

Military Temp, 18-Mbit (512K × 36) Flow-Through SRAM (With ECC)

Features

- Supports 133 MHz bus operations
- 512K × 36 common I/O
- 3.3 V core power supply (V_{DD})
- 2.5 V or 3.3 V I/O supply (V_{DDQ})
- Fast clock-to-output time
 - 6.5 ns (133 MHz version)
- Provides high-performance 2-1-1 access rate
- User selectable burst counter supporting interleaved or linear burst sequences
- Separate processor and controller address strobes
- Synchronous self-timed write
- Asynchronous output enable
- Available in JEDEC-standard lead-free 100-pin TQFP
- ZZ sleep mode option
- On-chip error correction code (ECC) to reduce soft error rate (SER)
- Operates over military temperature range: -55 °C to +125 °C

Functional Description

The CY7C1381KVE33 is a 3.3 V, 512K × 36 synchronous flow-through SRAMs, designed to interface with high-speed microprocessors with minimum glue logic. The maximum access delay from clock rise is 6.5 ns (133 MHz version). A 2-bit on-chip counter captures the first address in a burst and increments the address automatically for the rest of the burst access. All synchronous inputs are gated by registers controlled by a positive edge-triggered clock input (CLK). The synchronous inputs include all addresses, all data inputs, address pipelining chip enable (CE_1), depth-expansion chip enables (CE_2 and CE_3), burst control inputs (ADSC, ADSP, and ADV), write enables (BW_x and BWE), and global write (GW). Asynchronous inputs include the output enable (OE) and the ZZ pin.

The CY7C1381KVE33 allows interleaved or linear burst sequences, selected by the MODE input pin. A HIGH selects an interleaved burst sequence, while a LOW selects a linear burst sequence. Burst accesses can be initiated with the processor address strobe (ADSP) or the cache controller address strobe (ADSC) inputs. Address advancement is controlled by the address advancement (ADV) input.

Addresses and chip enables are registered at the rising edge of the clock when the address strobe processor (ADSP) or address strobe controller (ADSC) are active. Subsequent burst addresses can be internally generated as controlled by the advance pin (ADV).

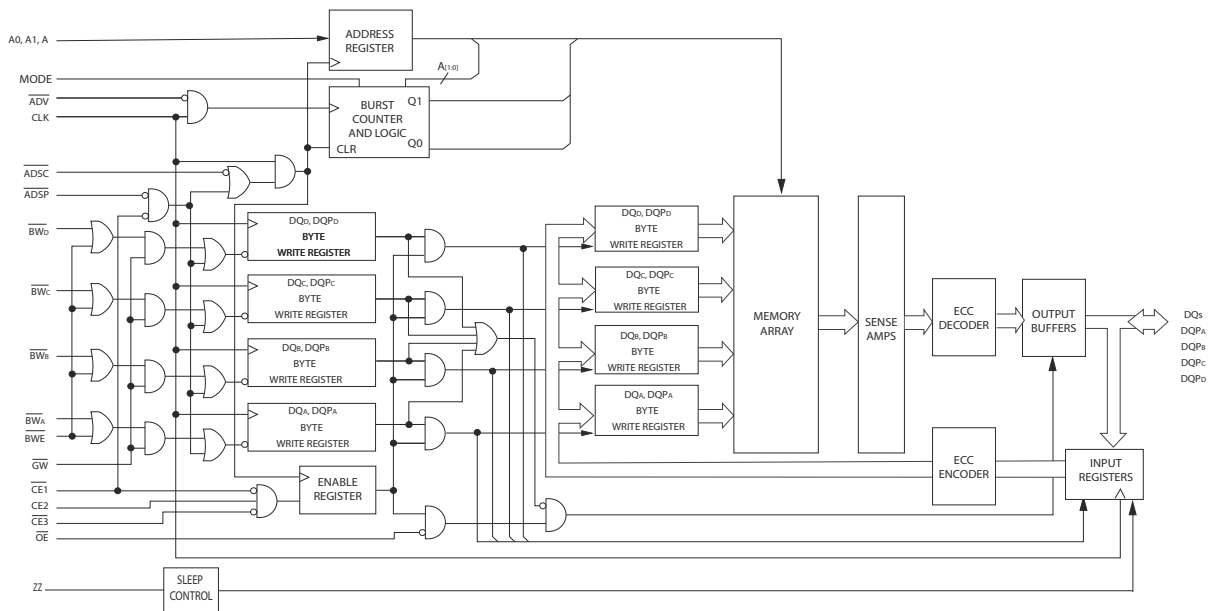

CY7C1381KVE33 operates from a +3.3 V core power supply while all outputs operate with a +2.5 V or +3.3 V supply. All inputs and outputs are JEDEC-standard and JESD8-5-compatible.

Selection Guide

Description		133 MHz	Unit

Pin Definitions

Name	I/O	Description
A ₀ , A ₁ , A	Input Synchronous	Address inputs used to select one of the address locations. Sampled at the rising edge of the CLK if ADSP or ADSC is active LOW, and CE ₁ , CE ₂ , and CE ₃ are sampled active. A _[1:0] feed the 2-bit counter.
BW _A , BW _B , BW _C , BW _D	Input Synchronous	Byte write select inputs, active LOW. Qualified with BWE to conduct byte writes to the SRAM. Sampled on the rising edge of CLK.
GW	Input Synchronous	Global write enable input, active LOW. When asserted LOW on the rising edge of CLK, a global write is conducted (all bytes are written, regardless of the values on BW _[A:D] and BWE).
CLK	Input Clock	Clock input. Used to capture all synchronous inputs to the device. Also used to increment the burst counter when ADV is asserted LOW, during a burst operation.
CE ₁	Input Synchronous	Chip enable 1 input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with CE ₂ and CE ₃ to select or deselect the device. ADSP is ignored if CE ₁ is HIGH. CE ₁ is sampled only when a new external address is loaded.
CE ₂	Input Synchronous	Chip enable 2 input, active HIGH. Sampled on the rising edge of CLK. Used in conjunction with CE ₁ and CE ₃ to select or deselect the device. CE ₂ is sampled only when a new external address is loaded.
CE ₃	Input Synchronous	Chip enable 3 input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with CE ₁ and CE ₂ to select or deselect the device. CE ₃ is sampled only when a new external address is loaded.
OE	Input Asynchronous	Output enable, asynchronous input, active LOW. Controls the direction of the I/O pins. When LOW, the I/O pins behave as outputs. When deasserted HIGH, I/O pins are tristated, and act as input data pins. OE is masked during the first clock of a read cycle when emerging from a deselected state.
ADV	Input Synchronous	Advance input signal. Sampled on the rising edge of CLK. When asserted, it automatically increments the address in a burst cycle.
ADSP	Input Synchronous	Address strobe from processor, sampled on the rising edge of CLK, active LOW. When asserted LOW, addresses presented to the device are captured in the address registers. A _[1:0] are also loaded into the burst counter. When ADSP and ADSC are both asserted, only ADSP is recognized. ADSP is ignored when CE ₁ is deasserted HIGH.
ADSC	Input Synchronous	Address strobe from controller, sampled on the rising edge of CLK, active LOW. When asserted LOW, addresses presented to the device are captured in the address registers. A _[1:0] are also loaded into the burst counter. When ADSP and ADSC are both asserted, only ADSP is recognized.
BWE	Input Synchronous	Byte write enable input, active LOW. Sampled on the rising edge of CLK. This signal must be asserted LOW to conduct a byte write.
ZZ	Input Asynchronous	ZZ sleep input. This active HIGH input places the device in a non time critical sleep condition with data integrity preserved. For normal operation, this pin has to be LOW or left floating. ZZ pin has an internal pull down.
DQ _s	I/O Synchronous	Bidirectional data I/O lines. As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by the addresses presented during the previous clock rise of the read cycle. The direction of the pins is controlled by OE. When OE is asserted LOW, the pins behave as outputs. When HIGH, DQ _s and DQP _x are placed in a tristate condition. The outputs are automatically tristated during the data portion of a write sequence, during the first clock when emerging from a deselected state, and when the device is deselected, regardless of the state of OE.
DQP _x	I/O Synchronous	Bidirectional data parity I/O lines. Functionally, these signals are identical to DQ _s . During write sequences, DQP _x is controlled by BW _x correspondingly.
MODE	Input Static	Selects burst order. When tied to GND, selects linear burst sequence. When tied to V _{DD} or left floating, selects interleaved burst sequence. This is a strap pin and must remain static during device operation. Mode pin has an internal pull-up.

Pin Definitions *(continued)*

Name	I/O	Description
V _{DD}	Power Supply	Power supply inputs to the core of the device.
V _{DDQ}	I/O Power Supply	Power supply for the I/O circuitry.
V _{SS}	Ground	Ground for the core of the device.
V _{SSQ}	I/O Ground	Ground for the I/O circuitry.
NC	–	No connects. Not internally connected to the die. 36M, 72M, 144M, 288M, 576M, and 1G are address expansion pins and are not internally connected to the die.
V _{SS} /DNU	Ground/DNU	This pin can be connected to ground or can be left floating.

Functional Overview

All synchronous inputs pass through input registers controlled by the rising edge of the clock. Maximum access delay from the clock rise (t_{CDV}) is 6.5 ns (133 MHz device).

CY7C1381KVE33 supports secondary cache in systems using a linear or interleaved burst sequence. The burst order is user selectable, and is determined by sampling the MODE input. Accesses can be initiated with the processor address strobe (ADSP) or the controller address strobe (ADSC). Address advancement through the burst sequence is controlled by the ADV input. A two-bit on-chip wraparound burst counter captures the first address in a burst sequence and automatically increments the address for the rest of the burst access.

Byte write operations are qualified with the byte write enable (\overline{BWE}) and byte write select (BW_X) inputs. A global write enable (GW) overrides all byte write inputs and writes data to all four bytes. All writes are simplified with on-chip synchronous self-timed write circuitry.

Three synchronous chip selects (\overline{CE}_1 , CE_2 , \overline{CE}_3) and an asynchronous output enable (\overline{OE}) provide for easy bank selection and output tristate control. ADSP is ignored if \overline{CE}_1 is HIGH.

Single Read Accesses

A single read access is initiated when the following conditions are satisfied at clock rise: (1) \overline{CE}_1 , CE_2 , and \overline{CE}_3 are all asserted active, and (2) ADSP or ADSC is asserted LOW (if the access is initiated by ADSC, the write inputs must be deasserted during this first cycle). The address presented to the address inputs is latched into the address register and the burst counter and/or control logic, and later presented to the memory core. If the \overline{OE} input is asserted LOW, the requested data is available at the data outputs with a maximum to t_{CDV} after clock rise. ADSP is ignored if \overline{CE}_1 is HIGH.

Single Write Accesses Initiated by ADSP

This access is initiated when the following conditions are satisfied at clock rise: (1) \overline{CE}_1 , CE_2 , and \overline{CE}_3 are all asserted active, and (2) ADSP is asserted LOW. The addresses presented are loaded into the address register and the burst inputs (GW, \overline{BWE} , and BW_X) are ignored during this first clock cycle. If the write inputs are asserted active (see [Truth Table for Read/Write on page 9](#) for appropriate states that indicate a write)

on the next clock rise, the appropriate data is latched and written into the device. Byte writes are allowed. All I/O are tristated during a byte write. Because this is a common I/O device, the asynchronous \overline{OE} input signal must be deasserted and the I/O must be tristated before the presentation of data to DQs. As a precaution, the data lines are tristated when a write cycle is detected, regardless of the state of \overline{OE} .

Single Write Accesses Initiated by ADSC

This write access is initiated when the following conditions are satisfied at clock rise: (1) \overline{CE}_1 , CE_2 , and \overline{CE}_3 are all asserted active, (2) ADSC is asserted LOW, (3) ADSP is deasserted HIGH, and (4) the write input signals (GW, \overline{BWE} , and BW_X) indicate a write access. ADSC is ignored if ADSP is active LOW.

The addresses presented are loaded into the address register and the burst counter, the control logic, or both, and delivered to the memory core. The information presented to DQ_[A:D] is written into the specified address location. Byte writes are allowed. All I/O are tristated when a write is detected, even a byte write. Because this is a common I/O device, the asynchronous \overline{OE} input signal must be deasserted and the I/O must be tristated prior to the presentation of data to DQs. As a precaution, the data lines are tristated when a write cycle is detected, regardless of the state of \overline{OE} .

Burst Sequences

CY7C1381KVE33 provides an on-chip two-bit wraparound burst counter inside the SRAM. The burst counter is fed by A_[1:0] and can follow either a linear or interleaved burst order. The burst order is determined by the state of the MODE input. A LOW on MODE selects a linear burst sequence. A HIGH on MODE selects an interleaved burst order. Leaving MODE unconnected causes the device to default to a interleaved burst sequence.

Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation sleep mode. Two clock cycles are required to enter into or exit from this sleep mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the sleep mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected before entering the sleep mode. \overline{CE}_1 , CE_2 , \overline{CE}_3 , ADSP, and ADSC must remain inactive for the duration of t_{ZZREC} after the ZZ input returns LOW.

Interleaved Burst Address Table

 (MODE = Floating or V_{DD})

First Address A1:A0	Second Address A1:A0	Third Address A1:A0	Fourth Address A1:A0
00	01	10	11
01	00	11	10
10	11	00	01
11	10	01	00

Linear Burst Address Table

(MODE = GND)

First Address A1:A0	Second Address A1:A0	Third Address A1:A0	Fourth Address A1:A0
00	01	10	11
01	10	11	00
10	11	00	01
11	00	01	10

ZZ Mode Electrical Characteristics

Parameter	Description	Test Conditions	Min	Max	Unit
I_{DDZZ}	Sleep mode standby current	$ZZ \geq V_{DD} - 0.2 \text{ V}$	–	90	mA
t_{ZZS}	Device operation to ZZ	$ZZ \geq V_{DD} - 0.2 \text{ V}$	–	$2t_{CYC}$	ns
t_{ZZREC}	ZZ recovery time	$ZZ \leq 0.2 \text{ V}$	$2t_{CYC}$	–	ns
t_{ZZI}	ZZ active to sleep current	This parameter is sampled	–	$2t_{CYC}$	ns
t_{RZZI}	ZZ inactive to exit sleep current	This parameter is sampled	0	–	ns

Notes

1. X = Don't Care, H = Logic HIGH, L = Logic LOW.
2. \overline{WRITE} = L when any one or more byte write enable signals, and \overline{BWE} = L or \overline{GW} = L. \overline{WRITE} = H when all byte write enable signals, \overline{BWE} , \overline{GW} = H.
3. The DQ pins are controlled by the current cycle and the \overline{OE} signal. \overline{OE} is asynchronous and is not sampled with the clock.
4. The SRAM always initiates a read cycle when \overline{ADSP} is asserted, regardless of the state of \overline{GW} , \overline{BWE} , or \overline{BW}_X . Writes may occur only on subsequent clocks after the \overline{ADSP} or with the assertion of \overline{ADSC} . As a result, \overline{OE} must be driven HIGH prior to the start of the write cycle to allow the outputs to tristate. \overline{OE} is a don't care for the remainder of the write cycle.
5. \overline{OE} is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle all data bits are tristate when \overline{OE} is inactive or when the device is deselected, and all data bits behave as output when \overline{OE} is active (LOW).

Truth Table for Read/Write

The truth table for CY7C1381KVE33 read/write follows. [6, 7]

Function (CY7C1381KVE33)	\overline{GW}	\overline{BWE}	$\overline{BW_D}$	$\overline{BW_C}$	$\overline{BW_B}$	$\overline{BW_A}$
Read	H	H	X	X	X	X
Read	H	L	H	H	H	H
Write Byte A (DQ _A , DQP _A)	H	L	H	H	H	L
Write Byte B (DQ _B , DQP _B)	H	L	H	H	L	H
Write Bytes A, B (DQ _A , DQ _B , DQP _A , DQP _B)	H	L	H	H	L	L
Write Byte C (DQ _C , DQP _C)	H	L	H	L	H	H
Write Bytes C, A (DQ _C , DQ _A , DQP _C , DQP _A)	H	L	H	L	H	L
Write Bytes C, B (DQ _C , DQ _B , DQP _C , DQP _B)	H	L	H	L	L	H
Write Bytes C, B, A (DQ _C , DQ _B , DQ _A , DQP _C , DQP _B , DQP _A)	H	L	H	L	L	L
Write Byte D (DQ _D , DQP _D)	H	L	L	H	H	H
Write Bytes D, A (DQ _D , DQ _A , DQP _D , DQP _A)	H	L	L	H	H	L
Write Bytes D, B (DQ _D , DQ _A , DQP _D , DQP _A)	H	L	L	H	L	H
Write Bytes D, B, A (DQ _D , DQ _B , DQ _A , DQP _D , DQP _B , DQP _A)	H	L	L	H	L	L
Write Bytes D, B (DQ _D , DQ _B , DQP _D , DQP _B)	H	L	L	L	H	H
Write Bytes D, B, A (DQ _D , DQ _C , DQ _A , DQP _D , DQP _C , DQP _A)	H	L	L	L	H	L

Notes

6. X=Don't Care, H = Logic HIGH, L = Logic LOW.

7. The table only has a partial listing of the byte write combinations. Any combination of $\overline{BW_X}$ is valid. Appropriate write is done based on which byte write is active.

Maximum Ratings

Exceeding the maximum ratings may impair the useful life of the device. For user guidelines, not tested.

Storage Temperature -65 °C to +150 °C

Case Temperature with
Power Applied -55 °C to +125 °C

Supply Voltage on V_{DD} Relative to GND -0.3 V to +4.6 V

Supply Voltage on V_{DDQ} Relative to GND -0.3 V to + V_{DD}

DC Voltage Applied to Outputs
in Tristate -0.5 V to $V_{DDQ} + 0.5$ V

DC Input Voltage -0.5 V to $V_{DD} + 0.5$ V

Current into Outputs (LOW) 20 mA

Static Discharge Voltage
(per MIL-STD-883, Method 3015) > 2001 V

Latch-up Current > 200 mA

Operating Range

Range	Case Temperature	V_{DD}	V_{DDQ}
Military	-55 °C to +125 °C	3.3 V – 5% / + 10%	2.5 V – 5% to V_{DD}

Neutron Soft Error Immunity

Parameter	Description	Test Conditions	Typ	Max*	Unit
LSBU	Logical Single-Bit Upsets	25 °C	0	0.01	FIT/Mb
LMBU	Logical Multi-Bit Upsets	25 °C	0	0.01	FIT/Mb
SEL	Single Event Latch up	85 °C	0	0.1	FIT/Dev

* No LMBU or SEL events occurred during testing; this column represents a statistical χ^2 , 95 percent confidence limit calculation. For more details refer to Application Note, AN54908 – Accelerated Neutron SER Testing and Calculation of Terrestrial Failure Rates.

Electrical Characteristics

Over the Operating Range

Parameter ^[8, 9]	Description	Test Conditions	Min	Max	Unit
V_{DD}	Power Supply Voltage		3.135	3.6	V
V_{DDQ}	I/O Supply Voltage	for 3.3 V I/O	3.135	V_{DD}	V
		for 2.5 V I/O	2.375	2.625	V
V_{OH}	Output HIGH Voltage	for 3.3 V I/O, $I_{OH} = -4.0$ mA	2.4	–	V
		for 2.5 V I/O, $I_{OH} = -1.0$ mA	2.0	–	V
V_{OL}	Output LOW Voltage	for 3.3 V I/O, $I_{OL} = 8.0$ mA	–	0.4	V
		for 2.5 V I/O, $I_{OL} = 1.0$ mA	–	0.4	V
V_{IH}	Input HIGH Voltage ^[8]	for 3.3 V I/O	2.0	$V_{DD} + 0.3$	V
		for 2.5 V I/O	1.7	$V_{DD} + 0.3$	V
V_{IL}	Input LOW Voltage ^[8]	for 3.3 V I/O	–0.3	0.8	V
		for 2.5 V I/O	–0.3	0.7	V

Notes

8. Overshoot: $V_{IH(AC)} < V_{DD} + 1.5$ V (pulse width less than $t_{CYC}/2$), undershoot: $V_{IL(AC)} > -2$ V (pulse width less than $t_{CYC}/2$).

9. $T_{Power-up}$: Assumes a linear ramp from 0 V to $V_{DD(min.)}$ of at least 200 ms. During this time $V_{IH} < V_{DD}$ and $V_{DDQ} \leq V_{DD}$.

t _{AH}	Address hold after CLK rise	0.5	–	ns
t _{ADH}	ADSP, ADSC hold after CLK rise	0.5	–	ns
t _{WEH}	$\overline{\text{GW}}$, $\overline{\text{BWE}}$, $\overline{\text{BW}}_{[\text{A:D}]}$ hold after CLK rise	0.5	–	ns
t _{ADVH}	$\overline{\text{ADV}}$ hold after CLK rise	0.5	–	ns
t _{DH}	Data input hold after CLK rise	0.5	–	ns
t _{CEH}	Chip enable hold after CLK rise	0.5	–	ns

Notes

10. Timing reference level is 1.5 V when V_{DDQ} = 3.3 V and is 1.25 V when V_{DDQ} = 2.5 V.

11. Test conditions shown in (a) of [Figure 2 on page 12](#) unless otherwise noted.

12. This part has a voltage regulator internally; t_{POWER} is the time that the power needs to be supplied above V_{DD(minimum)} initially, before a read or write operation can be initiated.

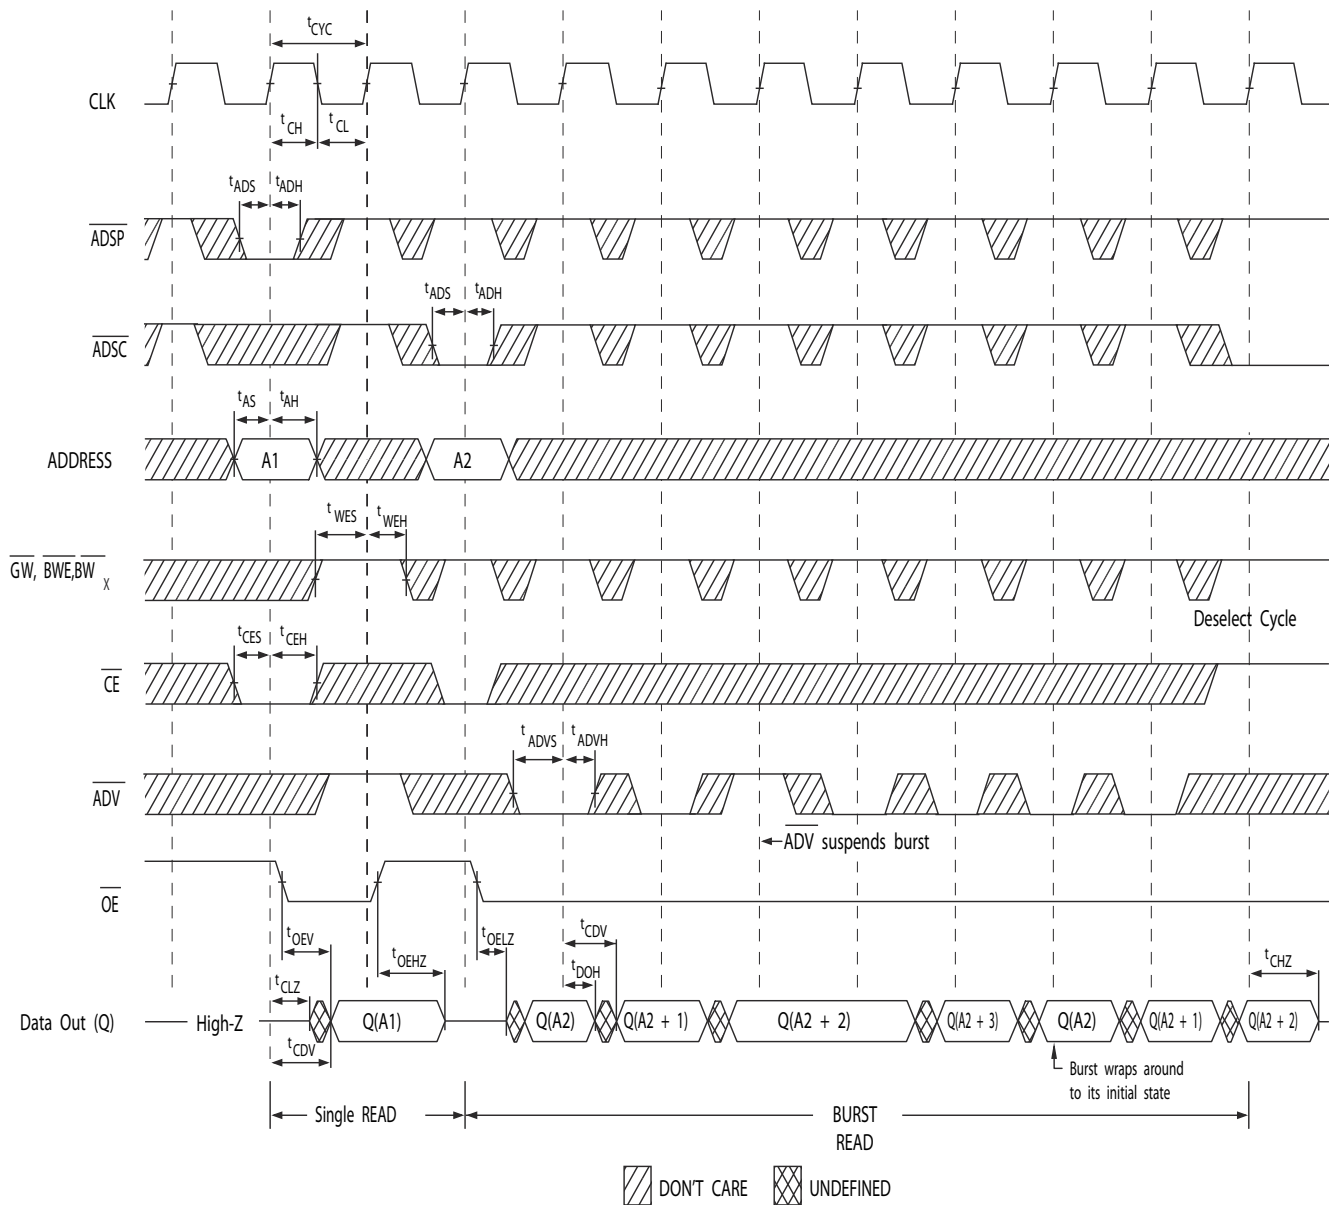

13. t_{CHZ}, t_{CLZ}, t_{OE_{LZ}}, and t_{OE_{HZ}} are specified with AC test conditions shown in part (b) of [Figure 2 on page 12](#). Transition is measured ±200 mV from steady-state voltage

14. At any given voltage and temperature, t_{OE_{HZ}} is less than t_{OE_{LZ}} and t_{CHZ} is less than t_{CLZ} to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst-case user conditions. The device is designed to achieve high-Z before low-Z under the same system condition.

15. This parameter is sampled and not 100 percent tested.

Timing Diagrams

Figure 3. Read Cycle Timing ^[16]

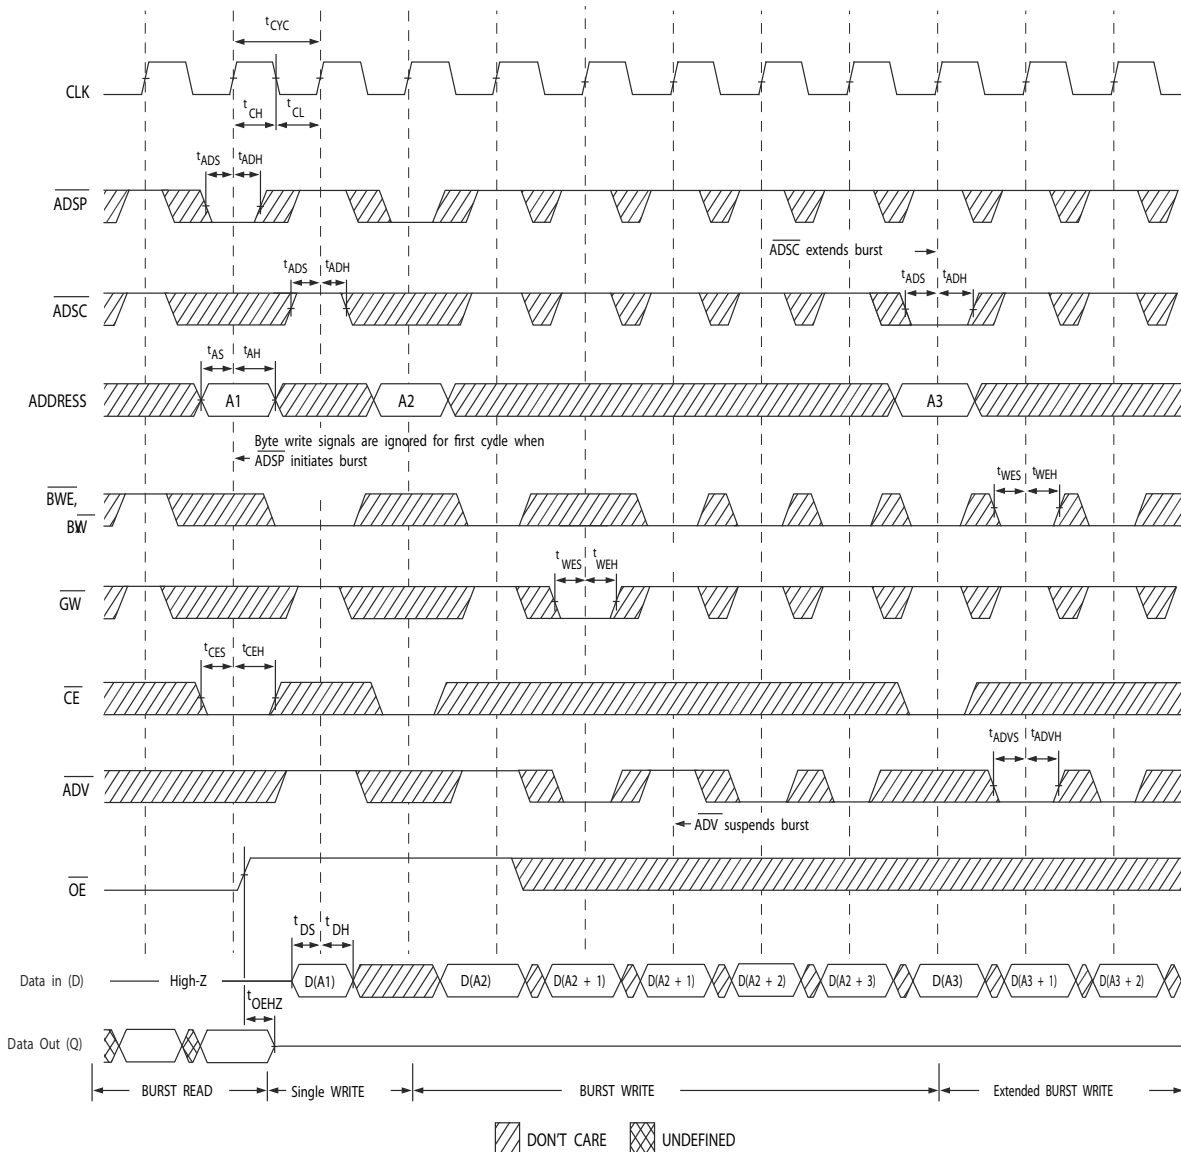

Note

16. In this diagram, when \overline{CE} is LOW: \overline{CE}_1 is LOW, CE_2 is HIGH, and \overline{CE}_3 is LOW. When \overline{CE} is HIGH: \overline{CE}_1 is HIGH, CE_2 is LOW, or \overline{CE}_3 is HIGH.

Timing Diagrams (continued)

Figure 4. Write Cycle Timing [17, 18]

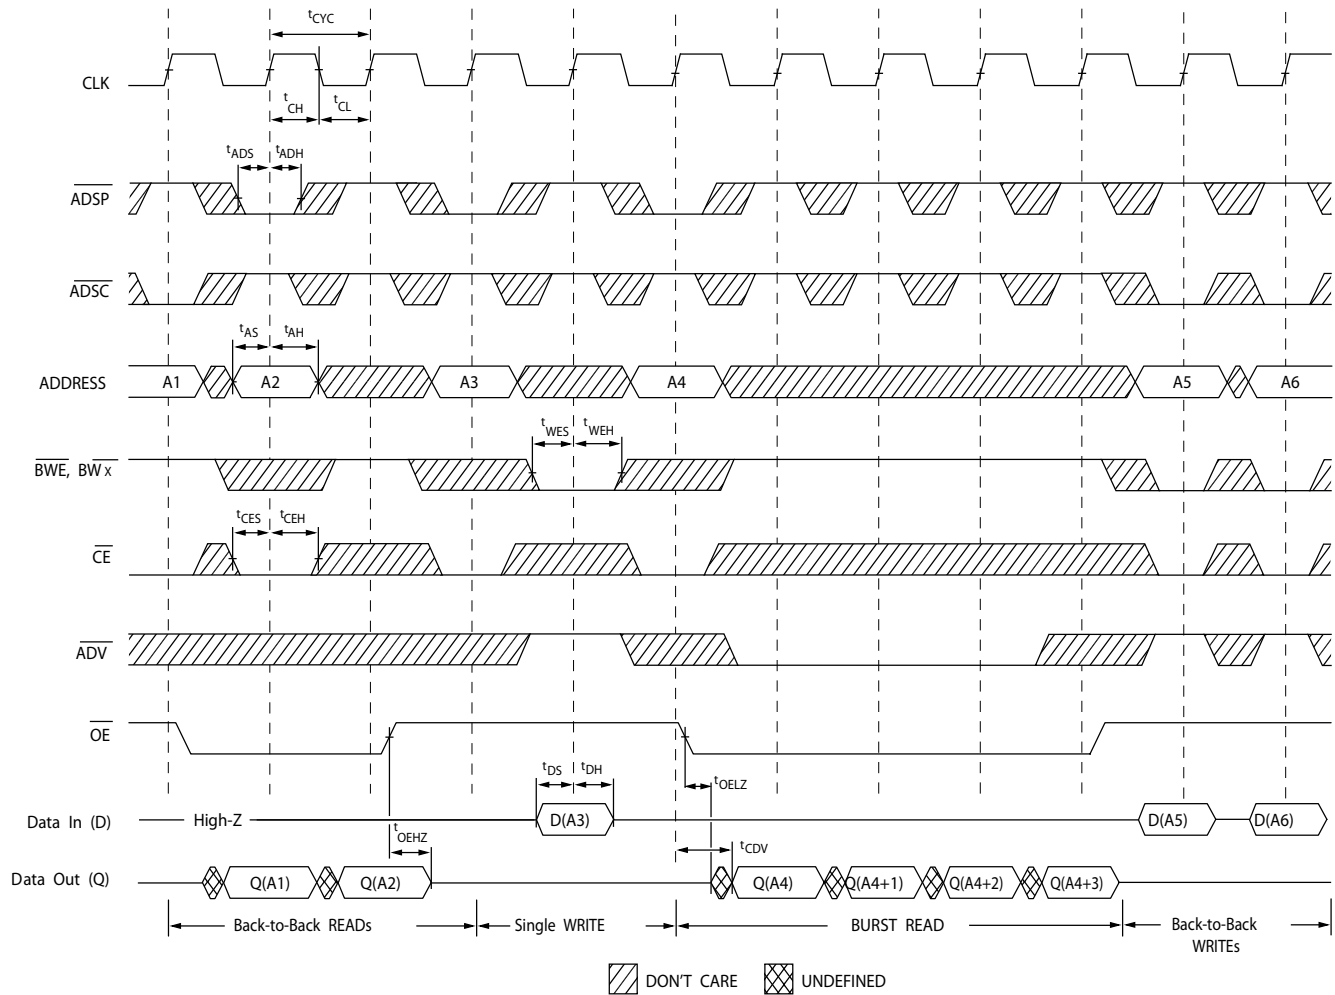

Notes

17. In this diagram, when \overline{CE} is LOW: \overline{CE}_1 is LOW, \overline{CE}_2 is HIGH, and \overline{CE}_3 is LOW. When \overline{CE} is HIGH: \overline{CE}_1 is HIGH, \overline{CE}_2 is LOW, or \overline{CE}_3 is HIGH.

18. Full-width write can be initiated by either \overline{GW} LOW; or by \overline{GW} HIGH, \overline{BWE} LOW, and \overline{BW}_X LOW.

Timing Diagrams (continued)

Figure 5. Read/Write Cycle Timing [19, 20, 21]

Notes

19. In this diagram, when \overline{CE} is LOW: \overline{CE}_1 is LOW, \overline{CE}_2 is HIGH, and \overline{CE}_3 is LOW. When \overline{CE} is HIGH: \overline{CE}_1 is HIGH, \overline{CE}_2 is LOW, or \overline{CE}_3 is HIGH.
 20. The data bus (Q) remains in high-Z following a Write cycle, unless a new read access is initiated by ADSP or ADSC.
 21. \overline{GW} is HIGH.

Timing Diagrams *(continued)*

Figure 6. ZZ Mode Timing [22, 23]

Notes

22. Device must be deselected when entering ZZ mode. See [Truth Table on page 8](#) for all possible signal conditions to deselect the device.

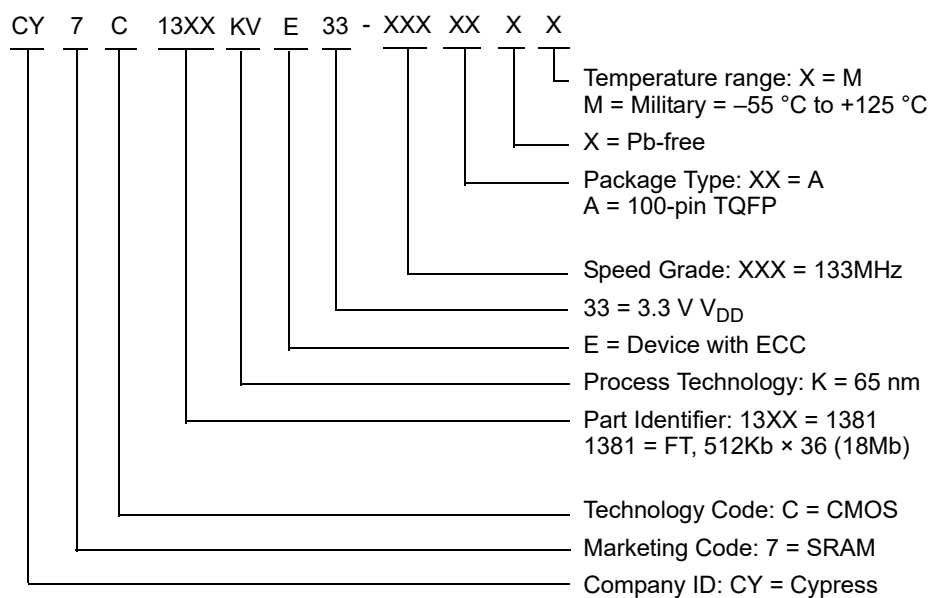

23. DQs are in high Z when exiting ZZ sleep mode.

Ordering Information

Cypress offers other versions of this product type in many different configurations and features. The following table contains only the list of parts that are currently available. For a complete listing of all options, visit the Cypress website at www.cypress.com and refer to the product summary page at www.cypress.com/products or contact your local sales representative. Cypress maintains a worldwide network of offices, solution centers, manufacturers' representatives and distributors. To find the office closest to you, visit www.cypress.com/go/datasheet/offices.

Speed (MHz)	Ordering Code	Package Diagram	Part and Package Type	Operating Range
