N3000 Series – Industrial M.2 PCIe SSD
240 GBytes up to 3840 GBytes

1. Product Summary

Capacities: 240 GBytes, 480 GBytes, 960 GBytes, 1920 GBytes, 3840 GBytes

Form Factor: PCI Express M.2 2242/2280 (42/80 mm x 22 mm x 3.8 mm)

Compliance[1]: PCI Express (PCIe) Base Specification Revision 4.0

Interface: Gen4 x 4 Lanes

- o Drive operates in x1 mode in x1 M.2 PCIe slots
- o Drive operates in x2 mode in x2 M.2 PCIe slots
- o Drive operates in x4 mode in x4 M.2 PCIe slots

Command Sets: Supports NVMe 1.4

Target Performance:

- o Read Performance: Sequential Read up to 3,850 MBytes/s, Random Read 4K up to 455,900 IOPS
- o Write Performance: Sequential Write up to 3,340 MBytes/s, Random Write 4K up to 505,200 IOPS

Operating Temperature Range[2]:

- o Industrial: –40 °C to 85 °C

Storage Temperature Range:

- o Industrial: –40 °C to 85 °C

Power:

- o Power States PS0, PS1, PS2, PS3 and PS4
- o Thermal Throttling supported

Data Retention[3]: 10 Years @ Life Begin; 1 Year @ Life End, @40 °C

Shock/Vibration: 1,500 g / 50 g

High-Performance Processor with Integrated, Parallel Flash Interface Engines:

- o Triple-Level Cell (TLC) 3D NAND Flash
- o DDR4 DRAM based Controller architecture
- o 240 bit LDPC correction per 2 KByte

High Reliability:

- o Mean Time Between Failure (MTBF): > 3,000,000 hours
- o Data Reliability: < 1 non-recoverable error per 10^{16} bits read

---

[1] To check the compatibility of the customer system and the storage device is part of the customer's responsibility. Swissbit can provide guidance and support on request.

[2] Adequate airflow is required to ensure the temperature, as reported in the S.M.A.R.T. data, does not exceed 110 °C (industrial temperature drive).

[3] NAND Flash suppliers refer to JEDEC JESD47 and JESD22 for Data Retention testing. Based on the information provided by the NAND Flash suppliers, Data Retention is targeted as shown.

2. Product Features

- Diagnostic features
- Life end read only mode
- RAID engine
- Drive self-test
- Data Care Management
  - Active: Adaptive Read Refresh
  - Passive: Background Media Scan
- Active State Power Management (ASPM) Support
- In-Field Firmware Update[4]
- Adaptive Thermal control
- DRAM-Buffer
- Self-Monitoring, Analysis, and Reporting Technology (S.M.A.R.T., Telemetry)
- SMBus[5] (NVMe Management Interface Basic Management Command, NVMe-MI v1.2)
- 30 µinch (0.8 µm) Gold-Plated Connector (IPC-6012C Class 2 Compliant)
- End-to-End (E2E) Data Protection
- Controlled "Locked" BOM
- RoHS / REACH Compliant
- Swissbit Device Manager Tool (SBDM)

3. Security features

- AES256 encryption
- TCG OPAL 2.0
- Secure Boot
- Crypto erase
- IEEE 1667

---

[4] The support of In-Field FW update capabilities on host systems is recommended.
[5] SMBus commands are not supported in PS4 power state.

5. Product Description

The Swissbit® N3000 Solid State Drive (SSD) leverages the M.2 standard and NVMe standard to support a PCIe electrical interface as well as AES encryption, E2E data protection and TCG Opal standards. The NVMe controller and the newest 3D NAND flash technology provides robust, non-volatile storage solution for today's embedded computing applications. A functional block diagram of the N3000 SSD is provided below in Figure 1.

Figure 1: N3000 Functional Block Diagram
The N3000 SSD incorporates a 75-position edge connector with M key to support host read/write, control, and power activity per the applicable JEDEC specification.

The on-board NVMe controller manages the interface between the host and the non-volatile NAND flash memory array. The controller is designed to support PCIe interface speeds and utilizes a dual processing core, providing an optimum balance between read/write performance, Data Care Management, and power fail protection.

Swissbit's N3000 SSDs deliver an impressive IOPS rate and highest endurance by combining 3D NAND flash technology with a high-end controller architecture, firmware, and an optimized configuration. The SSDs are designed for applications requiring high data transfer rates (see Table 5: Read/Write Performance 2280). This performance is achieved through a 4-channel flash controller and 4-lane PCIe interface.

An on-controller LDPC Error Correction Code (ECC) engine provides the N3000 hardware ECC, which is capable of correcting up to 240 bits per 2 KByte page. This engine, combined with Swissbit's Data Care Management firmware, provides both passive and active data management strategies to ensure data integrity and extract the maximum possible endurance and reliability from the NAND flash array. These strategies include, but are not limited to, Global Wear Leveling, Adaptive Read Refresh, and Dynamic Block Remapping.

5.1 Performance Specifications

The N3000 read/write sequential and random CDM performance benchmarks are detailed in Table 5.

Table 5: Read/Write Performance 2280[6]

Capacity	Sequential Read (MBPS)	Sequential Write (MBPS)	Random Read 4k (IOPS)	Random Write 4k (IOPS)
240 GBytes	3,650	1,480	108,300	177,500
480 GBytes	3,790	2,820	210,000	298,800
960 GBytes	3,850	3,340	392,800	457,000
1920 GBytes	3,790	3,330	455,900	394,300
3840 GBytes	3,210	2,850	429,200	505,200

5.2 Current Consumption

The drive-level current consumption as a function of operating mode is shown in Table 6.

Table 6: Current Consumption[7, 8, 9]

Capacity	Sequential Read	Sequential Write	Random Read 4k	Random Write 4k	Idle[10]	PS3[10]	PS4[10]	Unit
240 GBytes	1,150	910	740	930	49	9	1	mA
480 GBytes	1,180	1,230	870	1,150				
960 GBytes	1,210	1,470	1,090	1,290				
1920 GBytes	1,250	1,660	1,210	1,350				
3840 GBytes	1,250	1,250	1,200	1,100		12		

---

[6] The values are measured using Crystal Disk Mark 8 with a file size of 1GiB. Performance depends on flash type and number, file/cluster size, and burst speed.

[7] All values are typical total values recorded at 25 °C and 3.3V power supply

[8] Active values measured during burst workload using fio with QD=8 and threads=1 for 1MiB sequential read/write and QD=32 and threads=16 for 4kiB random read/write with file size = 1GiB.

[9] Active and idle based on highest averaged current peak over a 1s-window with a sample rate of 250kS/s. Peak based on highest averaged current peak over a 100us-window with a sample rate of 250kS/s.

[10] Measured with enabled ASPM L1.2

5.3 Environmental Specifications

5.3.1 Recommended Operating Conditions
The recommended operating conditions for the N3000 SSD are provided in Table 7.

Table 7: Recommended Operating Conditions[11]

Parameter	Value
Industrial Operating Temperature	–40 °C to 85 °C
Power Supply V_{CC} Voltage	3.3 V ± 5%

5.3.2 Recommended Storage Conditions
The recommended storage conditions are listed in Table 8.

Table 8: Recommended Storage Conditions

Parameter	Value
Industrial Storage Temperature	–40 °C to 85 °C

5.3.3 Shock, Vibration and Humidity
The maximum shock, vibration and humidity conditions are listed in Table 9.

Table 9: Shock, Vibration and Humidity

Parameter	Value
Non-Operating Shock	1,500 g, 0.5 ms pulse duration, half-sine wave (IEC 60068-2-27 and JESD22-B110 cond. B)
Non-Operating Vibration	50 g, 80-2,000 Hz, 3 axes, 12 cycles (IEC 60068-2-6, MIL-STD-883 H Method 2007.3)
Humidity (Non-Condensing)	85% RH 85 °C, 1000 hrs, max. supply voltage (JESD22-A101B)

---

[11] Adequate airflow is required to ensure the temperature, as reported in the S.M.A.R.T. data, does not exceed 110 °C (industrial temperature drive).

5.4 Regulatory Compliance

The N3000 devices comply with the regulations / standards listed in Table 10.

Table 10: Regulatory Compliance

Abbreviation	Regulation/ Standard
EMC	CE – 2014/30/EU FCC – 47 CFR Part 15 UKCA – S.I. 2016 No. 1091 and S.I. 2012 No. 3032
RoHS	2011/65/EU with 2015/863/EU and 2017/2102/EU
REACh	1907/2006/EU and 207/2011/EU
WEEE	2012/19/EU

5.5 Mechanical Specifications

Physical dimensions are detailed in Table 11. Figure 3 and Figure 4 on page 13 illustrates the N3000 dimensions.

Table 11: Physical Dimensions

Physical Dimensions		Unit
Length	42.00/80.00±0.15	mm
Width	22.00±0.15	
Thickness (nominal)	3.8	
Weight (Max Capacity)	≤ 9.0	g

5.6 Reliability and Endurance

The Mean Time Between Failure (MTBF) is specified to exceed the value listed in Table 12. Data reliability with effective error tolerance and data retention at the beginning and end of life is also provided.

Table 12: Reliability

Parameter	Value
MTBF (at 25 °C)	> 3,000,000 hours
Data Reliability	< 1 Non-Recoverable Error per 10^{16} Bits Read
Data Retention	10 Years at Start (JESD47), 1 Year at EOL

Endurance represented as both TeraBytes Written (TBW) and full Drive Writes Per Day (DWPD) for different application scenarios is provided in Table 13.

Table 13: Endurance[12, 13]

Capacity	Sequential		Client		Enterprise	
	TBW	DWPD[14]	TBW	DWPD[14]	TBW	DWPD[14]
240 GBytes	856	3.26	271	1.03	207	0.79
480 GBytes	1,684	3.20	503	0.96	379	0.72
960 GBytes	3,334	3.17	903	0.86	699	0.66
1920 GBytes	6,774	3.22	1,399	0.67	1,620	0.77
3840 GBytes	13,920	3.31	2,390	0.56	3,670	0.87

5.7 Drive Geometry Specification

The N3000 drive geometry is set to report industry standard LBA settings per the IDEMA standard (LBA1-03). The values for each capacity are shown in Table 14.

Table 14: Drive Geometry

Raw Capacity	User Capacity[15]	Total LBA	User Addressable Bytes
		Decimal	(Unformatted)
256 GBytes	240 GBytes	468,862,128	240,057,409,536
512 GBytes	480 GBytes	937,703,088	480,103,981,056
1024 GBytes	960 GBytes	1,875,385,008	960,197,124,096
2048 GBytes	1920 GBytes	3,750,748,848	1,920,383,410,176
4096 GBytes	3840 GBytes	7,501,476,528	3,840,755,982,336

---

[12] Client and Enterprise workloads follow the JEDEC JESD219 standard. Enterprise workload values are measured based on 240 hours of runtime. 1 TByte = 10^{12} bytes

[13] According to JEDEC (JESD47I), the time to write the full TBW is a minimum of 18 months. Higher average daily data volume reduces the specified TBW. The values listed are estimates and are subject to change without notice.

[14] DWPD values are based on a service life of 3 years.

[15] 1 GByte = 10^9 bytes

8. NVMe Commands

This section provides information on the NVMe commands supported by the SSD. The commands are issued by loading the DWords in the command block with the supplied parameter, and then writing the command code to the register. See the following Table 16 for a list of NVMe commands the device supports. For details about setting up the command registers, see the latest NVMe Specification.

Table 16: NVMe Command Set – Supported Commands

3072-4095	–	Vendor Specific (VS)

10. Health Monitoring Functionality

The N3000 SSDs support Self-Monitoring, Analysis, and Reporting Technology. The SSD supports log information as defined in the NVMe specification.

See the following table for the 512-byte data structure of the SMART/Health Information log page:

Table 21: SMART/Health Information (Log Identifier 02h)

Byte(s)	Description
0	Critical warning: for the state of the controller • Bit 0: If set to '1', then the available spare capacity has fallen below the threshold • Bit 1: If set to '1', then a temperature is greater than or equal to an over temperature threshold; or less than or equal to an under temperature threshold • Bit 2: If set to '1', then the NVM subsystem reliability has been degraded due to significant media related errors or any internal error that degrades NVM subsystem reliability. • Bit 3: If set to '1', then all of the media has been placed in read only mode
1-2	Composite Temperature: in degrees Kelvin
3	Available Spare: as a percentage of remaining spare capacity
4	Available Spare Threshold
5	Percentage Used: Estimate of the percentage of the NVM subsystem life left based on usage
6-31	Reserved
32-47	Data Units Read: Number of 512-byte sectors read by the host (in 1000 increments)
48-63	Data Units Written: Number of 512-byte sectors written by the host (in 1000 increments)
64-79	Host Read Commands: Number of Read commands completed by the controller
80-95	Host Write Commands: Number of Write commands completed by the controller
96-111	Controller Busy Time: Amount of time, in minutes, the controller was busy with I/0 commands
112-127	Power Cycles: Number of power cycles that has occurred over the life of the drive
128-143	Power On Hours: Number of hours the device has been powered over the life of the drive (does not include the time the device is in low power state conditions)
144-159	Unsafe Shutdowns: Number of shutdowns that occurred without a shutdown notification
160-175	Media and Data Integrity Errors: Number of unrecoverable errors, including UECC, CRC checksum failures, and LBA mismatches, that occurred over the life of the drive
176-191	Number of Error Information Log Entries: Number of entries recorded in the Error Information log over the life of the drive
192-195	Warning Composite Temperature Time: Amount of time, in minutes, the controller was operational and the Composite Temperature was equal to or greater than the Warning Composite Temperature Threshold (WCTEMP) but less than the Critical Composite Temperature Threshold (CCTEMP)
196-199	Critical Composite Temperature Time: Amount of time, in minutes, the controller was operational and the Composite Temperature was equal to or greater than the Critical Composite Temperature Threshold (CCTEMP)
200-201	Temperature Sensor 1: Current controller Tjunction temperature, in degrees Kelvin
202-203	Temperature Sensor 2: Current composite temperature, in degrees Kelvin
204-205	Temperature Sensor 3: Current maximum NAND temperature, in degrees Kelvin
206-215	Not used

| 216-219	Thermal Management Temperature 1 Transition Count: number of times the controller transitioned to lower power active power states or performed vendor specific thermal management actions while minimizing the impact on performance
220-223	Thermal Management Temperature 2 Transition Count: number of times the controller transitioned to lower power active power states or performed vendor specific thermal management actions regardless of the impact on performance
224-227	Total Time For Thermal Management Temperature 1: number of seconds that the controller had transitioned to lower power active power states or performed vendor specific thermal management actions while minimizing the impact on performance
228-231	Total Time For Thermal Management Temperature 2: number of seconds that the controller had transitioned to lower power active power states or performed vendor specific thermal management actions regardless of the impact on performance
232-511	Reserved

The following data structure is applied to both Telemetry Host-Initiated log and Telemetry Controller-Initiated log:

Table 22: Telemetry Log (Log Identifier 07h)

Byte(s)	Description
Telemetry Header	
0	Log Identifier: This field shall be 07h
1-4	Reserved
5-7	IEEE OUI Identifier (IEEE)
4	Telemetry Host-Initiated Data Area 1 Last Block: This field shall be 0001h
10-381	Reserved
382	Telemetry Controller-Initiated Data Available
383	Telemetry Controller-Initiated Data Generation Number
384-511	Reserved
Telemetry Data Block 1	
528-529	Minimum Temperature, in degrees Kelvin
530-531	Current Temperature, in degrees Kelvin
532-533	Maximum Temperature, in degrees Kelvin
560-561	Number of valid spare blocks
562-563	Number of initial spare blocks
564-565	Run Time Bad Block Count
596-599	Maximum Erase Count on system blocks
604-607	Average Erase Count on system blocks
612-615	Maximum Erase Count on data storage blocks
620-623	Average Erase Count on data storage blocks
624-627	Rated Erase Count on system blocks
636-639	Rated Erase Count on data storage blocks
640	Remaining Life Percentage on system blocks based on P/E
641	Remaining Life Percentage based on spare blocks
646	Remaining Life Percentage on data storage blocks based on P/E
647	Cap Health Status
