

General Description

PSoC® is a scalable and reconfigurable platform architecture for a family of programmable embedded system controllers with ARM® Cortex™ CPUs (single and multi-core). The PSoC 6 product family, based on an ultra low-power 40-nm platform, is a combination of a dual-core microcontroller with low-power Flash technology and digital programmable logic, high-performance analog-to-digital and digital-to-analog conversion, low-power comparators, and standard communication and timing peripherals.

Features

32-bit Dual Core CPU Subsystem

- 150-MHz ARM Cortex-M4F CPU with single-cycle multiply (Floating Point and Memory Protection Unit)
- 100-MHz Cortex M0+ CPU with single-cycle multiply and MPU
- User-selectable core logic operation at either 1.1 V or 0.9 V
- Inter-processor communication supported in hardware
- 8 KB 4-way set-associative Instruction Caches for the M4 and M0+ CPUs respectively
- Active CPU power consumption slope with 1.1-V core operation for the Cortex M4 is 40 μ A/MHz and 20 μ A/MHz for the Cortex M0+, both at 3.3-V chip supply voltage with the internal buck regulator
- Active CPU power consumption slope with 0.9-V core operation for the Cortex M4 is 22 μ A/MHz and 15 μ A/MHz for the Cortex M0+, both at 3.3-V chip supply voltage with the internal buck regulator
- Two DMA controllers with 16 channels each

Flexible Memory Subsystem

- 1 MB Application Flash with 32-KB EEPROM area and 32-KB Secure Flash
- 128-bit wide Flash accesses reduce power
- SRAM with Selectable Retention Granularity
- 288-KB integrated SRAM
- 32-KB retention boundaries (can retain 32K to 288K in 32K increments)
- One-Time-Programmable (OTP) E-Fuse memory for validation and security

Low-Power 1.7-V to 3.6-V Operation

- Active, Low-power Active, Sleep, Low-power Sleep, Deep Sleep, and Hibernate modes for fine-grained power management
- Deep Sleep mode current with 64K SRAM retention is 7 μ A with 3.3 V external supply and internal buck
- On-chip Single-In Multiple Out (SIMO) DC-DC Buck converter, <1 μ A quiescent current
- Backup domain with 64 bytes of memory and Real-Time-Clock

Flexible Clocking Options

- On-chip crystal oscillators (High-speed, 4 to 33 MHz, and Watch crystal, 32 kHz)
- Phase-locked Loop (PLL) for multiplying clock frequencies
- 8 MHz Internal Main Oscillator (IMO) with $\pm 2\%$ accuracy
- Ultra low-power 32-kHz Internal Low-speed Oscillator (ILO) with $\pm 10\%$ accuracy
- Frequency Locked Loop (FLL) for multiplying IMO frequency

Serial Communication

- Nine independent run-time reconfigurable serial communication blocks (SCBs), each is software configurable as I²C, SPI, or UART
- USB Full-Speed Dual-role Host and Device interface

Timing and Pulse-Width Modulation

- Thirty-two Timer/Counter Pulse-Width Modulator (TCPWM) blocks
- Center-aligned, Edge, and Pseudo-random modes
- Comparator-based triggering of Kill signals

Up to 104 Programmable GPIOs

- Drive modes, strengths, and slew rates are programmable
- Six overvoltage tolerant (OVT) pins

Packages

- 124-BGA (Qualification in process)
- 80-WLCSP (in 0.33 and 0.43 mm heights)

Audio Subsystem

- I2S Interface; up to 192 kilosamples Word Clock
- Two PDM channels for stereo digital microphones

QSPI Interface

- Execute-In-Place (XIP) from external Quad SPI Flash
- On-the-fly encryption and decryption
- 4 KB QSPI cache for greater XIP performance with lower power
- Supports 1, 2, 4, and Dual-Quad interfaces

Errata: For information on silicon errata, see "Errata" on page 62. Details include trigger conditions, devices affected, and proposed workaround.

Programmable Analog

- 12-bit 1 Msps SAR ADC with differential and single-ended modes and 16-Channel Sequencer with signal averaging
- One 12-bit voltage mode DAC with < 5-μs settling time
- Two opamps with low-power operation modes
- Two low-power comparators that operate in Deep Sleep and Hibernate modes.
- Built-in temp sensor connected to ADC

Programmable Digital

- 12 programmable logic blocks, each with 8 Macrocells and an 8-bit data path (called universal digital blocks or UDBs)
- Usable as drag-and-drop Boolean primitives (gates, registers), or as Verilog programmable blocks
- Cypress-provided peripheral component library using UDBs with common functions such as SDIO, Communication Peripherals such as LIN, UART, SPI, I2C, S/PDIF, Waveform Generator, Pseudo-Random Sequence (PRS) generation, and many other functions.
- Smart I/O (Programmable I/O) blocks enable Boolean operations on signals coming from, and going to, GPIO pins
- Two ports with Smart_IO blocks, capability are provided; these are available during Deep Sleep

Capacitive Sensing

- Cypress Capacitive Sigma-Delta (CSD) provides best-in-class SNR, liquid tolerance, and proximity sensing
- Mutual Capacitance sensing (Cypress CSX) with dynamic usage of both Self and Mutual sensing
- Wake on Touch with very low current
- Cypress-supplied software component makes capacitive sensing design fast and easy
- Automatic hardware tuning (SmartSense™)

Energy Profiler

- Block that provides history of time spent in different power modes
- Allows software energy profiling to observe and optimize energy consumption

PSoC Creator Design Environment

- Integrated Development Environment provides schematic design entry and build (with analog and digital automatic routing) and code development and debugging
- Applications Programming Interface (API Component) for all fixed-function and programmable peripherals

Industry-Standard Tool Compatibility

- After schematic entry, development can be done with ARM-based industry-standard development tools
- Configure in PSoC Creator and export to ARM/Keil or IAR IDEs for code development and debugging
- Supports industry standard ARM Trace Emulation Trace Module

Security Built into Platform Architecture

- Multi-faceted secure architecture based on ROM-based root of trust
- Secure Boot uninterruptible until system protection attributes are established
- Authentication during boot using hardware hashing
- Step-wise authentication of execution images
- Secure execution of code in execute-only mode for protected routines
- All Debug and Test ingress paths can be disabled

Cryptography Accelerators

- Hardware acceleration for Symmetric and Asymmetric cryptographic methods (AES, 3DES, RSA, and ECC) and Hash functions (SHA-512, SHA-256)
- True Random Number Generator (TRNG) function

PSoC Creator

[PSoC Creator](#) is a free Windows-based Integrated Design Environment (IDE). It enables you to design hardware and firmware systems concurrently, based on PSoC 6 MCU. As shown below, with PSoC Creator, you can:

1. Explore the library of 200+ Components in PSoC Creator
2. Drag and drop Component icons to complete your hardware system design in the main design workspace
3. Configure Components using the Component Configuration Tools and the Component datasheets
4. Co-design your application firmware and hardware in the PSoC Creator IDE or build project for 3rd party IDE
5. Prototype your solution with the PSoC 6 Pioneer Kits. If a design change is needed, PSoC Creator and Components enable you to make changes on the fly without the need for hardware revisions.

Functional Definition

CPU and Memory Subsystem

CPU

The CPU subsystem in the PSoC 61 consists of two ARM Cortex cores and their associated busses and memories: M4 with Floating-point unit and Memory Protection Units (FPU and MPU) and an M0+ with an MPU. The Cortex M4 and M0+ have 8-KB Instruction Caches (I-Cache) with 4-way set associativity. This subsystem also includes independent DMA controllers with 32 channels each, a Cryptographic accelerator block, 1 MB of on-chip Flash, 288 KB of SRAM, and 128 KB of ROM. The Cortex M0+ provides a secure, un-interruptible Boot function. This guarantees that post-Boot, system integrity is checked and privileges enforced. Shared resources can be accessed through the normal ARM multi-layer bus arbitration and exclusive accesses are supported by an Inter-Processor Communication (IPC) scheme, which implements hardware semaphores and protection. Active power consumption for the Cortex M4 is 26 μ A/MHz and 17 μ A/MHz for the Cortex M0+, both at 3V chip supply voltage with the internal buck enabled and at 0.9V internal supply.

DMA Controllers

There are two DMA controllers with 16 channels each. They support independent accesses to peripherals using the AHB Multi-layer bus.

Flash

The PSoC 6 A-M has a 1-MB flash module with additional 32K of Flash that can be used for EEPROM emulation for longer retention and a separate 32-KB block of Flash that can be securely locked and is only accessible via a key lock that cannot be changed (One Time Programmable). The Flash block supports Read-While-Write (RWW) operation so that Flash updates may be performed while the CPU is active.

SRAM with 32-KB Retention Granularity

There is 288 KB of SRAM memory, which can be fully retained or retained in increments of user-designated 32-KB blocks.

SROM

There is a supervisory 128-KB ROM that contains boot and configuration routines. This ROM will guarantee Secure Boot if authentication of User Flash is required.

One-Time-Programmable (OTP) eFuse

The 1024-bit OTP memory can provide a unique and unalterable Identifier on a per-chip basis. This unalterable key can be used to access Secured Flash.

System Resources

Power System

The power system provides assurance that voltage levels are as required for each respective mode and will either delay mode entry (on power-on reset (POR) . . . , for example) until voltage levels are as required for proper function or generate resets (Brown-Out Detect (BOD)) when the power supply drops below specified levels. The design will guaranteed safe chip operation between power supply voltage dropping below specified levels (for example, below 1.7 V) and the Reset occurring. There are no voltage sequencing requirements. The VDD core logic supply (1.7 to 3.6 V) will feed an on-chip buck, which will produce the core logic supply of either 1.1 V or 0.9 V selectable. Depending on the frequency of operation, the buck converter will have a quiescent current of <1 μ A. A separate power domain called Backup is provided; note this is not a power mode. This domain is powered from the VBACKUP domain and includes the 32-kHz WCO, RTC, and backup registers. It is connected to VDD when not used as a backup domain. Port 0 is powered from this supply. Pin 5 of Port 0 (P0.5) can be assigned as a PMIC wakeup output (timed by the RTC); P0.5 is driven to resistive pullup mode by default.

Clock System

The PSoC 61 clock system is responsible for providing clocks to all subsystems that require clocks and for switching between different clock sources without glitching. In addition, the clock system ensures that no metastable conditions occur.

The clock system for PSoC 61 consists of the Internal Main Oscillator (IMO) and the Internal Low-speed Oscillator (ILO), crystal oscillators (ECO and WCO), PLL, FLL, and provision for an external clock. An FLL will provide fast wake-up at high clock speeds without waiting for a PLL lock event (which can take up to 50 μ s). Clocks may be buffered and brought out to a pin on a Smart I/O port.

The 32-kHz oscillator is trimmable to within 2 ppm using a higher accuracy clock. The ECO will deliver ± 20 -ppm accuracy and will use an external crystal.

IMO Clock Source

The IMO is the primary source of internal clocking in PSoC 61. It is trimmed during testing to achieve the specified accuracy. The IMO default frequency is 8 MHz. IMO tolerance is $\pm 2\%$ and its current consumption is less than 10 μ A.

ILO Clock Source

The ILO is a very low power oscillator, nominally 32 kHz, which may be used to generate clocks for peripheral operation in Deep Sleep mode. ILO-driven counters can be calibrated to the IMO to improve accuracy. Cypress provides a software component, which does the calibration.

Watchdog Timer

A watchdog timer is implemented in the clock block running from the ILO or from the WCO; this allows watchdog operation during Deep Sleep and generates a watchdog reset if not serviced before the timeout occurs. The watchdog reset is recorded in the Reset Cause register.

Clock Dividers

Integer and Fractional clock dividers are provided for peripheral use and timing purposes. The clock dividers are 16 and 24 bits in length to allow very fine clock control.

Reset

The PSoC 61 can be reset from a variety of sources including a software reset. Reset events are asynchronous and guarantee reversion to a known state. The reset cause is recorded in a register, which is sticky through reset and allows software to determine the cause of the Reset. An XRES pin is reserved for external reset to avoid complications with configuration and multiple pin functions during power-on or reconfiguration.

Analog Blocks

12-bit SAR ADC

The 12-bit, 1-Msps SAR ADC can operate at a maximum clock rate of 18 MHz and requires a minimum of 18 clocks at that frequency to do a 12-bit conversion.

The block functionality is augmented for the user by adding a reference buffer to it (trimmable to $\pm 1\%$) and by providing the choice of three internal voltage references, V_{DD} , $V_{DD}/2$, and V_{REF} (nominally 1.024 V), as well as an external reference through a GPIO pin. The Sample-and-Hold (S/H) aperture is programmable; it allows the gain bandwidth requirements of the amplifier driving the SAR inputs, which determine its settling time, to be relaxed if required. System performance will be 65 dB for true 12-bit precision provided appropriate references are used and system noise levels permit it. To improve the performance in noisy conditions, it is possible to provide an external bypass (through a fixed pin location) for the internal reference amplifier.

The SAR is connected to a fixed set of pins through an 8-input sequencer. The sequencer cycles through the selected channels autonomously (sequencer scan) and does so with zero switching overhead (that is, the aggregate sampling bandwidth is equal to 1 Msps whether it is for a single channel or distributed over several channels). The sequencer switching is effected through a state machine or through firmware-driven switching. A feature provided by the sequencer is the buffering of each channel to reduce CPU interrupt-service requirements. To accommodate signals with varying source impedances and frequencies, it is possible to have different sample times programmable for each channel. Also, the signal range specification through a pair of range registers (low and high range values) is implemented with a corresponding out-of-range interrupt if the digitized value exceeds the programmed range; this allows fast detection of out-of-range values without having to wait for a sequencer scan to be completed and the CPU to read the values and check for out-of-range values in software.

The SAR is able to digitize the output of the on-chip temperature sensor for calibration and other temperature-dependent functions. The SAR is not available in Deep Sleep and Hibernate modes as it requires a high-speed clock (up to 18 MHz). The SAR operating range is 1.71 to 3.6 V.

Temperature Sensor

PSoC 61 has an on-chip temperature sensor. This consists of a diode, which is biased by a current source that can be disabled to save power. The temperature sensor is connected to the ADC, which digitizes the reading and produces a temperature value by using a Cypress-supplied software that includes calibration and linearization.

12-bit Digital-Analog Converter

There is a 12-bit voltage mode DAC on the chip, which can settle in less than 5 μ s. The DAC may be driven by the DMA controllers to generate user-defined waveforms. The DAC output from the chip can either be the resistive ladder output (highly linear near ground) or a buffered output.

Continuous Time Block (CTBm) with Two Opamps

This block consists of two opamps, which have their inputs and outputs connected to fixed pins and have three power modes and a comparator mode. The outputs of these opamps can be used as buffers for the SAR inputs. The non-inverting inputs of these opamps can be connected to either of two pins, thus allowing independent sensors to be used at different times. The pin selection can be made via firmware. The opamps can be set to one of the four power levels; the lowest level allowing operation in Deep Sleep mode in order to preserve lower performance Continuous-Time functionality in Deep Sleep mode. The DAC output can be buffered through an opamp.

Low-Power Comparators

PSoC 61 has a pair of low-power comparators, which can also operate in Deep Sleep and Hibernate modes. This allows the analog system blocks to be disabled while retaining the ability to monitor external voltage levels during Deep Sleep and Hibernate modes. The comparator outputs are normally synchronized to avoid metastability unless operating in an asynchronous power mode (Hibernate) where the system wake-up circuit is activated by a comparator-switch event.

Programmable Digital

Smart I/O

There are two Smart I/O blocks, which allow Boolean operations on signals going to the GPIO pins from the subsystems of the chip or on signals coming into the chip. Operation can be synchronous or asynchronous and the blocks operate in low-power modes, such as Deep Sleep and Hibernate. This allows, for example, detection of logic conditions that can indicate that the CPU should wake up instead of waking up on general I/O interrupts, which consume more power and can generate spurious wake-ups.

Universal Digital Blocks (UDBs) and Port Interfaces

The PSoC6 has 12 UDBs; the UDB array also provides a switched Digital System Interconnect (DSI) fabric that allows signals from peripherals and ports to be routed to and through the UDBs for communication and control.

Fixed-Function Digital

Timer/Counter/PWM Block

The timer/counter/PWM block consists of 32 counters with user-programmable period length. There is a Capture register to record the count value at the time of an event (which may be an I/O event), a period register which is used to either stop or auto-reload the counter when its count is equal to the period register, and compare registers to generate compare value signals which are used as PWM duty cycle outputs. The block also provides true and complementary outputs with programmable offset between them to allow the use as deadband programmable complementary PWM outputs. It also has a Kill input to force outputs to a predetermined state; for example, this is used in motor-drive systems when an overcurrent state is indicated and the PWMs driving the FETs need to be shut off immediately with no time for software intervention. There are 8 32-bit counters and 24 16-bit counters.

Serial Communication Blocks (SCB)

PSoC 61 has nine SCBs, which can each implement an I²C, UART, or SPI interface. One SCB will operate in Deep Sleep with an external clock, this SCB will only operate in Slave mode (requires external clock).

I²C Mode: The hardware I²C block implements a full multi-master and slave interface (it is capable of multimaster arbitration). This block is capable of operating at speeds of up to 1 Mbps (Fast Mode Plus) and has flexible buffering options to reduce the interrupt overhead and latency for the CPU. It also supports EzI²C that creates a mailbox address range in the memory of PSoC 61 and effectively reduces the I²C communication to reading from and writing to an array in the memory. In addition, the block supports an 8-deep FIFO for receive and transmit, which, by increasing the time given for the CPU to read the data, greatly reduces the need for clock stretching caused by the CPU not having read the data on time. The FIFO mode is available in all channels and is very useful in the absence of DMA.

The I²C peripheral is compatible with I²C Standard-mode, Fast-mode, and Fast-Mode Plus devices as defined in the NXP I²C-bus specification and user manual (UM10204). The I²C bus I/O is implemented with GPIO in open-drain modes.

UART Mode: This is a full-feature UART operating at up to 1 Mbps. It supports automotive single-wire interface (LIN), infrared interface (IrDA), and SmartCard (ISO7816) protocols, all of which are minor variants of the basic UART protocol. In addition, it supports the 9-bit multiprocessor mode that allows the addressing of peripherals connected over common RX and TX lines. Common UART functions such as parity error, break detect, and frame error are supported. An 8-deep FIFO allows much greater CPU service latencies to be tolerated.

SPI Mode: The SPI mode supports full Motorola SPI, TI Secure Simple Pairing (SSP) (essentially adds a start pulse that is used to synchronize SPI Codecs), and National Microwire (half-duplex form of SPI). The SPI block can use the FIFO and supports an EzSPI mode in which the data interchange is reduced to reading and writing an array in memory. The SPI interface will operate with a 48-MHz SPI Clock.

USB Full-Speed Dual Role Host and Device interface

The PSoC6 incorporates a dual-role USB Host and Device interface. The device can have up to eight endpoints. A 512-byte SRAM buffer is provided and DMA is supported.

QSPI Interface

A Quad SPI (QSPI) interface (selectable 1, 2, or 4 bits width) is provided running at 80 MHz. This block also supports on-the-fly encryption and decryption to support Execute-In-Place operation at reasonable speeds.

GPIO

PSoC 61 has up to 104 GPIOs. The GPIO block implements the following:

- Eight drive strength modes:
 - Analog input mode (input and output buffers disabled)
 - Input only
 - Weak pull-up with strong pull-down
 - Strong pull-up with weak pull-down
 - Open drain with strong pull-down
 - Open drain with strong pull-up
 - Strong pull-up with strong pull-down
 - Weak pull-up with weak pull-down
- Input threshold select (CMOS or LVTTTL)
- Hold mode for latching previous state (used for retaining the I/O state in Deep Sleep and Hibernate modes)
- Selectable slew rates for dV/dt-related noise control to improve EMI

The pins are organized in logical entities called ports, which are 8-bit in width. During power-on and reset, the blocks are forced to the disable state so as not to crowbar any inputs and/or cause excess turn-on current. A multiplexing network known as a high-speed I/O matrix (HSIOM) is used to multiplex between various signals that may connect to an I/O pin. Data output and pin state registers store, respectively, the values to be driven on the pins and the states of the pins themselves.

Every I/O pin can generate an interrupt if so enabled and each I/O port has an interrupt request (IRQ) and interrupt service routine (ISR) vector associated with it. Six GPIO pins are capable of overvoltage tolerant (OVT) operation where the input voltage may be higher than VDD (these may be used for I²C functionality to allow powering the chip off while maintaining physical connection to an operating I²C bus without affecting its functionality).

GPIO pins can be ganged to sink 16 mA or higher values of sink current. GPIO pins may not be pulled up higher than 3.6 V.

Special-Function Peripherals

CapSense

CapSense is supported on all pins in the PSoC 61 through a CapSense Sigma-Delta (CSD) block that can be connected to an analog multiplexed bus. Any GPIO pin can be connected to this AMUX bus through an analog switch. CapSense function can thus be provided on any pin or a group of pins in a system under software control. Cypress provides a software component for the CapSense block for ease-of-use.

Shield voltage can be driven on another mux bus to provide water-tolerance capability. Water tolerance is provided by driving the shield electrode in phase with the sense electrode to keep the shield capacitance from attenuating the sensed input. Proximity sensing can also be implemented.

The CapSense block is an advanced, low-noise, programmable block with programmable voltage references and current source ranges for improved sensitivity and flexibility. It can also use an external reference voltage. It has a full-wave CSD mode that alternates sensing to VDDA and ground to null out power-supply related noise.

The CapSense block has two 7-bit IDACs, which can be used for general purposes if CapSense is not being used (both IDACs are available in that case) or if CapSense is used without water tolerance (one IDAC is available). A (slow) 10-bit Slope ADC may be realized by using one of the IDACs.

The block can implement Swipe, Tap, Wake-up on Touch (< 3 μ A at 1.8 V), mutual capacitance, and other types of sensing functions.

Audio Subsystem

This subsystem consists of an I2S block and two PDM channels. The PDM channels interface to a PDM microphone's bit-stream output. The PDM processing channel provides droop correction and can operate with clock speeds ranging from 384 kHz to 3.072 MHz and produce word lengths of 16 to 24 bits at audio sample rates of up to 48 ksps.

The I2S interface supports both Master and Slave modes with Word Clock rates of up to 192 Ksps (8-bit to 32-bit words).

The correspondence of power supplies to ports by package type is as follows:

- P0: VBACKUP
- P1: VDDD. Port 1 GPIO Pins are Over-Voltage Tolerant (OVT).
- P2, P3, P4: VDDIOR
- P5, P6, P7, P8: VDDIO1
- P9, P10: VDDIO, VDDA (VDDIO and VDDA must be connected together on the PCB)
- P11, P12, P13: VDDIO0
- P14: VDDUSB

Each Port Pin has multiple alternate functions. These are defined in [Table 2](#).

Power

The power system diagram (see [Figure 3](#)) shows the general requirements for power pins on the PSoC 61. The PSoC 6 BLE power scheme allows different VDDIO and VDDA connections. Since no sequencing requirements need to be analyzed and specified, customers may bring up the power supplies in any order and the power system is responsible for ensuring power is good in all domains before allowing operation. VDDD, VDDA, and VDDIO may be separate nets, which are not ohmically connected on chip. Depending on different package requirements, these may be required to be connected off chip.

The power system will have a buck regulator in addition to an LDO. A Single Input Multiple Output (SIMO) Buck regulator with multiple outputs allows saving an inductor.

The preliminary diagram is shown in [Figure 3](#).

Figure 3. SOC Power Connections

[Figure 3](#) shows the power supply pins to the PSoC 61. It also shows which pins need bypass capacitors.

Description of power pins is as follows:

1. VBACKUP is the supply to the backup domain. The backup domain includes the 32 kHz WCO, RTC, and backup registers. It can generate a wake-up interrupt to the chip via the RTC timers or an external input. It can also generate an output to wakeup external circuitry. It is connected to VDDD when not used as a separate battery backup domain. VBACKUP provides the supply for Port 0.
2. VDDD is the main digital supply input (1.7 to 3.6 V). It provides the inputs for the internal Regulators and for Port 1.
3. VDDA is the supply for analog peripherals (1.7 to 3.6 V). It must be connected to VDDIOA on the PCB.
4. VDDIOA is the supply to for Ports 9 and 10. It must be connected to VDDA on the PCB when present. Ports 9 and 10 are supplied by VDDA when VDDIOA is not present.

5. VDD_NS is the supply input to the Buck and should be at the same potential as VDDD. The bypass capacitor between VDD_NS and ground should be 10 μ F.
6. VDDIO0 is the Supply for Ports 11 to 13 when present. When not present, these ports are supplied by VDDD.
7. VDDIO1 is the Supply for Ports 5 to 8 when present. When not present, these ports are supplied by VDDA.
8. VDDIOR is the Supply for Ports 2 to 4 on the BGA 124 only.

All the pins above may be shorted to VDDD as shown in [Figure 3](#).

9. VRF is the second output of the SIMO buck.
10. VBUCK1 is the SIMO buck output to the internal core logic and is to be connected to VCCD.
11. VCCD is the internal core logic and needs to be connected to VBUCK1 and decoupled.

The supply voltage range is 1.71 to 3.6 V with all functions and circuits operating over that range. All grounds must be shorted together on the PCB. Bypass capacitors must be used from VDDD and VDDA to ground and wherever indicated in the diagram. Typical practice for systems in this frequency range is to use a capacitor in the 10- μ F range in parallel with a smaller capacitor (0.1 μ F, for example). Note that these are simply rules of thumb and that, for critical applications, the PCB layout, lead inductance, and the bypass capacitor parasitic should be

simulated to design and obtain optimal bypassing. Recommended Buck output capacitor values are 10 μ F for V_{rf} and 4.7 μ F for VBUCK1. The capacitor connected to V_{ind2} should be 100 nF. All capacitors should be $\pm 20\%$ or better; the recommended inductor value is 2.2 μ H $\pm 20\%$ (for example, TDK MLP2012H2R2MT0S1).

Development Support

The PSoC 61 family has a rich set of documentation, development tools, and online resources to assist you during your development process. Visit <http://www.cypress.com/products/32-bit-arm-cortex-m4-psoc-6> to find out more.

Documentation

A suite of documentation supports the PSoC 61 family to ensure that you can find answers to your questions quickly. This section contains a list of some of the key documents.

Software User Guide: A step-by-step guide for using PSoC Creator. The software user guide shows you how the PSoC Creator build process works in detail, how to use source control with PSoC Creator, and much more.

Component Datasheets: The flexibility of PSoC allows the creation of new peripherals (Components) long after the device has gone into production. Component datasheets provide all of the information needed to select and use a particular Component, including a functional description, API documentation, example code, and AC/DC specifications.

Technical Reference Manual: The Technical Reference Manual (TRM) contains all the technical detail you need to use a PSoC device, including a complete description of all PSoC registers. The TRM is available in the Documentation section at <http://www.cypress.com/products/32-bit-arm-cortex-m4-psoc-6>.

Online

In addition to print documentation, the Cypress PSoC forums connect you with fellow PSoC users and experts in PSoC from around the world, 24 hours a day, 7 days a week.

Tools

With industry standard cores, programming, and debugging interfaces, the PSoC 61 family is part of a development tool ecosystem. Visit us at www.cypress.com/products/psoc-creator-integrated-design-environment-ide for the latest information on the revolutionary, easy to use PSoC Creator IDE, supported third party compilers, programmers, debuggers, and development kits.

SID7F	V _{DDUSB}	Supply for Port 14 (USB or GPIO) when present	1.7	–	3.6	V	Min supply is 2.85 V for USB
SID6B	V _{BACKUP}	Backup Power and GPIO Port 0 supply when present	1.7	–	3.6	V	Min. is 1.4 V in Backup mode

Note

- Usage above the absolute maximum conditions listed in Table 4 may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods of time may affect device reliability. The maximum storage temperature is 150 °C in compliance with JEDEC Standard JESD22-A103, High Temperature Storage Life. When used below absolute maximum conditions but above normal operating conditions, the device may not operate to specification.

Notes

- Cypress-supplied software wakeup routines take approximately 180 CPU clock cycles after hardware wakeup (the 25 μs) before transition to Application code. With an 8-MHz CPU clock (LP Active), the time before user code executes is 25 + 22.5 = 47.5 μs.
- Cypress-supplied software wakeup routines take approximately 180 CPU clock cycles after hardware wakeup (the 25 μs) before transition to Application code. With a 25-MHz CPU clock (FLL), the time before user code executes is 25 + 7.2 = 32.2 μs. With a 100-MHz CPU clock, the time is 25 + 1.8 = 26.8 μs.

Note

- It can take as much as 16 milliseconds to write to flash. During this time, the device should not be reset, or flash operations will be interrupted and cannot be relied on to have completed. Reset sources include the XRES pin, software resets, CPU lockup states and privilege violations, improper power supply levels, and watchdogs. Make certain that these are not inadvertently activated.

PSoC 6X Errata Summary: Devices with names on package markings ending in ES and ES3 have different sets of errata.

This table defines the errata applicability to PS0C6XX-ES devices.

Items	CY8C6XX	Silicon Revision	Fix Status
[1]. 124 BGA: SIMO Buck operation at VDDD input voltage >2.7 V.	All	Rev. *A	Silicon fix planned in next silicon. Current sample date is Q1 2018.
[2]. UDB Deep Sleep Retention.	All	Rev. *A	Silicon fix planned in next silicon. Current sample date is Q1 2018.
[3]. 116 BGA: HBM ESD Rating.	All	Rev. *A	Silicon fix planned in next silicon. Current sample date is Q1 2018.
[4]. Flash Read-While-Write (RWW) feature does not work.	All	Rev. *A	Silicon fix planned in next silicon. Current sample date is Q2 2018.
[5]. Flash RWW feature requires blocking for 1 ms when Writes to the Emulated EEPROM Sector (32 KB Sector) are done.	All	Rev. *A	Silicon fix planned in next silicon. Current sample date is Q1 2018.
[6]. CMAC-based authentication of Boot Flash code in Supervisory Flash can be spoofed.	All	Rev. *A	Silicon fix planned in next silicon. Current sample date is Q1 2018.
[7]. Protection Context (PC) is not restored properly in system calls that inherit the Client's PC. (Note that Cypress-provided API calls already have workarounds for this error)	All	Rev. *A	Silicon fix planned in next silicon. Current sample date is Q1 2018.
[8]. Hard Fault results if two system calls occur simultaneously and the first system call inherits a non-zero Context.	All	Rev. *A	Silicon fix planned in next silicon. Current sample date is Q1 2018.
[9]. Temperature range allowed is 0 °C to 85 °C.	All	Rev. *A	Silicon fix planned in next silicon. Current sample date is Q1 2018.

Detailed descriptions of the Errata items follow:

1. 124 BGA: SIMO Buck operation at VDDD input voltage >2.7 V.	
Problem Definition	SIMO Buck efficiency operates with very low efficiency for $V_{DDD} > 2.7$ V
Parameters Affected	Power consumption
Trigger Condition	$V_{DDD} > 2.7$ V
Scope of Impact	Power consumption increases above 2.7 V when using the Buck.
Workaround	None
Fix Status	Silicon and/or firmware fix is planned in Q1 2018 when this error will be removed from the datasheet.

2. UDB Deep Sleep Retention.	
Problem Definition	GPIOs driven from the UDB circuit may fail to maintain state after wakeup from Deep Sleep.
Parameters Affected	GPIO states if driven by UDBs
Trigger Condition	NA
Scope of Impact	Erroneous logic states may occur transiently for outputs controlled by UDB logic after wakeup from Deep Sleep.
Workaround	None
Fix Status	Silicon and/or firmware fix is planned in Q1 2018 when this error will be removed from the datasheet.

3. 116 BGA: HBM ESD Rating.	
Problem Definition	HBM ESD is rated at 1600 V versus spec of 2200 V on the 116 BGA package.
Parameters Affected	HBM ESD rating on the 116 BGA package
Trigger Condition	NA
Scope of Impact	HBM spec of 2000 V not met for the 116 BGA package.
Workaround	None
Fix Status	Silicon and/or firmware fix is planned in Q1 2018 when this error will be removed from the datasheet.

4. Flash Read-While-Write (RWW) feature does not work.	
Problem Definition	Reading from one Flash Sector while writing to another is non-functional.
Parameters Affected	NA
Trigger Condition	Attempting to read from a Flash address while Flash is being written to.
Scope of Impact	Attempting to use the RWW feature will cause Hard Faults.
Workaround	Use Blocking calls for System API functions. DMA/Data-Wire, Crypto, and SMIF (QSPI) blocks are bus masters and must be disabled while the Blocking call is underway if they make any Flash accesses. Basically, there must be no Flash access before the Blocking call is completed. There is a Partial Blocking workaround that allows access to the Flash for about 80% of the Flash Write time at different intervals. Please contact Cypress.
Fix Status	Silicon and/or firmware fix is planned in Q2 2018 when this error will be removed from the datasheet.

5. Flash RWW feature requires blocking for 1 ms when Writes to the Emulated EEPROM Sector (32 KB Sector) are done.	
Problem Definition	Writing to the 32-KB Flash Sector while attempting to read Flash before 1 ms from the beginning of the Write does not work.
Parameters Affected	NA
Trigger Condition	Attempting to read from a Flash address less than 1 ms after the beginning of a write to the 32-KB Flash sector.
Scope of Impact	Attempting to read from Flash less than 1 ms after the beginning of a write to the 32-KB sector will cause Hard Faults.
Workaround	DMA/Data-Wire, Crypto, and SMIF (QSPI) blocks are bus masters and must be disabled for a period of 1 ms after the call is made if they access Flash. Basically, there must be no Flash access for a period of 1 ms after a write to the 32-KB Sector is initiated. This workaround allows BLE connectivity to be maintained when the 32-KB sector is used for writing pairing information.
Fix Status	Silicon and/or firmware fix is planned in Q1 2018 when this error will be removed from the datasheet.

6. CMAC-based authentication of Boot Flash code in Supervisory Flash can be spoofed.	
Problem Definition	CMAC is used to verify authenticity of the Boot Flash but the AES key can be made visible and the integrity of the Message Authentication is compromised.
Parameters Affected	NA
Trigger Condition	NA
Scope of Impact	The AES Key is stored in SROM and can be read out in parts, which are in the normal life cycle stage mode. This will be replaced by a Secure Hash Authentication (SHA) method, which does not use a key.
Workaround	None
Fix Status	Silicon and/or firmware fix is planned in Q1 2018 when this error will be removed from the datasheet.

7. Protection Context (PC) is not restored properly in system calls that inherit the Client's PC.	
Problem Definition	Some System calls can inherit the client's Protection Context (PC); the PC is restored on completion of the call except for the inheritance of PC 0.
Parameters Affected	NA
Trigger Condition	NA
Scope of Impact	Protection context can be changed inadvertently causing access failures.
Workaround	For System Calls that inherit the Client's Protection Context (PC), PC_SAVED must be Set to 0 if the previous Protection Context was PC0. The CM0+ must be used in Protection Context 0.
Fix Status	Silicon and/or firmware fix is planned in Q1 2018 when this error will be removed from the datasheet.

8. Hard Fault results if two system calls occur simultaneously and the first system call inherits a non-zero Context.	
Problem Definition	If two system calls are made simultaneously, the NMI Handler will try to service the second system call as well before returning. If the first system call inherited a non-zero Protection Context, then the second call will cause a Hard Fault if tries to access a protected region.
Parameters Affected	NA
Trigger Condition	Back-to-back system calls with the first call inheriting a non-zero Protection Context.
Scope of Impact	Protection context can be changed inadvertently causing access failures.
Workaround	Use an IPC channel to make sure that the first system call is completed before making the next call.
Fix Status	Silicon and/or firmware fix is planned in Q1 2018 when this error will be removed from the datasheet.

9. Temperature range allowed is 0 °C to 85 °C.	
Problem Definition	Functionality is not guaranteed below 0 °C.
Parameters Affected	NA
Trigger Condition	NA
Scope of Impact	NA
Workaround	None
Fix Status	Silicon and/or firmware fix is planned in Q1 2018 when this error will be removed from the datasheet.

The following errata items are applicable to the PS0C6XX-ES3 family devices:

Items	CY8C6XX	Silicon Revision	Fix Status
[4]. Flash Read-While-Write (RWW) feature does not work.	All	Rev. *B	In progress. Resolution planned in Q2 2018.

The detailed descriptions of the Errata items are exactly as in the previous section.
