

CY7C135

4K × 8 Dual-Port Static RAM

Features

- True dual-ported memory cells, which allow simultaneous reads of the same memory location
- 4K × 8 organization
- 0.65 micron CMOS for optimum speed and power
- High speed access: 15 ns
- Low operating power: I_{CC} = 180 mA (max)
- Fully asynchronous operation
- Automatic power down
- Available in 52-pin plastic leaded chip carrier (PLCC)
- Pb-free packages available

Functional Description

The CY7C135 is a high speed CMOS 4K × 8 dual-port static RAMs. Two ports are provided permitting independent, asynchronous access for reads and writes to any location in memory. Application areas include interprocessor/multiprocessor designs, communications status buffering, and dual-port video/graphics memory.

Each port has independent control pins: chip enable (\overline{CE}), read or write enable (\overline{RW}), and output enable (\overline{OE}). The CY7C135 is suited for those systems that do not require on-chip arbitration or are intolerant of wait states. Therefore, the user must be aware that simultaneous access to a location is possible. An automatic power down feat<u>ure</u> is controlled independently on each port by a chip enable (\overline{CE}) pin.

The CY7C135 is available in 52-pin PLCC.

Selection Guide

Parameter		7C135-15	Unit
Maximum access time		15	ns
Maximum operating current	Commercial	220	mA
Maximum standby current for I _{SB1}	Commercial	60	mA

Pin Configurations

Figure 1. 52-pin PLCC pinout (Top View)

Pin Definitions

Left Port	Right Port	Description
A _{0L-11L}	A _{0R-11R}	Address lines
CEL	CE _R	Chip Enable
OEL	OE _R	Output Enable
R/WL	R/W _R	Read/Write Enable

Architecture

The CY7C135 consists of an array of 4K words of 8 bits each of $\frac{\text{dual}-\text{port RAM}}{\text{cells}}$ cells, I/O and address lines, and control signals (CE, OE, R/W).

Functional Description

Write Operation

Data <u>must</u> be set up for a duration of t_{SD} before the rising edge of R/W to guarantee a valid write. Because there is no on-chip arbitration, the user must be sure that a specific location is not accessed simultaneously by both ports or erroneous data could result. A write operation is controlled by either the OE pin (see Figure 6 on page 9) or the R/W pin (see Figure 7 on page 9). Data can be written t_{HZOE} after the OE is deasserted or t_{HZWE} after the falling edge of R/W. Required inputs for write operations are summarized in Table 1.

If a location is being written to by one port and the opposite port attempts to read the same location, a port-to-port flowthrough delay is met before the data is valid on the output. Data is valid on the port wishing to read the location $t_{\mbox{DDD}}$ after the data is presented on the writing port.

Read Operation

When reading the device, the user must assert both the \overline{OE} and CE pins. Data is available t_{ACE} after CE or t_{DOE} after OE are asserted. Required inputs for read operations are summarized in Table 1.

Table 1.	Non-Contending	Read/Write
----------	----------------	-------------------

	Inputs			Operation	
CE	R/W	OE	1/0 ₀ –1/0 ₇	Operation	
Н	Х	Х	High Z	Power-down	
Х	Х	Н	High Z	I/O Lines disabled	
L	Н	L	Data out	Read	
L	L	Х	Data in	Write	

Maximum Ratings

Exceeding maximum ratings ^[1] may shorten the useful life of the device. User guidelines are not tested.

Storage temperature	–65 °C to+150 °C
Ambient temperature with power applied	–55 °C to+125 °C
Supply voltage to ground potential (Pin 48 to Pin 24)	–0.5 V to+7.0 V
DC voltage applied to outputs in High Z state	–0.5 V to+7.0 V

DC input voltage ^[2]	3.0 V to +7.0 V
Static discharge voltage	
(per MIL-STD-883, Method 3015)	> 2001 V
Latch up current	> 200 mA

Operating Range

Range Ambient Temperature		V _{cc}
Commercial	0 °C to +70 °C	5 V ± 10%
Industrial	–40 °C to +85 °C	5 V ± 10%

Electrical Characteristics

I _{CC}	Operating current	V _{CC} = Max,	Commercial	-	220	mA
		I _{OUT} = 0 mA	Industrial	-	_	
I _{SB1}	Standby current	\overline{CE}_L and $\overline{CE}_R \ge V_{IH}$,	Commercial	-	60	mA
	(Both ports TTL levels)	$f = f_{MAX}^{[3]}$	Industrial	_	-	
I _{SB2}	Standby current	\overline{CE}_L and $\overline{CE}_R \ge V_{IH}$,	Commercial	-	130	mA
	(One port TTL level)	$f = f_{MAX}^{[3]}$	Industrial	_	-	
I _{SB3}	Standby current	Both ports	Commercial	I	15	mA
	(Both ports CMOS levels)	$\label{eq:central_constraint} \begin{array}{ c c c c } \hline \hline CE & and & \overline CE_R \geq V_{CC} - 0.2 \ V, \\ \hline V_{IN} \geq V_{CC} - 0.2 \ V \ or \ V_{IN} \leq 0.2 \ V, \\ \hline f = 0 \ [^{3]} \end{array}$	Industrial	-	_	
I _{SB4}	Standby current	One port	Commercial	_	125	mA
	(One port CMOS level)	\overline{CE}_L or $\overline{CE}_R \ge V_{CC} - 0.2$ V,	Industrial	-	-	
		$V_{IN} \geq V_{CC} - 0.2 \ V \ \text{or} \ V_{IN} \leq 0.2 \ V,$				
		Active port outputs, $f = f_{MAX}^{[3]}$				

Notes

The voltage on any input or I/O pin cannot exceed the power pin during power up.
 Pulse width < 20 ns.
 f_{MAX} = 1/t_{RC} = All inputs cycling at f = 1/t_{RC} (except output enable). f = 0 means no address or control lines change. This applies only to inputs at CMOS level standby I_{SB3}.

Capacitance

Parameter ^[4]	Description	Test Conditions	Max	Unit
C _{IN}	Input capacitance	$T_A = 25 \text{ °C}, f = 1 \text{ MHz}, V_{CC} = 5.0 \text{ V}$	10	pF
C _{OUT}	Output capacitance		10	pF

t _{HZOE} [6, 7, 8]	OE HIGH to High Z	-	10	ns
t _{LZCE} [6, 7, 8]	CE LOW to Low Z	3	-	ns
t _{HZCE} ^[6, 7, 8]	CE HIGH to High Z	-	10	ns
t _{PU} ^[8]	CE LOW to Power-up	0	-	ns
t _{PD} ^[8]	CE HIGH to Power-down	-	15	ns
Write Cycle				
t _{WC}	Write cycle time	15	-	ns
t _{SCE}	CE LOW to Write End	12	-	ns
t _{AW}	Address setup to Write End	12	-	ns
t _{HA}	Address hold from Write End	2	-	ns
t _{SA}	Address setup to Write Start	0	-	ns
t _{PWE}	Write pulse width	12	-	ns
t _{SD}	Data setup to Write End	10	-	ns
t _{HD}	Data hold from Write End	0	-	ns
t _{HZWE} ^[7, 8]	R/W LOW to High Z	-	10	ns
t _{LZWE} ^[7, 8]	R/W HIGH to Low Z	3	-	ns
t _{WDD} ^[9]	Write pulse to data delay	-	30	ns
t _{DDD} ^[9]	Write data valid to read data valid	-	25	ns

Notes

6. At any given temperature and voltage condition for any given device, t_{HZCE} is less than t_{LZCE} and t_{HZOE} is less than t_{LZOE} .

7. Test conditions used are Load 3.

8. This parameter is guaranteed but not tested.

^{5.} Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3.0 V, and output loading of the specified I_{OL}/I_{OH} and 30 pF load capacitance.

^{9.} For information on port-to-port delay through RAM cells from writing port to reading port, refer to Figure 5 on page 8.

Switching Waveforms

Notes

10. R/W is HIGH for read cycle. 11. Device is continuously selected, $\overline{CE} = V_{|L}$ and $\overline{OE} = V_{|L}$. 12. <u>Address valid prior to or</u> coincident with \overline{CE} transition LOW. 13. $\overline{CE}_L = \overline{CE}_R = LOW$; R/W_L = HIGH.

Switching Waveforms (continued)

Figure 6. Write Cycle No. 1: OE Three-States Data I/Os (Either Port) [14, 15, 16]

Figure 7. Write Cycle No. 2: R/W Three-States Data I/Os (Either Port) [15, 17]

Notes

- 14. The internal write time of the memory is defined by the overlap of CE and R/W LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input setup and hold timing should be referenced to the rising edge of the signal that terminates the write.

15. R^W must be HIGH during all address transactions.
16. If OE is LOW during a R/W controlled write cycle, the write pulse width must be the larger of t_{PWE} or (t_{HZWE} + t_{SD}) to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{SD}. If OE is HIGH during a R/W controlled write cycle (as in this example), this requirement does not apply and the write pulse can be as short as the specified t_{PWE}.
17. Data I/O pins enter high impedance when OE is held LOW during write.
