* to MDTR[3:0].				
Write	MDTR	[31:8] = 0x0 [7:4] = *d_coarse* [3:0] = *d_fine*	4	Set the memory delay trim register
Reference Auto-calibration setting in Section 57.5.5, Auto-calibration setting.				

Table 57.49 Table 54. Manual calibration sequences of OctaRAM (When there is no suitable highest 4-bit of delay line control)

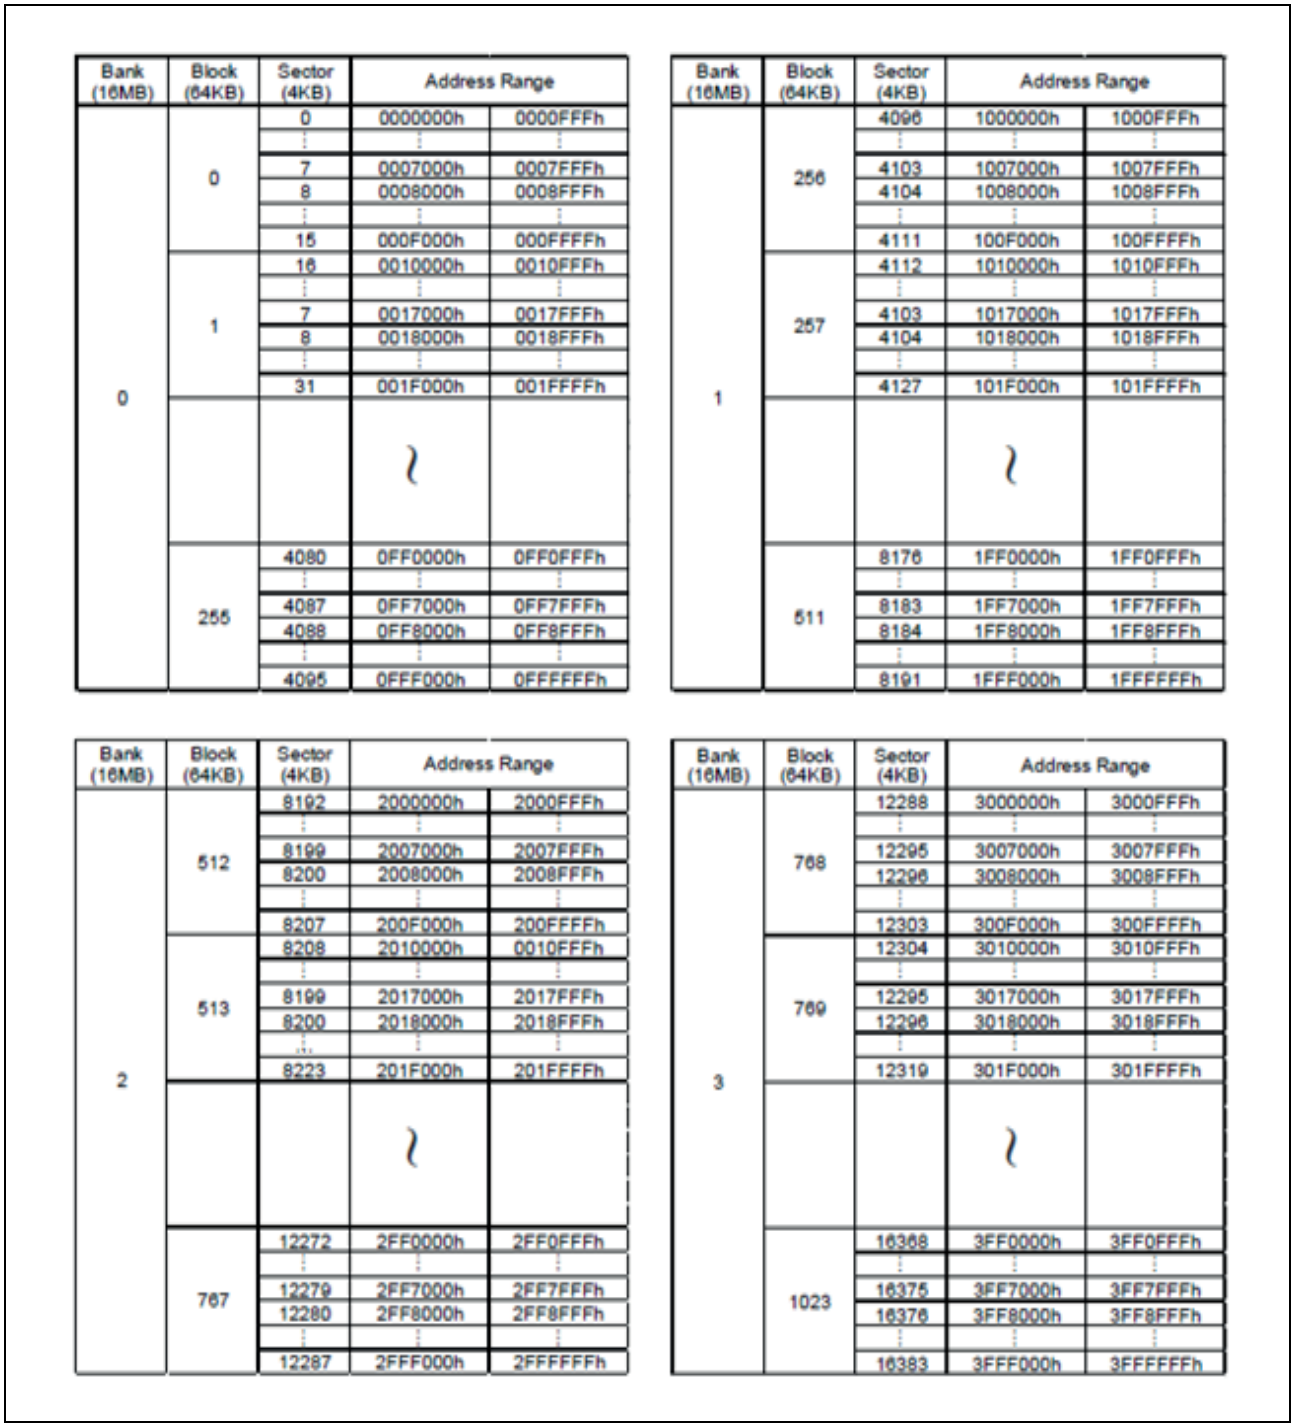
Read / Write	Register	Data	Data Length (byte)	Description
Start: 1. Repeat the following actions 256 times 2. The *delay* = 0x00 ~ 0xFF				
Write	MDTR	[31:8] = 0x0 [7:0] = *delay*	4	Set the memory delay trim register
Memory-Map Read	0x6000_0000 + ACAR0	N/A	16	Read the preamble pattern
Software compare the preamble patterns read from OctaRAM.				
End: Software confirms the consecutive pass area of MDTR value and does 1. Fetch the maximum delay and minimum delay in the longest consecutive successful read interval. 2. Let the *dqs_delay* = (maximum+minimum)/2, and set the MDTR[7:0] = *dqs_delay.* 3. Software sets the *dqs_delay* to MDTR[7:0].				
Write	MDTR	[31:8] = 0x0 [7:0] = *dqs_delay*	4	Set the memory delay trim register
Reference Auto-calibration setting in Section 57.5.5, Auto-calibration setting.				

57.6 Read while write operation flow

Octa controller supports read-while-write (RWW) feature. The brief introduction of Flash memory which supports RWW function is in Section 57.6.1, Flash memory organization, the operation flow of RWW function is shown in Section 57.6.2, Read-While-Write (RWW) operation flow, and the operation sequence of controller for executing the RWW function is shown in **Section 57.6.3, Controller sequences for Read-While-Write (RWW) function**.

57.6.1 Flash memory organization

The latest MX25LW series Flash memory supports the RWW function. Take the MX25LW51245G-Automotive for example. This Flash memory array is divided into banks. The multi bank structure enables RWW feature, which means read data from one bank while another bank is programing or erasing. The details of the address ranges and the corresponding sector and block addresses are shown in the figure below.



Bank (16MB)	Block (64KB)	Sector (4KB)	Address Range	
0	0	0	0000000h	0000FFFh
		⋮	⋮	⋮
		7	0007000h	0007FFFh

Figure 57.4 MX25LW51245G-Automotive memory organization

57.6.2 Read-While-Write (RWW) operation flow

The multi-bank read-while-write flash memory provides an interruptible write-to-buffer sequence during programming. This sequence provides the advantage that read operations could be inserted among program data write cycles. There are three steps for the operation: issuing WRBI (Write Buffer Initial command), WRCT (Write Buffer Continue command), and WRCF (Write Confirm command) as shown in the figure below.

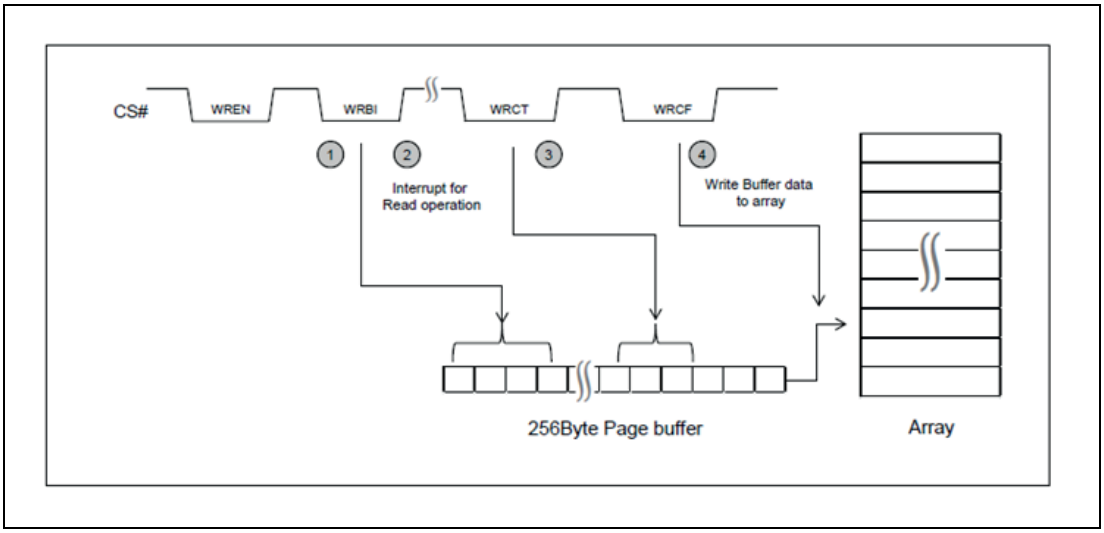

Figure 57.5 Write buffer sequence

To trigger the interruptible write-to-buffer sequence, the system issues WREN command first to enable the WEL bit, and then issues WRBI with 4-byte address and data of 1 ~ 256 byte. After CS# has gone high, the flash memory will return to the standby status, waiting for the next command. The system could either perform read operation or issue Write Buffer Continue command (WRCT) to write more data to the page buffer. After the data writing has finished, the system will issue a Write Confirm (WRCF) command to initiate an automatic program operation to write the page buffer data into the array cell.

Multiple read or WRCT commands can be issued between the WRBI and WRCF commands. The system could also issue a WRBI directly followed by a WRCF command if there is no needs for write interrupt on the system. WRBI command can clear the page buffer area. If a WRBI command is issued following another WRBI command, the data written by the previous WRBI command would be abandoned. Any WRCT or WRCF command without a preceding WRBI command would be ignored. A WRDI, program, erase, write register or reset command would abort the sequence; system has to do WREN and WRBI again to initiate another write-to-buffer sequence.

57.6.3 Controller sequences for Read-While-Write (RWW) function

The reference RWW flow is in the below. This will guarantee the ordering of sending WRBI command and WRCT command.

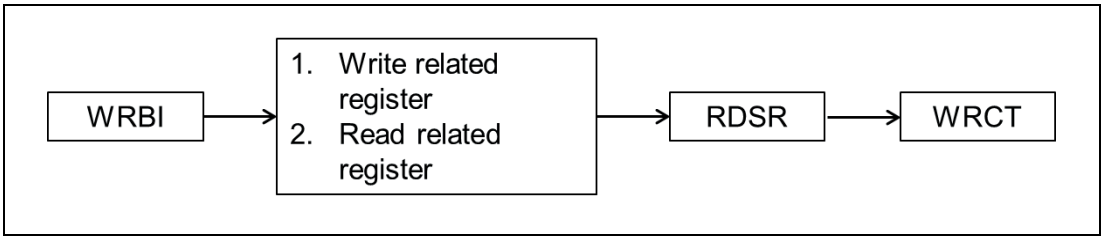

Figure 57.6 RWW commands reference flow

After sending the WRBI command, user needs to write related register then read back related register to make sure register already updated before RDSR. This is for ensuring WRBI before RDSR. Then, user sends RDSR to make sure WRBI ahead of WRCT.

The reference operation sequences of controller for executing RWW function is described in the below table.

After initializing the controller in DOPI mode, the RWW reference operation is described in the below table. The OctaFlash is connected to device 0. The parameters defined in the below are for the controller sequences of RWW function.

address_1: 32-bit address of the Flash.

address_2: address_2[31:8] = address_1[31:8]; address_2[7:0] inside {0x00 ~ 0xFF};

The address_3 is defined as 32-bit address of the Flash which is in another bank.

Step#	Read / Write	Register	Data	Data Length (byte)	Description
1	Write	DCR	0x000006F9	4	Set WREN command
2	Write	DCSR	0x00200000	4	Set DCSR for WREN command
3	Write	CWNDR	0x00000000	4	Send WREN command
4	Write	MRWCR0	0x24DBEE11	4	Set WRCT command for mem-map write
5	Write	DCR	0x000022DD	4	Set WRBI command
6	Write	DAR	address_1	4	Set address to DAR
7	Write	DCSR	0x04A00000	4	Set DCSR for WRBI command
8	Write	CWNDR	0x00000000	4	Send WRBI command
9	Write	DCR	0x000005FA	4	Write related register (RDSR)
10	Write	DAR	0x00000000	4	Set address to DAR
11	Write	DCSR	0x0c200401	4	Set DCSR for RDSR command
12	Read	DCSR	N/A	4	Read DCSR again to confirm the ordering
13	Memory-Map Write	0x6000_0000 + address_2	User_data	User_defined	Memory-Map Write
14*1	Memory-Map Read	0x6000_0000 + address_3	N/A	User_defined	Memory-Map Read
15	Memory-Map Write	0x6000_0000 + address_2	User_data	User_defined	Memory-Map Write
16	Write	DCR	0x000031CE	4	Set WRCF command
17	Write	DCSR	0x00200000	4	Set DCSR for WRCF command
18	Write	CWNDR	0x00000000	4	Send WRCF command

Note 1. User can repeat the memory-map read to another banks without disturbing the RWW program sequence.

57.7 DQS auto-calibration

Although controller has the capability of delay line adjustment by configuration register, the variation of voltage and temperature will affect the delay line / data valid window. These variations may lead to bad latch position and get wrong data from memory device. The periodic auto-calibration (CDSR[13:12] = 01_B) is shown in the below.

The concept of auto-calibration is similar to memory-mapped read/write function. When the calibration timer is time-out, OctaBus Controller generates a series of calibration sequences to read the specific preamble patterns with different delay-line setting and choose the best setting from previous step and

store to configuration register. Section 57.4.1.7, Auto-calibration timer register (ACTR) is the detailed information of auto-calibration timer register (ACTR). Please set reasonable value for the auto-calibration period. When auto-calibration sequence is active, the controller will not process any memory transaction. Before enabling the auto-calibration, user needs to do manual calibration first and set the suitable delay line control value to MDTR. Notice that auto-calibration only supports DOPI mode. If exiting the DOPI mode, please turn off the auto-calibration.

However, to reach such kind of auto-calibration, user needs to reserved 16 byte user area for store preamble pattern. Here, the auto-calibration is implemented by read and write 16-byte data space. User need to set the 16-bytes address for the preamble pattern in ACAR0 and ACAR1 and program the default preamble patterns into the devices.
If MRWCSR[22]/MRWCSR[6] equals 1, the default preamble pattern is
0xF700F708 00FFF700 000800FF FFFF0000 (Order: Byte[15] … Byte[0]).
If MRWCSR[22]/MRWCSR[6] equals 0, the default preamble pattern is
0x00F708F7 FF0000F7 0800FF00 FFFF0000 (Order: Byte[15] … Byte[0]).

Flash device: Program flash with 16 byte preamble pattern to reserved address

RAM device: Write RAM with 16 byte preamble pattern to reserved address

Initial sequence:

Use the manual calibration to obtain the initial sequence.

Auto-calibration sequence:

Auto-calibration timer time-out (Equal to ACTR)

- Arrange to Read/Write transaction order queue (In-order transfer)
- Configure MDTR for different delay setting
  - Read preamble data sequence
  - Check data correctness with preamble pattern (PPR0/PPR1/PPR2/PPR3)
  - Repeat until all valid delay setting is applied (16 stage)
- Choose best delay setting and store to MDTR and update the detailed results in ACASRR0 and ACASRR1
- Restart auto-calibration timer

The auto-calibration flow is shown in Figure 57.7, Auto-calibration flow chart. In the beginning, the auto-calibration start DQS delay line control set up by manual calibration. Here, we define the DQS delay line control (MDTR[23:16] / MDTR[7:0]) as two groups, {Coarse[3:0], Fine[3:0]}.

Step 1: Auto-calibration process utilizes the coarse part and searches all the combinations of fine part.

Step 2: Auto-calibration does low boundary check. If the passed delay line control of fine tune combinations from first step are only between 0000_B to 0011_B, auto-calibration will do step 3.

Step 3: Auto-calibration will minus 1 from coarse part and search all the combinations of its fine part. Then, auto-calibration will find the middle value of the consecutive longest passed DQS control delay line.

Example:
Initial: Manual Calibration Result = 0011_0111_B
Step 1: There are only passed read between 0011_0000_B to 0011_0010_B (low boundary)
Step 2: Determine the low boundary condition.
Step 3: Search 0010_0000_B ~ 0010_1111_B, and find 0010_1000_B to 0010_1111_B are passed. The final delay value is (0011_0111_B + 0010_1000_B)/2 = $0010\_ 1101_B$

Step 4: Auto-calibration does high boundary check. If the passed delay line control of fine tune combinations from first step are only between 1100b to 1111b, auto-calibration will do step 5.

Step 5: Auto-calibration will add 1 to coarse part and search all the combinations of its fine part. Then, auto-calibration will find the middle value of the consecutive longest passed DQS control delay line.

example:
Initial: Manual Calibration Result = 0011_0111_B
Step 1: There are only passed read between 0011_1100_B to 0011_1111_B (low boundary)
Step 2: Determine the low boundary condition and failed.
Step 4: Determine the high boundary condition and passed.
Step 5: Search 0100_0000_B ~ 0100_1111_B, and find 0100_0000_B to 0100_1100_B are passed. The final delay value is (0011_1100b_B + 0100_1100_B)/2 = 0100_0100_B

Step 6: Check whether all the combinations from Step 1 are fail. If it is true, auto-calibration will do Step 7.

Step 7: Scan the coarse part first and get the middle one. Then, scan the fine part with the known coarse part and get the middle one.

Step 8: Select the longest consecutive interval of Step 1 results and get the middle one.

Step 9: Set the MDTR[23:16] / MDTR[7:0]. Finish the auto-calibration process.

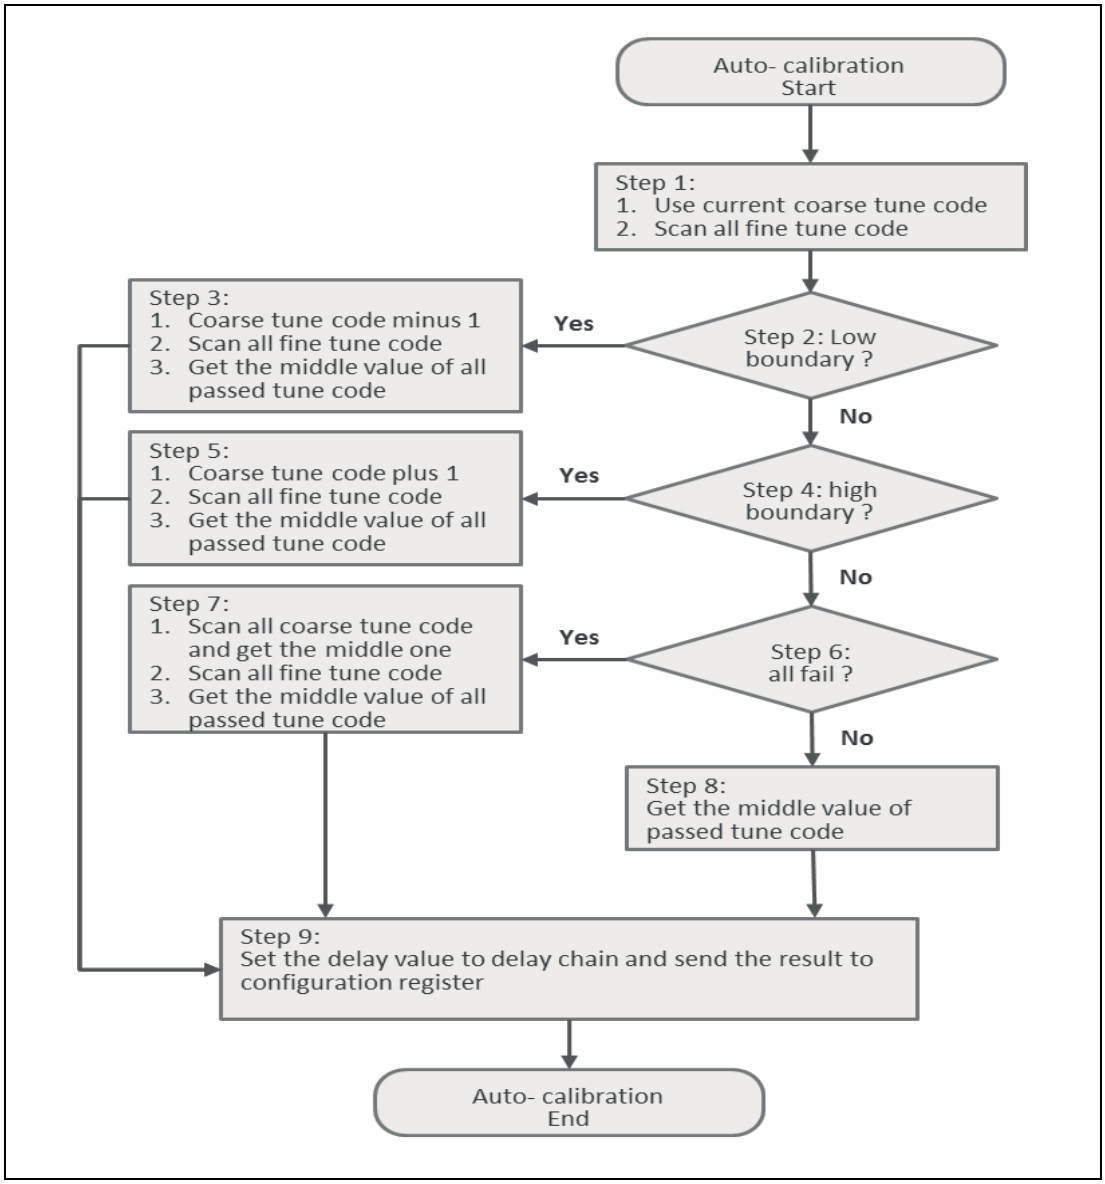

Figure 57.7 Auto-calibration flow chart

Section 58 NAND Flash Memory Interface A (NFMA)

This section contains a generic description of the NAND Flash Memory Interface.

The first section describes all properties specific to the RH850/D1L/D1M, such as units, register base addresses, input/output signal names, etc.
The subsequent sections describe the features that apply to all implementations.

58.1 Overview of the RH850/D1L/D1M NAND Flash Memory Interface (NFMA)

58.1.1 Units

This microcontroller has the following number of units of the NAND Flash Memory Interface.

Table 58.1 Units

NAND Flash Memory Interface	D1L1	D1L2(H)	D1M1	D1M1H	D1M1-V2	D1M1A	D1M2(H)
Units	–	–	–	–	–	1	–
Names	–	–	–	–	–	NFMA0	–

58.1.2 Indices

Following indices are used in this section:

Table 58.2 Indices

Index	Meaning
n	The individual NFMA units are generically indicated by the index “n”.

58.1.3 Register addresses

All NAND Flash Memory Interfaces register addresses are given as address offsets from the individual base addresses <NFMAn_base>.
The <NFMAn_base> addresses of each NFMAn are listed in the following table:

Table 58.3 Register base addresses <NFMAn_base>

NFMAn unit	<NFMAn_base> address
NFMA0	FFDE 2000_H

58.1.4 Clock supply

All NAND Flash Memory Interfaces provide two clock inputs.

Table 58.4 Clock supply

NFMAn unit	NFMAn clock	Connected to
NFMA0	Internal bus clock CLKA	Clock Controller C_ISO_XCCLK
	Operation clock CLKB	Clock Controller C_ISO_XCCLK

58.1.5 Interrupt requests

NFMAn interrupt requests are listed in the following table.

Table 58.5 Interrupt Requests

TPUn signals	Function	Connected to
NFMA0:		
INTNFMA	NFMA0 global interrupt	Interrupt Controller INTNFMA0

58.1.6 Reset sources

The NAND Flash Memory Interfaces and their registers are initialized by the following reset signal:

Table 58.6 Reset sources

NFMAn unit	Reset signal
NFMA0	• Reset Controller SYSRES

58.1.7 External Input/output signals

The following table shows the I/O signals of the NAND Flash Memory Interfaces.

Table 58.7 NFMAn I/O signals

NFMAn signals	Function	Connected to
NFMA0		
CE0#	Chip enable output 0	Port NAND_CS#
CLE	Command latch enable output	Port NAND_CLE
ALE	Address latch enable	Port NAND_ALE
RE#	Read enable output	Port NAND_RE#
WE#	Write enable output	Port NAND_WE#
R0B	Ready/busy inputs	Port NAND_RB0
DATA[7:0]	Data I/O	Port NAND_D[7:0]
DATA[15:8]		Not connected

58.2 Features

The NAND Flash Memory Interface controller implements the function of a high level interface to one NAND flash device.

NOTE

Throughout this chapter the term “system memory” denotes the memories, that are accessible via the NAND Flash Memory I/F master interface unit (MIU). These memories are

- external SDRAM via the SDR-SDRAM Memory Controller (SDRA)
- on-chip Local RAM
- on-chip Video RAMs (VRAM0 and VRAM1)
- external HyperRAM via the HyperBus Controller (HYPB)
- external OctaRAM via the OctaBus Controller (OCTA)

- Compatibility
  - Compatible with the ONFi 1.x specification.
  - Support for the Small Block devices - only devices that allow to disable CE signal when device is in the busy state are supported.
  - Support for the low capacity device (which use four address bytes) with the help of generic sequence.
- DMA Controller
  - Scatter-gather mode is supported.
  - Single transfer mode is supported.
  - Supports precise and imprecise burst modes.
  - Supports configurable burst types: single transfer, incrementing and stream.
  - 32-bit system memory addressing.
  - Triggering mechanism that depends on the programmable FIFO data level.
- Interrupt Controller
  - Each interrupt can be masked.
  - Each interrupt has its own status flag.
  - The status flags are also valid when the given interrupt is masked, and can be checked by the software polling mechanism.
  - Single interrupt signal output
- Data buffering
  - FIFO module based on dual port memory.
- ECC unit
  - The ECC module is based on the BCH algorithms.
  - The syndrome calculation, error detection and error correction phases in the BCH-based modules are pipelined.
  - The ECC unit supports the following options: 256, 512 bytes and 1024 bytes data blocks. The data block size depends on the selected ECC option.

- Advanced features
  - The page cache read/write sequences are supported.
  - The multiple planes read/write sequences are supported.
  - Command queuing mechanism.[Note]
- The advanced Bad Blocks Management system
  - Records tables are stored in the system memory.
  - Hardware implementation of the search algorithm.

NOTE

The queue is used when write access to registers is performed by the host. It is valid for all registers except:

- INT_STATUS
- STATUS
- FIFO_INIT
- ECC_STAT
- FIFO_DATA

Write to registers listed above will be performed immediately. Write to any other register will be performed through the command queue.

58.3 Register Descriptions

The table below shows the NFMA register configuration.

Register Access Size

All NFMAn registers are accessible in 32-bit units.

<NFMAn_base>

The base addresses <NFMAn_base> of the NFMAn are defined in the first section of this chapter under the key word “Register base addresses”.

CAUTION

The registers can be written only when the bit CTRL_STAT in STATUS register is ‘0’.

Table 58.8 Register Configuration (1/2)

Register Name	Symbol	Address
Controller commands register	COMMAND	<NFMAn_base> + 00_H
Main configurations register	CONTROL	<NFMAn_base> + 04_H
Controller status register	STATUS	<NFMAn_base> + 08_H
Mask register for the READ STATUS commands	STATUS_MASK	<NFMAn_base> + $0C_H$
Interrupts mask register	INT_MASK	<NFMAn_base> + 10_H
Interrupts status register	INT_STATUS	<NFMAn_base> + 14_H
ECC module control register	ECC_CTRL	<NFMAn_base> + 18_H
ECC offset in the spare area	ECC_OFFSET	<NFMAn_base> + $1C_H$
ECC module status register	ECC_STAT	<NFMAn_base> + 20_H
Column address register 0	ADDR0_COL	<NFMAn_base> + 24_H
Row address register 0	ADDR0_ROW	<NFMAn_base> + 28_H
Column address register 1	ADDR1_COL	<NFMAn_base> + $2C_H$
Row address register 1	ADDR1_ROW	<NFMAn_base> + 30_H
FIFO module interface	FIFO_DATA	<NFMAn_base> + 38_H
Data register	DATA_REG	<NFMAn_base> + $3C_H$
Data register size select	DATA_REG_SIZE	<NFMAn_base> + 40_H
Records table pointer register	DEV0_PTR	<NFMAn_base> + 44_H
Least significant part of the DMA base addressn	DMA_ADDR_L	<NFMAn_base> + 64_H
DMA module counter initial value	DMA_CNT	<NFMAn_base> + $6C_H$
DMA module control register	DMA_CTRL	<NFMAn_base> + 70_H
BBM module control register	BBM_CTRL	<NFMAn_base> + 74_H
Page size value	DATA_SIZE	<NFMAn_base> + 84_H
Timing configurations register 0	TIMINGS_ASYN	<NFMAn_base> + 88_H
Command sequence timing configuration	TIME_SEQ_0	<NFMAn_base> + 90_H
Command sequence timing configuration	TIME_SEQ_1	<NFMAn_base> + 94_H
Generic command sequence timing configuration	TIME_GEN_SEQ_0	<NFMAn_base> + 98_H
Generic command sequence timing configuration	TIME_GEN_SEQ_1	<NFMAn_base> + $9C_H$

Table 58.8 Register Configuration (2/2)

Register Name	Symbol	Address
Generic command sequence timing configuration	TIME_GEN_SEQ_2	<NFMAn_base> + $A0_H$
Control register for the FIFO module	FIFO_INIT	<NFMAn_base> + $B0_H$
FIFO module status	FIFO_STATE	<NFMAn_base> + $B4_H$
GENERIC_SEQ register	GEN_SEQ_CTRL	<NFMAn_base> + $B8_H$
Records table size register	DEV0_SIZE	<NFMAn_base> + $C0_H$
DMA trigger level value	DMA_TRIG_TLVL	<NFMAn_base> + 114_H
CMD ID initial value	CMD_MARK	<NFMAn_base> + 124_H
LUN per device status register	LUN STATUS 0	<NFMAn_base> + 128_H
Generic command sequence timing configuration	TIME_GEN_SEQ_3	<NFMAn_base> + 134_H
ECC errors counter register	ECC_CNT	<NFMAn_base> + $14C_H$

58.3.1 Controller commands register (COMMAND)

The write of the command sequence code to the COMMAND register triggers the programmed command sequence execution as soon as it is possible. If the execution cannot be started immediately, the transfer to this register is prolonged by the series of the WAIT responses. Each command sequence can trigger the interrupt when it is completed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMD_2[7:0]								CMD_1[7:0]/CMD_3[7:0]							
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMD_0[7:0]								DATA_SEL	INPUT_SEL	CMD_SEQ[5:0]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 58.9 COMMAND Register Contents

Bit Position	Bit Name	Function
31 to 24	CMD_2[7:0]	Code of the third command in a sequence.
23 to 16	CMD_1[7:0]/ CMD_3[7:0]*1	Code of the second command in a sequence.
15 to 8	CMD_0[7:0]	Code of the first command in a sequence.
7	DATA_SEL	Data / FIFO selection flag: 0 – the FIFO module selected 1 – the DATA register selected
6	INPUT_SEL	Input module selection flag: 0 – select the registers Slave I/F Unit (SIU) module as input 1 – select the DMA module as input
5 to 0	CMD_SEQ[5:0]	Command code.

Note 1. Depending on the selected command sequence, this field will store CMD1 or CMD3 code. Generic Sequence is only one case where both commands are used in a single sequence.

58.3.2 Main configurations register (CONTROL)

The CONTROL register stores the configuration parameters that are common to all controller modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 58.10 CONTROL Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 24	—	Reserved
23	AUTO_READ_STAT_EN	Auto Read Status mode enable. If active, the controller reads the status after the PROGRAM PAGE and BLOCK ERASE commands. It can trigger interrupt. The ERROR_MASK field in the STATUS_MASK register must be configured when this feature is enabled. It enables operation status checking after PROGRAM_PAGE/ERASE commands. It allows to detect that those operations failed. 0: Auto Read Status mode disabled 1: Auto Read Status mode enabled
22	—	Reserved
21	SMALL_BLOCK_EN	Enable small block mode. In this mode, the controller sends only a single byte as the column address instead of two bytes, as done in the big block NAND Flash devices. 0: big block mode enabled 1: small block mode enabled **CAUTION** Only devices that allow to disable CE signal when device is in the busy state are supported.
20 to 18	—	Reserved
17	ADDR1_AUTO_INCR	Address auto increment for row address register 1 (ADDR1_ROW). 0: auto increment disabled 1: auto increment enabled When this bit is set, sending any command sequence using address register 1 causes the increment of address register 1.
16	ADDR0_AUTO_INCR	Address auto increment for row address register 0 (ADDR0_ROW). 0: auto increment disabled 1: auto increment enabled When this bit is set, sending any command sequence using address register 0 causes the increment of address register 0.
15 to 14	—	Reserved
13	BBM_EN	Bad Block Management enable flag. For more details, see Section 58.4.4, Remapping Mechanism.
12	IO_WIDTH	NAND Flash I/O width. 0: 8 bits 1: Reserved
11 to 8	—	Reserved

Table 58.10 CONTROL Register Contents (2/2)

Bit Position	Bit Name	Function
7, 6	BLOCK_ SIZE[1:0]	The Block Size. 00: 32 pages per block 01: 64 pages per block 10: 128 pages per block 11: 256 pages per block
5	ECC_EN	Hardware ECC support enable. 0: ECC disabled 1: ECC enabled Hardware ECC can be used only when m * (ECC_BLOCK_SIZE[1:0]) ≤ DATA_SIZE[14:0] ≤ m * (ECC_BLOCK_SIZE[1:0] + 32), where m is 1,2,3,...
4	INT_EN	Global Interrupt enable. 0: Interrupts disabled 1: Interrupts enabled For more details, see Section 58.4.5, Interrupts Mechanism.
3	—	Reserved
2, 1	ECC_BLOCK_ SIZE[1:0]	The ECC Block Size (depends on core configuration): 00: 256 bytes 01: 512 bytes 10: 1024 bytes 11: not available The ECC block size can be changed only when all memory devices are ready.
0	READ_STATUS _EN	Automatically READ STATUS / check RnB lines. The STATUS_MASK field in the STATUS_MASK register must be configured when this feature is enabled. It selects how the controller detects device ready/busy state: 0: The controller checks RnB lines 1: The controller sends READ STATUS commands **CAUTION** Automatically sent READ STATUS command is only available in devices compatible with ONFI 1.0.

58.3.3 GENERIC_SEQ register (GEN_SEQ_CTRL)

The GENERIC_SEQ register is used to parameterize the generic command sequences.For more details, see Section 58.4.2, Generic Command Sequence. For examples, see **Table 58.47**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 58.11 GEN_SEQ_CTRL Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 24	—	Reserved
23 to 16	CMD3[7:0]	Command 3 code value.
15	IMD_SEQ	Enable immediate command execution. This bit allows the command sequence to be executed without checking the selected target state. 0: feature disabled 1: feature enabled
14, 13	DELAY_EN[1:0]	Enable the busy 0 or 1 phase. This bit allows enabling or disabling the presence of the “busy” phase in the universal command sequence. 00: disable both delays 01: enable delay 0 10: enable delay 1 11: disable both delays
12	DATA_EN	Enable data part sequence. This bit allows enabling or disabling the data phase of the universal command sequence. 0: disable data phase 1: enable data phase
11, 10	ROW_A1[1:0]	Row Address Cycles. Number of the row address bytes sent to NAND Flash device. 00: 0 address cycles 01: 1 address cycles 10: 2 address cycles 11: 3 address cycles
9, 8	ROW_A0[1:0]	Row Address Cycles. Number of the row address bytes sent to NAND Flash device. 00: 0 address cycles 01: 1 address cycles 10: 2 address cycles 11: 3 address cycles
7, 6	COL_A1[1:0]	Column Address Cycles. Number of the column address bytes sent to NAND Flash device. 00: 0 address cycles 01: 1 address cycles 10: 2 address cycles 11: not available

Table 58.11 GEN_SEQ_CTRL Register Contents (2/2)

Bit Position	Bit Name	Function
5, 4	COL_A0[1:0]	Column Address Cycles. Number of the column address bytes sent to NAND Flash device. 00: 0 address cycles 01: 1 address cycles 10: 2 address cycles 11: not available
3	CMD3_EN	Enable Command 3 phase. This bit allows enabling or disabling the presence of the “command 3” phase in the universal command sequence. 1: enable 0: disable
2	CMD2_EN	Enable Command 2 phase. This bit allows enabling or disabling the presence of the “command 2” phase in the universal command sequence. 1: enable 0: disable
1	CMD1_EN	Enable Command 1 phase. This bit allows enabling or disabling the presence of the “command 1” phase in the universal command sequence. 1: enable 0: disable
0	CMD0_EN	Enable Command 0 phase. This bit allows enabling or disabling the presence of the “command 0” phase in the universal command sequence. 1: enable 0: disable

58.3.4 Controller status register (STATUS)

The STATUS register stores the NAND Flash controller and connected device status flags. These flags can be used to obtain the current controller internal state.

The CTRL_STAT flag is set after the controller starts to execute the requested command for the selected NAND Flash device, and it is active while the command execution is not completed. Command execution can be divided into two phases. In the first phase, the command sequence is executed at the moment when the NAND Flash device goes into the busy state. After that, the controller stores information about the pending operation on the selected device. In the second phase, the controller automatically finishes the pending command execution based on the previously stored data. As long as this flag is set, the controller does not accept any new commands.

The MEMx_ST flags correspond to the NAND Flash device with the same index value. The flags give information about the NAND Flash devices' state. The flag has the same function as the NAND Flash device RnB line.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 58.12 STATUS Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 24	—	Reserved
23 to 16	CMD_ID[7:0]	Command ID The current command under execution identification marker added before command was put in to the command FIFO.
15 to 11	—	Reserved
10	DATA_REG_ST	The DATA_REG: Resetting of this flag is possible only by reading the data from the DATA_REG register. 1: data in DATA_REG is available 0: data in DATA_REG is not available
9	DATASIZE_ERROR_ST	The Data Size value error: When the ECC is enabled, this bit signal incorrect value in the DATA_SIZE register. The algorithm for correct data size value can be found in the DATA_SIZE register description. 0: correct value 1: incorrect value **Note:** When using "READ PARAMETER PAGE" command, ECC Block Size should same with DATA_SIZE. When using "SET FEATURES" or "GET FEATURES" or "READ ID" commands, ECC function should be disabled.
8	CTRL_STAT	The main controller status bit: 0: controller ready 1: controller busy
7 to 1	—	Reserved

Table 58.12 STATUS Register Contents (2/2)

Bit Position	Bit Name	Function
0	MEM0_ST	Device 0 status flag: 1: device ready 0: device busy

58.3.5 LUN per device status register (LUN_STATUS0)

The LUN_STATUS0 register allows to access the LUN status information for devices 0-3. Each bit of the LUN status field contain the status of single LUN of device. The busy status is marked as logical ‘0’, the ready state is marked as logical ‘1’.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 8	—	Reserved
7 to 0	MEM0_LUN[7:0]	Memory 0 LUN-s status field.

58.3.6 Interrupts mask register (INT_MASK)

The INT_MASK register allows masking of the selected interrupts source in the NAND Flash controller. The masked interrupts still set the appropriate bits in the status register, but do not assert the interrupt signal.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 58.14 INT_MASK Register Contents

Bit Position	Bit Name	Function
31 to 25	—	Reserved
24	ECC_INT0_EN	Enables the interrupt from the ECC module status for Memory device 0. 0: interrupt disabled 1: interrupt enabled
23 to 17	—	Reserved
16	STAT_ERR_INT0_EN	Enables the interrupt when the most recently finished operation on the Memory device 0 failed. This applies to PROGRAM PAGE and BLOCK ERASE operations. It is not valid following a READ-series operation. 0: interrupt disabled 1: interrupt enabled
15 to 9	—	Reserved
8	MEM0_RDY_INT_EN	The memory device 0 is ready for the new command: 0: interrupt disabled 1: interrupt enabled For more details see **Figure 58.30**.
7	—	Reserved
6	PG_SZ_ERR_INT_EN	Data Size error occur. 0: interrupt disabled 1: interrupt enabled
5	—	Reserved
4	TRANS_ERR_EN	The transfer on the slave interface error: 0: interrupt disabled 1: interrupt enabled
3	DMA_INT_EN	DMA transfer ended. 0: interrupt disabled 1: interrupt enabled
2	DATA_REG_INT_EN	Data in DATA_REG is available. 0: interrupt disabled 1: interrupt enabled
1	CMD_END_INT_EN	Command sequence ended. 0 – interrupt disabled 1 – interrupt enabled For more details see **Figure 58.30**.
0	—	Reserved

58.3.7 Interrupts status register (INT_STATUS)

The INT_STATUS register stores the NAND Flash controller interrupt flags. If the given bit is 0, the corresponding interrupt condition is not met. If the given bit is 1, the corresponding interrupt condition is met.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	ECC_INT0_FL	—	—	—	—	—	—	—	STAT_ERR_INT0_FL

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R/W	R	R/W	R/W	R/W	R/W	R

Table 58.15 INT_STATUS Register Contents

Bit Position	Bit Name	Function
31 to 25	—	Reserved
24	ECC_INT0_FL	Selected flag (source is ECC_UNC_0, ECC_ERROR_0 or ECC_OVER_0) in the ECC module is set.
23 to 17	—	Reserved
16	STAT_ERR_INT0_FL	Most recently finished operation on the Memory device 0 failed. This applies to PROGRAM PAGE and BLOCK ERASE operations. It is not valid following a READ-series operation.
15 to 9	—	Reserved
8	MEM0_RDY_INT_FL	The memory device 0 is ready for the new command.
7	—	Reserved
6	PG_SZ_ERR_INT_FL	Data Size error flag. When the ECC is enabled, the value written into the DATA_SIZE register has some restrictions. Interrupt condition is met when the value written to the DATA_SIZE register is not correct.
5	—	Reserved
4	TRANS_ERR_FL	The transfer on the slave interface error. The flag is set when the access to the FIFO memory has the opposite direction to the current FIFO configuration.
3	DMA_INT_FL	DMA transfer ended flag.
2	DATA_REG_INT_FL	Data in DATA_REG is available.
1	CMD_END_INT_FL	Transfer sequence ended.
0	—	Reserved

58.3.8 ECC module control register (ECC_CTRL)

The ECC_CTRL register stores all configuration parameters required by the ECC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECC_SEL[1:0]	
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 58.16 ECC_CTRL Register Contents

Bit Position	Bit Name	Function
31 to 18	—	Reserved
17, 16	ECC_SEL[1:0]	The ECC interrupt source select. These bits selects the ECC module flag that will be used as a source for the interrupt signal: 00: select ECC_ERROR (correctable error) flag as interrupt source. 01: select ECC_UNC (uncorrectable error) flag as interrupt source. 1x: select ECC_OVER (acceptable errors level overflow) flag as interrupt source. (ECC_OVER flag is not set by uncorrectable errors (ECC_UNC_0 = 1))
15, 14	—	Reserved
13 to 8	ERR_THRESHOLD[5:0]	The acceptable errors level. The value of this field contains the number of errors that is acceptable. This field must be initialized by the application program.
7 to 3	—	Reserved
2 to 0	ECC_CAP[2:0]	The ECC module correction ability. The correction ability can be changed only when all memory devices are ready. 000: 2 001: 4 010: 8 011: 16 100: 24 All others: 32

58.3.9 ECC module status register (ECC_STAT)

The ECC_STAT register stores all ECC module status information.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECC_OVER_0

R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Table 58.17 ECC_STAT Register Contents

Bit Position	Bit Name	Function
31 to 17	—	Reserved
16	ECC_OVER_0	The Memory device 0 acceptable errors level overflow. The bit is set when the number of errors is bigger than the value of declared ERR_THRESHOLD[5:0] bits. (Uncorrectable errors are not counted)
15 to 9	—	Reserved
8	ECC_UNC_0	The Memory device 0 uncorrectable error flag. The bit is set when the uncorrectable errors occur during the read operation.
7 to 1	—	Reserved
0	ECC_ERROR_0	The Memory device 0 correctable error flag. The bit is set when the correctable errors or the uncorrectable errors (ECC_UNC_0 = 1) occur during the read operation.

58.3.10 ECC offset in the spare area register (ECC_OFFSET)

The ECC_OFFSET register stores the offset value from the beginning of the page to the place where correction words will be stored.

The value of the ECC_OFFSET register must be bigger than the value in the DATA_SIZE register.

In small block mode, the value in the ECC_OFFSET is ignored and the correction words are located in the NAND Flash memory device just behind the data.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 58.18 ECC_OFFSET Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved
15 to 0	ECC_ OFFSET[15:0]	Correction words block offset.

58.3.11 ECC error level counter register (ECC_CNT)

The ECC_CNT register stores number of value detected during last page read operation. This register content is not automatically cleared, it must be done by software. The new page read operation does not overwrite previous register value. Register contain value of the largest error level detected in processed ECC blocks.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 58.19 ECC_CNT Register Contents

Bit Position	Bit Name	Function
31 to 6	—	Reserved
5 to 0	ERR_LVL[5:0]	Detected error level. (Uncorrectable errors are not counted)

58.3.12 Column/row address registers (ADDR[1:0]_COL, ADDR[1:0]_ROW)

The address registers store the packaged version of the address that will be used by the next command sequence during access to the NAND Flash device.

ADDR[1:0]_COL:

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 58.20 ADDR[1:0]_COL Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved
15 to 0	ADDR[1:0]_ COL[15:0]	Column address. A15-A0 address bits.

Table 58.21 ADDR[1:0]_ROW Register Contents

Bit Position	Bit Name	Function
31 to 24	—	Reserved
23 to 0	ADDR[1:0]_ ROW[23:0]	Row address. A39-A16 address bits (Page address, Block address and LUN address in the ONFI case).

CAUTIONS

1. **There is no register that defines the total memory size of the NAND Flash memory chip, thus the controller is not able to determine which address bits in ADDR[1:0]_COL and ADDR[1:0]_ROW are important and which must be zero. For this reason, the software must take special care with the values written to these registers. Incorrect values of unused address bits (none '0' values) can cause errors in memory access.**

A relation between address registers and memory device address width is configured by the command sequence field of the COMMAND register. This field determines which command sequence has to be used and how many address bytes are used when addressing a NAND Flash memory device. (Example: In order to erase blocks, the three address cycles containing the row address are written into the NAND Flash memory device. The NAND Flash Controller automatically writes bits A39-A16 to the NAND Flash device). Refer to Section 58.4.1.2, Command Sequence Encoding and Table 58.47 in order to see how many address cycles are written into the NAND Flash memory device by each Command Sequence.
The address written to the address register must be aligned according to the NAND Flash device. Unused bits must be padded with zeros.

2. **When the auto increment for the row address register is enabled, the proper value of this register can be read only when the bit CTRL_STAT in STATUS register is clear.**

Table 58.22 Address Registers and Address Bytes Relationship

Address Cycle	I/O 0	I/O 1	I/O 2	I/O 3	I/O 4	I/O 5	I/O 6	I/O 7
1st cycle	A0	A1	A2	A3	A4	A5	A6	A7
2nd cycle	A8	A9	A10	A11	A12	A13	A14	A15
3rd cycle	A16	A17	A18	A19	A20	A21	A22	A23
4th cycle	A24	A25	A26	A27	A28	A29	A30	A31
5th cycle	A32	A33	A34	A35	A36	A37	A38	A39

58.3.13 Page size value register (DATA_SIZE)

The DATA_SIZE register stores the value of the data block size. The data size value is remembered as the number of bytes per transferred block, but its size must be declared as the multiple of the chosen NAND Flash word size. The unused bits for the given word size configuration are ignored and replaced with zeros.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	DATA_SIZE[14:0]														
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 58.23 DATA_SIZE Register Contents

Bit Position	Bit Name	Function
31 to 15	—	Reserved
14 to 0	DATA_SIZE[14:0]	Data size. The value of this field defines data size.

CAUTION

Write the proper value to the DATA_SIZE register when ECC is enabled:

(ECC_BLOCK_SIZE[1:0]) × m ≤ DATA_SIZE[14:0] ≤ (ECC_BLOCK_SIZE[1:0] + 32) × m, where m is 1, 2, 3 …

Here is an example of which values are correct when ECC_BLOCK_SIZE[1:0] equals 512 bytes:

Table 58.24 Example, in which DATA_SIZE Values are Correct (1/2)

DATA_SIZE[14:0]	Value Correctness
0x0000	Not available
….	….
0x001F	Not available
0x0020	Not available
0x0021	Not available
….	….
0x01FF	Not available
0x0200	Available
0x0201	Available
….	….
0x0220	Available
0x0221	Not available

Table 58.24 Example, in which DATA_SIZE Values are Correct (2/2)

DATA_SIZE[14:0]	Value Correctness
….	….
0x03FF	Not available
0x0400	Available
0x0401	Available
….	….
0x0440	Available
0x0441	Not available
….	….

Note 1. ECC_BLOCK_SIZE[1:0] equals 512 bytes.

58.3.14 FIFO module interface register (FIFO_DATA)

The FIFO_DATA register is used as an entry point to the FIFO module. The CPU can access the FIFO module by reading from or writing to the FIFO_DATA register in the same way as it accesses any other register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FIFO_DATA[31:16]

Table 58.25 FIFO_DATA Register Contents

Bit Position	Bit Name	Function
31 to 0	FIFO_ DATA[31:0]	FIFO Data.

NOTE

FIFO_DATA register is able to access after issuing read or write command.

58.3.15 Bad block management (BBM) module control register (BBM_CTRL)

The BBM control register stores the BBM specific control parameters.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RMP_INIT
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 58.26 BBM_CTRL Register Contents

Bit Position	Bit Name	Function
31 to 1	—	Reserved
0	RMP_INIT	Remap initial flag. If set, this flag forces the BBM module to reread the remapping table after it was updated by software. This flag is set by software and cleared by hardware after rereading the remapping table.

58.3.16 Records table pointer register (DEV0_PTR)

The bad block management mechanism uses the tables in the system memory to store the remapping records. The DEV0_PTR register stores the table of the remapping record address.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PTR_ADDR[11:2]										—	—

Table 58.27 DEV0_PTR Register Contents

Bit Position	Bit Name	Function
31 to 12	–	Reserved
11 to 2	PTR_ ADDR[11:2]	Remap table pointer. The field contains an address of the remap table in the internal memory.
1, 0	–	Reserved

58.3.17 Records table size register (DEV0_SIZE)

The bad block management mechanism implemented in the controller uses the tables in the system memory to store the remapping records. Each table can store a variable number of records depending on the number of bad blocks in the NAND Flash device.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	DEV_SIZE[11:0]											
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 58.28 DEV0_SIZE Register Contents

Bit Position	Bit Name	Function
31 to 12	—	Reserved
11 to 0	DEV_SIZE[11:0]	Number of record.

58.3.18 DMA base address - least significant part register (DMA_ADDR_L)

The DMA_ADDR_L register is the least significant part of the 64-bit DMA base address. The register contains an address for the first data in the data block in the system memory, or the address of the first descriptor. The DMA module can read data from the memory location set by DMA_ADDR and write it to the FIFO module, or read data from the FIFO module and write it to the memory, starting from the location indicated by the DMA_ADDR.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMA_ADDR_L[31:16]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 58.29 DMA_ADDR_L Register Contents

Bit Position	Bit Name	Function
31 to 0	DMA_ADDR_L[31:0]	The least significant part of the DMA base address. The two least significant bits are ignored, thus the address must be aligned to 32-bit words.

58.3.19 DMA counter initial value register (DMA_CNT)

The DMA_CNT defines the number of bytes that will be transferred by the DMA module. The register remains unchanged during the transfer process.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CNT_INIT[31:16]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CNT_INIT[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 58.30 DMA_CNT Register Contents

Bit Position	Bit Name	Function
31 to 0	CNT_INIT[31:0]	Bytes counter initial value. The field contains data page length in bytes ($0000\ 0004_H$ – $FFFF\ FFFC_H$). The number of the bytes has to be divided by 4.

58.3.20 DMA control register (DMA_CTRL)

DMA_CTRL is a control register for the DMA channel. This register defines the parameters of the DMA transfer.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DMA_ START	—	DMA_ MODE	DMA_ BURST[2:0]			—	DMA_ READY
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R	R

Table 58.31 DMA_CTRL Register Contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved
7	DMA_START	DMA start. Set bit DMA_START to start DMA when the command sequence is sent to the NAND Flash memory. For more details see Section 58.5.2.2, DMA Description.
6	—	Reserved
5	DMA_MODE	DMA work mode: 0: the registers managed mode 1: the Scatter-Gather mode
4 to 2	DMA_ BURST[2:0]	Burst type. These bits define the main transfer type used by the DMA to precede the requested transfer. 000: incrementing precise burst of precisely four transfers (address increment) 010: single transfer (address increment) 011: burst of unspecified length (address increment) 100: incrementing precise burst of precisely eight transfers (address increment) 101: incrementing precise burst of precisely sixteen transfers (address increment) All others: Setting prohibited
1	—	Reserved
0	DMA_READY	DMA ready flag. The flag is set when transfer is completed.

58.3.21 DMA trigger level value register (DMA_TRIG_TLVL)

This register allows the setting of the data FIFO occupancy level that will trigger the DMA module. For more details see Section 58.5.2.2, DMA Description.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 58.32 DMA_TRIG_TLVL Register Contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved
7 to 0	DMA_TRIG_ LVL[7:0]	DMA trigger level The trigger level is counted using the 32-bit words as entity.

58.3.22 Mask register for the READ STATUS commands (STATUS_MASK)

The STATE_MASK field is used to mark the ready/busy bits in the NAND Flash device status byte. This field is used during the internal read status operation. In the case of ONFI, the user must mask all fields except RDY or ARDY (depending on the application).

The ERROR_MASK field is used to mask unused fields when the controller automatically reads the status of the NAND Flash memory device. In the case of ONFI, the user must mask all fields except FAIL or FAILC (depending on the application).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 58.33 STATUS_MASK Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved
15 to 8	ERROR_ MASK[7:0]	Error State Mask – used to mask the error bits if automatic read status feature is enabled.
7 to 0	STATE_ MASK[7:0]	State Mask – used to mask status bits when the read status command is used to obtain the NAND flash status.

58.3.23 Command sequence timing configuration register 0 (TIME_SEQ_0)

Some waveform configuration parameters are defined in the TIME_SEQ_0 register. The time delay generated by the controller equals the minimum value written into the register, increased by 1. All the timings are generated using the CLKB clock signal.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	TWHR[5:0]						—	—	TRHW[5:0]

Table 58.35 TIME_SEQ_1 Register Contents

Bit Position	Bit Name	Function
31 to 14	—	Reserved
13 to 8	TRR[5:0]	Read high to Read low. TRR time period from rising edge on read/busy input line to the moment when the read enable signal can be asserted.
7, 6	—	Reserved
5 to 0	TWB[5:0]	tWB delay. Time period measured from rising edge of the WE# or CLK signal to a falling edge on the RnB line or the NAND flash device SR[6] low.

58.3.25 Generic command sequence timing configuration register 0 (TIME_GEN_SEQ_0)

Some waveform configuration parameters for the Generic Sequence are defined in the TIME_GEN_SEQ_0 register. The time delay generated by the controller equals the minimum value written into the register, increased by 1. For more detail see Section 58.4.2, Generic Command Sequence. All the timings are generated using the CLKB clock signal.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 58.36 TIME_GEN_SEQ_0 Register Contents

Bit Position	Bit Name	Function
31, 30	—	Reserved
29 to 24	T0_D3[5:0]	Command to Data time. The time between sending a command and data transferring.
23, 22	—	Reserved
21 to 16	T0_D2[5:0]	Command to Delay time. The time between sending a command to the NAND Flash memory device and waiting until the memory is ready.
15, 14	—	Reserved
13 to 8	T0_D1[5:0]	Command to Command time. The time between two subsequent commands sent to the NAND Flash memory device.
7, 6	—	Reserved
5 to 0	T0_D0[5:0]	Command to Address time. The time between sending a command and sending the address to the NAND Flash memory device.

58.3.26 Generic command sequence timing configuration register 1 (TIME_GEN_SEQ_1)

Some waveform configuration parameters for the Generic Sequence are defined in the TIME_GEN_SEQ_1 register. The time delay generated by the controller equals the minimum value written into the register, increased by 1. For more detail see Section 58.4.2, Generic Command Sequence. All the timings are generated using the CLKB clock signal.

Table 58.37 TIME_GEN_SEQ_1 Register Contents

Bit Position	Bit Name	Function
31, 30	—	Reserved
29 to 24	T0_D7[5:0]	Address to Data time. The time between sending the address and data transferring.
23, 22	—	Reserved
21 to 16	T0_D6[5:0]	Address to Delay time. The time between sending the address to the NAND Flash memory device and waiting until the memory is ready.
15, 14	—	Reserved
13 to 8	T0_D5[5:0]	Address to Address time. The time between two subsequent addresses sent to the NAND Flash memory device.
7, 6	—	Reserved
5 to 0	T0_D4[5:0]	Address to Command time. The time between sending the address and sending a command to the NAND Flash memory device.

58.3.27 Generic command sequence timing configuration register 2 (TIME_GEN_SEQ_2)

Some waveform configuration parameters for the Generic Sequence are defined in the TIME_GEN_SEQ_2 register. The time delay generated by the controller equals the minimum value written into the register, increased by 1. For more detail see Section 58.4.2, Generic Command Sequence. All the timings are generated using the CLKB clock signal.

7, 6	—	Reserved
5 to 0	T0_D8[5:0]	Delay to Data time. The time between waiting until the memory is ready and data transferring.

58.3.28 Generic command sequence timing configuration register 3 (TIME_GEN_SEQ_3)

Some waveform configuration parameters for the Generic Sequence are defined in the TIME_GEN_SEQ_3 register. For more details see Section 58.4.2, Generic Command Sequence. All the timings are generated using the CLKB clock signal.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 6	—	Reserved
5 to 0	T0_D12[5:0]	Data to sequence end time. The time between the data transferring phase and sequence end. The sequence is ended when any other sequence phases after the data transfer phase are not enabled.

58.3.29 Timing configuration register (TIMINGS_ASYN)

Two waveform configuration parameters are defined in the TIMINGS_ASYN register. The time delay generated by the controller equals the minimum value written into the register, increased by 1. All the timings are generated using the CLKB clock signal.

Figure 58.1 shows how timings parameters are mapped to the NAND flash interface. The upper part of figure shows read transfer, lower part shows write transfer.

Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 58.43 FIFO_INIT Register Contents

Bit Position	Bit Name	Function
31 to 1	—	Reserved
0	FIFO_INIT	FIFO init bit. The setting of this bit causes the flushing of FIFO. It is not necessary to set this bit before sending each command to the NAND Flash memory device. This feature is reserved only for a situation where previous FIFO content must be purged before a new operation.

58.3.33 FIFO status control register (FIFO_STATE)

The FIFO_STATE register contains the data buffer status.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DF_W_EMPTY	DF_R_FULL	CF_ACCPT_W	CF_ACCPT_R	CF_FULL	CF_EMPTY	DF_W_FULL	DF_R_EMPTY
Initial value	0	0	0	0	0	0	0	0	1	0	0	1	0	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 58.44 FIFO_STATE Register Contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved
7	DF_W_EMPTY	FIFO empty state bit. This bit indicates that there is no data in the FIFO available. This flag is valid for the write direction.
6	DF_R_FULL	FIFO full state bit. This bit indicates that there is no free space for the data in FIFO available. This flag is valid for the read direction.
5	CF_ACCPT_W	Command FIFO accept flag – write direction. If this flag is set then next write access will finish with any additional delay.
4	CF_ACCPT_R	Command FIFO accept flag – read direction. This is informational flag. If it is set then read transfer on the CMD FIFO internal interface will be accepted with any additional delay.
3	CF_FULL	Command FIFO full flag. This bit indicates actual command FIFO state. It can't be used to check if next transfer will be accepted.
2	CF_EMPTY	Command FIFO empty flag. This bit indicates actual command FIFO state. It can't be used to check if next transfer will be accepted.
1	DF_W_FULL	FIFO full state bit. This bit indicates that there is no free space for the data in FIFO available. This flag is valid for the write direction.
0	DF_R_EMPTY	FIFO empty state bit. This bit indicates that there is no data in the FIFO available. This flag is valid for the read direction.

58.3.34 CMD ID initial value register (CMD_MARK)

The CMD MARK register allows to write initial value to the command marking generator in the register Slave I/F Unit (SIU).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 58.45 CMD_MARK Register Contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved
7 to 0	CMD_ID[7:0]	CMD ID initial value.

58.4 Operation

58.4.1 Command Generation

The NAND Flash devices are constantly extended and evaluated to the larger capacities and higher data throughput. Frequently during this process, new commands appear in the next generation of devices. To allow use of the NAND Flash controller with future generations of devices, the parameterizable command sequences have been added.

The parameterization allows for a defining set of parameters for each supported command sequence.

58.4.1.1 Instruction Encoding

The controller instruction field is constant and has 32 bits. The instruction field contains the command sequence code and optional parameters. Those parameters are:

- The command codes present in the instruction sequence.
- The flag used to select data destination; possible options are data register and FIFO module.
- The flag used to select data source/sink for the command sequence. The possible choices are the registers or the DMA unit.
- The command sequence code.

If the given command sequence does not use all parameter fields, unused fields are ignored. The instruction encoding scheme is presented in the table below:

Table 58.46 Instruction Encoding

Field Name	Bits	Description
CMD_2	[31:24]	Code of the third command in a sequence.
CMD_1/CMD3*1	[23:16]	Code of the second or fourth command in a sequence.
CMD_0	[15:8]	Code of the first command in a sequence.
DATA_SEL	[7]	Data register / FIFO select flag: 0 – the FIFO selected 1 – the DATA register selected
INPUT_SEL	[6]	Input module select flag: 0 – select the register as input 1 – select the DMA module as input
CMD_SEQ	[5:0]	Command code.

Note 1. Depending on the selected command sequence, this field will store the CMD1 or CMD3 code. Both commands are never used in a single sequence.

58.4.1.2 Command Sequence Encoding

The NAND Flash devices use the same set of signals independently of the memory capacity. This allows upgrading of obsolete devices with newer ones without PCB redesign. The NAND Flash devices use common IO bus to transfer commands, addresses and data. The predefined set of command sequences is used for the read and write operations on those devices. The set of supported command sequences is not constant for all NAND Flash device producers and evolves as the devices are more capable.

The NAND Flash controller must be able to support the new NAND Flash device features as they appear with a minimum effort from the designer side. This objective can be achieved in many cases because most of the new instructions use the previously defined sequence of commands and addresses, along with new command codes, data page size, data spare area size, etc..

The NAND Flash controller defines the set of commands, addresses and data sequences that allows implementation of all present and many future instructions. The following description of those sequences is adequate to define most of the future NAND Flash device instructions.

Table 58.47 contains the command sequence encoding details. Each sequence is encoded according to the fields defined in the GENERIC_SEQUENCE_CTRL register. For more details, **Section 58.3.3, GENERIC_SEQ register (GEN_SEQ_CTRL)**.

Table 58.47 Command Sequence Encoding

Sequence symbol	Sequence encoding	CMD0	CMD1	CMD2	CMD3	COL_A0*2	COL_A1	ROW_A0	ROW_A1	DATA_EN	DELAY_EN	IMD_SEQ*3
SEQ_0	000000	√	-	-	-	-	-	-	-	-	DELAY_1	-
SEQ_1	100001	√	-	-	-	1	-	-	-	√	-	-
SEQ_2	100010	√	-	-	-	1	-	-	-	√	DELAY_0	-
SEQ_3	000011	√	-	-	-	1	-	-	-	√	DELAY_1	-
SEQ_4	100100	√	-	-	-	-	-	-	-	√	-	√
SEQ_5	100101	√	-	-	-	-	-	3	-	√	-	√
SEQ_6	100110	√	-	√	-	2(1)	-	-	-	√	-	-
SEQ_7	100111	√	-	√	-	2(1)	-	3	-	√	DELAY_0	-
SEQ_8	001000	√	-	-	-	2(1)	-	-	-	√	-	-
SEQ_9	101001	√	√	-	-	2(1)	-	3	-	-	DELAY_1	-
SEQ_10	101010	√	-	√	-	2(1)	-	3	-	√	DELAY_0	-
SEQ_11	101011	√	-	-	-	-	-	-	-	√	DELAY_0	-
SEQ_12	001100	√	√	-	-	2(1)	-	3	-	√	DELAY_1	-
SEQ_13	001101	√	-	-	-	2(1)	-	3	-	√	DELAY_1	-
SEQ_14	001110	√	√	-	-	-	-	3	-	-	DELAY_1	-
SEQ_15	101111	√	-	√	√	2	2	3	3	√	DELAY_0	-
SEQ_17	110001	√	-	-	-	2(1)	-	3	-	√	DELAY_1	-
SEQ_18	110010	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
SEQ_19	010011	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
SEQ_20	110100	√	-	-	-	-	-	3	-	-	DELAY_1	-
SEQ_21	010101	√	-	-	-	1	-	-	-	-	-	-
SEQ_22	110110	√	-	√	-	2(1)	2	-	3	√	DELAY_0	-
SEQ_23	010111	√	√	-	-	-	-	3	-	√	DELAY_1	-
SEQ_24	011000	√	-	√	√	-	-	3	3	-	DELAY_0	-
SEQ_25	111001	√	-	√	√	2(1)	2	3	-	√	-	-

Note 1. SEQ_18 and SEQ_19 are the parameterized Generic Sequences. The GENERIC_SEQ_CTRL register defines which parts of sequences are executed.

Note 2. The value given in the brackets relates to the small block mode. In this mode, the controller sends only a single byte as the column address.

Note 3. IMD_SEQ - The command will be sent immediately.

Note: Gray rows – read from NAND Flash memory; White rows – write to NAND Flash memory; Blue rows – Non-directional commands

(1) Sequence SEQ_0

This non-directional sequence is composed from only one command. After the command is written to the NAND Flash device, the controller waits until the device goes into the busy state and drives the RnB line low, or sends the READ STATUS command. When delay time (tWB) passes or the device is ready, the sequence ends. The figure below shows the sequence.

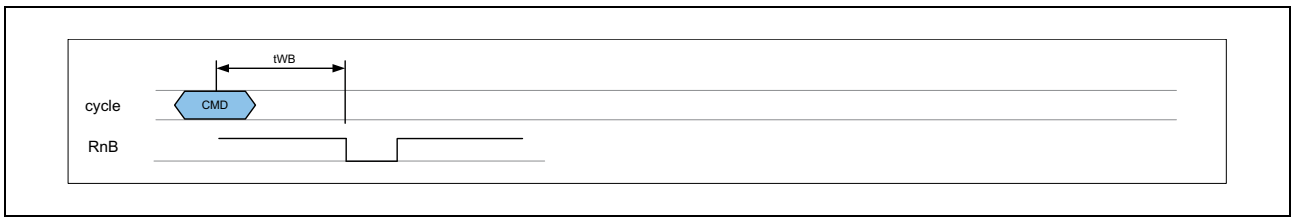

Figure 58.2 SEQ_0 Sequence

(2) Sequence SEQ_1

This is a read-sequence that is composed from a single command cycle, single address cycle and the single data cycle with a programmable number of read sequences. After the address sequence is finished, the controller measures the standard delay of first data read after the last write (tWHR). Next, the read data words are written to the FIFO module. The input module is selected by the INPUT_SEL field of the COMMAND register, the source for the address is placed in the ADDR0_COL register, and the command code is stored in the CMD_0 field. The figure below shows the sequence execution:

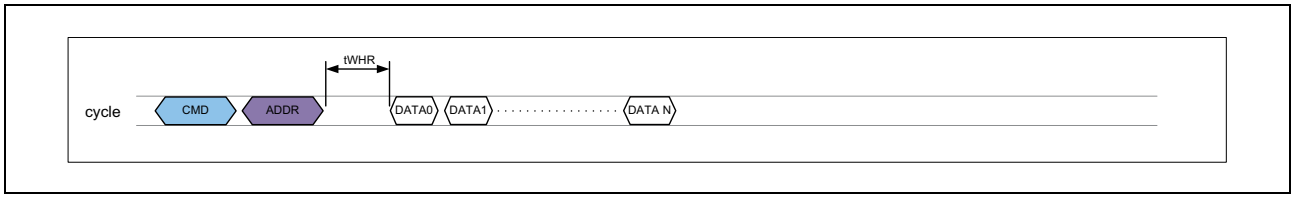

Figure 58.3 SEQ_1 Sequence

(3) Sequence SEQ_2

This is a read-sequence and it is similar to the SEQ_1 sequence except that after the address cycle the controller expects that device goes to the busy state. The controller sequentially checks state of the RnB line or send READ STATUS command to obtain the NAND Flash device status. The figure below shows the sequence execution:

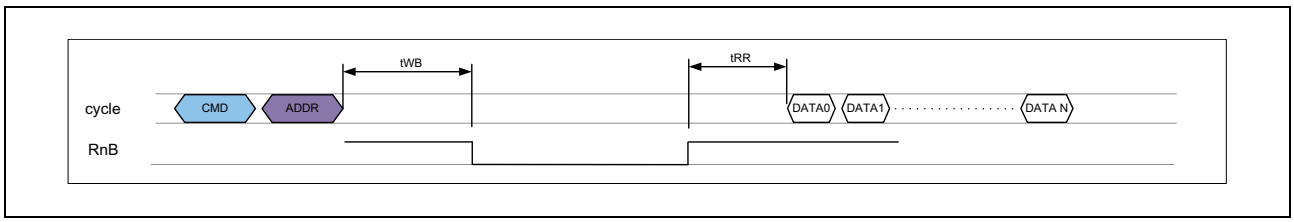

Figure 58.4 SEQ_2 Sequence

(4) Sequence SEQ_3

This is a write-sequence that is composed from a single command cycle, single address cycle and single data cycle with a programmable number of write sequences. After the address sequence is finished, the controller measures the standard delay of first data write after the last address cycle (tADL). The written words are read from the FIFO module. The controller sequentially checks the state of the RnB line or sends the READ STATUS command to obtain the NAND Flash device status. The input module is selected by the INPUT_SEL field of the COMMAND register; the source for the address is placed in the ADDR0_COL register, and the commend code is stored in the CMD_0 field. The figure below shows the sequence execution:

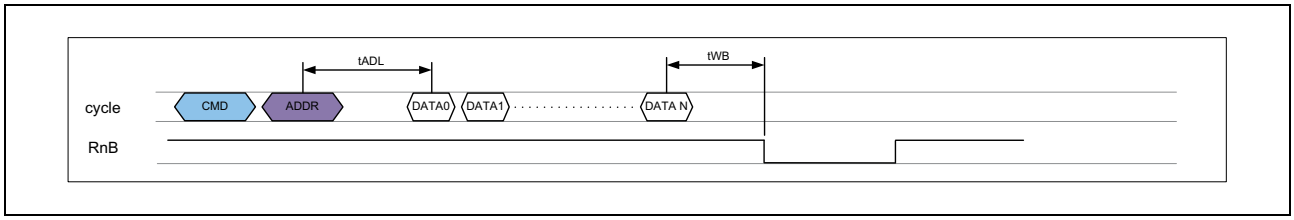

Figure 58.5 SEQ_3 Sequence

(5) Sequence SEQ_4

This is a special read-sequence that is used to implement the read status command sequences. The command is sent immediately. The sequence is composed of a single command cycle and a single data cycle. Between those cycles, the delay is counted (tWHR). The command code is read from the CMD_0 field.

When the DATA register is selected in the COMMAND register, the data is stored in the DATA register. The user defines the number of data in the DATA_REG_SIZE register. The registered mode is allowed only for the read direction.

When the FIFO register is selected in the COMMAND register, the data is stored in the FIFO. Because user has to change DATA_SIZE register, the command will be sent when all memories are ready and the Controller is in the idle state. The figure below shows the sequence execution:

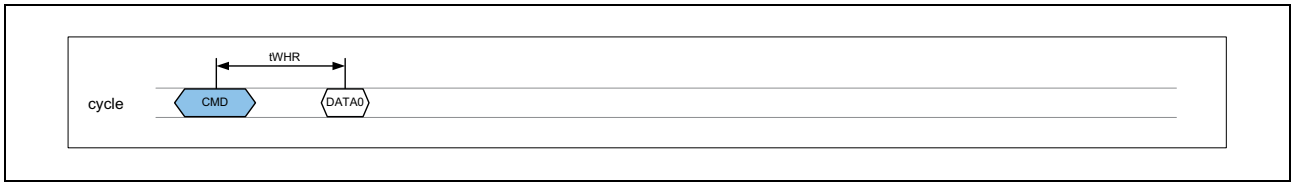

Figure 58.6 SEQ_4 Sequence

(6) Sequence SEQ_5

This is a read-sequence and it is similar to the SEQ_4 sequence. The command is sent immediately. The only difference is that after the command cycle, an additional address cycle is performed. The ADDR0_ROW register is used in this sequence. The figure below shows the sequence execution:

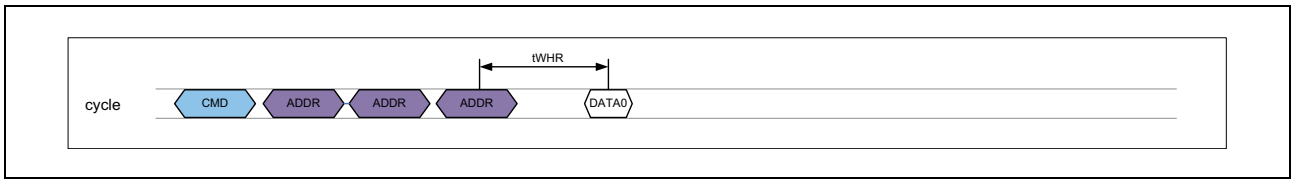

Figure 58.7 SEQ_5 Sequence

(7) Sequence SEQ_6

This is a read-sequence. The sequence of command cycle, address cycle, command cycle is executed. After that, the delay from the change column to the next operation (tCCS) is measured. Finally, the read data cycle is executed. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_2 instruction field; the ADDR0_COL register is used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

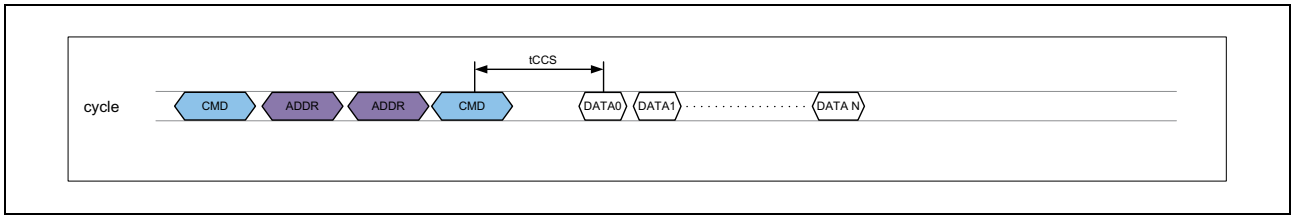

Figure 58.8 SEQ_6 Sequence

(8) Sequence SEQ_7

This read-sequence is similar to the SEQ_6 sequence, differing only because the address cycle in this sequence is composed of five bytes (ADDR0_COL[15:0] and ADDR0_ROW[23:0]) instead of three bytes. All else is the same as in the SEQ_6 sequence. The figure below shows the sequence execution:

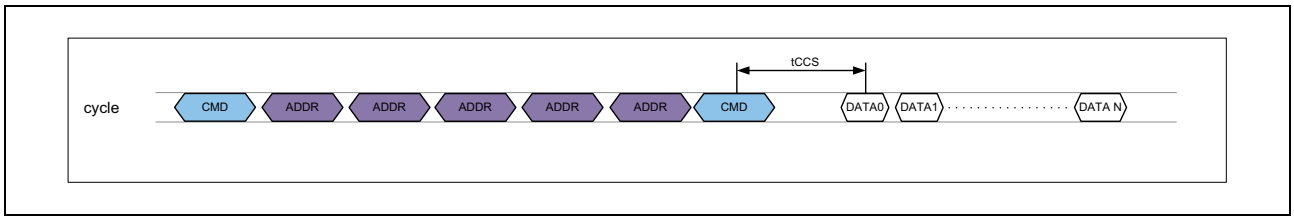

Figure 58.9 SEQ_7 Sequence

(9) Sequence SEQ_8

This is a write-sequence. First, the sequence of command cycle and two bytes address cycle is executed. Next, the delay after the column address changes (tCCS) is measured. Finally, the single data cycle with programmable number of write sequences is executed. The first command code is encoded in the CMD_0 instruction field; the ADDR0_COL register is used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

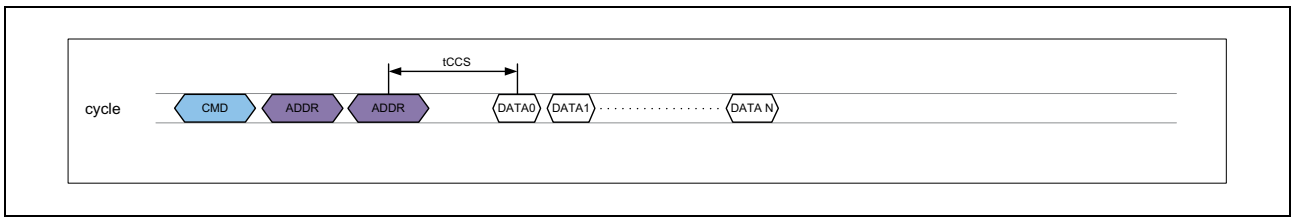

Figure 58.10 SEQ_8 Sequence

(10) Sequence SEQ_9

This is a non-directional sequence. The first step is to execute the five bytes address command cycle. The controller sequentially checks the state of the RnB line or sends the READ STATUS command to obtain the NAND Flash device status. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the ADDR0_COL and ADDR0_ROW registers are used in this sequence. The figure below shows the sequence execution:

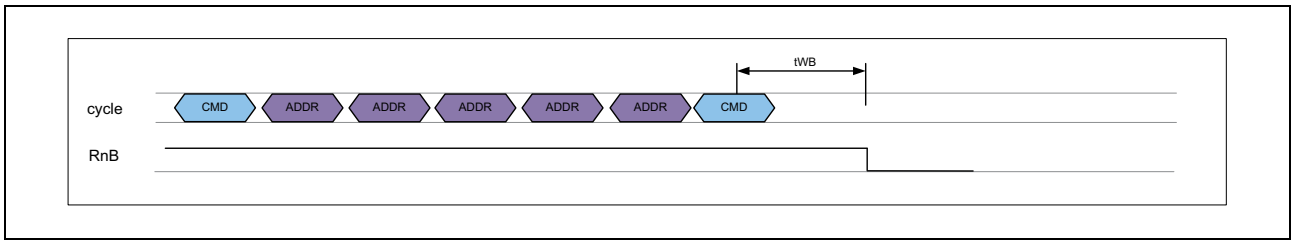

Figure 58.11 SEQ_9 Sequence

(11) Sequence SEQ_10

This is a non-directional sequence. The first step is to execute the five bytes address command cycle. The controller sequentially checks the state of the RnB line or sends the READ STATUS command to obtain the NAND Flash device status. Finally data block is read. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_2 instruction field; the ADDR0_COL and ADDR0_ROW registers are used in this sequence. The figure below shows the sequence execution:

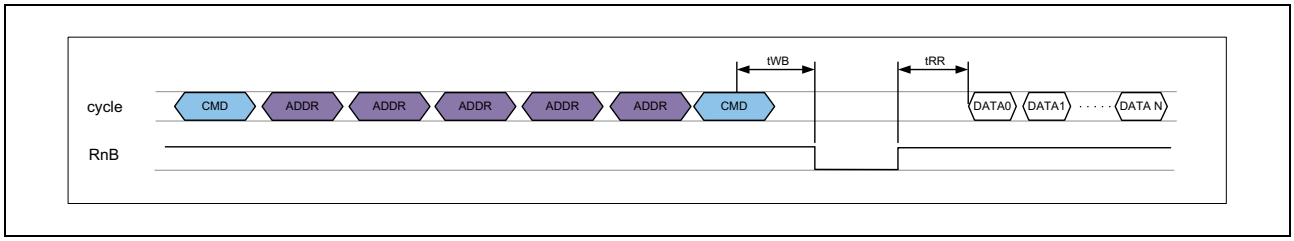

Figure 58.12 SEQ_10 Sequence

(12) Sequence SEQ_11

This is the read-sequence. The first step is to execute the command cycle. Next, the device goes to the busy state. The controller sequentially checks the state of the RnB line or sends the READ STATUS command to obtain the NAND Flash device status. As soon as the device reaches the ready state, the write data cycle with configurable read sequences is executed. The command code is encoded in the CMD_0 instruction field; the input module is selected by the INPUT_SEL field. The number of transferred bytes are configured using the DATA_SIZE register. The figure below shows the sequence execution:

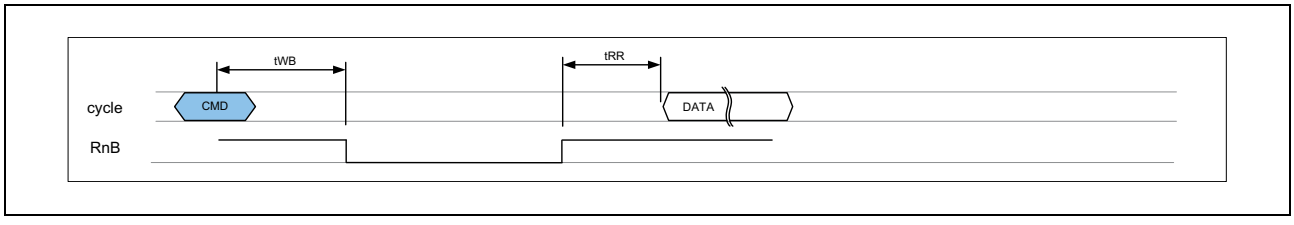

Figure 58.13 SEQ_11 Sequence

(13) SEQ_12 Sequence

This is a write-sequence. The SEQ_12 sequence is a series of command cycle, address cycle, and data cycle with a configurable number of write operations and another command cycle. Between the last address cycle and first data cycle, a delay is measured (tADL) and, after the second command cycle, another delay is measured (tWB). The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the ADDR0_COL and ADDR0_ROW registers are used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

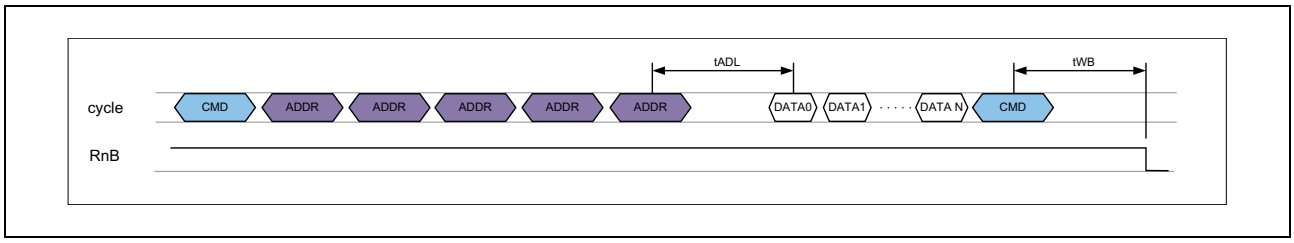

Figure 58.14 SEQ_12 Sequence

(14) SEQ_13 Sequence

This is a write-sequence. The SEQ_13 sequence is a series of command cycle and address cycles, data cycle with a configurable number of write operations. Between the last address cycle and first data cycle, a delay is measured (tADL). The command code is encoded in the CMD_0 instruction field; the ADDR0_COL and ADDR0_ROW registers are used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

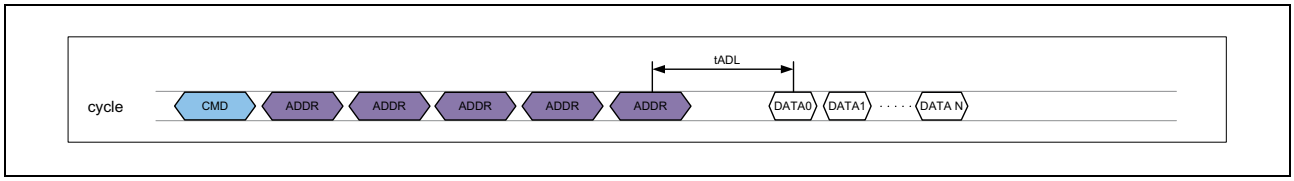

Figure 58.15 SEQ_13 Sequence

(15) SEQ_14 Sequence

This is a non-directional sequence. First, the series of command cycle, address cycle, command cycle is executed. The controller sequentially checks the state of the RnB line or sends the READ STATUS command to obtain the NAND Flash device status. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the ADDR0_ROW and ADDR0_COL registers are used in this sequence. The figure below shows the sequence execution:

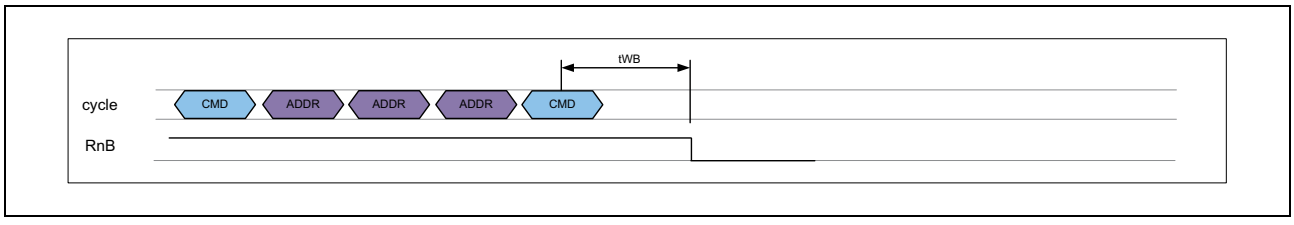

Figure 58.16 SEQ_14 Sequence

(16) SEQ_15 sequence

This is a read-sequence. First, the series of command cycle, address cycle, second command cycle, second address cycle, third command cycle is executed. The controller sequentially checks the state of the RnB line or sends the READ STATUS command to obtain the NAND Flash device status. After the NAND Flash device returns to the ready state, the data sequence, with a configurable number of read operations, is executed. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_3 instruction field; the third command code is encoded in the CMD_2 instruction field. In this sequence, both address registers are used. The ADDR0_ROW and ADDR0_COL register content is sent after the first command in the sequence, the ADDR1_ROW and ADDR1_COL register content is sent after the second command in the sequence. The figure below shows the sequence execution:

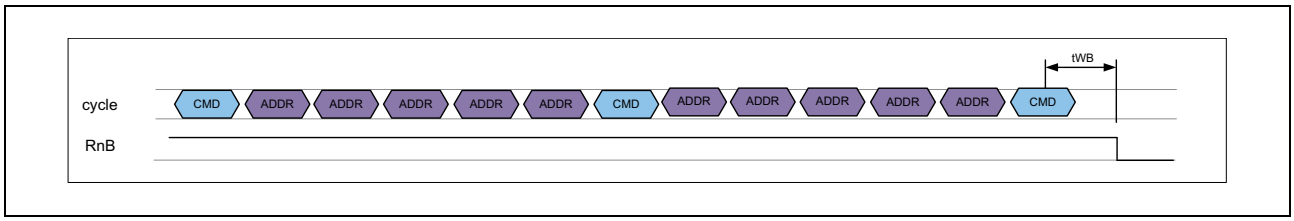

Figure 58.17 SEQ_15 Sequence

(17) SEQ_17 sequence

This is a read-sequence. This sequence is similar to the SEQ_10 sequence, except that the second command cycle is omitted. This sequence is implemented to use small block memories. The controller sends only four bytes of the address when the small block mode is enabled. The figure below shows the sequence execution:

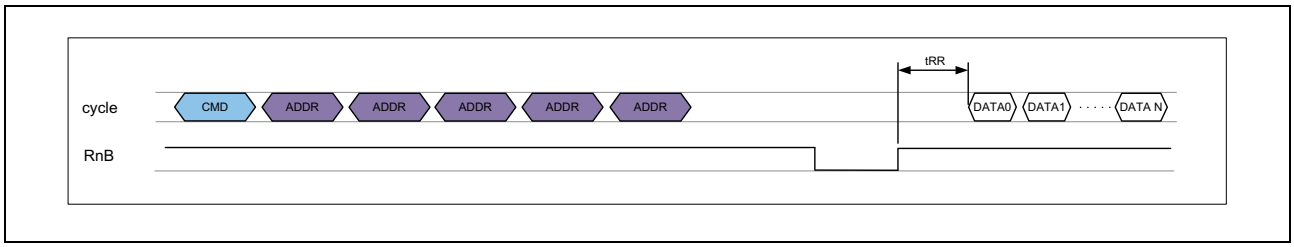

Figure 58.18 SEQ_17 Sequence

(18) SEQ_18 sequence

This generic read sequence is described in detail in Section 58.4.2, Generic Command Sequence.

(19) SEQ_19 sequence

This generic write sequence is described in detail in Section 58.4.2, Generic Command Sequence.

(20) SEQ_20 sequence

This non-directional sequence is composed from one command and three addresses bytes. After the command and addresses are written to the NAND Flash device, the controller waits until the device goes into the busy state and drives the RnB line low, or sends the READ STATUS command. When delay time (tWB) passes or the device is ready, the sequence ends. The figure below shows the sequence execution:

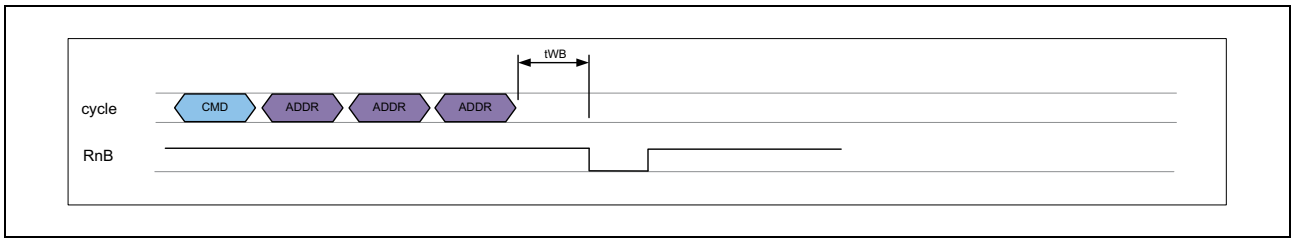

Figure 58.19 SEQ_20 Sequence

(21) SEQ_21 sequence

This non-directional sequence is composed from one command and one addresses byte. After the command and address are written to the NAND Flash device, the sequence ends. The figure below shows the sequence execution:

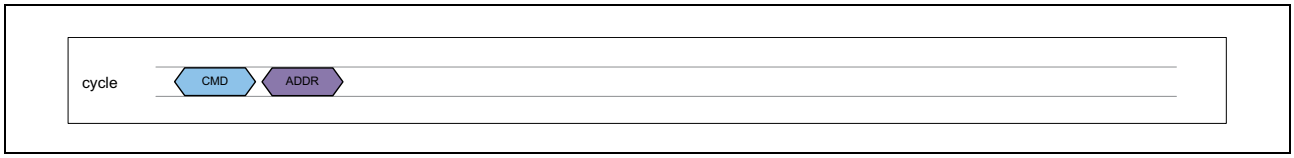

Figure 58.20 SEQ_21 Sequence

(22) SEQ_22 sequence

This is a read-sequence. The first step is to execute the five bytes address command cycle. The controller sequentially checks the state of the RnB line or sends the READ STATUS command to obtain the NAND Flash device status. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_2 instruction field; the ADDR0_COL, ADDR1_COL and ADDR1_ROW registers are used in this sequence. The figure below shows the sequence execution:

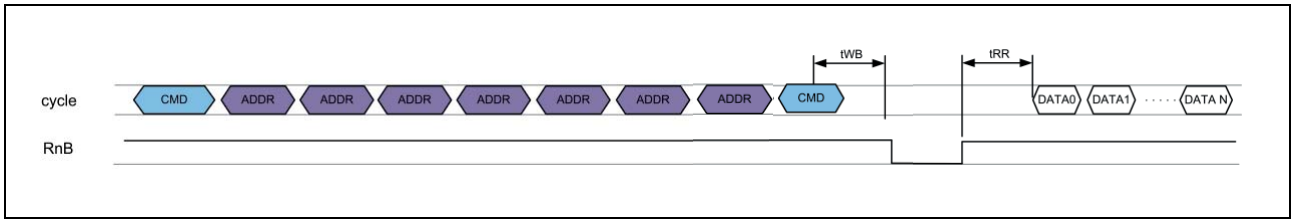

Figure 58.21 SEQ_22 Sequence

(23) SEQ_23 sequence

This is a write-sequence. The SEQ_23 sequence is a series of command cycle, address cycle, and data cycle with a configurable number of write operations and another command cycle. Between the last address cycle and first data cycle, a delay is measured (tADL) and, after the second command cycle, another delay is measured (tWB). The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the ADDR0_ROW registers is used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

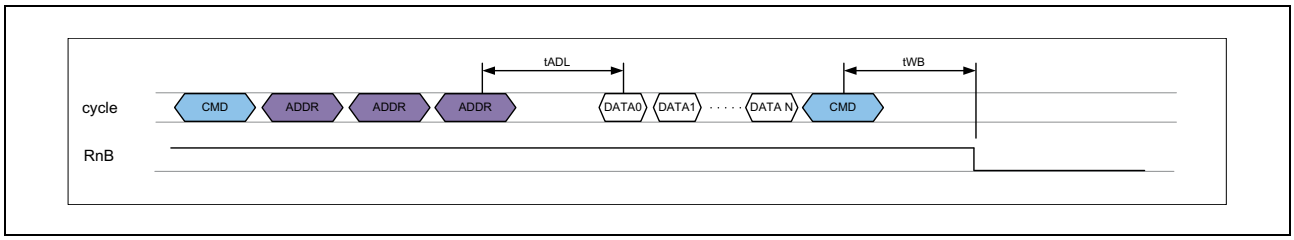

Figure 58.22 SEQ_23Sequence

(24) SEQ_24 sequence

This is a write-sequence. It is composed from the three commands cycles and two addresses cycles. Both addresses cycle contain the row address part. After the last command cycle the tWB delay is measured. The figure below shows the sequence execution.

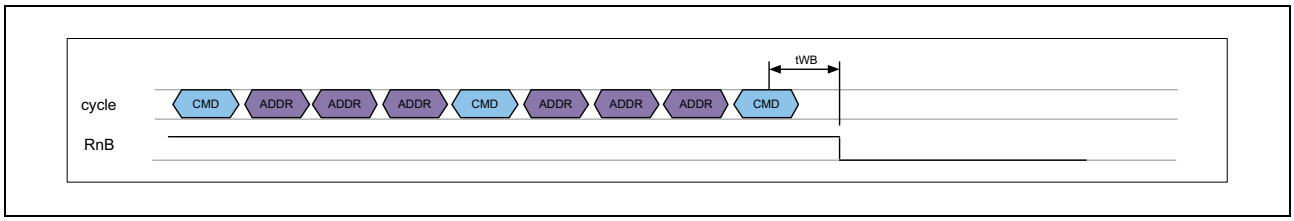

Figure 58.23 SEQ_24 Sequence

(25) SEQ_25 sequence

This is a read-sequence. It is composed from the three commands cycles and two addresses cycles. the first addresses cycle contain the column and row address part. The second address cycle contain only the column address part. After the last command cycle the tWHR delay is measured. The figure below shows the sequence execution.

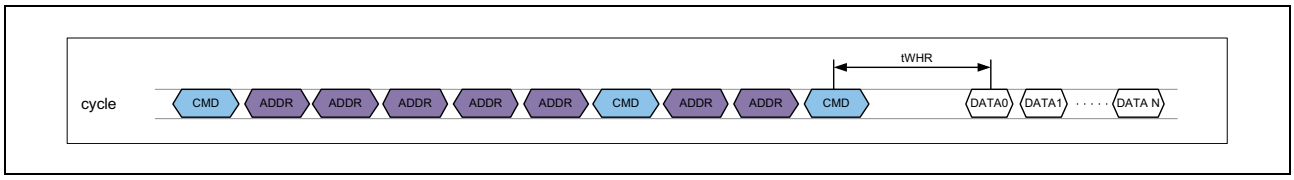

Figure 58.24 SEQ_25 Sequence

(26) SEQ_26 sequence

This is a write-sequence. The SEQ_26 sequence is a series of command cycle, address cycle, and data cycle with a configurable number of write operations and another command cycle. Between the last address cycle and first data cycle, a delay is measured (tADL). The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the ADDR0_ROW registers is used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

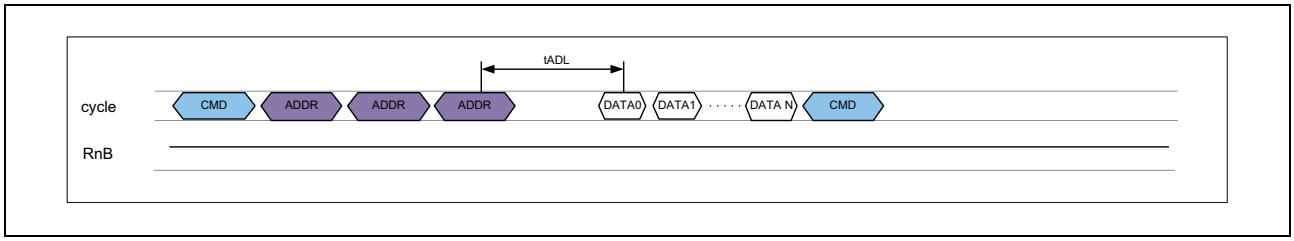

Figure 58.25 SEQ_26 Sequence

58.4.2 Generic Command Sequence

There will be cases where the set of predefined sequences above will not be sufficient to handle a new command sequence. If that occurs, the generic command sequence feature of the NAND flash controller can be used.

This sequence is designed to mimic almost every available command supported by the NAND Flash devices; however, additional effort required to trigger such commands.

Generic command sequence is executed in the following steps:

CMD0 – The first command in the sequence. The value of this command is stored in the CMD_0 field of the COMMAND register, described in **Table 58.9**.

ADDR0 – The first address sequence. This is enabled if the COL_A0 and ROW_A0 fields in the GEN_SEQ_CTRL register described in **Table 58.11** have values other than zero. In this phase, the address is sent to the NAND Flash device and is read from the ADDR0_COL and ADDR0_ROW registers. The number of the bytes in the address cycle is configured by the COL_A0 and ROW_A0 fields of the GEN_SEQ_CTRL register.

CMD1 – The fourth command in the sequence. The value of this command is stored in the CMD_1 field of the COMMAND register, described in **Table 58.9**. This is enabled by the CMD1_EN field in the GENERIC_SEQ_CTRL register, described in **Table 58.11**.

ADDR1 – The second address in the sequence. This is enabled if the COL_A1 and ROW_A1 fields of the GEN_SEQ_CTRL register described in **Table 58.11** have a value other than zero. In this phase, the address is sent to the NAND Flash device from the ADDR1_COL and ADDR1_ROW registers. The number of bytes in the address cycle is configured by the COL_A1 and ROW_A1 fields of the GEN_SEQ_CTRL register.

CMD2 – The third command in the sequence. The value of this command is stored in the CMD_2 field of the COMMAND register described in **Table 58.9**. This is enabled by the CMD2_EN field in the GEN_SEQ_CTRL register, described in **Table 58.11**.

DELAY0 – Waiting for the device to return to the ready state and continue the sequence. This is enabled by the DELAY_EN field in the GEN_SEQ_CTRL register, described in **Table 58.11**. Only one delay phase can be present in the generic sequence. For more details, see **Table 58.11**.

DATA – The data phase of the sequence. This is enabled by the DATA_EN field in the GEN_SEQ_CTRL register described in **Table 58.11**. Additionally, the transfer direction must be selected by the sequence number. Sequence number 18 reads data from the NAND Flash memory, sequence number 19 writes data to the NAND Flash memory. The size of the transferred data block is configured by the DATA_SIZE register value.

CMD3 – The second command in the sequence. This is enabled by the CMD3_EN field in the GEN_SEQ_CTRL register described in the **Table 58.11**. The value of this command is stored in the CMD_3 field of the GEN_SEQ_CTRL register.

DELAY1 – Waiting for the device to return to the ready state and finish the sequence. This is enabled by the DELAY_EN field in the GENERIC_SEQ_CTRL register described in **Table 58.11**. The controller waits for the device to return to the ready state and finish the sequence. Only one delay phase can be present in generic sequence.

The figure below presents the generic sequence composition:

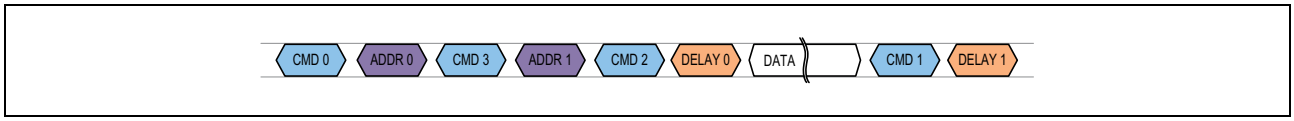

Figure 58.26 Generic Sequence

There are few constraints on the generic sequence usage:

- The DEL0 and DEL1 delay phases cannot both be enabled in a single command sequence
- The TIMINGS _ASYN register must be set even when the generic sequence is used.

It is possible to force an immediate command sequence execution by enabling the IMD_SEQ bit in the GEN_SEQ_CTRL register. In this case, the triggered command will be executed even if the previously sent command for a selected device is not completed. If both the IMD_SEQ and DATA_EN flags are enabled in a single sequence, then the register must be selected as data source/sink. The IMD_SEQ is valid only for the read direction. This feature is intended to implement all state read operations.

After each step of the generic sequence, the programmable time delay is measured. These delays are configured using the TIME_GEN_SEQ[0-3] registers. Refer to the TIME_GEN_SEQ[0-3] registers description for further information and see figures below.

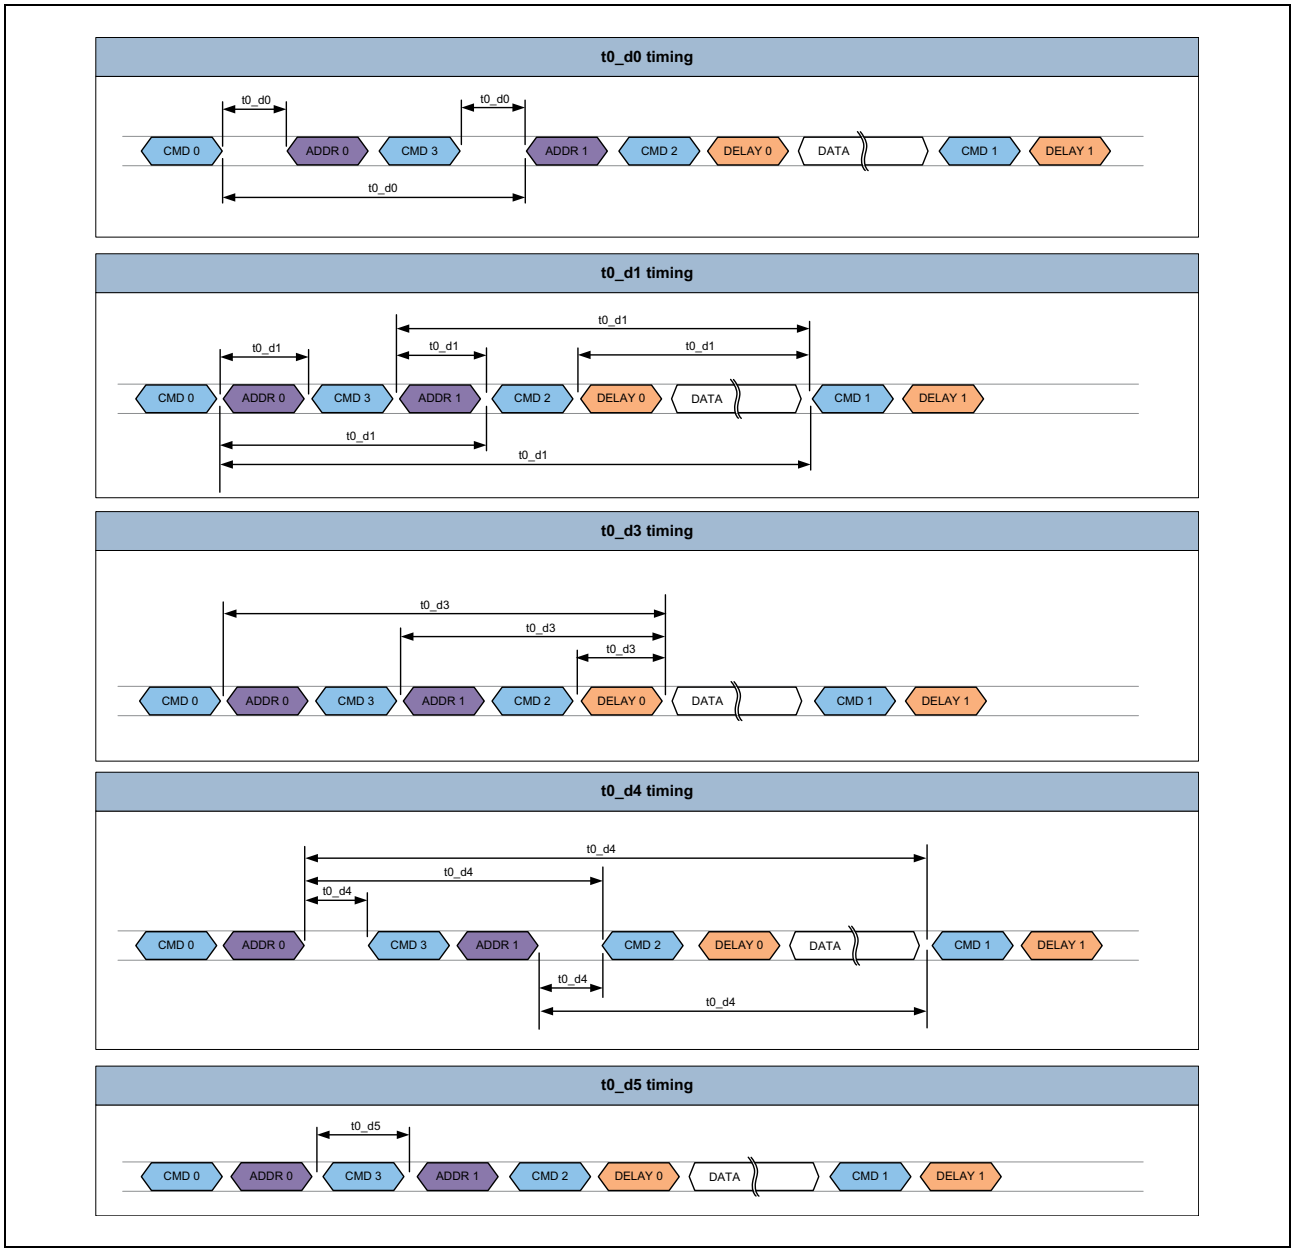

Figure 58.27 Generic Sequence Timing parameters

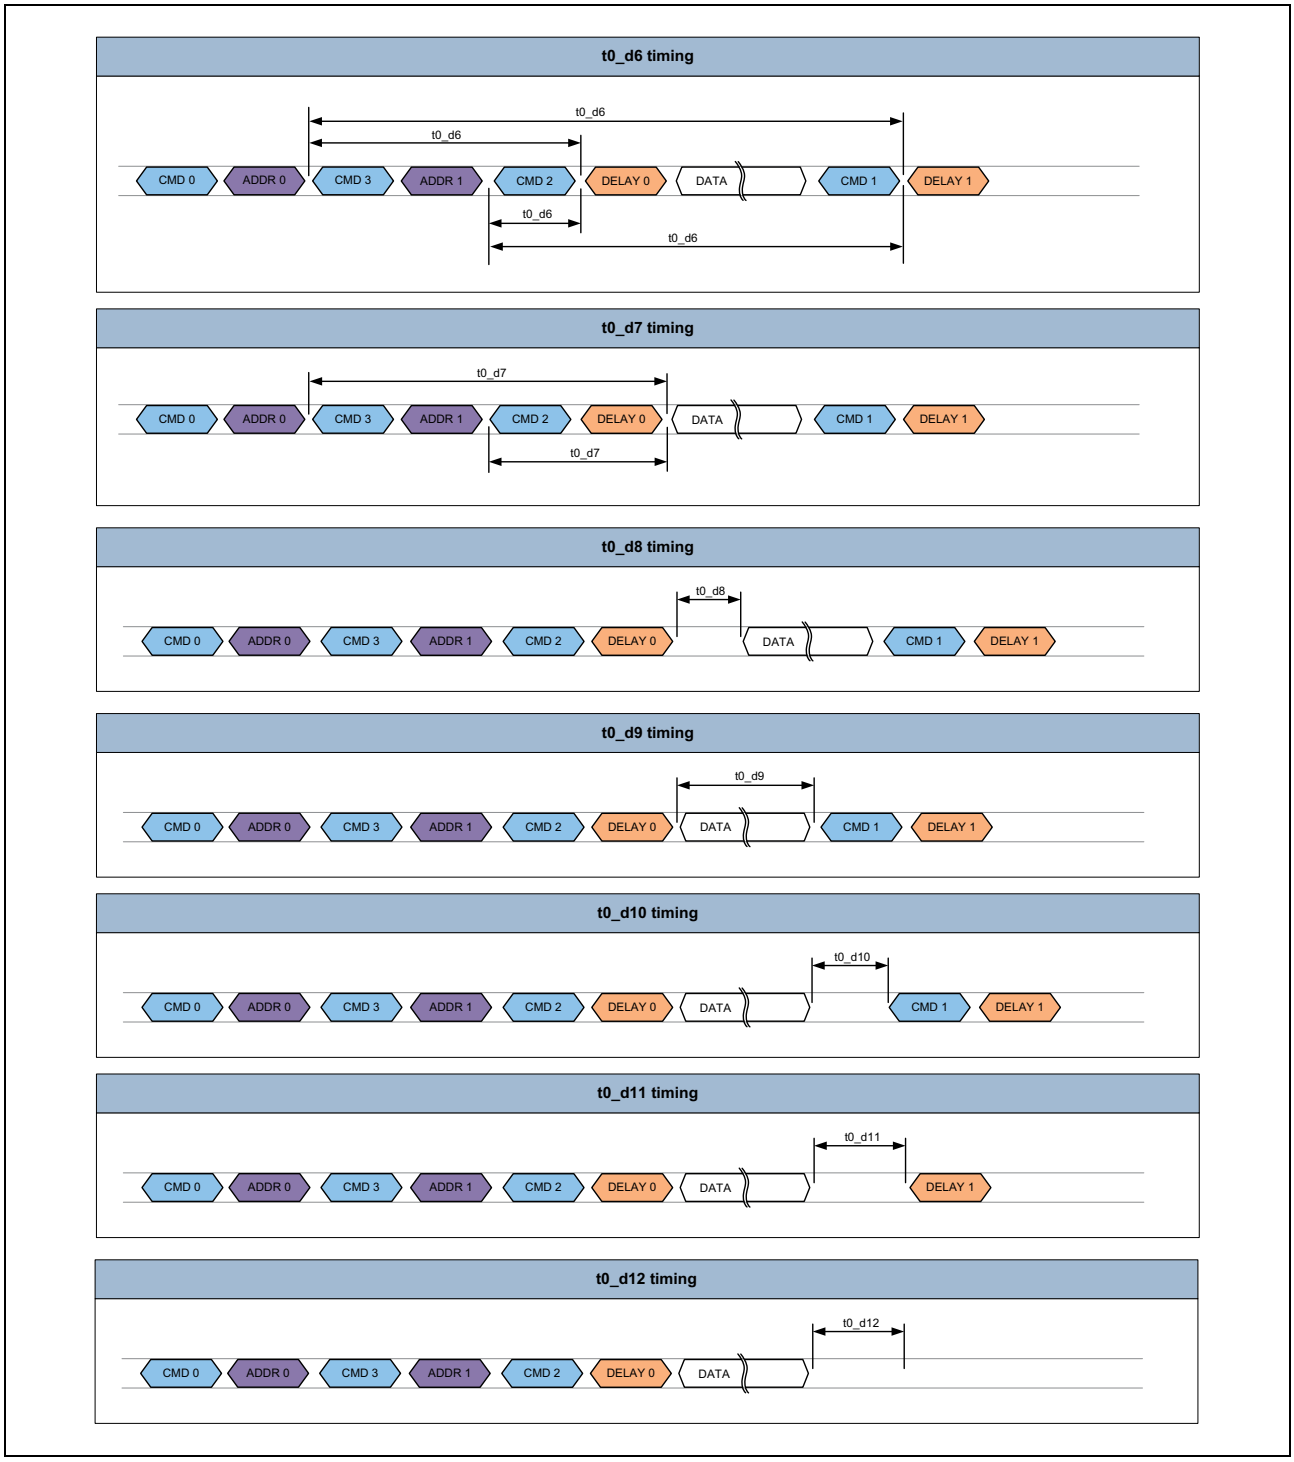

Figure 58.28 Generic Sequence Timing parameters

58.4.3 Instructions

The implementation of the instruction set presented at this point is an example of how to use the instruction encoding scheme presented in Section 58.4.1.1, Instruction Encoding. This chapter and the command sequences presented previously give sufficient information to implement new commands and command sequences for future NAND Flash devices.

58.4.3.1 Instructions Set

The table below contains the basic instruction defined to implement the all command sequences accessible in the ONFI 1.x standards.

Table 58.48 Instructions set (1/2)

Instruction	CMD_0	CMD_1 / CMD_3	CMD_2	CMD_SEQ	Send when memory is busy
Reset Commands					
RESET	0xFF	-	-	SEQ_0	No
Identification Operations					
READ ID	0x90	-	-	SEQ_1	No
READ PARAMETER PAGE	0xEC	-	-	SEQ_2	No
READ UNIQUE ID	0xED	-	-	SEQ_2	No
Configuration Operations					
GET FEATURES	0xEE	-	-	SEQ_2	No
SET FEATURES	0xEF	-	-	SEQ_3	No
Status Operations					
READ STATUS	0x70	-	-	SEQ_4	Yes
SELECT LUN WITH STATUS	0x78	-	-	SEQ_5	Yes
LUN STATUS	0x71	-	-	SEQ_5	Yes
DEVICE STATUS	0x72	-	-	SEQ_4	Yes
VOLUME_SELECT	0xE1	-	-	SEQ21	Yes
Column Address Operations					
CHANGE READ COLUMN	0x05	-	0xE0	SEQ_6	No
SELECT CACHE REGISTER	0x06	-	0xE0	SEQ_7	No
CHANGE WRITE COLUMN	0x85	-	-	SEQ_8	No
CHANGE ROW ADDRESS	0x85	0x11	-	SEQ_12	No
Read Operations					
READ PAGE	0x00	-	0x30	SEQ_10	No
READ PAGE CACHE	0x31	-	-	SEQ_11	No
READ PAGE CACHE LAST	0x3F	-	-	SEQ_11	No
READ MULTIPLANE	0x00	0x32	-	SEQ_9	No
TWO PLANE PAGE READ	0x00	0x00	0x30	SEQ_15	No
QUEUE PAGE READ	0x07	-	0x37	SEQ22	No
Program Operation					
PROGRAM PAGE	0x80	0x10	-	SEQ_12	No
PROGRAM PAGE IMD	0x80	0x10	-	SEQ_23	No
PROGRAM PAGE DEL	0x80	0x13	-	SEQ_23	No
PROGRAM PAGE 1	0x80	-	-	SEQ_13	No
PROGRAM PAGE CACHE	0x80	0x15	-	SEQ_12	No

Table 58.48 Instructions set (2/2)

Instruction	CMD_0	CMD_1 / CMD_3	CMD_2	CMD_SEQ	Send when memory is busy
PROGRAM MULTIPLANE	0x80	0x11	-	SEQ_12	No
WRITE PAGE	0x10	-	-	SEQ_0	No
WRITE PAGE CACHE	0x15	-	-	SEQ_0	No
WRITE MULTIPLANE	0x11	-	-	SEQ_0	No
Erase Operation					
ERASE BLOCK	0x60	0xD0	-	SEQ_14	No
ERASE MULTIPLANE	0x60	0xD1	-	SEQ_14	No
Copyback Operation					
COPYBACK READ	0x00	-	0x35	SEQ_10	No
COPYBACK PROGRAM	0x85	0x10	-	SEQ_9	No
COPYBACK PROGRAM 1	0x85	-	-	SEQ_13	No
COPYBACK MULTIPLANE	0x85	0x11	-	SEQ_12	No
OTP Operation					
PROGRAM OTP	0xA0	0x10	-	SEQ_12	No
DATA PROTECT OTP	0xA5	0x10	-	SEQ_9	No
READ PAGE OTP	0xAF	-	0x30	SEQ_10	No

58.4.3.2 RESET Command

(1) Command Description

The RESET command is used to put a target into a known condition and to abort command sequences in progress.

(2) Command Encoding

The RESET instruction uses the SEQ_0 commands sequence. The command is encoded, as shown in the table below:

Table 58.49 RESET Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0xFF	-	-	SEQ_0_ID

58.4.3.3 READ ID Command

(1) Command Description

The READ ID command is used to read identifier codes programmed into the target. This command is accepted by the target only when all LUNs on the target are in the IDLE state.

When the command is followed by an address cycle of 0x00, the target returns a 5-byte identifier code that includes the manufacturer's ID, device configuration, and part-specific information.

When the READ ID command is followed by an address cycle of 0x20, the target returns the 4-byte ONFI identifier code.

(2) Command Encoding

The READ ID instruction uses the SEQ_1 commands sequence. The command is encoded, as shown in the table below:

Table 58.50 READ ID Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0x90	0/1	0/1	SEQ_1_ID

58.4.3.4 READ PARAMETER PAGE Command

(1) Command Description

The READ PARAMETER PAGE command is used to read the ONFI parameter page programmed into the target. This command is accepted by the target only when all LUNs on the target are idle.

When the command is followed by an address cycle of 00h, the target goes into busy state. After the read process is completed, the controller enables the data output mode to read the parameter page.

(2) Command Encoding

The READ PARAMETER PAGE instruction uses the SEQ_2 commands sequence. The command is encoded, as shown in the table below:

Table 58.51 READ PARAMETER PAGE Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0xEC	0/1	0/1	SEQ_2_ID

58.4.3.5 READ UNIQUE ID Command

(1) Command Description

The READ UNIQUE ID instruction is used to read a unique identifier programmed into the target. This command is accepted by the target only when all LUNs on the target are idle.

When the address cycle of 00h is written to the target, then the target goes into busy state. After the read process is complete, the controller enables the data output mode to read the unique ID. Sixteen copies of the unique ID data are stored in the device. Each copy is 32 bytes. The first 16 bytes are unique data and the second 16 bytes are the complement of the first 16 bytes. The application program will XOR the first 16 bytes with the second 16 bytes. If the result is 16 bytes of 0xFF, then that copy of the unique ID data is correct. In the event that there is a non-0xFF result, the application program repeats the XOR operation on a subsequent copy of the unique ID data.

(2) Command Encoding

The READ UNIQUE ID instruction uses the SEQ_2 commands sequence. The command is encoded, as shown in the table below:

Table 58.52 READ UNIQUE ID Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0xED	0/1	0/1	SEQ_2_ID

58.4.3.6 GET FEATURES Command

(1) Command Description

The GET FEATURES instruction reads the sub-feature parameters (P1-P4) from the specified feature address. This command is accepted by the target only when all LUNs on the target are idle.

When the 0xEE command is followed by a feature address, the target goes into busy state. After the target internal read operation completes, the controller enables the data output mode to read the sub-feature parameters.

(2) Command Encoding

The GET FEATURES instruction uses the SEQ_2 commands sequence. The command is encoded, as shown in the table below:

Table 58.53 GET FEATURES Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0xEE	0/1	0/1	SEQ_2_ID

58.4.3.7 SET FEATURES Command

(1) Command Description

The SET FEATURES instruction writes the sub-feature parameters (P1-P4) to the specified feature address to enable or disable target-specific features. This command is accepted by the target only when all LUNs on the target are idle.

The 0xEF command is followed by a valid feature address. The possible address value depends on the features set implemented in the target device. The address cycle is followed by the configurable number of data cycles. Values of the address and data encoding scheme allowed are found in the device vendor documentation.

(2) Command Encoding

The SET FEATURES instruction uses the SEQ_3 commands sequence. The command is encoded, as shown in the table below:

Table 58.54 SET FEATURES Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0xEF	-	0/1	SEQ_3_ID

58.4.3.8 READ STATUS Command

(1) Command Description

Each LUN provides its status independently of other LUNs on the same target through its 8-bit status register. Once the READ STATUS instruction is issued, status register output is enabled. The contents of the status register are returned on DQ[7: 0] for each data output request.

The READ STATUS command returns the status of the most recently selected LUN.

(2) Command Encoding

The READ STATUS instruction uses the SEQ_4 commands sequence. The command is encoded, as shown in the table below:

Table 58.55 READ STATUS Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0x70	0/1	-	SEQ_4_ID

This instruction has special meaning because it can be executed when the target is in the BUSY state. The FIFO cannot be used to access the read data because it can be occupied by the operation under execution. For the sequence the data field of command must select the DATA_REG register as data destination. The DATA_REG_SIZE must be select single byte.

58.4.3.9 DEVICE STATUS Command

(1) Command Description

Each LUN provides its status independently of other LUNs on the same target through its 8-bit status register. Once the DEVICE STATUS instruction is issued, status register output is enabled. The contents of the status register are returned on DQ[7: 0] for each data output request.

The DEVICE STATUS command returns the status of the most recently selected LUN.

(2) Command Encoding

The DEVICE STATUS instruction uses the SEQ_4 commands sequence. The command is encoded, as shown in the table below:

Table 58.56 DEVICE STATUS Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0x72	0/1	-	SEQ_4_ID

This instruction has special meaning because it can be executed when the target is in the BUSY state. The FIFO cannot be used to access the read data because it can be occupied by the operation under execution. For the sequence the data field of command must select the DATA_REG register as data destination. The DATA_REG_SIZE must be select single byte.

58.4.3.10 VOLUME SELECT Command

(1) Command Description

The VOLUME SELECT command is used to select a particular volume based on the address specified. This command is accepted by all initialized devices that share a CE pin. The command may be executed with any volume on the target in any state. When the VOLUME SELECT command is issued, all volumes with unselected volume addresses will be deselected to save power. If the Volume address entered is invalid or does not match any appointed volume address, all volume addresses will be deselected. If the VOLUME SELECT command is not issued after CE high time then all volumes revert to their previous state.

(2) Command Encoding

The VOLUME SELECT instruction uses the SEQ_21 commands sequence. The command is encoded, as shown in the table below:

Table 58.57 VOLUME SELECT Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0xE1	0/1	-	SEQ_21_ID

58.4.3.11 SELECT LUN WITH STATUS Command

(1) Command Description

Each LUN provides its status independently of other LUNs on the same target through its 8-bit status register. Once the SELECT LUN WITH STATUS instruction is issued, status register output is enabled. The contents of the status register are returned on DQ[7: 0] for each data output request.

The SELECT LUN WITH STATUS command returns the status of the selected LUN.

(2) Command Encoding

The SELECT LUN WITH STATUS instruction uses the SEQ_5 commands sequence. The command is encoded, as shown in the table below:

Table 58.58 SELECT LUN WITH STATUS Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0x78	0/1	-	SEQ_5_ID

This instruction has special meaning because it can be executed when the target is in the BUSY state. The FIFO cannot be used to access the read data because it can be occupied by the operation under execution. For the sequence the data field of command must select the DATA_REG register as data destination. The DATA_REG_SIZE must be select single byte.

58.4.3.12 LUN STATUS Command

(1) Command Description

Each LUN provides its status independently of other LUNs on the same target through its 8-bit status register. Once the SELECT LUN WITH STATUS instruction is issued, status register output is enabled. The contents of the status register are returned on DQ[7: 0] for each data output request.

The LUN STATUS command returns the status of the selected LUN.

(2) Command Encoding

The LUN STATUS instruction uses the SEQ_5 commands sequence. The command is encoded, as shown in the table below:

Table 58.59 SELECT LUN WITH STATUS Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0x71	0/1	-	SEQ_5_ID

This instruction has special meaning because it can be executed when the target is in the BUSY state. The FIFO cannot be used to access the read data because it can be occupied by the operation under execution. For the sequence the data field of command must select the DATA_REG register as data destination. The DATA_REG_SIZE must be select single byte.

58.4.3.13 CHANGE READ COLUMN Command

(1) Command Description

The CHANGE READ COLUMN command changes the column address of the selected cache register and enables data output of the last selected LUN. This command is accepted by the selected LUN when it is ready. Writing 0x05 to the target command register, followed by two column address cycles containing the column address, followed by the 0xE0 command puts the selected LUN into data output mode. The selected LUN stays in data output mode until another valid command is issued.

(2) Command Encoding

The CHANGE READ COLUMN instruction uses the SEQ_6 commands sequence. The command is encoded, as shown in the table below:

Table 58.60 CHANGE READ COLUMN Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
0xE0	-	0x05	0/1	-	SEQ_6_ID

58.4.3.14 SELECT CACHE REGISTER Command

(1) Command Description

The SELECT CACHE REGISTER command enables data output on the addressed LUN and cache register at the specified column address. This command is accepted by a LUN when it is ready. Writing the 0x06 to the target internal command register, followed by two column address cycles and three row address cycles, followed by 0xE0 enables data output mode on the address LUN and cache register at the specified column address.

(2) Command Encoding

The SELECT CACHE REGISTER instruction uses the SEQ_7 commands sequence. The command is encoded, as shown in the table below:

Table 58.61 SELECT CACHE REGISTER Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
0xE0	-	0x06	0/1	-	SEQ_7_ID

58.4.3.15 CHANGE WRITE COLUMN Command

(1) Command Description

The CHANGE WRITE COLUMN command changes the column address of the selected cache register and enables data input on the last selected LUN. Writing the 0x85 to the target internal command register, followed by two column address cycles containing the column address puts the selected LUN into data input mode.

(2) Command Encoding

The CHANGE WRITE COLUMN instruction uses the SEQ_8 commands sequence. The command is encoded, as shown in the table below:

Table 58.62 CHANGE WRITE COLUMN Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0x85	-	-	SEQ_8_ID

58.4.3.16 CHANGE ROW ADDRESS Command

(1) Command Description

The CHANGE ROW ADDRESS command changes the row address (block and page) where the cache register contents are to be programmed in the NAND array. It also changes the column address of the selected cache register and enables data input on the specified LUN.

(2) Command Encoding

The CHANGE ROW ADDRESS instruction uses the SEQ_12 commands sequence. The command is encoded, as shown in the table below:

Table 58.63 CHANGE ROW ADDRESS Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	0x11	0x85	0	-	SEQ_12_ID

58.4.3.17 READ PAGE Command

(1) Command Description

The READ PAGE command copies a page from the NAND Flash array to its respective cache register and enables data output. This command is accepted by the LUN when it is ready. To read a page from the NAND Flash array, the controller writes the 0x00 command to the target internal command register, then writes 5 address cycles to the address registers, and concludes with the 0x30 command. The selected LUN will go into busy state as the data is transferred. When the LUN is ready, data output is enabled for the cache register linked to the plane addressed in the READ PAGE command. The controller reads the programmed number of bytes to the FIFO.

(2) Command Encoding

The READ PAGE instruction uses the SEQ_10 commands sequence. The command is encoded, as shown in the table below:

Table 58.64 READ PAGE Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
0x30	-	0x00	0/1	0/1	SEQ_10_ID

58.4.3.18 READ PAGE CACHE Command

(1) Command Description

The READ PAGE CACHE command reads the next sequential page within a block into the data register, while the previous page is output from the cache register. To issue this command, the controller writes 0x31 to the target internal command register. After this command is issued, the R/B# goes LOW and the LUN goes into busy state. Afterwards, the R/B# goes HIGH and the LUN is busy with a cache operation, indicating that the cache register is available and that the specified page is copying from the NAND Flash array to the data register. At this point, data is read from the cache register.

(2) Command Encoding

The READ PAGE CACHE instruction uses the SEQ_11 commands sequence. The command is encoded, as shown in the table below:

Table 58.65 READ PAGE CACHE Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0x31	0/1	0/1	SEQ_11_ID

58.4.3.19 READ PAGE CACHE LAST Command

(1) Command Description

The READ PAGE CACHE LAST command ends the READ PAGE CACHE sequence and copies a page from the data register to the cache register. This command is accepted by the LUN when it is ready. To issue the READ PAGE CACHE LAST command, the controller writes 0x3F to the target internal command register. After this command is issued, R/B# goes LOW and the LUN goes into busy state. Afterwards, the R/B# goes HIGH and the LUN is ready. At this point, data from the targets cache register is read into the FIFO.

(2) Command Encoding

The READ PAGE CACHE LAST instruction uses the SEQ_11 commands sequence. The command is encoded, as shown in the table below:

Table 58.66 READ PAGE CACHE LAST Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0x3F	0/1	0/1	SEQ_11_ID

58.4.3.20 READ MULTIPLANE Command

(1) Command Description

The READ MULTIPLANE command queues a plane to transfer data from the NAND array to its cache register. This command can be issued one or more times. Each time a new plane address is specified, that plane is also queued for data transfer. To select the final plane and to begin the read operation for all previously queued planes, issue the READ PAGE command. All queued planes will transfer data from the NAND array to their cache registers.

(2) Command Encoding

The READ MULTIPLANE instruction uses the SEQ_9 commands sequence. The command is encoded, as shown in the table below:

Table 58.67 READ MULTIPLANE Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	0x32	0x00	-	-	SEQ_9_ID

58.4.3.21 QUEUE PAGE READ Command

(1) Command Description

The QUEUE PAGE READ operation allows for partial-page reads by using a 7-address cycle. The first two bytes of the address cycle indicate the length of the page to read - those bytes are stored in ADDR0 register, followed by the column and row addresses - those bytes are stored in the ADDR1 register. This can help overall performance should only a portion of the page data be needed because only the codeword containing the requested data will have ECC decoded. This command is exclusive for the CLEAR NAND devices.

(2) Command Encoding

The QUEUE PAGE READ instruction uses the SEQ_22 commands sequence. The command is encoded, as shown in the table below:

Table 58.68 QUEUE PAGE READ Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
0x37	-	0x07	-	-	SEQ_22_ID

58.4.3.22 TWO PLANE PAGE READ command

(1) Command description

This command was implemented to preserve the compatibility with the ONFI 1.x and some older devices.

The TWO PLANE PAGE READ (00h-00h-30h) operation is similar to the PAGE READ (00h-30h) operation. It transfers two pages of data from the NAND Flash array to the data registers. Each page must be from a different plane on the same die. The software is responsible for generating correct addresses for the requested pages. Both the ADDR0 and ADDR1 address registers are used in this case.

(2) Command Encoding

The TWO PLANE PAGE READ instruction uses the SEQ_15 commands sequence. The command is encoded, as shown in the table below. In this case, both the address registers are used.

Table 58.69 TWO PLANE PAGE READ Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
0x30	0x00	0x00	0/1	0/1	SEQ_15_ID

58.4.3.23 PROGRAM PAGE Command

(1) Command Description

The PROGRAM PAGE command allows the application program to input data to a cache register and moves the data from the cache register to the specified block and page address in the array of the selected LUN. This command is accepted by the LUN when it is ready. To input a page to the cache register and move it to the NAND array at the block and page address specified, the controller writes 0x80 to the target internal command register. Then five address cycles containing the column address and row address are written. Data input cycles follow. Serial data is input, beginning at the column address specified. When data input is complete, the controller writes 0x10 to the target internal command register. The selected LUN goes into the busy state.

(2) Command Encoding

The PROGRAM PAGE instruction uses the SEQ_12 commands sequence. The command is encoded, as shown in the table below:

Table 58.70 PROGRAM PAGE Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	0x10	0x80	0	0/1	SEQ_12_ID

58.4.3.24 PROGRAM PAGE IMMEDIATE Command

(1) Command Description

The PROGRAM PAGE IMMEDIATE command allows the application program to input data to a cache register and moves the data from the cache register to the specified block and page address in the array of the selected LUN. This command is accepted by the LUN when it is ready. To input a page to the cache register and move it to the NAND array at the block and page address specified, the controller writes 0x80 to the target internal command register. Then five address cycles containing the column address and row address are written. Data input cycles follow. Serial data is input, beginning at the column address specified. When data input is complete, the controller writes 0x10 to the target internal command register. The selected LUN goes into the busy state. This command writes only the row address to the NAND flash device

(2) Command Encoding

The PROGRAM PAGE IMMEDIATE instruction uses the SEQ_23 commands sequence. The command is encoded, as shown in the table below:

Table 58.71 PROGRAM PAGE IMD Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	0x10	0x80	0	0/1	SEQ_23_ID

58.4.3.25 PROGRAM PAGE DELAYED Command

(1) Command Description

The device's internal controller can automatically manage multi-plane programming. It does this with PROGRAM PAGE DELAYED command. When this command issued, the controller will delay issuing the program operation to the array until the address for the subsequent program operation is examined. If that operation allows the previous operation to complete as part of multi-plane operation, the controller will issue a multi-plane program to the array. Multi-plane operations are only completed if an LUN address from plane 0 is issued prior to a LUN address from plane 1. If the subsequent program operation does not allow the multi-plane operation, the controller will immediately start the previous program. It is presumed that the application program may use this command to initiate all the program operations. In this way the application program does not have to maintain information regarding multi-plane operation usage.

(2) Command Encoding

The PROGRAM PAGE DELAY instruction uses the SEQ_12 commands sequence. The command is encoded, as shown in the table below:

Table 58.72 PROGRAM PAGE DELAY Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	0x13	0x80	0	0/1	SEQ_23_ID

58.4.3.26 PROGRAM PAGE 1 Command

(1) Command Description

The PROGRAM PAGE 1 command allows the application program to input data to a cache register and moves the data from the cache register to the specified block and page address in the array of the selected LUN. This command is accepted by the LUN when it is ready. To input a page to the cache register and move it to the NAND array at the block and page address specified, the controller writes 0x80 to the target internal command register. Then five address cycles containing the column address and row address are written. Data input cycles follow. Serial data is input, beginning at the column address specified. When data input is complete, the commands sequence ends.

(2) Command Encoding

The PROGRAM PAGE 1 instruction uses the SEQ_13 commands sequence. The command is encoded, as shown in the table below:

Table 58.73 PROGRAM PAGE 1 Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0x80	0	0/1	SEQ_13_ID

58.4.3.27 PROGRAM PAGE CACHE Command

(1) Command Description

The PROGRAM PAGE CACHE command allows the controller to input data to a cache register, copies the data from the cache register to the data register, and then moves the data register contents to the specified block and page address in the array of the selected LUN. After the data is copied to the data register, the cache register is available for additional PROGRAM PAGE CACHE or PROGRAM PAGE commands. The PROGRAM PAGE CACHE command is accepted by the LUN when it is ready. To input a page to the cache register to move it to the NAND array at the block and page address specified, the controller writes 0x80 to the target internal command register. Then five address cycles containing the column address and row address are written. Data input cycles follow. Serial data is input, beginning at the column address specified. When data input is complete, 0x15 is written to the command register. The selected LUN goes into busy state to allow the data register to become available from a previous program cache operation, to copy data from the cache register to the data register, and then to begin moving the data register contents to the specified page and block address.

(2) Command Encoding

The PROGRAM PAGE CACHE instruction uses the SEQ_12 commands sequence. Command is encoded as shown in the table below.

Table 58.74 PROGRAM PAGE CACHE Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	0x15	0x80	0	0/1	SEQ_12_ID

58.4.3.28 PROGRAM MULTIPLANE Command

(1) Command Description

The PROGRAM MULTIPLANE command allows the controller to input data to the addressed plane's cache register and queue the cache register to ultimately be moved to the NAND array. This command can be issued one or more times. Each time a new plane address is specified that plane is also queued for data transfer. This command is accepted by the LUN when it is ready. The controller writes 0x80 to the target internal command register. Then five address cycles containing the column address and row address are written. Data input cycles follow. Serial data is input beginning at the column address specified. When data input is complete, the controller writes 0x11 to the target internal command register.

(2) Command Encoding

The PROGRAM MULTIPLANE instruction uses the SEQ_12 commands sequence. The command is encoded, as shown in the table below:

Table 58.75 PROGRAM MULTIPLANE Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	0x11	0x80	0	0/1	SEQ_12_ID

58.4.3.29 WRITE PAGE Command

(1) Command Description

The WRITE PAGE command allows the controller to move data from the targets cache register to the NAND array. This command is accepted by the LUN when it is ready. The controller writes 0x10 to the target internal command register.

(2) Command Encoding

The WRITE PAGE instruction uses the SEQ_0 commands sequence. The command is encoded, as shown in the table below:

Table 58.76 WRITE PAGE Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0x10	-	-	SEQ_0_ID

58.4.3.30 WRITE PAGE CACHE Command

(1) Command Description

The WRITE PAGE CACHE command allows the controller to moved data from the targets cache register to the targets data register. This command is accepted by the LUN when it is ready. The controller writes 0x15 to the target internal command register.

(2) Command Encoding

The WRITE PAGE CACHE instruction uses the SEQ_0 commands sequence. The command is encoded, as shown in the table below:

Table 58.77 WRITE PAGE CACHE Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0x15	-	-	SEQ_0_ID

58.4.3.31 WRITE MULTIPLANE Command

(1) Command Description

The WRITE MULTIPLANE command allows the controller to queue data from the targets cache register to the NAND array. This command is accepted by the LUN when it is ready. The controller writes 0x11 to the target internal command register.

(2) Command Encoding

The WRITE MULTIPLANE instruction uses the SEQ_0 commands sequence. The command is encoded, as shown in the table below:

Table 58.78 WRITE MULTIPLANE Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0x11	-	-	SEQ_0_ID

58.4.3.32 ERASE BLOCK Command

(1) Command Description

The ERASE BLOCK command erases the specified block in the NAND array. This command is accepted by the LUN when it is ready. To erase a block, the controller writes 0x60 to the target internal command register. Then three address cycles containing the row address are written; the column address is ignored. Finally, 0xD0 is written to the target internal command register.

(2) Command Encoding

The ERASE BLOCK instruction uses the SEQ_14 commands sequence. The command is encoded, as shown in the table below:

Table 58.79 ERASE BLOCK Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	0xD0	0x60	-	-	SEQ_14_ID

58.4.3.33 ERASE MULTIPLANE Command

(1) Command Description

The ERASE MULTIPLANE command queues a block in the specified plane to be erased from the NAND array. This command can be issued one or more times. Each time a new plane address is specified, that plane is also queued for a block to be erased. This command is accepted by the LUN when it is ready. To queue a block to be erased, the controller writes0x60 to the command register. Then three address cycles containing the row address are written; the column address is ignored. Finally, 0xD1 is written to the command register.

(2) Command Encoding

The ERASE MULTIPLANE instruction uses the SEQ_14 commands sequence. The command is encoded, as shown in the table below:

Table 58.80 ERASE MULTIPLANE Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	0xD1	0x60	-	-	SEQ_14_ID

58.4.3.34 COPYBACK READ Command

(1) Command Description

The COPYBACK READ command is functionally identical to the READ PAGE command, except that 0x35 is written to the target internal command register instead of 0x30. For more details, see Section 58.4.3.17, READ PAGE Command.

(2) Command Encoding

The COPYBACK READ instruction uses the SEQ_10 commands sequence. The command is encoded, as shown in the table below:

Table 58.81 COPYBACK READ Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
0x35	-	0x00	0/1	0/1	SEQ_10_ID

58.4.3.35 COPYBACK PROGRAM Command

(1) Command Description

The Copyback function reads a page of data from one location and then moves that data to a second location. The COPYBACK PROGRAM command is functionally identical to the PROGRAM PAGE command, except that when 85h is written to the target internal command register, the cache register contents are not cleared. The SEQ_9 command sequence does not have the data phase, so the data from the cache register are written into the second location without modification. If data must be written with modification to the second location, the SEQ_12 command sequence, which includes the data phase, is used.

(2) Command Encoding

The COPYBACK PROGRAM instruction uses the SEQ_9 commands sequence. The command is encoded, as shown in the table below:

Table 58.82 COPYBACK PROGRAM Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	0x10	0x85	-	-	SEQ_9_ID

58.4.3.36 COPYBACK PROGRAM 1 Command

(1) Command Description

The COPYBACK PROGRAM 1 command is functionally identical to the PROGRAM PAGE 1 command, except that when 85h is written to the target internal command register, the cache register contents are not cleared. See Section 58.4.3.26, PROGRAM PAGE 1 Command for further details.

(2) Command Encoding

The COPYBACK PROGRAM 1 instruction uses the SEQ_13 commands sequence. The command is encoded as shown in the table below:

Table 58.83 COPYBACK PROGRAM 1 Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	-	0x85	0	-	SEQ_13_ID

58.4.3.37 COPYBACK MULTIPLANE Command

(1) Command Description

The COPYBACK MULTIPLANE command is functionally identical to the PROGRAM MULTIPLANE command, except that when 0x85 is written to the target internal command register, cache register contents are not cleared. See Section 58.4.3.28, PROGRAM MULTIPLANE Command for further details.

(2) Command Encoding

The COPYBACK MULTIPLANE instruction uses the SEQ_12 commands sequence. The command is encoded, as shown in the table below:

Table 58.84 COPYBACK MULTIPLANE Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	0x11	0x85	0	0/1	SEQ_12_ID

58.4.3.38 PROGRAM OTP Command

(1) Command Description

The PROGRAM OTP command is used to write data to the pages within the OTP area. An entire page can be programmed at one time, or a page can be partially programmed up to four times. There is no ERASE operation for the OTP pages. To use the PROGRAM OTP command, the controller issues the 0xA0 command. Next, 5 address cycles are issued. The address write is followed by a programmable number of data cycles. After data input is complete, the controller issues the 0x10 command. The internal control logic automatically executes the proper programming algorithm and controls the necessary timing for programming and verification.

(2) Command Encoding

The PROGRAM OTP instruction uses the SEQ_12 commands sequence. The command is encoded as shown in the table below.

Table 58.85 PROGRAM OTP Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	0x10	0xA0	0	0/1	SEQ_12_ID

58.4.3.39 DATA PROTECT OTP Command

(1) Command Description

The DATA PROTECT OTP command is used to protect all the data in the OTP area. After the data is protected. it cannot be further programmed. When the OTP area is protected, the pages within the area are no longer programmable and cannot be unprotected. To use the DATA PROTECT OTP command, the controller issues the 0xA5 command. Next, the controller issues the following 5 addresses cycles. Finally, the 0x10 command is issued.

(2) Command Encoding

The DATA PROTECT OTP instruction uses the SEQ_9 commands sequence. The command is encoded, as shown in the table below:

Table 58.86 DATA PROTECT OTP Instruction Encoding

CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
-	0x10	0xA5	-	-	SEQ_9_ID

58.4.3.40 PAGE READ OTP Command

(1) Command Description

The PAGE READ OTP command is used to read data from a page within the OTP area. An OTP page within the OTP area is available for reading data whether or not the area is protected. To use the PAGE READ OTP command, the controller issues the 0xAF command. Next, 5 address cycles are issued. Finally, the 0x30 command is issued. After internal read from the NAND matrix is ended, the data is copied to the FIFO.

(2) Command Encoding

The PAGE READ OTP instruction uses the SEQ_9 commands sequence. The command is encoded, as shown in the table below:

Table 58.87 PAGE READ OTP Instruction Encoding

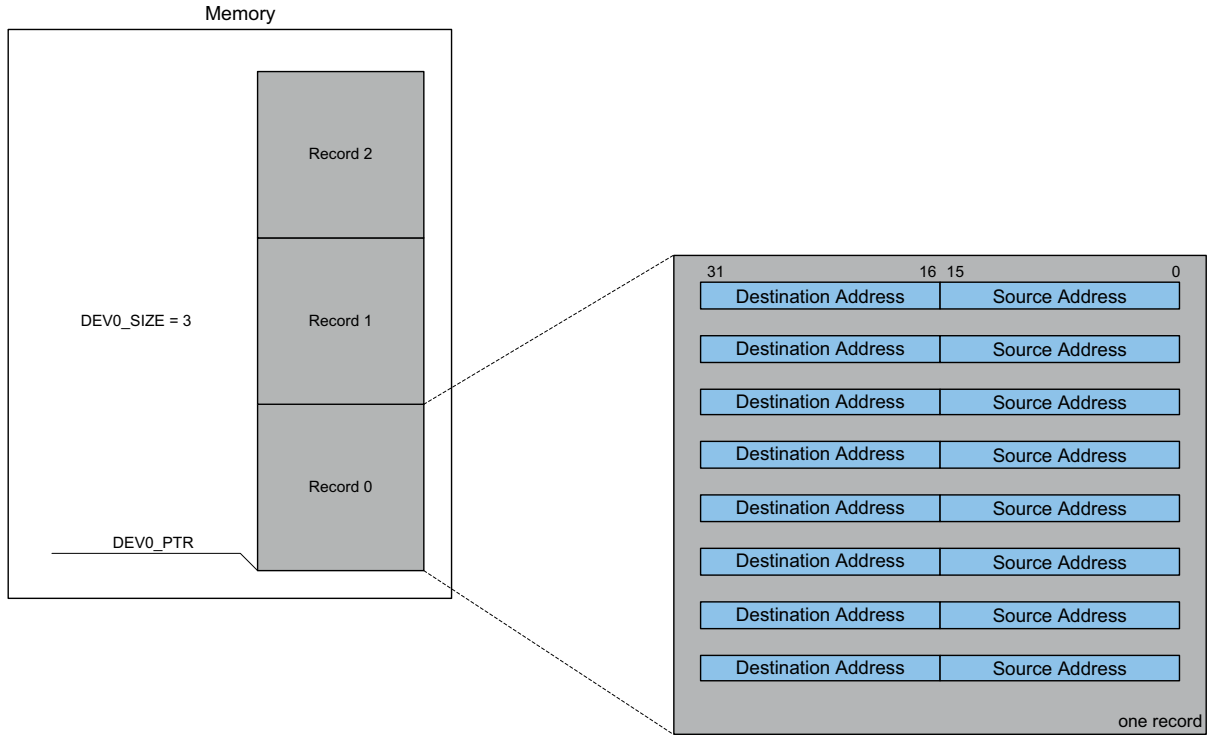
CMD_2	CMD_1 / CMD_3	CMD_0	DATA_SEL	INPUT_SEL	CMD_SEQ
0x30	-	0xAF	0/1	0/1	SEQ_10_ID

58.4.4 Remapping Mechanism

The remapping mechanism supports the bad blocks management (BBM) solution. The hardware remapping mechanism relieves software from the time-consuming operations of finding the physical address for the given linear address in the requested operation. The software initializes only the remapping tables for uses in the application of the NAND Flash device. It sorts those tables in ascending order, and then the whole operation of searching tables and substituting addresses is accomplished automatically.

The remapping solution uses two groups of the control registers:

- The pointer register DEV0_PTR. This register stores the address in the internal memory where record tables used by the BBM mechanism are placed.
- The size register DEV0_SIZE. This register stores the number of records in a table.



Note 1. Block Number are written to Destination Address and Source Address.
The table have to set by ascending order of Source Address.
When some Address of one record is unused, these Address should filled by 0xFFFF_FFFF.

Figure 58.29 Example of BBM records

58.4.5 Interrupts Mechanism

The NAND Flash controller interrupt system uses two control registers:

The interrupt mask register – each bit of this register masks a single interrupt. The register is described in more detail in Section 58.3.6, Interrupts mask register (INT_MASK).

The interrupt flag register – each bit of this register is an active flag from the single interrupt source. The register is described in more detail in Section 58.3.7, Interrupts status register (INT_STATUS).

In case an interrupt event occurs, i.e. the respective interrupt flag in INT_STATUS is 1, and its respective mask bit in INT_MASK is 1, the interrupt signal INTNFMA is asserted.
Note that the interrupt mask bits in INT_MASK affects only the interrupt signal INTNFMA, but not the flags in INT_STATUS.
A set flag in INT_STATUS must be cleared by the application program.

The available interrupt sources and their respective INT_STATUS flags are:

INT_STATUS.CMD_END_INT_FL

Command sequence finished interrupt – This interrupt occurs when the previously triggered command sequence is finished and the new one can be started. The command sequence is marked as finished when the full sequence is executed or when the NAND Flash device goes into the busy state.

INT_STATUS.ECC_INT0_FLAG

The ECC module detects an uncorrectable error in the transmitted data.
The ECC module detects when the configured errors threshold level is exceeded.

INT_STATUS.MEM0_RDY_INT_FL

The memory device is ready – This interrupt occurs when the NAND Flash device finishes executing the programmed command sequence and is ready for the new one. Each NAND Flash device has a single interrupt flag. The difference between “command sequence finished” interrupt and “memory device is ready” interrupt is presented in **Figure 58.30**.

INT_STATUS.TRANS_ERR_FL

The error on the slave interface during access to the controller FIFO – This interrupt occurs if the access to the FIFO memory has the opposite direction to the current FIFO configuration: the FIFO is read when it is configured for write, or the FIFO is write when it is configured for read.

INT_STATUS.STAT_ERR_INT0_FL

Most recently finished operation on the memory device failed. This applies to PROGRAM PAGE and BLOCK ERASE operations. It is not valid following a READ-series operation.

INT_STATUS.PG_SZ_ERR_INT_FL

Data Size error flag.
When the ECC is enabled, the value written into the DATA_SIZE register has some restrictions.
Interrupt condition is met when the value written to the DATA_SIZE register is not correct.

INT_STATUS.DMA_INT_FL

DMA transfer ended flag.

CAUTION

The DMA transfer end interrupt is asserted before the bus transaction completion.

To avoid data coherency issues following workaround needs to be implemented:

Always load additional unused 64 byte of data. This delays the interrupt and thus ensures that it is asserted when all intended data was completely transferred to the SDRAM.

INT_STATUS.DATA_REG_INT_FL

Data in DATA_REG is available.

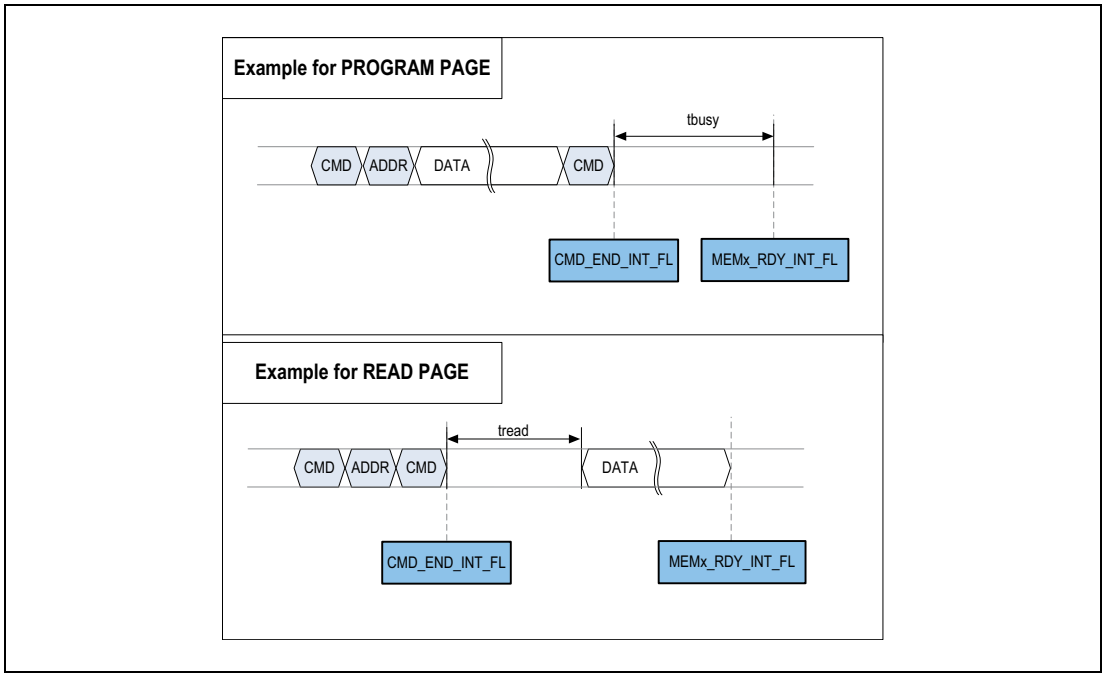


Figure 58.30 Command Sequence End and Memory-Ready Interrupts

58.4.6 Setup and Configuration

The CONTROL register is the main control register in the NAND Flash controller.

The following bits configure basic settings of the controller:

- INT_EN – Bit which enables Global Interrupt.
- ECC_EN – Bit which enables Hardware ECC.
- BLOCK_SIZE[1:0] – Bits which configure block size.
- IO_WIDTH – Bit which configures width of the I/O bus connected to the NAND Flash memory device.
- BBM_EN – Bit which enables remapping process.
- ADDRx_AUTO_INCR - Addresses auto increment for row address register 0 or 1.
- SMALL_BLOCK_EN – Bit which enables Small Block Mode.
- AUTO_READ_STAT_EN – Bit which activates automatic read status after the PROGRAM PAGE and BLOCK ERASE commands.
- READ_STATUS_EN – Bit which chooses whether the controller checks RnB lines or sends READ_STATUS commands.
- ECC_BLOCK_SIZE[1:0] – Bits which define ECC Block Size.

The registers described below are configured according to the settings of other bits in the CONTROL register:

- If INT_EN bit is set, the software must write the mask into the INT_MASK register, which masks the selected interrupts source in the NAND Flash controller.
- If ECC_EN bit is set, the software must correctly configure the ECC module by writing the appropriate configuration into the ECC_CTRL. Additionally, the software configures the offset in the ECC_OFFSET register. In small block mode, the value in the ECC_OFFSET is ignored and the correction words are located in the NAND Flash memory device, right behind the data.
- The write number of the data which will be transferred by the controller (DATA_SIZE register). When ECC is enabled, there are some restrictions to the DATA_SIZE value.
- If the BBM_EN bit is set, the software must initialize the remapping tables (DEVn_PTR and DEVn_SIZE registers).
- Additionally, the software must configure time parameters which can be found in the TIMINGS_ASYN register. Additionally, the software must configure the TIME_SEQ_0 and TIME_SEQ_1 registers.

When the NAND Flash controller uses DMA to transfer data, the software must configure the DMA_ADDR, DMA_CTRL and DMA_CNT registers. The software can modify these registers before any transfer or during the initialization procedure.

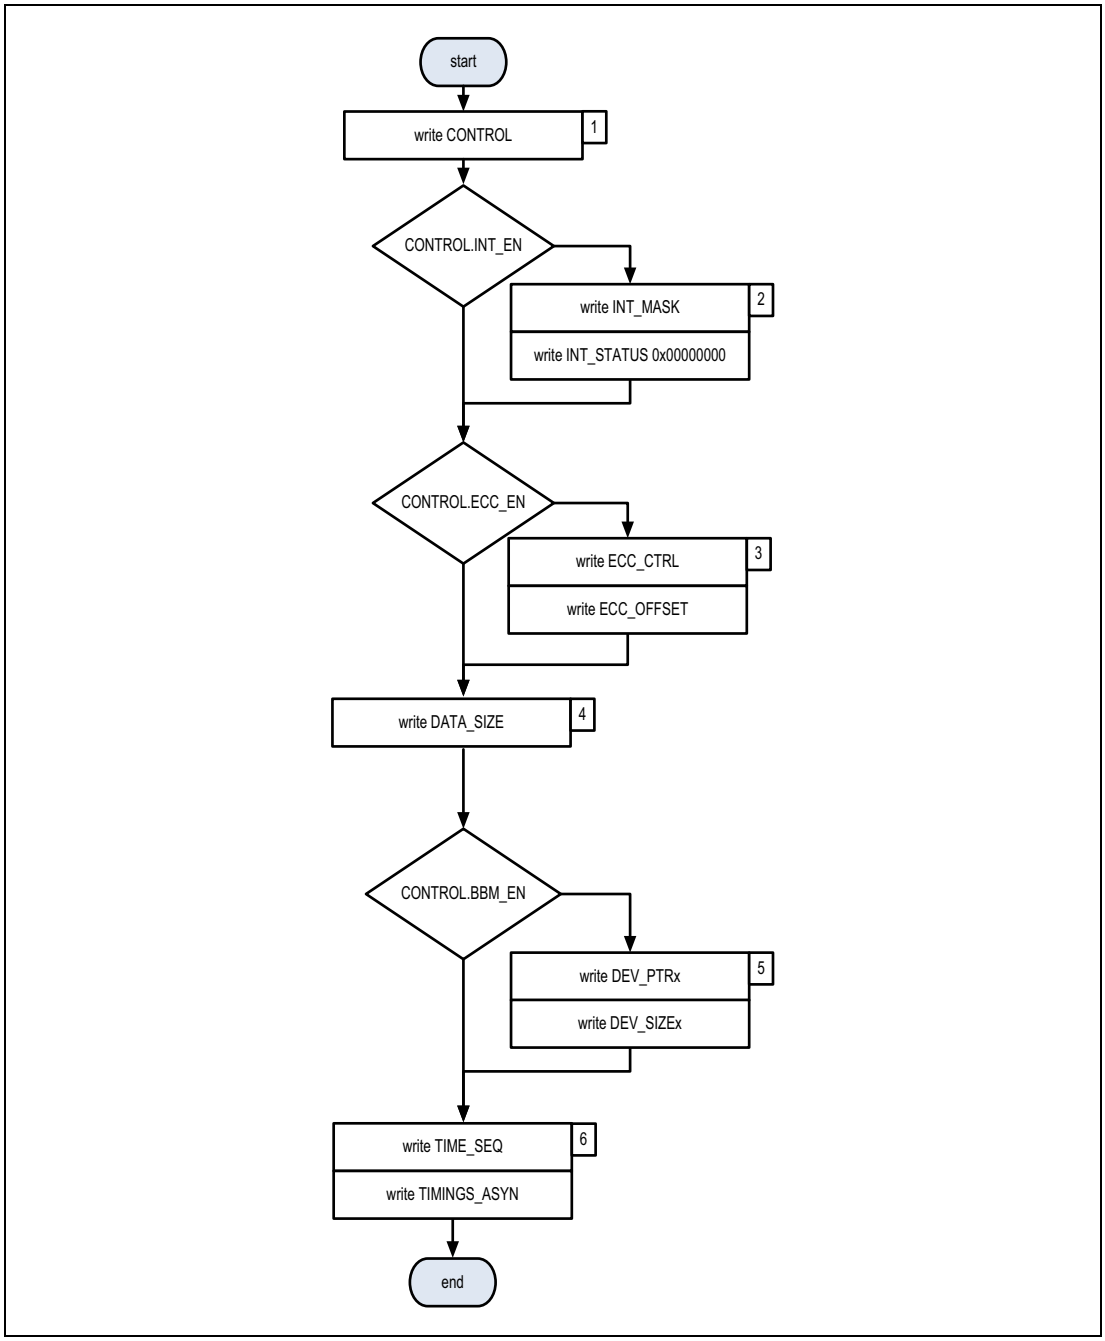

Figure 58.31 Configuration

58.4.6.1 Send Data to NAND Flash via Slave Interface

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in Section 58.4.6, Setup and Configuration and Section 58.3, Register Descriptions.
2. Write the address of the data in NAND Flash memory into the address register 0 (ADDR_COL and ADDR_ROW registers). Write the number of data which you want to read (DATA_SIZE register).
3. To use the simplest program command, write 0x0010800C to the COMMAND register (PROGRAM PAGE command, FIFO module selected, registers as input).
4. Write data to the FIFO using the FIFO_DATA register. Data is sent to the NAND Flash memory device.

When the memory is ready for further work, the appropriate bit MEMx_ST is set. When the software needs to send the command to another memory, it is not necessary to wait for the MEMx_ST bit to be set.

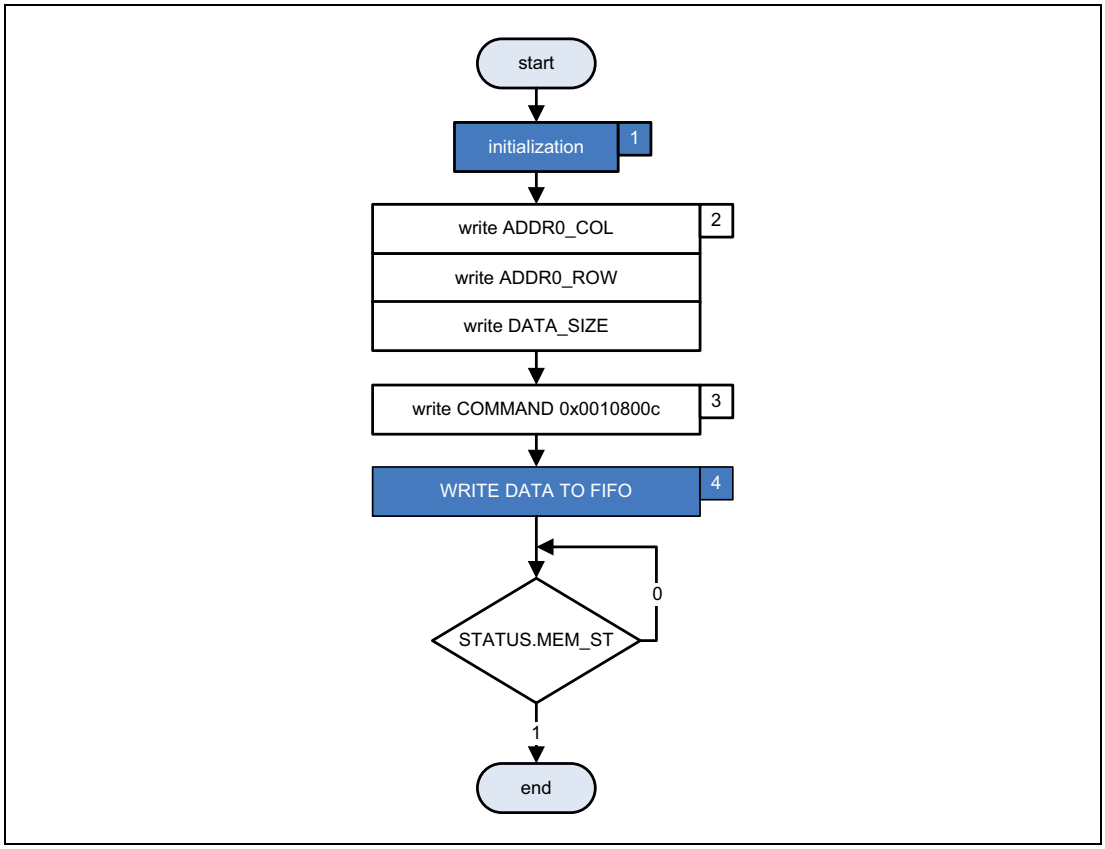

Figure 58.32 Write data to NAND Flash memory via Slave Interface

58.4.6.2 Read Data from NAND Flash via Slave Interface

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in Section 58.4.6, Setup and Configuration and Section 58.3, Register Descriptions.
2. Write the address of the data in NAND Flash memory into the address register 0 (ADDR_COL and ADDR_ROW registers). Write the number of data which you want to read (DATA_SIZE register).
3. To use the simplest read command, write 0x3000002A to the COMMAND register (READ PAGE command, FIFO module selected, registers as input).
4. The application program can read data immediately after sending the command but in this case the NAND flash controller will send a very few WAIT replies.
   If this situation shall be avoided the application program must read FIFO_STATE register and wait when CF_EMPTY bit is set. After that wait for the DF_R_EMPTY bit in the FIFO_STATE register to be clear.
5. Read data from the FIFO using the FIFO_DATA register.

When the memory is ready for further work, the appropriate bit MEMx_ST is set. When the software needs to send the command to another memory, it is not necessary to wait for the MEMx_ST bit to be set.

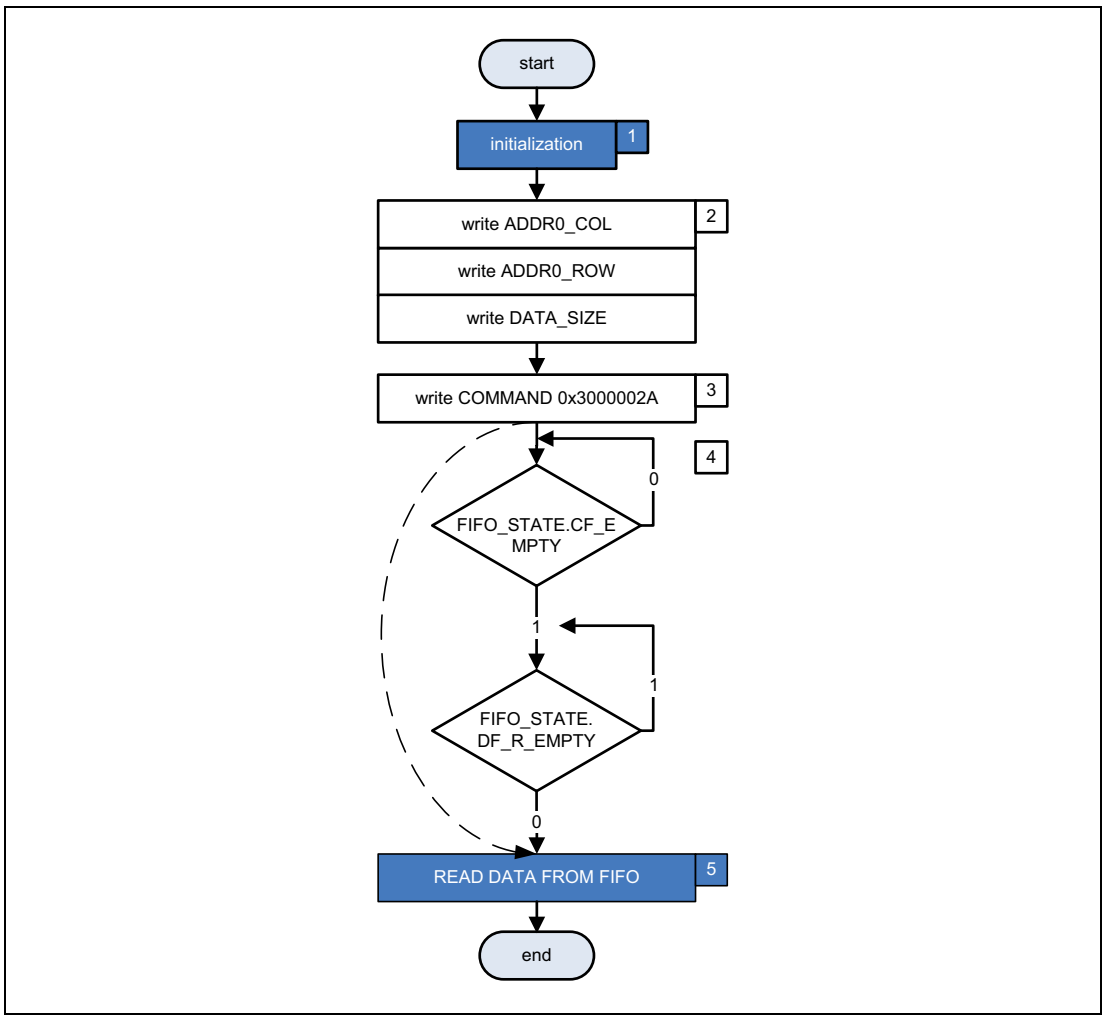

Figure 58.33 Read data from NAND Flash memory via Slave Interface

58.4.6.3 Send Data to NAND Flash via Master Interface (using DMA)

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in Section 58.4.6, Setup and Configuration and Section 58.3, Register Descriptions.
2. Set the INT_EN bit in the CONTROL register to enable global interrupt.
3. Select active interrupt in the INT_MASK register and write 0x00000000 into the INT_STATUS register to clear all interrupts.
4. Select the DMA work mode to configure the DMA module correctly:
   In registers managed mode, the address of the data is written in the system memory (DMA_ADDR_L register). Write the number of the transferred data into the DMA_CNT register. Set bit DMA_START to start DMA when the command sequence is sent to the NAND Flash memory. Bits ERR_FLAG and DMA_READY are read-only. The first indicates the error on the internal bus while DMA is transferring data; the second indicates when DMA is ready (transfer is completed).
5. Write the address of the data in the NAND Flash memory device into the address register 0.
6. To use the simplest program command, write 0x0010804C to the COMMAND register (PROGRAM PAGE command, FIFO module selected, DMA module as input).
7. When the memory is ready for further work, the appropriate bit MEMx_ST is set and interrupt is active. (recommended interrupt is MEM0_RDY_INT).

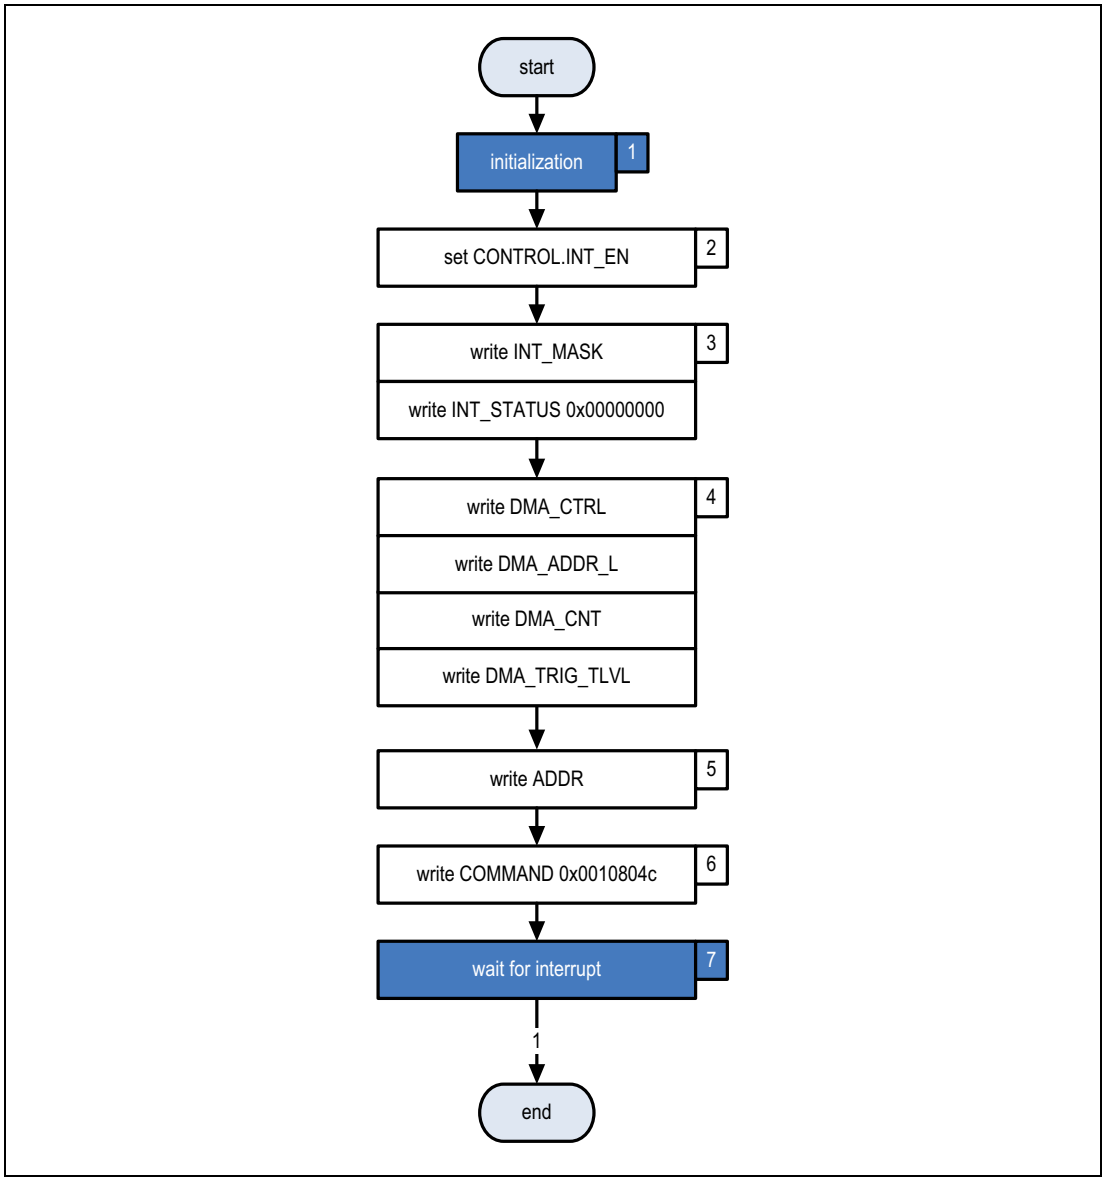

Figure 58.34 Send Data to NAND Flash Using DMA, Interrupt Enable

58.4.6.4 Fast Writing and Reading of Several Pages from the Memory using DMA

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in Section 58.4.6, Setup and Configuration and Section 58.3, Register Descriptions.
2. Set INT_EN bit in CONTROL register to enable global interrupt.
3. Select the active interrupt (CMD_END_INT_EN) in the INT_MASK register and write 0x00000000 into the INT_STATUS register to clear all interrupts.
4. In Scatter-Gather mode, it is necessary to write the descriptors into the system memory.
   Select the DMA work mode to correctly configure the DMA module.
   In Scatter-Gather mode, it is not necessary to configure the DMA_CNT register. For more details, see Section 58.5.2.2, DMA Description, **(b)**
5. Set DMA_START bit to start the DMA when the command sequence is sent to the NAND Flash memory.
   Bits ERR_FLAG and DMA_READY are read-only. The former indicates the error on the internal bus while DMA is transferring data, the latter indicates when the DMA is ready (transfer is completed).
6. Set the ADDR0_INCR bit to auto increment row address 0 register after each command.
   Write address of the data in the NAND Flash memory device into the 0 address register.
7. Write 0x00000000 into the INT_STATUS register to clear all interrupts.
8. Write address of the first descriptor into the DMA_ADDR_L register.
9. Write PROGRAM PAGE CACHE command to the NAND Flash memory device by writing 0x0015804C into the COMMAND register (DMA module as input, FIFO module selected).
   When the controller is ready for further work, the appropriate CMD_END_INT_FL bit is set and the interrupt is activated.
10. When the number of the pages to transfer does not equal one, go to section 7.
11. Write 0x00000000 into the INT_STATUS register to clear all interrupts.
    Write address of the first descriptor into the DMA_ADDR_L register.
    The last command in the sequence of sending data is the PROGRAM PAGE (write 0x0010804C) into the COMMAND register (DMA module as input, FIFO module selected).
12. Wait for interrupts and write 0x00000000 into the INT_STATUS register to clear all interrupts.
    Write the address of the read data to the NAND Flash memory device into address register 0.
13. Write the new descriptors to the system memory.
14. If DMA should work in the same work mode and burst type do not modify DMA_BURST[2:0] and DMA_MODE bits. Set DMA_START bit to start DMA when the command sequence is sent to the NAND Flash memory.
15. Write the READ PAGE command into the NAND Flash memory device by writing 0x00300069 into the COMMAND register (FIFO module selected, DMA module as input).
16. Write 0x00000000 into the INT_STATUS register to clear all interrupts.
17. Write the address of the first descriptor to the DMA_ADDR_L register.
18. Write READ PAGE CACHE SEQUENTIAL command to the NAND Flash memory device by writing 0x0000316B into the COMMAND register (FIFO module selected, DMA module as input).

19. When the controller is ready for further work, the appropriate CMD_END_INT_FL bit is set and the interrupt is activated.

When the number of the pages to transfer does not equal one, go to section 16.

20. Write 0x00000000 into the INT_STATUS register to clear all interrupts.Write the address of the first descriptor to the DMA_ADDR_L register. The last command in the sequence of reading data is READ PAGE CACHE LAST (write 0x00003F6B into the COMMAND register).

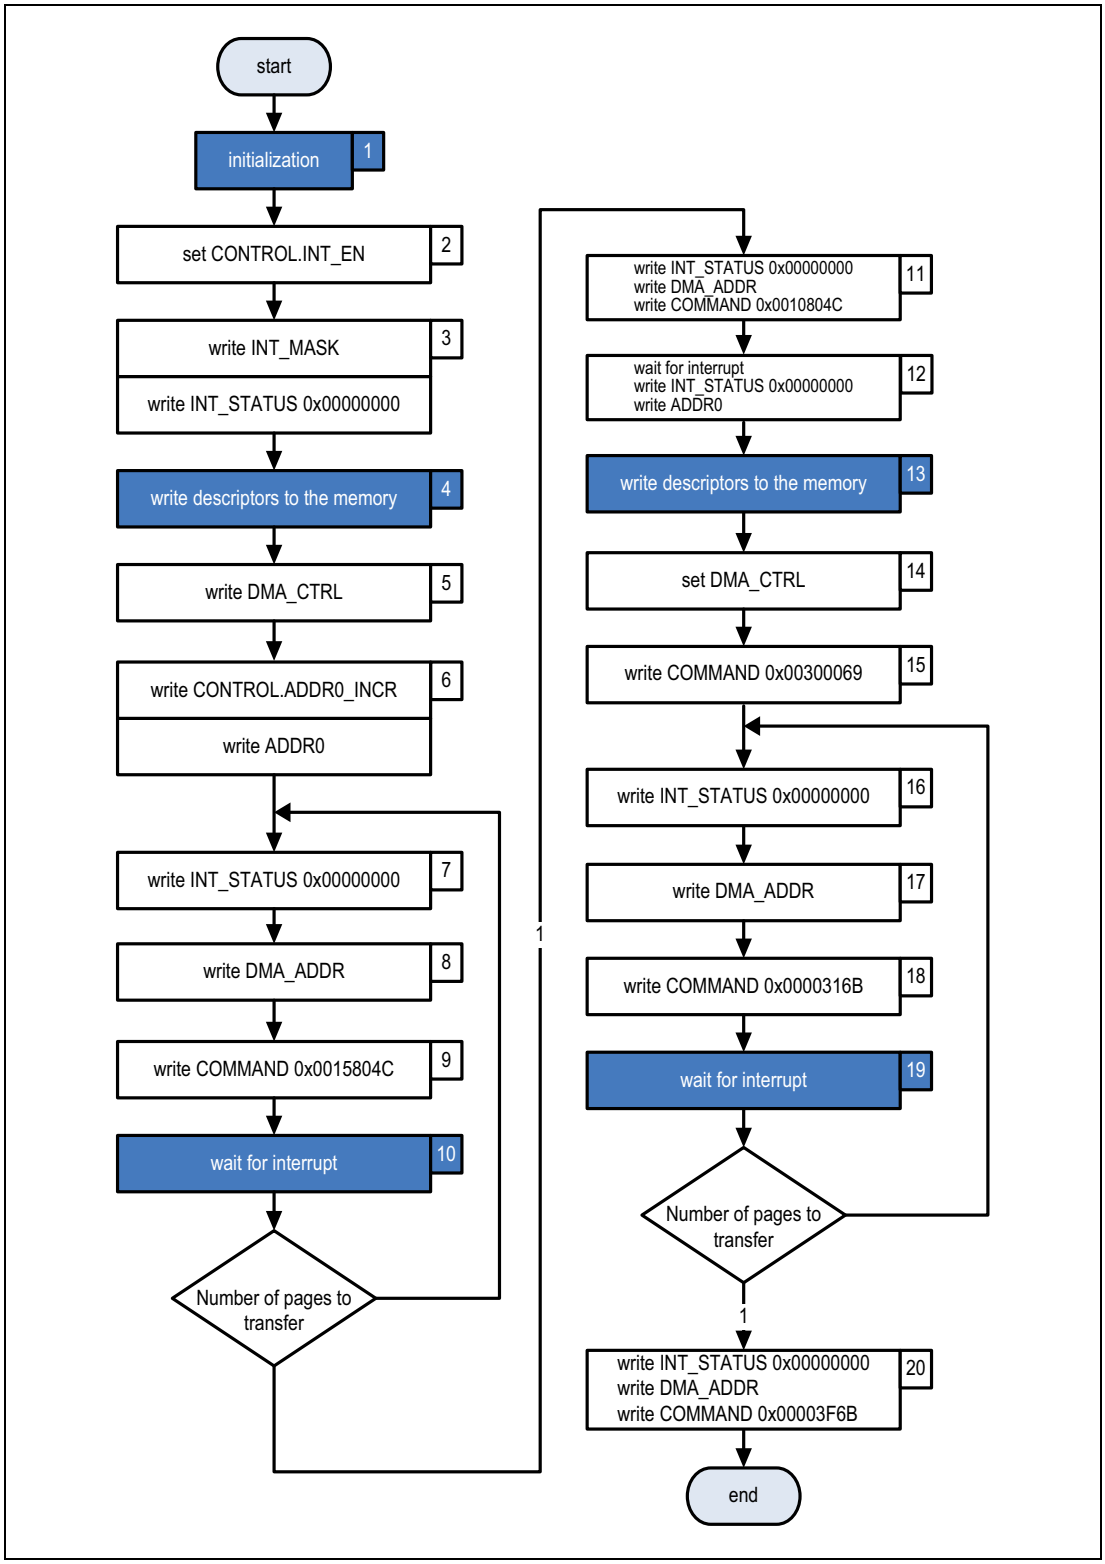

Figure 58.35 Fast Writing and Reading of Several Pages from the Memory Using DMA

58.4.6.5 Writing Partial Pages

The following procedure need to be used to write partial pages with ECC engine enabled:

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in Section 58.4.6, Setup and Configuration and Section 58.3, Register Descriptions.
2. Write the address of the data in NAND Flash memory into the address register 0 (ADDR_COL and ADDR_ROW registers). You need to write partial page offset into the ADDR_COL register. Write the number of data which you want to read (DATA_SIZE register) – in this case you need to set partial sector size. Write the offset value of the ecc data into the ECC_OFFSET register.
3. To use the simplest program command, write 0x0010800C to the COMMAND register (PROGRAM PAGE command, FIFO module selected, registers as input).
4. Write data to the FIFO using the FIFO_DATA register. Data is sent to the NAND Flash memory device.

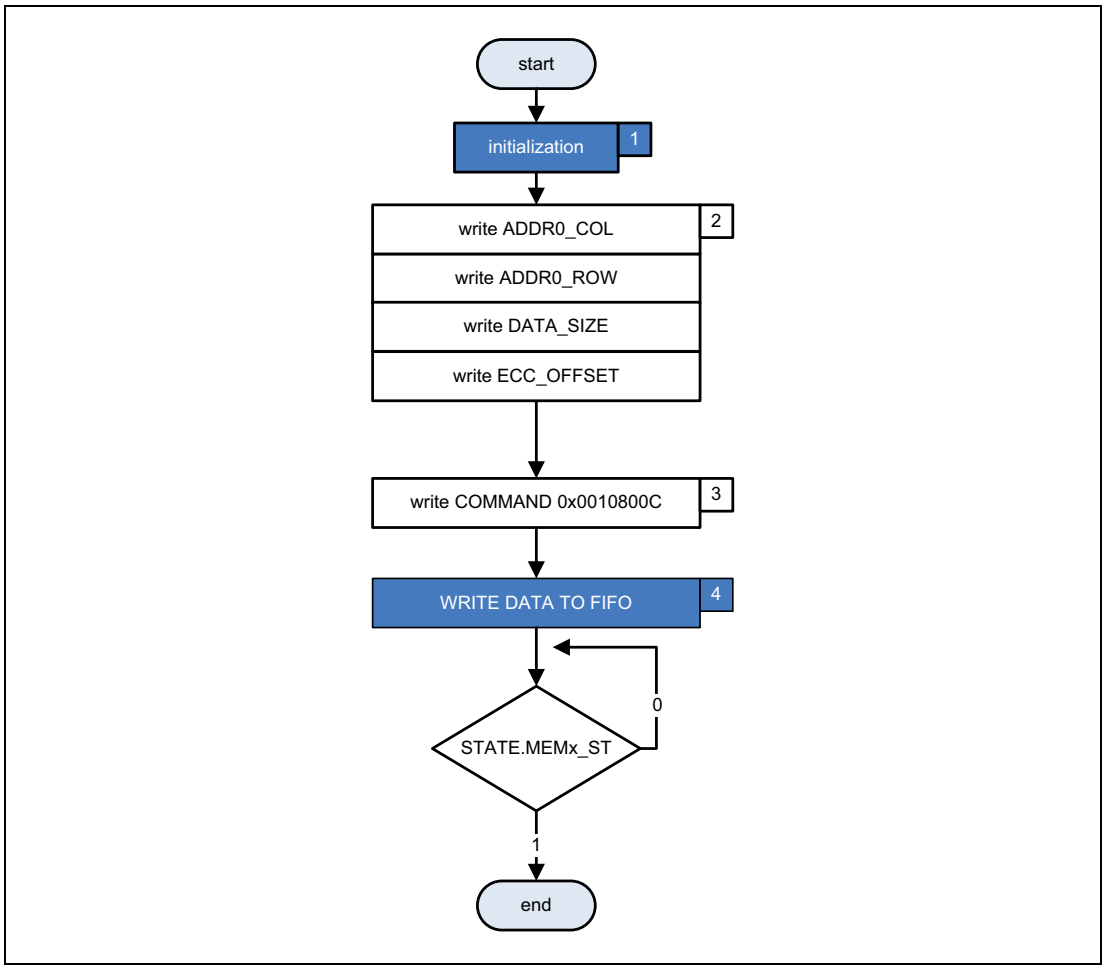

Figure 58.36 Writing Partial Pages

58.4.6.6 Reading Partial Pages

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in Section 58.4.6, Setup and Configuration and Section 58.3, Register Descriptions.

2. Write the address of the data in NAND Flash memory into the address register 0 (ADDR_COL and ADDR_ROW registers). You need to write partial page offset into the ADDR_COL register. Write the number of data which you want to read (DATA_SIZE register) – in this case you need to set partial page size.
3. To use the simplest read command, write 0x3000002A to the COMMAND register (READ PAGE command, FIFO module selected, registers as input).
4. You can read data immediately after sending the command but in this case the NAND flash controller will send a very few WAIT replies.
   If this situation shall be avoided the application program must read FIFO_STATE register and wait when CF_EMPTY bit is set. After that wait for the DF_R_EMPTY bit in the FIFO_STATE register to be clear.
5. Read data from the FIFO using the FIFO_DATA register.

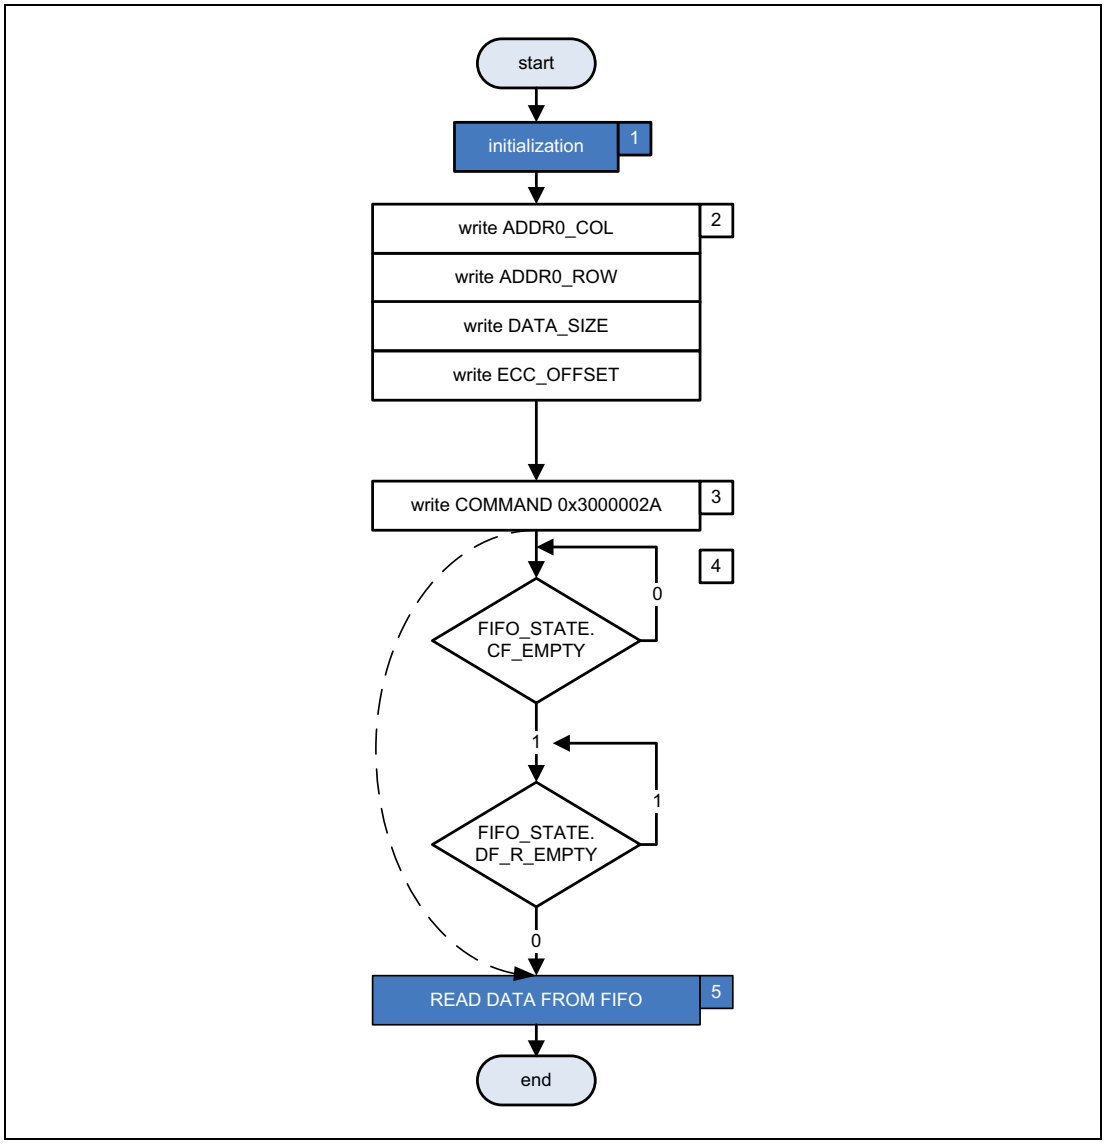

Figure 58.37 Reading Partial Pages

58.5 Functional Details

58.5.1 Block Diagram

The figure below shows the NAND Flash controller block diagram.

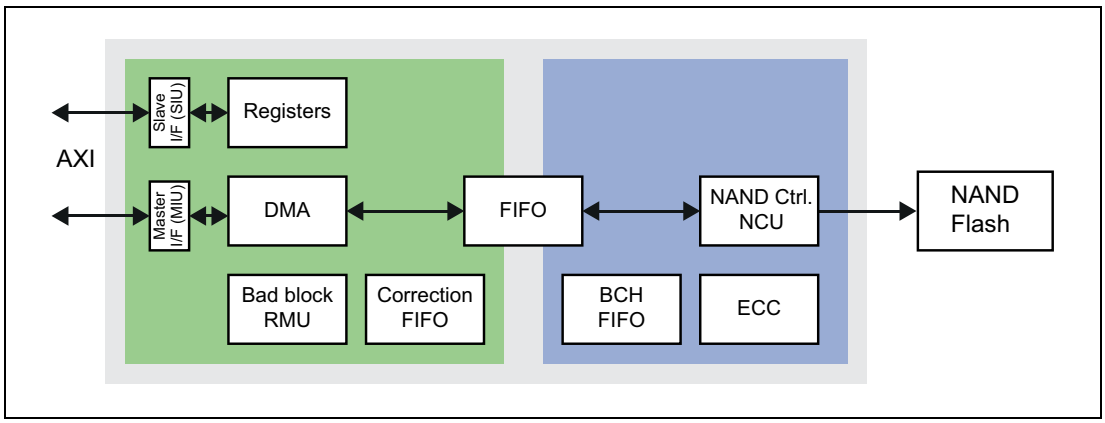

Figure 58.38 Block diagram

The main components of the controller are:

- **FIFO** – This unit provides the FIFO queue interface to the other controller modules. Using the FIFO interface allows closing of the read and write pointers in the same module; thus, two modules can read and write in parallel. Depending on the controller software configuration, one side of the queue is the SIU or DMA module, the second one is always the NAND Control Unit (NCU).
- **DMA** – This unit is responsible for the fast transfer of data between the external memory location and the controller. The unit can works in two modes: the Scatter-Gather mode and the internally triggered single mode. DMA functions as the master side of the OCP socket. This block is optional and can be disabled during the compile process.
- **NAND control unit (NCU)** – This unit is responsible for the generation of the NAND Flash device access sequences.
- **ECC** – An error correction code calculator. A correction word is calculated for each 256B, 512B or 1024B ECC block of the NAND Flash memory page. During the read operation, the unit can automatically correct bad bits without any interaction with the CPU. It has a status register, the bits of which signal errors occurring during a read, and then it inform when errors are corrected. The ECC module has an integrated FIFO that is used to transfer the calculated words to the NCU modules during the encode process and to store the calculated partial syndromes during the decode process. An additional FIFO module is used to transfer correction data between the correction module and the BCH-CHIEN module.
- **Bad block (RMU)** – It is bad block remapping unit. This module remaps blocks excluded from the poll of the usable blocks into the blocks that will be its substitute. Whole process is transparent for the software.

58.5.2 DMA Module

58.5.2.1 DMA Overview

The DMA engine integrated into the NAND Flash controller has the following properties:

- Two work modes:
  - The registers managed mode
  - The Scatter-Gather mode
- Supported burst types:
  - Imprecise bursts
  - Precise bursts
- Supported burst sequences:
  - The stream burst mode
  - The incrementing mode
- The DMA module preserves the configuration registers. These are copied into the DMA working registers.
- DMA trigger level enables DMA to send packet data.

58.5.2.2 DMA Description

DMA_ADDR_L gives a 32-bit address when the DMA is configured as 32-bit.

DMA supports two modes:

- The registers managed mode – the DMA does one transfer depending on the contents of DMA_ADDR, DMA_CNT, and DMA_CTRL registers.
- The Scatter-Gather mode – new DMA transfer algorithm.

The DMA mode for the current transfer is selected via the DMA_CTRL.DMA_MODE bit and cannot be changed during each consecutive data transfer. The application program can change the DMA mode when the transfer is completed and the DMA_CTRL.DMA_READY bit is set.

In order to begin the transfer, the DMA should be in an IDLE state (DMA_CTRL.DMA_READY = 1).

Setting the DMA_CTRL.DMA_START bit triggers the DMA after the commands are sent to the NAND Flash memory (writing CONTROL register). When the DMA_START bit is clear, sending commands to the NAND Flash memory will not trigger the DMA. Because of this solution, it is possible to program the DMA to transfer more data than the page size of the NAND Flash memory (example: the DMA is configured to 32 KB data transfer, the size of the page in NAND Flash memory is 4 KB. In order to send 32 KB of data into the NAND Flash memory, it is necessary to set the DMA_START bit in the register DMA_CTRL, then it is necessary to send the PROGRAM PAGE command to the NAND Flash memory, clear the DMA_START bit in the DMA_CTRL register, and send seven commands to the NAND Flash memory). In this example, the DMA is set free only once at the beginning.
The DMA transfers four 32-bit words in one package when working in a 4-beat incrementing burst, eight words in an 8-beat incrementing burst, and sixteen words in a 16-beat incrementing burst. The burst size indicates the number of 32-bit words in the burst, not the number of bytes transferred.
The DMA trigger level enables the DMA to send packet data. It indicates when the DMA has to start transferring data. The application program must set trigger level depending on arbitration type, system and NAND Flash memory performance. For example:

1. If the DMA trigger level equals 0, the DMA does not wait, but transfers data immediately because the trigger level is always exceeded.
2. For read from the NAND Flash memory: If the DMA trigger level equals 0x40 (256 bytes), the DMA waits until data level reach the previously programmed trigger level (256 bytes). Then the DMA will transfer data until FIFO gets empty status. Next the wait for required data level cycle is repeated as long as remain data size allow to reach programmed trigger level. The trigger level value should be chosen to ensure that only the continuous data block will be transferred and the FIFO will not be overflowed.
3. For write to NAND Flash memory: If the DMA trigger level equals 0x40 (256 bytes), the DMA writes data to the FIFO until the FIFO is full. Then, the DMA waits until 256 bytes are written in to the NAND Flash memory. Next, again the DMA transfers data until FIFO is full. The trigger level value should be chosen to ensure that only the continuous data block will be transferred.

(a) Registers Managed Mode:

When the DMA works in this mode, it transfers only one continuous block (DMA_CNT is block length) to or from the system memory at address DMA_ADDR. Block can be multiple of DATA_SIZE value in the DATA_SIZE register. All the registers which modify this transfer are described in **Table 58.29**, **Table 58.30** and **Table 58.31**.

The DMA_BURST[2:0] bit in register DMA_CTRL defines the main transfer type used by the DMA to precede the requested transfer.

(b) Scatter-Gather Mode:

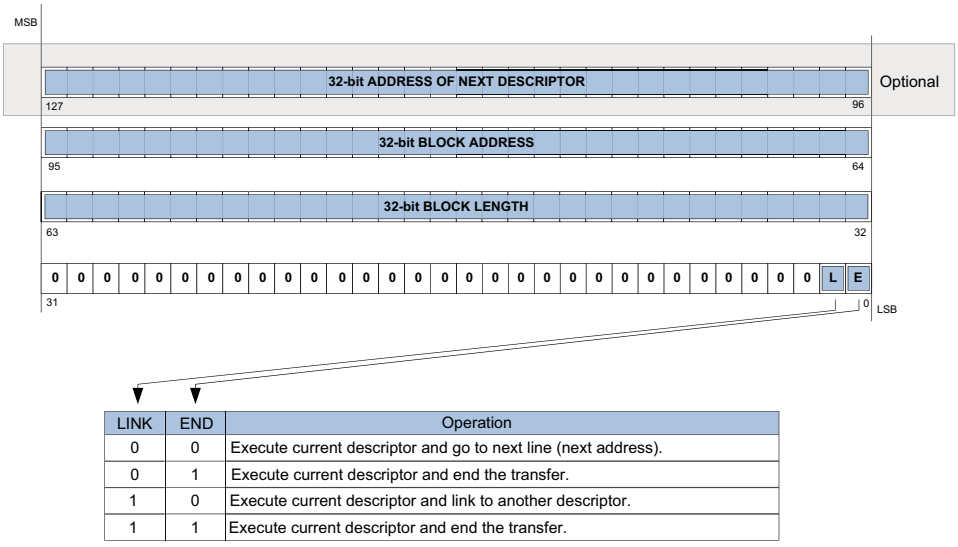
The Scatter-Gather Direct Memory Access (SG-DMA) controller implements high-speed data transfer between two components, when DMA transfers and merges non-contiguous memory to a continuous address space, and vice versa.

The DMA in Scatter-Gather mode uses the Descriptors List to describe data transfers. The NAND Flash registers only points to the base address of the Descriptors List. The base address for this list is set in the DMA_ADDR register whether it is a read or write transfer. The base address, sizes of the data blocks, and flags are defined inside the descriptors.

The DMA_BURST[2:0] bit in register DMA_CTRL defines the main transfer type used by the DMA to precede the requested transfer.

When in Scatter-Gather mode, the DMA transfers data from data blocks. Each descriptor can define only one data block.

The DMA adopts the scatter-gather DMA algorithm so that higher data transfer speed is available. The application program can program a list of data transfers between the system memory and NAND Flash to the Descriptor Table before executing Scatter-Gather mode.



LINK	END	Operation
0	0	Execute current descriptor and go to next line (next address).
0	1	Execute current descriptor and end the transfer.
1	0	Execute current descriptor and link to another descriptor.
1	1	Execute current descriptor and end the transfer.

Figure 58.39 Scatter-Gather DMA Descriptor Fields (32-bit system memory addressing)

The table below defines the SG-DMA descriptor fields and their functions:

Table 58.88 Scatter-Gather DMA Descriptor Fields (32-bit system memory addressing)

Bit	Symbol	Description
[127:96]	ADDRESS	This optional field contains the address of the next descriptor lit when LINK= 1 and END = 0
[95:64]	ADDRESS	The field contains the data block address.
[63:32]	LENGTH	The field contains the data page length in bytes ($0000\ 0004_H$ - $FFFF\ FFFD_H$). The number of the bytes has to be divided by 4 (two least significant bits should equal 00).
[31: 2]	–	Reserved for future use.
[1]	LINK	
[0]	END	

LINK	END	Comment
0	0	Execute current descriptor and go to next descriptor on the list.
0	1	Execute current descriptor and end the transfer.
1	0	Execute current descriptor and link to another descriptor.
1	1	Execute current descriptor and end the transfer.

Table 58.89 DMA Data Counter Length Field

Length Field	Value of Length
$0000\ 0000_H$	Not available
$0000\ 0001_H$	Not available
$0000\ 0002_H$	Not available
$0000\ 0003_H$	Not available
$0000\ 0004_H$	4 bytes
$0000\ 0005_H$	Not available
$0000\ 0006_H$	Not available
$0000\ 0007_H$	Not available
$0000\ 0008_H$	8 bytes
….	….

The Descriptor Table is created in system memory by the application program. SG-DMA can support only 32-bit system memory addressing. Each descriptor line (one executable unit) consists of the address, length and flags. The flags specify operation of the descriptor line.

The figure below shows the example of Scatter-Gather programming:

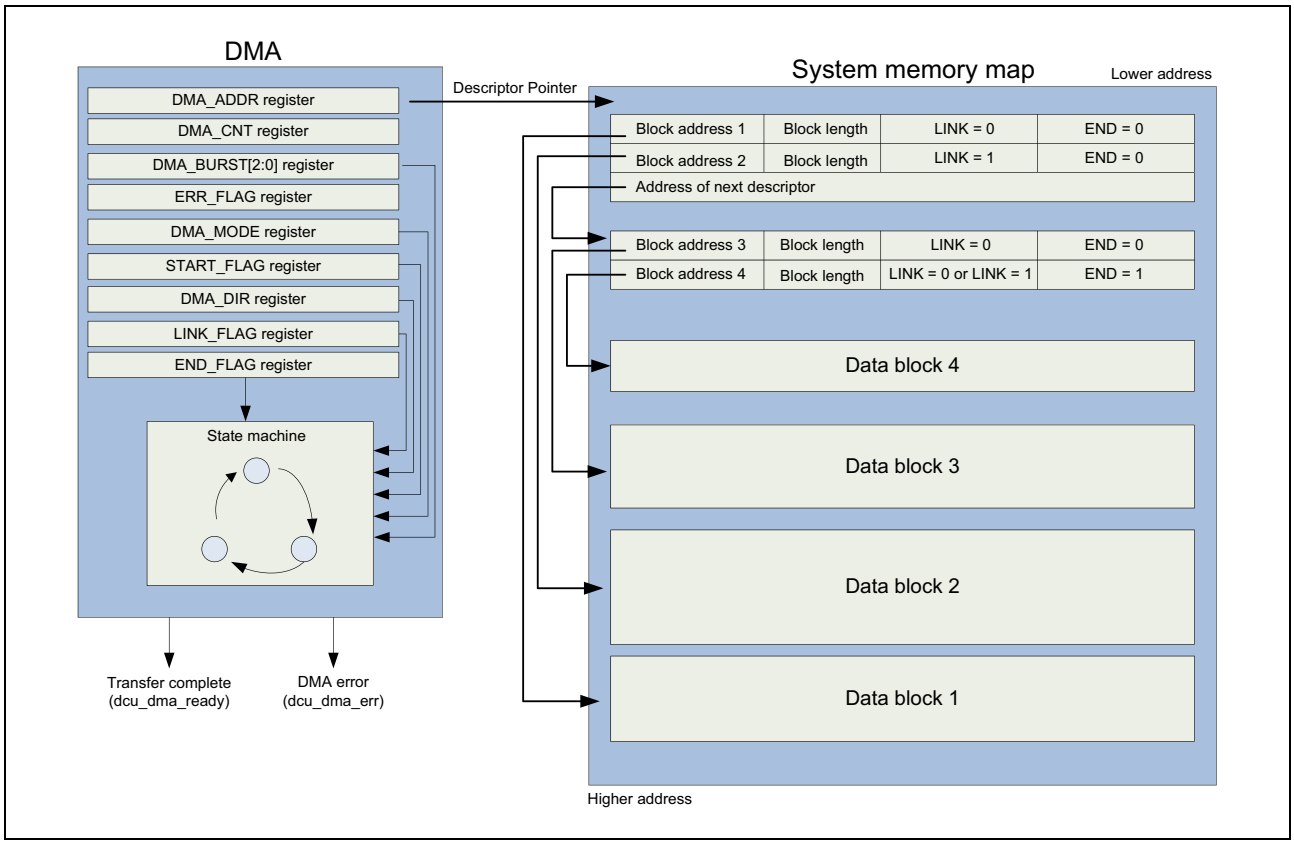


Figure 58.40 Example of Scatter-Gather DMA Data Transfer

58.5.3 ECC Module

58.5.3.1 Module Overview

The ECC module is based on one of the BCH algorithms and allows correction of multiple bit errors. The ECC engine integrated into the NAND Flash controller has the following properties:

- The encoder and decoder works on the 256, 512, 1024 bytes data blocks.
- Programmable correction capability: 2, 4, 8, 16, 24 or 32 errors.
- The corrected data words are aligned to the 32 bits.
- The correction words are aligned to the 32 bits.
- Correction words are placed after the data.

58.5.3.2 Block Diagram

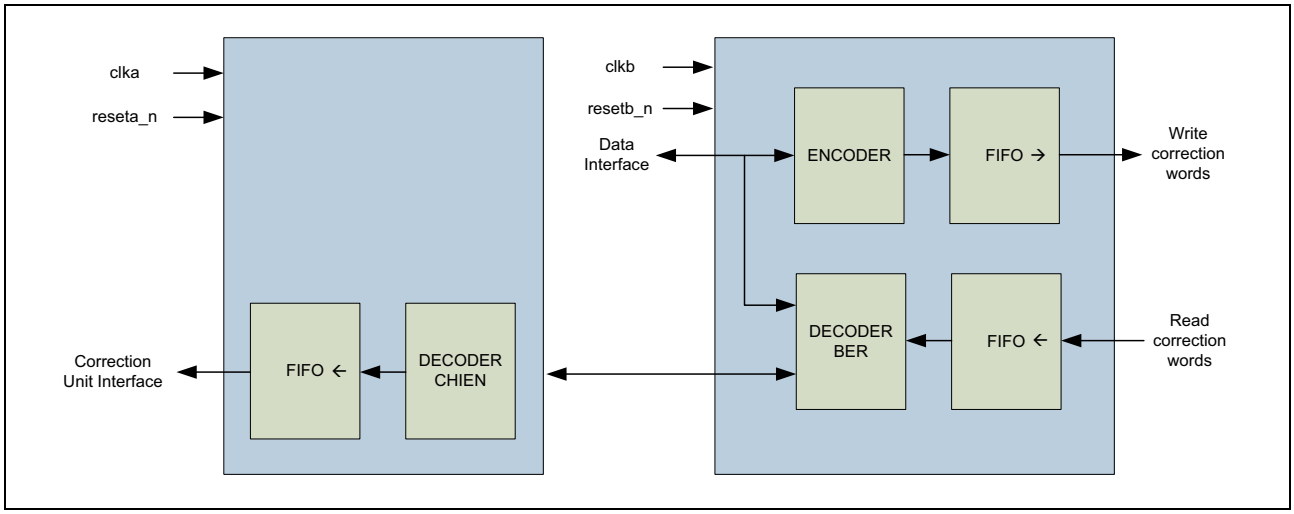

Figure 58.41 ECC Module Block Diagram

58.5.3.3 BCH Algorithm Implementation

- Data block length:
  - 256 (small block memory), 512 bytes or 1024 bytes.
- Programmable memory page length, multiple of the block length by any power of 2 (optional).
- Programmable correction capability: 2, 4, 8, 16, 24 or 32 errors.
- Separate encoder and decoder modules.
- Calculation of correction data performed during write to memory.
- Error detection performed during read data from memory.
- Internal pipeline allows the correction of errors in one data block simultaneously with detection of errors in the following data block.

Table 58.90 Size of Correction Bytes

Correction Capability	ECC Block Size	Size of Correction Bytes per one ECC Block
2 bit	256 / 512 / 1024 byte	4 byte
4 bit	256 / 512 / 1024 byte	7 byte
8 bit	256 / 512 / 1024 byte	14 byte
16 bit	256 / 512 / 1024 byte	28 byte
24 bit	256 / 512 / 1024 byte	42 byte
32 bit	256 / 512 / 1024 byte	56 byte

Revision History

Revision 0.60 History

This revision history list shows all modifications of

Rev. 0.60 compared to Rev. 0.50.

NOTE

The chapter and page numbers in the table below refer to the older Rev. 0.60 and thus may not be valid for the current revision.

Revision 0.60 History, Date Aug 29, 2014 (1/13)

Section	Page	Summary
1	89	Code Flash size of D1L2(H) devices changed to 4 MB
1	89	MainOsc frequency range changed
1	90	name of CAN interface with FD support changed to RSCAN-FD
1	91	RS-CANFD added to D1L1 block diagram
1	92	RS-CANFD added to D1L2(H) block diagram
1	93	MainOsc frequency range changed
1	94	name of CAN interface with FD support changed to RSCAN-FD
1	95	ISO power supply for D1M2 devices corrected
1	95	D1M1 package type changed to HLQFP
1	96	RS-CANFD added to D1M1(H) block diagram
1	97	RS-CANFD added to D1M2(H) block diagram
1	98	part numbers for devices with RS-CANFD I/F added
2	102	D1M1 package type changed to 176 HQFP
2	104	D1M2 pin connection diagram added
2	112	"Module Name" column added to register table
2	113	note added concerning register names in header files
2	114	typo correction (FCLA0CTLm -> FCLAnCTLm)
2	120	caution added concerning usage of alternative functions
2	121	caution added concerning usage of alternative functions
2	137	port initialization flow for alternative ports with PIPC=1 corrected
2	138	PODCEn.PODCEn_m removed from flowchart
2	142	input buffer characteristics tables separated for the different devices
2	142	input characteristic name "CMOS" changed to "CMOS1"
2	148	input buffer characteristic selection of JP0_3 and JP0_4 corrected
2	151	P21 port input buffer characteristics corrected
2	151	P40 port input buffer characteristics corrected
2	152	P44 port input buffer characteristics corrected
2	153	P45 port input buffer characteristics corrected
2	204	XOR Compare Unit removed from SG0FAOL at port P3_3
2	204	XOR Compare Unit removed from SG0AO at port P3_5
2	207	ISM channel connections of P16_[11:8] corrected
2	207	P16 ISM assignment changed (ISM/ZPD3 -> ISM/ZPD5)

Revision 0.60 History, Date Aug 29, 2014 (2/13)

Section	Page	Summary
2	208	ISM channel connections of P17_[11:0] corrected
2	208	P16 ISM assignment changed (ISM/ZPD4 -> ISM/ZPD6)
2	208	ZPD4x changed to ZPD6x
2	208	P16 ISM assignment changed (ISM/ZPD5 -> ISM/ZPD3)
2	208	ZPD5x changed to ZPD3x
2	208	P16 ISM assignment changed (ISM/ZPD6 -> ISM/ZPD4)
2	208	ZPD6x changed to ZPD4x
2	212	VDCE1_VO_TCON3 added as 2nd alternative output of P43_6
2	214	TAUB2O8 exchanged by VDCE0_VO_TCON3
2	218	ports for "Port output check by timers" corrected
2	228	correction: controls digital filter processing -> controls filter processing
2	233	X1/X2 pin states in normal operation mode corrected
2	233	XT1/XT2 pin states in normal operation mode corrected
2	233	signal name corrections (SDRAA[13:9] -> SDRAA[13:11])
2	233	signal name corrections (SDRAA10PC -> SDRAA10)
2	234	signal name corrections (SDRBA[13:9], SDRBA10PC -> SDRBA[13:11], SDRBA10)
2	234	Note1. added
2	234	X1/X2 pin states in normal operation mode corrected
2	234	XT1/XT2 pin states in normal operation mode corrected
2	235	signal name corrections (SDRAA[13:9] -> SDRAA[13:11])
2	235	signal name corrections (SDRAA10PC -> SDRAA10)
2	235	signal name corrections (SDRBA[13:9], SDRBA10PC -> SDRBA[13:11], SDRBA10)
2	235	Note1. added
2	235	Note2. added
2	236	signal name corrections (SDRAA[13:9] -> SDRAA[13:11])
2	236	signal name corrections (SDRAA10PC -> SDRAA10)
2	237	signal name corrections (SDRBA[13:9], SDRBA10PC -> SDRBA[13:11], SDRBA10)
2	238	correction: connect XT1 to OSCVSS when unused
2	238	recommended connection of unused RESETZ corrected
2	238	note added for all unused general purpose I/O ports
3	247	note added concerning register names in header files
3	260	upper window address of cache window example changed
3	262	buffer base and mask registers added
3	268	Index type (IDX_*, CLEAR) register description corrected
3	276	initial values of ACCABASEn corrected
3	277	initial values of ACCAMASKn corrected
3	278	Buffer base n register (AXCBFBASEn) added
3	279	Buffer mask n register (AXCBFMASKn) added
4	282	SWRESA register assigned to control protection cluster 0
4	283	register name IDMODI changed to SELBIDMODI
4	285	"Module Name" column added to register table
4	286	note added concerning register names in header files
4	301	register name IDMODI changed to SELBIDMODI
4	301	register name IDMODI changed to SELBIDMODI

Revision 0.60 History, Date Aug 29, 2014 (3/13)

Section	Page	Summary
4	302	register name IDMODI changed to SELBIDMODI
5	307	D1L2(H) Code Flash size changed to 4 MB
5	309	D1L2(H) Code Flash size changed to 4 MB
7	313	register access size column added
7	313	note added concerning register names in header files
7	363	typo correction (BERR0SSF28 -> BERR0SSF128)
7	364	BERR0CL017 removed
7	364	typos correction in table (BERR0ST1 -> BERR0ST0)
7	364	BERR0CL017 removed
7	366	section "DMA bus error status registers" added
8	381	DMA transfer request acceptance indicators completed
8	382	typo correction (requests -> request)
8	393	VM bit added to table
8	393	typo correction (UM -> VM)
8	397	table column name "Channel" changed to "DMA trigger ID"
8	401	"Module Name" column added to register table
8	401	note added concerning register names in header files
8	407	description of VM bit corrected
8	408	"Module Name" column added to register table
8	409	note added concerning register names in header files
9	428	signal name "PWRGD" added
9	429	Reset controller block diagram corrected
9	430	Low Speed IntOsc removed from table as reset target
9	430	Low Speed and High Speed reset targets separated
9	431	typo correction (POC1RES -> POC0RES)
9	431	external ISO reset control output corrected to PWRCTL
9	431	"Isolated-Area power reset control" in diagram indicated
9	431	correction (ISO power reset flag -> ISOPWRES power reset flag
9	432	typo correction (POC1RES -> POC0RES)
9	432	external ISO reset control output corrected to PWRCTL
9	432	"Isolated-Area poser reset control" in diagram indicated
9	434	description of external reset input/output improved
9	437	"Module Name" column added to register table
9	437	note added concerning register names in header files
9	443	reset sources of MRSTC stated more precisely
9	443	VDCE1RES and VDCE0RES exchanged in register image
10	451	correction: B2VCC/B2VSS only for D1M2(H)
10	452	note concerning relation between ZPDVCC and REG0VCC removed
10	455	note concerning relation between ZPDVCC and REG0VCC removed
11	460	"Module Name" column added to register table
11	460	Temperature Sensor status register (TSNSTAT) address corrected
11	460	note added concerning register names in header files
12	464	MainOsc frequency range changed
12	469	section "CPU Subsystem and bus clock domains" revised

Revision 0.60 History, Date Aug 29, 2014 (4/13)

Section	Page	Summary
12	472	CLMAOTCTL1 register initial value corrected
12	472	note added concerning register names in header files
12	474	PLL0E register added to caution
12	474	PLL1E register added to caution
12	475	MainOsc reset described more precisely
12	475	MainOsc frequency range changed
12	477	SubOsc reset described more precisely
12	477	"SubOsc STOP requests in DEEPSTOP mode" added
12	479	High Speed IntOsc reset corrected in diagram
12	479	CLMA0RES added as reset source in figure
12	479	High Speed IntOsc reset described more precisely
12	484	typo correction (CKCS_IPLL2INS_CTL -> CKSC_IPLL2INS_CTL)
12	484	typo correction (CKDV_IPLL2IND_CLT -> CKDV_IPLL2IND_CTL)
12	484	typo correction (CKCS_IPLL2INS_CTL -> CKSC_IPLL2INS_CTL)
12	487	"Module Name" column added to register table
12	487	SubOsc stop mask register added
12	487	typo correction (CKSC_IPPL0S_CTL -> CKSC_IPLL0S_CTL)
12	487	typo correction (CKSC_IPPL0S_ACT -> CKSC_IPLL0S_ACT)
12	487	typo correction (CKSC_IPPL1S_CTL -> CKSC_IPLL1S_CTL)
12	487	typo correction (CKSC_IPPL1S_ACT -> CKSC_IPLL1S_ACT)
12	488	BUS_CLK_RATIO register removed
12	488	C_AWO_WDTA0 clock divider active register (CKSC_AWDTA0D_STPM) removed
12	489	BUS_CLK_RATIO register removed
12	489	C_AWO_WDTA0 clock divider active register (CKSC_AWDTA0D_STPM) removed
12	490	note added concerning register names in header files
12	493	settings of MOSCAMPSEL[1:0] corrected
12	493	note added concerning oscillators for low power modes
12	498	SubOsc Stop Mask Register (SOSCSTPM) added
12	499	ROSCE reset source corrected
12	500	ROSCS reset source corrected
12	501	ROSCST reset source corrected
12	502	ROSCSTPM reset source corrected
12	511	typo correction (NI[6:0]PLL1 -> NI[6:0])
12	516	table columns names corrected
12	518	"(default)" added
12	531	typo correction (IPLLFIXS ACT[1:0] -> PLLFIXS ACT[1:0])
12	532	typo correction (ISDRBSSTP -> SDRBSSTP)
12	532	"(default)" added
12	533	typo correction (SDRBACT -> SDRBDACT)
12	538	initial value of CKSC_IXCCLKS_CTL corrected
12	538	caution added concerning activation of the cross-connect clock domain C_ISO_XCCLK
12	539	initial value of CKSC_IXCCLKS_ACT corrected
12	540	"(default)" added
12	542	"(default)" added

Revision 0.60 History, Date Aug 29, 2014 (5/13)

Section	Page	Summary
12	545	CKSC_IPCMLBBS_ACT initial value corrected
12	546	default value in IXCMLBBSSTP bit description corrected
12	551	typo correction (WOTSACT[2:0] -> AWOTSACT[2:0])
12	555	caution added concerning CKSC_AWDTA0D_CTL register setting
12	571	note for PLLFIXCLK/12 and /24 removed
12	571	typo correction (RSCANSCSID[2:0] -> RSCANDCSID[2:0])
12	571	correction: selection -> divider
12	574	typo correction (RSCANXINSACT0 -> IRSCANXINSACT0)
12	585	"(default)" added
12	587	type correction (CKLJIT -> CLKJIT)
12	587	caution added concerning C_ISO_ADCE frequency
12	592	section "Clock Controller set-up" added
12	594	"Clock Selection" section added
12	600	"Module Name" column added to register table
12	600	note added concerning register names in header files
12	600	typo correction (R -> R/W)
12	600	FOUTDIV settings corrected
12	601	correction read/written -> read
12	601	typo correction (R/W -> R)
12	603	CLMAn output signal connections corrected
12	605	note added concerning register names in header files
12	606	Clock Monitor block diagram corrected
12	609	figure title corrected
12	609	figure title corrected
12	609	figure title corrected
12	611	"Module Name" column added to register table
12	611	note added concerning register names in header files
13	623	typo correction (INTRTCA0S -> INTRTCA01S)
13	623	ECM signal name corrected (INTECM -> ECMTI)
13	623	ECM signal name corrected (NMIECM -> ECMTNMI)
13	628	"Module Name" column added to register table
13	628	note added concerning register names in header files
13	629	initial value of WUF0 register corrected
13	634	"Preparation for DEEPSTOP" flow improved
14	637	"Bus Systems Clock Supply" section added
14	666	"SPID and PEID assignment table" relocated
14	670	description of PEGGnMK.GnMASK corrected
14	680	"Module Name" column added to register tables
14	680	note added concerning register names in header files
14	680	PBG channel numbers for PBG5A corrected
14	683	"SPID and PEID assignment table" relocated
14	683	"SPID and PEID assignment table" relocated
14	686	VM moved from bit 5 to bit 7
14	694	typo correction (XCGnINT1L -> XCGnINTL1)

Revision 0.60 History, Date Aug 29, 2014 (6/13)

Section	Page	Summary
16	710	SDRBA10PC signal name corrected to SDRBAPC
16	712	typo correction (I/Memory -> Memory)
16	712	"Module Name" column added to register table
16	712	PHY control register 0 added
16	712	PHY control register 1 added
16	712	PHY control register 3 added
16	713	note added concerning register names in header files
16	718	typo correction (ARFEN = -> ARFEN = 1)
16	723	typo correction (DBCONF0.DB0[1:0] -> DBCONF0.DW0[1:0])
16	736	READ/WRITE interval calculation formula corrected
16	741	DQL calculation formula corrected
16	753	description of RODTOUT0 corrected
16	753	description of WODTOUT0 corrected
16	755	PHY control register 0 (DBPDCNT0) added
16	756	PHY control register 1 (DBPDCNT1) added
16	757	PHY control register 3 (DBPDCNT3) added
16	762	typo correction (3FFFFH -> 3FFFH)
16	765	step (3) added to initialization sequence
16	765	step (4) added to initialization sequence
17	787	"Module Name" column added to register table
17	787	note added concerning register names in header files
17	793	correction in register image: BFM[1:0] -> BFM[2:0]
17	793	description of DRCR.BFM[2:0] corrected
17	811	bit position of CKDLYOC[2:0] corrected
17	811	CKDLYOC[2:0]=010B setting added
17	813	typo correction in register image (DRDRD -> DRDRE)
17	829	Output pin (CPHAT = 1) signal corrected
17	830	Output pin (CPHAT = 1) signal corrected
19	896	typo correction (CSIHnCSx -> CSIHnCSLx)
19	901	removed sentence concerning CSIHnCTL0.CSIHnPWR = 0
19	914	typo correction (CSIHnDAPxOSC -> CSIHnDAPx)
19	916	changed "inter-data delay time" into "inter-data time"
19	921	typo correction (CSIHnRX0Hn -> CSIHnRX0H)
19	989	typo correction (INCSIHTIC -> INTCSIHTIJC)
19	989	typo correction (IHTIC -> INTCSIHTIJC)
19	989	typo correction (IHTIC -> INTCSIHTIJC)
20	991	caution added concerning RLIN3 clock frequencies
20	1027	typo correction (LBRP0[15:0] -> BRP[15:0])
20	1043	typo correction (R -> R/W)
20	1090	typo correction (N +1 -> M + 1)
21	1135	write value of unused bits in RIICnDRT corrected
22	1182	"Number of Units" table corrected
22	1182	"Unit Configurations and Channels" table corrected
22	1183	number range of index r corrected

Revision 0.60 History, Date Aug 29, 2014 (7/13)

Section	Page	Summary
22	1207	RAM test page access registers 30 to 63 removed
22	1240	typo correction (GAFLRVM -> GAFLRMV)
22	1243	NRXMB[7:0] number range corrected
22	1312	RTMPS[6:0] number range corrected
22	1312	RTMPS[6:0] number range corrected
22	1316	number range of index r corrected
22	1322	max. transition time Global test -> Global reset corrected
22	1322	max. transition time Global operation -> Global reset corrected
22	1325	max. transition time Channel reset -> Channel communication corrected
22	1325	max. transition time Channel halt -> Channel reset corrected
22	1325	max. transition time Channel halt -> Channel reset corrected
22	1329	number of Rx buffers corrected
22	1329	number of receive rules corrected
22	1329	maximum number of pages corrected
22	1338	formatting of bulleted list corrected
22	1344	number range of index r corrected
22	1344	total RAM size corrected
22	1345	RAM initialization time corrected
22	1348	maximum number of Rx rule pages corrected
22	1349	number of buffers corrected
22	1350	maximum number of Rx buffers corrected
22	1368	number range of index r corrected
23	1381	RS-CANFD description added
24	1715	"Module Name" column added to register table
24	1716	"Module Name" column added to register table
24	1716	note added concerning register names in header files
24	1777	"QFF0 to 17 Receive 0 to 17 Full Interrupt Status Bits" description corrected
24	1881	"Flow of Transmission Time Stamping" corrected
24	1919	"Rx-FIFO read error may not be flagged when using FEMPTY_ND descriptor" usage note added
24	1919	"When trying to release non-existing timestamp FIFO entry, new FIFO update flag may be lost: usage note added
24	1919	"gPTP compare may fail for range of compare values" usage note added
24	1919	"UFC stop level triggers RIS2.QFFr even no received frame is lost" usage note added
24	1920	"RIS0.FRFr may lost when data processing stops close below configured warning level" usage note added
25	1925	"Module Name" column added to register table
25	1926	note added concerning register names in header files
26	1929	caution concerning reset conflictions added
26	1931	typo corrections (WDT0. -> WDT0, WDTA1. -> WDTA1)
26	1940	added "Note 2" for reference to reset conflict cases
28	1971	wording and format improved
28	1973	formula for AWOTOUT cycle duration calculation added
28	1973	note added
28	1974	formula for capture period calculation added

Revision 0.60 History, Date Aug 29, 2014 (8/13)

Section	Page	Summary
28	1978	explanation of "Counter start delay" improved
29	1988	TAUBn signals interrupt names corrected
29	1993	TAUB2O15 declared as "Error Control Module timer input"
32	2380	correction: no A/D conversion trigger to ADCE1
32	2388	condition for writing to PWGAnCTL corrected
33	2408	DMA trigger ID of INTSG0TI corrected
33	2408	DMA trigger ID of INTSG1TI corrected
33	2408	DMA trigger ID of INTSG2TI corrected
33	2408	DMA trigger ID of INTSG3TI corrected
33	2408	DMA trigger ID of INTSG4TI corrected
33	2409	"XOR Compare Unit check of SG output signals" added
35	2473	DMA trigger ID of INTSSIF0TX corrected
35	2473	DMA trigger ID of INTSSIF0RX corrected
35	2473	DMA trigger ID of INTSSIF1TX corrected
35	2473	DMA trigger ID of INTSSIF1RX corrected
35	2476	"Module Name" column added to register table
35	2476	notes added concerning register names in header files
36	2554	access width of all registers corrected to 32-bit
36	2556	access width of all registers corrected to 32-bit
37	2562	note added concerning concurrent usage of video 0 downscaler and 00 upscaler
37	2563	note added concerning concurrent usage of video 1 downscaler and 10 upscaler
37	2565	four graphics layers configuration 2 added
37	2566	note added concerning concurrent usage of video 0 downscaler and video 00 upscaler
37	2567	one video + up to three graphics layers configuration 2 added
37	2567	note added concerning concurrent usage of video 0 downscaler and video 00 upscaler
37	2568	note added concerning concurrent usage of video 0 downscaler and video 00 upscaler
37	2568	note added concerning concurrent usage of video 1 downscaler and video 01 upscaler
37	2569	cross-reference in note corrected
37	2570	clock name C_ISO_VOnPIXCLK correct to C_ISO_VDCEnCLK
37	2570	clock name C_ISOVO0PIXCLK correct to C_ISO_VDCE0CLK
37	2570	clock name C_ISOVO0PIXCLK in figure correct to C_ISO_VDCE0CLK
37	2570	clock name C_ISOVOnPIXCLK correct to C_ISO_VDCEnCLK
37	2571	C_ISO_VI1PIXCLK selector VDCECTL.VI1CTL added
37	2572	section "Clock selections for different layer configurations" added
37	2575	typo correction (CKSC_IPLL2IND_CTL -> CKDV_IPLL2IND_CTL)
37	2575	typo correction (PLL0PIXCLK -> PLL0CLK)
37	2608	typo correction (channel10 -> channel 1)
37	2608	typo correction (PFCEn_m=01 -> PFCEn_m =0)
37	2612	typo correction (Manximum -> Maximum)
37	2614	Reserved data type error check register (MIPInRDT_ERR_ON) added
37	2617	DT_EN bit added
37	2620	MIPInBUF_CTL register description corrected
37	2629	LP11 reset delay adjustment register (MIPInRESET_DLY_CTL0) description added
37	2630	Reserved data type error check register (MIPIn_RDT_ERR_ON) added

Revision 0.60 History, Date Aug 29, 2014 (9/13)

Section	Page	Summary
37	2642	"MIPI port setup" corrected
37	2642	"Start sequence" corrected
37	2642	"Example start sequence" added
37	2643	"Stop sequence" corrected
37	2643	"Interrupt handling sequence" added
37	2644	"Video Input Setup for MIPI" added
37	2645	"Conditions for MIPI video clock selection" added
37	2647	signal name corrected (VDCE0_VO_TCON0_VS -> VDCE0_VO_TCON0)
37	2647	signal name corrected (VDCE0_VO_TCON2_HS -> VDCE0_VO_TCON2)
37	2647	signal name corrected (VDCE0_VO_TCON3_DE -> VDCE0_VO_TCON3)
37	2649	signal name corrected (VDCE0_VO_TCON0_VS -> VDCE0_VO_TCON0)
37	2649	signal name corrected (VDCE0_VO_TCON2_HS -> VDCE0_VO_TCON2)
37	2649	signal name corrected (VDCE0_VO_TCON3_DE -> VDCE0_VO_TCON3)
37	2650	section "Video output clock inversion in LVTTL mode" added
37	2653	"Module Name" column added to register table
37	2653	note added concerning register names in header files
37	2654	typo correction (VDCE control registers -> VDCE control register)
37	2654	VDCECTL.VI1CTL bit added
37	2655	typo correction (RHSL[1:0] -> RPHSL[1:0])
37	2657	arrow direction between OIR and Video Output Module 0 corrected
37	2658	"Module Name" column added to register table
37	2658	note added concerning register names in header files
37	2660	typo correction (initial value R/W -> 0)
37	2660	typo correction (R -> R/W)
38	2665	TCON0, TCON2 and TCON3 port signal names corrected
38	2665	port signal name corrected (VDCE0_VO_TCON0_VS -> VDCE0_VO_TCON0)
38	2665	port signal name corrected (VDCE0_VO_TCON2_HS -> VDCE0_VO_TCON2)
38	2665	port signal name corrected (VDCE0_VO_TCON3_DE -> VDCE0_VO_TCON3)
38	2665	port signal name corrected (VDCE1_VO_TCON0_VS -> VDCE1_VO_TCON0)
38	2665	port signal name corrected (VDCE1_VO_TCON2_HS -> VDCE1_VO_TCON2)
38	2665	port signal name corrected (VDCE1_VO_TCON3_DE -> VDCE1_VO_TCON3)
38	2668	maximum output video image size corrected
38	2669	Image quality improver blocks corrected
38	2669	correction: "Image Renderer for display (IMR-LSD)" changed to "Video Output Warping Engine (VOWE)"
38	2700	"Module Name" column added to register table
38	2700	"Module Name" column added to register table
38	2701	"Module Name" column added to register table
38	2701	"Module Name" column added to register table
38	2701	note added concerning register names in header files
38	2745	"Module Name" column added to register table
38	2749	"Module Name" column added to register table
38	2753	note added concerning register names in header files
38	2840	"Module Name" column added to register table

Revision 0.60 History, Date Aug 29, 2014 (10/13)

Section	Page	Summary
38	2841	"Module Name" column added to register table
38	2841	note added concerning register names in header files
38	2873	"Module Name" column added to register table
38	2874	"Module Name" column added to register table
38	2875	"Module Name" column added to register table
38	2875	"Module Name" column added to register table
38	2876	"Module Name" column added to register table
38	2877	"Module Name" column added to register table
38	2878	"Module Name" column added to register table
38	2878	"Module Name" column added to register table
38	2879	note added concerning register names in header files
38	2935	"Image renderer for display (IMR-LSD)" corrected to "Video Output Warping Engine (VOWE)"
38	2944	"Module Name" column added to register table
38	2945	note added concerning register names in header files
38	3002	"Module Name" column added to register table
38	3005	"Module Name" column added to register table
38	3006	"Module Name" column added to register table
38	3006	"Module Name" column added to register table
38	3009	"Module Name" column added to register table
38	3010	"Module Name" column added to register table
38	3010	note added concerning register names in header files
38	3072	"Module Name" column added to register table
38	3072	"Module Name" column added to register table
38	3073	note added concerning register names in header files
39	3083	Video Output Warping Engine product specific information added
40	3086	signal name correction (VDCE0_VO_TCON0_VS -> Port VDCE0_VO_TCON0)
40	3086	signal name correction (VDCE0_VO_TCON2_HS -> Port VDCE0_VO_TCON2)
40	3086	signal name correction (VDCE1_VO_TCON0_VS -> Port VDCE1_VO_TCON0)
40	3086	signal name correction (VDCE1_VO_TCON2_HS -> Port VDCE1_VO_TCON2)
40	3099	note 3 added concerning ACTMON_INT error interrupt
40	3112	typo correction (VOCAnDIFF[17:0] -> VOCAnDIFF0[17:0])
41	3127	"Module Name" column added to register table
41	3127	note added concerning register names in header files
42	3158	typo correction (GPU2DCOL_ARGB_OUT_0 -> GPU2D0COL_ARGB_OUT_0)
42	3158	typo correction (GPU2DCOL_ARGB_OP1B_1 -> GPU2D0COL_ARGB_OP1B_1)
42	3162	typo correction (GPU2DCOL_ARGB_OUT_0 -> GPU2D0COL_ARGB_OUT_0)
42	3162	typo correction (GPU2DCOL_ARGB_OP1B_1 -> GPU2D0COL_ARGB_OP1B_1)
43	3164	typo correction (m = 00 to 15 -> m = 0 to 15)
43	3164	Sprite Engine base address corrected
43	3185	description of SPEAnVDCi registers improved
44	3197	typo correction (Code -> Codec)
44	3200	"Module Name" column added to register table
44	3201	JCSWRST register added

Revision 0.60 History, Date Aug 29, 2014 (11/13)

Section	Page	Summary
44	3201	note added concerning register names in header files
44	3202	note changed concerning JCUA reset for mode selection
44	3203	bit 7 of JCCMD register removed
44	3232	JPEG Codec Unit A Software reset register (JCSWRST) register added
44	3234	"Software reset" description changed.
44	3239	"Software reset" description changed.
44	3250	section "Procedure of checking JINTS1" added
44	3250	section name "Bus Reset Processing" changed to "Software Reset Processing"
44	3250	text concerning bus reset changed
45	3252	number range of index j corrected
45	3253	correction: scan group 2 issues ADCE0TRGI2
45	3253	correction: scan group 3 issues ADCE0TRGI3
45	3258	reference to "Self-Diagnostic Function" corrected
45	3260	typo corrections in figure (ADCA -> ADCE)
45	3261	"Module Name" column added to register table
45	3261	addresses of Data register j corrected
45	3262	note added concerning register names in header files
45	3267	address of ADCEnDRj registers corrected
45	3284	caution changed concerning ADCEnSGCRx
45	3307	note added concerning start trigger during scanning
45	3308	typo corrections in figure (ADCA -> ADCE)
45	3309	typo corrections in figure (ADCA -> ADCE, INTADCEnI0 -> INTADCEnI1)
45	3309	typo corrections in figure (ADCA -> ADCE, INTADCEnI0 -> INTADCEnI1)
45	3310	typo corrections in figure (ADCA -> ADCE, INTADCEnI0 -> INTADCEnI1)
45	3311	typo corrections in figure (ADCA -> ADCE, INTADCEnI0 -> INTADCEnI1 or ADCEnI2)
45	3311	typo corrections in figure (ADCA -> ADCE, INTADCEnI0 -> INTADCEnI1)
45	3312	typo corrections in figure (ADCA -> ADCE, INTADCEnI0 -> INTADCEnI1)
45	3313	SG4 interrupt INTADCEnI0 remove from diagram
45	3314	typo correction in diagram (Simultaneous T&H -> A/D conversion)
45	3315	typo correction in diagram (Simultaneous T&H -> A/D conversion)
45	3317	typo corrections in figure (ADCA -> ADCE, INTADCEnI0 -> INTADCEnI1)
45	3317	typo corrections in figure (ADCA -> ADCE, INTADCEnI0 -> INTADCEnI1)
45	3318	typo corrections in figure (ADCA -> ADCE, INTADCEnI0 -> INTADCEnI1)
45	3318	typo corrections in figure (ADCA -> ADCE, INTADCEnI0 -> INTADCEnI1 or ADCEnI2)
45	3319	typo corrections in figure (ADCA -> ADCE, INTADCEnI0 -> INTADCEnI1 or ADCEnI2)
45	3319	typo corrections in figure (ADCA -> ADCE, INTADCEnI0 -> INTADCEnI1 or ADCEnI2)
45	3322	"A/D Error Interrupt Request" description corrected
45	3323	correction in figure: ADCEnDGCTL1.DC14 connected to DIAGOUT2
45	3324	meaning of ADCEnSGVCEPx in diagnostic procedure corrected
45	3325	step 9 of diagnostic procedure corrected
45	3330	usage note added concerning "Analog input (ADCEnIm) pins can be used as port pins"
46	3333	port assignment corrected: motor drivers 2 -> ports ISM5
46	3333	port assignment corrected: motor drivers 3 -> ports ISM6
46	3333	port assignment corrected: motor drivers 4 -> ports ISM3

Revision 0.60 History, Date Aug 29, 2014 (12/13)

Section	Page	Summary
46	3333	port assignment corrected: motor drivers 5 -> ports ISM4
46	3334	note added concerning register names in header files
46	3373	ZIS[1:0] settings corrected
46	3412	ISMnCZISm settings corrected
48	3432	note added concerning NMI for ECM
48	3433	note added concerning CLMA3 error for ECM
48	3433	note added concerning CLMA4 error for ECM
48	3434	note 1. added
48	3434	note 2. added
48	3438	correction: ECMMESET register is W
48	3438	correction: ECMMECLR register is W
48	3438	correction: ECMCESET register is W
48	3438	correction: ECMCECLR register is W
48	3439	initial value of ECMPS corrected
48	3440	typo correction (ECMmEST -> ECMmESET)
48	3442	typo correction (R/W -> R)
48	3446	access mode of ECMMICFG0 register corrected
48	3447	ECMMICFG1 register description modified
48	3447	access mode of ECMMICFG1 register corrected
48	3448	ECMNICFG0 register description modified
48	3448	access mode of ECMNMICFG0 register corrected
48	3449	ECMNICFG1 register description modified
48	3449	access mode of ECMNMICFG1 register corrected
48	3450	access mode of ECMIRCFG0 register corrected
48	3451	access mode of ECMIRCFG1 register corrected
48	3452	access mode of ECMEMK0 register corrected
48	3453	access mode of ECMEMK1 register corrected
48	3458	ECMPE0[31:00] bit description corrected
48	3459	correction: R -> R/W
48	3462	access mode of ECMDTMCFG0 register corrected
48	3463	access mode of ECMDTMCFG1 register corrected
48	3464	access mode of ECMDTMCFG2 register corrected
48	3465	access mode of ECMDTMCFG3 register corrected
48	3465	typos correction (ECMTE[305:301] -> ECMTE[315:311])
50	3475	section "Intelligent Cryptographic Unit (ICU-S2)" completed
51	3478	typo correction (ISMnSVSDIS -> ISMnSVDIS)
51	3481	remark concerning IDMODI write protection added
51	3481	note added concerning register names in header files
51	3482	caution added concerning debugger usage and DEEPSTOP mode
52	3483	D1L2(H) Code Flash size changed to 4 MB
52	3485	start address of block125 and 165 corrected
52	3485	address map for 4 MB devices included
52	3498	note added concerning register names in header files
52	3500	note added concerning register names in header files

Revision 0.60 History, Date Aug 29, 2014 (13/13)

Section	Page	Summary
52	3501	typo corrections (WDT0. -> WDT0)
52	3501	typo correction (WDT1OPWDTRP -> WDT1OPWDTPR)
52	3502	typo correction (WDT1.OPWDOFV[2:0] -> WDT1OPWDOVF[2:0])
52	3502	typo corrections (WDT0. -> WDT0)
52	3502	typo correction (WDT0OPWDTRP -> WDT0OPWDTPR)
52	3502	typo correction (WDT0.OPWDOFV[2:0] -> WDT0OPWDOVF[2:0])
52	3502	note added concerning register names in header files
52	3503	note added concerning register names in header files
52	3504	note added concerning register names in header files
52	3506	"Module Name" column added to register table
52	3506	note added concerning register names in header files
52	3507	typo correction (R -> R/W)
52	3514	"Module Name" column added to register table
52	3514	note added concerning register names in header files
52	3515	bit name corrected: SECDDIS -> SECDIS
52	3515	bit name corrected: SECDDIS -> SECDIS
53	3522	Local RAM described more precisely
53	3522	section "Local RAM initialization" added
53	3524	"Module Name" column added to register table
53	3524	note added concerning register names in header files
53	3529	typo correction (GRAM -> Local RAM)
54	3545	"VRAM Transaction Restrictor" section added
55	3568	description of manufacturer ID by DID.MD[10:0] corrected

Revision 1.00 History

This revision history list shows all modifications of

Rev. 1.00 compared to Rev. 0.60.

NOTE

The chapter and page numbers in the table below refer to the older Rev. 1.00 and thus may not be valid for the current revision.

Revision 1.00 History, Date Feb 27, 2015 (1/37)

Section	Page	Summary
1	91	correction: SSCG0 -> PLL0
1	91	"Operating ambient temperature" removed
1	94	D1M1H CPU frequency increased to 200 MHz
1	95	correction: RS-CANFD available for all products
1	96	correction: SSCG0 -> PLL0
1	96	"Operating ambient temperature" removed
2	100	"Tentative" removed from all pin connection diagrams
2	100	correction in figure: RESETZ is bi-directional
2	101	correction in figure: RESETZ is bi-directional
2	102	correction in figure: RESETZ is bi-directional
2	103	correction in figure: RESETZ is bi-directional
2	104	D1M1H pin connection diagram added
2	107	number of D1M2 port groups corrected
2	107	P40 removed from D1M2 port group list
2	108	note 2 added
2	110	table corrected for PMCn_m=1, PMn_m=1 and PIBCn_m=0
2	119	note 4 added
2	138	Example of Port Configuration Flow (in alternative mode) modified
2	148	TTL(MLB) removed from P21
2	152	correction: P21 TTL(MLB) only for D1M2H
2	163	PDSC21 and PISA21 removed
2	164	correction: bit 8 of PIPC42 available
2	166	PIS44/PISA44 registers added
2	167	PIS45/PISA45 registers added
2	176	PDSC21 and PISA21 removed
2	177	correction: bit 8 and bit 3 of PIPC42 available
2	179	PIS44/PISA44 registers added
2	180	PIS45/PISA45 registers added
2	195	correction: bit 8 and bit 3 of PIPC42 available
2	202	CAN0DREN signal added as 4th alternative output of P0_3
2	202	CAN2DREN signal added as 4th alternative output of P0_7
2	202	CAN1DREN signal added as 4th alternative output of P0_9
2	214	correction: VDCE0 also for D1L2 products
2	222	caution added
2	223	cross references changed

Revision 1.00 History, Date Feb 27, 2015 (2/37)

Section	Page	Summary
2	224	control bit names of Digital Noise Elimination Enable Registers corrected
2	226	correction: DNFA6NFEN1 only for CSIH0SI at port P0_2
2	226	addition: DNFA6NFEN8 for CSIH0SI at port P1_4
2	227	in the table: control bit names of Digital Noise Elimination Enable Registers corrected
2	227	XOR compare unit filters for SG0FAO, SG0FAOL (P3_7), SG0AO (P3_7 corrected
2	228	"Filter Type" section introduced
2	229	"Port Filter Registers" section introduced
2	229	cross references to FCLAnCTLm assignment tables completed
2	229	correction: "7 to 0" -> "7 to 3"
2	229	table title added
2	229	cross reference to filter allocations corrected
2	230	cross references to DNFAnCTLm assignment tables completed
2	230	cross reference to filter allocations corrected
2	231	cross references to DNFAnEN assignment tables completed
2	231	cross reference to filter allocations corrected
2	232	category for P43_[2:0] corrected
2	232	correction: RESET pin has no internal pull-down
2	232	correction: PWRCTL = L while RESET pin = L
2	232	ADCE0Im in DEEPSTOP corrected
2	232	correction: SDRAA[13:11] -> SDRAA[12:11]
2	232	SDRADQ[31:0] pin states corrected
2	232	SDRADQS[3:0] pins removed
2	232	correction: SDRABA[2:0] -> SDRABA[1:0]
2	232	inverted SDRACLK clock removed
2	232	SDRADM[3:0] pin states corrected
2	232	SDRAODT removed
2	232	SDRACS, SDRACAS, SDRARAS, SDRAWE pin states corrected
2	233	note 2 added
2	233	category for P43_[2:0] corrected
2	233	correction: RESET pin has no internal pull-down
2	233	correction: PWRCTL = L while RESET pin = L
2	233	ADCE0Im in DEEPSTOP corrected
2	233	correction: SDRAA[13:11] -> SDRAA[12:11]
2	233	SDRADQ[31:0] pin states corrected
2	233	SDRADQS[3:0] pins removed
2	233	correction: SDRABA[2:0] -> SDRABA[1:0]
2	233	inverted SDRACLK clock removed
2	233	SDRADM[3:0] pin states corrected
2	233	SDRAODT removed
2	233	SDRACS, SDRACAS, SDRARAS, SDRAWE pin states corrected
2	234	note 3 added
2	234	category for P43_[2:0] corrected
2	234	correction: RESET pin has no internal pull-down
2	234	correction: PWRCTL = L while RESET pin = L

Revision 1.00 History, Date Feb 27, 2015 (3/37)

Section	Page	Summary
2	234	ADCE0Im in DEEPSTOP corrected
2	235	correction: SDRAA[13:11] -> SDRAA[12:11]
2	235	SDRADQ[31:0] pin states corrected
2	235	SDRADQS[3:0] pins removed
2	235	correction: SDRABA[2:0] -> SDRABA[1:0]
2	235	inverted SDRACLK clock removed
2	235	SDRADM[3:0] pin states corrected
2	235	SDRAODT removed
2	235	SDRACS, SDRACAS, SDRARAS, SDRAWE pin states corrected
2	235	note 1 added
2	236	handling recommendation of PWRGD pin corrected
2	236	recommendations for unused SDRA pins included
2	237	recommendation for unused SDRAVCC pin included
2	237	recommendation for unused ZPDREF changed
3	239	CPU Subsystem block diagram corrected
3	241	correction: PBUS modules in 4 functional segments, distributed to five separate PBUSes.
3	242	SDR-SDRAM Memory Controller (SDRA) added to caution list
3	243	"Retention RAM (RRAM)" added
3	246	SECDIS (bit 1) removed
3	246	SECDIS bits
3	251	typo correction (CF1STERSTR -> ID1STERSTR)
3	254	correction: "(for bank 0)" removed
3	255	correction: "(for bank 0)" removed
3	256	correction: "error status clear register" -> "error status register"
3	257	"or an address parity error" removed
3	258	"Retention RAM (RRAM)" access through XC Cache added
3	258	correction: "Granularity is 1 MB" -> "Minimum granularity is 1 MB"
3	258	XC cache buffered mode added
3	259	"Cache/Buffer window set-up" corrected
3	259	"XC Cache latency" added
3	260	devices with XC cache control registers specified
3	260	"Buffer flush register" added in table
3	260	note added concerning XC cache control registers
3	261	BUF0 and BUF1 bits added
3	262	AXCSYSERR initial value corrected
3	262	ETYPE[11:8] added
3	265	"AXCBUFFLUSH — Buffer flush register" added
3	277	XC cache ECC control registers added
3	293	"Usage Notes" added
4	297	change: "(indicated by the error monitor bit set to “1”)" -> "(the error monitor bit set to “1”)"
4	297	"Emulation break during the protection unlock sequence" modified
4	298	table title changed
4	299	APB_CLK_RATIO register added

Revision 1.00 History, Date Feb 27, 2015 (4/37)

Section	Page	Summary
4	299	correction: SELBIDMODI -> IDMODI
4	304	PROTERR description changed
4	306	PROTERR description changed
4	307	PROTDERR description changed
4	308	CLMAnPRERR description changed
4	309	CLMATPRERR description changed
4	310	CLMATPRERR2 description changed
4	311	CLMATPRERR3 description changed
4	313	bit name corrected: MRSTCPRERR -> MRSTCPERR
4	313	MRSTCPERR description changed
4	313	APB_CLK_RATIO register added
4	313	APB_CLK_RATIO register added
4	314	APB_CLK_RATIO register added
4	314	PWRGDPRERR description changed
4	314	correction: SELBIDMODI -> IDMODI
4	314	correction: SELBIDMODI -> IDMODI
4	315	correction: SELBIDMODI -> IDMODI
4	315	bit name corrected: IDMODIPRERR -> IDMODIPERR
4	315	IDMODIPERR description changed
4	317	PPROTSnPRERR description changed
4	319	FLMDPRERR description changed
5	321	CPU address map corrected
5	321	note added concerning initial value of CPU reset vector
5	324	corrected start address of D1L1 Local RAM and exchanged VRAM0 and VRAM1 in D1M2(H) address map
6	325	note 1 added
6	325	notes 1 and 2 added
7	334	caution concerning tentativeness of interrupt tables removed
7	336	correction: INTDCUTDI is level interrupt
7	338	Flash sequencer ready (INTFLENDNM0 interrupt added
7	343	correction: INTDCUTDI is level interrupt
7	345	Flash sequencer ready (INTFLENDNM0 interrupt added
7	350	correction: INTDCUTDI is level interrupt
7	352	Flash sequencer ready (INTFLENDNM0 interrupt added
7	357	correction: INTDCUTDI is level interrupt
7	359	Flash sequencer ready (INTFLENDNM0 interrupt added
7	360	Underflow of auto refresh - level interrupt (INTSDRA) added
7	364	correction: INTDCUTDI is level interrupt
7	366	Flash sequencer ready (INTFLENDNM0 interrupt added
7	371	correction: INTDCUTDI is level interrupt
7	373	Flash sequencer ready (INTFLENDNM0 interrupt added
7	376	typo correction (indicated -> indicate)
7	377	BERR0ST1 register description improved
7	379	typo correction (BUERR0ST0 -> BERR0ST0)

Revision 1.00 History, Date Feb 27, 2015 (5/37)

Section	Page	Summary
7	380	typo correction (BUERR0ST1 -> BERR0ST1)
7	386	typo correction ("BECM0BUSERRINF0 and BECM0BUSERRINF1" -> "BECMBUSERRINFO0 and BECMBUSERRINFO1")
8	418	DMnnCM initial value corrected
8	418	PEID[2:0] description corrected
8	424	typo correction (SHNSEL0 -> CHNSEL0)
9	438	"Clock Supply" added
9	439	abbreviations "RESC" and "RESCR" removed from diagram
9	439	modification in diagram: circle instead of solid point as signal inverter
9	439	modification in diagram: SDRB0RES -> SDRA0RES/SDRB0RES
9	439	typo correction (RESET -> RESET with overbar)
9	439	note 5 added
9	440	ISOPWRES added as reset source
9	440	"Retention RAM RRAM" removed from table
9	440	DBRES effect on Low Speed IntOsc corrected
9	440	DBRES effect on High Speed IntOsc corrected
9	441	correction: POC0RES does not assert ISOPWRES
9	441	modification in diagram: circle instead of solid point as signal inverter
9	442	D1M2(H) Isolated-Area power reset description corrected
9	442	modification in diagram: circle instead of solid point as signal inverter
9	443	typo correction ("Wake-up from DEEPSTOP PWRCTL/" -> "Wake-up from DEEPSTOP")
9	444	typo correction (programing -> programming)
9	445	note 1 added
9	445	typo correction (SGnRES -> SGn)
9	445	correction: "Memory Controller SDRB0" -> "Memory Controller SDRB0 PHY"
9	445	note added concerning SDRA0 reset
9	445	typo correction (cross-conenct -> cross-connect)
9	445	(RESC) removed
9	445	(RESCR) removed
9	445	correction: RESC -> Reset Controller
9	445	correction: RESCR -> Reset Controller
9	447	PWRG protection command and status registers added
9	448	note 2 added
9	448	note 2 about initial value for RESF/RESFR added
9	448	RESF8 initial value corrected
9	448	typo correction (13 to 12 -> 13 to 11)
9	449	note changed
9	450	rephrased RESFC, RESFCR registers explanation
9	450	typo correction ("13 to 12" -> "13 to 11")
9	453	note added concerning reset of unused modules
9	453	typo correction (PROTCMDMRSTC -> PROTCMDMRST)
9	453	XC0RES description corrected
9	453	addition: SDRB0RES not for all products available
9	453	correction: "Memory Controller SDRB0" -> "Memory Controller SDRB0 PHY"

Revision 1.00 History, Date Feb 27, 2015 (6/37)

Section	Page	Summary
9	453	note added concerning SDRA0 reset
9	453	addition: MLBB0RES not for all products available
9	454	SG3RES description corrected
9	454	SG2RES description corrected
9	454	addition: VDCE1RES not for all products available
9	454	addition: VDCE0RES not for all products available
9	455	reset source for register initialization added
9	456	(RESC) removed
9	456	(RESCR) removed
9	456	description about REGVCC < VPOC modified
9	458	"Overview of CPU System Startup after Power-On-Clear" added
9	458	correction in note 1: "RESFR.RESFR8 is" -> "RESF8.RESF8 and RESFR.RESFR8 are"
9	461	typo correction (CLM0RES -> CLMA0RES)
9	461	typo correction (CLM0RES -> CLMA0RES)
9	461	additional note concerning DBRES and IntOsc
10	462	B0VCC supply for D1L2 port group P42 corrected
10	462	typo correction ("port groups 46, 47" -> "port groups P46, P47")
10	463	correction: REG1VCC for D1M1(H), but not for D1M2 devices
10	466	correction in diagram: "VI0 MIPI I/F port buffers" assigned to note 2 instead of note 3
12	473	PLL1 nominal frequencies corrected
12	473	typo correction (VDCE1_VI-CLK -> VDCE1_VI_CLK)
12	476	change: "If the High Speed IntOsc clock ..." -> "Only if the High Speed IntOsc clock ..."
12	476	correction: High Speed IntOsc clock fRH stop is indicated by ROSC.ROSCCLKACT = 0
12	477	D1M1H Clock Controller block diagram separated
12	478	CKSC_IPLL1S_CTL location corrected
12	478	change: "If the High Speed IntOsc clock ..." -> "Only if the High Speed IntOsc clock ..."
12	478	correction: High Speed IntOsc clock fRH stop is indicated by ROSC.ROSCCLKACT = 0
12	479	typo correction (comain -> domain)
12	480	APB_CLK_RATIO selector included in diagram
12	481	typo correction (CLMA3RES -> INTCLMA3TI)
12	481	typo correction (CLMA4RES -> INTCLMA4TI)
12	481	typo correction ("CLMA3RES or CLMA4RES" -> "INTCLMA3TI or INTCLMA4TI")
12	481	typo corrections in diagram 9 (CLMA3RES -> INTCLMA3TI, CLMA4RES -> INTCLMA4TI)
12	482	typo correction ("CLMA3RES or CLMA4RES" -> "INTCLMA3TI or INTCLMA4TI")
12	482	caution added
12	483	correction: "It can not be stopped by software, but can be automatically ..." -> "It can be automatically ..."
12	484	typo correction ("stop mask change" -> "clock selector change")
12	485	"when a waveform is output from the MainOsc" added
12	486	"and the oscillation stabilization time is counted" added
12	486	typo correction (MOSCSTPM.MOSCSTPMSK = 1: STOP request signal is masked)
12	487	"SubOsc stabilization" corrected
12	487	"SubOsc STOP requests in DEEPSTOP mode" removed
12	488	exchanged "SubOsc enable trigger" with "SubOsc enable trigger/disable trigger"

Revision 1.00 History, Date Feb 27, 2015 (7/37)

Section	Page	Summary
12	489	correction in diagram: POC0RES -> PURES
12	489	typo correction ("After reset release after release from Power-On-Clear 0 reset (POC0RES)" -> "After reset release from Power-up reset (PURES)"
12	489	note concerning High Speed IntOsc start/stop changed
12	495	typo correction (fPPLkCLK -> fPLLkCLK)
12	495	fractional part PLLkCNF removed from PLL0 and PLL1
12	495	PLL1 correction: PLL1 settings are product dependend
12	495	typo correction (PLL1C.NI[5:0] -> PLL2C.NI[5:0])
12	495	Pr value tables separated
12	496	PLL1 frequency ranges corrected
12	497	SubOsc stop mask register removed from table
12	497	SubOsc stabilization time register added in table
12	498	PBUS clock ratio selection register added
12	498	typo correction (CKSC_AAWOTD_STMP -> CKSC_AAWOTD_STPM)
12	498	CKSC_AWDTA0D_ACT register added
12	499	Write protection registers list added
12	500	note 1 concerning stopping MainOsc changed
12	502	addition concerning MOSCC writing
12	503	addition concerning MOSCST writing
12	503	typo correction (ROSCCLKSCT -> ROSCCLKST)
12	503	typo correction (ROSCCLKSCT -> ROSCCLKST)
12	504	typo correction (MOSCSTMP -> MOSCSTPM)
12	505	note 1 concerning stopping SubOsc changed
12	506	section "SOSCSTPM — SubOsc Stop Mask Register" removed
12	507	"SOSCST — SubOsc stabilization time register" added
12	508	reset sources of ROSCE corrected
12	508	note 1 concerning stopping High Speed IntOsc changed
12	509	reset sources of ROSCS corrected
12	509	section "ROSCST — High Speed IntOsc stabilization time register" removed
12	510	reset sources of ROSCSTPM corrected
12	511	note 1 concerning stopping PLL0 changed
12	513	typo correction (fPPL0CLK -> fPLL0CLK)
12	513	fractional part PLL0.NF[3:0] removed
12	513	frequency range for FVV[2:0] settings corrrected
12	515	frequency range for P[2:0] settings corrrected
12	516	NI[6:0] settings corrected
12	519	PLL1C description separated for different devices and corrected all settings
12	519	typo correction (fPPL1CLK -> fPLL1CLK)
12	519	fractional part PLL1.NF[3:0] removed
12	525	typo correction (fPPL0CLK -> fPLL2CLK)
12	526	NI[5:0] settings corrected
12	528	note added concerning CKSC_IPLL0S_ACT register
12	530	note added concerning CKSC_IPLL1S_ACT register
12	532	CKDV_ICLKJITD_STAT initial value corrected

Revision 1.00 History, Date Feb 27, 2015 (8/37)

Section	Page	Summary
12	536	CKDV_ICLKFIXD_STAT initial value corrected
12	539	addition: PLL2CLK selection only for D1M2(H)
12	541	addition: CKSC_ISDRBS_CTL not for all products available
12	542	addition: CKSC_ISDRBS_ACT not for all products available
12	543	note 1 added
12	543	caution added
12	551	addition: CKSC_IXCETNBS_CTL not for all products available
12	552	addition: CKSC_IXCETNBS_ACT not for all products available
12	553	addition: CKSC_IPCMLBBS_CTL not available for all products
12	554	addition: CKSC_IPCMLBBS_ACT not available for all products
12	555	addition: CKSC_IXCMLBBS_CTL not available for all products
12	556	addition: CKSC_IXCMLBBS_ACT not available for all products
12	556	CKSC_IXCMLBBS_ACT initial value corrected
12	559	APB_CLK_RATIO register description added
12	564	AWOTDSTPMSK description changed
12	567	typo correction ("High Speed IntOsc fRL" -> "High Speed IntOsc fRH"
12	567	note added
12	571	RTCADSTPMSK description changed
12	572	addition: PLL2CLK/4 selection only for D1M2(H)
12	572	caution added concerning PLL0CLK and PLL1CLK FOUT
12	575	addition: CKSC_IMLBBS_CTL not for all products available
12	576	addition: CKSC_IMLBBS_ACT not for all products available
12	578	CKSC_ISFMAS_ACT initial value corrected
12	579	SFMADCSID[2:0] description corrected
12	580	typo correction (ISFMAD -> SFMAD)
12	581	CKSC_IRSCAND_CTL initial value corrected
12	582	CKSC_IRSCAND_ACT initial value corrected
12	582	correction: RSCANDACT[1:0] -> RSCANDACT[2:0]
12	582	note added concerning CKSC_IRSCAND_ACT register
12	584	CKSC_IRSCANXINS_ACT initial value corrected
12	596	typo correction ("C_ISO_LCBI clock active register" -> "C_ISO_LCBI source clock active register")
12	596	CKSC_ILCBIS_ACT initial value corrected
12	598	note added concerning CKSC_IADCED_ACT register
12	601	CKSC_IRLINS_CTL initial value corrected
12	601	RLINSCSID[1:0] description corrected
12	603	PLLk and SubOsc configuration order swapped
12	603	typo correction (CKSC_IPLLkS_CTL.PLLkSTP -> CKSC_IPLLkS_CTL.PLLkSSTP)
12	603	item added in "Configure the SubOsc"
12	603	actions order to activate C_ISO_XCCLK changed
12	603	typo correction ("the the" -> "the")
12	605	typo correction (regsiters -> registers)
12	605	cautions added concerning changing the source clock via the clock selectors and clock supply for registers access
12	606	targets for SDRBCLK clock corrected

Revision 1.00 History, Date Feb 27, 2015 (9/37)

Section	Page	Summary
12	606	typo correction (regsiters -> registers)
12	606	"Base clocks maximum frequencies" table added
12	606	order of divisors changed
12	606	addition: ETNBXCCLK not for all products available
12	606	addition: MLBBCLK not for all products available
12	606	addition: MLBBXCCLK not for all products available
12	607	"CPU and buses subsystems clocks maximum frequencies" table added
12	607	correction "Each AWO clock domain ..." -> "Each AWO clock domain except for C_AWO_WDTA0 ..."
12	607	order of selections changed
12	607	divisor options corrected
12	608	order of selections changed
12	608	addition: PLL2CLK/4 not for all products available
12	608	typo correction (regsiters -> registers)
12	608	"Always-On-Area clock domain clocks maximum frequencies" table added
12	608	CKSC_IRSCAND_CTL default value corrected
12	609	typo correction (C_ISO_SOSTM -> C_ISO_OSTM)
12	609	typo correction (regsiters -> registers)
12	609	note 3 added
12	610	"Isolated-Area clock domain clocks maximum frequencies" table added
12	611	divider range corrected: "1 to 511" -> "1 to 512"
12	611	FOUTDIV.FOUTDIV[x:x] corrected to FOUTDIV.FOUTDIV[9:0]
12	612	FOUTDIV reset source corrected
12	612	note *1 added and 000H declared as default
12	613	correction: "This register defines the clock divisor." -> "This register defines the clock divider status."
12	613	FOUTSTAT reset source corrected
12	613	FOUTCLKACT description corrected
12	613	FOUTSYNC description corrected
12	614	number of clock monitor units corrected
12	614	CLMAn clock supply table completed
12	617	addition: CLMAOTCTL0 not for all product available
12	620	note added concerning PLL jitter
12	621	"Notification of Abnormal Clock Frequency" corrected
12	621	"CLMAn Enable (Write to CLMAnCTL0)" description changed
12	621	"(1) Initial value of CLMAnCTL0" and "(2) Procedures to enable CLMAn" removed
12	622	"Write protection registers" added in table
12	622	reference to register base addresses table corrected
12	623	reference to "Write-Protected Registers" section corrected
12	623	change: readable/writable -> read/written
12	623	note added concerning reset source of CLMA[2:0]CTL
12	624	reference to calculation methods corrected
12	624	change: readable/writable -> read/written
12	624	note added concerning reset source of CLMA[2:0]CMPH
12	624	CLMAnCMPH[11:0] formula corrected

Revision 1.00 History, Date Feb 27, 2015 (10/37)

Section	Page	Summary
12	625	reference to calculation methods corrected
12	625	change: readable/writable -> read/written
12	625	note added concerning reset source of CLMA[2:0]CMPL
12	626	explanation concerning register write protection changed
12	626	reset sources for CLMATEST corrected
12	626	typo correction ("Value after reset" -> "Initial value")
12	626	typo correction ("Value after reset" -> "Initial value")
12	626	typo correction ("1:" -> "1")
12	626	RESCLM description corrected
12	627	reset sources for CLMATESTS corrected
12	627	typo correction ("Value after reset" -> "Initial value")
12	627	typo correction ("Value after reset" -> "Initial value")
12	628	explanation concerning register write protection changed
12	628	reset sources for CLMATEST2 corrected
12	628	typo correction ("Value after reset" -> "Initial value")
12	628	typo correction ("Value after reset" -> "Initial value")
12	628	typo correction ("1:" -> "1")
12	628	RESCLM description corrected
12	629	reset sources for CLMATESTS2 corrected
12	629	typo correction ("Value after reset" -> "Initial value")
12	629	typo correction ("Value after reset" -> "Initial value")
12	630	explanation concerning register write protection changed
12	630	reset sources for CLMATEST3 corrected
12	630	typo correction ("Value after reset" -> "Initial value")
12	630	typo correction ("Value after reset" -> "Initial value")
12	630	addition: CLMA6TESEN not for all products available
12	630	addition: CLMA5TESEN not for all products available
12	630	typo correction ("1:" -> "1")
12	630	RESCLM description corrected
12	631	reset sources for CLMATESTS3 corrected
12	631	typo correction ("Value after reset" -> "Initial value")
12	631	typo correction ("Value after reset" -> "Initial value")
12	631	addition: CLMA6ERRS not for all products available
12	631	addition: CLMA5ERRS not for all products available
12	632	change: readable/writable -> read/written
13	633	"Clock Supply" added
13	634	caution added concerning usage of external interrupts for DEEPSTOP wake-up
13	634	note added concerning OCD wake-up by breakpoint hit
13	635	correction: "In order to clear a wake-up factor flag of the wake-up factor register (WUF0), its assigned bit has to be set to 1." moved under previous bullet paragraph
13	635	typo correction ("does not mean, that the" -> "does not mean that the")
13	635	improved description concerning setting of wake-up factor bits
13	635	sentence concerning I/O buffers in DEEPSTOP mode rephrased
13	636	notes concerning I/O buffers in DEEPSTOP mode corrected

Revision 1.00 History, Date Feb 27, 2015 (11/37)

Section	Page	Summary
13	636	correction: "Thus it is recommended to switch off the the DDR2-SDRAM I/F supply SDRBVCC." -> "Thus the DDR2-SDRAM I/F supply SDRBVCC must be switched off."
13	636	"SOSCSTPM: SubOsc" removed
13	637	note 6 added
13	639	"Stand-by Controller Registers overview" moved in separate section
13	639	correction: WUFMSK0 initial value is FFFF FFFFH
13	641	Initial value corrected
13	641	correction: bits 31 to 19 are reserved
13	642	correction: bits 31 to 19 are reserved
13	643	typo correction ("WUFC0:" removed)
13	643	correction: bits 31 to 19 are reserved
14	651	"List of XC1 QoS Register" added
14	658	SFMA and module registers access options corrected
14	660	SFMA and module registers access options corrected
14	663	CPU-Subsystem, SFMA, SDRA and module registers access options corrected
14	668	CPU-Subsystem, SFMA and module registers access options corrected
14	668	correction: GPU2D and MLBB can write to CPU Subsystem
14	668	Note 5 for Sprite Unit 2 corrected
14	671	JCUA latency numbers corrected
14	675	correction: "ECCRAN0" -> "ECCRCAN0 / ECCRCFD0,1*1"
14	675	correction: "RSCAN" -> "RSCAN / RSCFD0*1"
14	678	correction: P50A_ERR_SLV -> P32A_ERRSLV
14	678	correction: P50B_ERR_SLV -> P32B_ERRSLV
14	681	PEID[2:0] description corrected
14	682	note added
14	684	addition concerning PEG Protection set up
14	685	typo correction (GnMask -> PEGGnMK)
14	686	note added
14	687	"Internal Peripheral Guard error signals" section removed
14	703	note added concerning XCG for SDR-SDRAM Memory Controller (SDRA)
14	708	note added concerning accesses after register modifications
14	716	typo correction ("Read error address register" -> "Write error address register")
14	718	typo correction ("Read error type register" -> "Write error type register")
15	719	"SDR-SDRAM Memory Controller (SDRA)" completed
15	720	Underflow flag of auto refresh cycle interrupt (INTSDRA) added
15	736	LV1TH condition corrected
15	740	"xx = 00B: 8 bit memory width" removed
15	740	"y = 1: 8 banks" removed
16	755	note added concerning accesses after register modifications
16	797	PHYBUS_ WIDTH description corrected
17	825	typo correction (SPBMO0 -> SPBMO1)
17	825	typo correction (SPBMI0 -> SPBMI1)
17	827	SPODLY and CLKDLY registers in block diagram included
17	828	SMWDR0/1 access size corrected

Revision 1.00 History, Date Feb 27, 2015 (12/37)

Section	Page	Summary
17	828	SPODLY initial value corrected
17	830	CPHAT-CPHAR settings corrected
17	830	typo correction (COHAR -> CPHAR)
17	834	BFM[2:0] description corrected
17	834	typo correction (Furhter -> Further)
17	835	RBE decription corrected
17	857	SPODLY initial value corrected
17	860	typo correction (DRECR -> DRCR)
17	862	data width corrected in figure
17	865	SPI command issue and AC characteristics set up included in flow
17	866	correction: "purpose" -> "tag address"
17	867	correction: "set to 1 to when the TEND bit is set to 1" -> "when the TEND bit in CMNSR is set to 1"
17	868	AC characteristics set up included in flow
17	881	correction: "SPBCLK is maximum 40 MHz." -> "SPBCLK is maximum 40 MHz by SPBR[7:0] = 1."
17	882	typo correction (CKLDYOC[2:0] -> CKDLYOC[2:0])
17	882	typo correction (CKLDYRX[2:0] -> CKDLYRX[2:0])
17	882	typo correction (CKLDY.CKLDYRX[2:0] -> CKDLY.CKDLYRX[2:0])
18	886	CSIGTSSO signals removed from table
18	889	"Functional Overview Description" modified
18	890	"Main Registers of CSIG" table title added
18	891	note added
18	896	"over clearing to 0" removed
18	897	"over clearing to 0" removed
18	897	"over clearing to 0" removed
18	899	reference to "Section 18.5.7, Communication in Slave Mode" removed
18	903	change: "This register is initialized when ..." -> "These bits are initialized when ..."
18	903	change: "values of the register must be read" -> "values of these bits must be read"
18	905	correction: "When writing, always write 0." -> "When writing, always write 1."
18	905	CSIGnBCTL0.CSIGnSCE write caution changed
18	910	"When the BRG is disabled, CSIGTSCK stays on the level specified by CSIGnCTL1.CSIGnCKR." removed
18	911	"in transmit-only mode or transmit/receive mode (CSIGnCTL0.CSIGnTXE = 1)" added
18	913	text order changed
18	913	correction: "it is not necessary to write data to the CSIGnTX0W or CSIGnTX0H register of the slave" -> "it is not necessary to read data from the CSIGnRX0 register of the slave"
18	913	correction: "In receive-only mode, any previously ..." -> "In slave mode, any previously ..."
18	916	figure corrected
18	916	figure corrected
18	920	diagram corrected
18	921	change: "Overrun error" -> "Overrun error (received data)"
18	922	addition concerning parity check in EDL
18	924	diagram corrected
18	925	typo correction (INTCSIGTIC -> INTCSIGTIR)

Revision 1.00 History, Date Feb 27, 2015 (13/37)

Section	Page	Summary
18	925	step 6 changed
19	930	CSIH FIFO size corrected to 16
19	931	"Main Registers of CSIH" table title added
19	932	RAM size in diagram corrected to "16 x 32 bit"
19	932	note added concerning FIFO buffer size
19	934	note added
19	937	change: "handshake mode" -> "handshake function"
19	937	change: "Input signal CSIHTSSI is ignored" -> "Input signal CSIHTSSI is disabled"
19	940	text added concerning time-out error in slave mode
19	942	CSIHnTSF description changed
19	943	change: "Transmission is in progress or being prepared" -> "Communication is in progress or being prepared"
19	954	"requires that the EDL function is used (see also Section 19.5.8.2, Data Length Greater than 16 Bits)." removed
19	965	"Transmit-only buffer" and "Dual buffer" separated
19	966	"(The setting of the CSIHnSIT bit is invalid in slave mode.)" added
19	974	change "The example below shows the communication in master mode for 8 data bits" -> "The example below shows the communication in master mode for 8-bit data"
19	975	addition to note
19	976	change: "by using the bit CSIHnCTL1.CSIHnSSE" -> "by using the CSIHnCTL1.CSIHnSSE bit"
19	977	"in transmit-only mode or transmit/receive mode (CSIHnCTL0.CSIHnTXE = 1)" added
19	980	correction in diagram: "Inter-data time" -> "Idle time"
19	986	"The size is 128 words." removed
19	987	typo correction (CSIHnMCTL2.CSIHnND[6:0] -> CSIHnMCTL2.CSIHnND[7:0])
19	987	ranges corrected
19	987	typo correction (CSIHnMCTL2.CSIHnND[6:0] -> CSIHnMCTL2.CSIHnND[7:0])
19	988	change: "when bit CSIHnMCTL2.CSIHnBTST is set" -> "when the CSIHnMCTL2.CSIHnBTST bit is set"
19	988	change: "when bit CSIHnMCTL2.CSIHnBTST is set" -> "when the CSIHnMCTL2.CSIHnBTST bit is set"
19	988	change: "when bit CSIHnMCTL2.CSIHnBTST is set" -> "when the CSIHnMCTL2.CSIHnBTST bit is set"
19	989	change: "setting bit CSIHnCTL1.CSIHnEDLE to 1" -> "setting the CSIHnCTL1.CSIHnEDLE bit to 1"
19	991	diagram corrected
19	992	change: "CSIH is set to transmit/receive mode" -> "The transmit/receive mode is set"
19	992	change: "The “transmission in progress” flag" -> "The transfer status flag"
19	993	change: "by bit CSIHnCTL1.CSIHnHSE" -> "by the CSIHnCTL1.CSIHnHSE bit"
19	993	change: "The timing depends on the data phase selection bit, CSIHnCFGx.CSIHnDAPx setting." -> "The busy timing depends on the data phase selection bit CSIHnCFGx.CSIHnDAPx."
19	996	"while CSIHnCTL1.CSIHnHSE = 1" added
19	997	change: "by bit CSIHnCTL1.CSIHnDCS" -> "by the CSIHnCTL1.CSIHnDCS bit"
19	997	change: "Bit CSIHnSTR0.CSIHnDCE is set." -> "The CSIHnSTR0.CSIHnDCE bit is set."
19	998	change: "Bit CSIHnSTR0.CSIHnPE is set." -> "The CSIHnSTR0.CSIHnPE bit is set."
19	1000	change: "Bit CSIHnSTR0.CSIHnPCT is set." -> "The CSIHnSTR0.CSIHnPCT bit is set."

Revision 1.00 History, Date Feb 27, 2015 (14/37)

Section	Page	Summary
19	1000	change: "Bit CSIHnSTR0.CSIHnTMOE is set." -> "The CSIHnSTR0.CSIHnTMOE bit is set."
19	1000	addition concenring CSIH0 dedicated time-out counter
19	1000	addition concenring CSIH1 dedicated time-out counter
19	1001	change: "Bit CSIHnSTR0.CSIHnOFE is set." -> "The CSIHnSTR0.CSIHnOFE bit is set."
19	1004	change: "Bit CSIHnSTR0.CSIHnOVE is set." -> "The CSIHnSTR0.CSIHnOVE bit is set."
19	1005	explanation concerning loop-back mode changed
19	1005	diagram corrected
19	1008	typo correction (CSIHTIJC -> INTCSIHTIJC)
19	1011	typo correction ("CS0 to CS3" -> "CSIHTCSS0 to CSIHTCSS3"
19	1011	"bits" removed
19	1011	change: "CSIHnRXE = 1 (permits reception), CSIHnMBS = 1" -> "CSIHnRXE = 1 (permits reception), and CSIHnMBS = 1"
19	1014	CSIHnMCTL2.CSIHnSOP[6:0] values in diagram corrected
19	1014	typo correction ("CS0 to CS3" -> "CSIHTCSS0 to CSIHTCSS3"
19	1014	"the bits" removed
19	1014	change: "by setting bits CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0]" -> "by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits"
19	1014	change: "Bit CSIHnMCTL2.CSIHnSOP[6:0] is automatically" -> "The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically"
19	1014	change: "and bit CSIHnMCTL2.CSIHnND[7:0] is decremented" -> "and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented"
19	1015	CSIHnMCTL2.CSIHnSOP[6:0] values in diagram corrected
19	1016	typo correction ("CS1, CS3 and CS7" -> "CSIHTCSS0, CSIHTCSS3, and CSIHTCSS7"
19	1016	"bits" removed
19	1016	change: "by setting bits CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0]" -> "by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits"
19	1016	change: "Bit CSIHnMCTL2.CSIHnSOP[6:0] is automatically incremented and bit CSIHnMCTL2.CSIHnND[7:0] is decremented after each data transmission" -> "The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission"
19	1017	CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMRWP0.CSIHnRRA[6:0] values in diagram corrected
19	1018	typo correction ("CS0 to CS3" -> "CSIHTCSS0 to CSIHTCSS3"
19	1018	"bits" removed
19	1018	change: "by setting CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0]" -> "by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits"
19	1018	change: "Bit CSIHnMCTL2.CSIHnSOP[6:0] is automatically incremented and bit CSIHnMCTL2.CSIHnND[7:0] is decremented after each data transmission." -> "The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission."
19	1019	CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMRWP0.CSIHnRRA[6:0] values in diagram corrected
19	1019	typo correction ("CS0 to CS7" -> "CSIHTCSS0 to CSIHTCSS7"
19	1019	"bits" removed
19	1019	change: "permits reception" -> "permits the reception"

Revision 1.00 History, Date Feb 27, 2015 (15/37)

Section	Page	Summary
19	1019	change: "by setting bits CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0]" -> "by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits"
19	1019	change: "Bit CSIHnMCTL2.CSIHnSOP[6:0] is automatically incremented, and bits CSIHnMCTL2.CSIHnND[7:0] is decremented" -> "The CSIHnMCTL2.CSIHnSOP[6:0] are automatically incremented, and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented"
19	1021	CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMRWP0.CSIHnRRA[6:0] values in diagram corrected
19	1021	"bits" removed
19	1021	change: "permits reception" -> "permits the reception"
19	1021	change: "by setting CSIHnMCTL2.CSIHnSOP[6:0] and the number of data by setting CSIHnMCTL2.CSIHnND[7:0]." -> "by setting the CSIHnMCTL2.CSIHnSOP[6:0] bits and the number of data by setting the CSIHnMCTL2.CSIHnND[7:0] bits."
19	1021	change: "Bit CSIHnMCTL2.CSIHnSOP[6:0] is automatically incremented and bit CSIHnMCTL2.CSIHnND[7:0] is decremented after each data transmission" -> "The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission"
19	1023	typo correction ("CS0 to CS3" -> "CSIHTCSS0 to CSIHTCSS3"
19	1025	CSIHTSOE signal removed from diagram
19	1025	typo correction ("CS0 to CS7" -> "CSIHTCSS0 to CSIHTCSS7"
19	1025	"bit" removed
19	1025	change: "Make sure CSIHnSTR0.CSIHnFLF" -> "Make sure that CSIHnSTR0.CSIHnFLF"
19	1025	"bits" removed
20	1027	typo correction (RLIN3nLCUC -> RLN3nLCUC)
20	1027	typo correction (RLIN3nLDBR1 -> RLN3nLDBRb)
20	1034	correction: "LIN / UART ID buffer register" -> "LIN ID buffer register"
20	1045	correction in entire table: "interrupt" -> "interrupt request"
20	1045	typo correction ("interrupt" -> "interrupt request")
20	1045	correction: "Interrupt" -> "Interrupt Request"
20	1045	correction: "Interrupt" -> "Interrupt Request"
20	1045	correction: "Interrupt" -> "Interrupt Request"
20	1046	correction: "Interrupt" -> "Interrupt Request"
20	1066	"to be received as expected value" removed
20	1073	"However, when this bit is 1, an interrupt is not generated upon completion of transmission from the UART buffer." removed
20	1078	"Setting range: 00H to FFH." added
20	1078	explanation concerning bit arrangement in RLN3nLUDB0 added
20	1079	"Setting range: 00H to FFH." added
20	1079	explanation concerning bit arrangement in RLN3nLUDB0 added
20	1080	"UROE Bit (Reception Enable)" explanation improved
20	1089	paragraph concerning prescaler settings removed
20	1095	correction in diagram: Synchronized RLIN3RX adjusted
20	1098	typo correction in diagram (RLIN3nLST -> RLN3nLST)
20	1108	"Synchronized RLIN3nRX" added in diagram
20	1110	correction in diagram: "1 or 2 stop bits" -> "stop bit"
20	1111	timing relation of signals in diagram adjusted

Revision 1.00 History, Date Feb 27, 2015 (16/37)

Section	Page	Summary
20	1112	correction in diagram: RLIN3LUOR1 -> RLN3LUOR1
20	1112	correction in diagram: RLIN3nLEST -> RLN3nLEST
20	1113	correction in diagram: RLIN3nLEST -> RLN3nLEST
20	1114	corrections in diagram: RLIN3nLEST -> RLN3nLEST, RLIN3nLIDB -> RLN3nLIDB
20	1114	note added
20	1119	explanation added
20	1120	explanation added
20	1122	typo correction in diagram (RLIN3nLBRPx -> RLN3nLBRPx)
20	1123	formula for baud rate removed
20	1124	figure corrected
20	1125	diagram improved
21	1126	note added concerning RIIC clock supply
21	1127	addition to RIIC I/O signals
21	1136	BBSY explanation changed
21	1137	correction: "master transmit mode" -> "master mode"
21	1138	TRS Bit [Setting conditions] changed
21	1138	TRS Bit [Clearing conditions] changed
21	1139	caution added concerning BBSY Flag
21	1140	access type for MTWP bit corrected
21	1140	BCWP explanation corrected
21	1141	BC[2:0] Bits explanation corrected
21	1142	TMOH explanation changed
21	1143	TMOL explanation changed
21	1143	typo correction ([fm] -> [Fm])
21	1145	ACKBT Bit description changed
21	1147	MALE description changed
21	1148	MALE Bit description changed
21	1148	NALE Bit changed
21	1148	NACKE Bit description changed
21	1148	SCLE Bit description changed
21	1152	RIE Bit description changed
21	1153	R/W indicator of bit 2 and 3 corrected
21	1155	DID Flag [Setting condition] changed
21	1157	TMOF Flag [Setting condition] changed
21	1159	RDRF Flag [Setting conditions] changed
21	1160	TDRE Flag [Setting conditions] changed
21	1161	SVA[9:1] description corrected
21	1162	correction: SVA[9:1] Bits are upper address bits
21	1163	typo ciorrection ([fm] -> [Fm])
21	1164	correction in formula: "RIICnBRH+1)/ IICφ" -> "(RIICnBRH+1)/ IICφ"
21	1164	correction in formula: "RIICnBRH+3)" -> "(RIICnBRH+3)"
21	1165	typo correction ("tf: SCL line rising time" -> "tf: SCL line falling time"
21	1165	"Duty cycle: 0% < Duty < 100%" added
21	1170	diagram corrected

Revision 1.00 History, Date Feb 27, 2015 (17/37)

Section	Page	Summary
21	1170	"A#:" explanation added
21	1171	additional remark concerning initial settings
21	1172	correction: "in response to setting of the TRS bit to 1" -> "in response to setting of the TRS and MST bits to 1"
21	1172	typo correction (W -> W#)
21	1176	explanation concerning master reception with 10-bit address changed
21	1177	diagram corrected
21	1178	correction in diagram: "Set RIICnMR3.ACKBT" -> "RIICnMR3.ACKBT = 1"
21	1180	Slave Transmit Operation (1) changed
21	1181	Slave Transmit Operation (6) changed
21	1181	correction in diagram: "[1] ... [6]" -> "[1] ... [7]"
21	1183	Slave Receive Operation (1) changed
21	1183	Slave Receive Operation (5) changed
21	1187	diagram corrected
21	1187	note corrected
21	1189	"Slave-Address Match Detection" explanation corrected
21	1192	correction in diagram: shift of DID rising edge
21	1193	typo correction (Automatically -> Automatic)
21	1193	explanation improved
21	1193	bulleted item added in <Master transmit mode>
21	1193	bulleted item added in <Slave transmit mode>
21	1198	explanation added concerning TRS bit
21	1199	"immediately cancels the slave match condition and" removed
21	1200	"is immediately released from the slave-matched state and" removed
21	1201	explanation changed
21	1201	diagram corrected (8 -> 9)
21	1204	corection in diagram: TMOS settings swappped
21	1205	[Output conditions for using the RIICnCR1.CLO bit] replace with [Additional output conditions for the SCL clock]
21	1206	typo correction (CKS2-0 -> CKS[2:0])
21	1206	typo correction (BC2-0 ->BC[2:0])
21	1206	typo correction (NF1-0 -> NF[1:0])
21	1207	note 1 changed
22	1286	channel index (n -> m) corrected in "CFTML[3:0] Bits"
22	1394	reference to FEINTFMSK register removed
22	1394	caution concerning RS-CAN RAM initialization changed
22	1398	typo correction ("sy nd rom" -> "syndrome")
23	1405	correction: RSCFDnXXX -> RSCANnXXX
23	1406	explanation of index "x" modified
23	1406	typo correction (p = 0 -> q = 0)
23	1407	typo correction (RSCAN0 -> RSCFD0)
23	1407	typo correction (RSCAN0 -> CAN0)
23	1407	typo correction (RSCAN0 -> CAN1)
23	1407	typo correction (RSCAN0 -> CAN0)
23	1407	note added concerning RS-CANFD interrupts and wake-up factors

Revision 1.00 History, Date Feb 27, 2015 (18/37)

Section	Page	Summary
23	1408	typo correction (m = 0 to 3 -> (m = 0 to 2)
23	1408	CANmDREN signals added
23	1409	"Protocol" specification modified
23	1409	"Communication speed" specification modified
23	1409	correction: RSCFDnCmCFG -> RSCANnCmCFG
23	1410	"Transmit history function" specification modified
23	1411	section "Interface Modes" added
23	1411	"Test function" specification modified
23	1412	block diagram modified
23	1412	corrections: RSCFDnCmCFG -> RSCANnCmCFG
23	1412	additional hint concerning clock settings in CAN FD mode
23	1413	register prefix "RSCFD" changed to "RSCANn" in entire "Registers (Classical CAN Mode)" section
23	1413	Global TX Interrupt Status Register 1 (RSCFDnGTINTSTS1) removed
23	1420	"CRCT Bit" explanation concerning communication with other CAN nodes modified
23	1438	typo correction (m = 0 to 5 -> m = 0 to 2)
23	1441	typo correction (RCAN0TMSTSp -> RSCFDnTMSTSp)
23	1441	typo correction (RCAN0TMSTSp -> RSCFDnTMSTSp)
23	1442	"RSCFDnGTINTSTS1 - Global TX Interrupt Status Register 1" removed
23	1450	register name RSCFDnGAFLP0j changed to RSCFDnGAFLP0_j
23	1450	typo correction (GAFLRVM -> GAFLRMV)
23	1452	register name RSCFDnGAFLP1j changed to RSCFDnGAFLP1_j
23	1457	register name RSCFDnRMDF0q changed to RSCFDnRMDF0_q
23	1458	register name RSCFDnRMDF1q changed to RSCFDnRMDF1_q
23	1466	register name RSCFDnRFDF0x changed to RSCFDnRFDF0_x
23	1467	register name RSCFDnRFDF1x changed to RSCFDnRFDF1_x
23	1469	typo correction (16 × n -> 16 × m)
23	1481	register name RSCFDnCFDF0k changed to RSCFDnCFDF0_k
23	1482	register name RSCFDnCFDF1k changed to RSCFDnCFDF1_k
23	1483	correction: 0001 FFFFH -> 03FF FFFFH
23	1490	typo correction (k = 0 to 17 -> k = 0 to 8)
23	1497	"THLEN Bit" explanation modified
23	1500	register name RSCFDnTMDF0p changed to RSCFDnTMDF0_p
23	1501	register name RSCFDnTMDF1p changed to RSCFDnTMDF1_p
23	1502	"TMIEp Bit Assignment" corrected
23	1504	typo correction (y = 0 to 2 -> y = 0, 1)
23	1505	"TMTRSTp Bit Assignment" corrected
23	1506	"TMTARSTp Bit Assignment" corrected
23	1508	"TMTCSTSp Bit Assignment" corrected
23	1510	typo correction (y = 0 to 2 -> y = 0, 1)
23	1510	"TMTASTSp Bit Assignment" corrected
23	1529	Global TX Interrupt Status Register 1 (RSCFDnCFDGTINTSTS1) removed
23	1530	FIFO DMA-related registers removed
23	1533	"RCMC Bit" explanation modified

Revision 1.00 History, Date Feb 27, 2015 (19/37)

Section	Page	Summary
23	1534	typo correction (m = 0 to 5 -> m = 0 to 2)
23	1535	cross reference corrected
23	1535	"NTSEG2[4:0] Bits" explanation modified
23	1537	SOCOIE bit description changed
23	1537	"ROM Bit" explanation modified
23	1538	"CRCT Bit" explanation concerning communication with other CAN nodes modified
23	1541	RSCFDnCFDCmSTS access description corrected
23	1549	explanation concerning RSCFDnCFDCmDCFG register access modified
23	1549	cross reference corrected
23	1549	"DTSEG2[2:0] Bits" explanation modified
23	1550	"TDCO[6:0]" explanation modified
23	1551	correction: Error Counting Method Select -> Error Occurrence Method Select
23	1551	removed "This gateway function cannot receive CAN FD frames with a payload length of more than 8 bytes."
23	1551	removed "Modify this bit only in channel reset mode."
23	1552	Table 1.101 explanation modified
23	1552	CAN mode format names modified
23	1552	"TDCO[6: 0] Bits" explanation modified
23	1552	"ESIC Bit" explanation modified
23	1552	"Error active" description modified
23	1552	"TDCE Bit" explanation modified
23	1553	"EOCCFG[2: 0] Bits" explanation modified
23	1554	"SOCCLR" function modified
23	1554	"EOCCLR" function modified
23	1554	"SOCCLR Bit" explanation modified
23	1554	"EOCCLR Bit" explanation modified
23	1555	RSCFDnCFDCmFDSTS register access description corrected
23	1555	typo correction (TDCV -> TDCVF)
23	1555	correction: communication success counter -> successful occurrence counter
23	1555	"EOC[7:0]" function modified
23	1555	"SOCO" function modified
23	1555	"EOCO" function modified
23	1555	"TDCVF" function modified
23	1555	"TDCR[6"0]" function modified
23	1555	"SOC[7: 0] Bits" explanation modified
23	1556	"EOC[7: 0] Bits" explanation modified
23	1556	"SOCO Flag" explanation modified
23	1556	"EOCO Flag" explanation modified
23	1556	"TDCVF Flag" explanation modified
23	1556	"TDCR[6:0] Flag" explanation modified
23	1558	TSBTCS[2:0] bits added
23	1558	TSSS bit added
23	1559	"TSBTCS[2:0] Bits" explanation added
23	1560	"TSSS Bit" explanation added

Revision 1.00 History, Date Feb 27, 2015 (20/37)

Section	Page	Summary
23	1560	correction: RSCFDnCFDCFCCd -> RSCFDnCFDCFCCk
23	1567	"EEFm Flag" explanation modified
23	1567	typo correction (m = 0 to 5 -> m = 0 to 2)
23	1568	"TS[15:0] Bits" explanation modified
23	1570	typo correction (RCANnCFDTMSTSp -> RSCFDnCFDTMSTSp)
23	1570	typo correction (RCANnCFDTMSTSp -> RSCFDnCFDTMSTSp)
23	1571	RSCFDnCFDGTINTSTS1 register removed
23	1574	RSCFDnCFDGAFLCFG1 register removed
23	1579	register name RSCFDnCFDGAFLP0j changed to RSCFDnCFDGAFLP0_j
23	1579	typo correction (GAFLRVM -> GAFLRMV)
23	1581	register name RSCFDnCFDGAFLP1j changed to RSCFDnCFDGAFLP1_j
23	1582	typo correction (0 to 96 -> 0 to 47)
23	1594	hint concening enabled DMA trasfer request removed
23	1594	correction: RSCFDnCFDRFDF0x -> RSCFDnCFDRFFDSTSx
23	1594	correction: RSCFDnCFDRFDF1x -> RSCFDnCFDRFDFd_x
23	1595	correction: RSCFDnRFIDxH -> RSCFDnCFDRFIDxH
23	1600	correction: RSCFDnCFDRFPTRq -> RSCFDnCFDRFPTRx
23	1601	CFITSS bit added
23	1603	"CFITSS Bit" explanation modified
23	1604	correction: RSCFDnCFCCk -> RSCFDnCFDCFCCk
23	1608	hint concening enabled DMA trasfer request removed
23	1610	CFRTR function modified
23	1611	"CFRTR Bit" explanation modified
23	1616	register name RSCFDnCFDCFDFdk changed to RSCFDnCFDCFDFd_k
23	1616	correction: RSCAN0CFCCk -> RSCFDnCFDCFCCk
23	1616	correction: RSCAN0CFPTRk -> RSCFDnCFDCFPTRk
23	1617	correction: 0001 FFFFH -> 03FF FFFFH
23	1624	typo correction (k = 0 to 17 -> k = 0 to 8)
23	1625	"Details of FIFO DMA-Related Registers" removed
23	1626	description concerning RSCFDnCFDTMCp registers correspondence corrected
23	1630	TMRTR function modified
23	1631	"THLEN Bit: explanation modified
23	1634	valid number range of p corrected
23	1636	register name RSCFDnCFDTMDFbp changed to RSCFDnCFDTMDFb_p
23	1637	typo correction (y = 0 to 2 -> y = 0, 1)
23	1638	TMIEp Bit Assignment corrected
23	1639	typo correction (y = 0 to 2 -> y = 0, 1)
23	1640	TMTRSTSp Bit Assignment corrected
23	1641	TMTARSTSp Bit Assignment corrected
23	1643	TMTCSTSp Bit Assignment corrected
23	1645	typo correction (y = 0 to 2 -> y = 0, 1)
23	1645	TMTASTSp Bit Assignment corrected
23	1649	function of bits 12 to 8 modified
23	1657	"TMTS[15:0] Bits" explanation modified

Revision 1.00 History, Date Feb 27, 2015 (21/37)

Section	Page	Summary
23	1661	numbering corrected
23	1664	correction: " Interrupt Sources and DMA Trigger" -> " Interrupt Sources"
23	1664	typo correction (CMPOF -> CMPOFIE)
23	1666	"CAN Channel Interrupt Block Diagram" figure added
23	1666	"DMA Trigger (Only in CAN FD Mode)" removed
23	1672	Note 3. modified
23	1672	correction: RSCFDnCmCFG -> RSCANnCmCFG
23	1674	RSCFDnCFDCDTCT and RSCFDnCFDCDTSTS registers removed from table
23	1677	typo correction (normal -> nominal)
23	1677	typo correction (normal -> nominal)
23	1678	"Timestamp Function Block Diagram" corrected
23	1679	correction: RSCFDnGCFG -> RSCANnGCFG
23	1681	correction concerning unused interval timer
23	1682	typo correction in figure (normal -> nominal)
23	1682	"Interval Timer Timing Chart" figure modified
23	1684	paragraph concerning transmit buffer modified
23	1684	typo correction ("stored for each message.]" -> "stored for each message.")
23	1684	correction: RSCFDnGCFG -> RSCANnGCFG
23	1684	correction: 402 cycles -> 386 cycles
23	1686	reference to "CRC Error Test" corrected
23	1689	typo correction (staandard -> standard)
23	1690	typo correction (CRCREG[15:0] -> CRCREG[14:0])
23	1690	correction: 3794 cycles -> 1897 cycles
23	1691	explanatory text in figure concerning "Receive rule setting" and "In CAN FD mode: RSCFDnCFDCnCFG register setting" modified
23	1691	correction in figure: RSCFDnCmCFG -> RSCANnCmCFG in classical CAN mode context
23	1692	correction: "by the RSCFDnCmCFG register" -> "by the corresponding register"
23	1692	correction: RSCFDnCmCFG -> RSCANnCmCFG
23	1692	correction: RSCFDnCmCFG -> RSCANnCmCFG
23	1692	correction: "segment value" -> "respective segment value"
23	1692	settings for classical CAN mode in figure modified
23	1693	references to Note 1. added in table
23	1694	correction in figure: normal bit time -> nominal bit time
23	1695	typo corrections in table (nominal -> Nominal)
23	1697	wording of "Buffer Setting" modified
23	1697	buffer settings for classical CAN mode changed
23	1697	change: "Setthe number of buffers ..." -> "Configure the number of buffers ..."
23	1698	number of fixed buffers in figure corrected
23	1699	settings for CAN FD mode added in figure
23	1700	correction: "maximum 3CANm bit time" -> "3 CANm bit time"
23	1701	"Read a message" registers corrected in figure
23	1702	typo correction (k = 0 to 17 -> k = 0 to 8)
23	1703	"Read a message" registers corrected in figure
23	1705	"FIFO Buffer Reading Procedure by DMA Transfer" removed

Revision 1.00 History, Date Feb 27, 2015 (22/37)

Section	Page	Summary
23	1706	"Store messages" registers corrected in figure
23	1708	correction: RSCFDnGCFG -> RSCANnGCFG
23	1709	correction: RSCFDnGCFG -> RSCANnGCFG
23	1710	"Store messages" registers corrected in figure
23	1720	"Detection and Correction of Errors in RS-CANFD RAM" section added
24	1739	CERCR and CEECR registers removed from table
24	1743	typo correction (TAL3[1:0] -> TA[31:0])
24	1747	typo correction ("b16 to b9" -> "b15 to b9")
24	1768	typo corrections in "Value after reset" rows
24	1775	typo correction (TSV[31:16] -> TSV[63:48])
24	1775	typo correction (TSV[15:0] -> TSV[47:32])
24	1777	typo correction ("b31?b0" -> "b31 to b0"
24	1777	correction: "H'0000 0000 to H'0000 FFFF" -> "H'0000 0001 to H'0000 FFFF"
24	1779	typo correction ("b31?b0" -> "b31 to b0"
24	1788	typo correction ("from 00 ... to 10" -> "from B'00 ... to B'10")
24	1788	typo correction ("from 00 ... to 10" -> "from B'00 ... to B'10")
24	1789	typo correction (CULF1 -> CLLF1)
24	1789	typo correction ("from 00 ... to 10" -> "from B'00 ... to B'01")
24	1804	"[Conditions for Changing]" corrected
24	1809	"[Conditions for Changing]" corrected
24	1809	correction: "The bit is set to 0" -> "The bit is set to 1"
24	1809	correction: "The bit is set to 0" -> "The bit is set to 1"
24	1809	correction: "The bit is set to 0" -> "The bit is set to 1"
24	1810	"[Conditions for Changing]" changed
24	1813	typo correction (AVB-DMAV -> AVB-DMAC)
24	1817	typo correction ("register Register" -> "Register")
24	1821	correction: Received PAUSE frames with the Timer value 0 are discarded." removed
24	1821	correction: "1 BP = 1 ns (1000 Mbps)" removed
24	1821	typo correction ("100 bps" -> "100 Mbps")
24	1824	ECSR register initial value corrected
24	1824	PHYI bit removed
24	1824	LCHNG bit removed
24	1825	PHYIM bit removed
24	1825	LINKIM bit removed
24	1826	PIR initial value corrected
24	1827	APFTP[15:0] description corrected
24	1828	MP[15:0] description corrected
24	1831	SPEED description corrected
24	1831	"The default value 0 of this bit must be changed to 1." removed
24	1834	correction: TPOCR -> TROCR
24	1834	correction: TPOC[15:0] -> TROC[15:0]
24	1834	correction: TPOCR -> TROCR
24	1834	correction: TPOC[15:0] -> TROC[15:0]
24	1834	correction: TPOC[15:0] -> TROC[15:0]

Revision 1.00 History, Date Feb 27, 2015 (23/37)

Section	Page	Summary
24	1841	"Lost Carrier Extension Counter Register (CERCR)" and "Carrier Extension Error Counter Register (CEECR)" removed
24	1846	correction concerning operation mode configuration
24	1850	reference to EMAC initialization flow corrected
24	1860	correction in diagram: DBAT.TA + 08h points to Tx queue 1
24	1921	correction in diagram: check operation mode via CSR.OPS[3:0]
26	1950	note added concerning WDTA0 operation during DEEPSTOP mode
26	1954	WDTAnWDTE reset sources corrected
26	1954	correction: "Software trigger start" -> "WDTA is disabled"
26	1956	WDTAnEVAC reset sources corrected
26	1956	correction: "Software trigger start" -> "WDTA is disabled"
26	1957	WDTAnREF reset sources corrected
26	1958	explanation concerning WDTAnMD updating corrected
26	1958	WDTAnMD reset sources corrected
26	1958	WDTAnWIE value after reset corrected
27	1978	typo correction (OSTMnTE -> OSTMnCTL)
29	2010	note 3 and 4 added for some TAUB channels
29	2013	"INTTAUBnIm from master channel" removed
29	2013	"Operating mode" item added
29	2016	Count clock selector inputs corrected in block diagram
29	2016	typo correction ("CK0 to CK2" -> "CK0 to CK3")
29	2017	"INTTAUBnIm from master channel" removed
29	2017	"Effective TAUBTTINm input edge" added as trigger
29	2018	note added
29	2023	reference to operation mode removed
29	2025	typo correction (TAUBnCSR.TAUBnOVF -> TAUBnCSRm.TAUBnOVF)
29	2025	TAUBnSTS[2:0] explanation corrected
29	2031	1-bit access removed
29	2034	TAUBnTOEm description corrected
29	2037	TAUBnTOLm description corrected
29	2043	TAUBnRDMm for C1 method corrected
29	2046	diagram corrected
29	2052	"TAUBnTOE.TAUBnTOEm" removed from bulleted list
29	2055	typo correction in diagram (TAUBnTOL -> TAUBnTOLm)
29	2070	description corrected
29	2074	"Description" changed
29	2079	description changed
29	2087	description changed
29	2090	status of TAUBn during operation corrected
29	2106	typo correction (CMORn:MD0 -> TAUBnCMORm.TAUBnMD0)
29	2106	typo correction (TAUBnCMORn: TAUBnMD0 -> TAUBnCMORm.TAUBnMD0)
29	2106	description corrected
29	2106	formulas removed
29	2107	typo correction (CMORn:MD0 -> TAUBnCMORm.TAUBMD0)

Revision 1.00 History, Date Feb 27, 2015 (24/37)

Section	Page	Summary
29	2107	typo correction (CMORn:MD0 -> TAUBnCMORm.TAUBMD0)
29	2111	typo correction (TAUBnCSC.CLOV -> TAUBnCSC.TAUBnCLOV)
29	2116	typo correction in entire paragraph (CSRn: OVF -> TAUBnCSRm.TAUBnOVF)
29	2129	typo correction in diagram ("NG" relocated)
29	2133	correction in diagram: "NG" included
29	2147	"Conditions" corrected
29	2148	"The following settings ..." paragraph removed
29	2149	diagram corected (relocation of TAUBnRSF.TAUBnRSFm)
29	2152	typo correction (TAUBnCDR.CDRm -> TAUBnCDR.TAUBnCDRm)
29	2157	typo corrections in note (TAUBnRDS -> TAUBnRDSm, TAUBnCDR -> TAUBnCDRm)
29	2161	diagram corrected (INTTAUBnIm shifted)
29	2165	reference to table corrected
29	2165	reference to table corrected
29	2169	addition concerning clock selection of amster and slave
29	2175	additions to (3)
29	2177	diagram corrected
29	2179	reference to table added
29	2179	reference to table corrected
29	2192	typo correction in diagram (INTTAUBnTm -> INTTAUBnIm) and Slave-2 TAUBnCNTm shifted
29	2192	typo correction ("the counter of the slave channels" -> "the counter of the slave channel 1"
29	2193	start value of Slave-3 TAUBnCNTm corrected in diagram
29	2195	typo corrections in diagram (TSm -> TAUBnTSm, TEm -> TAUBnTEm)
29	2196	reference to table corrected
29	2199	TAUBTTOUTm timing adjusted in diagram
29	2205	explanation corrected
29	2206	explanation corrected
29	2207	addition concerning usage of slave channel 1
29	2208	addition concerning usage of slave channel 1
29	2208	addition concerning INTTAUBnIM generation
29	2209	"Equations" corrected
29	2211	"Slave channel 3" settings corrected
29	2211	correction in diagram: Slave 3 TAUBnCDRm value f -> g
29	2215	typo correction (TDLm -> TAUBnTDL.TAUBnTDLm)
29	2218	table title corrected
29	2222	explanation corrected
29	2222	explanation corrected
29	2223	explanation corrected
29	2225	typo correction ("the set signal" -> "the reset signal")
29	2227	correction: "the set signal has priority" -> "the reset signal has priority"
29	2227	typo corrections in diagram (TAUBnCDRn -> TAUBnCDRm)
30	2235	"Valid edge of the TAUJTTINm input signal" removed
30	2235	"Operating mode" added
30	2242	operation reference for initial value removed

Revision 1.00 History, Date Feb 27, 2015 (25/37)

Section	Page	Summary
30	2245	TAUJnCOS[1:0] description changed
30	2253	restriction concerning Only restriction concerning TAUJnTOm removed
30	2255	TAUJnTOCm description corrected
30	2257	cross reference added
30	2263	"Description (6)" changed
30	2266	removed "TAUJnTOE.TAUJnTOEm" from bulleted list
30	2270	typo correction in diagram (TAUJn.CNTm -> TAUJnCNT.TAUJnCNTm)
30	2270	typo correction in diagram (TAUJn.CNTm -> TAUJnCNT.TAUJnCNTm)
30	2275	typo correction ("0, 1" -> "1, 0")
30	2276	cross reference to other section corrected
30	2278	typo correction (TAUJTTOUTm -> TAUJnTTOUTm)
30	2281	diagram correction: TAYJTTOUTm adjusted
30	2283	cross reference to other section corrected
30	2285	"The timing diagrams ..." paragraph changed
30	2287	"Conditions" changed
30	2298	typo correction (TAUJnCSC.CLOV -> TAUJnCSCm.TAUJnCLOV
30	2298	Status of TAUJn during operation changed
30	2303	note added
31	2374	typo correction (RTCA0CEST -> RTCAnCTL0.RTCAnCEST)
31	2375	typo correction (RTCA0WST -> RTCAnCTL2.RTCAnWST)
31	2377	typo correction (RTCA0CEST -> RTCAnCTL0.RTCAnCEST)
32	2403	typo correction (PWGAnSTR -> PWSAnSTR)
32	2403	typo correction (PWSAQUEj -> PWSAnQUEj)
32	2404	typo correction (PWGAnSTC -> PSGAnSTC)
32	2406	typo correction (PWSA0QUEn -> PWSA0QUEj)
33	2422	typo correction "he duty cycle" -> "The duty cycle")
33	2426	PWM base frequency calculation formula corrected
33	2432	M values in example corrected
33	2432	tone duration values corrected
33	2433	additional information concerning M
33	2434	typo correction (ALD -> ADI)
33	2435	reference to "M" calculation equations added
33	2436	note corrected
33	2450	references to other sections corrected
33	2452	typo correction (oncrement -> increment)
33	2453	correction: "ALD, ADI, and ADC modes" -> "ALD and ADI modes"
34	2459	note 2 added
34	2467	output control table corrected
34	2475	reference to other section corrected
34	2475	reference to other section corrected
35	2482	reset sources for SSIFn modules added
35	2482	caution added
35	2484	sampling frequency change interrupt removed
35	2486	correction: SSIFCCR_0, SSIFCMR_0, SSIFCSR_0 registers removed

Revision 1.00 History, Date Feb 27, 2015 (26/37)

Section	Page	Summary
35	2486	correction: SSIFCCR_1, SSIFCMR_1, SSIFCSR_1 registers removed
35	2486	correction: "and no need "_0" "_1" at the end. (i.e. SSIF0SSICR)" -> "and also needs "_0" "_1" at the end (i.e. SSIF0SSICR_0, SSIF0SSICR_1)."
35	2486	modification: SSIF0SSICR_1 -> SSIF1SSICR_1
35	2499	SSIFCCR, SSIFCMR, SSIFCSR register descriptions rmoved
35	2500	correction: 0: Continues AUDIO clock, 1: Stops AUDIO clock
35	2500	correction: 0: Continues SSISCK clock, 1: Stops SSISCK clock
35	2501	references to note 1 added in table
35	2501	correction: "using master transceiver mode" -> "using transceiver mode"
36	2519	<tbc> removed from Interrupt Controller INTLCBI0EMPTY
36	2519	<tbc> removed from Interrupt Controller INTLCBI0HALF
36	2519	<tbc> removed from Interrupt Controller INTLCBI0FULL
36	2519	<tbc> removed from Interrupt Controller INTLCBI0QTR
36	2519	<tbc> removed from Interrupt Controller INTLCBI03QTR
36	2557	initial value corrected
37	2566	caution added
37	2571	typo correction ("01 for channel 1" -> "10 for channel 1")
37	2573	typo correction ("01 for channel 1" -> "10 for channel 1")
37	2577	D1M1(H) pixel clock generator corrected and separated from others
37	2579	typo correction in diagram (CDECTL.VI1CTL -> VCDECTL.VI1CTL)
37	2581	"List of video channels clock generators registers" table added
37	2594	correction: CKSC_IVIDEO0S_CTL -> CKSC_IDOTCLK0S_CTL
37	2596	correction: CKSC_IVIDEO0S_CTL -> CKSC_IDOTCLK1S_CTL
37	2606	correction: CKSC_IVDCE0VIS_CTL also for D1M1(H)
37	2607	correction: CKSC_IVDCE0VIS_ACT also for D1M1(H)
37	2608	typo correction: PLL0PIX -> PLL0PIXCLK
37	2610	"All others: Setting prohibited" removed
37	2615	typo corrections (NP_EXT_SYNC_CN -> INP_EXT_SYNC_CNT)
37	2616	correction "VDCECTL.PXSL = 0" -> "VDCECTL.PXSL = 1"
37	2617	typo corrections (VDCE0_VI_ -> VDCE1_VI_)
37	2617	typo corrections (INP_EXT_SYNC_CN -> INP_EXT_SYNC_CNT)
37	2622	typo correction (MIPI_VI_D[23:0] -> MIPI0_VI_D[23:0])
37	2622	typo correction (MIPI_VI_D[23:0] -> MIPI0_VI_D[23:0])
37	2624	VTIM bit added
37	2624	typo correction ("TCLK-SETTLE are dined in MIPInSOT_COUNT.CLK_COUNT[7:0]." -> "TCLK-SETTLE is defined in MIPInSOT_COUNT.CLK_COUNT[7:0]."
37	2624	typo correction ("TCLK-SETTLE are dined in MIPInEOT_COUNT.EOT_COUNT[7:0]." -> "TEOT is defined in MIPInEOT_COUNT.EOT_COUNT[7:0].")
37	2625	RSTN_DATA_ON description corrected
37	2631	typo correction ("RX_STOP_STATE_C0 = RX_STOP_STATE_C1 = RX_STOP_STATE_C = 0" -> RX_STOP_STATE_0 = RX_STOP_STATE_1 = RX_STOP_STATE_C = 0"
37	2631	MIPInRX_STATE_PHY initial value corrected
37	2631	MIPInRX_STATE register description corrected
37	2635	values of bits 15 to 8 added and "R/W" corrected to "R"
37	2638	MIPInRDT_ERR_ON initial value corrected

Revision 1.00 History, Date Feb 27, 2015 (27/37)

Section	Page	Summary
37	2638	RDT_ERR_ ON3 description corrected
37	2638	RDT_ERR_ ON2 description corrected
37	2638	RDT_ERR_ ON1 description corrected
37	2638	RDT_ERR_ ON0 description corrected
37	2639	meaning of MIPInINTSTATUS bits corrected
37	2642	typo correction ("enable enable" -> "enable")
37	2646	typo correction (d-assert -> de-assert)
37	2651	typo correction ("4 bpp (RGB888)" -> "24 bpp (RGB888)")
37	2651	"Stop sequence" corrected
37	2652	DEMODE0.DE_4HS_EN and MIPInMODE.VTIM effect added in MIPI setup
37	2654	"VSYNC Timing from MIPI to VDCE" added
37	2658	new section "Video data and clock output settings" added, including further video output signal tables
37	2666	note added concerning accesses after register modifications
37	2670	typo correction ("the the" -> the)
37	2671	note added concerning accesses after register modifications
37	2672	"Initial value" and "R/W" rows corrected
38	2674	PCLK clock source for VDCEn corrected
38	2679	"Operating frequency" item removed from table, specification included in the data sheet
38	2680	typo correction (YCbCr422 -> YCC422)
38	2680	typo correction (YCbCr444 -> YCC444)
38	2680	note added concerning alpha blending and chroma-key feature for GR0
38	2680	addition: "ITU-R BT.656" -> "ITU-R BT.656 and BT.601"
38	2681	"distortion correction" removed from block diagram
38	2684	"(2) Notes" added
38	2685	Recorded external video input removed
38	2688	correction: "BT601" -> "BT601 (extended)"
38	2701	section "SVA/EAV Code in BT656 Progressive Format" renamed in "BT656 Progressive Format" and completely changed
38	2713	"Video input by data enable" added
38	2716	data enable input register tables added
38	2718	INP_HS_EDGE description corrected
38	2721	"Image Quality Adjustment Block Matrix YG Adjustment Register 1 (IMGCNT_MTX_YG_ADJ1)" displaced
38	2726	DEMODE0 register added
38	2727	DEMODE1 register added
38	2728	typo correction (IMP_UPDATE -> INP_UPDATE)
38	2729	typo correction (INT_UPDATE -> INP_UPDATE)
38	2731	cross reference corrected
38	2735	SC_RES_QVLOCK bit description improved
38	2738	correction: (VSYNC + V backporch lines) -> (VSYNC + (V backporch -1) lines)
38	2740	correction in diagram: "SC_RES_VS" -> "SC_RES_VS + 1"
38	2752	cross reference corrected
38	2754	"After making the setting to enable writing, writing starts from the second frame." added
38	2756	correction in diagram: "SC_RES_VS" -> "SC_RES_VS + 1"

Revision 1.00 History, Date Feb 27, 2015 (28/37)

Section	Page	Summary
38	2757	SC_RES_FLM_CNT[9:0] description corrected
38	2757	SC_RES_FLM_CNT_B[9:0] description corrected
38	2759	cross reference corrected
38	2759	GR_FLD_NXT description corrected
38	2760	"After making the setting to enable writing, writing starts from the second frame." added
38	2760	cross reference corrected
38	2762	SC0_SCL0_MON0 initial value corrected to 16 bit
38	2762	SC0_SCL0_INT initial value corrected to 16 bit and R/W access specified
38	2764	VDCE0 SC1_SCL0_DS1 and SC1_SCL0_DS6 registers added in table
38	2766	SC0_SCL0_MON0 address corrected and initial value changed to 16 bit
38	2766	SC0_SCL0_INT initial value changed to 16 bit and R/W specified
38	2768	VDCE1 SC1_SCL0_DS1 and SC1_SCL0_DS6 registers added in table
38	2777	SC0_RES_ QVLOCK bit description improved
38	2777	SC0_RES_ QVLACK bit description improved
38	2778	bit access modes corrected
38	2779	correction: (VSYNC + V backporch lines) -> (VSYNC + (V backporch - 1) lines)
38	2783	addition to note
38	2788	note added concerning initial value of SC0_SCL0_US5
38	2793	note added
38	2797	"After making the setting to enable writing, writing starts from the second frame." added
38	2798	SC0_RES_FLM_CNT[9:0] description corrected
38	2800	SC0_RES_FLM_CNT_B[9:0] description corrected
38	2802	correction: SC0_SCL0_FRC3 -> SC0_SCL1_WR1
38	2802	rows of reserved bits 7 to 1 merged
38	2802	GR0_IMR_FLM_INV reference removed
38	2803	GR0_FLD_NXT description corrected
38	2806	typo correction (YCC422 -> YCbCr422)
38	2806	typo correction (GR0_CNV444 -> GR0_CNV444_MD)
38	2807	note added concerning alpha blending and chroma-key feature for GR0
38	2808	note added concerning GR0_GRC_ VW[10:0] setting
38	2809	note added concerning GR0_GRC_HW[10:0] setting
38	2810	note added concerning alpha blending and chroma-key feature for GR0
38	2811	note added concerning alpha blending and chroma-key feature for GR0
38	2821	SC1_RES_ QVLOCK bit description improved
38	2821	SC1_RES_ QVLACK bit description improved
38	2822	"Scaling-Down Control Register (SC1_SCL0_DS1)" added
38	2823	"Vertical Scaling Register (SC1_SCL0_DS6)" added
38	2829	note corrected
38	2832	reference to GR1_IMR_FLM_INV removed
38	2833	GR1_FLD_NXT description corrected
38	2836	typo correction (YCC422 -> YCbCr422)
38	2838	note added concerning GR1_GRC_ VW[10:0] setting
38	2839	note added concerning GR1_GRC_ HW[10:0] setting
38	2842	GR1_CK_A[7:0] description corrected

Revision 1.00 History, Date Feb 27, 2015 (29/37)

Section	Page	Summary
38	2843	GR1_A0[7:0] description corrected
38	2844	GR1_A1[7:0] description corrected
38	2848	typo correction (GR_FLM_LNUM[9:0] -> GR_FLM_LNUM[10:0]
38	2851	block diagram corrected
38	2853	typo correction (ADJ_MTX_CBB_ADJ9 -> ADJ_MTX_CBB_ADJ0)
38	2867	note 3 added
38	2873	typo correction ("GR_BASE[31:3] = t (H_OFF ÷ 2)" -> "GR_BASE[31:3] = int (H_OFF ÷ 2)"
38	2874	typo correction (GR1_FLM6 -> GR_FLM6)
38	2874	typo correction (GR1_CNV444_MD -> GR_CNV444_MD)
38	2881	note added concerning alpha blending and chroma-key feature for GR0
38	2884	note added concerning alpha blending and chroma-key feature for GR0
38	2885	note added concerning alpha blending and chroma-key feature for GR0
38	2887	typo correction (GR_ACALC_MD -> GR_ARC_MUL)
38	2887	typo correction (GR_ACALC_MD -> GR_ARC_MUL)
38	2887	(premultiplication) removed
38	2896	"GR2_BST_MD is updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1." removed
38	2904	note added concerning GR2_GRC_ VW[10:0] setting
38	2905	note added concerning GR2_GRC_ HW[10:0] setting
38	2916	"GR3_BST_MD is updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1." removed
38	2924	note added concerning GR3_GRC_ VW[10:0] setting
38	2925	note added concerning GR3_GRC_ HW[10:0] setting
38	2937	note added concerning GR_VIN_ GRC_VW [10:0] setting
38	2938	note added concerning GR_VIN_ GRC_HW [10:0] setting
38	2945	Output Image Generator function description corrected
38	2948	OIR_RES_VS_SEL description correted
38	2949	correction: "an external input Vsync signal" -> "a Vsync signal input from the image synthesizer"
38	2950	descriptions in diagram improved
38	2950	figure "Vsync Signal Phases (One Frame-Buffer Plane Used)" removed
38	2951	correction: (VSYNC + V backporch lines) -> (VSYNC + (V backporch - 1) lines)
38	2952	"Screen Synthesis" removed
38	2953	section title changed
38	2953	"Accordingly, set the OIR_RES_IBUS_SYNC_SEL bit to 1 to select graphics display." removed
38	2953	table title and table content changed
38	2953	cross reference corrected
38	2954	OIR_SCL0_OVR1 register removed from table
38	2956	note added concerning OIR_SCL0_UPDATE availability in D1L2 devices
38	2958	OIR_RES_EN description corrected
38	2958	OIR_RES_VS_SEL description corrected
38	2962	correction: (VSYNC + V backporch lines) -> (VSYNC + (V backporch - 1) lines)
38	2964	correction: "written to the frame buffer" -> "written to VOWE"
38	2964	explanations concerning OIR_SCL1_WR1.GR_OIR_FLM_LOOP removed

Revision 1.00 History, Date Feb 27, 2015 (30/37)

Section	Page	Summary
38	2968	OIR_SCL0_OVR1 register removed
38	2969	note added concerning OIR_SCL1_UPDATE availability in D1L2 devices
38	2970	access type for bit 1 corrected
38	2970	typo correction (R/W -> R)
38	2972	note added concerning GR_OIR_UPDATE) availability in D1L2 devices
38	2974	note added concerning update of bit[9:8] and bit0
38	2977	correction: GR_OIR_HW[9:0] -> GR_OIR_HW[10:0]
38	2979	note added concerning GR_OIR_GRC_DISP_ON availability in D1L2 devices
38	2979	GR_OIR_DISP_SEL[1:0] description corrected
38	2980	note added concerning GR_OIR_ GRC_VW [10:0] setting
38	2981	note added concerning GR_OIR_ GRC_HW [10:0] setting
38	2984	access type of bit 16 corrected
38	2984	GR_OIR_LINE[10:0] bit positions corrected
38	2990	"GAM_G_TH_01 to GAM_G_TH_31 [7:0]" description corrected
38	2991	"GAM_B_TH_01 to GAM_B_TH_31 [7:0]" description corrected
38	2991	"GAM_R_TH_01 to GAM_R_TH_31 [7:0]" description corrected
38	3019	bit descriptions corrected
38	3019	typo correction ("next area d" -> "next area")
38	3020	bit descriptions corrected
38	3020	typo correction ("next area d" -> "next area")
38	3021	bit descriptions corrected
38	3022	bit descriptions corrected
38	3023	bit descriptions corrected
38	3024	bit descriptions corrected
38	3025	bit descriptions corrected
38	3026	bit descriptions corrected
38	3030	bit descriptions corrected
38	3031	bit descriptions corrected
38	3032	bit descriptions corrected
38	3033	bit descriptions corrected
38	3034	bit descriptions corrected
38	3035	bit descriptions corrected
38	3036	bit descriptions corrected
38	3037	bit descriptions corrected
38	3041	bit descriptions corrected
38	3042	bit descriptions corrected
38	3043	bit descriptions corrected
38	3044	bit descriptions corrected
38	3045	bit descriptions corrected
38	3046	bit descriptions corrected
38	3047	bit descriptions corrected
38	3048	bit descriptions corrected
38	3056	typo correction (xThough -> Though)
38	3071	reserved interrupts removed from table

Revision 1.00 History, Date Feb 27, 2015 (31/37)

Section	Page	Summary
38	3072	name change in entire section; INT0 -> S0_VI_VSYNC
38	3072	name change in entire section; INT1 -> S0_LO_VSYNC
38	3072	name change in entire section; INT2 -> S0_VSYNCERR
38	3072	name change in entire section; INT3 -> GR3_VLINE
38	3072	name change in entire section; INT4 -> S0_VFIELD
38	3072	name change in entire section; INT5 -> IV1_VBUFERR
38	3072	name change in entire section; INT6 -> IV3_VBUFERR
38	3072	name change in entire section; INT7 -> IV5_VBUFERR
38	3072	name change in entire section; INT8 -> IV6_VBUFERR
38	3072	name change in entire section; INT9 -> S0_WLINE
38	3072	name change in entire section; INT11 -> S1_LO_VSYNC
38	3072	name change in entire section; INT12 -> S1_VSYNCERR
38	3073	name change in entire section; INT15 -> IV4_VBUFERR
38	3073	name change in entire section; INT17 -> OIR_VI_VSYNC
38	3073	name change in entire section; INT18 -> OIR_LO_VSYNC
38	3073	name change in entire section; INT19 -> OIR_VLINE
38	3073	name change in entire section; INT22 -> IV8_VBUFERR
38	3074	INT_OUT23_ON bit removed from table
38	3077	correction: INT_STA7 is bit 28, INT-STA3 is bit 12
38	3079	access modes of bits 8 and 20 corrected
38	3080	access modes of bit 16 corrected
38	3081	INT_OUT5 bit added
38	3083	access mode of bits 8 and 20 corrected
38	3083	INT_OUT14_ON bit removed
38	3084	INT_OUT16_ON and INT_OUT23_ON bits removed
38	3084	access mode of bit 16 corrected
38	3085	initial values of bits 12, 8, 4 and 0 in table corrected
39	3086	PCLK clock source corrected
40	3099	flow of Video Output Monitor error flags clearing corrected
40	3102	note completed with "If the Activity Monitor for only channel 1 is to be enabled, channel 0 also is monitored at first because channel 0 is selected by default."
40	3107	VOCAnE18 description corrected
40	3107	note added concerning VOCAnE17 setting
40	3108	VOCAnCL18 description corrected
40	3108	typo correction (VOCSnCL18 -> VOCAnCL18)
40	3108	typo correction (VOCSnCL17 -> VOCAnCL17)
40	3109	typo correction (VOCSnCL16 -> VOCAnCL16)
40	3109	typo correction (VOCSnCLm -> VOCAnCLm)
40	3111	note added concerning VOCAnCH setting
40	3112	note added concerning availability of VOCAnTIME1
40	3112	typo correction ("Upper detection" -> "Lower detection")
40	3113	note added concerning availability of VOCAnOFFSj
40	3113	initial value of bit 16 corrected
40	3113	caution added

Revision 1.00 History, Date Feb 27, 2015 (32/37)

Section	Page	Summary
40	3114	note added concerning availability of VOCAnDISPj
40	3114	initial value of bit 16 corrected
40	3114	caution added
40	3115	note added concerning VOCAnACTj setting
40	3115	typo correction (VOCSnVOUTj -> VOCAnVOUTj)
40	3125	VOCAnEXPDk initial value corrected
41	3134	typo correction ("Pixel Format Data Width" removed)
41	3134	caution added concerning change of CMPSELP[3:0] default value
41	3139	typo correction (aRGB888 -> aRGB8888)
42	3146	GPU2D operation clock connections corrected
43	3164	typo correction in diagram (SPEanRLSL.SPEAnRBUSSEL -> SPEAnRLSL.SPEAnRBUSSEL)
43	3166	"that marks the virtual frame start address." added
43	3166	caution added
43	3170	correction in diagram: Red/Green12 -> Red/Green11 for 18 bpp colour format
43	3173	typo correction in diagram ("Image Synthesizer layer 10" -> "Image Synthesizer layer 11")
43	3174	typo correction (SPEnSkENm -> SPEAnSkENm)
43	3174	typo correction (SPEnSkDSm -> SPEAnSkDSm)
43	3175	typo correction (SPEAnSkLYmH -> SPEAnSkLYHm)
43	3176	typo correction (SPEnSkENm -> SPEAnSkENm)
43	3182	SPEAnRVDCi[3:0] description corrected
44	3193	Register access clock PCLK clock source corrected
44	3200	typo correction ("7" -> "7 to 3")
44	3207	INT[7:5] bit descriptions corrected
44	3209	JCRST initial value changed
44	3211	correction: "Byte/Word Swap" -> "Byte/Word/Longword Swap"
44	3215	correction: "in 8-byte units" -> "in 8-line units"
44	3225	DINLEN bit description corrected
44	3226	typo correction ("is only valid when" -> "is valid only when")
44	3232	typo correction ("H'0000 0000" -> "H'00")
44	3234	correction in "Input Pixel Format" section: JOUTSWAP -> DINSWAP
44	3235	case "DINSWAP bits = 011" added
44	3238	addition to "Error Handling"
44	3239	"Error Handling Flow" changed
44	3240	correction: "SOF0, DQT, and DHT" -> "SOF0, DQT, or DHT"
44	3240	correction: "after a bus reset." -> "after a reset."
44	3241	typo correction ("this error is not detected" -> "this error is not detected.")
44	3246	typo correction ("has been read" -> "has been read.")
44	3246	typo correction ("has been read" -> "has been read.")
45	3249	note added concerning external H/W trigger sources
45	3257	caution concerning ADCEnVCRj setting changed
45	3260	typos corrected (readwritten -> read/written)
45	3261	typo correction ("32-bit read-only register" -> "32-bit/16-bit read-only register"
45	3261	ADCEnDRj 16-bit access registers added

Revision 1.00 History, Date Feb 27, 2015 (33/37)

Section	Page	Summary
45	3261	ADCEnDRj 16-bit access addresses added
45	3263	correction: "32-bit read-only register" -> "32-bit/16-bit read-only register"
45	3263	ADCEnPWDTSNDRj 16-bit access registers added
45	3263	ADCEnPWDTSNDRj 16-bit access addresses added
45	3264	WFLG description changed
45	3267	ADCEnADCR Access corrected
45	3272	correction: ULMTB[15:0] -> ULMTB[11:0]
45	3272	correction: LLMTB[15:0] -> LLMTB[11:0]
45	3272	cautions added and changed
45	3273	ULEC description corrected
45	3273	OWEC description corrected
45	3274	ULSG[1:0] description improved
45	3277	typo correction (Levle -> Level)
45	3277	correction: ADCEnSGPRCR register can be read/written
45	3277	initial value in bit map corrected
45	3279	note added
45	3281	typo correction (PWM-Diag -> Temperature Sensor)
45	3290	caution added
45	3301	left/right cropped diagram corrected
45	3309	diagram changed
45	3310	diagram changed
45	3320	resistor name changed in figure
45	3321	"Diagnostic procedure 1." corrected
46	3324	motor control channel indices m for D1M2 devices corrected
46	3375	correction: ISMnGSTC.ISMnGIPCLAD -> ISMnGSTC.ISMnGIPCLADm
46	3375	"(all measured voltages were higher than the reference voltage)" changed to section reference
46	3376	correction: Channel management is not switched off by software reset
46	3377	correction: "writing 0 to ISMnGSTC.ISMnGIPCLREm." -> "writing 1 to ISMnGSTC.ISMnGIPCLREm."
46	3383	ISMnGIEDO description corrected
46	3383	ISMnGIEREm description corrected
46	3393	ISMnCIVEm description corrected
46	3401	ISMnGGRV2[3:0] description corrected
46	3402	ISMnGGRV1[3:0] description corrected
46	3405	correction: ISMnCZCFG.ISMnCZBTm[15:0] -> ISMnZPDCMP.ISMnCZBTm[15:0]
46	3411	correction: ISMSVDIS is bit 7 of ISMnEMU register
46	3412	reference to FEINTFMSK register removed
46	3416	typo correction ("sy nd rom" -> "syndrome")
47	3422	remark concerning ASIL B rephrased
47	3422	"Memory -DMA-CRC check" explanation improved
47	3422	"CANFD Interface (RS-CANFD)" added
47	3423	cross reference to VOCA corrected
48	3426	"Internal Peripheral Guards errors" removed from ECM errors list
48	3427	error numbers 42 to 47 added

Revision 1.00 History, Date Feb 27, 2015 (34/37)

Section	Page	Summary
48	3428	"Error Control Module Block Diagram" added
48	3428	delay timer clock supply corrected in figure and note added
48	3428	"Operations for Error Output" description improved
48	3430	section reference instead of description about interrupted unlock sequence
48	3430	description about delay timer clock suplly added
48	3432	correction: ECMMPCMD0 is "Not protected"
48	3432	correction: ECMCPCMD0 is "Not protected"
48	3434	correction: ECMmSSE037 -> ECMmSSE105
48	3434	correction: ECMEMK037 - ECMEMK105
48	3434	correction: "ECMIE037 bit of the ECMNMICFG1 register" -> "ECMNMIE105 bit of the ECMNMICFG1 and the ECMMIE105 bit of the ECMMICFG1 register"
48	3434	correction: ECMIRE037 -> ECMIRE105
48	3434	correction: ECMCLSSE037 -> ECMCLSSE105
48	3434	correction: ECMEMK037 - ECMEMK105
48	3434	correction: "ECMIE037 bit of the ECMMICFG1 register" -> "ECMMIE105 bit of the ECMMICFG1 and the ECMNMIE105 bit of the ECMNMICFG1 register"
48	3434	correction: ECMIRE037 -> ECMIRE105
48	3435	correction: ECMEMK037 - ECMEMK105
48	3435	correction: "ECMNMIE037 bit of the ECMMICFG1 register" -> "ECMMIE105 bit of the ECMMICFG1 and the ECMNMIE105 bit of the ECMNMICFG1 register"
48	3435	correction: ECMIRE037 -> ECMIRE105
48	3435	correction: ECMCLSSE037 -> ECMCLSSE105
48	3436	typo correction (ECMMSSExxx -> ECMmSSExxx)
48	3436	typo corrections (ECMMSSExxx -> ECMmSSExxx)
48	3437	typo correction (ECMMSSExxx -> ECMmSSExxx)
48	3437	typo correction (ECMMSSExxx -> ECMmSSExxx)
49	3462	typo correction in diagram (DCRAnCTL.DCRnPOL -> DCRAnCTL.DCRAnPOL)
49	3467	typo corrections ("DCRAnISZ = 10" -> "DCRAnISZ = 10B")
49	3467	typo correction (DCRAnCTL.DCRAnISZn -> DCRAnCTL.DCRAnISZ[1:0])
49	3468	typo correction (DCRA0COUT -> DCRAnCOUT)
51	3472	ADCE added to list of modules with optional peripheral break
51	3472	PWM-Diag added to list of modules with optional peripheral break
51	3472	"Modules that stop when EPC.SVSTOP = 1" table added
51	3473	"(14) Trace function" removed
51	3474	correction: "and inhibits interference from a debugger by register operation to special sequence access (SVACCESS)" removed
51	3474	SVACCESS bit removed
51	3476	note 3 added
52	3487	signal level notations in figure changed
52	3489	rephrased
52	3492	product name storage register's initial values for products with RS-CANFD added
52	3499	initial state of address parity error check removed
52	3514	prohibited item added during programming and erasure
53	3516	correction: "8-bit wide ECC RAM" -> "7-bit wide ECC RAM"
53	3516	correction: "The 8-bit ECC value is calculated for each 128-bit transfer." -> "The 7-bit ECC value is calculated for each 32-bit transfer."

Revision 1.00 History, Date Feb 27, 2015 (35/37)

Section	Page	Summary
53	3516	"Local RAM clock diagram" corrected
53	3518	LRAM test registers added to table
53	3520	LRERRINT register initial value corrected
53	3520	handling of LRERRINT register reserved bits changed
53	3521	correction in LRSTCLR description table: "Error Overflow Flag Clear" -> "Error Status / Error Overflow Flag Clear"
53	3523	"(during RMW processing for Local RAM)" removed
53	3524	correction: EADR[12:0] -> EADR[14:0]
53	3525	"LRTSTCTL — Local RAM Test Control Register" added
53	3526	"LRTSTCTL — Local RAM Test Control Register" added
53	3527	typo correction ("n = 0, 1" -> "n = 0")
53	3527	typo corrections in table (Local RAM -> Retention RAM)
53	3528	"Retention RAM initialization" added
53	3530	typo correction ("m = 0 to 6" -> "m = 0 to 7")
53	3530	typo correction (ECSEDEF[6:0] -> ECSEDF[7:0])
53	3530	correction: INTVRMECCDED -> INTECCDEDRRAM
53	3530	typo correction ("m = 0 to 6" -> "m = 0 to 7")
53	3530	typo correction (ECSEDEF[6:0] -> ECSEDEF[7:0])
53	3530	assertion of the overflow interrupt INTECCOVF removed
53	3531	"ECC modes overview" table corrected
53	3532	RRAM ECC test registers added to table
53	3532	note added concerning accesses after register modifications
53	3533	RRAMECCnCTL initial value corrected
53	3533	correction: ECC error judgement disabled by RRAMECCnCTL.ECERVF = 0
53	3533	correction: ECC error judgement disabled by RRAMECCnCTL.ECERVF = 0
53	3534	correction: ECER2C = 1 clears ECER2F/ECDEDFm/ECOVFF
53	3534	ECERVF description corrected
53	3534	EC2EDIC description corrected
53	3534	EC1EDIC description corrected
53	3534	correction: ECC error judgement disabled by RRAMECCnCTL.ECERVF = 0
53	3534	correction: ECC error judgement disabled by RRAMECCnCTL.ECERVF = 0
53	3535	correction: ECC error judgement disabled by RRAMECCnCTL.ECERVF = 0
53	3536	typo corrrections ("Initial value" and "R/W" rows corrected)
53	3536	correction: "read address = 8000 0000H + ECEAD[31:0] * 8" -> "read address = 3FCE 4000H + ECEAD[31:0] * 8
53	3537	"RRAMECCTMC – ECC test mode control register" added
53	3539	"RRAMECCTED1 – ECC encode/decode input/output substitution register 1" register added
53	3539	correction: "handles lower 32 bit data " -> "handles upper 32 bit data"
53	3539	correction: ECEDB[31:0] -> ECEDB[63:32]
53	3539	correction: RAM data [31:0] -> RAM data [63:32]
53	3540	"RRAMECCTED2 – ECC encode/decode input/output substitution register 2" register added
53	3540	correction: "handles upper 32 bit data" -> "handles lower32 bit"
53	3540	correction: ECEDB[63:32] -> ECEDB[31:0]

Revision 1.00 History, Date Feb 27, 2015 (36/37)

Section	Page	Summary
53	3541	"RRAMECCTRC – ECC test redundant bit data control register" added
53	3541	SYND[7:0] bits removed
54	3548	typo correction (WTOVFL[7:0] -> WTOVFL[6:0])
54	3548	typo correction (WTOVFL[7:0] -> WTOVFL[6:0])
54	3549	typo correction (RTOVFL[7:0] -> RTOVFL[6:0])
54	3549	typo correction (RTOVFL[7:0] -> RTOVFL[6:0])
54	3550	correction: "<VRAMn_base> + 40H + n x 10H" -> "<VRAMn_base> + 40H"
54	3550	correction: "<VRAMn_base> + 44H + n x 10H" -> "<VRAMn_base> + 44H"
54	3551	typo correction ("<VRAM_base> +40H + 10H"-> "<VRAMn_base> +40H")
54	3552	typo correction ("<VRAM_base> +44H + 10H"-> "<VRAMn_base> +44H")
54	3552	initial values of bit 1 and 0 corrected
54	3556	remove all SDRAM references from diagram
54	3558	exchanged VRAM0 and VRAM1
54	3558	note added concering DDR2-SDRAM > 128 Mbyte
54	3560	"ECC process during data write with less than 64 bit" removed and note added instead
54	3560	"VRAM initialization" added
54	3561	typo correction ("m = 0 to 6" -> "m = 0 to 7")
54	3561	typo correction (ECSEDEF[6:0] -> ECSEDF[7:0])
54	3561	correction: INTVRMECCDED -> INTECCDEDVRAM
54	3561	typo correction ("m = 0 to 6" -> "m = 0 to 7")
54	3561	typo correction (ECSEDEF[6:0] -> ECSEDEF[7:0])
54	3561	correction: overflow interrupt INTECCOVF assertion removed
54	3561	typo corrections (VRMECCnCTL -> VRAMnCTL)
54	3561	correction: "It is only cleared by ..." -> "It is cleared by ..."
54	3561	correction: "It is only cleared by ..." -> "It is cleared by ..."
54	3561	cross reference to VRAMnCTL register added
54	3562	"ECC modes overview" table corrected
54	3563	VRAM ECC test registers added to table
54	3563	note added concerning accesses after register modifications
54	3564	initial value of VRAMnCTL corrected
54	3564	correction: ECC error judgement disabled by VRAMnCTL.ECERVF = 0
54	3564	correction: ECC error judgement disabled by VRAMnCTL.ECERVF = 0
54	3565	ECERVF description corrected
54	3565	EC2EDIC description corrected
54	3565	EC1EDIC description corrected
54	3565	correction: ECC error judgement disabled by VRAMnCTL.ECERVF = 0
54	3565	correction: ECC error judgement disabled by VRAMnCTL.ECERVF = 0
54	3566	correction: ECC error judgement disabled by VRAMnCTL.ECERVF = 0
54	3567	typo correction (R/W indicators corrected)
54	3568	"VRAMECCTMC – ECC test mode control register" added
54	3570	"VRAMECCTED1 – ECC encode/decode input/output substitution register 1" register added
54	3570	correction: "handles lower 32 bit" -> "handles upper 32 bit data"
54	3570	correction: ECEDB[31:0] -> ECEDB[63:32]

Revision 1.00 History, Date Feb 27, 2015 (37/37)

Section	Page	Summary
54	3570	correction: "RAM data [31:0]" -> "RAM data [63:32]"
54	3571	"VRAMECCTED2 – ECC encode/decode input/output substitution register 2" register added
54	3571	correction: "handles upper 32 bit" -> "handles lower 32 bit data"
54	3571	correction: ECEDB[63:32] -> ECEDB[31:0]
54	3572	"VRAMECCTRC – ECC test redundant bit data control register" added
54	3572	SYND[7:0] bits removed

Revision 1.10 History

This revision history list shows all modifications of

Rev. 1.10 compared to Rev. 1.00.

NOTE

The chapter and page numbers in the table below refer to the older Rev. 1.10 and thus may not be valid for the current revision.

Revision 1.10 History, Date May 29, 2015 (1/5)

Section	Page	Summary
	4	Product Naming added
1	95	D1M1H external memory interfaces SDRAM I/F Max. clock increased to 100MHz
1	97	correction: voltage regulator of internal logic (ISO) (3.3V, 5V → 3.3V)
2	129	description removed concerning PDSC21
2	132	PDSCn_[15:0] description improved
2	141	correction: Pin Name CSIG0DCS, CSIG2DCS, CSIG3DCS, CSIG4DCS, CSIH0DCS, CSIH1DCS removed
2	204	correction: CSIH0DCS removed as 2nd alternative input of P0_1
2	205	correction: CSIG0DCS, CSIG1DCS, CSIG2DCS, CSIH0DCS, and CSIH1DCS removed
2	205	correction: CSIG3DCS, CSIG1DCS removed
2	211	description added concerning PDSC21
2	213	Table 2.109 Port42(P42) corrected
2	213	Table “Port 42(P42)” corrected
2	215	Table “Port 44(P44)” corrected
2	216	Table “Port 45(P45)” corrected
2	231	CAUTION added
2	232	CAUTION added
2	233	CAUTION added
2	234	Pin category corrected
2	234	SDRADM[3:0], SDRACS, SDRACAS, SDRARAS, SDRAWE pin status corrected while POC0RES = L SDRBDM[3:0], SDRBCS, SDRBCAS, SDRBRAS, SDRBWE pin status corrected while POC0RES = H
2	235	Pin category corrected
2	235	Pin category corrected
2	235	PWRCTL pin status corrected during DEEPSTOP SDRADM[3:0], SDRACS, SDRACAS, SDRARAS, SDRAWE pin status corrected while POC0RES = L
2	236	SDRBDM[3:0], SDRBCS, SDRBCAS, SDRBRAS, SDRBWE pin status corrected while POC0RES = H
2	236	SDRADM[3:0], SDRSCS, SDRSCAS, SDRSRAS, SDRAWE pin status corrected while POC0RES = L SDRBDM[3:0], SDRBCS, SDRBCAS, SDRBRAS, SDRBWE pin status corrected while POC0RES = H
2	239	SDRADQ[31:0] and CAUTION added
2	240	Pin TVCC removed
2	242	Pin TVSS removed
3	248	description concerning calculation of ECC value added

Revision 1.10 History, Date May 29, 2015 (2/5)

Section	Page	Summary
3	248	“ECC error detection” description changed
3	256	“and correction and 1-bit error detection” removed
3	256	correction; “ECC error detection and correction” → “ECC error detection”
3	262	description concerning calculation of ECC value added
3	264	correction: “cache miss occur” → “a cache miss occur”
7	392	BECMBUSERRINFO0 added
7	393	BECMBUSERRINFO1 added
9	447	RRAM module reset status added into AWO area, note5 added
10	469	Isolated-Area power supply description corrected
12	484	D1M1H Clock Controller block diagram corrected concerning SDR-SRAM Memory Controller
12	526	correction: PLL1C initial value of D1L1, D1L2(H), and D1M1(H) corrected(6000 003B_H → 0000 003B_H)
12	613	D1M1H SDRBCLK increased to 200MHz
12	617	note1 added
12	633	typo correction (CLMA Test Reset Signal → CLMA0 Error(_CLMA0RES) Signal)
12	633	“RESCLM” function corrected
12	635	ERRMSK removed
12	635	“RESCLM” function corrected
12	635	typo correction
12	635	typo correction
12	637	ERRMSK removed
12	637	“RESCLM” function corrected
14	676	“D1M1H: 64 bit x 100MHz = 800 MB/sec” added
14	688	description of PEID[2:0] bits added concerning Cross-connect XC1 master
15	720	table “D1M1H unused SDRAM interface handling” added
15	726	note added
15	728	table “ML-E unused SDRAM interface handling” added
15	732	“(e.g. <SDRAn_base> + 1 0000$_H$)” removed
15	735	description of CMD[2:0] bits corrected
15	746	correction: bits 15 to 13 are reserved
15	748	table “1Memory configuration settings(1/2)” corrected
15	749	table “1Memory configuration settings(2/2)” corrected
15	751	“Refresh counter reload” changed
15	754	15.5 SDR-SDRAM Transaction Restrictor added
15	757	table “x 16-bit SDRAM (DBCONF.BWIDTH[1:0] = 01$_B$)” corrected
15	757	table “1 x 32-bit or 2 x 16-bit SDRAM (DBCONF.BWIDTH[1:0] = 10$_B$)” corrected
15	758	table “32-bit interface” corrected
15	758	table “16-bit interface” corrected
16	761	note added
16	768	“(e.g. <SDRBn_base> + 1 0000$_H$)” removed
17	891	typo corrected
22	1224	description concerning calculation of ECC value added
22	1250	“ERRD Bit” description changed
22	1256	CRCREG[14:0] Flag description added

Revision 1.10 History, Date May 29, 2015 (3/5)

Section	Page	Summary
22	1289	RFE Bit description added
22	1302	CFMC[7:0] Bits description added
22	1348	description added concerning channel reset mode
22	1349	description added concerning channel reset mode
22	1353	description added concerning global reset mode
22	1354	description added concerning global reset mode
22	1355	description added concerning global reset mode
22	1358	RSCAN description corrected
22	1364	correction: “Three CANm bit times” → “Four CANm bit times”
22	1375	description added concerning channel halt mode
22	1377	description added concerning channel halt mode
22	1386	correction: “Communication speed” → “Communication Rate”
22	1406	correction: “Note: m = 0 to 2” → “Note: m = 0 to 1”
23	1422	description concerning calculation of ECC value added
23	1422	note added
23	1425	register name corrected (RSCFDnCFDGRMCFG → RSCFDn(CFD)GRMCFG)
23	1425	23.2.3 CAN FD protocol switchover added
23	1427	Global interface mode select register RSCANnGRMCFG added
23	1427	correction: “(r = 0 to 63)” → “classical CAN mode: r = 0 to 29, CAN FD mode: r = 0 to 41”
23	1431	Global interface mode select register RSCANnGRMCFG added
23	1436	ERRD bit description corrected
23	1442	CRCREG[14:0] Flag description corrected
23	1476	description of RFE Bit corrected
23	1489	description of CFMC[7:0] corrected
23	1513	description of THLEN Bit corrected
23	1534	description of THLE bit corrected
23	1535	description of THLMC[4:0] bits corrected
23	1541	description of C2ICBCE bit corrected
23	1541	description of C1ICBCE/C0ICBCE bits corrected
23	1542	description of RTME/ICBCTME bits corrected
23	1545	Globoal FD configuration register and global CRC configuration register added
23	1549	note1 added
23	1550	correction: “RAM Test Page Access Register (r = 0 to 63)” → “RAM Test Page Access Register (r = 0 to 29)”
23	1553	typo correction (error counter → error occurrence counter)
23	1554	description of ERRD bit corrected
23	1566	RFEE and FDOE bits added
23	1567	typo correction (Transceiver → Transmitter)
23	1567	description of REFE and FDOE bits added
23	1568	typo correction (transmission delay → transmitter delay)
23	1572	description of TDCR[6:0] Flag added
23	1573	SCNT[3:0] bit added
23	1573	description of SCNT[3:0] flag added
23	1577	typo correction (RSCFDnCFDRFCCA → RSCFDnCFDRFCCx)

Revision 1.10 History, Date May 29, 2015 (4/5)

Section	Page	Summary
23	1589	RSCFDnCFDGFDCFG — Global FD configuration register added
23	1590	RSCFDnCFDGCRCCFG —Global CRC configuration register added
23	1607	typo correction (RSCFDnCFDRMFDSTSp → RSCFDnCFDRMFDSTSq)
23	1610	description of RFE bit added
23	1611	description of RFMC[7:0] flag added
23	1618	typo correction (RSCFDnCFDRMFDSTSp → RSCFDnCFDRFFDSTSx)
23	1625	description of CFMC[7:0] bits added
23	1633	typo correction (RSCFDnCFDCFFDCSTSp → RSCFDnCFDCFFDCSTSk)
23	1633	elimination of unnecessary whitespace
23	1633	elimination of unnecessary whitespace
23	1645	typo correction (“m = 0 to 5” → “m = 0 to 2”)
23	1672	description of THLE bit added concerning channel reset mode
23	1673	description of THLMC[4:0] bits added concerning channel reset mode
23	1679	description of C2ICBCE bit added concerning global reset mode
23	1679	description of C1ICBCE/C0ICBCE bits added concerning global reset mode
23	1680	description of RTME/ICBCTME bits added concerning global reset mode
23	1683	RS-CANFD description corrected
23	1688	correction: “RAM Test Page Access Register (r = 0 to 63)” → “RAM Test Page Access Register (r = 0 to 41)”
23	1689	Table 23.174 Channel Mode Transition Time typo correction (Three → Four)
23	1692	Table 23.176 Registers Initialized in Global Reset Mode or Channel Reset Mode
23	1696	addition concerning CAN FD mode
23	1697	“CAN3 bit time clock” removed
23	1699	typo correction (“Setting the TMME bit” → “Setting the TMME bit to 1”)
23	1700	addition concerning the transition to channel halt mode
23	1700	description of Interval Transmission Function corrected
23	1701	typo correction (RSCANnGCFG → RSCFDn(CFD)GCFG, RSCANnCFCCk → RSCFDn(CFD)CFCCk)
23	1702	addition concerning the transition to channel halt mode
23	1702	elimination of unnecessary whitespace
23	1709	correction: CRCREG[15:0] → CRCREG[14:0]
23.0	1710.0	typo correction (RSCFDnCFDGRMCFG → RSCFDn(CFD)GRMCFG, RSCFDnCFDCnNCFG → RSCFDnCFDCnNCFG, RSCFDnCFDCnDCFG → RSCFDnCFDCmDCFG), note1 added
23	1711	typo correction (RSCFDnGCFG → RSCFDn(CFD)GCFG)
23	1713	typo correction (RSCFDn(CFD)CmCFG → RSCANnCmCFG, RSCFDn(CFD)CmNCFG→ RSCFDnCFDCmNCFG RSCFDn(CFD)CmDCFG → RSCFDnCFDCmDCFG)
23	1713	correction: “(r = 0 to 63)” → “(classical CAN mode: r = 0 to 29, CAN FD mode: r = 0 to 41)”
23	1714	correction: Communication speed → Communication Rate
23	1714	note added
23	1714	correction: “baud rate prescaler division values” → “nominal bit rate prescaler / data bit rate prescaler division values”
23	1717	correction: Transmit buffer mx16+0 → Transmit buffer 0, Transmit buffer mx16+15 → Transmit buffer 15
23	1719	correction: “a delay of” → “a delay up to”

Revision 1.10 History, Date May 29, 2015 (5/5)

Section	Page	Summary
23	1726	correction: “the first bit of the CRC field” → “the first bit of CRC field for the next transmission”
23	1727	correction: “only when the EEFE bit in the RSCANnGCFG register is 1 in classical CAN mode” → “In classical CAN mode, only when the EEFE bit in the RSCANnGCFG register is 1”
23	1727	correction: “only when the EEFE bit in the RSCANnGCFG register is 1 in classical CAN mode” → “In classical CAN mode, only when the EEFE bit in the RSCANnGCFG register is 1”
23	1729	elimination of unnecessary whitespace
23	1730	correction: “register (a = 0 to 8) is 1” → “register is 1”
23	1738	correction: “Note: m = 0 to 2” → “Note: m = 0 to 1”
23	1743	correction: “r = 0 to 63” → “r = 0 to 29(Classical CAN mode), 0 to 41(CAN FD mode)”
23	1750	correction: “the values” → “the value after reset”
23	1751	typo correction: “Receiveption” → “Receive”
30	2293	Figure 30.13 General Timing Diagram for Interval Timer Function corrected
35	2509	note added
35	2514	note2 added
35	2518	correction: bit 17 is reserved
35	2518	correction: bit 17 is reserved
37	2597	“CKSC_IVDCE0VOS_CTL” added
37	2617	correction: (D1M2(H) only → D1M1(H) and D1M2(H) only)
37	2617	table “CKSC_IVDCE0VOS_CTL register contents” changed
37	2618	correction: (D1M2(H) only → D1M1(H) and D1M2(H) only)
38	2698	Examples of input video image size corrected
38	2812	Note removed
40	3117	Video Output Monitor behaviour after error detection removed
40	3119	Monitor process status description changed
40	3126	VOCAnSELMON[3:0]] description changed
40	3127	“VOCAnMKVOC” function corrected
40	3129	caution added
42	3165	typo corrected
44	3213	“Reset Controller JCUA0RES” added
44	3267	“Software Reset Processing” description added
45	3343	“Relationship between analog input voltage and A/D conversion result” added
46	3416	typo correction (ISMnGGEN → ISMnGGCE)
46	3417	typo correction (ISMnGGEN → ISMnGGCE)
46	3418	typo correction (ISMnGGEN → ISMnGGCE)
46	3418	typo correction (ISMnGGEN → ISMnGGCE)
46	3419	typo correction (ISMnGGEN → ISMnGGCE)
46	3419	typo correction (ISMnGGEN → ISMnGGCE)
46	3433	description concerning calculation of ECC value added
52	3520	description concerning calculation of ECC value added
52	3523	Value after reset corrected ($0000\ 0000_H$ → $0000\ 0006_H$)
52	3528	description concerning calculation of ECC value added

Revision 1.20 History

This revision history list shows all modifications of

Rev. 1.20 compared to Rev. 1.10.

NOTE

The chapter and page numbers in the table below refer to the older Rev. 1.20 and thus may not be valid for the current revision.

Revision 1.20 History, Date Oct 26, 2015 (1/21)

Section	Page	Summary
1	96	corrected Table 1.2 RH850/D1M Products Overview (2/3): (“2D Graphics Processing Unit (GPU2D), 80 MHz operation clock” → “2D Graphics Processing Unit (GPU2D), 80 MHz operation clock” and “2D Graphics Processing Unit (GPU2D), 100 MHz operation clock”
2	102	corrected Figure 2.2 D1L2 pin connection diagram (144 pins LQFP package): (FLMD0 pin: “↔(input/output)” → “→ (Input)”)
2	132	(4) PDSCn/JPDSC0 — Port drive strength control register: “NOTE” added concerning table 2.25 PDSCn register contents
2	134	(3) Write Sequence of the Port Register to be Protected: “Step 4” corrected Figure 2.8 Write Sequence of the Port Register to be Protected: corrected
2	135	(1) Port Control Register (PCRn_m): bit 30, bit 28, bit 24 in the bit chart, corrected (“R” → “R/W”)
2	135	Table 2.28 PCRn_m register contents: functional description on PINV, PODC, PDSC, PISA, PIS, corrected
2	146	corrected Table 2.30 D1L1 ports input buffer characteristics (3/3): P21: “PISAn_m = 1” (“<t.b.c.>” → “—” (none)), “PISAn_m = 0” (“<t.b.c.>” → “CMOS1”), “Default” (“<t.b.c.>” → “CMOS1”)
2	146	Table 2.30 D1L1 ports input buffer characteristics (3/3): P21_6 to P21_9 deleted
2	214	Table 2.112 Port 43 (P43): P43_2 to P43_9: “Input” of “2nd Alternative”, corrected P43_7 to P43_9: “Input” of “3rd Alternative”, corrected
2	217	Table 2.121 Port 46 (P46): corrected
2	240	Table 2.142 Recommended connection of unused pins (2/3): “B5VCC” pin added
3	242	description corrected (“V8503v5-V” → “V850E3v5-V”, “R01US0058EJxxxx” → “R01US0123EJxxxx”)
3	243	3.1.1 Processor Element (PE) and CPU: description of “Floating Point Unit (FPU)”, “Code Flash cache”, corrected description of “CPU snooze instruction”, added
3	248 to 253	3.1.5 System Error Notification Control Function (SEG): added
3	254 to 255	3.1.6 Product denpendent registers: added
3	273	3.3.5 XC Cache control registers (D1L2(H), D1M1(H), D1M2(H)): NOTE” added concerning table 3.25 List of XC Cache control registers
3	297	3.3.6.5 AXCD1STERSTRn_PE1_OS . XC cache data RAM 1st error status register (n = 0 - 3): bit 25, bit 24, bit 17, bit 18, bit 9, bit 8, bit 1, bit 0 in the bit chart, corrected (bit name: “n+3” → “4n+3”)
3	297, 298	Table 3.51 AXCD1STERSTRn_PE1_OS register contents: corrected (bit name: “n+3” → “4n+3”, “n+2” → “4n+2”, “n+1” → “4n+1”, “n” → “4n”
3	305	3.3.6.12 AXCT1STEADRn_PE1_OS . XC cache tag RAM 1st error address register (n = 0, 1): address corrected (“FFC6 6450_H + 4 × n” → “FFC6 7450_H + 4 × n”)
3	306	3.4.1 Synchronization of Store Instruction Completion and Subsequent Instruction Generation: corrected (“(TS.W, etc.)” → “(ST.W, etc.)”)

Revision 1.20 History, Date Oct 26, 2015 (2/21)

Section	Page	Summary
4	310	4.1.1 Register protection unlock sequence: description added
4	313	4.2.1 Port protection clusters: description added
4	321	Table 4.9 CLMAnPCMD Register Contents: functional description on CLMAnREG[7:0], corrected
6	338	“CAUTION” added
7	346	7.4 Interrupt Exception Handler and Priority Operations: description corrected, and “NOTE” added
7	394	corrected (description of “which interrupt?”, deleted)
9	455	Table 9.2 Reset sources and targets overview: corrected Real-Time Clock RTCA0: “Reset level 2 (SYSRES)” (“reset” → “not reset”)
9	457	corrected (“sinals” → “signals”)
9	463	9.3.2.1 RESF, RESFR — Reset factor register: description correted
9	470	9.3.4.1 PWRGD_CNT — PWRGD counter register: “NOTE” added
9	472	Figure 9.5 POC reset timing: Note corrected
9	473	Figure 9.6 When $\overline{\text{RESET}}$ is Released before the Flash Sequence is Completed: Note 1 corrected
9	475	9.4.3 External Reset Signal ($\overline{\text{RESET}}$): description corrected
10	477	10.1 Function: description corrected
10	477	Table 10.1 Power Supply Pins Overview (1/2): description of “EVCC EVSS”, corrected
12	499	12.1.4 Clock selectors: description corrected
12	499	“CAUTION” added
12	503	12.2.2 Sub Oscillator (SubOsc): description corrected of “SubOsc enable trigger/disable trigger”
12	504	“NOTE” corrected
12	525	Table 12.13 ROSCSTPM register contents: fuctional description on ROSCSTPMSK, corrected
12	582	12.3.5.8 CKSC_ARTCAS_CTL . C_AWO_RTCA source clock selection register: “CAUTION” added
12	617	12.3.6.28 CKSC_IRLINS_ACT . C_ISO_RLIN source clock active register: bit 1 in the bit chart, corrected (initial value: “1” → “1*[1]”)
12	617	note 1. added concerning bit chart
12	622	Table 12.102 CPU and buses subsystems clocks maximum frequencies: C_ISO_PCLK: “D1M1H” corrected (100 MHz → 50 MHz) ETNBPCLK: “D1M1” (80 MHz → 80 MHz), “D1M1H” corrected (80 MHz → 50 MHz)
12	625	Table 12.106 Isolated-Area clock domain clocks maximum frequencies: C_ISO_RSCANXIN: “D1L1, D1L2, D1L2H, D1M1, D1M1H, D1M2, D1M2H” corrected (8 MHz → 16 MHz)
12	627	Table 12.109 FOUTDIV register contents: functional discription on FOUTDIV[9:0], corrected (Note 1 deleted)
12	629	Table 12.111 Units: corrected Clock Monitor A: “D1M2” added, “D1M2(H)” → “D1M2H” corrected
12	631	12.7.2 CLMA Enabling: description corrected
12	638	Table 12.117 CLMAnCTL0 Register Contents: fuctionctional description on CLMAnCLME, corrected, and Note 1 added
13	648	description added
13	648	13.1 Functions: description of “HALT mode”, corrected
13	648	13.1 Functions: description of “HALT” and “RUN”, deleted
13	648	13.1 Functions: “NOTE” added
13	648	Table 13.1 Clock Supply: corrected (“Clock” → “Unit Clock Name”)

Revision 1.20 History, Date Oct 26, 2015 (3/21)

Section	Page	Summary
13	650	13.1.3.1 I/O buffer hold state: description corrected
13	650	13.1.3.2 I/O buffers during DEEPSTOP mode: description corrected
13	651	13.1.4 Clock supply in DEEPSTOP mode: description of “ROSCSTPM: High Speed IntOsc”, corrected
13	651	13.1.4 Clock supply in DEEPSTOP mode: description of “NOTES 1”, corrected
13	653	Figure 13.1 State transition diagram of stand-by mode: corrected (“Wake-up event” → “Wake-up event*2”, “Stand-by request” → “Stand-by request*1” Note 1 corrected
13	655	13.2.2.1 STBC0PSC — Stand-by control register: description corrected
13	656	13.2.2.2 WUF0 — Wake-up factor register: description corrected
13	657	13.2.2.3 WUFMSK0 — Wake-up factor mask register: description corrected
13	658	13.2.2.4 WUFC0 — Wake-up factor clear registers: initial value corrected (“This register is always read as 0000 0000_H.” → “Undefined”) initial value of bit 31 to 0 in the bit chart, corrected (“0” → “—”) R/W of bit 31 to 19 in the bit chart (“W” → “R”)
13	658	Table 13.7 WUFC0 Register Contents: functional description on bit 31 to bit 19 (Reserved), corrected
13	659	13.2.2.5 IOHOLD — Port IOHOLD control register: description corrected
13	662	Figure 13.2 Example of DEEPSTOP mode transition: corrected
14	689	Table 14.15 PBUS structure (1/7): corrected PBG0A: Channel 1 added, (Channel: “1 to 3” → “2 to 3”), (Channel 6: “Data Flash ECC” → “Code Flash ECC / Data Flash ECC”) PBUS0: Module added (SYSCTRL, ECCIC1, ECCCPU1, ECCAXC))
14	690	Table 14.15 PBUS structure (2/7): corrected PBG2A: Channel 2 (“GPU2D” → “GPU2D0”) PBG3A: Channel 4 to Channel 7 (“RLIN30” → “RLN30”, “RLIN31” → “RLN31”, RLIN32” → “RLN32”, RLIN33” → “RLN33”) and Channel 8 (“RSCAN / RSCFD0*1” → “RSCAN0 / RSCFD0*1”)
14	691	Table 14.15 PBUS structure (3/7): corrected PBG30A: Channel 0 to Channel 11 (note 1 and note 2, added) PBG30B: Channel 0 (“ISM0RAMECC” → “ECCISM0”)
14	692	Table 14.15 PBUS structure (4/7): corrected PBG3B: Channel 3 (“SLPWGA” → “SLPWGA0”)
14	693	Table 14.15 PBUS structure (5/7): corrected PBUS3 (“PGB32A” → “PBG32A”): Channel 8 (“Analog port filter control FLCA0” → “Analog port filter control FCLA0”), Channel 15 (“Analog port filter control FLCA1” → “Analog port filter control FCLA1”), and PBUS3 (“PGB32B” → “PBG32B”)
14	694	Table 14.15 PBUS structure (6/7): corrected PBG5A: (Channel: “4 to 6” → “4 to 5”), Channel 6 added, Channel 7 (“SELB” added), Channel 11 (“Reserved” → “SD_ISO_VDD (QOS registers)”), Channel 12 (“Stand-by Controller” → “SYS (Stand-by Controller, RESF,RESFR, RESFC, RESFCR, SWRESA, PROTCMD0, PROTS0)”)
14	695	Table 14.15 PBUS structure (7/7): corrected PBUS5: Module added (CLMA0 to CLMA6, CLMAC, SYS (others), PWRG)
14	707	(4) Peripheral Device Protection Setting Register 0 (IPGPMTUM0, IPGnPMT0, and IPGnPMTUM0 (n=0)): bit chart corrected bits of bit 2 to bit 0 (“X0” → “—”, “W0” → “—”, “R0” → “—”) R/W of bit 2 to bit 0 (“R/W” → “R”)
14	707	Table 14.27 IPGPMTUM0, IPGnPMT0, and IPGnPMTUM0 (n=0) register contents: functional description of bit 3 to bit 0 (—), corrected
14	709	(7) Peripheral Device Protection Setting Register 4 (IPGPMTUM4, IPGnPMT4, and IPGnPMTUM4 (n=0)): bit chart corrected bits of bit 6 to bit 4 (“—” → “X1”, “—” → “W1”, “—” → “R1”) R/W of bit 6 to bit 4 (“R” → “R/W”)

Revision 1.20 History, Date Oct 26, 2015 (4/21)

Section	Page	Summary
14	709	Table 14.30 IPGPMTUM4, IPGnPMT4, and IPGnPMTUM4 (n=0) register contents: functional description on X1, W1, R1
14	710	14.5.4.1 List of Registers: desription corrected
14	713	Table 14.31 FSGDxxPROTn register contents (2/2): functional discription on PROTUM, corrected (note added)
15	736	Table 15.7 D1M1H unused SDRAM interface handling: corrected (“36 bit” → “32 bit”, “DM[3:0]: all used” and “DM[3:2]: leave open” added)
15	745	Table 15.14 DBDMOV register contents: functional description on TRCDC[1:0], corrected (“01_B” → “00_B”)
15	749	Table 15.17 DBTR2 register contents: functional description on WRRD[3:0], corrected (“1 cycles” → “2 cycles”, “2 cycles” → “3 cycles”, “12 cycles” → “13 cycles”)
17	887	Figure 17.16 Example of Initial Setting Flow in SPI Operating Mode: corrected
17	899	corrected ($f_{PHCLK}/f_{B\Phi}$: “100_B” → “011_B”)
17	900	corrected ($f_{PHCLK}/f_{B\Phi}$: “110_B” → “100_B”)
17	900	“NOTE” corrected (“$f_{B\Phi}$” → “f_{PHCLK}”)
17	901	Table 17.13 Clock adjustment settings examples (for f_{PHCLK} = 480 MHz): corrected (CKDLYOC[2:0]: “100_B” → “011_B”, “110_B” → “100_B”)
17	901	description of “Sampling point calibration procedure”, corrected
17	902	description of “Example: Calibration for f_{PHCLK} = 480 MHz, BΦ = 160 MHz”, corrected
18	904	Table 18.4 Clock Supply: corrected (“Clock for the Unit” → “Unit Clock Name”)
18	908	18.2.1 Functional Overview: description of “Maximum transfer clock frequency”, corrected
18	909	Figure 18.1 CSIG Block Diagram: corrected (“Prescaler Baudrate Generator” → “BRG”)
18	915	Table 18.16 CSIGnSTR0 Register Contents (1/2): functional description on CSIGnDCE, corrected
18	924	Table 18.24 List of Cautions when Setting Registers: description of contents for CSIGnBCTL0, corrected
18	925	18.4.1 Interrupt Delay: corrected (“CSIGnCFG0.CSIGnCKR” → “CSIGnCTL1.CSIGnCKR”)
18	925	18.4.2 INTCSIGTIC (Communication Status Interrupt): corrected (“CSIGnCFG0.CSIGnCKR” → “CSIGnCTL1.CSIGnCKR”)
18	926	Figure 18.4 Generation of INTCSIGTIC at the Beginning of Communication: corrected
18	926	18.4.3 INTCSIGTIR (Reception Status Interrupt): corrected (“CSIGnCFG0.CSIGnCKP” → “CSIGnCTL1.CSIGnCKR”)
18	928	18.5.1.1 Master Mode: corrected (“CSIGnCFG0.CSIGnCKP” → “CSIGnCTL1.CSIGnCKR”)
18	931	description of “Transfer clock frequency upper and lower limits”, corrected
18	937	18.5.8.1 Slave Mode: description corrected
18	942	Figure 18.24 Overrun Error Detection: corrected
18	943	18.6.1 Master Mode Transmission/Reception by DMA: corrected (“CSIGnCFG0.CSIGnCKP” → “CSIGnCTL1.CSIGnCKR”)
19	946	Table 19.6 Clock Supply: corrected (“Clock for the Unit” → “Unit Clock Name”)
19	947	Table 19.9 External Input/Output Signals: corrected (“CSIHTCSS[5:1]” → “CSIHTCSS[7:1]”)
19	961	Table 19.18 CSIHnSTR0 Register Contents (2/3): funtional description on CSIHnTMOE and CSIHnOFE, corrected
19	962	Table 19.18 CSIHnSTR0 Register Contents (3/3): funtional description on CSIHnPE, corrected
19	973	Table 19.25 CSIHnCFGx Register Contents (2/5): funtional description on CSIHnPE, corrected (“CSHBAnDLSx[3:0]” → “CSIHnDLSx[3:0]”)

Revision 1.20 History, Date Oct 26, 2015 (5/21)

Section	Page	Summary
19	977	19.3.12 CSIHnTX0W . CSIHn Transmit Data Register 0 for Word Access: value after reset corrected (“X0XX $XXXX_H$” → “Undefined”)
19	979	19.3.14 CSIHnRX0W . CSIHn Receive Data Register 0 for Word Access: value after reset corrected (“0XXX $XXXX_H$” → “Undefined”)
19	982	Table 19.32 Notes on Setting Registers (1/2): description of contents for CSIHnSTR0, corrected (“->” → “→”)
19	983	Table 19.32 Notes on Setting Registers (2/2): description of contents for CSIHnCFGx x = 0, corrected
19	997	19.5.3.1 Configuration Registers: description of “Hold time T_{hold}”, corrected
19	999	Figure 19.14 Chip Select and RCB Example: corrected (“(dominant: nigh priority)” → “(dominant: high priority)”)
19	1011	19.5.10 Slave Select (SS) Function: description corrected
19	1013	19.5.11.1 Slave Mode: description of “2.” corrected
19	1014	Figure 19.32 Busy Signal from the Slave (Direct Access Mode; CSIHnCFGx.CSIHnDAPx = 0): corrected (“CSIHnRX0-full” → “CSIHnRX0W-full”, “Read CSIHnRX0” → “Read CSIHnRX0W”)
19	1014	Figure 19.33 Busy Signal from the Slave (Direct Access Mode; CSIHnCFGx.CSIHnDAPx = 1): corrected (“CSIHnRX0-full” → “CSIHnRX0W-full”, “Read CSIHnRX0” → “Read CSIHnRX0W”)
19	1017	Figure 19.36 Data Consistency Check Functional Block Diagram: corrected (“On error” → “Error occurrence”)
19	1025	Figure 19.46 Example of CPU-Controlled High-Priority Communication: corrected (“INTCSIHTIC” → “INTCSIHTIJC”)
19	1026	Figure 19.48 Transition from High-Priority Mode to Low-Priority Mode: corrected
19	1039	19.6.3.3 Transmit/Receive in Slave Mode when Job Mode is Disabled: description corrected (additional description)
20	1047	Table 20.6 Clock Supply: corrected (“Clock for the Unit” → “Unit Clock Name”)
20	1052	Figure 20.1 LIN/UART Interface Block Diagram: corrected (“LINn interrupt controller circuit” → “LINn interrupt control circuit”)
20	1053	Table 20.11 Registers (1/2): corrected (“RLIN3n” → “RLN3n”)
20	1054	Table 20.11 Registers (2/2): corrected (“RLIN3n” → “RLN3n”)
20	1055	20.3.2.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register: description of “LWBR0 Bit (Wake-up Baud Rate Select)”, corrected
20	1061	20.3.2.6 RLN3nLBFC — LIN Break Field Configuration Register: description of “BDT[1:0] Bits (Transmission Break Delimiter (High Level) Width Select)”, corrected
20	1064	20.3.2.9 RLN3nLIE — LIN Interrupt Enable Register: description corrected, and description of “ERRIE Bit (Error Detection Interrupt Request Enable), corrected”
20	1064	Table 20.20 RLN3nLIE Register Contents: functional description on bit 7 to bit 4 (Reserved), corrected
20	1066	note added concerning table 20.21 RLN3nLEDE Register Contents
20	1069	20.3.2.12 RLN3nLTRC — LIN Transmission Control Register: description of “RTS Bit (Response Transmission/Reception Start)” and “FTS Bit (Frame Transmission/Wake-up Transmission/Reception Start)”, corrected
20	1071	Table 20.25 RLN3nLST Register Contents: functional description on D1RC, corrected
20	1077	20.3.2.17 RLN3nLIDB — LIN ID Buffer Register: description of “IDP[1:0] Bits (Parity Setting)”, corrected
20	1079	Table 20.30 RLN3nLDBRb Register Contents: functional description on LDB[7:0], corrected
20	1084	20.3.3.4 RLN3nLBFC — UART Configuration Register: description of “UTPS Bit (UART Output Polarity Switch)”, corrected
20	1086	20.3.3.5 RLN3nLSC — UART Space Configuration Register: description of “IBS[1:0] Bits (Inter-Byte Space Select)”, corrected (additional description)

Revision 1.20 History, Date Oct 26, 2015 (6/21)

Section	Page	Summary
20	1088	20.3.3.7 RLN3nLCUC — UART Control Register: description of “OM0 Bit (LIN Reset)”, corrected
20	1092	20.3.3.10 RLN3nLST — UART Status Register: description of “ERR Flag (Error Detection Flag)”, corrected (“UPER, EXBT, OER, and ER flag” → “UPER, IDMT, EXBT, FER, OER, and BER flag”)
20	1100	20.3.3.17 RLN3nLUOR1 — UART Option Register 1: description of “UTIGTS Bit (Transmission Interrupt Generation Timing Select)”, corrected
20	1105	20.4 Interrupt Sources: description corrected
20	1110	20.7.1.1 Header Transmission: description corrected
20	1111	Table 20.60 Processing in Response Transmission: description of “(4)”, corrected (“RFC” → “RLN3nLDFC”)
20	1111	20.7.1.2 Response Transmission: “NOTE” corrected
20	1112	20.7.1.3 Response Reception: “NOTE” corrected
20	1115	20.7.3.1 Transmission of LIN Frames: description of “[Frame Separate Mode]”, corrected
20	1116	20.7.3.3 Multi-Byte Response Transmission/Reception Function: description corrected
20	1122	Table 20.64 LIN/UART Interface (UART Mode) Transmission Processing (1/2): description of “(3)”, corrected
20	1123	20.8.1 Transmission: “NOTE” added
20	1124	Table 20.65 UART Buffer Transmission Processing in LIN/UART Interface (in UART Mode) (1/2): description of “(2)”, corrected
20	1125	Table 20.65 UART Buffer Transmission Processing in LIN/UART Interface (in UART Mode) (2/2): description of “(4)”, corrected
20	1125	20.8.1.2 UART Buffer Transmission: “NOTE” added
20	1129	20.8.2 Reception: “NOTE” added
20	1133	20.8.3.4 Expansion Bit Reception (with Data Comparison): description corrected
20	1136	20.9 LIN Self-Test Mode: description corrected
20	1139	20.9.3 Reception in LIN Master Self-Test Mode: description corrected
20	1140	20.10 Baud Rate Generator: description corrected
20	1141	20.10.1 LIN Master Mode: description corrected
20	1143	Figure 20.31 Example of Noise Filter Circuit: corrected
21	1145	Table 21.4 Clock Supply: corrected (“Clock for the Unitn” → “Unit Clock Name”)
21	1153	Table 21.9 RIICnCR1 Register Contents (2/2): functional description on SDAI, corrected
21	1164	21.3.6 RIICnMR3 — I^2C Bus Mode Register 3: title of “NF[1:0] Bits (Digital noise Filter Stage Selection)”, corrected
21	1168	21.3.8 RIICnSER — I^2C Bus Status Enable Register: access corrected
21	1172	21.3.10 RIICnSR1 — I^2C Bus Status Register 1: bit name in the bit chart, corrected bits of bit 5, bit 3 to bit 0 (“RIICn” deleted)
21	1172	Table 21.18 RIICnSR1 Register Contents: bit name corrected bits of bit 5, bit 3 to bit 0 (“RIICn” deleted)
21	1175	21.3.11 RIICnSR2 — I^2C Bus Status Register 2: bit name in the bit chart, corrected bits of bit 7 to bit 0 (“RIICn” deleted)
21	1175	Table 21.19 RIICnSR2 Register Contents: bit name corrected bits of bit 7 to bit 0 (“RIICn” deleted)
21	1225	Table 21.26 RIIC Reset Functions (1/2): corrected RIICnSR1, RIICnSR2: bit name corrected (“RIICn” deleted)
22	1229	Table 22.5 Clock Supply: corrected (“Clock for the Unit” → “Unit Clock Name”)
22	1232	Table 22.10 RSCAN Module Specifications (1/2): corrected (Reception filter function: “(0 to 128)” → “(0 to 127)”)

Revision 1.20 History, Date Oct 26, 2015 (7/21)

Section	Page	Summary
22	1233	Table 22.10 RSCAN Module Specifications (2/2): description corrected of “Bus off recovery mode selection”
22	1243	Table 22.11 Registers (9/18): symbol name corrected (“RSCAN0MDF019” → “RSCAN0RMDF019”)
22	1255	22.3.2 RSCAN0CmCFG — Channel Configuration Register (m = 0 to 2): description corrected
22	1259	22.3.3 RSCAN0CmCTR — Channel Control Register (m = 0 to 2): description of “CSLPR Bit”, corrected
22	1260	22.3.4 RSCAN0CmSTS — Channel Status Register (m = 0 to 2): access and address corrected
22	1262	22.3.5 RSCAN0CmERFL — Channel Error Flag Register (m = 0 to 2): access corrected
22	1266	22.3.6 RSCAN0GCFG — Global Configuration Register: bit name in the bit chart, corrected bit 31 to bit 16 (“ITRCP” → “ITRCP[15:0]”)
22	1269	22.3.7 RSCAN0GCTR — Global Control Register: access and address corrected
22	1271	22.3.8 RSCAN0GSTS — Global Status Register: access and address corrected
22	1273	22.3.9 RSCAN0GERFL — Global Error Flag Register: access and address corrected
22	1273	Table 22.23 RSCAN0GERFL Register Contents: corrected bit position (“31 to 14, 7, 6, 3” → “31 to 14” “13 to 8” “7, 6”, “5” divided, and “4, 3” added) fuctional description on bit 13 to bit 8 (Reserved), corrected
22	1274	22.3.9 RSCAN0GERFL — Global Error Flag Register: “NOTE” added
22	1275	22.3.10 RSCAN0GTINTSTS0 — Global TX Interrupt Status Register 0: access and address corrected
22	1278	22.3.11 RSCAN0GTSC — Global Timestamp Counter Register: access and address corrected
22	1279	22.3.12 RSCAN0GAFLECTR — Receive Rule Entry Control Register: access and address corrected
22	1280	22.3.13 RSCAN0GAFLCFG0 — Receive Rule Configuration Register 0: access and address corrected
22	1286	22.3.16 RSCAN0GAFLP0j — Receive Rule Pointer 0 Register (j = 0 to 15): access and address corrected
22	1289	22.3.18 RSCAN0RMNB — Receive Buffer Number Register: access and address corrected
22	1295	22.3.24 RSCAN0RFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7): access and address corrected
22	1297	22.3.25 RSCAN0RFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7): access and address corrected
22	1299	22.3.26 RSCAN0RFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7): access and address corrected, and description of “RFPC[7:0] Bits”, corrected
22	1308	22.3.32 RSCAN0CFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 8): access and address corrected
22	1311	22.3.33 RSCAN0CFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 8): access and address corrected
22	1319	22.3.38 RSCAN0FESTS — FIFO Empty Status Register: access, address, value after reset corrected value after reset of bit 25 to bit 17 in the bit chart, corrected (“0” → “1”) description corrected
22	1321	22.3.39 RSCAN0FFSTS — FIFO Full Status Register: access and address corrected
22	1323	22.3.40 RSCAN0FMSTS — FIFO Message Lost Status Register: access and address corrected
22	1325	22.3.41 RSCAN0RFISTS — Receive FIFO Buffer Interrupt Flag Status Register: access and address corrected

Revision 1.20 History, Date Oct 26, 2015 (8/21)

Section	Page	Summary
22	1326	22.3.42 RSCAN0CFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register: access and address corrected
22	1327	22.3.43 RSCAN0CFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register: access and address corrected
22	1332	22.3.46 RSCAN0TMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0, 1): address corrected (“0253_H” → “0353_H”)
22	1334	22.3.47 RSCAN0TMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0, 1): address corrected (“0263_H” → “0363_H”)
22	1344	22.3.52 RSCAN0TMPTRp — Transmit Buffer Pointer Register (p= 0 to 47): access and address corrected
22	1348	22.3.55 RSCAN0TXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 2): access and address corrected
22	1350	22.3.56 RSCAN0TXQSTSm — Transmit Queue Status Register (m = 0 to 2): access and address corrected
22	1350	Table 22.75 RSCAN0TXQSTSm Register Contents: fuctional description on bit 12 to bit 8 (Reserved), corrected
22	1352	22.3.57 RSCAN0TXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 2): access and address corrected
22	1353	22.3.58 RSCAN0THLCCm — Transmit History Configuration and Control Register (m = 0 to 2): access and address corrected
22	1355	22.3.59 RSCAN0THLSTSm — Transmit History Status Register (m = 0 to 2): access and address corrected
22	1357	22.3.60 RSCAN0THLACCm — Transmit History Access Register (m = 0 to 2): access and address corrected
22	1358	22.3.61 RSCAN0THLPCTRm — Transmit History Pointer Control Register (m = 0 to 2): access and address corrected
22	1359	22.3.62 RSCAN0GTSTCFG — Global Test Configuration Register: access and address corrected, and description of “RTMPS[6:0] Bits”, corrected
22	1361	22.3.63 RSCAN0GTSTCTR — Global Test Control Register: access and address corrected
22	1362	22.3.64 RSCAN0GLOCKK — Global Lock Key Register: access and address corrected
22	1371	Table 22.88 Channel Mode Transition Time (2/2): corrected Channel halt: “Three CANm bit times” → “Four CANm bit times”
22	1372	description of Note 3. concerning table 22.89 Operation a Channel Transitions to Channel Reset Mode/Channel Halt Mode, corrected
22	1380	22.7.1 Transmit Priority Determination: description corrected
22	1385	22.8 Gateway Function: description corrected
22	1388	22.9.4 RAM Test: description corrected (additional description)
22	1395	Figure 22.21 Buffer Setting Procedure: corrected
22	1416	22.11.4 ECCRCAN0TMC — RSCAN0 ECC Test Mode Control Register: access corrected
22	1419	22.11.6 ECCRCAN0TRC — RSCAN0 ECC Redundant Bit Data Control Test Register: access corrected
22	1420	22.11.8 ECCRCAN0HORD — RSCAN0 ECC 7-Bit Redundant Bit Data Hold Test Register: access corrected
22	1420	22.11.9 ECCRCAN0ECRD — RSCAN0 ECC Encode Test Register: access corrected
22	1421	22.11.10 ECCRCAN0ERDB — RSCAN0 ECC Redundant Bit Input/Output Replacement Buffer Register: title corrected
23	1425	Table 23.5 Clock Supply: corrected (“Clock for the Unit” → “Unit Clock Name”)
23	1425	Table 23.6 Setting Range example of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/D1L/D1M (1/2): table title and description (“Data Bit Rate”, “pclk”, “clkc, clk_xincan*1”) corrected

Revision 1.20 History, Date Oct 26, 2015 (9/21)

Section	Page	Summary
23	1426	Table 23.6 Setting Range example of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/D1L/D1M (2/2): table title and description (“Data Bit Rate”, “pclk”, “clkc, clk_xincan*1”) corrected
23	1427	Table 23.9 External Input/Output Signals: corrected (“CANmDREN (m = to 2)” → “CANmDREN (m = 0 to 2)”)
23	1429	Table 23.10 RS-CANFD module Specifications (2/3): description of “Reception filter function”, corrected
23	1436	23.3.2.1 RSCANnGRMCFG — Global Interface Mode Select Register: access and address corrected
23	1444	23.3.2.4 RSCANnCmSTS — Channel Status Register (m = 0 to 2): access and address corrected
23	1446	23.3.2.5 RSCANnCmERFL — Channel Error Flag Register (m = 0 to 2): access corrected
23	1453	23.3.3.2 RSCANnGCTR — Global Control Register: access and address corrected
23	1455	23.3.3.3 RSCANnGSTS — Global Status Register: access and address corrected
23	1457	23.3.3.4 RSCANnGERFL — Global Error Flag Register: access and address corrected
23	1457	Table 23.24 RSCANnGERFL Register Contents: corrected bit position (“15 to 3” → “15, 14” “13 to 8” “7, 6”, “5” “4, 3” divided) fuctional description on bit 15, bit 14 (Reserved), corrected
23	1459	23.3.3.5 RSCANnGTSC — Global Timestamp Counter Register: access and address corrected
23	1460	23.3.3.6 RSCANnGTINTSTS0 — Global TX Interrupt Status Register 0: access and address corrected
23	1463	23.3.4.1 RSCANnGAFLECTR — Receive Rule Entry Control Register: access and address corrected
23	1464	23.3.4.2 RSCANnGAFLCFG0 — Receive Rule Configuration Register 0: access and address corrected
23	1470	23.3.4.5 RSCANnGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15): access and address corrected
23	1473	23.3.5.1 RSCANnRMNB — Receive Buffer Number Register: access and address corrected
23	1479	23.3.6.1 RSCANnRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7): access and address corrected
23	1481	23.3.6.2 RSCANnRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7): access and address corrected
23	1483	23.3.6.3 RSCANnRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7): access and address corrected
23	1484	23.3.6.4 RSCANnRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7): access and address corrected
23	1492	23.3.7.2 RSCANnCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 8): access and address corrected
23	1495	23.3.7.3 RSCANnCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 8): access and address corrected
23	1503	23.3.8.1 RSCANnFESTS — FIFO Empty Status Register: access and address corrected
23	1505	23.3.8.2 RSCANnFFSTS — FIFO Full Status Register: access and address corrected
23	1507	23.3.8.3 RSCANnFMSTS — FIFO Message Lost Status Register: access and address corrected
23	1509	23.3.8.4 RSCANnRFISTS — Receive FIFO Buffer Interrupt Flag Status Register: access and address corrected
23	1510	23.3.8.5 RSCANnCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register: access and address corrected

Revision 1.20 History, Date Oct 26, 2015 (10/21)

Section	Page	Summary
23	1511	23.3.8.6 RSCANnCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register: access and address corrected
23	1518	23.3.9.4 RSCANnTMPTRp — Transmit Buffer Pointer Register (p = 0 to 47): access and address corrected
23	1532	23.3.11.1 RSCANnTXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 2): access and address corrected
23	1534	23.3.11.2 RSCANnTXQSTSm — Transmit Queue Status Register (m = 0 to 2): access and address corrected
23	1536	23.3.11.3 RSCANnTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 2): access and address corrected
23	1537	23.3.12.1 RSCANnTHLCCm — Transmit History Configuration and Control Register (m = 0 to 2): access and address corrected
23	1539	23.3.12.2 RSCANnTHLSTSm — Transmit History Status Register (m = 0 to 2): access and address corrected
23	1541	23.3.12.3 RSCANnTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 2): access and address corrected
23	1544	23.3.13.1 RSCANnGTSTCFG — Global Test Configuration Register: access and address corrected
23	1546	23.3.13.2 RSCANnGTSTCTR — Global Test Control Register: access and address corrected
23	1547	23.3.13.3 RSCANnGLOCKK — Global Lock Key Register: access and address corrected
23	1553	23.4.2.1 RSCFDnCFDGRMCFG — Global Interface Mode Select Register: access and address corrected
23	1555	23.4.3.1 RSCFDnCFDCmNCFG — Channel Nominal Bit Rate Configuration Register (m = 0 to 2): description of “NBRP[9:0] Bits”, corrected (additional description)
23	1561	23.4.3.3 RSCFDnCFDCmSTS — Channel Status Register (m = 0 to 2): access corrected
23	1564	23.4.3.4 RSCFDnCFDCmERFL — Channel Error Flag Register (m = 0 to 2): access corrected
23	1568	23.4.3.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration register (m = 0 to 2): access and address corrected
23	1569	23.4.3.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration register (m = 0 to 2): description of “DBRP[7:0] Bits”, corrected (additional description)
23	1570	23.4.3.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration register (m = 0 to 2): description of “DBRP[7:0] Bits”, corrected (additional description)
23	1574	23.4.3.7 RSCFDnCFDCmFDCTR — Channel CAN FD Control Register (m = 0 to 2): access and address corrected
23	1575	23.4.3.8 RSCFDnCFDCmFDSTS — Channel CAN FD Status Register (m = 0 to 2): access corrected
23	1576	23.4.3.8 RSCFDnCFDCmFDSTS — Channel CAN FD Status Register (m = 0 to 2): description of “TDCVF Flag”, corrected
23	1583	23.4.4.2 RSCFDnCFDGCTR — Global Control Register: access and address corrected
23	1585	23.4.4.3 RSCFDnCFDGSTS — Global Status Register: access and address corrected
23	1587	23.4.4.4 RSCFDnCFDGERFL — Global Error Flag Register: access and address corrected
23	1589	23.4.4.5 RSCFDnCFDGTSC — Global Timestamp Counter Register: access and address corrected
23	1590	23.4.4.6 RSCFDnCFDGTINTSTS0 — Global TX Interrupt Status Register 0: access and address corrected
23	1593	23.4.4.7 RSCFDnCFDGFDCFG — Global FD configuration register: access and address corrected

Revision 1.20 History, Date Oct 26, 2015 (11/21)

Section	Page	Summary
23	1594	23.4.4.8 RSCFDnCFDGCRCCFG — Global CRC configuration register: access and address corrected
23	1595	23.4.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register: access and address corrected
23	1596	23.4.5.2 RSCFDnCFDGAFLCFG0 — Receive Rule Configuration Register 0: access and address corrected
23	1602	23.4.5.5 RSCFDnCFDGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15): access and address corrected
23	1605	23.4.6.1 RSCFDnCFDRMNB — Receive Buffer Number Register: access and address corrected
23	1611	23.4.6.5 RSCFDnCFDRMFDSTSq — Receive Buffer CAN FD Status Register (q = 0 to 47): access and address corrected
23	1613	23.4.7.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7): access and address corrected
23	1615	23.4.7.2 RSCFDnCFDRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7): access and address corrected
23	1617	23.4.7.3 RSCFDnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7): access and address corrected
23	1622	23.4.7.6 RSCFDnCFDRFFDSTSx — Receive FIFO CAN FD Status Register (x = 0 to 7): access and address corrected
23	1628	23.4.8.2 RSCFDnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 8): access and address corrected
23	1631	23.4.8.3 RSCFDnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 8): access and address corrected
23	1637	23.4.8.6 RSCFDnCFDCFFDCSTSk — Transmit/Receive FIFO CAN FD Configuration/ Status Register (k = 0 to 8): access and address corrected
23	1640	23.4.9.1 RSCFDnCFDFESTS — FIFO Empty Status Register: access and address corrected
23	1642	23.4.9.2 RSCFDnCFDFFSTS — FIFO Full Status Registerr: access and address corrected
23	1644	23.4.9.3 RSCFDnCFDFMSTS — FIFO Message Lost Status Register: access and address corrected
23	1646	23.4.9.4 RSCFDnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register: access and address corrected
23	1647	23.4.9.5 RSCFDnCFDCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register: access and address corrected
23	1648	23.4.9.6 RSCFDnCFDCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register: access and address corrected
23	1655	23.4.10.4 RSCFDnCFDTMPTRp — Transmit Buffer Pointer Register (p = 0 to 47): access and address corrected
23	1657	23.4.10.5 RSCFDnCFDTMFDCTRp — Transmit Buffer CAN FD Configuration Register (p = 0 to 47): access and address corrected
23	1670	23.4.12.1 RSCFDnCFDTXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 2): access and address corrected
23	1672	23.4.12.2 RSCFDnCFDTXQSTSm — Transmit Queue Status Register (m = 0 to 2): access and address corrected
23	1674	23.4.12.3 RSCFDnCFDTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 2): access and address corrected
23	1675	23.4.13.1 RSCFDnCFDTHLCCm — Transmit History Configuration and Control Register (m = 0 to 2): access and address corrected
23	1677	23.4.13.2 RSCFDnCFDTHLSTSm — Transmit History Status Register (m = 0 to 2): access and address corrected

Revision 1.20 History, Date Oct 26, 2015 (12/21)

Section	Page	Summary
23	1679	23.4.13.3 RSCFDnCFDTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 2): access and address corrected
23	1682	23.4.14.1 RSCFDnCFDGTSTCFG — Global Test Configuration Register: access and address corrected description of “RTMPS[6:0] Bits”, corrected (additional description)
23	1684	23.4.14.2 RSCFDnCFDGTSTCTR — Global Test Control Register: access and address corrected
23	1685	23.4.14.3 RSCFDnCFDGLOCKK — Global Lock Key Register: access and address corrected
23	1702	23.8.1 Transmit Priority Determination: description corrected
23	1708	23.9 Gateway Function: description corrected
23	1711	23.10.5 RAM Test: description corrected (additional description)
23	1715	23.11.1.2 Bit Timing Setting: description corrected
23	1716	Figure 23.17 Bit Timing Chart: corrected (“TSEG1 > TSEG2 ≥ SJW” → “TSEG1 ≥ TSEG2 ≥ SJW”)
23	1723	Figure 23.22 SSP timing: note added
23	1723	23.11.1.6 Transceiver delay compensation (Only in CAN FD Mode): description corrected
23	1746	23.12.5 ECCRCFDnTMC — RSCFDn ECC Test Mode Control Register: access corrected
23	1749	23.12.7 ECCRCFDnTRC — RSCFDn ECC Redundant Bit Data Control Test Register: R/W of bit 7 in the bit chart, corrected (“R/W” → “R”)
23	1750	23.12.8 ECCRCFDnSYND — RSCFDn ECC Decode Syndrome Data Register: access corrected
23	1750	23.12.9 ECCRCFDnHORD — RSCFDn ECC 7-Bit Redundant Bit Data Hold Test Register: access corrected
23	1751	23.12.10 ECCRCFDnECRD — RSCFDn ECC Encode Test Register: access corrected
23	1752	23.12.11 ECCRCFDnERDB — RSCFDn ECC Redundant Bit Input/Output Replacement Buffer Register: section title corrected
24	1758	Table 24.5 Reset sources: corrected (“ETNBn” → “ETNB0”)
24	1763	Table 24.9 Configuration of E-MAC-related Registers: corrected (register name: “MAC” → “E-MAC”), and “ETNBn Delayed collision detect counter register” deleted entire row
24	1793	Table 24.26 TGC register contents (2/2): corrected (“Non-ABV mode” → “Non-AVB mode”)
24	1801	Table 24.32 CIVRc register contents: corrected (“(0 to H’FFFF)” → “(1 to H’FFFF)”)
24	1855	24.3.58 EthernetAVB Mode Register (GECMR): “CAUTION” corrected
24	1856	24.3.59 E-MAC Address High Register (MAHR): corrected (“MAC” → “E-MAC”)
24	1856	Table 24.68 MAHR register contents: corrected (“MAC” → “E-MAC”)
24	1857	24.3.60 E-MAC Address Low Register (MALR): corrected (“MAC” → “E-MAC”)
24	1857	Table 24.69 MALR register contents: corrected (“MAC” → “E-MAC”)
24	—	24.3.62 Delayed Collision Detect Counter Register (CDCR): deleted
24	1867	24.4.1 AVB-DMAC Operating Modes: description corrected
24	1869	Figure 24.6 Flow for Transitions of Operating Mode (Other than from Operation Mode to Configuration Mode): corrected
24	1872	(1) Initializing the Receiver Section: description corrected
24	1881	Figure 24.14 Example of URAM Memory Map: corrected (“Storage element” added)
24	1884	24.4.3.4 Descriptor Chain Processing: description corrected
24	1887	Table 24.78 Summary of Descriptor Types: description on FEMPTY_IC, corrected
24	1893	(7) How to Use Chain Control Descriptors: description corrected

Revision 1.20 History, Date Oct 26, 2015 (13/21)

Section	Page	Summary
24	1896	24.4.4.1 Reception Queues: description corrected
24	1899	(2) Separating Streams: corrected (“ABV network” → “AVB network”, “22nd byte” → “23rd byte”)
24	1906	(a) Setting Up an Incremental Data Area: description corrected
24	1908	(4) Support for Reception Time Stamps: description corrected
24	1911	(a) Support for Traffic Classes and Associated Priority: description corrected
24	1916	(3) Setting the Size of the Transmission FIFO: description corrected
24	1919	(1) Transmitting Frames: description corrected
24	1920	Figure 24.35 Software Flow for Immediate Frame Transmission: corrected
24	1924	Figure 24.41 Mechanism to Support Transmission Time Stamps: corrected (“Frame 1 data in local memory with the TAG and TSR values.” → “Frame 2 data in local memory with the TAG and TSR values.”)
24	1927	24.4.6 CBS (Credit-Based Shaping): corrected (“being clear (0)” deleted)
24	1930	24.4.6 CBS (Credit-Based Shaping): description of “Example”, corrected
24	1934	24.4.6.3 Example: description corrected
24	1935	24.4.7.1 gPTP Timer: description corrected
24	1936	24.4.7.3 Synchronization with the Grandmaster Clock: description corrected
24	1938	24.4.8 Support for IEEE 1722: corrected (“pPTP time” → “gPTP timer”, “(TCCR.TCSS)” → “(GCCR.TCSS)”)
24	1939	24.4.9 Flow Control: description corrected (additional description)
24	1940	24.4.10 Magic Packet Detection: description corrected, and “NOTE” added
24	1941	Table 24.89 EthernetAVB Interrupts: corrected (EIINT Interrupt Channel Number) Other management (FIFO caution level, etc.) interrupt: “247” → “246” E-MAC interrupt: “248” → “247”
24	1943	Figure 24.49 Flow of E-MAC Initialization (for AVB Mode and Full-Duplex Operation): corrected (figure title, “ABV Mode” → “AVB Mode”(description))
24	1944	Figure 24.50 Flow of AVB-DMAC Initialization (for AVB Mode and Full-Duplex Operation): corrected (figure title, “ABV Mode” → “AVB Mode”(description))
26	1970	Table 26.2 Index: corrected (““n” (n = 0,1)” → ““n””)
26	1970	26.1.2 Register Base Addresses: section title corrected
26	1970	Table 26.3 Register Base Address: table title corrected
26	1970	Table 26.4 Clock Supply: corrected (“Clock for the Unit” → “Unit Clock Name”)
26	1974	Table 26.9 WDTA start-up options: fucntion and description on OPWDOVF[2:0], corrected
26	1977	26.3.2 WDTAnWDTE — WDTA Enable Register: value after reset of bit 7 in the bit chart, corrected (“0/1” added)
26	1977	Table 26.11 WDTAnWDTE Register Contents: functional description corrected
26	1979	26.3.3 WDTAnEVAC — WDTA Enable VAC Register: value after reset of bit 7 in the bit chart, corrected (“0/1” added)
26	1979	Table 26.14 WDTAnEVAC Register Contents: functional description corrected
26	1986	26.5.2.1 Calculating an Activation Code when the VAC Function is Used: “NOTE” corrected
27	1990	Table 27.4 Clock Supply: corrected (“Clock for the Unit” → “Unit Clock Name”)
27	1992	Figure 27.1 Block diagram of OSTM: figure title corrected (“OS Timer” → “OSTM”)
27	1993	27.2.4 Output Modes: description corrected (“OS Timer” → “OSTM”)
27	1996	27.3.2 OSTMnCMP - OSTMn Compare Register: section title corrected (“OSTM” → “OSTMn”)
27	1998	27.3.4 OSTMnTO - OSTMn Output Register: section title corrected (“OSTM” → “OSTMn”)

Revision 1.20 History, Date Oct 26, 2015 (14/21)

Section	Page	Summary
27	1998	27.3.5 OSTMnTOE - OSTMn Output Enable Register: section title corrected ("OSTM" → "OSTMn")
27	1999	Table 27.14 OSTMnTE Register Contents: functional description on OSTMnTE, corrected ("OSTMnTT.OSTMnTTF" → "OSTMnTT.OSTMnTT")
27	1999	27.3.6 OSTMnTE — OSTMn Count Enable Status Register: "NOTE" corrected
27	2000	Table 27.15 OSTMnTS Register Contents: functional description on OSTMnTS, corrected
27	2000	Table 27.16 OSTMnTT Register Contents: functional description on OSTMnTT, corrected
27	2002	27.3.10 OSTMnEMU — OSTMn Emulation Register: value after reset corrected
27	2002	Table 27.18 OSTMnEMU Register Contents: functional description on OSTMnSVSDIS, corrected
27	2004	27.4.2.1 Basic operation in interval timer mode: description of "Forced restart", corrected ("OS Timer" → "OSTM")
27	2005	27.4.2.1 Basic operation in interval timer mode: description of "(2)", corrected
27	2006	27.4.2.2 Operation when OSTMnCMP = 0000 0000_H: description of "(4)", corrected
27	2008	27.4.3.1 Basic operation in free-run compare mode: description of "OSTMnTINT period", corrected
27	2009	27.4.3.2 Operation when OSTMnCMP = 0000 0000_H: description of "(4)", corrected
29	2028	Table 29.4 TAUBn Clock Supply: corrected ("Clock for the Unit" → "Unit Clock Name")
29	2036	29.2.1 Features Summary: description of "Independent and synchronous operation", corrected
29	2037	29.2.2 Terms: description of "Trigger selector", corrected
29	2042	Table 29.10 List of Registers: address corrected ("<TAUBn_base> + m × 4_H" → "<TAUBn_base> + 0_H + m × 4_H")
29	2048	Table 29.15 TAUBnCMORm Register Contents (1/3): functional description on TAUBnCKS [1:0], corrected
29	2051	29.3.3.4 TAUBnCMURm — TAUBn Channel Mode User Register: value after reset corrected ("0000_H" → "00_H")
29	2052	29.3.3.6 TAUBnCSCm — TAUBn Channel Status Clear Register: access corrected ("0000_H" → "00_H")
29	2053	Table 29.20 TAUBnTE Register Contents: functional description corrected
29	2055	Table 29.23 TAUBnRDS Register Contents: corrected (table title) ("TAUBnRDM" → "TAUBnRDS")
29	2057	29.3.4.6 TAUBnRSF — TAUBn Channel Reload Status Register: description corrected
29	2063	29.3.7.1 TAUBnEMU — TAUBn Emulation Register: section title corrected ("TAUB" → "TAUBn")
29	2063	Table 29.35 TAUBnEMU Register Contents: corrected (table title) ("TTAUBn" → "TAUBn")
29	2065	29.5.1 Rules of Synchronous Channel Operation Function: description of "Operation clock", corrected
29	2066	29.5.2.1 Simultaneous Start and Stop within the Same Unit: section title corrected
29	2068	29.6.2.1 Initial Settings: reference description corrected
29	2069	29.6.2.2 Start Counter and Count Operation: corrected ("TAUBnRSF.RSFm" → "TAUBnRSF.TAUBnRSFm")
29	2069	29.6.3 Other General Rules of Simultaneous Rewrite: description corrected ("TAUBnRDE.RDEm" → "TAUBnRDE.TAUBnRDEm") ("TAUBnRDS.RDSm" → "TAUBnRDS.TAUBnRDSm") ("TAUBnRDM.RDMm" → "TAUBnRDM.TAUBnRDMm") ("TAUBnRDC.RDCm" → "TAUBnRDC.TAUBnRDCm") ("TAUBnTOL.TOLm" → "TAUBnTOL.TAUBnTOLm") ("TAUBnRDC.RDCm" → "TAUBnRDC.TAUBnRDCm")

Revision 1.20 History, Date Oct 26, 2015 (15/21)

Section	Page	Summary
29	2077	Figure 29.8 General Procedure for Specifying a TAUBTTOUTm Channel Output Mode: figure titile corrected
29	2079	Figure 29.9 Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output: corrected (“TAUBnTDL.TAUBnTDL” → “TAUBnTDL.TAUBnTDLm”)
29	2079	29.7.3.3 Synchronous Channel Output Mode 2 with Dead Time Output: corrected (“TAUBnTDM.TAUBnTDMm” → “TAUBnTDE.TAUBnTDEm”)
29	2081	29.8.2 Event Count Mode: description corrected
29	2084	29.10.1 Example of Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function: description corrected
29	2085	29.10.2 Example of Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement): corrected (“TAUDTTINm” → “TAUBTTINm”)
29	2091	Table 29.39 Contents of the TAUBnCMORm Register for Interval Timer Function: functional description on TAUBnMD0, corrected
29	2104	29.12.3.1 Overview: “NOTE” corrected
29	2108	Table 29.53 Operating Procedure for Clock Divide Function: description of “Status of TAUBn”, corrected (“During operation” and “Stop operation”)
29	2111	29.12.4.1 Overview: description corrected
29	2112	29.12.4.3 Block Diagram and General Timing Diagram: section title corrected
29	2117	29.12.5.1 Overview: description of “Summary”, corrected
29	2133	29.12.7.3 Block Diagram and General Timing Diagram: corrected (“TAUBnCSRm.OVF” → “TAUBnCSRm.TAUBnOVF”)
29	2135	Table 29.71 Simultaneous Rewrite Settings for TAUBTTINm Input Signal Width Measurement Function: corrected (“(TAUBnRDE.RDEm = 0)” → “(TAUBnRDE.TAUBnRDEm = 0)”)
29	2141	29.12.8.1 Overview: “NOTE” corrected
29	2146	29.12.9.1 Overview: corrected (“(TAUBnCDRn + 1)” → “(TAUBnCDRm + 1)”)
29	2156	29.12.11.1 Overview: corrected (“(TAUBnTS.TSm)” → “(TAUBnTS.TAUBnTSm)”)
29	2165	29.12.13.1 Overview: corrected (“TAUBnCMURm.TIS[1:0]” → “TAUBnCMURm.TAUBnTIS[1:0]”)
29	2169	Table 29.96 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection): description of “Status of TAUBn”, corrected (“During operation” and “Stop operation”)
29	2176	Table 29.101 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1: description of “Status of TAUBn”, corrected (“Start operation” and “Stop operation”)
29	2179	29.14.1.3 Block Diagram and General Timing Diagram: “NOTE” corrected
29	2180	Table 29.102 Contents of the TAUBnCMORm Register for the Master Channel of the PWM Output Function: functional description on TAUBnCKS[1:0], corrected corrected (“CKS[1:0]” → “TAUBnCKS[1:0]”)
29	2182	Table 29.105 Contents of the TAUBnCMORm Register for the Slave Channel of the PWM Output Function: functional description on TAUBnCKS[1:0], corrected corrected (“CKS[1:0]” → “TAUBnCKS[1:0]”)
29	2184	Table 29.109 Operating Procedure for PWM Output Function: description of “Status of TAUBn”, corrected (“During operation”)
29	2187	(3) Operation stop and restart: section title corrected
29	2189	29.14.2.1 Overview: description of “Description”, corrected
29	2190	29.14.2.1 Overview: “NOTE” corrected
29	2193	Table 29.110 Contents of the TAUBnCMORm Register for the Master Channel of the One-Shot Pulse Output Function: functional description on TAUBnCKS[1:0], corrected corrected (“CKS[1:0]” → “TAUBnCKS[1:0]”)

Revision 1.20 History, Date Oct 26, 2015 (16/21)

Section	Page	Summary
29	2195	Table 29.115 Control Bit Settings for Independent Channel Output Mode 2: description of “Setting” (“TAUBnTDL.TAUBnTDLm”)
29	2196	Table 29.117 Operating Procedure for One-Shot Pulse Output Function: description of “Status of TAUBn”, corrected (“During operation”)
29	2200	(4) TAUBnCMORm.TAUBnMD0 = 1: description corrected
29	2203	29.14.3.1 Overview: description corrected
29	2209	Table 29.121 Contents of the TAUBnCMORm Register for the Slave Channel 1 of the Delay Pulse Output Function: functional description on bit 13 (Reserved) and bit 5 (Reserved), corrected
29	2210	Table 29.122 Contents of the TAUBnCMURm Register for the Slave Channel 1 of the Delay Pulse Output Function: functional description on bit 7 to bit 2 (Reserved), corrected
29	2215	Table 29.132 Operating Procedure for Delay Pulse Output Function (2/2): description of “Operation”, corrected (“Start operation”) corrected (“TAUBnTS.TSm” → “TAUBnTS.TAUBnTSm”)
29	2228	Table 29.141 Operating Procedure for Triangle PWM Output Function: description of “Status of TAUBn”, corrected (“During operation”) corrected (“TAUBnTTOUTm” → “TAUBTTOUTm”)
29	2240	Table 29.151 Contents of the TAUBnCMORm Register for the Slave Channel 3 of the Triangle PWM Output Function with Dead Time: functional description on TAUBnCCS0, corrected (“00_B” → “0_B”)
29	2242	Table 29.155 Operating Procedure for Triangle PWM Output Function with Dead Time: description of “Status of TAUBn”, corrected (“Start operation”)
29	2244	(3) TAUBTTOUTm (slave 2) = 0% and TAUBTTOUTm (slave 3) ≥ 0%: section title corrected corrected (“> 0%” → “ ≥ 0%”)
29	2251	(6) Inhibited INTTAUBnIm to set TAUBTTOUTm negative phase period: description corrected
29	2251	(7) Slave 2 TAUBnCDRm = 0000_H (Duty cycle = 100%): section title corrected
29	2251	Figure 29.110 Slave 2 TAUBnCDRm = 0000_H (Duty cycle = 100%): figure title corrected
30	2254	Table 30.4 Clock Supply: corrected (“Clock for the Unit” → “Unit Clock Name”)
30	2256	30.2.1 Functional Overview: description of “Independent and synchronous operation”, corrected
30	2258	30.2.6 Description of Blocks: description of “Prescaler block”, corrected
30	2259	30.2.6 Description of Blocks: description of “Clock and count selection”, corrected
30	2268	Table 30.15 TAUJnCMORm Register Contents (1/3): functional description on TAUJnCCS[1:0], corrected
30	2272	30.3.3.5 TAUJnCSRm — TAUJn Channel Status Register: value after reset of bit 1 in the bit chart, corrected (“0” → “×”)
30	2272	Table 30.17 TAUJnCSRm Register Contents: corrected bit position (“7 to 1” → “7 to 2”), and bit 1 added
30	2293	30.8.2 Other Operating Modes: description corrected
30	2294	Figure 30.9 INTTAUJnIm Generation Timing (when TAUJnCMORm.TAUJnMD0 = 0): figure title corrected (“TAUJMD0” → “TAUJnMD0”)
30	2294	Figure 30.10 INTTAUJnIm Generation Timing (when TAUJnCMORm.TAUJnMD0 = 1): figure title corrected (“TAUJMD0” → “TAUJnMD0”)
30	2297	30.12.1.1 Overview: corrected (“TAUJnTTOUTm” → “TAUJTTOUTm”)
30	2302	(2) TAUJnCDRm = 0000 0000_H, count clock = PCLK: corrected (“TAUJnTTOUTm” → “TAUJTTOUTm”)
30	2305	30.12.2.3 Block Diagram and General Timing Diagram: corrected (“(TAUJnCMORm.TAUJnMD0 = 0)” → “(TAUJnCMORm.TAUJnMD0 = 1)”)
30	2319	30.12.4.1 Overview: corrected (“(TAUJnCSRm.OVF = 1)” → “TAUJnCSRm.TAUJnOVF”)

Revision 1.20 History, Date Oct 26, 2015 (17/21)

Section	Page	Summary
30	2327	30.12.5.1 Overview: description of “Description”, corrected
30	2335	Table 30.60 Operating Procedure for TAUJTTINm Input Period Count Detection Function: description of “Status of TAUJn”, corrected (“During operation”)
30	2347	30.13.1.3 Block Diagram and General Timing Diagram: “NOTE” corrected
31	2355	Table 31.4 Clock Supply: corrected (“Clock for the Unit” → “Unit Clock Name”)
31	2359	Table 31.8 Registers: register name, symbol, address of “sub-count register read buffer” and “clock error correction register”, corrected
31	2365	Table 31.13 RTCAnSRBU Register Contents: functional description on RTCAnSRBU[21:0], corrected
31	2377	31.3.4.9 RTCAnDAYC — RTCA Day of the Month Count Register, “NOTE” corrected
31	2390	Table 31.38 RTCAnEMU Register Contents: functional description on RTCAnSVSDIS, corrected
31	2392	31.4.2 Fixed Interval Interrupt Function: description corrected
31	2393	31.4.3 Alarm Interrupt Function: description corrected
31	2398	31.5.1.2 RTCA Initialization Procedure: “CAUTION” corrected
31	2399	31.5.2 Updating Clock Counters: description of “1.” in “CAUTION”, corrected
31	2400	31.5.3.1 Procedure for Reading Count Buffer Registers: description corrected
31	2401	31.5.3.1 Procedure for Reading Count Buffer Registers: description of “1.” and “3.” in “CAUTION”, corrected
31	2402	Figure 31.8 Reading Clock Counter Registers: corrected
31	2408	31.6.3 Timing of Sub-Counter Read Buffer Reading while Counter is Enabled: description of “(3)” corrected
32	2409	32.1.1 Number of Units and Channels: description corrected
32	2410	Table 32.4 Register Base Addresses: table title corrected
32	2410	Table 32.5 Clock Supply: corrected (“Clock for the Unit” → “Unit Clock Name”)
32	2411	Table 32.9 Internal Input/Output Signals: unit signal name corrected (“PWGA_TRGOUT” → “PWGA_TRGOUT[11:0]”)
32	2412	32.1.8 Outline of Functions: description of “PWBA” and “PWGA”, corrected
32	2413	32.1.8 Outline of Functions: description of “PWGA” and “PWSA”, corrected
32	2415	Table 32.10 List of PMW-Diag Registers: corrected (“Register name”) (“PWGAnCRDR” → “PWGAnCTDR buffer register”)
32	2418	32.2.1.3 PWBAnTS Register: description corrected (“(n = 0 to 3).” → “(m = 0 to 3)”) R/W of bit 7 to bit 4 in the bit chart, corrected (“W” → “R”)
32	2419	32.2.1.4 PWBAnTT Register: R/W of bit 7 to bit 4 in the bit chart, corrected (“W” → “R”)
32	2420	32.2.1.5 PWBAnEMU Register: description corrected section title: “PWBA0EMU” → “PWBAnEMU” bit name of bit 7 in the bit chart: “PWBA0SVSDIS” → “PWBAnSVSDIS”
32	2420	Table 32.15 PWBAnEMU Register Contents: corrected table title: “PWBA0EMU” → “PWBAnEMU” bit name: “PWBA0SVSDIS” → “PWBAnSVSDIS”
32	2422	Table 32.18 PWGAnCSDR Register Contents: functional description on PWGAnCSDR[11:0], corrected
32	2422	Table 32.19 PWGAnCRDR Register Contents: functional description on PWGAnCRDR[12:0], corrected
32	2423	Table 32.20 PWGAnCTDR Register Contents: functional description on PWGAnCTDR[11:0], corrected
32	2423	Table 32.21 PWGAnCSBR Register Contents: functional description on PWGAnCSBR[11:0], corrected
32	2424	Table 32.22 PWGAnCRBR Register Contents: functional description on PWGAnCRBR[12:0], corrected

Revision 1.20 History, Date Oct 26, 2015 (18/21)

Section	Page	Summary
32	2424	Table 32.23 PWGAnCTBR Register Contents: functional description on PWGAnCTBR[11:0], corrected
32	2425	Table 32.25 PWGAnRDT Register Contents: functional description on PWGAnRDT, corrected
32	2427	32.2.1.18 PWSAnSTR Register: description corrected
32	2427	Table 32.28 PWSAnSTR Register Contents: functional description on PWSAnQNE, corrected
32	2428	32.2.1.19 PWSAnSTC Register: R/W of bit 7 to bit 2, corrected (“W” → “R”)
32	2429	32.2.1.21 PWSAnPVCRx_y (x = 00, 02, 04 ... 10, y = 01, 03, 05 ... 11) Register: address corrected
32	2429	Table 32.31 PWSAnPVCRx_y Register Contents: bit position corrected (“7 to 6” → “7, 6”)
32	2430	Table 32.32 PWSAnEMU Register Contents: functional description on PWSAnSVSDIS, corrected
32	2431	Figure 32.2 PWM-Diag Operating Procedure: corrected (“PWGA0” → “PWGAn”)
32	2432	32.3 Operating Procedure: description corrected
32	2432	Figure 32.3 Simultaneous Rewrite Procedure: corrected
37	2607	37.5.5.2 CKSC_IPLL0PIXS_ACT . PLL0PIXCLK clock active register (D1L2(H), D1M1(H) and D1M2(H) only): section title corrected (“(D1M2(H) only)” → “(D1L2(H), D1M1(H) and D1M2(H) only)”)
37	2630	37.5.5.25 CKSC_IVDCE0VIS_CTL — C_ISO_VI0PIXCLK source clock selection register (D1M1(H) and D1M2H only): section title corrected (“(D1M1(H) and D1M2(H) only)” → “(D1M1(H) and D1M2H only)”)
37	2637	37.6 Sprite Engine registers update control: description corrected
37	2637	Figure 37.13 Sprite Engine registers update control for video channel n: corrected
37	2637	Table 37.34 VDCEnVEm signals (1/2): corrected (“VSYNC” → “VE”)
37	2638	Table 37.34 VDCEnVEm signals (2/2): corrected (“VSYNC” → “VE”)
37	2638	37.6 Sprite Engine registers update control: description corrected
37	2639	Figure 37.14 Video channel 0 video input selections: “*2” and “Note 2.” deleted
37	2641	Figure 37.15 Video channel 1 video input selections: “*2” and “Note 2.” deleted
37	2643	Table 37.42 Clock Supply: corrected (“Clock for the Unit” → “Unit Clock Name”)
37	2678	37.8.5.5 VSYNC Timing from MIPI to VDCE: description of “MIPI setting”, corrected (“16” → “17”)
37	2691	Table 37.73 VDCECTL register contents: functional description on UPDT1 and UPDT0, corrected (“VSYNC1” → “VUPDATE1”, “VSYNC0” → “VUPDATE0”)
37	2693	Table 37.75 SPEAUPDEN register contents: functional description on UPDEN[15:0], corrected (“VE” → “VSYNC”)
38	2704	Table 38.8 Features of Video Display Controller (2/2): functional description on “Graphics”, corrected (“Y: 8 bits, Cb/Cr: 8 bits” → “Y: 8 bits, Cb: 8 bits, Cr: 8 bits; 24 bits”)
38	2707	Table 38.10 Input/Output Pins (Channel 1): corrected (“Figure 38.4” → “Table 38.10”)
38	2718	Figure 38.9 BT601 Horizontal Timing (625 Lines/50.00 Hz): corrected
38	2721	Figure 38.13 BT656 Horizontal Timing (625 Lines/50.00 Hz): corrected
38	2723	38.3.1.8 Typical Signal Timing of BT656 Format: “Timing Example of 525-Line Interface Input in BT656 Format”, added (remove from “38.3.1.10 BT656 Progressive Format”)
38	2723	Figure 38.15 Timing of Vertical/Horizontal Synchronization Signal from 525-Line Interlaced Input in BT656 Format (Top to Bottom), added (remove from “38.3.1.10 BT656 Progressive Format”)
38	2723	Figure 38.16 Timing of Vertical/Horizontal Synchronization Signal from 525-Line Interlaced Input in BT656 Format (Bottom to Top), added (remove from “38.3.1.10 BT656 Progressive Format”)

Revision 1.20 History, Date Oct 26, 2015 (19/21)

Section	Page	Summary
38	2725	Table 38.24 SAV/EAV Code in BT656 Format (625 Lines/50.00 Hz): value for “1725” and “1727” of “valid area”, corrected
38	2726	Table 38.25 SAV/EAV Code in BT656 Format (525 Lines/59.94 Hz): value for “1713” and “1715” of “valid area”, corrected
38	2727	(c) Timing Example of 525-Line Interface Input in BT656 Format: deleted (removed to the end of “38.3.1.8 Typical Signal Timing of BT656 Format”)
38	2728	Table 38.27 SAV/EAV Code in BT656 Progressive Format (525 Lines/59.94 Hz): value for “1713” and “1715” of “valid area”, corrected
38	2728	Figure 38.17 Vertical/Horizontal Synchronization Signal in BT656 Format (525 Lines, Progressive): note corrected
38	2730	“NOTE” added
38	2731	Figure 38.19 YCbCr Data Expansion for YCbCr422 Input: corrected
38	2739	Table 38.39 Video input by data enable: corrected description on DE_VLAST_EN: note added register name corrected (“DEMODE0” → “DEMODE1”)
38	2752	38.3.2.15 Video input with data enable control register 0 (DEMODE0): initial value and description of bit 31 to 5 (Reserved), corrected
38	2753	38.3.2.16 Video input with data enable control register 1 (DEMODE1): initial value and description of bit 31 to 11 (Reserved), corrected
38	2786	Table 38.84 Frame Buffer Control: description on GR_FLM_SEL: corrected (“SC_SCL0_FRC3” → “SC0_SCL1_WR1”)
38	2798	38.4.3.3 Missing Vsync Compensation Control Register (SC0_SCL0_FRC2): note 2. added
38	3022	Table 38.149 Signals Generated by LCD TCON: description and signal name on STVA/VS and STVA/HS, corrected
38	3029	Table 38.155 Vertical Panel Driver Signal Generation: description on TCON_STVA_VS[10:0] and TCON_STVB_VS[10:0], corrected (“TCON_STVA_HS” → “TCON_STVA_VS”, “TCON_STVB_HS” → “TCON_STVB_VS”)
38	3031	Table 38.157 Panel Driver Signal Output Selection: description on TCON_STVA_SEL[2:0] and TCON_STH_SEL[2:0, corrected] (“VS” → “STVA/VS”, “HSS” → “STH/SP/HS”)
38	3076	38.8.2.35 TCON Vertical Timing Setting Register A2 (TCON_TIM_STVA2): description on TCON_STVA_SEL[2:0], corrected (“VS” → “STVA/VS”)
38	3080	38.8.2.39 TCON Horizontal Timing Setting Register STH2 (TCON_TIM_STH2): description on TCON_STH_SEL[2:0], corrected (“HS” → “STH/SP/HS”)
39	3112	Table 39.3 Clock Supply: corrected (“Clock for the Unit” → “Unit Clock Name”)
40	3134	Table 40.11 VOCAnCTL register contents (1/2): bit name (*3 added) and functional description on VOCAnMKVOC, corrected
40	3135	Table 40.11 VOCAnCTL register contents (2/2): functional description on VOCAnCL16 and VOCAnCLm, corrected, and note 3. added
40	3135	note 3. added concerning table 40.11 VOCAnCTL register contents.
41	3166	Table 41.19 Pixel Format: corrected (“CMDBT” → “CMPBT”)
41	3167	41.5.6 CRC Calculation Time Period and Comparison Timing: reference number corrected (“Figure 43.4” → “Figure 41.5”)
43	3188	Table 43.5 SPEA internal signal connections: corrected (“VSYNC” → “VUPDATE”)
43	3190	Figure 43.1 RLE Engines block diagram: corrected (“VSYNC” → “VUPDATE”)
43	3193	Table 43.6 RLE Units supported color formats: table title corrected
43	3195	Table 43.7 RLE Targa packets: table title corrected
43	3198	43.3.5 RLE definition registers modification: corrected (“VSYNC” → “VUPDATE”)
43	3199	Figure 43.9 Sprite Units block diagram: corrected (“VSYNC” → “VUPDATE”)

Revision 1.20 History, Date Oct 26, 2015 (20/21)

Section	Page	Summary
43	3201	(b) SPEAnSkLYm.SPEAnSkLYHm: height: description of “Image Synthesizer line offset”, corrected (“8192 KB” → “8192 Byte”)
43	3203	43.4.7 Sprite definition registers modification: corrected (“VSYNC” → “VUPDATE”)
43	3204	Table 43.8 Sprite and RLE Units registers overview: register name on SPEAnSkVDm (“VSYNC” → “VUPDATEn”)
43	3210	Table 43.14 SPEAnRUP register contents: functional description on SPEAnRUP1 and SPEAnRUP0, corrected (“VSYNC” → “VUPDATE”)
43	3214	Table 43.18 SPEAnSkUP register contents: functional description on SPEAnSkUP1 and SPEAnSkUP0, corrected (“VSYNC” → “VUPDATE”)
43	3214	“NOTE” corrected (“VSYNC” → “VUPDATE”)
43	3216	43.5.2.5 SPEAnSkVDm - Sprite Unit k sprite m VUPDATEn selection register: section title, description, and functional description, corrected (“VSYNC” → “VUPDATE”)
44	3239	44.3.20 JPEG Interface Compression Line Offset Register (JIFESOFST): references corrected
44	3262	44.4.2.1 Overview of Processing: description of “4.”, corrected (“JIFECNT” → “JIFDCNT”)
44	3265	(a) Error Marker: references corrected (“table 41.3” → “Table 44.43”)
44	3266	(b) Huffman Coded Segment Error: references corrected (“Table 41.4” → “Table 44.44”)
44	3270	44.4.3.7 Swap: description corrected (“JIFECNT” → “JIFDCNT”)
45	3281	Figure 45.3 Usage Example of Virtual Register: figure corrected, and description of “note 3.” corrected (“register m” → “register j”)
45	3282	Table 45.11 Register Address List (1/2): register name corrected (“Scan Group x status register” → “Scan Group status register”)
45	3284	Table 45.12 ADCEnVCRj register contents: functional description on GCTRL[5:0], corrected
45	3284	45.3.2.1 ADCEnVCRj — Virtual Channel Register j: “CAUITION” corrected
45	3288	45.3.2.4 ADCEnDRj — Data Register j: description corrected (“ADCEnVCRm” → “ADCEnVCRj”)
45	3289	Table 45.17 ADCEnDIRj register contents: table title (“ADCEnDIRm” → “ADCEnDIRj”) and functional description on ID[5:0], corrected
45	3291	Table 45.19 ADCEnPWDDIR Register Contents: functional description on WFLG and ID[5:0], corrected
45	3295	45.3.3.2 ADCEnADCR — A/D Control Register: “NOTE” corrected (“AD channel conversion” → “A/D channel conversion”)
45	3299	45.3.4.2 ADCEnULLMTBR0 to 2 — Upper Limit/Lower Limit Table Register 0 to 2: access corrected
45	3299	45.3.4.2 ADCEnULLMTBR0 to 2 — Upper Limit/Lower Limit Table Register 0 to 2: “CAUTION” corrected
45	3301	Table 45.28 ADCEnULER register contents (1/2): functional description on ULSG[1:0], corrected
45	3302	Table 45.28 ADCEnULER register contents (2/2): functional description on ULECAP[5:0], corrected
45	3315	45.3.5.11 ADCEnSGSTR — Scan Group Status Register: section title corrected
45	3330	Figure 45.6 Flow at the End of A/D Conversion: corrected, and note added
45	3342	45.4.11.1 Stopping Scan Group by ADHALT: description corrected (“(AD force halt trigger)” → “(A/D force halt trigger)”)
45	3342	45.4.12 Scan End Interrupt Request: description corrected (“ADCEnVCRm” → “ADCEnVCRj”)
45	3346	45.5.2 Diagnostic of Channel Multiplexer: description corrected
45	3350	45.7.1 Range of Channel Input Voltage: added
45	3351	45.7.2 Usage Notes for Analog Input Pins: description corrected

Revision 1.20 History, Date Oct 26, 2015 (21/21)

Section	Page	Summary
46	3446	46.6.6 ECCISMnTRC — ISMn RAM ECC Redundant Bit Data Control Test Register: R/W of bit 7 in the bit chart, corrected (“R/W” → “R”)
48	3456	Figure 48.1 Error Control Module block diagram: corrected (“OSTM1” → “OSTM0”, “OSTM1TTOUT” → “OSTM0TTOUT”)
48	3459	48.1.11 ECM Master - Checker operation: description corrected
48	3464	48.2.4 ECM Master/Checker Error Source Status Register 0 (ECMmESSTR0, m = M/C): corrected (“regsiter” → “register”)
48	3482	48.2.23 ECM Delay Timer Register (ECMDTMR): description corrected (additional description)
48	3483	48.2.24 ECM Delay Timer Compare Register (ECMDTMCMP): corrected (“ECMmSSE129n” → “ECMmSSE129”)
49	3489	Table 49.3 Clock Supply: corrected (“Clock for the Unit” → “Unit Clock Name”)
49	3495	Table 49.8 DCRAnCTL Register Contents: functional description on DCRAnPOL, corrected
49	3496	49.3.4 DCRAnCTL — CRC Control Register: “CAUTION” corrected
51	3499	(1) Debug interface: description corrected
51	3499	(2) Debug monitoring function: description corrected
51	3500	Table 51.4 Modules with optional peripheral break: “Control register bit” on PWM Generators and Diagnostic (PWM-Diag), corrected (“PWBA0EMU.PWBA0SVSDIS” → “PWBAnEMU.PWBAnSVSDIS”)
51	3501	(10) Timer function: description corrected
51	3501	(13) Security function: description corrected
51	3502	51.3.1.1 EPC — Emulation Peripheral Control Register: initial value of bit 7 in the bit chart, corrected (“0” → “0*1”), and note1. added
51	3502	51.3.1.1 EPC — Emulation Peripheral Control Register: description of “1.” in “NOTES”, corrected
51	3504	51.4.1 Treatment of devices using debugging: description corrected
52	3512	Table 52.5 Available Operations and Security Settings: “Serial programming” on Prohibition of programming commands, corrected (*1 added)
52	3512	note 1. added concerning table 52.5 Available Operations and Security Settings
52	3530	Table 52.23 CFERRINT_VCI2CFB/PE1_OS register contents: functional description on bit 31 to bit 2 (Reserved), corrected

Revision 2.01 History

This revision history list shows all modifications of

Rev. 2.01 compared to Rev. 1.20.

NOTE

The chapter and page numbers in the table below refer to the older Rev. 2.01 and thus may not be valid for the current revision.

Revision 2.01 History, Date Aug 26, 2016 (1/18)

Section	Page	Summary
1	4	D1M1A added
1	96	"Former products" section added
1	96	caution added: D1M1A features are preliminary
1	97	D1L devices' PLL1 frequency corrected: "fixed to 480 MHz" -> "max. 480 MHz"
1	98	"Error Control Module (ECM)" added
1	101	"RH850/D1M products overview" section split into D1M1 and D1M2 products overview subsections
1	101	D1M1 devices' PLL1 frequency corrected: "fixed to 480 MHz" -> "max. 480 MHz"
1	101	D1M1(H) devices' PLL0 frequency corrected: "480 MHz" -> "max. 480 MHz"
1	102	RS-CANFD modules removed from D1M1(H)
1	105	RS-CANFD modules removed from D1M1(H) block diagram
1	107	D1M1A added to overview table
1	107	D1M2 devices' PLL0 frequency corrected: "480 MHz" -> "max. 480 MHz"
1	107	D1M2 devices' PLL1 frequency corrected: "fixed to 480 MHz" -> "max. 960 MHz"
1	111	D1M1A block diagram added
1	111	note references for video channel 0 CLMA, MIPI, VI modules corrected (* -> *2)
1	112	part numbers for D1M1A added
1	112	D1M1(H) device variants with RS-CANFD removed from "Ordering information" table
2	113	"Pin Connection Diagrams" section rearranged
2	116	"D1M1A pin connection" section added
2	119	D1M1A port groups added to table
2	119	Port Group Index n = 22 added
2	119	number of D1M2 port groups corrected
2	121	expanded alternative mode selection by PFCAEn described
2	124	PFCAEn register added to table
2	132	correction: "PFCEn register" -> "PFECn and PFCAEn registers"
2	133	"Setting alternative functions" expanded with PFCAEn_m bits
2	133	correction: "PFCn register" -> "PFCn and PFCAEn registers"
2	134	"PFCAEn — Port Function Control Additional Expansion Register" added
2	135	addition: (the alternative input function that is set with PFCn.PFCn_m and PFCEn.PFCEn_m -> (the alternative input function that is set with PFCn.PFCn_m, PFCEn.PFCEn_m and PFCAEn_m)
2	147	correction: "...writing to the PDSCn and PINVn registers..." -> "...writing to the PDSCn, PODCn and PINVn registers..."
2	147	PFCAE added to "Pin-unit Register"
2	149	PFCAEn added in diagram

Revision 2.01 History, Date Aug 26, 2016 (2/18)

Section	Page	Summary
2	151	PFCAEn added in diagram
2	152	PFCAEn added in diagram
2	153	addtion: "PFCn_m and PFCEn_m" -> "PFCn_m, PFCEn_m and PFCAEn_m"
2	155	HyperBus Controller (HYPB0) pins added
2	155	NAND Flash Memory I/F A (NFMA0) pins added
2	168	section "D1M1A input buffers characteristics" added
2	172	"SDRA/SFMA I/O drive strength control Register (DSCTRL)" added
2	220	section "List of D1M1A Port Registers" added
2	229	PFCAE42 register added
2	242	HyperBus pins added as 3rd alternative of port 21
2	242	typo correction ("Medial Local Bus" -> "Media Local Bus")
2	242	SFMA0O[3:0]0 and SFMA0I[3:0]0 pins added to port group P21
2	243	section "Port 22 (P22)" added
2	267	D1M1A P22 pins states in normal operation mode added
2	268	D1M1A P22 pins states in debug mode added
2	270	D1M1A P22 pins states in serial programming mode added
2	272	PWRGD handling added for D1M1A
3	276	hypervisor removed from CPU protection functions
3	277	D1M1A added
3	278	typo corredction (busses -> buses)
3	278	typo corredction (busses -> buses)
3	279	HyperBus and OctaBus Controllers added in caution
3	279	hypervisor removed from CPU protection functions
3	280	typo correction (SNYCP -> SYNCP)
3	282	note 2 reference added to VCRE bit description
3	283	note 2 added
3	283	VCIE bit description completed
3	286	further explanation to SEGADDR regsiter description added
3	288	typo correction ("dependentregisters" -> "dependent registers")
3	288	typo correction (denpendent -> dependent)
3	291	correction: "In the initial state, notification of the ECC 2-bit error is enabled,..." -> "In the initial state, notification of the ECC 2-bit error is disabled,..."
3	304	D1M1A added
3	304	HyperBus Controller added to list
3	305	correction: all XC cache ECC error notifications are disabled initially
3	307	D1M1A added
3	307	caution corrected concerning hypervisor and supervisor mode
3	311	AXCERRADR.ADR[31:0] bit description corrected
3	313	"AXCCACHECMD — Cache command register" description corrected
3	324	D1M1A added
3	340	reference added regarding the procedure of system register update
3	341	"When switching Code Flash area:" added
3	341	description "When the updated results in the control registers and memories are reflected in the instruction fetch of a subsequent instruction:" modified
4	349	port P22 protection command and status registers added

Revision 2.01 History, Date Aug 26, 2016 (3/18)

Section	Page	Summary
5	368	D1M1A added
5	368	typo correction (dependend -> dependent)
5	370	D1M1A added
5	370	typo correction (dependend -> dependent)
5	371	"Cross-connect address map" section revised
5	371	correction: local RAM removed from all cross-connect address maps
5	372	typo correction (possiblity -> possibility)
7	378	typo correction ("e, setting of the IMRn register is reflected in the corresponding EIMK bit." removed)
7	381	typo correction (SNYCP -> SYNCP)
7	424	section "D1M1A Interrupt Exception Handler and Priority" added
7	428	NFMA0 interrupt added
7	445	correction: "Interrupt Response Times to be Considered" -> "Minimum interrupt Response Times to be Considered" and tables corrected
8	447	"Dual-address (2-cycle) transfer operation is adopted to DMA cycle." added
8	458	"In case that the continuous transfer enable bit (DTCTn.MLE) is set, ..." paragraph added
8	459	note 2 added
8	460	"DMA Transfer Error" section added
8	483	caution 1 modified
9	496	D1M1A added to "Note 3"
9	497	D1M1A added to "Note 4"
9	498	D1M1A added in figure title
9	498	D1M1A added in section title
9	502	addition: "In D1M1H, SDRB0RES bit corresponds ..." -> "In D1M1H and D1M1A, SDRB0RES bit corresponds ..."
9	510	addition: "In D1M1H, SDRB0RES bit ..." -> "In D1M1H and D1M1A, SDRB0RES bit ..."
9	510	addition: (D1M2(H), D1M1H only) -> "(D1M2(H), D1M1H, D1M1A only)
9	511	addition: (D1L2(H), D1M1(H), D1M2(H) only) -> (D1L2(H), D1M1(H), D1M2(H), D1M1A only)
9	511	addition: (D1M2(H) only) -> (D1M2(H), D1M1A only)
9	512	addition: "D1L1, D1L2(H), D1M1(H)" -> "D1L1, D1L2(H), D1M1(H), D1M1A"
9	513	addition: "D1Lx and D1M1(H)" -> "D1Lx, D1M1(H) and D1M1A"
9	515	resistor values removed from note 1 (are described in data sheet)
10	519	addition: "D1L1, D1L2(H) and D1M1(H)" -> "D1L1, D1L2(H), D1M1(H) and D1M1A"
10	519	D1M1A added to table
10	519	typo correction ("for for" -> "for")
10	520	D1M1A added in "Power-On-Clear" section
10	520	D1M1A added in "SDRAVCC, SDRAVSS" row
10	522	D1M1A added in diagram
12	530	D1M1A added in clock controller features summary
12	535	"D1M1A Clock Controller block diagram" section added
12	538	D1M1A added to "CPU and bus subsystems clock domains" section
12	540	note concerning header files names corrected
12	553	allowed PLL1 "Nr value" ranges corrected
12	553	typo corrections in "Nr value" (NI -> Nr)

Revision 2.01 History, Date Aug 26, 2016 (4/18)

Section	Page	Summary
12	553	PLLs Nr values for D1M1A added
12	553	typo correction ("Mr is determined by PLLkC.P[2:0]:" -> "Mr is determined by PLLkC.M[2:0]:")
12	554	PLLs Pr values for D1M1A added
12	558	write protection registers for "Isolated-Area clock control protection command register 2" corrected
12	562	typo corrections in MOSCCLKST[16:0] bit description (ROSCS.ROSCCLKST -> ROSCS.ROSCCLKACT)
12	566	typo corrections in SOSCCLKST[29:0] bit description (SOSCCLKST[16:0] -> SOSCCLKST[29:0])
12	572	PLL0.FVV[2:0] settings added for D1M1A device
12	575	PLL0.P[2:0] settings added for D1M1A device
12	576	PLL0.NI6:0] settings added for D1M1A device
12	576	typo correction (Inavalid -> Invalid)
12	579	D1M1A device added in PPL1C description
12	601	D1M1A added
12	602	D1M1A added
12	611	D1M1A added
12	612	D1M1A added
12	619	APB_CLK_RATIO regsiter access type corrected (R -> R/W)
12	637	typo correction ("31 to 1" -> "31 to 2")
12	638	typo correction ("31 to 1" -> "31 to 2")
12	639	D1M1A added
12	641	RSCANDCSID[2:0] description completed for D1M1A device
12	661	D1M1A added
12	661	D1M1A added
12	661	D1M1A added
12	662	D1M1A added
12	666	D1M1A added
12	666	D1M1A added
12	666	D1M1A added to "Base clocks maximum frequencies" table
12	667	D1M1A added to "CPU and buses subsystems clocks maximum frequencies" table
12	668	D1M1A added to "Always-On-Area clock domain clocks maximum frequencies" table
12	669	D1M1A added
12	670	C_ISO_LCBI removed from D1M1H and D1M2(H)
12	670	D1M1A added to "Isolated-Area clock domain clocks maximum frequencies" table
12	674	D1M1A added to CLMA units table
12	677	D1M1A added
12	677	note concerning header files names corrected
12	679	correction: "When CLMATMON stops or its frequency is lower than the limit*,..." -> "When CLMATMON's frequency is lower than the limit*,..."
12	679	note added concerning non-detection of completely stopped CLMAMON
12	690	D1M1A added
12	691	D1M1A added
13	695	Addtion in "I/O buffer hold state" section ("Further the P0 port buffers on the Always-On-Area, ...")

Revision 2.01 History, Date Aug 26, 2016 (5/18)

Section	Page	Summary
13	695	addtion in "I/O buffers during DEESPSTOP" ("Also the Always-On-Area port buffers of P0...")
13	695	typo correction (DeepSTOP -> DEEPSTOP)
13	706	DEEPSTOP mode preparation item added concerning stop of all active PLLs
14	709	D1M1A added
14	709	D1M1A added
14	710	NAND Flash Controller (NANDC) added
14	711	D1M1A added
14	712	D1M1A added
14	713	D1M1A added
14	713	typo correction ("...set the initial value..." -> "...set to the initial value...")
14	714	D1M1A added
14	714	correction: "...accesses is permitted..." -> "...accesses that are permitted..."
14	714	correction: "...accesses is permitted..." -> "...accesses that are permitted..."
14	715	D1M1A added
14	715	correction: "...accesses is permitted..." -> "...accesses that are permitted..."
14	715	correction: "...accesses is permitted..." -> "...accesses that are permitted..."
14	724	"D1M1A bus architecture" section added
14	733	D1M1A cross-connect bandwidth added
14	735	NANDC, HyperBus and OctaBus added in read access latency table
14	735	NANDC, HyperRAM and OctaRAM added in write access latency table
14	735	write access latency for Image Syntheziser 1 removed
14	735	correction: SDSB -> SDRA/SDRB
14	736	correction: SDSB -> SDRA/SDRB
14	737	"Bus Switch for HyperBus and OctaBus" section added
14	738	PBG2B guard added in diagram
14	740	"Data Flash Memory Control (DCIB)" added to PBUS0
14	741	PBG2A channel 8 PBUS guard added
14	741	PBG2B PBUS guard added
14	746	"XC Guard XCG15 (OctaBus)" added to PBG5B PBUS guard
14	746	correction in PBG5A-7 description: :SELB" -> "SELB (except SLPWGA0)"
14	747	"XC Guard XCG13 (HyperBus)" added to PBG5C PBUS guard
14	747	"XC Guard XCG13 (SFMA1)" added to PBG5C PBUS guard
14	748	document number reference for S/W User's Manual removed
14	761	" the own IPG and" removed in R0 bit description
14	761	" the own IPG and" removed in W0 bit description
14	762	addition: "ex) All corresponding registers for PBUS2 are not available in D1L1."
14	763	PBG2A PBUS guard channels corrected
14	763	PBG2B PBUS guard added
14	763	PBG5B PBUS guard channels corrected
14	763	PBG5C PBUS guard channels corrected
14	763	PBG0A PBUS guard channels corrected
14	764	typos in bitnames in FSGD0BPROTn register image corrected
14	770	modification: "Serial Flash Memory I/F (SFMA)" -> "Serial Flash Memory I/F 0 (SFMA0)"

Revision 2.01 History, Date Aug 26, 2016 (6/18)

Section	Page	Summary
14	770	correction: (n = 3 to 11) -> (n = 3 to 15)
14	770	XCG registers base addresses table completed
14	770	XCG Units table corrected
14	771	Cross-connect Guards error signals" table completed
15	803	D1M1A added
15	805	D1M1A added
15	806	"Data bus width and maximum bandwidth" added for D1M1A
15	824	correction: OFFSET[1:0] -> OFFSET[2:0]
15	824	ENOFFSET[3:0] values in bit description corrected
15	826	correction: "DBPDCNT0.ENOFFSET = 011B" -> "DBPDCNT0.ENOFFSET = 0011B"
15	831	typo correction ("The VRAM transaction restrictor..." -> "The SDR-SDRAM transaction restrictor...")
15	832	D1M1A added
15	833	D1M1A added
16	838	D1M1A added
16	864	"TRDPR[3:0] must be at least four times as large..." removed from TRDPR[3:0] bit description
16	867	correction: "TWRRD >= CWL + BL/2" -> "TWRRD >= CWL + BL/2 + tWTR"
17	912	D1M1A added in SFMA overview section
17	922	typo correction ("31 to 25" -> "28 to 25")
17	941	note added in CKDLYRX[2:0] description
17	946	correction: "Output delay nominal 2 ns" -> "Output delay minimum 2 ns"
17	946	correction: "Output delay nominal 2 ns" -> "Output delay minimum 2 ns"
17	959	"Output pin (CPHAT = 0)" signal in diagram corrected
17	960	"Output pin (CPHAT = 0)" signal in diagram corrected
17	961	typo correction (DRDMC -> DRDMCR)
17	961	typo correction (SMCMC -> SMDMCR)
17	969	correction: "fixed delay of nominal 2 ns" -> "fixed delay of minimum 2 ns"
17	969	note 2 added concerning SFMA1 clock frequencies
17	970	correction "fPHCLK/fBΦ = 4: set CKDLY.CKDLYOC[2:0] = 100B" -> "fPHCLK/fBΦ = 4: set CKDLY.CKDLYOC[2:0] = 101B"
17	971	"If the CKDLYRX[2:0] value reaches 000B ..." added in "Sampling point calibration prcoedure"
17	971	CKDLYOC[2:0] correction for fPHCLK/fBF = 4
17	971	note 1 added
17	972	"Sampling point calibration procedure flow" diagram added
18	978	correction: "...and data consistency checking" -> "...and data consistency checking is possible"
18	978	P42_12 added for CSIG3 data consistency check
18	1007	correction: "CSIGnCTL1.CSIGnCKR = 1" -> "CSIGnCTL1.CSIGnCKR = 0"
19	1033	CSIHnPE bit description corrected: "Writing to this bit is enabled when CSIHnCTL0.CSIHnPWR = 0." removed
19	1046	CSIHnIDx[2:0] bit description corrected
19	1047	CSIHnSPx[3:0] = 0000B added
19	1053	CSIHnSTR0.CSIHnHPST bit added to list of bits with write prohibition
19	1054	cautions for CSIHnRX0W and CSIHnRX0H modified

Revision 2.01 History, Date Aug 26, 2016 (7/18)

Section	Page	Summary
20	1118	typo correction (fulfil -> fulfill)
20	1140	typo correction ("transmission reception" -> "transmission/reception")
20	1149	paragraph "When response data of 9 bytes ..." repositioned
20	1150	correction: "...or reads the received data." -> "...or holds the received data."
20	1157	"Set IBS[1:0] bits to “00B” when UART buffer is not used." added
20	1160	typo correction ("RLN3nLRFC register" -> "RLN3nLDFC register")
20	1174	rephrasing: "Set the reception data" -> "Stores the received data"
20	1199	typo correction ("RLN3nBLFC register" -> "RLN3nLBFC register")
20	1208	typo corrections ("1010 0111" -> "1010 0111B", "1010 1000" -> "1010 1000B")
21	1231	typo correction (000 -> 000B)
21	1245	"When a restart condition is detected after a match ..." removed from GCA flag setting conditions
21	1280	typo correction in diagram ("7-bit slave address ICSAR1" -> "7-bit slave address RIICnSAR1")
21	1292	readability of text in the diagram improved
22	1298	D1M1(H) devices R7F701424 to R7F701427 removed from RSCAN Unit Configurations and Channels table
22	1298	D1M1(H) devices R7F701424 to R7F701427 removed from RSCAN units table
22	1298	D1M1A added in RSCAN units table
22	1299	typo correction ("... by the letter “y” (y = 0, 1)" -> "... by the index “y” (y = 0, 1)")
22	1299	r index number range corrected: (r = 0 to 29) -> (r = 0 to 63)
22	1323	RAM test page access registers 30 to 63 added in table
22	1331	rephrasing: "forcibly returns the state" -> "forcibly changes the state"
22	1335	BLF bit description corrected: "bus" -> "bus lock"
22	1335	correction: "If any of these flags is set to 0 at the same time..." -> "If any of these flags is set to 1 at the same time..."
22	1335	rephrase: "the flag bits are only set by the error event" -> "the flag bits are only set to 1 by the error event"
22	1335	typo correction ("were all 0 at the when time the error occurred." -> "at the time when the error occurred."
22	1335	typo correction (channe -> channel)
22	1337	correction: "(REC[7:0] or TEC[7:0] value > 127)" -> "((128 <= TEC[7:0] <= 255) or (128 <= REC[7:0]))"
22	1337	modifications in "BOEF Flag" description: "bus off state is reached" -> "bus off state is entered"
22	1340	repharsing: "the lowest transmit buffer number" -> "the transmit buffer with the smallest number"
22	1348	typo correction ("RCAN0TMSTSp register" -> "RSCAN0TMSTSp register")
22	1348	typo correction ("RCAN0TMSTSp register" -> "RSCAN0TMSTSp register")
22	1348	typo correction ("TMIE bit" -> "TMIEp bit")
22	1352	typo correction ("as the entire unit" -> "for the entire unit")
22	1352	typo correction ("in the entire unit" -> "for the entire unit")
22	1369	"This flag is 00H in global reset mode." added to RFMC[7:0] bits description
22	1369	RSCAN0RFSTSx register access type corrected
22	1371	typo correction ("is decremented" -> " is decremented by 1")
22	1376	CFITR bit description correction: pclk -> pclk/2
22	1378	typo correction (FIFIO -> FIFO)

Revision 2.01 History, Date Aug 26, 2016 (8/18)

Section	Page	Summary
22	1378	rephrasing: "on the identical channel" -> "on the same channel"
22	1382	correction: "The CFMLT flag..." -> "The CFFLL flag..."
22	1384	typo correction ("is decremented" -> " is decremented by 1")
22	1385	typo correction ("is incremented" -> " is incremented by 1")
22	1402	rephrasing: "arbitration loss" -> "arbitration-lost"
22	1421	correction: "(g + 1)-buffer transmit queue" -> "(g + 1) transmit queue"
22	1432	correction" "Do not access more than 96 bytes in the last page..." -> "Do not access more than 160 bytes in the last page..."
22	1435	typo corrections (<RCAN0_base> -> <RSCAN0_base>)
22	1436	correction: (r = 0 to 29) -> (r = 0 to 63)
22	1437	correction: "(in transmit mode, gateway mode)" -> "(in revceive mode, gateway mode)"
22	1444	correction: "CAN registers can be read," -> "Channel-related registers can be read,"
22	1444	corrections in "Channel Stop Mode" section: "GSLPR -> CSLPR
22	1452	obsolete sentence "The priority is determined by using one of the following methods." removed
22	1456	correction: "...timer is decremented by the next..." -> "...timer is decremented by 1 upon the next..."
22	1457	correction in table: "Buffer No. and "Buffer type" swapped
22	1461	correction: "Do not access more than 96 bytes..." -> "Do not access more than 160 bytes..."
22	1461	correction: (r = 0 to 29) -> (r = 0 to 63)
22	1471	correction: "...is incremented." -> "...is incremented by 1."
22	1472	typo correction in diagram ("RFMC[7:0], CFEMP, RFIF: Flags in the RSCAN0RFSTSx register" -> "RFMC[7:0], RFEMP, RFIF: Flags in the RSCAN0RFSTSx register")
22	1478	correction: "...is decremented." -> "...is decremented by 1."
22	1479	correction: "...is decremented." -> "...is decremented by 1."
22	1481	correction: "p = 47" -> "p = m x 16 + 15"
22	1483	typo corrections in diagram ("RSCAN0LOCKK register" -> "RSCAN0GLOCKK register")
22	1484	correction in diagram: "r = 0 to 29" -> "r = 0 to 63"
22	1487	ECERVF and EC1EDIC bits added to ECCRCAN0CTL register
22	1492	typo correction (ECCRSCAN0ERDB -> ECCRCAN0ERDB)
22	1492	typo correction (ECCRSCAN0ERDB -> ECCRCAN0ERDB)
22	1496	typo correction ("must not bet allocated" -> "must not be allocated")
23	1497	D1M1(H) devices R7F701424 to R7F701427 removed from RSCAN Unit Configurations and Channels table
23	1497	D1M1(H) devices R7F701424 to R7F701427 removed from RSCAN units table
23	1497	D1M1A added in RS-CANFD units table
23	1498	typo correction ("... by the letter “y” (y = 0, 1)" -> "... by the index “y” (y = 0, 1)")
23	1498	r index number range corrected
23	1515	rephrasing: "forcibly returns the state" -> "forcibly changes the state"
23	1520	BLF bit description corrected: "bus" -> "bus lock"
23	1520	correction: "If any of these flags is set to 0 at the same time..." -> "If any of these flags is set to 1 at the same time..."
23	1520	rephrase: "the flag bits are only set by the error event" -> "the flag bits are only set to 1 by the error event"
23	1520	typo correction ("were all 0 at the when time the error occurred." -> "at the time when the error occurred."

Revision 2.01 History, Date Aug 26, 2016 (9/18)

Section	Page	Summary
23	1522	correction: "(REC[7:0] or TEC[7:0] value > 127)" -> "((128 <= TEC[7:0] <= 255) or (128 <= REC[7:0]))"
23	1522	modifications in "BOEF Flag" description: "bus off state is reached" -> "bus off state is entered"
23	1525	repharsing: "the lowest transmit buffer number" -> "the transmit buffer with the smallest number"
23	1537	typo correction ("as the entire unit" -> "for the entire unit")
23	1537	typo correction ("in the entire unit" -> "for the entire unit")
23	1546	valid number range of NRXMB[7:0] corrected (47 -> 48)
23	1554	"This flag is 00H in global reset mode." added to RFMC[7:0] bits description
23	1556	typo correction ("is decremented" -> " is decremented by 1")
23	1561	CFITR bit description corrected (pclk -> pclk/2)
23	1563	rephrasing: "on the identical channel" -> "on the same channel"
23	1567	correction: "The CFMLT flag..." -> "The CFFLL flag..."
23	1568	typo correction ("is decremented" -> " is decremented by 1")
23	1569	typo correction ("is incremented" -> " is incremented by 1")
23	1584	table layout corrected
23	1586	rephrasing: "arbitration loss" -> "arbitration-lost"
23	1605	correction: "(g + 1)-buffer transmit queue" -> "(g + 1) transmit queue"
23	1621	correction: (r = 0 to 29) -> (r = 0 to 63)
23	1628	"NBRP[9:0] Bits" description modified
23	1633	rephrasing: "forcibly returns the state" -> "forcibly changes the state"
23	1638	BLF bit description corrected: "bus" -> "bus lock"
23	1638	correction: "If any of these flags is set to 0 at the same time..." -> "If any of these flags is set to 1 at the same time..."
23	1638	rephrase: "the flag bits are only set by the error event" -> "the flag bits are only set to 1 by the error event"
23	1638	typo correction ("were all 0 at the when time the error occurred." -> "at the time when the error occurred."
23	1638	typo correction (channe -> channel)
23	1640	correction: "(REC[7:0] or TEC[7:0] value > 127)" -> "((128 <= TEC[7:0] <= 255) or (128 <= REC[7:0]))"
23	1640	modifications in "BOEF Flag" description: "bus off state is reached" -> "bus off state is entered"
23	1642	"DBRP[7:0] Bits" description corrected
23	1645	"These bits are based on CAN clock frequency (fCAN)." added
23	1645	correction: "rounded to..." -> "rounded down to..."
23	1645	rephrasing: "...in the channel by setting of..." -> "...from the channel according to the setting of..."
23	1645	correction: "These bits are set to the SSP offset value." -> "These bits set the SSP offset value."
23	1646	typo correction ("CFESI bit in..." -> "(CFESI bit in...")
23	1649	"transmitter delay compensation" removed from "TDCR[7:0] Flag" description
23	1651	"These bits are cleared to 0 in channel reset mode." added
23	1652	TSBTCS[2:0] settings for channels 3 to 5 removed
23	1655	repharsing: "the lowest transmit buffer number" -> "the transmit buffer with the smallest number"
23	1666	access type of reserved RSCFDnCFDGFDCFG register bits corrected (R/W -> R)

Revision 2.01 History, Date Aug 26, 2016 (10/18)

Section	Page	Summary
23	1666	RSCFDnCFDGFDCFGH register removed from access options
23	1667	access type of reserved RSCFDnCFDGCRCCFG register bits corrected (R/W -> R)
23	1669	typo correction ("as the entire unit" -> "for the entire unit")
23	1669	typo correction ("in the entire unit" -> "for the entire unit")
23	1678	valid number range of NRXMB[7:0] corrected (47 -> 48)
23	1690	typo correction ("is decremented" -> " is decremented by 1")
23	1697	CFITR bit description corrected: pclk -> pclk/2
23	1699	rephrasing: "on the identical channel" -> "on the same channel"
23	1704	correction: "The CFMLT flag..." -> "The CFFLL flag..."
23	1705	typo correction ("is decremented" -> " is decremented by 1")
23	1706	typo correction ("is incremented" -> " is incremented by 1")
23	1708	typo correction ("the the" -> "the")
23	1711	typo correction (CFBRS -> CFESI)
23	1716	table layout corrected
23	1721	table layout corrected
23	1724	rephrasing: "arbitration loss" -> "arbitration-lost"
23	1730	correction: "When the MFDF bit is 1 (CAN FD frame)," -> "When the TMFDF bit is 1 (CAN FD frame),"
23	1734	table cross-reference corrected
23	1736	table cross-reference corrected
23	1738	table cross-reference corrected
23	1740	table cross-reference corrected
23	1744	correction: "(g + 1)-buffer transmit queue" -> "(g + 1) transmit queue"
23	1753	correction: "...register is decremented." -> "...register is decremented by 1."
23	1756	correction: "In CAN FD mode, do not access more than 96 bytes..." -> "In CAN FD mode, do not access more than 160 bytes..."
23	1759	correction: "(<RSCFDn_base> + 0000H to <RSCFDn_base> + 0FFFH)" -> "(<RSCFDn_base> + 0000H to <RSCFDn_base> + 05FFH)"
23	1760	correction: (r = 0 to 41) -> (r = 0 to 63)
23	1763	several register names corrected in diagram
23	1768	correction: "CAN registers can be read," -> "Channel-related registers can be read,"
23	1768	corrections in "Channel Stop Mode" section: "GSLPR -> CSLPR
23	1776	obsolete sentence "The priority is determined by using one of the following methods." removed
23	1780	correction: "...timer is decremented by the next..." -> "...timer is decremented by 1 upon the next..."
23	1781	correction in table: "Buffer No. and "Buffer type" swapped
23	1785	correction: "In CAN FD mode, do not access more than 96 bytes..." -> "In CAN FD mode, do not access more than 160 bytes..."
23	1785	RAM test index r corrected
23	1788	register name correction in diagram: RSCFDnCFDCnCFG ->RSCFDnCFDCmFDCFG
23	1789	description concerning NBRP[9:0] and DBRP[7:0] modified
23	1796	interrupt enabling more detailed in diagram
23	1797	"If the next message is received before reading the message out of buffer, the message will be overwritten." added
23	1799	correction: "...is incremented." -> "...is incremented by 1."

Revision 2.01 History, Date Aug 26, 2016 (11/18)

Section	Page	Summary
23	1801	typo correction in diagram ("RFMC[7:0], CFEMP, RFIF: Flags in the RSCAN0RFSTSx register" -> "RFMC[7:0], CFEMP, RFIF: Flags in the RSCAN0RFSTSx register")
23	1808	correction: "...is decremented." -> "...is decremented by 1."
23	1809	correction: "...is decremented." -> "...is decremented by 1."
23	1815	RAM test index r number range corrected
23	1818	ECERVF and EC1EDIC bits added to ECCRCFDnCTL register
23	1823	typo correction (ECCRSCFD0ERDB -> ECCRCFD0ERDB)
23	1828	typo correction ("must not bet allocated" -> "must not be allocated")
24	1830	D1M1A added in ETNB units table
24	1841	correction: "...to load the values from the count descriptor address register..." -> "...to load the values from the current descriptor address register..."
24	1848	typo correction (RAVBES1 -> ETNB)
24	1848	typo correction (RCR -> ESR)
24	1849	typo correction (RAVBES1 -> ETNB)
24	1849	typo correction (RAVBES1 -> ETNB)
24	1849	typo correction (RAVBES1 -> ETNB)
24	1921	initial value of ECSR register corrected
24	1923	initial value of PIR register corrected
24	1923	typo corrections in PIR register bits descriptions (ET_ -> AVB_)
24	1934	typo correction ("ET_RX-ER pin" -> "AVB_RX-ER pin")
24	1978	typo corrections in diagram (RAVBES1 -> ETNB)
24	2007	correction in diagram: txd[7:0] -> txd[3:0]
24	2028	typo corrections in next 3 diagrams (AVB_RX-ER -> AVB_RX_ER)
24	2029	typo corrections in following 6 diagrams (AVB_RXD7 to 0 -> (AVB_RXD3 to 0, AVB_RX-ER ->AVB_RX_ER, AVB_RX-CSR -> AVB_RX_CSR)
24	2032	correction in diagram: "ET_MDC = 0" -> "PIR_MDC = 0"
24	2032	typo corrections in next 4 diagrams (ET_ -> PIR_)
24	2035	typo correction (RAVBES1 -> ETNB)
25	2037	D1M1A added in MLBB units table
26	2045	"Conflict factors" table corrected
26	2056	"Start mode selection" table corrected
26	2059	"When writing the processing to clear WDTA successively, ..." paragraph added
27	2082	"OSTMnTINT period" description modified
29	2108	D1M1A added to note 4
29	2126	typo correction ("TAUBnCSRm Register Contents" -> "TAUBnCSCm Register Contents")
29	2134	typo corrections in TAUBnTOCm bit description (TAUBnTTOUTm -> TAUBTTOUTm)
29	2141	cross reference corrected ("Section 29.12" -> "Section 29.13")
29	2152	typo correction (TAUBnTTOUTm -> TAUBTTOUTm)
29	2191	correction: "subsequently, in a specific interval." -> "continues to generate interrupts at the specified interval."
29	2214	correction: "(100H + a+1)" -> "(10000H + a+1)"
29	2215	typo correction (TAUBnTTINm -> TAUBTTINm)
29	2224	typo correction (TAUBnTTINm -> TAUBTTINm)
29	2229	correction: "TAUBnCNTm ≤ TAUBnCDRm" -> "TAUBnCNTm > TAUBnCDRm"
29	2243	correction: "TAUBnCNTm reloads the TAUBnCDRm value" -> "TAUBnCNTm loads the TAUBnCDRm value"

Revision 2.01 History, Date Aug 26, 2016 (12/18)

Section	Page	Summary
29	2245	correction: "TAUBnCDRm_master + 1" -> "value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1"
29	2257	correction: "Control Bit Settings for Independent Channel Output Mode 1" -> "Control Bit Settings for Synchronous Channel Output Mode 1"
29	2262	correction: " is issued when the count operation is started after restart." -> "is issued when the count operation is started."
29	2262	rephrasing: "Stopping and restarting the operation" -> "Operation stop and restart"
29	2270	correction: "TAUBnCNTm (slave) reloads the TAUBnCDRm ..." -> "TAUBnCNTm (slave) loads the TAUBnCDRm ..."
29	2270	typo correction (TAUBnTTINm -> TAUBTTINm)
29	2275	correction: "... concurrently sets TAUBnTE.TAUBnTEm to 0," -> "... clears TAUBnTE.TAUBnTEm to 0,"
29	2277	modification: "This in turn sets TAUBnTE.TAUBnTEm, ..." -> "This in turn sets TAUBnTE.TAUBnTEm to 1, ..."
29	2287	correction: "Control Bit Settings for Synchronous Channel Output Mode 2" -> "Control Bit Settings for Independent Channel Output Mode 2"
29	2289	correction: "TAUBnCNTm (master) reloads the TAUBnCDRm ..." -> "TAUBnCNTm (master) loads the TAUBnCDRm ..."
29	2290	TAUBnCNTm counter level corrected in diagram (0000H -> 0001H)
29	2292	typo corrections in diagram (TAUBnTTINm -> TAUBTTINm)
29	2293	typo correction in diagram (TAUBnTTOUTm -> TAUBTTOUTm)
29	2296	typo corrections in diagram (TAUBnTTINm -> TAUBTTINm)
29	2302	correcion: "TAUBnCNTm (slave) reloads the TAUBnCDRm ..." -> "TAUBnCNTm (slave) loads the TAUBnCDRm ..."
29	2302	correction: "TAUBnCNTm (master) reloads the TAUBnCDRm ..." -> "TAUBnCNTm (master) loads the TAUBnCDRm ..."
29	2305	correction: "... must be set to synchronous channel output mode" -> "... must be set to synchronous channel output mode 2"
29	2306	modification: "... starts to count down from this value" -> "... starts to count down from this TAUBnCDRm value."
29	2308	typo corrections in diagram (TAUBnTTINm -> TAUBTTINm)
29	2326	correction in diagram: "Eet forced ditomg TAUBnCDRm = 0000H" -> "Set is forced during TAUBnCDRm = 0000H"
29	2327	"AD Conversion Trigger Output Function Type 2" Summary modified
29	2327	typo corrections in diagram (TAUBnTTINm -> TAUBTTINm)
30	2347	"It is always read as 00H." added to TAUJnCSCm register access
30	2348	"It is always read as 00H." added to TAUJnTS register access
30	2349	"It is always read as 00H." added to TAUJnTT register access
30	2351	"It is always read as 00H." added to TAUJnRDT register access
30	2376	typo correction (AUJnCDRm -> TAUJnCDRm)
30	2382	"11: Setting prohibited" added to TAUJnTIS[1:0] bit description
30	2382	typo correction (TAUJnTTINm -> TAUJTTINm)
30	2388	"11: Setting prohibited" added to TAUJnTIS[1:0] bit description
30	2404	"11: Setting prohibited" added to TAUJnTIS[1:0] bit description
30	2410	typo correction (TAUJnTTINm -> TAUJTTINm)
30	2425	correction: "Control Bit Settings for Independent Channel Output Mode 1" -> "Control Bit Settings for Synchronous Channel Output Mode 1"
31	2430	typo correction ("base addresses" -> "base address")

Revision 2.01 History, Date Aug 26, 2016 (13/18)

Section	Page	Summary
31	2430	typo correction ("RTCAn base addresses are listed in the following table." -> "RTCAn base address is listed in the following table.")
31	2437	typo corrections in RTCAnRSUB register description (RTCA0SRBU -> RTCAnSRBU)
31	2464	typo correction ("0000 0001" -> "0000 0001B")
31	2464	typo correction ("0000 0100" -> "0000 0100B")
31	2464	typo correction ("0000 1010" -> "0000 1010B")
31	2476	correction: "... until the completion of the count buffer register reading." -> "... until the counter resuming."
31	2483	typo correction (RTCA0SRBU -> RTCAnSRBU)
32	2484	D1M1A added in PWM-Diag "Number of Units and Channels" section
32	2490	module name "SELB" added
32	2491	typo correction ("<PWBAn_base> + > + 0004H × m" -> <PWBAn_base> + 0004H × m")
32	2505	typo correction (PWSA0QUE0 -> PWSAnQUE0)
32	2507	typo correction in diagram (#PWGAnRSF -> PWGAnRSF)
36	2617	D1M1A added in LCBI units table
37	2667	D1M1A added
37	2667	D1M1A added
37	2667	D1M1A graphics subsystem features added
37	2668	D1M1A added
37	2668	RLE/Sprite Units configuration modified in diagram
37	2669	D1M1A added
37	2669	note 2 added
37	2669	RLE/Sprite Units configuration modified in diagram
37	2670	D1M1A added
37	2670	RLE/Sprite Units configuration modified in diagram
37	2671	D1M1A added
37	2671	RLE/Sprite Units configuration modified in diagram
37	2672	D1M1A added
37	2672	D1M1A added
37	2672	RLE/Sprite Units configuration modified in diagram
37	2673	D1M1A added
37	2673	RLE/Sprite Units configuration modified in diagram
37	2676	D1M1A added
37	2676	D1M1A added
37	2676	D1M1A added
37	2677	D1M1A added
37	2680	section "D1M1A video channels clock generator" added
37	2681	"D1M1A video channels clock generator" diagram added
37	2682	addition: "Clock selections for different layer configurations" -> "D1M2(H) Clock selections for different layer configurations"
37	2684	device list added to CKSC_IPLL0PIXS_CTL register description
37	2685	D1M1A added
37	2694	D1M1A added
37	2695	D1M1A added
37	2696	DOTCLK0DCSID[7:0] = 1 described for D1M1A

Revision 2.01 History, Date Aug 26, 2016 (14/18)

Section	Page	Summary
37	2698	D1M1A added
37	2698	DOTCLK1DCSID[7:0] = 1 described for D1M1A
37	2699	D1M1A added
37	2700	added "DOTCLK0 /7 (D1M1A only)" in VDCE0VOSCSID[2:0] bit description
37	2700	caution modified for D1M1A
37	2700	D1M1A added
37	2701	D1M1A added
37	2702	added "DOTCLK0 /7 (D1M1A only)" in VDCE1VOSCSID[2:0] bit description
37	2702	caution modified for D1M1A
37	2702	D1M1A added
37	2702	addition: "C_ISO_V1PIXCLK" -> "C_ISO_V1PIXCLK (D1M2(H) only)"
37	2703	D1M1A added
37	2704	CKSC_IVOEXS_CTL.VOEXSCSID0 bit description modified for D1M1A
37	2704	D1M1A added
37	2705	D1M1A added
37	2708	D1M1A added
37	2708	D1M1A added
37	2708	correction: "10B: C_ISO_MIPIPIXCLK (D1M2(H))" -> 10B: C_ISO_MIPIPIXCLK (D1M2H)"
37	2709	correction: "D1M1(H) and D1M2(H) only" -> "D1M1(H), D1M2H and D1M1A only"
37	2714	correction: CLMA6 for D1M2(H) only
37	2716	D1M1A added
37	2721	D1M1A added to MIPI units table
37	2724	"Reserved data type error check register" removed from table
37	2726	RSTN_CLK_ON bit description correction: RSTN_CLK_ON = 0 is prohibited
37	2726	DT_EN bit removed from MIPInMODE register
37	2727	RSTN_DATA_ON bit description correction: RSTN_DATA_ON = 0 is prohibited
37	2729	condtions concerning MIPI I/F reset corrected
37	2729	typo correction ("MIP interface" -> "MIPI interface")
37	2731	correction: 1/fMIPIADCLK -> 1/fMIPI_VI_CLK
37	2731	typo correction (MIPISDCLK -> MIPIADCLK)
37	2733	note added in RX_STOP_STATE_C bit description
37	2733	PHY STOP state indication corrected: "RX_STOP_STATE_C = 0" -> "RX_STOP_STATE_C = 1"
37	2739	"MIPInRDT_ERR_ON – Reserved data type error check register" section removed
37	2740	DT_ERR bit removed from MIPInINTSTATUS register
37	2741	"Packet Header word count error (bit[17])" description corrected
37	2743	DT_ERR_EN bit removed from MIPInINTENSET register
37	2745	DT_ERR_MASK bit removed from MIPInINTENCLR register
37	2747	DT_ERR_CLR bit removed from MIPInINTFFCLR register
37	2751	MIPInRDT_ERR_ON removed from "Start Sequence"
37	2752	"MIPInRDT_ERR_ON = 0000 0000H" removed from "Example start Sequence"
37	2752	MIPInRDT_ERR_ON removed from caution
37	2765	"D1M1A Video output selection" section added
37	2765	section "D1M1A video output mode configuration" added

Revision 2.01 History, Date Aug 26, 2016 (15/18)

Section	Page	Summary
37	2772	addition: "VDCE0" -> "VDCE0 (D1M2(H) only)"
37	2772	D1M1A added
37	2772	D1M1A added
37	2772	correction: VDCECTL.V1CTL for D1M2(H) and D1M1 only
37	2773	section name change: "RSDSCFG — RSDS configuration register" -> "RSDSCFG — RSDS and other video output control register"
37	2773	SRGB1_OEN, OLDI_OEN and VODDR_OEN bits added to RSDSCFG register
37	2773	(D1M2(H) only) added
37	2773	(D1M2(H) only) added
37	2774	(D1M2(H) only) added
37	2775	D1M1A added
37	2779	section "Open LDI Interface" added
38	2806	D1M1A added to VDCE units table
38	2813	Serial RGB progressive output added
38	2813	note 3 added in table
38	2815	note 1 added in diagram
38	2816	text addition concerning clocks in serial RGB mode
38	2820	note added concerning input controller and D1L2(H) devices
38	2847	D1M1A added
38	2866	note added concering scaling functions in D1L2(H) devices
38	2915	note added in SC0_RES_DS_H_ON bit description
38	2915	note added in SC0_RES_DS_V_ON bit description
38	2922	note added in SC0_RES_US_H_ON bit description
38	2922	note added in SC0_RES_US_V_ON bit description
38	2961	note added in SC1_RES_US_H_ON bit description
38	2961	note added in SC1_RES_US_V_ON bit description
38	3082	note added concerning Output Image Generator for D1L2(H) devices
38	3084	table note 2 added concerning D1L2(H) devices
38	3123	LVDS I/F remove from video output block diagram
38	3123	gamma correction excluded for D1L2(H) devices
38	3123	note added in diagram concerning gamma correction for D1L2(H) devices
38	3134	"Bit Allocation of LCD Serial for Serial RGB Output" section added
38	3135	"Parallel to Serial Conversion" section added
38	3137	note added concerning settings for Serial RGB output
38	3157	note added in GAM_ON bit description
38	3205	OUT_FORMAT[1:0] = 3 for serial RGB added
38	3205	OUT_FRQ_SEL[1:0] description expanded
38	3205	OUT_PHASE[1:0] bits added to OUT_SET register
38	3215	SYSCNT_INT6.INT_OUT16_ON and SYSCNT_INT6.INT_OUT17_ON removed from table
39	3227	D1M1A added to VOWE units table
40	3229	D1M1A added to video channels index table
40	3229	D1M1A added to VOCA units table
40	3231	D1M1A added
40	3232	D1M1A added

Revision 2.01 History, Date Aug 26, 2016 (16/18)

Section	Page	Summary
40	3253	D1M1A added
40	3253	VOCAnMAXj[11:0] = 4095 setting removed
40	3254	D1M1A added
40	3255	D1M1A added
41	3267	D1M1A added to DISCOM units table
42	3287	D1M1A added in GPU2D clock supply table
42	3287	D1M1A added to GPU2D units table
42	3301	"(VRAM or SDRAM, SFMA)" removed
43	3302	D1M1A added to Sprite Engine units table
43	3302	"Sprite and RLE Units indices" redefined
43	3304	"Bus master IDs" section expanded
43	3305	"Functional Overview" expanded for D1M1A
43	3305	"Indices" list removed here
43	3306	block names changed according to new indices definitions: "RLE Unit 0/1" -> "RLE Engine 0/1"; "RLE0/1 engine" -> "RLE0/1 decocder"
43	3309	addition: "not supported" -> "not supported by RLE units"
43	3314	D1M1A RLE definition registers update procedure added
43	3314	typo correction ("must be change,..." -> "must be changed,...")
43	3316	"Sprite X/Y position" for 16 bpp color formats added
43	3317	"Image Synthesizer line offset" for 16 bpp color formats added
43	3317	"Sprite width and height" for 16 bpp color formats added
43	3320	"RLE/Sprite Units (D1M1A only)" section added
43	3323	D1M1A RLE/Sprite Units registers overview table added
43	3323	typo correction (SPEAnRjRjRBYP -> SPEAnRjRBYP)
43	3324	D1M1A registers added in "RLE Units registers" section
43	3330	"SPEAnRjRBYP - RLE unit bypass mode register" added
43	3332	D1M1A registers added in "Sprite Units registers" section
43	3335	"SPEAnSkBYP - Sprite unit bypass mode register" added
44	3340	D1M1A added to JCUA units table
44	3345	module name for JCSWRST register corrected
44	3385	typo correction (syncm -> SYNCM)
44	3395	typo correction (syncm -> SYNCM)
45	3396	D1M1A added in A/D Converter channels table
45	3396	correction of virtual channels index: (j = 0 to 19) -> (j = 0 to 20)
45	3400	correction: "ADCE0 has 20 virtual channels. " -> "ADCE0 has 21 virtual channels."
45	3459	typo corrections in "Overwrite Error Detecting Function" section (DR -> ADCEnDRj, DIR -> ADCEnDIRj)
45	3471	correction: "(CDGn = 0, CDGn-15 = 1)" -> (CDGn-1 = 0, CDGn to CDG15 = 1)
45	3471	typo correction ("When ad over-voltage ..." -> "When an over-voltage ...")
45	3472	first "Usage Notes for Analog Input Pins" corrected
45	3472	A/D conversion result value formula corrected
46	3473	D1M1A added in Motor control channels table
46	3475	ports for Motor Drivers 2 to 5 corrected
46	3476	note corrected concerning module names in header files
46	3489	typo correction (SMVDD -> SMVCC)

Revision 2.01 History, Date Aug 26, 2016 (17/18)

Section	Page	Summary
46	3513	cross-reference improved
46	3515	cross-reference improved
46	3543	typo correction ("Redirection to the power supply SMVDD" -> "Redirection to the power supply SMVCC")
46	3548	ISMnVAR6CFGm register bits description corrected
46	3563	ECERVF and EC1EDIC bits added to ECCISMnCTL register
48	3574	"ECM Master and Checkers" section added
48	3579	typo correction (ERROUT -> ERROROUT)
48	3579	typo correction in diagram (ERROUT -> ERROROUT)
48	3582	typo corrections in diagram (ERROUT -> ERROROUT)
51	3625	note 2 corrected concerning module names in header files
51	3626	note concerning header file names modified
52	3628	flash memory overview table updated
52	3642	note corrected concerning module names in header files
52	3643	"Registers Related to Product Information" section updated
52	3645	note corrected concerning module names in header files
52	3646	sentence "Changes in settings such as initial setting ..." removed
52	3647	note corrected concerning module names in header files
52	3648	correction: OPBT9 can not be changed by the user
52	3648	note corrected concerning module names in header files
52	3649	correction: OPBT10 can not be changed by the user
52	3649	table note "Temperature sensor reference values are evaluated and written during device production test." removed
52	3649	note corrected concerning module names in header files
52	3650	correction: "...and error notification is enabled upon detection of an ECC 1-bit error." -> "...and error notification is disabled upon detection of an ECC 1-bit error."
52	3660	description of "Reserved" bits in DFECCCTL register description modified
52	3661	description of "Reserved" bits in DFERSTR register description modified
52	3662	description of "Reserved" bits in DFERSTC register description modified
52	3663	description of "Reserved" bits in DFERRINT register description modified
52	3663	typo correction ("32 to 2" -> "31 to 2")
52	3664	description of "Reserved" bits in DFTSTCTL register description modified
52	3664	typo correction ("31 to 21" -> "31 to 16")
53	3666	RAM overview table updated
53	3676	address parity check removed from "LRTSTCTL — Local RAM Test Control Register" description
53	3678	D1M1A added to RRAMECC units table
54	3695	D1M1A added to Video RAM and Wrapper units table
54	3700	typo correction ("..., either of the following events occurs:" -> "..., until either of the following events occurs:")
54	3700	typo correction ("RTOVFL[6:0], x 2" -> "RTOVFL[6:0] x 2")
54	3704	"2D Graphics Processing Unit (GPU2D) write transaction restrictor (D1M1A only)" section added
54	3704	note modified
54	3704	additional description to GPU2D read transactions restrictor
54	3704	additional description to GPU2D write transactions restrictor

Revision 2.01 History, Date Aug 26, 2016 (18/18)

Section	Page	Summary
54	3704	section "2D Graphics Processing Unit (GPU2D) read transaction restrictor" relocated
54	3704	typo correction ("... restricts read transaction" -> ""... restricts read transactions")
54	3704	typo correction ("... restricts write transaction" -> ""... restricts write transactions")
54	3705	correction: "...while a VRAM access is ongoing." -> "...while a GPU2D access is ongoing."
54	3705	typo correction ("FFCO 605CH" -> "FFC0 605CH")
54	3705	typo correction ("These registers..." "This register...")
54	3711	"D1M1A Mirror/VRAM Wrapper window memory map" section added
55	3730	D1M1A added in Boundary scan ID register description
55	3730	correction: "MID[10:0] + 1" -> "{MID[10:0], 1}"
56	3731	section "HyperBus Controller (HYPB)" added
57	3769	section "OctaBus Controller (OCTA)" added
58	3771	section "NAND Flash Memory Interface A (NFMA)" added

Revision 2.10 History

This revision history list shows all modifications of

Rev. 2.10 compared to Rev. 2.01.

NOTES

1. The following revision history table does not mention corrections of very simple and obvious spelling and formatting errors.
2. Throughout this document the features and properties of the new D1M1-V2 device are added. These additions are not explicitly mentioned in the table below.
3. The chapter and page numbers in the table below refer to the older Rev. 2.10 and thus may not be valid for the current revision.

Revision 2.10 History, Date Mar 31, 2017 (1/12)

Section	Page	Summary
1	98	D1M1-V2 device added in caution
1	98	D1M1_3.75M and D1M1_5M added to former products list
1	103	section "RH850/D1M1 products overview" split into "former products" and "development product" overviews
1	107	Serial Flash Memory I/F 2 added for D1M1A
1	107	"Max. clock" specification removed from NAND Flash I/F (NFMA)
1	107	D1M1_3.75M and D1M1_5M devices moved to former products
1	109	correction for D1M1A VO1: "30 MHz VODDR" -> "10 MHz VODDR"
2	153	corrections in "Step 1" to "Step 4": "in 32-bit units" -> "in accordance with each register's size"
2	154	cautions added concerning port control registers (PCRn_m) setting
2	179	DSCTRL register address corrected
2	179	drive strength control Register (DSCTRL) description corrected
2	187	correction: PIPC17 bits 4 to 11 are available
2	234	PFCE21 register availability for D1M1A devices corrected
2	235	PFCE22.bit10 availability for D1M1A devices corrected
2	237	PFC43.bit1 availability for D1M1A devices corrected
2	237	PFCE43.bit[1:0] availability for D1M1A devices corrected
2	239	PFCAE45 register for D1M1A devices added
2	276	note 3 added concerning JP0_4 (DCUTRST) during RESET = L in normal operation mode
2	276	P10, P11, ADCE0Im normal operation pin states during DEEPSTOP corrected
2	277	P10, P11, ADCE0Im debug pin states during DEEPSTOP corrected
2	277	addition to note 3 concerning SYSRES, external RESET and JP0_4
2	279	note 2 added concerning JP0_4 (DCUTRST) during RESET = L in serial programming mode
2	279	P10, P11, ADCE0Im serial programming pin states during DEEPSTOP corrected
2	280	addition to note 2 concerning SYSRES, external RESET and JP0_4
2	281	addition: "Must always be connected" -> "Must always be connected to oscillator"
2	281	recommended connection of unused XT2 corrected
2	281	addition concerning JP0_4 handling if unused
3	284	name of the CPU user's manual corrected

Revision 2.10 History, Date Mar 31, 2017 (2/12)

Section	Page	Summary
3	289	correction: "HV privilege" -> "SV privilege (PSW.UM = 0)"
3	290	correction: "(VM = 0)" => "(UM = 0)"
3	297	additions: "SV" -> "SV (PSW.UM = 0)"
3	305	"If more than one error..." removed from ID1STERSTR_PE1_OS register description
3	311	"If more than one error..." removed from IT1STERSTR_PE1_OS register description
3	324	correction: TAG[19:0] -> TAG[18:0]
3	340	"If more than one error..." removed from AXCD1STERSTRn_PE1_OS register description removed
3	347	"If more than one error..." removed from AXCT1STERSTRn_PE1_OS register description removed
7	386	correction: "PMF bit in ICSR" -> "PMFI bit in ICSR"
7	390	CPU Subsystem interrupts removed from all "Interrupt Exception Handler and Priority" tables
7	390	reserved level interrupts indicated in all "Interrupt Exception Handler and Priority" tables
7	395	Flash access error (INTFLERR) added
7	402	Flash access error (INTFLERR) added
7	409	Flash access error (INTFLERR) added
7	410	correction: D1M1 interrupt channel 205 is reserved
7	416	Flash access error (INTFLERR) added
7	417	correction: D1M1H interrupt channel 205 is reserved
7	423	Flash access error (INTFLERR) added
7	424	correction: D1M2 interrupt channel 205 is reserved
7	430	Flash access error (INTFLERR) added
7	431	correction: D1M2H interrupt channel 205 is reserved
7	437	Flash access error (INTFLERR) added
7	438	correction: D1M1A interrupt channel 205 is reserved
7	447	typo correction (EEINT ->EIINT)
7	448	typo correction (EEINT ->EIINT)
7	455	typo correction (EEINT ->EIINT)
8	475	typo correction (DMACCTL.DMASPD -> DMACTL.DMASPD)
8	478	correction: "the master information of the CPU or PCU assigned to the DMA channel" -> "the master information of the CPU assigned to the DMA channel"
8	509	typo correction (DRQCn.DRQC -> DTFRRQCn.DRQC)
8	509	correction: DRQCn.DRQC -> DTFRRQCn.DRQC
8	510	typo corrections in DRQC bit description (DRQS.DRQ -> DTFRRQn.DRQ)
9	513	reset sources for Real-Time Clock RTCA0 corrected
9	516	"Isolated-Area reset control" seperated for different devices
11	543	typo corrections (TSNSMP[7:0] -> TSNSMPT[7:0])
11	543	initialization step "Temperature measurement start control register" removed
12	565	correction in figure: CLMA0RES is active low level
12	571	typo correction ("Mr is determined by PLLkC.P[2:0]:" -> "Mr is determined by PLLkC.M[1:0]:")
12	629	CKSC_IXCETNBS_CTL register also available for D1M1H
12	630	CKSC_IXCETNBS_ACT register also available for D1M1H
12	659	RSCANDCSID[2:0] description completed
12	684	correction: D1M1H -> D1M1(H)

Revision 2.10 History, Date Mar 31, 2017 (3/12)

Section	Page	Summary
12	685	typo correction: C_ISO_CPU_CLK -> C_ISO_CPUCLK
12	686	SFMA1 and SFMA2 added to C_ISO_SFMA clock domain
12	690	FOUTDIV[9:0] description completed
12	711	"ECM detects false error signals from CLMA at resuming DEEPSTOP" usage note added
13	713	caution 1 corrected
13	715	D1M1A added
14	729	XC0 master ID table completed
14	741	correction in diagram: Video Output Warping Engine has bi-directional data
14	741	correction in diagram: write path of Output Image Generator to XC0 removed
14	747	D1M1A cross-connect XC0 diagram corrected
14	747	SFMA2 added in "D1M1A bus architecture" section (SFMAn, n= 0 to 2)
14	749	correction in diagram: Video Output Warping Engine has bi-directional data
14	760	typo correction ("MRTSC.XC0RES = 1" -> "MRSTC.XC0RES = 1")
14	760	"Bus Switch for HyperBus and OctaBus" section changed to "Bus Switch for external memory interface" and completed description
14	763	PBUS guard 0 channels 2 and 3 added for FCURAM and FACI command-issuing area
14	779	correction in "Right" table column (HV -> SV) and related table note
14	784	corrections in IPGPMTUM4, IPGnPMT4, and IPGnPMTUM4 register description: "PBUS and Data Flash" -> "cross-connect XC1"
14	785	correction: D1L1BL-2M-100/144 -> D1L1
14	787	typo correction (LOCK -> PROTLOCK)
14	788	PROTRDPDEF, PROTWRPDEF, PROTRD. PROTWR bit descriptions modified
14	797	register and bit names corrected in "Guard function matrix" table header row
14	798	typo correction (’Address mask registers" -> "Address valid registers")
14	800	XCGnVLDi register’s reserved bits descriptions added
14	801	XCGnCTL register’s reserved bits descriptions added
14	802	XCGnCTLWi register’s reserved bits descriptions added
14	803	XCGnINTL1 register’s reserved bits descriptions added
14	804	XCGnOVF register’s reserved bits descriptions added
14	807	XCGnERRRTYPE register’s reserved bits descriptions added
14	809	XCGnERRWTYPE register’s reserved bits descriptions added
14	810	section "XC Guard Operation" added
14	811	information about Performance Monitor availability corrected
14	815	PMRIDSET.RIDSET[3:0] bits description corrected
14	816	PMWIDSET.WIDSET[3:0] bits description corrected
14	826	"PRLB units assignments" tables corrected
14	826	note added concerning PRLID settings
15	833	access type of several DBSVCR register bits corrected (R/W -> R)
15	835	access type of several DBKIND register bits corrected (R/W -> R)
15	836	access type of several DBEN register bits corrected (R/W -> R)
15	837	access type of several DBCMDCNT register bits corrected (R/W -> R)
15	838	access type of several DBCONF register bits corrected (R/W -> R)
15	839	access type of several DBDMOV register bits corrected (R/W -> R)
15	840	access type of several DBTR0 register bits corrected (R/W -> R)

Revision 2.10 History, Date Mar 31, 2017 (4/12)

Section	Page	Summary
15	842	access type of several DBTR1 register bits corrected (R/W -> R)
15	843	access type of several DBTR2 register bits corrected (R/W -> R)
15	844	access type of several DBRFPDN0 register bits corrected (R/W -> R)
15	845	access type of several DBRFPDN1 register bits corrected (R/W -> R)
15	846	access type of several DBRFPDN2 register bits corrected (R/W -> R)
15	847	access type of several DBRFSTS register bits corrected (R/W -> R)
15	848	access type of several DBMRCNT register bits corrected (R/W -> R)
15	849	access type of several DBPDCNT0 register bits corrected (R/W -> R)
15	851	note 3 concering setting of DBDCNT0 register removed
15	852	note 2 concering setting of DBDCNT0 register removed
15	855	note 2 concering setting of DBDCNT0 register removed
15	857	reserved bits in SDRATRCTL register description added
15	858	reserved bits in SDRATRINTVL register description added
16	869	access type of several DBSVCR register bits corrected (R/W -> R)
16	871	access type of several DBSTATE0 register bits corrected (R/W -> R)
16	872	access type of several DBACEN register bits corrected (R/W -> R)
16	873	access type of several DBRFEN register bits corrected (R/W -> R)
16	874	access type of several DBCMD register bits corrected (R/W -> R)
16	876	access type of several DBWAIT register bits corrected (R/W -> R)
16	877	access type of several DBKIND register bits corrected (R/W -> R)
16	878	access type of several DBCONF0 register bits corrected (R/W -> R)
16	878	DBCONF0.AWRW0[4:0] bit description completed
16	880	access type of several DBPHYTYPE register bits corrected (R/W -> R)
16	881	access type of several DBTR0 register bits corrected (R/W -> R)
16	882	access type of several DBTR1 register bits corrected (R/W -> R)
16	883	access type of several DBTR2 register bits corrected (R/W -> R)
16	884	access type of several DBTR3 register bits corrected (R/W -> R)
16	885	access type of several DBTR4 register bits corrected (R/W -> R)
16	886	access type of several DBTR5 register bits corrected (R/W -> R)
16	887	access type of several DBTR6 register bits corrected (R/W -> R)
16	888	access type of several DBTR7 register bits corrected (R/W -> R)
16	889	access type of several DBTR8 register bits corrected (R/W -> R)
16	890	access type of several DBTR9 register bits corrected (R/W -> R)
16	891	access type of several DBTR10 register bits corrected (R/W -> R)
16	892	access type of several DBTR11 register bits corrected (R/W -> R)
16	893	access type of several DBTR12 register bits corrected (R/W -> R)
16	894	access type of several DBTR13 register bits corrected (R/W -> R)
16	895	access type of several DBTR14 register bits corrected (R/W -> R)
16	896	access type of several DBTR15 register bits corrected (R/W -> R)
16	897	access type of several DBTR16 register bits corrected (R/W -> R)
16	899	access type of several DBTR17 register bits corrected (R/W -> R)
16	900	access type of several DBTR18 register bits corrected (R/W -> R)
16	902	access type of several DBBL register bits corrected (R/W -> R)
16	902	DBBL.BL[1:0] bit description completed

Revision 2.10 History, Date Mar 31, 2017 (5/12)

Section	Page	Summary
16	903	access type of several DBADJ0 register bits corrected (R/W -> R)
16	904	access type of several DBADJ2 register bits corrected (R/W -> R)
16	904	DBADJ2 register bit descriptions completed
16	905	access type of several DBRFCNF0 register bits corrected (R/W -> R)
16	906	typo correction (03FFH -> 3FFFH)
16	908	access type of several DBRFCNF2 register bits corrected (R/W -> R)
16	909	access type of several DBRNK0 register bits corrected (R/W -> R)
16	910	access type of several DBPDNCNF register bits corrected (R/W -> R)
16	910	DBPDNCNF.PDMODE[1:0] bit description completed
16	910	DBPDNCNF.PDWAIT[7:0] bit description completed
16	911	access type of several DBPDCNT0 register bits corrected (R/W -> R)
16	912	access type of several DBPDCNT1 register bits corrected (R/W -> R)
16	913	access type of several DBPDCNT3 register bits corrected (R/W -> R)
16	914	access type of several DBBS0CNT1 register bits corrected (R/W -> R)
16	915	access type of several DBLGCNTi register bits corrected (R/W -> R)
16	915	DBLGCNTi register’s reserved bits description added
16	915	correction: DBLGSTSn.UDF -> DBLGSTSi.UDF
16	916	access type of several DBTMVAL0i register bits corrected (R/W -> R)
16	916	DBTMVAL0i register’s reserved bits description added
16	916	correction: "2001H to 3FFFFH" -> "2001H to 3FFFH"
16	917	access type of several DBRQCTRi register bits corrected (R/W -> R)
16	917	DBRQCTRi register’s reserved bits description added
16	918	access type of several DBTHRES0i register bits corrected (R/W -> R)
16	918	DBTHRES[2:0]i register’s reserved bits description added
16	919	DBLGSTSi register’s reserved bits description added
16	920	access type of several DBLGQONi register bits corrected (R/W -> R)
16	920	DBLGQONi register’s reserved bits description added
16	923	typo correction ("OPC = PDEA" -> "OPC[5:0] = PDEn")
16	926	threshold register names in the diagram corrected
16	926	correction: DBTHRESi[2:0] -> DBTHRES[2:0]i
16	926	correction: DBTHRESi[2:0] -> DBTHRES[2:0]i
16	927	correction: DBTHRESi[2:0] -> DBTHRES[2:0]i
16	929	QoS counter name corrected in diagram
16	930	QoS counter name corrected in diagram
17	938	3rd Serial Flash Memory Interface A (SFMA2) added for D1M1A devices
17	950	DRCR.BFM{2:0] bit description completed
17	979	correction: "64 bits x RBURST[3:0]" -> "64 bits x (RBURST[3:0] + 1)"
17	980	correction in diagram: "64 x RBURST (read burst length) bits" -> "64 x (RBURST (read burst length) bits + 1)"
17	981	correction in diagram: "64 x RBURST bits" -> "64 x (RBURST (read burst length) bits + 1)"
17	981	correction in diagram: "64 x RBURST bits" -> "64 x (RBURST (read burst length) bits + 1)"
17	983	correction: "64 × RBURST (read burst length)" -> "64 × (RBURST[3:0] (read burst length) + 1)"

Revision 2.10 History, Date Mar 31, 2017 (6/12)

Section	Page	Summary
17	989	correction: "64 x RBURST[3:0] bits" -> "64 x (RBURST[3:0] bits + 1)"
17	997	note 2 concerning SFMA1 clock frequencies removed
18	1030	typo correction (q -> alpha)
19	1135	figure corrected
19	1136	procedure step 6 split into 6 and 7
19	1136	typo corrections in register and bit names: CSSIH0 -> CSIHn
19	1139	figure corrected
19	1139	procedure step 6 split into 6 and 7
21	1262	access type of RIICnMR3.ACKWP bit corrected (R -> R/W)
22	1489	addition concerning channels not included in the test
23	1813	addition concerning channels not included in the test
23	1813	note *1 added concerning RAM test size
24	1858	Ethernet AVB MAC "External clock" defined
24	1860	table note 1 added concerning signals with MII-Lite interface
24	1864	gPTP captured Presentation Time register (GCPT) register removed from table
24	1865	access type of several CCC register bits corrected (R/W -> R)
24	1869	access type of several DLR register bits corrected (R/W -> R)
24	1872	access type of several CSR register bits corrected (R/W -> R)
24	1876	access type of several ESR register bits corrected (R/W -> R)
24	1878	access type of several RCR register bits corrected (R/W -> R)
24	1883	access type of several RPC register bits corrected (R/W -> R)
24	1885	access type of several UFCW register bits corrected (R/W -> R)
24	1886	access type of several UFCS register bits corrected (R/W -> R)
24	1887	access type of several UFCVi register bits corrected (R/W -> R)
24	1889	access type of several UFCDi register bits corrected (R/W -> R)
24	1890	access type of several SFO register bits corrected (R/W -> R)
24	1893	access type of several TGC register bits corrected (R/W -> R)
24	1895	access type of several TCCR register bits corrected (R/W -> R)
24	1897	access type of several TSR register bits corrected (R/W -> R)
24	1901	access type of several TFA2 register bits corrected (R/W -> R)
24	1908	access type of several DIS register bits corrected (R/W -> R)
24	1910	access type of several EIC register bits corrected (R/W -> R)
24	1912	access type of several EIS register bits corrected (R/W -> R)
24	1918	access type of several RIS0 register bits corrected (R/W -> R)
24	1920	access type of several RIC1 register bits corrected (R/W -> R)
24	1921	access type of several RIS1 register bits corrected (R/W -> R)
24	1922	access type of several RIC2 register bits corrected (R/W -> R)
24	1924	access type of several RIS2 register bits corrected (R/W -> R)
24	1928	access type of several TIS register bits corrected (R/W -> R)
24	1940	access type of several GIC register bits corrected (R/W -> R)
24	1941	access type of several GIS register bits corrected (R/W -> R)
24	1941	gPTP captured Presentation Time register (GCPT) register removed
24	2061	typo corrections (E-DMAC -> AVB-DMAC)
28	2121	AWOTnCTL register's reserved bits description added

Revision 2.10 History, Date Mar 31, 2017 (7/12)

Section	Page	Summary
28	2122	AWOTnTOE register's reserved bits description added
28	2123	correction: AWOTnSTC can be accessed in 8-bit units.
28	2123	AWOTnFLG register's reserved bits description added
28	2123	AWOTnSTC register's reserved bits description added
28	2127	AWOTnEMU register's reserved bits description added
30	2373	TAUJnCSRm register value after reset corrected
30	2377	correction: (TAUJnRDFm = 1) -> (TAUJnRDTm = 1)
32	2514	typo corrections in "PWGA" description paragraph: PWGAnCRBR -> PWGAnCRDR
34	2586	correction: "PCMPnSTC.PCMPnOV = 1" -> "PCMPnSTR.PCMPnOV = 1"
34	2586	correction: "PCMPnSTC.PCMPnUR = 1" -> "PCMPnSTR.PCMPnUR = 1"
34	2603	correction in PCMPnOV and PCMPnUR bit descriptions: interrupt -> flag
34	2604	correction in PCMPnOVC and PCMPnURC bit descriptions: interrupt -> flag
34	2604	correction: "This register is used to reset the FIFO buffer interrupt flags." -> "This register is used to reset the FIFO buffer status flags."
35	2609	SSIRxD and SSITxD signals combined to SSIDATA
35	2611	SSIRxD and SSITxD signals combined to SSIDATA in block diagram
35	2614	corrections in SCKP bit description: SCK -> SSISCK
35	2617	corrections in TOIRQ, RUIRQ, ROIRQ and IIRQ bit descriptions: "SSI interrupt" -> "SSIF interrupt"
35	2633	type correction in diagram: "SSI module" -> "SSIF module"
35	2640	typo correction in diagram: "SSI status register bits" -> "SSIF status register bits"
35	2642	typo correction in diagram: "SSI status register bits" -> "SSIF status register bits"
36	2659	LCBInTGTFTSEQ signal removed from diagram
36	2685	clock divisors in LCBInTFTPCPRS[15:0] bit description corrected
37	2698	D1M1H removed from note 1
37	2707	several video input clock settings added
37	2730	correction: CKSC_IDOTCLK0S_CTL -> CKSC_IDOTCLK1S_CTL
37	2734	typo correction (DOTCLK0 -> DOTCLK1)
37	2734	VDCE1VOSCSID[2:0] bit description corrected
37	2736	CKSC_IVOEXS_CTL.VOEXSCSID0 bit description corrected for D1M1A
37	2740	correction: D1M2H -> D1M2(H)
37	2740	correction: CKSC_IVDCE0VIS_CTL register also in D1M2 available
37	2741	correction: CKSC_IVDCE0VIS_ACT register also in D1M2 available
37	2747	typo correction ("VDCEnVENm signals" -> "VDCEnVEm signals")
37	2751	correction: "INP_FORMAT[2:0] = 000B" for RGB888, YCrCb444
37	2756	typo correction (MIPI0VI_VSYNC -> MIPI0_VI_VSYNC)
37	2758	condition for RSTN_CLK_ON = 0 corrected
37	2759	condition for RSTN_DATA_ON = 0 corrected
37	2762	correction: "MIPInBUF_CTL – Buffer control" -> "MIPInBUF_CTL – SubLVDS buffer control"
37	2763	correction: CLK_COUNT -> DATA_COUNT[7:0]
37	2764	correction: CLK_COUNT -> DATA_COUNT[7:0]
37	2764	correction: CLK_COUNT -> DATA_COUNT[7:0]
37	2764	correction: CLK_COUNT -> DATA_COUNT[7:0]
37	2764	correction: CLK_COUNT -> DATA_COUNT[7:0]

Revision 2.10 History, Date Mar 31, 2017 (8/12)

Section	Page	Summary
37	2773	correction: "Escape Mode Entry Command Error (bit[15])" -> "Escape Mode Entry Command Error (bit[15], [11])"
37	2773	correction: "False Control Error (bit[16])" -> "False Control Error (bit[16], [12])"
37	2776	corrections in CTL_ERR_0_EN, ESC_ERR_0_3_EN, SOT_SYNC_ERR_0_EN, SOT_ERR_0_EN bit descriptions: "lane 1" -> "lane 0"
37	2776	corrections in CTL_ERR_1_EN, ESC_ERR_1_3_EN, SOT_SYNC_ERR_1_EN, SOT_ERR_1_EN bit descriptions: "lane 2" -> "lane 1"
37	2777	corrections in CTL_ERR_1_MASK, ESC_ERR_1_3_MASK, SOT_SYNC_ERR_1_MASK, SOT_ERR_1_MASK bit descriptions: "lane 2 enable" -> "lane 1 mask"
37	2778	correction in BUF_OR_ERR_MASK bit description: "BUFFER overrun error enable" -> "BUFFER overrun error mask"
37	2778	corrections in CTL_ERR_0_MASK, ESC_ERR_0_3_MASK, SOT_SYNC_ERR_0_MASK, SOT_ERR_0_MASK bit descriptions: "lane 1 enable" -> "lane 0 mask"
37	2779	corrections in CTL_ERR_0_CLR, ESC_ERR_0_3_CLR, SOT_SYNC_ERR_0_CLR, SOT_ERR_0_CLR bit descriptions: "lane 1 enable" -> "lane 0 enable clear"
37	2779	corrections in CTL_ERR_1_CLR, ESC_ERR_1_3_CLR, SOT_SYNC_ERR_1_CLR, SOT_ERR_1_CLR bit descriptions: "lane 2 enable" -> "lane 1 enable clear"
37	2780	correction in BUF_OR_ERR_CLR bit description: "BUFFER overrun error enable" -> "BUFFER overrun error enable clear"
37	2783	typo correction (MIPIn_RST_CTL -> MIPInRST_CTL)
37	2789	typo correction ("OUT_SET.OUT_FORMAT[2:0] = 000B" -> "OUT_SET.OUT_FORMAT[1:0] = 00B"
37	2791	typo correction ("OUT_SET.OUT_FORMAT[2:0] = 000B" -> "OUT_SET.OUT_FORMAT[1:0] = 00B"
37	2797	note *1 removed from Serial RGB
37	2798	footnote 5 added
37	2798	D1M1A video output selection figure corrected
37	2807	D1M1A removed from C_ISO_VI1PIXCLK selection
37	2811	correction: VOWEMSC.RBMASK[31:0] -> VOWEMMC.RBMASK[31:0]
37	2814	correction: CKSC_OLDI0SYS_CTL -> CKSC_IVOEXS_CTL
37	2818	addition to LVEN and LVRES bit descriptions: bits must not be changed to 0 during Open LDI operation
37	2819	OLDInCR1 description corrected
37	2825	"Sample Configuration flow of OpenLDI" revised
37	2829	"Limitation" section added
38	2847	S0_WLINE interrupts removed from table
38	2861	correction: INP_ES_EDGE -> INP_HS_EDGE
38	2876	correction: SC_SCL0_DS4.SC_RES_DS_H_ON -> SC_SCL0_DS1.SC_RES_DS_H_ON
38	2878	correction: SC_SCL0_DS4.SC_RES_DS_H_ON -> SC_SCL0_DS1.SC_RES_DS_H_ON
38	2886	correction: SCL0_DS3.RES_HW -> SC_SCL0_DS3.SC_RES_HW
38	2887	correction: DE_HS_BYPASS -> DE_HSBYPS_EN
38	3044	correction: "The GR_BASE[31:0] bits should be set in units of 64 bits" -> "The GR_BASE[31:0] bits should be set in units of 128 bytes"
38	3044	"Restriction", "Recommendation" and "Example" added concering frame buffer addressing
38	3049	"Calculation Formula" for GR_BASE[31:7] corrected

Revision 2.10 History, Date Mar 31, 2017 (9/12)

Section	Page	Summary
38	3050	correction in GR_STA_POS[5:0] bit description: "amount of data" -> "amount of pixels"
38	3073	note added concerning frame buffer addressing
38	3078	correction in GR_STA_POS[5:0] bit description: "amount of data" -> "amount of pixels"
38	3090	GR3_UPDATE.GR3_P_VEN bit description corrected
38	3114	correction: "set GR_VIN_HW to 2 and GR_VIN_GRC_HW..." -> "set GR_VIN_GRC_HW[10:0]..."
38	3123	corrections in table: GR_OIR_VEN -> GR_OIR_UPDATE
38	3150	note 2 added concerning frame buffer addressing
38	3153	name of bits 12 to 10 corrected
38	3183	correction: TCON_STVA_HW -> TCON_STVA_VW[10:0]
38	3183	correction: TCON_STVB_HW -> TCON_STVB_VW[10:0]
38	3250	OUT_SET.OUT_PIXEL_INV_ON and OUT_SET.OUT_SUM_MOVE[4:0], OUT_SET.OUT_PHASE[1:0] bit descriptions removed from table
38	3251	note added concerning interrupt settings and clock supply
38	3251	S0_WLINE interrupt removed
38	3252	SYSCNT_INT2.INT_STA9 bit removed
38	3253	SYSCNT_INT5.INT_OUT14_ON bit description removed from table
38	3253	SYSCNT_INT5.INT_OUT9_ON bit removed
38	3259	INT_STA9 bit removed from SYSCNT_INT2 register
38	3263	INT_OUT9_ON bit removed from SYSCNT_INT5 register
40	3275	correction: VOCAnCFG0 -> VOCAnMmCFG0
40	3275	correction: VOCAnCFG1 -> VOCAnMmCFG1
40	3275	correction: VOCAnOFFSj.VOCAnHOFFS/.VOCAnVOFFS -> VOCAnOFFSj.VOCAnHOFFSj/.VOCAnVOFFSj
40	3275	typo correction (VOCAnHOFFS -> VOCAnHOFFSj)
40	3275	typo correction (VOCAnVOFFS -> VOCAnVOFFSj)
40	3282	activity monitor detection time settings corrected
40	3282	Activity Monitor functional description corrected
40	3284	correction: VOCAn.VOCAnE16/E17 -> VOCAnSTR.VOCAnE16/E17
40	3287	VOCAn register names corrected in overview table
40	3293	time values in VOCAnTIMEj register description defined accurately
40	3294	VOCAnOFFSj register's reserved bits description added
40	3295	VOCAnDISPj register's reserved bits description added
40	3296	VOCAnACTj register's reserved bits description added
40	3297	VOCAnDIFF register's reserved bits description added
40	3298	VOCAnMmCFG0 register's reserved bits description added
40	3299	VOCAnMmCFG1 register's reserved bits description added
40	3300	VOCAnMmCFG2 register's reserved bits description added
40	3301	VOCAnMmCFG3 register's reserved bits description added
40	3302	VOCAnMmCFG4 register's reserved bits description added
40	3303	VOCAnMmCFG5 register's reserved bits description added
40	3304	VOCAnMmCFG6 register's reserved bits description added
40	3305	VOCAnMmCFG7 register's reserved bits description added
40	3306	VOCAnEXPDk register's reserved bits description added
40	3307	"Procedure for entering and resuming DEEPSTOP" usage note added

Revision 2.10 History, Date Mar 31, 2017 (10/12)

Section	Page	Summary
43	3366	SPEAnRjRUP, SPEAnRjRBYP and SPEAnRjRCFG register addresses corrected
43	3367	access type of several SPEAnRLSL/SPEAnRjRLSL register bits corrected (R/W -> R)
43	3368	access type of several SPEAnSTAi/SPEAnRjSTAi register bits corrected (R/W -> R)
43	3369	access type of several SPEAnPHAi/SPEAnRjPHAi register bits corrected (R/W -> R)
43	3370	access type of several SPEAnVDCi/SPEAnRjVDCi register bits corrected (R/W -> R)
43	3370	"SPEAnVDCi/SPEAnRjVDCi - RLE Engine i read master ID register" description modified
43	3370	typo corrections in master ID assignment tables (SPEAnVDCi[3:0] -> SPEAnRVDCi[3:0])
43	3372	access type of several SPEAnRCMi/SPEAnRjRCMi register bits corrected (R/W -> R)
43	3373	access type of several SPEAnRUP/SPEAnRjRUP register bits corrected (R/W -> R)
43	3374	access type of several SPEAnRjRBYP register bits corrected (R/W -> R)
43	3375	access type of several SPEAnRCFG/SPEAnRjRCFG register bits corrected (R/W -> R)
43	3376	access type of several SPEAnSkEN register bits corrected (R/W -> R)
43	3377	access type of several SPEAnSkDS register bits corrected (R/W -> R)
43	3378	access type of several SPEAnSkUP register bits corrected (R/W -> R)
43	3379	access type of several SPEAnSkBYP register bits corrected (R/W -> R)
43	3380	access type of several SPEAnSkDAm register bits corrected (R/W -> R)
43	3381	access type of several SPEAnSkVDm register bits corrected (R/W -> R)
43	3382	access type of several SPEAnSkLYm register bits corrected (R/W -> R)
43	3383	access type of several SPEAnSkPSm register bits corrected (R/W -> R)
44	3388	several JCUA register names in overview table corrected
44	3414	correction: JIFECNT -> JIFDCNT
44	3426	typo correction (JIFDSLC -> JIFDSDC)
44	3427	correction in diagram: "JINEN bit in JINTE0" -> "JINEN bit in JINTE1"
44	3428	correction: JINT1 -> JINTS1
44	3428	typo correction in figure (JUIFDDOST -> JIFDDFST)
44	3430	correction in diagram: "Detect INTJCU0EDI" -> "Detect INTJCUA0EDI"
44	3430	note added concerning unknow markers
44	3438	correction in diagram: "Detect INTJCU0DTI interrupt" -> "Detect INTJCUA0DTI interrupt"
45	3448	Pull Down control register 1 (ADCEnPDCTL1) removed
45	3459	correction: ADCEnADCR.TSNSELFDIAG bit is R/W
45	3459	typo correction: ADCELnDRj -> ADCEnDRj
45	3468	correction: ADCEnPWDTSNDR.TSN[15:0] -> ADCEnPWDTSNDR.TSNDR[15:0]
45	3480	correction: "The SHACT and SGACT bits are cleared when HALT is executed." -> "The SGACT bits are cleared when HALT is executed."
45	3481	ADCEnSGSTR.SEF[0] bit description corrected
45	3482	initial value of ADCEnSGTSELx register corrected
45	3486	initial value of ADCEnTSNSGTSEL register corrected
45	3488	output signal names corrected
45	3489	Pull Down control register 1 (ADCEnPDCTL1) description removed
45	3507	sentence "ADPEm is enabled if PEIE of ADCEnSFTCR is set to 1." removed
45	3511	ADCEnPDCTL1.PDNAm bits removed from "Diagnostic of Open Pins" section
45	3511	ADCEnPDCTL1.PDNAm bits removed from figure
45	3512	correction: "...declines to 0 V" -> "...declines to almost 0 V"
46	3574	access type of several ISMnGCTL register bits corrected (R/W -> R)

Revision 2.10 History, Date Mar 31, 2017 (11/12)

Section	Page	Summary
46	3576	access type of several ISMnGSTR register bits corrected (R/W -> R)
46	3577	access type of several ISMnGCFG register bits corrected (R/W -> R)
46	3580	correction: ISMnCTL -> ISMnGCTL
46	3581	access type of several ISMnGSTC register bits corrected (W -> R)
46	3582	access type of several ISMnCCMRm register bits corrected (R/W -> R)
46	3584	access type of several ISMnCCMPm register bits corrected (R/W -> R)
46	3585	access type of several ISMnCIOCm register bits corrected (R/W -> R)
46	3586	access type of several ISMnCOPT register bits corrected (R/W -> R)
46	3587	access type of several ISMnPAR0CFGm register bits corrected (R/W -> R)
46	3588	access type of several ISMnPAR1CFGm register bits corrected (R/W -> R)
46	3589	access type of several ISMnPARiCFGm register bits corrected (R/W -> R)
46	3590	access type of several ISMnVARjCFGm register bits corrected (R/W -> R)
46	3591	access type of several ISMnVAR6CFGm register bits corrected (R/W -> R)
46	3592	access type of several ISMnGZPDCTL register bits corrected (R/W -> R)
46	3598	access type of several ISMnZPDCTL register bits corrected (R/W -> R)
46	3598	signal names corrected
46	3599	access type of several ISMnZPDOPT register bits corrected (R/W -> R)
46	3603	access type of several ISMnZPDCMPm register bits corrected (R/W -> R)
46	3605	access type of several ISMnEMU register bits corrected (R/W -> R)
46	3608	correction in ECCISMnCTL.EC2EDIC bit description: INTECCDCNRAM -> INTECCDPERIRAM
46	3608	correction in ECCISMnCTL.ECER2FC bit description: INTECCDCNRAM -> INTECCDPERIRAM
48	3620	FACI error sources No. 17, 18 added in ECM error inputs list
48	3620	note 3 added to Video Output Monitor error
48	3621	note 4 added to Clock Monitor interrupts CLMAn
48	3623	correction: Error Output Level = L in the last table row
48	3636	added note concerning ECMMICFG1 register write protection
51	3670	access type of several IDMODI register bits corrected (W -> R)
52	3691	"Chip ID Register" added
52	3697	Code Flash sub-test control register (PE1) added in the table
52	3697	Code Flash sub-test control register (VCI) added in the table
52	3702	"If more than one error occurs..." removed from CF1STERSTR_VCI2CFB/PE1_OS register description
52	3704	"CFSTSTCTL_VCI2CFB/PE1 — Code flash sub-test control register" description added
52	3709	typo corrections in ERRCLR bit description (CF1STERSTR -> DFERSTR)
52	3712	correction: items prohibited also during blank check
53	3713	D1M1_5MB and D1M1H_5MB product names corrected in table
53	3721	"If more than one error occurs..." removed from LR1STERSTR register description
53	3725	Local RAM "Usage Notes" added
53	3732	ECDEDFm, ECSEDFm clearing conditions corrected
53	3733	ECOVFF clearing conditions corrected
54	3767	ECDEDFm, ECSEDFm clearing conditions corrected
54	3768	ECOVFF clearing conditions corrected
56	3781	typo correction ("MRTSC.XC0RES = 1" -> "MRSTC.XC0RES = 1")

Revision 2.10 History, Date Mar 31, 2017 (12/12)

Section	Page	Summary
56	3781	OctaBus Controller connected signals corrected
56	3782	note added concerning HyperBus memory area access in Manual Mode
56	3782	maximum flash/RAM size given in "HyperBus Interface" features
56	3795	"Manual Mode Enable Setting Register (SMENR)" section corrected
56	3802	DRDMCR.DMCYC[3:0] bit description completed
56	3803	SMDMCR.DMCYC[4:0] bit description completed
56	3807	correction: "By external address space read mode,..." -> "By external address space read/write mode,..."
56	3808	correction: "SMCMR = 0x0060_0000" -> "SMCMR = 0x0020_0000"
56	3809	correction: "DRCMR = 0x00e0_0000" -> "DRCMR = 0x00a0_0000"
56	3815	"Write Buffer Area" information table corrected
57	3818	typo correction ("MRTSC.XC0RES = 1" -> "MRSTC.XC0RES = 1")
57	3818	OctaBus Controller connected signals corrected
57	3819	OctaBus module description added
58	3898	DMA_CTRL.DMA_BURST[2:0] bit description corrected
58	3954	correction in figure: "write DMA_TRIG_LVL" -> "write DMA_TRIG_TLVL"

Revision 2.20 History

This revision history list shows all modifications of

Rev. 2.20 compared to Rev. 2.10.

NOTE

The following revision history table does not mention corrections of very simple and obvious spelling and formatting errors.

Revision 2.20 History, Date Jan 26, 2018 (1/8)

Section	Page	Summary
1	98	caution concerning D1M1A and D1M1-V2 devices preliminary specification removed
1	103	D1M1H_ CPU frequencies corrected
1	108	PLL0 frequency correction: "max. 480 MHz" -> "max. 960 MHz"
1	109	correction: TCON available in D1M1A devices
1	110	footnote numbers for D1M1 development products "Voltage supply" items corrected
1	110	D1M1-V2 package type corrected
1	115	correction: TCON available in D1M2 devices
1	116	footnote numbers for D1M2 products "Voltage supply" items corrected
2	121	corrections in diagram: A0VREFN -> A0VSS, ZPDVREFVSS -> ZPDVSS
2	123	corrections in diagram: SDRADQM[3:0] -> SDRADM[3:0]
2	129	appropriate "PPRn_m read value" column cells merged
2	179	device dependency of DSCTRL.SDRDSA[1:0] added
2	179	device dependency of DSCTRL.SDRDSD2[1:0] added
2	179	device dependency of DSCTRL.SDRDSD3[1:0] added
2	180	note added concerning header files module name
2	180	device dependency of DSCTRL.SDRDSC[1:0] added
2	180	device dependency of DSCTRL.SDRDSD0[1:0] added
2	180	device dependency of DSCTRL.SDRDSD1[1:0] added
2	180	correction in all port register tables: PPCMDn and PPROTSn access size 8 bit -> 32 bit
2	196	correction: PIPC3.bit 0 not available in D1L2H
2	204	correction: PFCE44.bit5 not available in D1L2H
2	235	correction: PFC22.bit10 not available in D1M1-V2
2	237	correction: PIPC43.bit[1:0] not available in D1M1A
2	237	correction: PFC43.bit1 not available in D1M1A
2	237	correction: PFCE43.bit[1:0] not available in D1M1A
2	238	correction: PIPC44.bit[11:10,8,6,3,1] not available in D1M1A
2	239	correction: PIPC45.bit[11:6,4,2:0] not available in D1M1A
2	239	device dependency of PFCAE45.bit13 added
2	256	note 2 added concerning usage of P45_1
2	257	description of 2nd chip select for Octa memory interface added
2	276	ADCE0Im DEEPSTOP pin state in normal operation mode corrected
2	276	P10, P11 pin state in normal operation mode corrected
2	277	ADCE0Im DEEPSTOP pin state in debug mode corrected
2	277	P10, P11 pin state in debug mode corrected
2	279	ADCE0Im DEEPSTOP pin state in serial programming mode corrected

Revision 2.20 History, Date Jan 26, 2018 (2/8)

Section	Page	Summary
2	279	P10, P11 pin state in serial programming mode corrected
2	281	recommended connection of unused XT2 corrected
3	322	access type of reserved bits corrected (R/W -> R)
3	333	"XC cache tag RAM ECC Control Register" removed
3	333	correction: "XC cache data RAM ECC Control Register" -> "XC cache data/tag RAM ECC Control Register"
3	334	correction: "cache data RAM" -> "cache data RAM and tag RAM"
3	334	correction: "XC cache data RAM data ECC control register" -> "XC cache data/tag RAM ECC control register"
3	342	"AXCTECCCTL_PE1_OS – XC cache tag RAM ECC control register" description removed
4	353	step 3 of the "Register protection unlock sequence" rephrased
5	377	extended area added to address map
5	379	extended area added to address map
7	383	"Index" table added
7	386	correction: "PMFI bit in ICSR" -> "PMEI bit in ICSR"
7	389	index correction throughout this section: INTPn ->INPx
7	452	DMA bus error status registers addresses corrected throughout this section
7	454	initial value of BECMBUSERRMASK register corrected
8	478	"VM" item removed from table
8	491	VM bit removed from DMnnCM registers
9	516	note added
9	516	PWRGD counter frequency corrected: 240 kHz -> 100 kHz
9	517	step (6) description improved
9	517	note added concerning ISOPWRES occurrence
9	517	correction: "0.5 ms, when High Speed IntOsc clock fRH is running" -> "0.8 ms, when High Speed IntOsc clock fRH is running"
9	533	diagram corrected
9	534	diagram corrected
12	548	typo correction ((HS IntOsc) -> (LS IntOsc))
12	551	typo correction (ROSC -> ROSCS)
12	552	typo correction (ROSC -> ROSCS)
12	553	typo correction (ROSC -> ROSCS)
12	554	typo correction (ROSC -> ROSCS)
12	555	typo correction (ROSC -> ROSCS)
12	557	note 2 added related to APC_CLK_RATIO
12	588	note added concerning wake-up by INTPx
12	619	CKSC_IPLLFIXS_ACT register availability corrected
12	638	device dependency of APB_CLK_RATIO register corrected
12	646	correction: "...at a frequency of 4 MHz or higher..." -> "...at a frequency of higher than 4 MHz..."
12	687	maximum C_AWO_RTCA clock frequency corrected: 8 MHz-> 4 MHz
12	689	note 3 rephrased
13	714	cautions 3 and 4 added
13	714	correction: INTPn->INTPx
13	716	corrected description concerning IOHOLD in DEEPSTOP

Revision 2.20 History, Date Jan 26, 2018 (3/8)

Section	Page	Summary
13	727	"Preparation for DEEPSTOP" description corrected
13	730	figure added
13	730	figure corrected
14	764	correction: "SFMA2 SPBSSL" -> "SFMA2SSL"
14	764	XCRAMCFG0.CSSEL2 (bit 21) added
14	767	correction: PBGA10A -> PBG10A
14	774	reference added concerning Flash Memory User's Manual
14	782	"IPG Protection Setting Registers for Illegal Virtual Machine" section removed
14	783	VD bit desription corrected
14	783	"IPGnECR, and IPGnECRUM (n=0)" removed from register description
14	784	"IPGnADR, and IPGnADRUM (n=0)" removed from register description
14	784	"IPGnEN, and IPGnENUM (n=0)" removed from register description
14	785	"IPGnPMT0, and IPGnPMTUM0 (n=0)" removed from register description
14	786	"IPGnPMT2, and IPGnPMTUM2 (n=0)" removed from register description
14	786	"IPGnPMT3, and IPGnPMUTM3 (n=0)" removed from register description
14	787	"IPGnPMT4, and IPGnPMTUM4 (n=0)" removed from register description
14	788	note added
14	789	PBG0A PBUS guard channels corrected
14	789	PBG2B PBUS guard added
14	789	PBG5A PBUS guard added
14	790	PROTLOCK (bit 31) added to FSGD0BPROTn register
14	790	PROTVM (bit 26) removed from FSGDxxPROTn register
14	794	VM (bit 7) removed from ERRSLVxxTYPE registers
14	814	information about Performance Monitor availability corrected
14	818	PMRIDSET.RIDSET[3:0] bits description corrected
14	819	PMWIDSET.WIDSET[3:0] bits description corrected
14	830	section "Video frame buffer and PRLB usage" added
15	862	addition concerning signal representations
17	948	CMNCR.MOIIO1[1:0] bit description modified
17	948	CMNCR.MOIIO2[1:0] bit description modified
17	948	CMNCR.MOIIO3[1:0] bit description modified
17	949	CMNCR.IO0FV[1:0] bit description modified
17	949	CMNCR.IO2FV[1:0] bit description modified
17	949	CMNCR.IO3FV[1:0] bit description modified
17	949	CMNCR.MOIIO0[1:0] bit description modified
17	953	note added to DRCR.BFM[2:0] bit description
17	966	SMRDR0.RDATA0[31:0] bit description modified
17	967	SMRDR1.RDATA1[31:0] bit description modified
17	968	SMWDR0.WDATA0[31:0] bit description modified
17	969	SMWDR1.WDATA1[31:0] bit description modified
17	971	CKDLY_TS[1:0] bits added to CKDLY register of D1M1A and D1M1-V2 devices
17	986	note added concerning SFMA access via XC cache
17	999	correction in "Pin Status (2)" table: MOIIOx -> IOxFV
17	999	correction in "Pin Status (3)" table: MOIIOx -> IOxFV

Revision 2.20 History, Date Jan 26, 2018 (4/8)

Section	Page	Summary
17	1002	description concerning sampling point value modified
17	1004	note concerning data learning pattern corrected
17	1006	"Notes on using the SFMA Cache" added
19	1061	CSIH1BRS[11:0] bits access modes corrected (R -> R/W)
19	1105	correction: ", and thus all CSIHTSCK are stopped" -> ", and thus CSIHTSCK of the corresponding channel is stopped"
19	1107	correction: ", and thus all CSIHTSCK are stopped" -> ", and thus CSIHTSCK of the corresponding channel is stopped"
19	1139	CSIHnMCTL2.CSIHnRRA[6:0] in figure corrected
20	1182	"For response reception:" description corrected
20	1222	typo correction (PRER -> RPER)
20	1222	typo correction (PRER -> RPER)
20	1223	"When the FSM bit in the RLN3nLDFC ..." added
22	1350	correction: "<RSCAN0_base> + <RSCAN0_base> + 104CH" -> "<RSCAN0_base> + 104CH"
22	1411	added "After all other bits in the RSCANnCFCCk register ..." to CFE bit description
22	1472	references to *1 note added in the table
22	1517	note added concerning ECC decoder assignments
22	1519	relation to ECC 1-bit detection added in EC1EDIC register description
22	1519	relation to ECC 1-bit detection added in ECER1F register description
22	1519	relation to ECC 2-bit detection added in EC2EDIC register description
22	1519	relation to ECC 2-bit detection added in ECER2F register description
23	1535	ISO standard compatibilities in "CAN FD protocol switchover" corrected
23	1537	references added concerning registers initialization
23	1541	"To switch the RS-CAN FD module ..." in "RCMC Bit" description added
23	1589	RSCANnRFIDx access options completed
23	1594	references to register tables in "CFTML[3:0] Bits" description corrected
23	1638	reference to register table in "TXQDC[3:0] Bits" description added
23	1651	reference to figure in "RTME Bit" description added
23	1654	references added concerning registers initialization
23	1658	"To switch the RS-CAN FD module ..." in "RCMC Bit" description added
23	1677	"GWBRS Bit" description corrected
23	1678	"Modify this bit only in channel reset mode." added to "GWEN Bit" description
23	1682	note added in "TDCR[7:0] Flag" description
23	1687	", and depending on the DRE bit ..." added in "CMPOC Bit" description
23	1700	references to ISO standards in RSCFDnCFDGCRCCFG register description corrected
23	1708	RSCFDnCFDGAFLP0_j.GAFLDLC[3:0] description corrected
23	1732	references to register tables in "CFTML[3:0] Bits" descritpion corrected
23	1743	"Reserved" bit description corrected
23	1777	reference to register table added in "TXQDC[3:0] Bits" description
23	1790	reference to figure in "RTME Bit" description added
23	1799	BOM[1:0] settings corrected in figure
23	1799	note 3 added
23	1806	", and depending on the DRE bit ..." added
23	1810	"(Use this count source ..." added

Revision 2.20 History, Date Jan 26, 2018 (5/8)

Section	Page	Summary
23	1811	note 1 added in figure
23	1818	addition concerning channels not included in the test
23	1822	correction in figure for "ClassicalCAN mode:": "TSEG1 > TSEG2 > SJW" ->"TSEG1 > TSEG2 >= SJW"
23	1847	note 1 added in figure
24	2066	Usage note "Receive frame interrupt and descriptor interrupt may be issued before completion of writing data" added
26	2084	correction concerning WDTAnMD value becoming effective
26	2084	rephrased: "generated generates an error," -> "generated causes an error,"
26	2089	paragraph "After writing the processing ..." rephrased
29	2154	TAUBnCMORm.TAUBnMD[4:0] bit description completed
29	2165	TAUBnTOLm description corrected
29	2199	typo correction (TAUBnMDO -> TAUBnMD0)
29	2222	TAUBnCNTm 0000H and 0001H lines corrected in figure
29	2296	TAUBnCNTm 0000H and 0001H lines corrected in figure
29	2301	TAUBnCNTm 0000H and 0001H lines corrected in figure
29	2302	TAUBnCNTm 0000H and 0001H lines corrected in figure
29	2303	TAUBnCNTm 0000H and 0001H lines corrected in figure
29	2304	TAUBnCNTm 0000H and 0001H lines corrected in figure
29	2306	TAUBnCNTm 0000H and 0001H lines corrected in figure
29	2311	TAUBnCNTm 0000H and 0001H lines corrected in figure
29	2337	brackets settings corrected in "Equations"
30	2375	TAUJBnCMORm.TAUJnMD[4:0] bit description completed
30	2385	TAUJnTOLm description corrected
30	2415	figure corrected
31	2462	note added concerning RTCA interrupts
31	2463	correction: "32 kHz to 4.194304 MHz" -> "32 kHz to 4 MHz"
32	2519	typo correction ("or ADCE1" removed)
37	2714	VDCE1_VO_CLK in Open LDI output mode corrected
37	2719	note added concerning video clock generator's registers module name in header files
37	2805	description of D1M1A video output selection for D1M1-V2 deleted
37	2806	section "Phase shift" revised
37	2806	cleaned up figure
37	2834	typo correction in figure (VDCECTL.VOS -> VDCECTL.VOSL)
38	2849	typo correction (INTVDCE0IRVLINE -> INTVDCE0OIRVLINE)
38	2888	"Input timing by data enable" figure and explanation corrected
38	2908	scaler 0 sync signals flow corrected
38	2909	scaler 1 sync signals flow corrected
38	2918	notes added in figure
38	2930	notes added in figure
38	2936	note added in figure
38	2937	note added in figure
38	2954	note added to SC0_SCL0_FRC7.SC0_RES_F_HW[10:0] bit description
38	2993	note added concerning CLUT table switching
38	2999	note added to SC1_SCL0_FRC7.SC1_RES_F_HW[10:0] bit description

Revision 2.20 History, Date Jan 26, 2018 (6/8)

Section	Page	Summary
38	2999	typo correction (SC0_RES_F_HW -> SC1_RES_F_HW)
38	3025	note added concerning CLUT table switching
38	3066	formulars corrected in "Alpha Blending Calculation" because of up-rounding
38	3067	note added concerning CLUT table switching
38	3094	note added concerning CLUT table switching
38	3114	note added concerning CLUT table switching
38	3133	remark added concerning vertical front porch setting
38	3134	note added to figure
38	3141	note added to OIR_SCL0_FRC7.OIR_RES_F_HW[10:0] bit description
38	3141	typo correction (SC0_RES_F_HW -> OIR_RES_F_HW)
38	3179	added "Timing of Parallel to Serial Conversion in Triple Speed Mode Mode" figure for OUT_SEQ_SEL = 1
38	3179	figure "Timing of Parallel to Serial Conversion in Triple Speed Mode" corrected
38	3179	OUT_SEQ_SEL included in "Specifications of Serial RGB Output" table
38	3185	correction: "...every horizontal period." -> "...every vertical period."
38	3186	correction: "TCON_POLA_HS[10:0] + 1" -> "TCON_POLA_HS[10:0]"
38	3186	correction: "TCON_POLB_HS[10:0] + 1" -> "TCON_POLB_HS[10:0]"
38	3238	correction: "TCON_STH_HS[10:0] + 1" -> "TCON_STH_HS[10:0]"
38	3240	correction: "TCON_STB_HS[10:0] + 1" -> "TCON_STB_HS[10:0]"
38	3242	correction: "TCON_CPV_HS[10:0] + 1" -> "TCON_CPV_HS[10:0]"
38	3249	OUT_SEQ_SEL bit added to OUT_SET register
40	3276	"Restriction" added
40	3280	(max. horizontal/vertical size is 128) added
40	3290	"Completion signal failure" added in figure
40	3292	notes added concerning indices
40	3304	notes added to VOCAnMmCFG1 register’s bits descriptions
40	3306	note added concerning VOCA threshold
43	3384	initial values of SPEAnSkBYP corrected
45	3453	notice added concening index j format
45	3454	notice added concening index j format
45	3456	caution added concerning ADCEnVCRj setting
45	3457	caution added concerning ADCEnVCRj setting
45	3457	initial value of ADCEnTSNVCR register corrected
45	3458	notice added concening index j format
45	3459	notice added concening index j format
45	3474	ADCEnOWER.SGPR[18:0] bit description completed
45	3484	typo corrections in register description (ADCEnTSNSGSEFCRx -> ADCEnTSNSGSEFCR)
45	3504	correction: "As the trigger signal PVCR_TRG..." -> "If the trigger signal PVCR_TRG..."
45	3509	figure corrected
45	3520	1st usage note item ("To use the standby function, ...") removed
46	3610	ISMnEMU.ISMnSVDIS bit description improved
48	3625	initial settings for FACI and flash sequencer error sources No. 17, 18 corrected
52	3683	OTP description with regards to configuration clearing command corrected
52	3683	security setting options for D1M1A, D1M1-V2 corrected

Revision 2.20 History, Date Jan 26, 2018 (7/8)

Section	Page	Summary
52	3685	Hardware protection summary description modified
52	3696	note added concerning chip ID register module name in header files
52	3698	"Debug Interface" table added
52	3702	explanation added concerning masters for code flash access
52	3715	DFERRINT register's "Initial value" corrected
53	3727	LR1STEADRn register description corrected
53	3737	ECDEDFm, ECSEDFm clearing conditions rephrased
53	3738	ECOVFF clearing conditions rephrased
53	3738	ECER2C bit description corrected
54	3749	note 3 for INTECCSED of VRAM1 added
54	3758	note added concerning GPU2DTRCTL register module name in header files
54	3772	ECDEDFm, ECSEDFm clearing conditions rephrased
54	3773	ECOVFF clearing conditions rephrased
54	3775	VRAMnEADm register description corrected
55	3783	boundary scan instructions table corrected
56	3786	HYPB clock supplies corrected
56	3787	note added concerning support of dual-die-HyperRAM devices
56	3787	correction: HyperRAM -> HyperFlash/RAM
56	3787	correction: manual mode does not support write access to HyperRAM
56	3787	supported burst type added
56	3788	INT output removed from HyperBus Controller block diagram
56	3791	SSLDR register's initial value corrected
56	3791	SSLDR.SCKDL[2:0] bit description corrected
56	3791	SSLDR.SLNDL[2:0] bit description corrected
56	3792	DRCR.SSLN access type corrected (R -> W)
56	3792	DRCR.SSLN bit description corrected
56	3792	note in DRCR.SSLE bit description corrected
56	3795	correction: "sets the bit size of the command, optional command, address, option data, and read data" -> "sets the read data"
56	3796	SMCR.SPIE bit description corrected
56	3796	SMCR.SPIRE bit description corrected
56	3796	SMCR.SPIWE bit description corrected
56	3800	SMENR register description corrected
56	3802	SMRDR0 register description corrected
56	3803	SMRDR1 register description corrected
56	3809	SMDRENR.HYPE[2:0] bit description corrected
56	3810	access type for PHYCNT.WBUF bit corrected (R -> R/W)
56	3810	crossreference to write buffer section corrected in PHYCNT register description
56	3811	correction: "the serial flash memory and HyperBus to be connected" -> "the HyperBus to be connected"
56	3812	"Set the transfer data size in bit units." removed from initial setting flow figure
56	3813	correction: "SMWDR0 = 0x3900_0000" -> "SMWDR0 = 0x3800_0000"
56	3814	typo correction (HyperFlash -> HyperRAM)
56	3814	"SMDRENR = 0x0000_5111" added
56	3815	correction: "4 Kbyte boundary" -> "1 Kbyte boundary"

Revision 2.20 History, Date Jan 26, 2018 (8/8)

Section	Page	Summary
56	3815	correction: "serial flash memory" -> "HyperFlash/HyperRAM memory"
56	3819	table added
56	3820	"TEND Bit" description corrected
56	3820	correction: "F2FF 8800H to F2FF 8900H" -> "F2FF 8800H to F2FF 88FFH"
56	3821	"Is transfer completed?" check removed from flow diagram
57	3823	description of 2nd chip select for Octa memory interface added
57	3823	OctaBus chip select CS_1/MCS1 added
58	3879	"Separate remapping records tables for each device in the bank." removed
58	3879	note added to "Command queuing mechanism"
58	3883	CONTROL.AUTO_READ_STAT_EN bit description improved
58	3884	CONTROL.READ_STAT_EN bit description improved
58	3887	note added to STATUS.DATASIZE_ERROR_ST bit dscription
58	3892	ECC_CTRL.ECC_SEL[1:0] bits description improved
58	3893	ECC_STAT.ECC_ERROR_0 bit description improved
58	3893	ECC_STAT.ECC_OVER_0 bit description improved
58	3895	ECC_CNT.ERR_LVL[5:0] bit description improved
58	3901	BBM_CTRL.RMP_INIT bit description improved
58	3908	typo correction (read/buys -> read/busy)
58	3916	register name correction: "FIFO control register (FIFO_STATE)" -> "FIFO status control register (FIFO_STATE)"
58	3925	correction: "the second command code is encoded in the CMD_1 instruction field" -> "the second command code is encoded in the CMD_3 instruction field;"
58	3926	correction: "the second command code is encoded in the CMD_1 instruction field" -> "the second command code is encoded in the CMD_2 instruction field"
58	3926	figure corrected
58	3932	"TWO PLANE PAGE READ" instruction codes corrected
58	3943	"TWO PLANE PAGE READ" instruction codes corrected
58	3943	"QUEUE PAGE READ Instruction Encoding" corrected
58	3952	note added to diagram
58	3953	caution added to INT_STATUS.DMA_INT_FL description
58	3959	added recommendation concerning interrupt
58	3973	"Size of Correction Bytes" table corrected
