

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

4-Mbit (128K × 36) Pipelined Sync SRAM

Features

- Fully registered inputs and outputs for pipelined operation
- 128K × 36 common I/O architecture
- 3.3 V core power supply (V_{DD})
- 2.5 V/ 3.3 V I/O power supply (V_{DDQ})
- Fast clock to output times: 2.6 ns (for 250 MHz device)
- User selectable burst counter supporting Intel Pentium interleaved or linear burst sequences
- Separate processor and controller address strobes
- Synchronous self timed writes
- Asynchronous output enable
- Offered in Pb-free 100-pin TQFP package
- “ZZ” sleep mode option and stop clock option
- Available in commercial and industrial temperature range

Functional Description

The CY7C1347G is a 3.3 V, 128K × 36 synchronous pipelined SRAM designed to support zero-wait-state secondary cache with minimal glue logic. CY7C1347G I/O pins can operate at either the 2.5 V or the 3.3 V level. The I/O pins are 3.3 V tolerant when $V_{DDQ} = 2.5$ V. All synchronous inputs pass through input registers controlled by the rising edge of the clock. All data outputs pass through output registers controlled by the rising edge of the clock. Maximum access delay from the clock rise is 2.6 ns (250 MHz device). CY7C1347G supports either the interleaved burst sequence used by the Intel Pentium processor or a linear burst sequence used by processors such as the Power PC. The burst sequence is selected through the MODE pin. Accesses can be initiated by asserting either the address strobe from processor (\overline{ADSP}) or the address strobe from controller (\overline{ADSC}) at clock rise. Address advancement through the burst sequence is controlled by the ADV input. A 2-bit on-chip wraparound burst counter captures the first address in a burst sequence and automatically increments the address for the rest of the burst access.

Byte write operations are qualified with the four Byte Write Select ($BW_{[A:D]}$) inputs. A global write enable (\overline{GW}) overrides all byte write inputs and writes data to all four bytes. All writes are conducted with on-chip synchronous self timed write circuitry.

Three synchronous chip Selects (\overline{CE}_1 , \overline{CE}_2 , \overline{CE}_3) and an asynchronous output enable (\overline{OE}) provide for easy bank selection and output tristate control. To provide proper data during depth expansion, \overline{OE} is masked during the first clock of a read cycle when emerging from a deselected state.

Note

1. **Errata:** The ZZ pin (Pin 64) needs to be externally connected to ground. For more information, see "Errata" on page 22.

Pin Definitions

Name	I/O	Description
A ₀ , A ₁ , A	Input-Synchronous	Address Inputs Used to Select One of the 128 K Address Locations. Sampled at the rising edge of the CLK if ADSP or ADSC is active LOW, and CE ₁ , CE ₂ , and CE ₃ are sampled active. A _[1:0] feeds the 2-bit counter.
BW _A , BW _B , BW _C , BW _D	Input-Synchronous	Byte Write Select Inputs, Active LOW. Qualified with BWE to conduct byte writes to the SRAM. Sampled on the rising edge of CLK.
GW	Input-Synchronous	Global Write Enable Input, Active LOW. When asserted LOW on the rising edge of CLK, a global write is conducted (ALL bytes are written, regardless of the values on BW _[A:D] and BWE).
BWE	Input-Synchronous	Byte Write Enable Input, Active LOW. Sampled on the rising edge of CLK. This signal must be asserted LOW to conduct a byte write.
CLK	Input-Clock	Clock Input. Used to capture all synchronous inputs to the device. Also used to increment the burst counter when ADV is asserted LOW, during a burst operation.
CE ₁	Input-Synchronous	Chip Enable 1 Input, Active LOW. Sampled on the rising edge of CLK. Used in conjunction with CE ₂ and CE ₃ to select or deselect the device. ADSP is ignored if CE ₁ is HIGH. CE ₁ is sampled only when a new external address is loaded.
CE ₂	Input-Synchronous	Chip Enable 2 Input, Active HIGH. Sampled on the rising edge of CLK. Used in conjunction with CE ₁ and CE ₃ to select or deselect the device. CE ₂ is sampled only when a new external address is loaded.
CE ₃	Input-Synchronous	Chip Enable 3 Input, Active LOW. Sampled on the rising edge of CLK. Used in conjunction with CE ₁ and CE ₂ to select or deselect the device. CE ₃ is sampled only when a new external address is loaded.
OE	Input-Asynchronous	Output Enable, Asynchronous Input, Active LOW. Controls the direction of the I/O pins. When LOW, the I/O pins behave as outputs. When deasserted HIGH, I/O pins are tristated, and act as input data pins. OE is masked during the first clock of a read cycle when emerging from a deselected state.
ADV	Input-Synchronous	Advance Input Signal, Sampled on the Rising Edge of CLK. When asserted, it automatically increments the address in a burst cycle.
ADSP	Input-Synchronous	Address Strobe from Processor, Sampled on the Rising Edge of CLK. When asserted LOW, addresses presented to the device are captured in the address registers. A _[1:0] are also loaded into the burst counter. When ADSP and ADSC are both asserted, only ADSP is recognized. ADSP is ignored when CE ₁ is deasserted HIGH.
ADSC	Input-Synchronous	Address Strobe from Controller, Sampled on the Rising Edge of CLK. When asserted LOW, addresses presented to the device are captured in the address registers. A _[1:0] are also loaded into the burst counter. When ADSP and ADSC are both asserted, only ADSP is recognized.

Pin Definitions (continued)

Name	I/O	Description
ZZ ^[2]	Input-Asynchronous	ZZ “Sleep” Input. This active HIGH input places the device in a non-time-critical “sleep” condition with data integrity preserved. During normal operation, this pin must be LOW or left floating. ZZ pin has an internal pull-down.
DQ _A , DQ _B , DQ _C , DQ _D , DQP _A , DQP _B , DQP _C , DQP _D	I/O-Synchronous	Bidirectional Data I/O Lines. As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by the addresses presented during the previous clock rise of the read cycle. The direction of the pins is controlled by OE. When OE is asserted LOW, the pins behave as outputs. When HIGH, DQs and DQPs are placed in a tristate condition.
V _{DD}	Power Supply	Power Supply Inputs to the Core of the Device.
V _{SS}	Ground	Ground for the Core of the Device.
V _{DDQ}	I/O Power Supply	Power Supply for the I/O circuitry.
V _{SSQ}	I/O Ground	Ground for the I/O circuitry.
MODE	Input-Static	Selects Burst Order. When tied to GND selects linear burst sequence. When tied to V _{DDQ} or left floating selects interleaved burst sequence. This is a strap pin and must remain static during device operation. Mode pin has an internal pull-up.
NC, NC/9M, NC/18M, NC/36M, NC/72M, NC/144M, NC/288M, NC/576M, NC/1G	—	No Connects. Not internally connected to the die. NC/9M, NC/18M, NC/36M, NC/72M, NC/144M, NC/288M, NC/576M, and NC/1G are address expansion pins that are not internally connected to the die.

Note

2. **Errata:** The ZZ pin needs to be externally connected to ground. For more information, see ["Errata"](#) on page 22.

Functional Overview

All synchronous inputs pass through input registers controlled by the rising edge of the clock. All data outputs pass through output registers controlled by the rising edge of the clock. Maximum access delay from the clock rise (t_{CO}) is 2.6 ns (250 MHz device).

The CY7C1347G supports secondary cache in systems using either a linear or interleaved burst sequence. The linear burst sequence is suited for processors that use a linear burst sequence. The burst order is user selectable, and is determined by sampling the MODE input. Accesses can be initiated with either the Address Strobe from Processor (ADSP) or the Address Strobe from Controller (ADSC). Address advancement through the burst sequence is controlled by the ADV input. A two-bit on-chip wraparound burst counter captures the first address in a burst sequence and automatically increments the address for the rest of the burst access.

Byte write operations are qualified with the Byte Write Enable (BWE) and Byte Write Select ($BW_{[A:D]}$) inputs. A Global Write Enable (GW) overrides all byte write inputs and writes data to all four bytes. All writes are simplified with on-chip synchronous self timed write circuitry.

Three synchronous Chip Selects (\overline{CE}_1 , CE_2 , \overline{CE}_3) and an asynchronous Output Enable (\overline{OE}) provide for easy bank selection and output tristate control. ADSP is ignored if CE_1 is HIGH.

Single Read Accesses

This access is initiated when the following conditions are satisfied at clock rise: (1) ADSP or ADSC is asserted LOW, (2) \overline{CE}_1 , CE_2 , CE_3 are all asserted active, and (3) the write signals (GW, BWE) are all deasserted HIGH. ADSP is ignored if CE_1 is HIGH. The address presented to the address inputs ($A_{[16:0]}$) is stored into the address advancement logic and the Address Register while being presented to the memory core. The corresponding data is allowed to propagate to the input of the Output Registers. At the rising edge of the next clock the data is allowed to propagate through the Output Register and onto the data bus within 2.6 ns (250 MHz device) if \overline{OE} is active LOW. The only exception occurs when the SRAM is emerging from a deselected state to a selected state, its outputs are always tristated during the first cycle of the access. After the first cycle of the access, the outputs are controlled by the \overline{OE} signal. Consecutive single read cycles are supported. After the SRAM is deselected at clock rise by the chip select and either ADSP or ADSC signals, its output tristates immediately.

Single Write Accesses Initiated by ADSP

This access is initiated when both of the following conditions are satisfied at clock rise: (1) ADSP is asserted LOW, and (2) \overline{CE}_1 , CE_2 , CE_3 are all asserted active. The address presented to $A_{[16:0]}$ is loaded into the Address Register and the address advancement logic while being delivered to the RAM core. The write signals (GW, BWE, and $BW_{[A:D]}$) and ADV inputs are ignored during this first cycle.

ADSP-triggered write accesses require two clock cycles to complete. If GW is asserted LOW on the second clock rise, the data presented to the DQs and DQPs inputs is written into the corresponding address location in the RAM core. If \overline{GW} is HIGH, then the write operation is controlled by BWE and $BW_{[A:D]}$ signals. The CY7C1347G provides byte write capability that is described in "Partial Truth Table for Read/Write" on page 10. Asserting the Byte Write Enable input (BWE) with the selected Byte Write ($BW_{[A:D]}$) input selectively writes to only the desired bytes.

Bytes not selected during a byte write operation remain unaltered. A synchronous self timed write mechanism is provided to simplify the write operations.

Because the CY7C1347G is a common I/O device, the Output Enable (\overline{OE}) must be deasserted HIGH before presenting data to the DQs and DQPs inputs. Doing so tristates the output drivers. As a safety precaution, DQs and DQPs are automatically tristated whenever a write cycle is detected, regardless of the state of \overline{OE} .

Single Write Accesses Initiated by ADSC

ADSC write accesses are initiated when the following conditions are satisfied: (1) ADSC is asserted LOW, (2) ADSP is deasserted HIGH, (3) CE_1 , CE_2 , CE_3 are all asserted active, and (4) the appropriate combination of the write inputs (GW, BWE, and $BW_{[A:D]}$) are asserted active to conduct a write to the desired byte(s). ADSC-triggered write accesses require a single clock cycle to complete. The address presented to $A_{[16:0]}$ is loaded into the address register and the address advancement logic while being delivered to the RAM core. The ADV input is ignored during this cycle. If a global write is conducted, the data presented to the DQs and DQPs is written into the corresponding address location in the RAM core. If a byte write is conducted, only the selected bytes are written. Bytes not selected during a byte write operation remain unaltered. A synchronous self timed write mechanism has been provided to simplify the write operations.

Because the CY7C1347G is a common I/O device, the Output Enable (\overline{OE}) must be deasserted HIGH before presenting data to the DQs and DQPs inputs. Doing so tristates the output drivers. As a safety precaution, DQs and DQPs are automatically tristated whenever a write cycle is detected, regardless of the state of \overline{OE} .

Burst Sequences

The CY7C1347G provides a two-bit wraparound counter, fed by $A_{[1:0]}$, that implements either an interleaved or linear burst sequence. The interleaved burst sequence is designed specifically to support Intel Pentium applications. The linear burst sequence is designed to support processors that follow a linear burst sequence. The burst sequence is user-selectable through the MODE input.

Asserting \overline{ADV} LOW at clock rise automatically increments the burst counter to the next address in the burst sequence. Both read and write burst operations are supported.

Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation “sleep” mode. Two clock cycles are required to enter into or exit from this “sleep” mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the “sleep” mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected before entering the “sleep” mode. CE_1 , CE_2 , CE_3 , ADSP, and ADSC must remain inactive for the duration of t_{ZZREC} after the ZZ input returns LOW.

Interleaved Burst Sequence

First Address $A_{[1:0]}$	Second Address $A_{[1:0]}$	Third Address $A_{[1:0]}$	Fourth Address $A_{[1:0]}$
00	01	10	11
01	00	11	10
10	11	00	01
11	10	01	00

Notes

3. X = "Do not Care." H = Logic HIGH, L = Logic LOW.

4. $\overline{WRITE} = L$ when any one or more Byte Write Enable signals (\overline{BW}_A , \overline{BW}_B , \overline{BW}_C , \overline{BW}_D) and $\overline{BWE} = L$ or $\overline{GW} = L$. $\overline{WRITE} = H$ when all Byte Write Enable signals (\overline{BW}_A , \overline{BW}_B , \overline{BW}_C , \overline{BW}_D), \overline{BWE} , $\overline{GW} = H$.

5. The DQ pins are controlled by the current cycle and the \overline{OE} signal. \overline{OE} is asynchronous and is not sampled with the clock.

6. The SRAM always initiates a read cycle when \overline{ADSP} is asserted, regardless of the state of \overline{GW} , \overline{BWE} , or $\overline{BW}_{[A,D]}$. Writes may occur only on subsequent clocks after the \overline{ADSP} or with the assertion of \overline{ADSC} . As a result, \overline{OE} must be driven HIGH before the start of the write cycle to allow the outputs to tristate. \overline{OE} is a do not care for the remainder of the write cycle.

7. \overline{OE} is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle all data bits are tristate when \overline{OE} is inactive or when the device is deselected, and all data bits behave as output when \overline{OE} is active (LOW).

Partial Truth Table for Read/Write

The partial truth table for read/write for part number CY7C1347G follow.

Function ^[8, 9]	\overline{GW}	\overline{BWE}	$\overline{BW_D}$	$\overline{BW_C}$	$\overline{BW_B}$	$\overline{BW_A}$

Capacitance

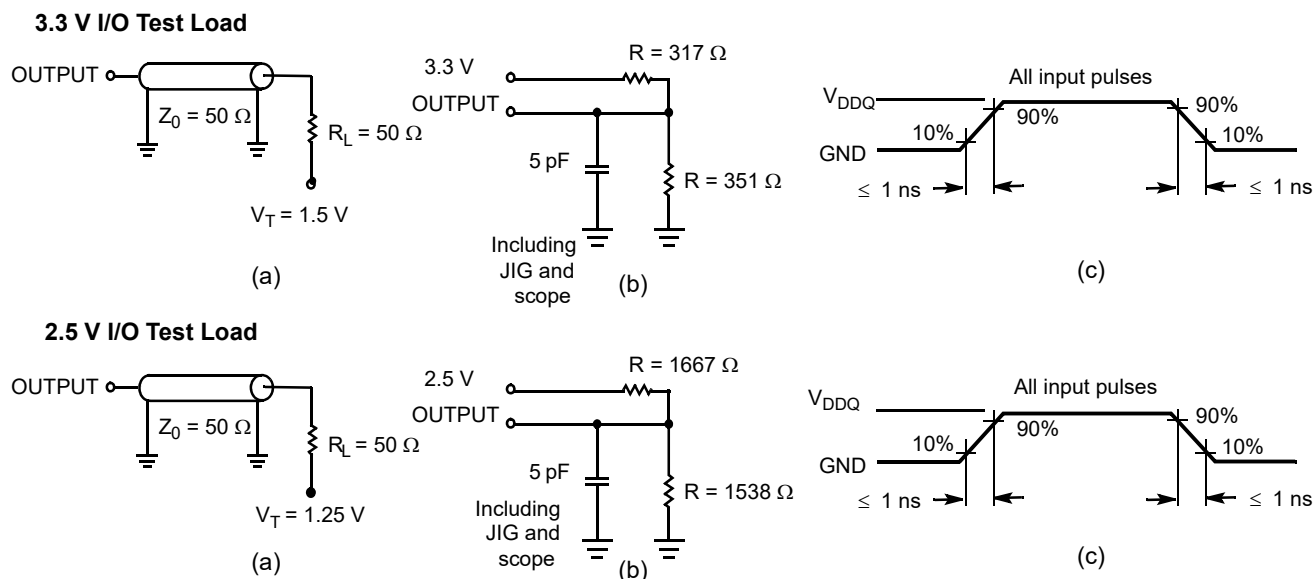

Parameter ^[12]	Description	Test Conditions	100-pin TQFP Max	Unit
C_{IN}	Input capacitance	$T_A = 25^\circ\text{C}$, $f = 1\text{ MHz}$, $V_{DD} = 3.3\text{ V}$, $V_{DDQ} = 3.3\text{ V}$	5	pF
C_{CLK}	Clock input capacitance		5	pF
C_{IO}	I/O capacitance		5	pF

Thermal Resistance

Parameter ^[12]	Description	Test Conditions	100-pin TQFP Package	Unit
Θ_{JA}	Thermal resistance (junction to ambient)	Test conditions follow standard test methods and procedures for measuring thermal impedance, per EIA/JESD51.	30.32	$^\circ\text{C/W}$
Θ_{JC}	Thermal resistance (junction to case)		6.85	$^\circ\text{C/W}$

AC Test Loads and Waveforms

Figure 2. AC Test Loads and Waveforms

Note

12. Tested initially and after any design or process changes that may affect these parameters.

Switching Characteristics

Over the Operating Range

Parameter ^[13, 14]	Description	-250		-200		-166		-133		Unit
		Min	Max	Min	Max	Min	Max	Min	Max	
t _{POWER}	V _{DD} (typical) to the first access ^[15]	1	–	1	–	1	–	1	–	ms
Clock										
t _{CYC}	Clock cycle time	4.0	–	5.0	–	6.0	–	7.5	–	ns
t _{CH}	Clock HIGH	1.7	–	2.0	–	2.5	–	3.0	–	ns
t _{CL}	Clock LOW	1.7	–	2.0	–	2.5	–	3.0	–	ns
Output Times										
t _{CO}	Data output valid after CLK rise	–	2.6	–	2.8	–	3.5	–	4.0	ns
t _{DOH}	Data output hold after CLK rise	1.0	–	1.0	–	1.5	–	1.5	–	ns
t _{CLZ}	Clock to low Z ^[16, 17, 18]	0	–	0	–	0	–	0	–	ns
t _{CHZ}	Clock to high Z ^[16, 17, 18]	–	2.6	–	2.8	–	3.5	–	4.0	ns
t _{OEV}	\overline{OE} LOW to output valid	–	2.6	–	2.8	–	3.5	–	4.5	ns
t _{OELZ}	\overline{OE} LOW to output low Z ^[16, 17, 18]	0	–	0	–	0	–	0	–	ns
t _{OEHZ}	\overline{OE} HIGH to output high Z ^[16, 17, 18]	–	2.6	–	2.8	–	3.5	–	4.0	ns
Setup Times										
t _{AS}	Address setup before CLK rise	1.2	–	1.2	–	1.5	–	1.5	–	ns
t _{ADS}	\overline{ADSC} , \overline{ADSP} setup before CLK rise	1.2	–	1.2	–	1.5	–	1.5	–	ns
t _{ADVS}	\overline{ADV} setup before CLK rise	1.2	–	1.2	–	1.5	–	1.5	–	ns
t _{WES}	\overline{GW} , \overline{BWE} , $\overline{BW_X}$ setup before CLK rise	1.2	–	1.2	–	1.5	–	1.5	–	ns
t _{DS}	Data input setup before CLK rise	1.2	–	1.2	–	1.5	–	1.5	–	ns
t _{CES}	Chip enable setup before CLK rise	1.2	–	1.2	–	1.5	–	1.5	–	ns
Hold Times										
t _{AH}	Address hold after CLK rise	0.3	–	0.5	–	0.5	–	0.5	–	ns
t _{ADH}	\overline{ADSP} , \overline{ADSC} hold after CLK rise	0.3	–	0.5	–	0.5	–	0.5	–	ns
t _{ADVH}	\overline{ADV} hold after CLK Rise	0.3	–	0.5	–	0.5	–	0.5	–	ns
t _{WEH}	\overline{GW} , \overline{BWE} , $\overline{BW_X}$ hold after CLK rise	0.3	–	0.5	–	0.5	–	0.5	–	ns
t _{DH}	Data input hold after CLK rise	0.3	–	0.5	–	0.5	–	0.5	–	ns
t _{CEH}	Chip enable hold after CLK rise	0.3	–	0.5	–	0.5	–	0.5	–	ns

Notes

13. Timing references level is 1.5 V when V_{DDQ} = 3.3 V and is 1.25 V when V_{DDQ} = 2.5 V on all datasheets.

14. Test conditions shown in (a) of Figure 2 on page 13 unless otherwise noted.

15. This part has an internal voltage regulator; t_{POWER} is the time that the power must be supplied above V_{DD(min)} initially before a read or write operation can be initiated.

16. t_{CHZ}, t_{CLZ}, t_{OELZ}, and t_{OEHZ} are specified with AC test conditions shown in part (b) of Figure 2 on page 13. Transition is measured ±200 mV from steady-state voltage.

17. At any voltage and temperature, t_{OEHZ} is less than t_{OELZ} and t_{CHZ} is less than t_{CLZ} to eliminate bus contention between SRAMs when sharing the same data bus.

These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve High Z before Low Z under the same system conditions.

18. This parameter is sampled and not 100% tested.

Switching Waveforms

Figure 3. Read Cycle Timing ^[19]

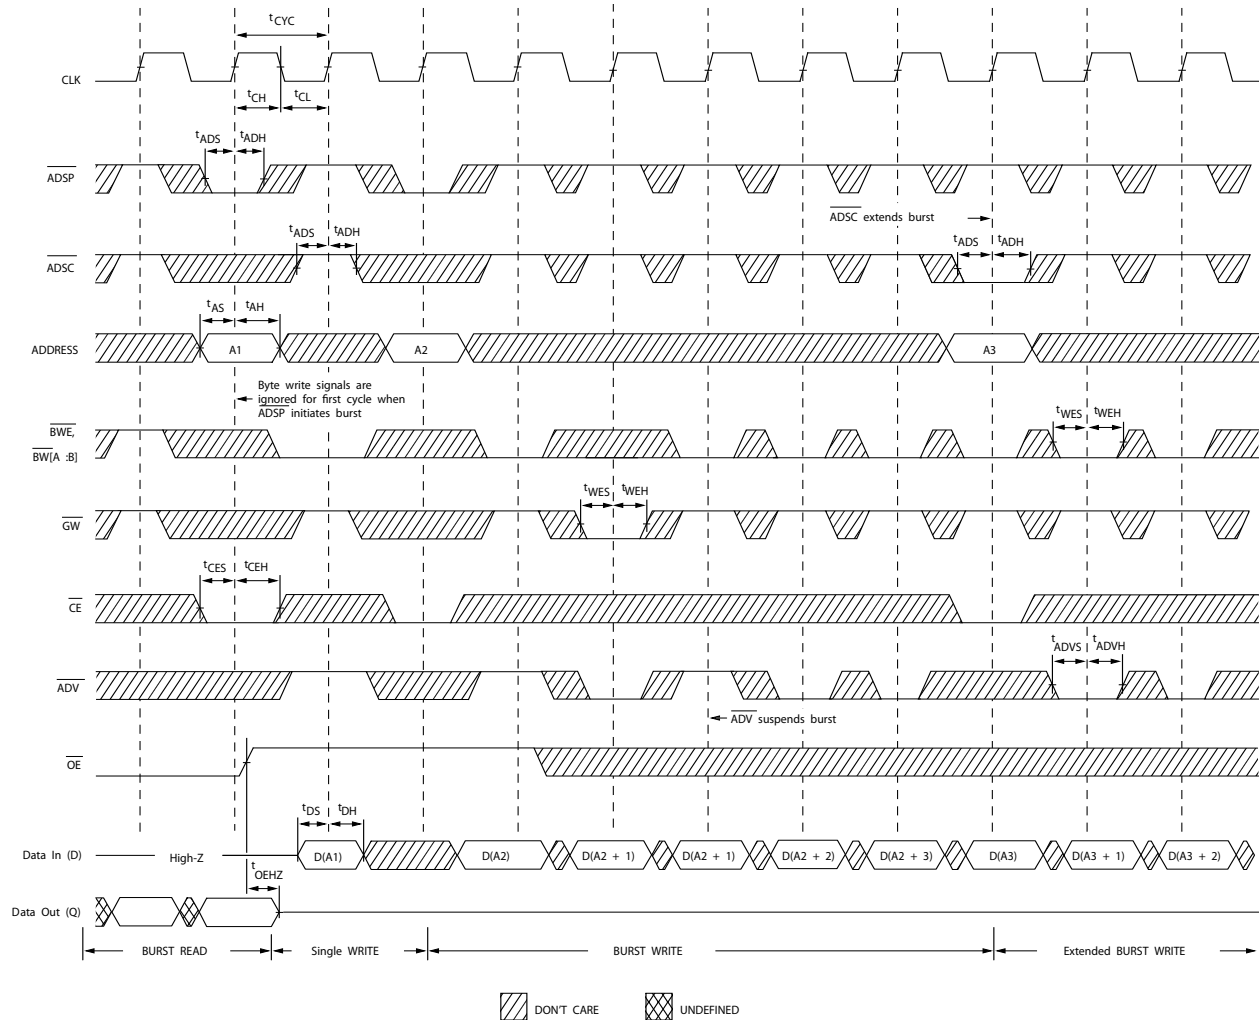

Note

19. In this diagram, when \overline{CE} is LOW, \overline{CE}_1 is LOW, CE_2 is HIGH, and \overline{CE}_3 is LOW. When \overline{CE} is HIGH, \overline{CE}_1 is HIGH, CE_2 is LOW, or \overline{CE}_3 is HIGH.

Switching Waveforms (continued)

Figure 4. Write Cycle Timing [20, 21]

Notes

20. In this diagram, when \overline{CE} is LOW, \overline{CE}_1 is LOW, CE_2 is HIGH, and \overline{CE}_3 is LOW. When \overline{CE} is HIGH, \overline{CE}_1 is HIGH, CE_2 is LOW, or \overline{CE}_3 is HIGH.
 21. Full width write can be initiated by either \overline{GW} LOW, or by \overline{GW} HIGH, \overline{BWE} LOW, and BW_x LOW.

Switching Waveforms (continued)

Figure 5. Read/Write Cycle Timing [22, 23, 24]

Notes

22. In this diagram, when \overline{CE} is LOW, \overline{CE}_1 is LOW, CE_2 is HIGH, and \overline{CE}_3 is LOW. When \overline{CE} is HIGH, \overline{CE}_1 is HIGH, CE_2 is LOW, or \overline{CE}_3 is HIGH.

23. The data bus (Q) remains in High Z following a write cycle, unless a new read access is initiated by ADSP or ADSC.

24. \overline{GW} is HIGH.

Switching Waveforms (continued)

Figure 6. ZZ Mode Timing [25, 26]

Notes

25. Device must be deselected when entering ZZ mode. See "Truth Table" on page 9 for all possible signal conditions to deselect the device.
 26. DQs are in High Z when exiting ZZ sleep mode.

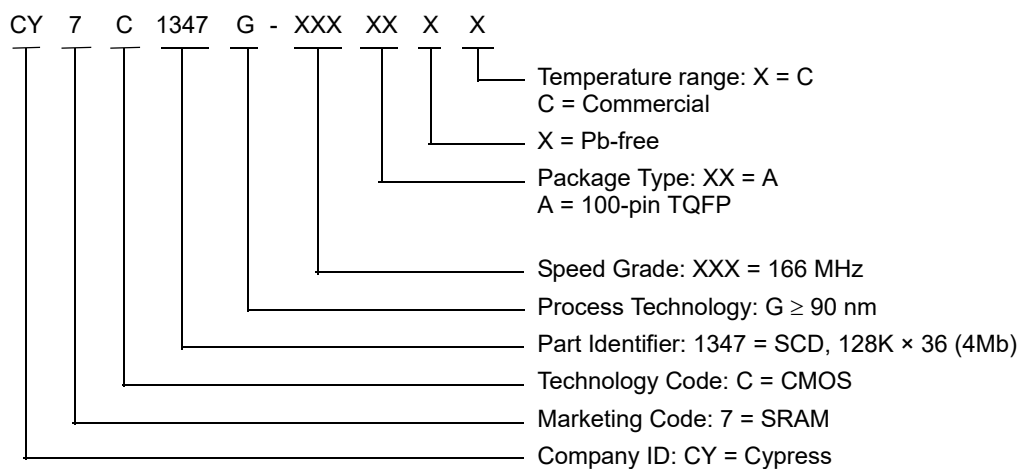

Ordering Information

The table below contains only the parts that are currently available. If you don't see what you are looking for, please contact your local sales representative. For more information, visit the Cypress website at www.cypress.com and refer to the product summary page at <http://www.cypress.com/products>

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives and distributors. To find the office closest to you, visit us at <http://www.cypress.com/go/datasheet/offices>

Speed (MHz)	Ordering Code	Package Diagram	Package Type	Operating Range
166	CY7C1347G-166AXC	51-85050	100-pin TQFP (14 × 20 × 1.4 mm) Pb-free	Commercial

Ordering Code Definitions

Acronyms

Acronym	Description
\overline{CE}	Chip Enable
CMOS	Complementary Metal Oxide Semiconductor
I/O	Input/Output
JEDEC	Joint Electron Device Engineering Council
LMBU	Logical Multi-Bit Upsets
LSBU	Logical Single-Bit Upsets
\overline{OE}	Output Enable
SEL	Single Event Latch-up
SRAM	Static Random Access Memory
TQFP	Thin Quad Flat Pack
TTL	Transistor-Transistor Logic
\overline{WE}	Write Enable

Errata

This section describes the Ram9 Sync ZZ pin issue. Details include trigger conditions, the devices affected, proposed workaround and silicon revision applicability. Please contact your local Cypress sales representative if you have further questions.

Part Numbers Affected

Density & Revision	Package Type	Operating Range
4Mb-Ram9 Synchronous SRAMs: CY7C134*G	100-pin TQFP	Commercial and Industrial

Product Status

All of the devices in the Ram9 4Mb Sync family are qualified and available in production quantities.

Ram9 Sync ZZ Pin Issues Errata Summary

The following table defines the errata applicable to available Ram9 4Mb Sync family devices.

Item	Issues	Description	Device	Fix Status
1.	ZZ Pin	When asserted HIGH, the ZZ pin places device in a "sleep" condition with data integrity preserved. The ZZ pin currently does not have an internal pull-down resistor and hence cannot be left floating externally by the user during normal mode of operation.	4M-Ram9 (90 nm)	For the 4M Ram9 (90 nm) devices, there is no plan to fix this issue.

1. ZZ Pin Issue

■ Problem Definition

The problem occurs only when the device is operated in the normal mode with ZZ pin left floating. The ZZ pin on the SRAM device does not have an internal pull-down resistor. Switching noise in the system may cause the SRAM to recognize a HIGH on the ZZ input, which may cause the SRAM to enter sleep mode. This could result in incorrect or undesirable operation of the SRAM.

■ Trigger Conditions

Device operated with ZZ pin left floating.

■ Scope of Impact

When the ZZ pin is left floating, the device delivers incorrect data.

■ Workaround

Tie the ZZ pin externally to ground.

■ Fix Status

For the 4M Ram9 (90 nm) devices, there is no plan to fix this issue.

Document History Page

Document Title: CY7C1347G, 4-Mbit (128K × 36) Pipelined Sync SRAM Document Number: 38-05516				
Revision	ECN	Orig. of Change	Submission Date	Description of Change
**	224364	RKF	05/17/2004	New data sheet.
*A	276690	VBL	10/14/2004	Updated Ordering Information (Updated part numbers; added comment on the BG and BZ Pb-free package availability below the table).
*B	333625	SYT	03/16/2005	Updated Features (Removed 225 MHz and 100 MHz frequencies related information). Updated Selection Guide (Removed 225 MHz and 100 MHz frequencies related information). Updated Pin Configurations (Updated Address Expansion balls in the pinouts for 100-pin TQFP Package as per JEDEC standards). Updated Pin Definitions : Removed "NC" and its details. Added "NC, NC/9M, NC/18M, NC/36M, NC/72M, NC/144M, NC/288M, NC/576M, NC/1G" and their details. Updated Electrical Characteristics (Updated test conditions for V_{OL} and V_{OH} parameters; removed 225 MHz and 100 MHz frequencies related information). Updated Switching Characteristics (Removed 225 MHz and 100 MHz frequencies related information). Updated Thermal Resistance (Replaced TBDs with respective values for Θ_{JA} and Θ_{JC} parameters). Updated Ordering Information (Updated part numbers (By shading and unshading MPNs as per availability); changed the package name for 100-pin TQFP from A100RA to A101 in Package Name column; removed comment on the availability of BG Pb-free package).
*C	419256	R XU	01/10/2006	Changed status from Preliminary to Final. Changed address of Cypress Semiconductor Corporation from "3901 North First Street" to "198 Champion Court". Updated Truth Table (Swapped typo CE_2 and \overline{CE}_3 in the column heading). Updated Electrical Characteristics (Changed "Input Load Current except ZZ and MODE" to "Input Leakage Current except ZZ and MODE"; updated Note 11 (Changed test condition from $V_{IH} \leq V_{DD}$ to $V_{IH} < V_{DD}$)). Updated Ordering Information (Updated part numbers; removed Package Name column; added Package Diagram column in the table). Updated Package Diagrams : spec 51-85050 – Changed revision from *A to *B. Updated to new template.
*D	480124	VKN	07/14/2006	Updated Maximum Ratings (Added "Supply Voltage on V_{DDQ} Relative to GND" and its corresponding details). Updated Ordering Information (Updated part numbers).
*E	1078184	VKN	05/23/2007	Updated Switching Waveforms (Updated Figure 4).
*F	2633279	NXR / AESA	01/15/2009	Updated Ordering Information (Updated part numbers). Updated to new template.
*G	2756998	VKN	08/28/2009	Added Neutron Soft Error Immunity . Updated Ordering Information (Updated part numbers (By including parts that are available); and modified the disclaimer for the Ordering information). Updated Package Diagrams : spec 51-85180 – Changed revision from *A to *B.
