

General Description

EZ-PD™ CCG5C is a one-port USB Type-C controller that complies with the latest USB Type-C and Power Delivery (PD) specifications. CCG5C provides a complete USB Type-C and USB PD port control solution for PCs and notebooks. CCG5C includes a 32-bit, 48-MHz Arm® Cortex®-M0 processor with 128 KB flash and integrates one complete Type-C Transceiver including the Type-C termination resistors R_P , R_D , and R_{D-DB} . CCG5C is available in a 40-pin QFN package.

Applications

- PCs and notebooks
- Thunderbolt hosts and devices

Features

Type-C and USB-PD Support

- Integrated USB Power Delivery (USB-PD) 3.0 support
- Integrated UFP^[1] (R_D) and current sources for DFP^[2] (R_P)
 - Fast Role Swap
 - Extended data messaging
- Integrated dead battery termination
- Integrated VCONN FETs with overcurrent protection (OCP) to power electronically marked cable assembly (EMCA) cables
- Integrated high-voltage LDO, operational up to 21.5 V
- Integrated USB 2.0 Analog Mux
- Integrated SBU Analog Mux
- Integrated USB Charger Detect blocks
 - Battery Charging (BC) v1.2, Apple Charging (both source only)
- Integrated overvoltage protection (OVP) and overcurrent protection (OCP) on VBUS
- Gate Driver, tolerant to 24 V, to drive external VBUS PFET on the consumer and provider path
- Configurable hardware-controlled VBUS overvoltage protection and overcurrent protection
- VBUS high-side current-sense amplifier capable of measuring current across a 10-m Ω series resistance

32-bit MCU Subsystem

- 48-MHz Arm Cortex-M0 CPU
- 128-KB Flash
- 12-KB SRAM

Integrated Digital Blocks

- Up to two integrated timers and counters to meet response times required by the USB-PD protocol
- Four runtime serial communication blocks (SCBs) with reconfigurable I²C, SPI, or UART functionality

Clocks and Oscillators

- Integrated oscillator eliminating the need for an external clock

Low-Power Operation

- 2.75 V to 21.5 V operation

Hot-Swappable I/Os

- I²C pins from SCB1 and CC1, CC2 pins are hot-swappable

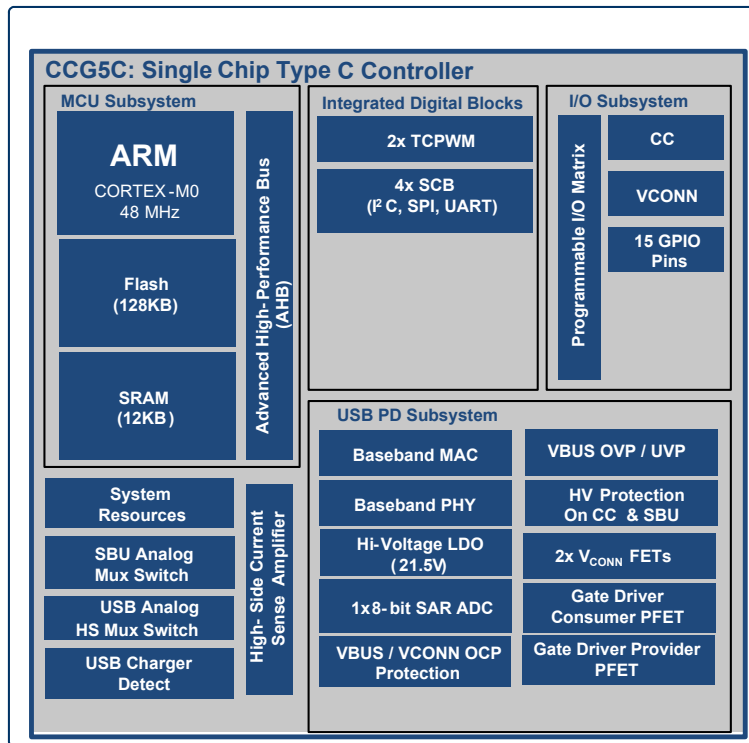

Packages

- 6.0 mm × 6.0 mm × 0.6 mm, 40-pin QFN
- Supports industrial temperature range (–40 °C to +85 °C)

Notes

1. UFP refers to Power Sink.
2. DFP refers to Power Source.

Functional Overview

USB-PD Subsystem (SS)

USB-PD Physical Layer

The CCG5C USB-PD subsystem consists of the USB-PD physical layer (PHY) block and supporting circuits. The PHY block consists of a transmitter and receiver that communicates using BMC and 4b/5b encoded/decoded data over the CC channel based on the PD 3.0 specification. All communication is half-duplex. The PHY block practices collision avoidance to minimize communication errors on the channel.

Additionally, the CCG5C USB-PD block includes all termination resistors (R_P and R_D) and their switches as required by the USB Type-C specification. R_P and R_D resistors are required for connection detection, plug orientation detection, and for establishing the USB source/sink roles.

The integrated R_P resistor enables CCG5C to be configured as a downstream facing port (DFP). The R_P resistor is implemented as a current source and can be programmed to support the complete range of current capacity on VBUS defined in the USB Type-C specification.

The R_D resistor is used to identify CCG5C as an upstream facing port (UFP) in a dual-role power (DRP) application. When the device is not powered, the Dead Battery (DB) R_D resistor on CC pins is required for dead battery termination detection and charging.

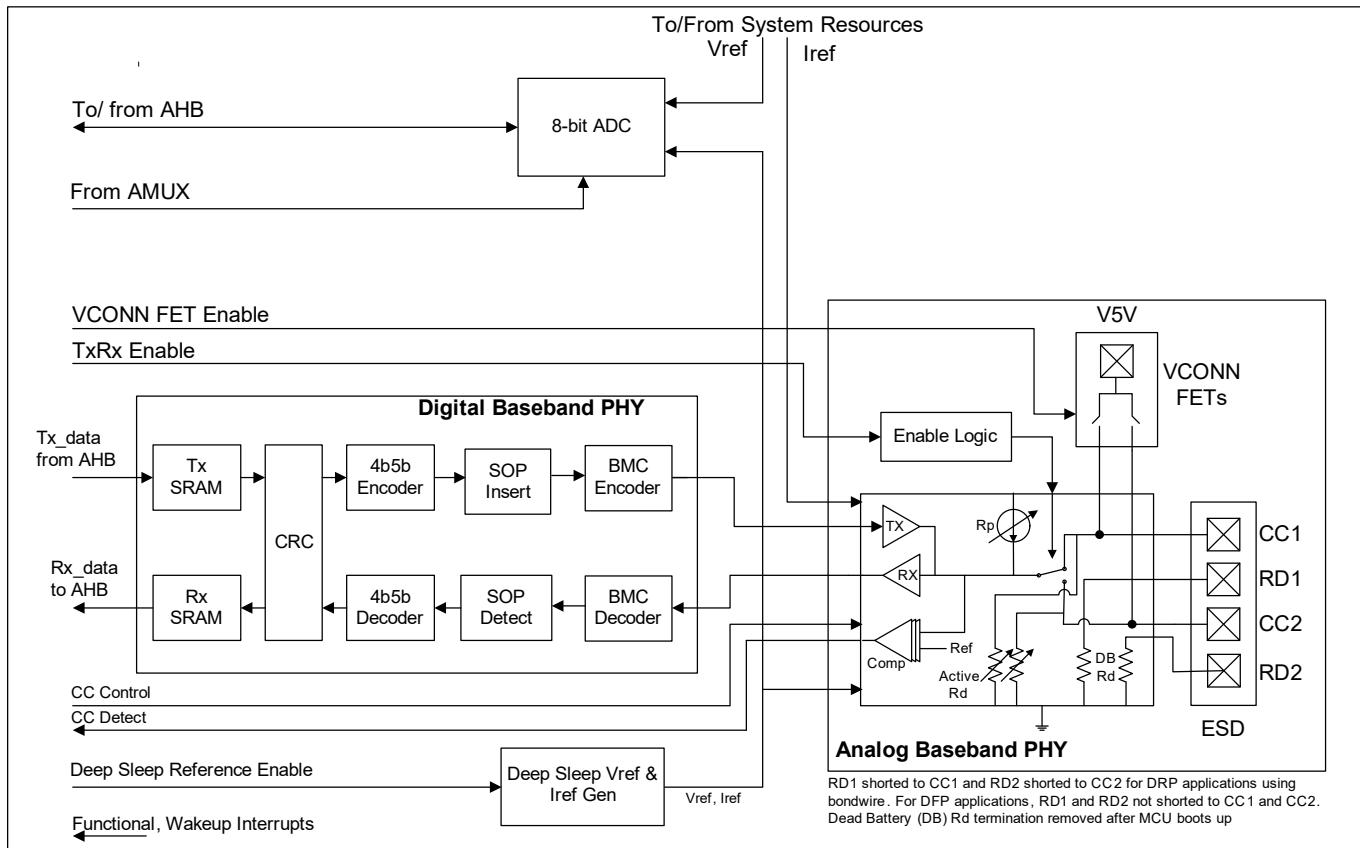

To support the latest USB-PD 3.0 specification, CCG5C includes Fast Role Swap (FRS). The FRS feature enables externally powered docks and hubs to rapidly switch to bus power when their external power supply is removed. CCG5C also supports FRS detection in Deep Sleep mode.

For more details about FRS, refer to Section 6.3.17 in the [USB-PD 3.0 specification](#).

CCG5C is designed to be fully interoperable with revision 3.0 and 2.0 of the USB Power Delivery specification.

CCG5C supports Extended Messages containing data of up to 260 bytes. The Extended Messages will be larger than expected by the USB-PD 2.0 hardware. To accommodate systems based on Revision 2.0, a Chunking mechanism is implemented such that messages are limited to Revision 2.0 sizes unless it is discovered that both systems support longer message lengths.

Figure 1. USB-PD Subsystem

VCONN FET

CCG5C has a power supply input, V5V, for providing power to EMCA cables through integrated VCONN FETs. There are two VCONN FETs to power either CC1 or CC2 pins. These FETs can provide 1.5-W power over VCONN on CC1 and CC2 pins for active EMCA cables. CCG5C also includes overcurrent protection (OCP) on VCONN.

ADC

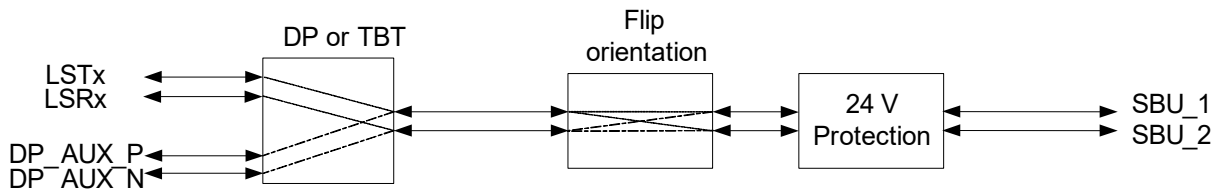

The USB-PD subsystem contains one 8-bit successive approximation register analog-to-digital converter (SAR ADC). The ADC includes an 8-bit digital-to-analog converter (DAC) and a comparator. The DAC output forms the positive input of the

comparator. The negative input of the comparator is from a 4-input multiplexer. The four inputs of the multiplexer are a pair of global analog multiplex busses, an internal bandgap voltage, and an internal voltage proportional to the absolute temperature. All GPIOs on the chip have access to the ADC through the chip-wide analog mux bus. CC1 and CC2 pins are not available to connect to the mux bus.

SBU Mux

CCG5C integrates a SBU 4x2 mux that enables selection between the DisplayPort or Thunderbolt alternate mode and Type-C orientation as shown in Figure 2. Type-C facing SBU pins are protected from accidental short to high-voltage VBUS.

Figure 2. CCG5C SBU Crossbar Switch Block Diagram

USB 2.0 Mux

The HS mux contains a 2×2 cross bar switch to route the system D \pm lines to the Type-C top or bottom port based on the CC (Type-C plug) orientation. Unused D \pm top or bottom lines can be connected to a UART (Debug) port. The maximum operating frequency of UART must be 1 Mbps.

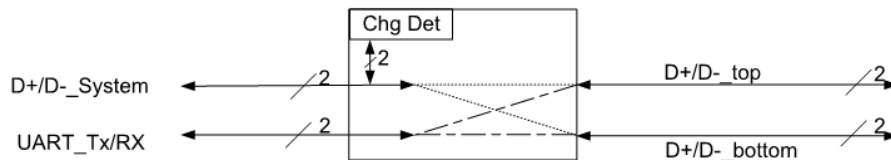

The USB 2.0 mux also contains charger detection/emulation for detecting USB BC 1.2 and Apple terminations. The charger detection block is connected to D \pm from the system as shown in Figure 3.

To meet the HS eye diagram requirements with sufficient margin, follow these guidelines:

- Trace lengths of HS signals shall be no more than 2 inches from the USB 2.0 Host to the CCG5C device. Similarly, trace length from the CCG5C device to Type-C connector pins shall be no more than 2 inches.
- The differential impedance across the DP/DM signal traces shall be 90 Ω .
- Trace width shall be 6 mils.
- Air gap (distance between lines) shall be 8 mils.

Increasing the trace length by more than two inches on either side of the CCG5C device degrades the HS eye diagram.

Figure 3. CCG5C DP/DM Switch Block Diagram

Overvoltage and Undervoltage Protection on VBUS

CCG5C implements an undervoltage/overvoltage (UVOV) detection circuit for the VBUS supply. The threshold for OV and UV detection can be set independently. Both UV and OV detector have programmable thresholds and is controlled by the firmware.

Overcurrent Protection on VBUS

CCG5C integrates a high-side current sense amplifier to detect overcurrent on the VBUS. Overcurrent protection is sensed using an external 10-m Ω sense resistor connected between the CSP and CSN pins. The OCP detector threshold is programmable and controlled by the firmware.

VBUS Discharge

CCG5C also has integrated VBUS discharge circuit. It is used to discharge VBUS to meet the USB-PD specification timing on a detach condition and negative voltage transition.

VBUS Regulator

CCG5C can operate from two power supplies – VSYS and VBUS. CCG5C integrates the regulator (that supports up to 21.5 V) to derive operating supply voltage. The VSYS always takes priority over VBUS. In the absence of VSYS, the regulator powers CCG5C from VBUS.

Gate Driver for VBUS PFET on Consumer and Provider Path

CCG5C has an integrated PFET gate driver to drive external PFETs on the VBUS consumer and provider path. The gate

driver can drive only low or high-Z, thus requiring an external pull-up. This pin is VBUS voltage-tolerant.

Charger Detect

CCG5C integrates battery charger emulation and detection for USB BC 1.2 and Apple Charging.

High-Voltage-Tolerant SBU and CC Lines

The chip has high-voltage-tolerant SBU and CC lines. In the case of SBU/CC short to VBUS through connectors, these lines will be protected internally.

CPU and Memory Subsystem

CPU

The Cortex-M0 CPU in EZ-PD CCG5C is part of the 32-bit MCU subsystem, which is optimized for low-power operation with extensive clock gating.

The CPU also includes a serial wire debug (SWD) interface, which is a 2-wire form of JTAG. The debug configuration used for EZ-PD CCG5C has four break-point (address) comparators and two watchpoint (data) comparators.

Flash

The EZ-PD CCG5C device has a 128-KB flash module with a flash accelerator, tightly coupled to the CPU to improve average access times from the flash block. The flash block is designed to deliver two wait-states (WS) access time at 48 MHz. The flash accelerator delivers 85% of single-cycle SRAM access performance on average. A part of the flash module can be used to emulate EEPROM operation if required.

SRAM

A supervisory ROM that contains boot and configuration routines is provided.

SRAM

CCG5C has 12 KB SRAM.

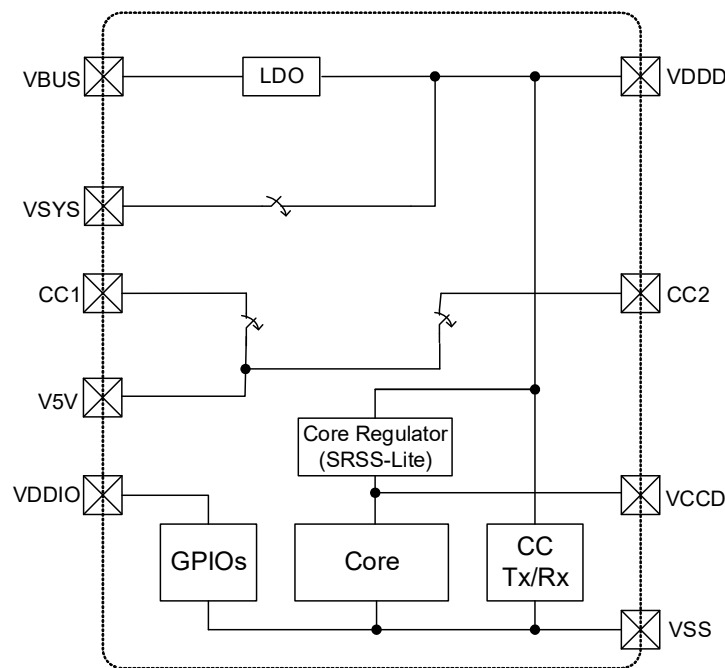

Power System Overview

Figure 4 provides an overview of the EZ-PD CCG5C power system. CCG5C can operate from two possible external supply sources: VBUS (4–21.5 V) or VSYS (2.75 to 5.5 V). The VBUS supply is regulated inside the chip with a LDO. The switched supply, V_{DD} , is used directly inside some analog blocks and further regulated down to V_{CCD} , which powers majority of the core. CCG5C has two different power modes: Active and Deep Sleep. Transitions between these power modes are managed by the power system. A separate power domain, VDDIO, is provided for the GPIOs. The VDDD and VCCD pins, both outputs of regulators, are brought out for connecting a 1- μ F and 0.1- μ F capacitor respectively for the regulator stability only. The VCCD pin is not supported as a power supply. VDDD can source 2 mA (max) for external load. In CCG5C, VDDD shall be shorted to VDDIO on PCB.

Table 1. CCG5C Power Modes

Mode	Description
RESET	Power is valid and XRES is not asserted. An internal reset source is asserted or Sleep Controller is sequencing the system out of reset.
ACTIVE	Power is valid and CPU is executing instructions.
DEEP SLEEP	Main regulator and most blocks are shut off. Deep Sleep regulator powers logic, but only low-frequency clock is available.

Figure 4. EZ-PD CCG5C Power System

Peripherals

CCG5C has four SCBs, which can each implement an I²C, UART, or SPI interface.

I²C Mode: The hardware I²C block implements a full multimaster and slave interface (it is capable of multimaster arbitration). This block is capable of operating at speeds of up to 1 Mbps (Fast Mode Plus) and has flexible buffering options to reduce interrupt overhead and latency for the CPU. The FIFO mode is available in all channels and is very useful in the absence of DMA.

The I²C peripheral is compatible with the I²C Standard mode, Fast mode, and Fast Mode Plus devices as defined in the NXP I²C bus specification and user manual (UM10204). The I²C bus I/O is implemented with GPIO in open-drain modes. The I²C bus uses open-drain drivers for clock and data with pull-up resistors on the bus for clock and data connected to all nodes. The required Rise and Fall times for different I²C speeds are guaranteed by using appropriate pull-up resistor values depending on V_{DD}, bus capacitance, and resistor tolerance.

For detailed information on how to calculate the optimum pull-up resistor value for your design, refer to the UM10204 I²C bus specification and user manual (the latest revision is available at www.nxp.com).

CCG5C is not completely compliant with the I²C spec for the following:

- Only SCB1 is overvoltage-tolerant. SCB2, SCB3, and SCB4 GPIO cells are not overvoltage-tolerant and, therefore, cannot be hot-swapped or powered up independently of the rest of the I²C system.
- Fast Mode Plus has an I_{OL} specification of 20 mA at a V_{OL} of 0.4 V. GPIO cells can sink a maximum of 8-mA I_{OL} with a V_{OL} maximum of 0.6 V.
- Fast mode and Fast Mode Plus specify minimum Fall times, which are not met with the GPIO cell; Slow strong mode can help meet this spec depending on the bus load.

UART Mode: This is a full-feature UART operating at up to 1 Mbps. It supports automotive single-wire interface (LIN), infrared interface (IrDA), and SmartCard (ISO7816) protocols, all of which are minor variants of the basic UART protocol. In addition, it supports the 9-bit multiprocessor mode that allows addressing of peripherals connected over common Rx and Tx lines. Common UART functions such as parity error, break detect, and frame error are supported. An 8-deep FIFO allows much greater CPU service latencies to be tolerated.

SPI Mode: The SPI mode supports full Motorola SPI, TI SSP (essentially adds a start pulse used to synchronize SPI Codecs), and National Microwire (half-duplex form of SPI). The SPI block can use the FIFO.

Timer/Counter/PWM Block (TCPWM)

CCG5C has up to two TCPWM blocks. Each TCPWM block consists of four 16-bit counters with user-programmable period length. There is a capture register to record the count value at the time of an event (which may be an I/O event), a period register which is used to either stop or auto-reload the counter when its count is equal to the period register, and compare registers to generate compare value signals which are used as PWM duty cycle outputs. The block also provides true and complementary outputs with programmable offset between them to allow use as deadband programmable complementary PWM outputs. It also has a kill input to force outputs to a predetermined state; for example, this is used in motor drive systems when an overcurrent state is indicated and the PWMs driving the FETs need to be shut off immediately with no time for software intervention.

GPIO

CCG5C has 15 GPIOs that includes the SCB and SWD pins, which can also be used as GPIOs. The I²C pins from only SCB 1 are overvoltage-tolerant. The GPIO block implements the following:

- Seven drive strength modes:
 - Input only
 - Weak pull-up with strong pull-down
 - Strong pull-up with weak pull-down
 - Open drain with strong pull-down
 - Open drain with strong pull-up
 - Strong pull-up with strong pull-down
 - Weak pull-up with weak pull-down
- Input threshold select (CMOS or LVTTTL)
- Individual control of input and output buffer enabling/disabling in addition to the drive strength modes
- Hold mode for latching previous state (used for retaining I/O state in Deep Sleep mode)
- Selectable slew rates for dV/dt-related noise control to improve EMI

The pins are organized in logical entities called ports, which are 8-bit in width. During power on and reset, the blocks are forced to the disable state so as not to crowbar any inputs and/or cause excess turn-on current. A multiplexing network known as a high-speed I/O matrix is used to multiplex between various signals that may connect to an I/O pin. Pin locations for fixed-function peripherals are also fixed to reduce internal multiplexing complexity.

Data output and pin state registers store, respectively, the values to be driven on the pins and the states of the pins themselves. Every I/O pin can generate an interrupt if so enabled and each I/O port has an interrupt request (IRQ) and interrupt service routine (ISR) vector associated with it (5 for CCG5C since it has five ports).

Application Diagram

Figure 6 illustrates a Type-C port Thunderbolt notebook DRP application diagram using CCG5C. The Type-C port can be used as a power provider or a power consumer.

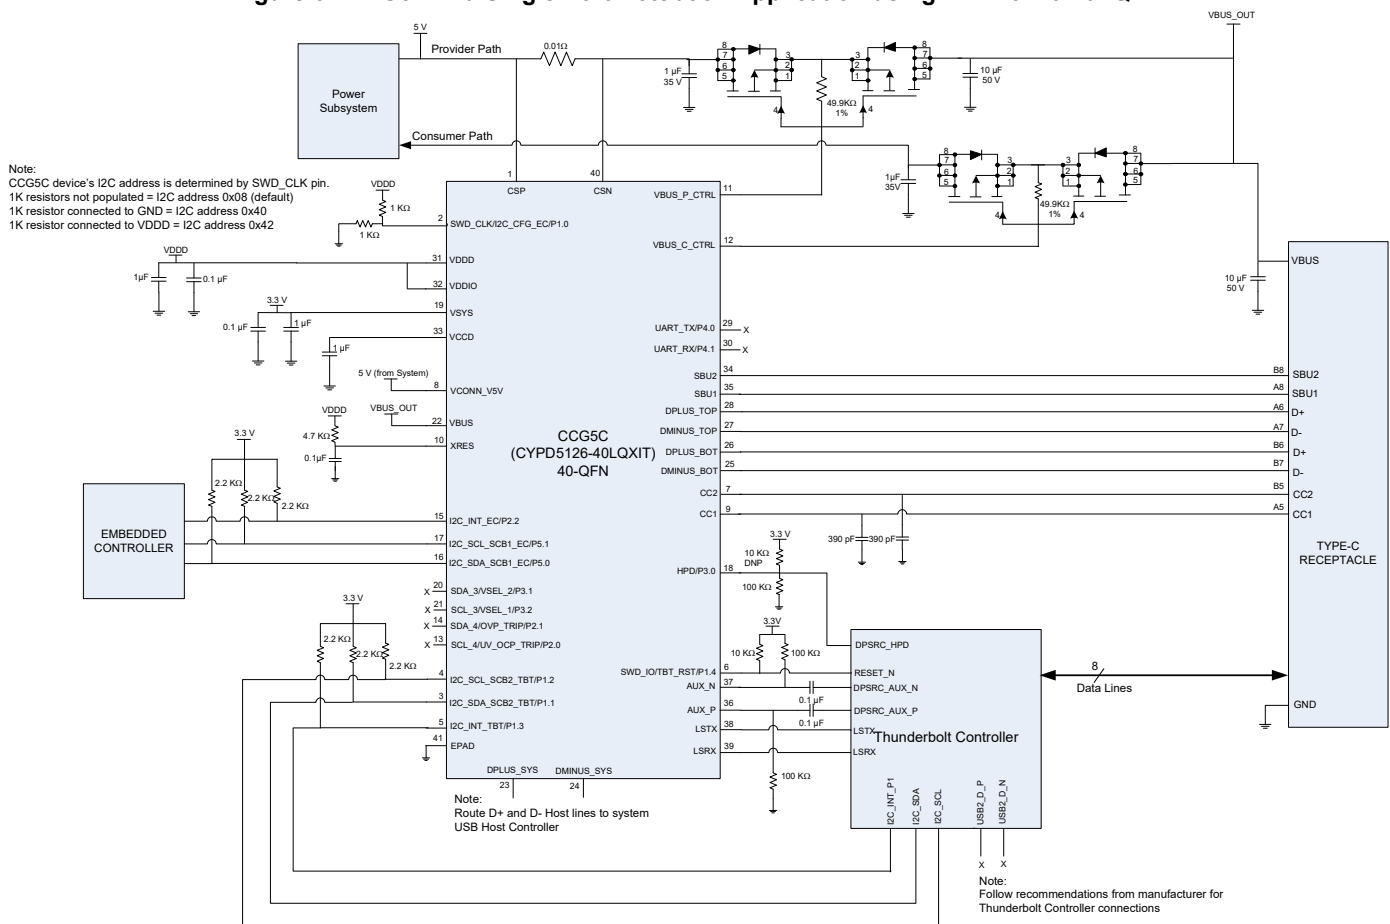

The CCG5C device communicates with the embedded controller (EC), which manages the Battery Charger Controller (BCC) to control the charging and discharging of the internal battery. It also updates the Thunderbolt Controller via I²C to route the high-speed signals coming from the Type-C port to the USB host (during normal mode) or the graphics processor unit (during DisplayPort Alternate mode) or the Thunderbolt Host (during Thunderbolt Alternate mode) based on the alternate mode negotiation.

The CCG5C device controls the transfer of USB 2.0 D[±] lines from the top and bottom of the Type-C receptacle to the D[±] lines of the USB Host controller. CCG5C also handles the routing of SBU1 and SBU2 lines from the Type-C receptacle to the Thunderbolt controller for link management. CCG5C offers VBUS short protection on SBU and CC lines.

The CCG5C device has an integrated VCONN FET for applications that need to provide power for accessories and cables using the VCONN pin of the Type-C receptacle. VBUS FETs are also used for providing power over VBUS and for consuming power over VBUS. The 10-mΩ resistor between the 5-V supply and provider FETs is used for overcurrent detection on the VBUS. The VBUS_P_CTRL pin of CCG5C has an in-built VBUS monitoring circuit that can detect OV and UV on VBUS.

Note

3. Usage above the absolute maximum conditions listed in Table 7 may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods of time may affect device reliability. The maximum storage temperature is 150 °C in compliance with JEDEC Standard JESD22-A103, High Temperature Storage Life. When used below absolute maximum conditions but above normal operating conditions, the device may not operate to specification.

Acronyms

Table 45. Acronyms Used in this Document

Acronym	Description
ADC	analog-to-digital converter
API	application programming interface
Arm®	advanced RISC machine, a CPU architecture
CC	configuration channel
BOD	Brown out Detect
CPU	central processing unit
CRC	cyclic redundancy check, an error-checking protocol
CS	current sense
DB	dead battery
DFP	downstream facing port
DIO	digital input/output, GPIO with only digital capabilities, no analog. See GPIO.
DRP	dual-role power
EEPROM	electrically erasable programmable read-only memory
EMCA	a USB cable that includes an IC that reports cable characteristics (e.g., current rating) to the Type-C ports
EMI	electromagnetic interference
ESD	electrostatic discharge
FPB	flash patch and breakpoint
FS	full-speed
GPIO	general-purpose input/output
IC	integrated circuit
IDE	integrated development environment
I ² C, or IIC	Inter-Integrated Circuit, a communications protocol
ILO	internal low-speed oscillator, see also IMO
IMO	internal main oscillator, see also ILO
I/O	input/output, see also GPIO
LVD	low-voltage detect
LVTTL	low-voltage transistor-transistor logic
MCU	microcontroller unit
NC	no connect
NMI	nonmaskable interrupt

Table 45. Acronyms Used in this Document (continued)

Acronym	Description
NVIC	nested vectored interrupt controller
opamp	operational amplifier
OCP	overcurrent protection
OVP	overvoltage protection
PCB	printed circuit board
PD	power delivery
PGA	programmable gain amplifier
PHY	physical layer
POR	power-on reset
PRES	precise power-on reset
PSoC®	Programmable System-on-Chip™
PWM	pulse-width modulator
RAM	random-access memory
RISC	reduced-instruction-set computing
RMS	root-mean-square
RTC	real-time clock
RX	receive
SAR	successive approximation register
SCL	I ² C serial clock
SDA	I ² C serial data
S/H	sample and hold
SPI	Serial Peripheral Interface, a communications protocol
SRAM	static random access memory
SWD	serial wire debug, a test protocol
TX	transmit
Type-C	a new standard with a slimmer USB connector and a reversible cable, capable of sourcing up to 100 W of power
UART	Universal Asynchronous Transmitter Receiver, a communications protocol
USB	Universal Serial Bus
USBIO	USB input/output, CCG5C pins used to connect to a USB port
XRES	external reset I/O pin

Symbol	Unit of Measure
°C	degrees Celsius
Hz	hertz
KB	1024 bytes
kHz	kilohertz
kΩ	kilo ohm
Mbps	megabits per second
MHz	megahertz
MΩ	mega-ohm
Msp	megasamples per second
μA	microampere
μF	microfarad
μs	microsecond
μV	microvolt
μW	microwatt
mA	milliampere
ms	millisecond
mV	millivolt
nA	nanoampere
ns	nanosecond
Ω	ohm
pF	picofarad
ppm	parts per million
ps	picosecond
s	second
sps	samples per second
V	volt

Notice regarding compliance with Universal Serial Bus specification. Cypress offers firmware and hardware solutions that are certified to comply with the Universal Serial Bus specification, USB Type-C™ Cable and Connector Specification, and other specifications of USB Implementers Forum, Inc (USB-IF). You may use Cypress or third party software tools, including sample code, to modify the firmware for Cypress USB products. Modification of such firmware could cause the firmware/hardware combination to no longer comply with the relevant USB-IF specification. You are solely responsible ensuring the compliance of any modifications you make, and you must follow the compliance requirements of USB-IF before using any USB-IF trademarks or logos in connection with any modifications you make. In addition, if Cypress modifies firmware based on your specifications, then you are responsible for ensuring compliance with any desired standard or specifications as if you had made the modification. CYPRESS IS NOT RESPONSIBLE IN THE EVENT THAT YOU MODIFY OR HAVE MODIFIED A CERTIFIED CYPRESS PRODUCT AND SUCH MODIFIED PRODUCT NO LONGER COMPLIES WITH THE RELEVANT USB-IF SPECIFICATIONS.
