

Datasheet for Telink BLE + IEEE802.15.4 Multi-Standard Wireless SoC TLSR8253F512

DS-TLSR8253-E14

Ver 1.0.1

2024/1/11

Keyword:

Bluetooth Low Energy; BLE Mesh; RF4CE; 2.4GHz

Brief:

This datasheet is dedicated for Telink BLE + IEEE802.15.4 multi-standard SoC TLSR8253F512 (VID: 0x02). In this datasheet, key features, working mode, main modules, electrical specification and application of the TLSR8253F512 are introduced.

1 Overview

The TLSR8253F512 is Telink-developed Bluetooth LE + IEEE802.15.4 multi-standard wireless SoC solution with internal Flash and audio support. It's completely RoHS-compliant and 100% lead (Pb)-free.

The TLSR8253F512 combines the radio frequency (RF), digital processing, protocols stack software and profiles for Bluetooth Low Energy, BLE Mesh, RF4CE and 2.4GHz proprietary standard into a single SoC. The TLSR8253F512's embedded 512kB FLASH enables dynamic stack and profile configuration, and the final end product functionality is configurable via software, providing ultimate flexibility. The TLSR8253F512 also has hardware OTA upgrades support and multiple boot switching, allowing convenient product feature roll outs and upgrades.

The TLSR8253F512 supports concurrent multi-standards. For some use cases, the TLSR8253F512 can "concurrently" run two standards, for example, stacks such as BLE and 802.15.4 can run concurrently with one application state but dual radio communication channels for interacting with different devices. The end product working in this mode can maintain active Bluetooth Smart connections to smart phones or other BLE devices while control and communicate with 802.15.4 or other 2.4GHz devices at the same time. In this case, it's compatible with Bluetooth standard, supports BLE specification, allows easy connectivity with Bluetooth Smart Ready mobile phones, tablets, laptops, which supports BLE slave and master mode operation, including broadcast, encryption, connection updates, and channel map updates. At the same time, it also supports IEEE 802.15.4 standard-compliant platform, and is perfect for creating interoperable solution for use within the home combined with leading RF4CE software stack. This feature enables products to bridge the smartphone and home automation world with a single chip and no requirement for an external hub.

The TLSR8253F512 integrates hardware acceleration to support the complicated security operations required by Bluetooth, without the requirement for an external DSP, thereby significantly reducing the product eBOM.

The TLSR8253F512 supports single or dual analog microphones or digital microphone, and stereo audio output with enhanced voice performance for voice search and other such applications. The TLSR8253F512 also includes a full range of on-chip peripherals for interfacing with external components such as LEDs, sensors, touch controllers, keyboards, and motors. This makes it an ideal single-chip solution for IoT (Internet of Things) and HID (Human Interface Devices) application such as wearable devices, smart lighting, smart home devices, advanced remote controls, and wireless toys.

1.1 Block diagram

The TLSR8253F512 is designed to offer high integration, ultra-low power application capabilities. The system's block diagram is as shown in Figure 1-1.

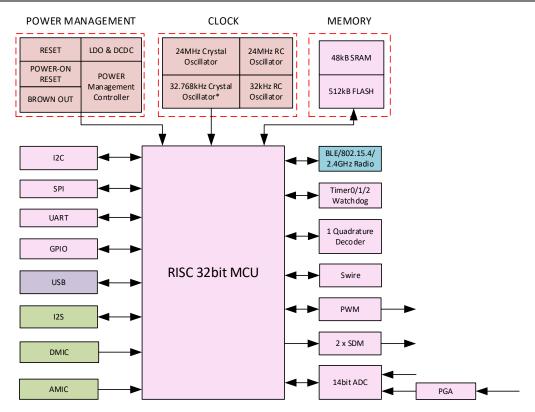

Figure 1-1 Block diagram of the system

*Notes:

- Modules marked with different colors belong to different power domains. Power state of each power domain can be controlled independent of other power domains, for example, the audio module (including I2S, DMIC, AMIC) can be independently powered on or powered down irrespective of other modules such as power management module, clock, and etc.
- 2) The BLE/802.15.4/2.4GHz Radio and Audio (I2S, DMIC, AMIC) are powered down by default.
- 3) The power management module and clock should be always powered on, even in deep sleep.
- 4) In deep sleep, except for the power management and clock, all other modules should be powered down.

The TLSR8253F512 integrates a power-balanced 32-bit MCU, BLE/802.15.4/2.4GHz Radio, 48kB SRAM, 512kB internal Flash, 14bit ADC with PGA, analog and digital microphone input, stereo audio output, 6-channel PWM (1-channel IR/IR FIFO/IR DMA FIFO), one quadrature decoder (QDEC), abundant and flexible GPIO interfaces, and nearly all the peripherals needed for IoT (Internet of Things) and HID (Human Interface Devices) application development (e.g. Bluetooth Low Energy and IEEE 802.15.4/RF4CE).

The TLSR8253F512 also includes multi-stage power management design allowing ultra-low power operation and making it the ideal candidate for wearable and power-constraint applications.

With the high integration level of TLSR8253F512, few external components are needed to satisfy customers' ultra-low cost requirements.

1.2 Key features

1.2.1 General features

General features are as follows:

- 1) 4-byte Chip UID (Unique ID).
- 2) Embedded 32-bit proprietary microcontroller.
 - ♦ Better power-balanced performance than ARM M0
 - ♦ Instruction cache controller
 - ♦ Maximum running speed up to 48MHz
- 3) Program memory: internal 512kB Flash.
- 4) Data memory: 48kB on-chip SRAM, including up to 32kB SRAMs with retention in deep sleep, and one 16kB SRAM without retention in deep sleep.
- 5) RTC and other timers:
 - Clock source of 32.768kHz & 24MHz Crystal and 32kHz/24MHz embedded RC oscillator, among which, the external 24MHz is to verify internal 32K clock, the internal 32KHz is for low precision application, external 32.768 is for high precision application
 - ♦ Three general 32-bit timers with four selectable modes in active mode
 - ♦ Watchdog timer
 - ♦ A low-frequency 32kHz timer available in low power mode
- 6) A rich set of I/Os:
 - ♦ Up to 32/17 GPIOs. All digital IOs can be used as GPIOS.
 - ♦ DMIC (Digital Mic).
 - ♦ AMIC (Analog Mic).
 - ♦ 12S.
 - ♦ Stereo Audio output.
 - ♦ SPI.
 - ♦ I2C.
 - ♦ UART with hardware flow control and 7816 protocol support.
 - ♦ USB.
 - ♦ Swire debug Interface.
- 7) Up to 6 channels of differential PWM:
 - ♦ PWM1~PWM5: 5-channel normal PWM output.
 - ♦ PWM0: 1 channel with IR/IR FIFO/IR DMA FIFO mode for IR generation.
- 8) Sensor:
 - 14bit 6-channel (only GPIO input) SAR ADC, with 4-channel differential input PGA, effective bits: 10.5bits

```
DS-TLSR8253-E14
```

- ♦ Temperature sensor
- 9) One quadrature decoder.
- 10) Embedded hardware AES block cipher with 128 bit keys and software AES-CCM.
- 11) Embedded hardware acceleration for Elliptical curve cryptography (ECC).
- 12) Embedded low power comparator.
- 13) Operating temperature range(ET/AT: Telink defined temperature range symbols):
 - ♦ ET version: -40°C~+85°C
 - ♦ AT version: -40° C~+125 $^{\circ}$ C
- 14) Supports BLE, BLE Mesh, RF4CE and 2.4GHz proprietary technologies into a single SoC without the requirement for an external DSP.

1.2.2 RF Features

RF features include:

- 1) BLE/802.15.4/2.4GHz RF transceiver embedded, working in worldwide 2.4GHz ISM band.
- 2) Bluetooth LE 1Mbps and 2Mbps, Long Range 125kbps and 500kbps.
- 3) IEEE802.15.4 compliant, 250kbps.
- 4) 2.4GHz proprietary 1Mbps/2Mbps/250kbps/500kbps mode with Adaptive Frequency Hopping feature support.
- 5) A NT mode.
- 6) Rx Sensitivity: -96dBm@BLE 1Mbps, -99.5dBm@ IEEE802.15.4 250kbps, -93dBm @ BLE 2Mbps mode, -99dBm @ BLE 500kbps mode, -101dBm @ BLE 125kbps mode .
- 7) Tx output power: up to +10dBm.
- 8) Single-pin antenna interface.
- 9) RSSI monitoring with +/-1dB resolution.
- 10) Auto acknowledgement, retransmission and flow control.
- 11) Support full-function BLE location features.

1.2.3 Features of power management module

Features of power management module include:

- 1) Power supply: 1.8V~3.6V.
- 2) Embedded LDO and DCDC.
- 3) Battery monitor: Supports low battery detection.
- 4) Multiple stage power management to minimize power consumption.
- 5) Low power consumption:
 - ♦ Whole Chip RX mode: 5.3mA

- ♦ Whole Chip TX mode: 4.8mA @ 0dBm with DCDC
- \diamond Deep sleep with external wakeup (without SRAM retention): 0.4 μ A
- Deep sleep with SRAM retention: 1μA (with 8kB SRAM retention), 1.2μA (with 16kB SRAM retention), 1.4μA (with 32kB SRAM retention)
- Deep sleep with external wakeup, with 32K RC oscillator on (without SRAM retention):
 0.9μA
- ♦ Deep sleep with SRAM retention, with 32K RC oscillator on: 1.5μ A (with 8kB SRAM retention), 1.7μ A (with 16kB SRAM retention), 1.9μ A (with 32kB SRAM retention)

1.2.4 USB features

USB features include:

- 1) Compatible with USB2.0 Full speed mode.
- 2) Supports 9 endpoints including control endpoint 0 and 8 configurable data endpoints.
- 3) Independent power domain.
- 4) Supports ISP (In-System Programming) via USB port.

1.2.5 Flash features

The TLSR8253F512 embeds Flash with features below:

- 1) Total 512kB (4Mbits).
- 2) Flexible architecture: 4kB per Sector, 64kB/32kB per block.
- 3) Up to 256 Bytes per programmable page.
- 4) Write protect all or portions of memory.
- 5) Sector erase (4kB).
- 6) Block erase (32kB/64kB).
- 7) Cycle Endurance: 100,000 program/erases.
- 8) Data Retention: typical 20-year retention.
- 9) Multi firmware encryption methods for anti-cloning protection.

1.2.6 RF4CE features

RF4CE features include:

- 1) Based on IEEE 802.15.4 Standard, certified RF4CE platform, with ZRC1.1/ZRC2.0 and MSO profile support.
- 2) Various transmission options including broadcast.
- 3) Provides a secured key generation mechanism.
- 4) Supports a simple pairing mechanism for devices with full application confirmation.
- 5) Only authorized devices are able to communicate.

- 6) Various power saving modes are supported for all device classes.
- 7) Supports AES-128bit encryption and AES-CCM (Counter with the CBC-MAC) mode.
- 8) Extensible to vendor specific profiles.
- 9) Telink extended profile with audio support for voice command based searches.
- 10) Over the air (OTA) firmware upgrade with hardware support.

1.2.7 BLE features

BLE features include:

- 1) Qualified for Bluetooth 5.3, main features supported include:
 - ♦ 1Mbps, 2Mbps, Long Range S2 (500Kbps), S8 (125Kbps).
 - ♦ High duty cycle non-connectable ADV.
 - \diamond Extended ADV.
 - ♦ LE Channel selection algorithm #2.
- 2) Bluetooth SIG Mesh support.

1.2.8 BLE Mesh features

BLE Mesh features include:

- 1) Compatible with Bluetooth SIG Mesh specification 1.0, with additional features from Telink enhanced design.
- 2) Support flexible mesh control, e.g. N-to-1 and N-to-M.
- 3) Supports switch control for over 200 nodes without delay.
- 4) Supports real time status update for over 200 nodes.
- 5) Secure and safe control and scalable identification within network.
- 6) 8/16 groups can be controlled at the same time.
- 7) 128/256 nodes within mesh network.
- 8) Configurable to more or fewer hops (e.g. 4 hops) within mesh network, single hop delay less than 15ms.
- 9) Flexible RF channel usage with both BLE advertising channels and data channels for good anti-interference performance.

1.2.9 Concurrent mode feature

In concurrent mode, the chip supports multiple standard working concurrently.

Typical combination is Bluetooth LE + 802.15.4 based standard (e.g. RF4CE): BLE and 802.15.4 based stacks can run concurrently with one application state based on time division technology, e.g. BLE stack will run alternately during the divided time slots.

1.3 Typical applications

The TLSR8253F512 can be applied to IoT (Internet of Things) and HID (Human Interface Devices) applications, such as BLE smart devices, BLE mesh devices, and 2.4GHz IEEE 802.15.4, RF4CE remote control /set-top box.

Its typical applications include, but are not limited to the following:

- ♦ Smartphone and tablet accessories
- ♦ RF Remote Control
- ♦ Sports and fitness tracking
- ♦ Wearable devices
- ♦ Wireless toys
- ♦ Smart Lighting, Smart Home devices
- ♦ Building Automation
- ♦ Smart Grid
- ♦ Intelligent Logistics/Transportation/City
- ♦ Consumer Electronics
- ♦ Industrial Control
- ♦ Health Care

1.4 Ordering information

Table 1-1Ordering information of the TLSR8253F512*1

| Product Series | Package Type | Temperature Range | Product Part No. | Packing Method ^{*2} | Minimum Order Quantity |
|----------------|---------------------------|----------------------|------------------|---------------------------------|------------------------------|
| TLSR8253F512 | 48-pin TQFN 7x7x0.75mm | -40℃~+85℃ | TLSR8253F512ET48 | TR | 3000 |
| | 32-pin TQFN 5x5x0.75mm | -40℃~+85℃ | TLSR8253F512ET32 | TR | 3000 |
| | 32-pin TQFN 5x5x0.75mm | -40℃~+125℃ | TLSR8253F512AT32 | TR | 3000 |

¹ MSL (Moisture Sensitivity Level): The 8253 series is applicable to MSL3 (Based on JEDEC Standard J-STD-020).

[♦] After the packing opened, the product shall be stored at <30°C / <60%RH and the product shall be used within 168 hours.</p>

[♦] When the color of the indicator in the packing changed, the product shall be baked before soldering.

 $[\]diamond$ If baking is required, please refer to IPC/JEDEC J-STD-033 for baking procedure.

² Packing method "TR" means tape and reel. The tape and reel material DO NOT support baking under high temperature.

1.5 Package

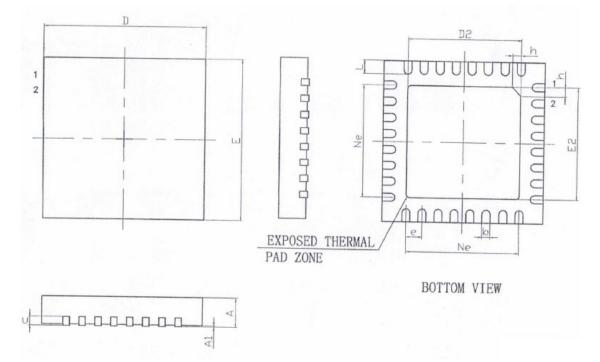

Package dimensions for the TLSR8253F512ET48 and TLSR8253F512ET/AT32 are shown as below.

1.6.3 Notes

- 1) All digital IOs including PA<0> ~ PD<7> can be used as GPIOs and have configurable pull-up/pulldown resistor.
- 2) SPI:
 - ♦ PD<7>: SPI_CK, PB<6>: SPI_DI, PB<7>: SPI_DO, PD<2>: SPI_CN
 - ♦ PA<2>: DO, PA<3>: DI, PA<4>: CK, PD<6>: CN
- 3) I2C:
 - ♦ PC<0> ~ PC<3> can be used as I2C. PC<0>: I2C_SDA, PC<1>: I2C_SCK, PC<2>: I2C_SDA, PC<3>: I2C_SCK
 - I2C can also be multiplexed with SPI interface, i.e. I2C_SDA/I2C_SCK can be multiplexed with SPI_DI /SPI_CK respectively.
- 4) Audio PGA/AMIC input: PC<0>~PC<3>. Please refer to section 12 PGA. Any GPIO pin can be used as AMIC BIAS.
- 5) DMIC:
 - ♦ PA<0>: DMIC_DI, PA<1>: DMIC_CLK
- 6) I2S:
 - ♦ PD<7>: I2S_BCK, PA<1>: I2S_CLK, PD<2>: I2S_LR, PD<3>: I2S_SDI, PD<4>: I2S_SDO
- 7) Stereo audio output:
 - ♦ PB<4>: SDM_P0, PB<5>: SDM_N0, PB<6>: SDM_P1, PB<7>: SDM_N1
- 8) UART:
 - ◇ PA<0>: UART_RX, PA<2>: UART_TX, PB<0>: UART_RX, PB<1>: UART_TX, PB<7>: UART_RX, PC<3>: UART_RX, PC<5>: UART_RX, PD<6>: UART_RX
 - ♦ UART hardware flow control:

PA<3>: UART_CTS, PA<4>: UART_RTS, PA<7>: UART_RTS, PB<2>: UART_CTS, PB<3>: UART_RTS, PB<6>: UART_RTS, PC<0>: UART_RTS, PC<4>: UART_CTS, PD<1>: UART_CTS

♦ UART 7816:

PD<7>: 7816_TRX (UART_TX), PA<1>: 7816_CLK, PC<2>: 7816_TRX (UART_TX), PD<0>: 7816_TRX (UART_TX), PD<3>: 7816_TRX (UART_TX)

- 9) USB:
 - ♦ PA<5>: DM
 - ♦ PA<6>: DP
- 10) Single Wire debug interface:

- ♦ PA<7>: SWS. SWS can also be multiplexed with DP
- ♦ PD<4>: SWM
- 11) RX_CYC2LNA & TX_CYC2PA:
 - ◇ PB<2>: RX_CYC2LNA, PB<3>: TX_CYC2PA, PC<6>: RX_CYC2LNA, PC<7>: TX_CYC2PA, PD<0>: RX_CYC2LNA, PD<1>: TX_CYC2PA
 - RX_CYC2LNA/TX_CYC2PA serves to control enabling external PA/LNA. Please refer to section 3.1 Block diagram
- 12) ATSEL0~2:
 - ♦ PB<0>: ATSEL1, PB<1>: ATSEL2, PC<5>: ATSEL0, PC<6>: ATSEL1, PC<7>: ATSEL2, PD<6>: ATSEL0
 - ☆ ATSEL0~2 serves to select one of up to eight external antennas connected to the antenna select component. The selected antenna channel is connected to the RF_IO pin.
- 13) Low power comparator input: PB<1>~ PB<7>. Please refer to **chapter 13**.
- 14) ADC GPIO input: PB<0>~ PB<7>, PC<4>~ PC<5>
- 15) For register configuration to select pin multiplexed function, please refer to section 7.1.1.3 Multiplexed functions.
- 16) For 24MHz crystal, the load capacitor range supported by design is 7.33pF~12.66pF. If the crystal needs load capacitor of 15pF, two external capacitors will be required.
- 17) Do not use PC<7:5> for dynamic applications. It's highly recommended to use these IOs in DC applications, e.g. as control or detect lines.
- 18) Pin drive strength:
 - ◇ PA<5:7> and PB<0:3> support drive strength up to 8mA (8mA when "DS"=1, 4mA when "DS"=0); PB<4:7> support drive strength up to 16mA (16mA when "DS"=1, 12mA when "DS"=0); other GPIOs (PA<0:4>, PC<0:7> and PD<0:7>) support drive strength up to 4mA (4mA when "DS"=1, 2mA when "DS"=0).
 - "DS" configuration will take effect when the pin is used as output. Please refer to section
 7.1.1 Basic configuration for the corresponding "DS" register address and the default setting.
- 19) When PB[0] and PB[1] are used as wakeup source, they can only act as input IO signals instead of output IO signals when normal working. The PC[7:0] can only wake up the chip at low level voltage.

2 Memory and MCU

2.1 Memory

The TLSR8253F512 embeds 48kB SRAM (including up to 32kB SRAMs with retention in deep sleep, and one 16kB SRAM without retention) as data memory, and 512kB internal FLASH as program memory.

2.1.1 SRAM/Register

SRAM/Register memory map is shown as follows:

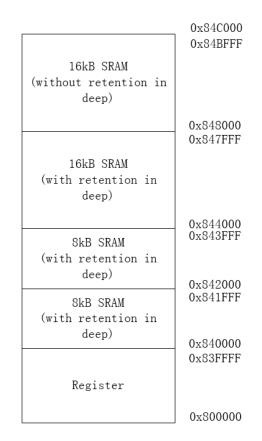

Figure 2-1 Physical memory map

Register address: 0x800000 ~ 0x83FFFF.

Address for two independent 8kB SRAMs with retention in deep sleep: 0x840000 ~ 0x841FFF, 0x842000 ~ 0x843FFF.

Address for 16kB SRAM with retention in deep sleep: 0x844000 ~ 0x847FFF.

Address for 16kB SRAM without retention in deep sleep: 0x848000 ~ 0x84BFFF.

Both register and SRAM address can be accessed (read or write) via debugging interface (SWS/SWM, SPI/I2C interface).

Figure 2-2 Register space

2.1.2 Flash

The internal Flash mainly supports page program, sector/block/chip erase operations, and deep power down operation. Please refer to the corresponding SDK for Flash memory operation details.

For chip identification and traceability, the Flash is preloaded with Unique ID (UID). User is not allowed to modify this preloaded UID, but can read the UID via corresponding API interface.

MCU uses the system frequency to load instructions, and adopts flash driver to access (read/write) flash with the speed of half of the system clock.

2.2 Firmware encryption

The TLSR8253F512 supports multiple firmware encryption methods to achieve the anti-cloning protection, including:

♦ UID-based authentication code generation method

During firmware burning (e.g. via specific burning jig), user can use customized key and AES encryption algorithm to encrypt the UID read from the chip flash, generate unique ciphertext and write the ciphertext into Flash section.

During application, an encryption authentication procedure is added. User should use the same key and AES encryption algorithm to encrypt the UID read from the chip flash, and generate new ciphertext. Before running main application firmware, the new ciphertext will be compared with the ciphertext read from the Flash section. Only when the authentication passes, i.e. the comparison result matches, the main firmware will be up and running, otherwise the chip will stop running the main firmware.

♦ Bootloader-based firmware encryption/decryption

The firmware can be encrypted using a customer-provided security key. The customer security key is written into a specific secure register, and becomes unreadable. Any attempt to read the key will only result in either all 1's or all 0's.

The encrypted firmware can be generated based on the plaintext firmware and the customer security key. The customer can burn the security key into the obscured memory area and also the encrypted firmware into Flash.

The firmware is readable by all, but appears as garbled binaries to 3rd party.

2.3 MCU

The TLSR8253F512 integrates a powerful 32-bit MCU developed by Telink. The digital core is based on 32-bit RISC, and the length of instructions is 16 bits; four hardware breakpoints are supported.

2.4 Working modes

The TLSR8253F512 supports six working modes, including Active, Idle, Suspend, Deep sleep with SRAM retention, deep sleep without SRAM retention, and Shutdown.

♦ The Power Management (PM) module is always active in all working modes.

```
DS-TLSR8253-E14
```

✤ For modules such as MCU, RF transceiver (Radio), and SRAM, the state depends on working mode, as shown below.

| Mode | Active | Idle | Suspend | Deep sleep with SRAM retention | Deep sleep without SRAM retention | Shutdown |
|--|--|-----------|-----------|---|--------------------------------------|----------|
| MCU | active | stall | stall | off | off | off |
| 16k Normal SRAM (without retention in deep sleep) | on | on | on | off | off | off |
| Radio | available | available | off | off | off | off |
| USB | available | available | off | off | off | off |
| Audio | available | available | off | off | off | off |
| Wakeup time to Active mode | | Ous | 100us | Shorter than deep sleep without retention, almost same as Suspend | 1ms | 10ms |
| (16k+8k+8k) retention SRAMs (with retention in deep sleep) | full | full | full | full | off | off |
| Wakeup on RTC (32K Timer wakeup) | | | available | available | available | off |
| Wakeup on pin (IO wakeup) | | | available | available | available | off |
| Wakeup on interrupt | | available | | | | |
| Wakeup on reset pin (RESETB) | | available | available | available | available | on |
| Current | Please refer to section 15.3 DC characteristics . | | | | | |

Table 2-1 Working modes

*Notes:

- 1) "active": MCU is at working state.
- 2) "stall": In Idle and Suspend mode, MCU does not work, while its clock is still running.
- 3) "available" for Modules: It's selectable to be at working state, or stall/be powered down if it does not need to work.
- 4) "available"/"on" for wakeup: Corresponding wakeup method is supported.
- 5) "off" for wakeup: Corresponding wakeup method is not supported.
- 6) "on"/"off"/"full" for SRAMs:
 - ☆ "on": The 16kB SRAM is powered on and works normally (can be accessed) in Active, Idle and Suspend mode.
 - "full": Full speed. In Active, Idle and Suspend mode, the two 8kB and one 16kB retention SRAMs are powered on and work normally (can be accessed); in Deep sleep with SRAM retention, the retention SRAMs are powered on, however, the contents of the retention SRAMs can be retained and cannot be accessed.

- "off": The 16kB SRAM is powered down in two Deep sleep modes and Shutdown mode.
 The retention SRAMs are powered down in Deep sleep without SRAM retention and Shutdown mode.
- 7) Current:
 - ☆ In Deep sleep without SRAM retention, only the PM module is active, all digital and analog modules are powered down, thus the power consumption is largely decreased.
 - In Deep sleep with SRAM retention, the PM module is active, all analog and digital modules except for the retention SRAMs are powered down, thus the power consumption is a little higher than in Deep sleep without SRAM retention, but much lower than in Suspend.

| Address | R/W | Description | Default Value |
|---------|-----|-------------------------------|---------------|
| 0x35 | R/W | buffer, watch dog reset clean | 0x20 |
| 0x36 | R/W | buffer, watch dog reset clean | 0x00 |
| 0x37 | R/W | buffer, watch dog reset clean | 0x00 |
| 0x38 | R/W | buffer, watch dog reset clean | 0x00 |
| 0x39 | R/W | buffer, watch dog reset clean | Oxff |
| 0x3a | R/W | buffer, power on reset clean | 0x00 |
| 0x3b | R/W | buffer, power on reset clean | 0x00 |
| 0x3c | R/W | buffer, power on reset clean | 0x00 |

 Table 2-2
 Retention analog registers in deep sleep

Analog registers (0x35 \sim 0x3c) as shown in Table 2- 2 are retained in deep sleep mode and can be used to store program state information across deep sleep cycles.

- Analog registers 0x3a~0x3c are non-volatile even when chip enters deep sleep or chip is reset by watchdog or software, i.e. the contents of these registers won't be changed by deep sleep or watchdog reset or chip software reset.
- ♦ Analog registers 0x35~0x39 are non-volatile in deep sleep, but will be cleared by watchdog reset or chip software reset.
- ☆ After POR (Power-On-Reset), all registers will be cleared to their default values, including these analog registers.

User can set flag in these analog registers correspondingly, so as to check the booting source by reading the flag.

For chip software reset, please refer to section **2.5 Reset**.

2.5 Reset

The chip supports three types of reset methods, including POR (Power-On-Reset), watchdog reset and software reset.

1) POR: After power on, the whole chip will be reset, and all registers will be cleared to their default values.

```
DS-TLSR8253-E14
```

- 2) Watchdog reset: A programmable watchdog is supported to monitor the system. If watchdog reset is triggered, registers except for the retention analog registers 0x3a~0x3c will be cleared.
- 3) Software reset: It is also feasible to carry out software reset for the whole chip or some modules.
 - ☆ Setting address 0x6f[5] as 1b'1 is to reset the whole chip. Similar to watchdog reset, the retention analog registers 0x3a~0x3c are non-volatile, while other registers including 0x35~0x39 will be cleared by chip software reset.
 - Addresses 0x60~0x62 serve to reset individual modules: if some bit is set to logic "1", the corresponding module is reset.

Table 2-3 Register configuration for software reset

2.6 Power Management

The multiple-stage Power Management (PM) module is flexible to control power state of the whole chip or individual functional blocks such as MCU, RF Transceiver, and peripherals.

2.6.1 Power-On-Reset (POR) and Brown-out detect

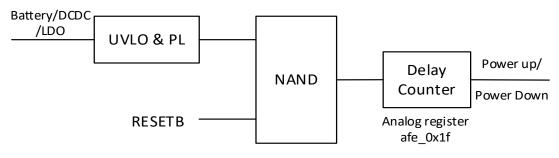

Figure 2-3 Control logic for power up/down

The whole chip power up and down is controlled by the UVLO (Ultra-low Voltage Lockout) & PL (Power Logic) module and the external RESETB pin via the logic shown in the above diagram. UVLO takes the external power supply as input and releases the lock only when the power supply voltage is higher than a preset threshold. The RESETB pin has an internal pull-up resistor; an external Cap can be connected on the RESETB pin to control the POR delay.

After both UVLO and RESETB release, there is a further configurable delay before the system reset signal ("Sysrst") is released. The delay is adjusted by analog register afe_0x1f. Since the content of afe_0x1f is reset to default only after power cycle, watchdog reset, or software reset, the delay change using afe_0x1f is only applicable when the chip has not gone through these reset conditions. For example, after deep sleep wakeup, the setting in afe_0x1f will take effect.

| Address | R/W | Description | Default Value |
|----------|-----|-----------------------------------|------------------|
| afe_0x1f | R/W | wait for DCDC ready (16kHz count) | 0x40 |

Table 2- 4 Analog register to control delay counters

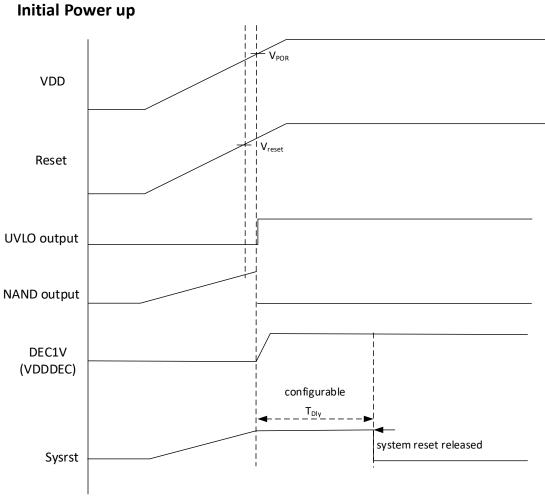

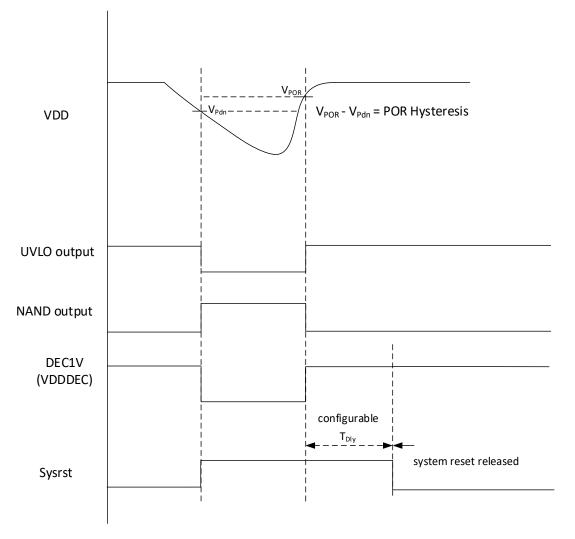

Figure 2-4 Initial Power-up sequence

Power down

| Symbol | Parameter | Min. | Тур. | Max. | Unit |
|------------------|--|--------|----------------|-----------------|--------|
| V _{POR} | VDD voltage when V _{UVLO} turns to high level | | 1.62 | | V |
| V _{Pdn} | VDD voltage when V _{UVLO} turns to low level | | 1.55 | | V |
| T _{Dly} | Delay counter value | Config | urable via ana | log register af | e_0x1f |

2.6.2 Working mode switch

In Active mode, MCU is active, all SRAMs are accessible, and other modules are selectable whether to be at working state.

The chip can switch to Idle mode to stall the MCU. In this mode, all SRAMs are still accessible, modules such as RF transceiver and Audio are still selectable whether to be at working state. The chip can be triggered to Active mode by interrupt or RESETB pin, and the time to switch to Active mode is negligible.

To decrease power consumption to different levels, the chip can switch to power saving mode (Suspend, Deep sleep with SRAM retention, Deep sleep without SRAM retention, Shutdown) correspondingly. (Please refer to Table 2- 1.)

- In Suspend mode, MCU stalls, all SRAMs are still accessible, the PM module is active, and modules such as RF transceiver and Audio are powered down. The chip can be triggered to Active mode by 32k Timer, IO pin or RESETB pin. It takes 100µs or so to switch from Suspend mode to Active mode.
- In Deep sleep with SRAM retention, the PM module is active, analog and digital modules except for the two 8kB and one 16kB retention SRAMs are powered down, while the retention SRAMs can be retained and not accessible. The chip can be triggered to Active mode by 32k Timer, IO pin or RESETB pin. The time to switch to Active mode is shorter than Deep sleep without SRAM retention and close to Suspend.
- In Deep sleep without SRAM retention, only the PM module is active, while analog and digital modules including the retention SRAMs are powered down. The chip can be triggered to Active mode by 32k Timer, IO pin or RESETB pin. The time to switch to Active mode is 1ms or so.
- In Shutdown mode, all digital and analog modules are powered down, and only the PM module is active. The chip can be triggered to Active mode by RESETB pin only. The time to switch to Active mode is 10ms or so.

User can directly invoke corresponding library function to switch working mode of the chip.

If certain module doesn't need to work, user can power down this module in order to save power.

| Address | Local name | Default | Description |

2.6.3 LDO and DCDC

The chip embedded DCDC can generate 1.8V output voltage and supply power for the internal flash; the DCDC can also generate 1.4V output voltage.

The embedded LDO regulator takes the 1.4V voltage output from the DCDC, and generates 1.2V regulated voltage to supply power for 1.2V digital core and analog modules in Active/Idle/Suspend mode.

2.6.4 VBAT and VANT power-supply mode

The RF PA module has two power-supply modes including VBAT mode and VANT mode.

- In VBAT mode, the RF PA module is supplied by 3.3V voltage regulated from 4.2V lithium battery or directly from two AA/AAA batteries in series. The maximum output power is related to power supply voltage of RF PA, for example, the maximum power is 10dBm at 3.3V power supply.
- In VANT mode, the RF PA module is supplied with 1.2V voltage by the embedded DCDC. In this mode, output power won't change with AVDD basically, and the maximum power is 5dBm or so. Corresponding to the VBAT mode, the VANT mode is more power-saving at the same Tx

power.

When the chip works in VBAT mode, it can be configured to the maximum output power. However, as the VBAT/VDD supply decreases below 3.0 V, the maximum transmit power of TX is then slightly attenuated. The detailed RF transmit power level refers to the code comments in the corresponding driver SDK, in which the RF transmit power level under VBAT mode is the result tested in 3.3 V VBAT voltage.

2.7 Wakeup sources

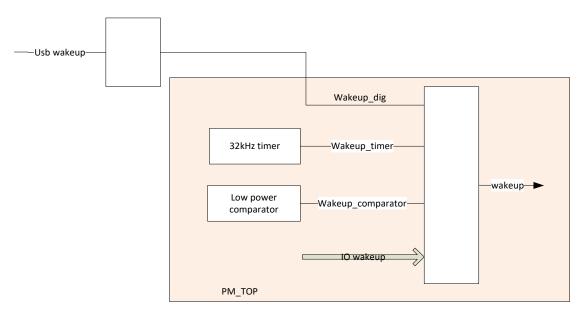

Figure 2-6 Wakeup sources

2.7.1 Wakeup source - USB

This wakeup source can only wake up the system from suspend mode.

First, set the digital register 0x6e bit[2] as 1b'1.

To activate this mode, analog register afe_0x26[5] should also be set as 1b'1.

Once USB host sends out resuming signal, the system will be woke up.

2.7.2 Wakeup source – 32kHz timer

This wakeup source is able to wake up the system from suspend mode or two deep sleep modes.

To enable the wakeup source from 32kHz timer, analog register afe_0x26[6] should be set as 1b'1.

2.7.3 Wakeup source – low power comparator

This wakeup source is able to wake up the system from suspend mode or two deep sleep modes.

To enable the wakeup source from low power comparator, analog register 0x26[7] should be set as 1b'1. The low power comparator wakeup is active high.

2.7.4 Wakeup source – IO

This wakeup source is able to wake up the system from suspend mode or two deep sleep modes. And IO wakeup supports high level or low level wakeup which is configurable via polarity control registers.

Analog register afe_0x26[4] should be set as 1b'1 to enable IO wakeup source.

Enabling control analog registers: PA[7:0] enabling control register is afe_0x27[7:0], PB[7:0] enabling control register is afe_0x28[7:0], PC[7:0] enabling control register is afe_0x28[7:0], and PD[7:0] enabling control register is afe_0x2a[7:0]. Total wakeup pin can be up to 32.

Polarity control registers: PA[7:0] polarity control register is afe_0x21[7:0], PB[7:0] polarity control register is afe_0x22[7:0], PC[7:0] polarity control register is afe_0x23[7:0], and PD[7:0] polarity control register is afe_0x24[7:0].

The corresponding driver is available so that user can directly invoke it to use IO wakeup source.

Analog register 0x44[3:0] indicates the wakeup source which triggers system wakeup. After wakeup, the corresponding wakeup status will be set as 1b'1 automatically, and it's needed to write 1 to manually clean the status.

3 BLE/802.15.4/2.4GHz RF Transceiver

3.1 Block diagram

The TLSR8253F512 integrates an advanced BLE/802.15.4/2.4GHz RF transceiver. The RF transceiver works in the worldwide 2.4GHz ISM (Industrial Scientific Medical) band.

The transceiver consists of a fully integrated RF synthesizer, a Power Amplifier (PA), a Low Noise Amplifier (LNA), a TX filter, a RX filter, a TX DAC, an ADC, a modulator and a demodulator. The transceiver can be configured to work in standard-compliant 1Mbps BLE mode, 2Mbps enhancement BLE mode, 125kbps BLE long range mode (S8), 500kbps BLE long range mode (S2), IEEE 802.15.4 standard-compliant 250kbps mode, and Proprietary 1Mbps, 2Mbps, 250kbps and 500kbps mode.

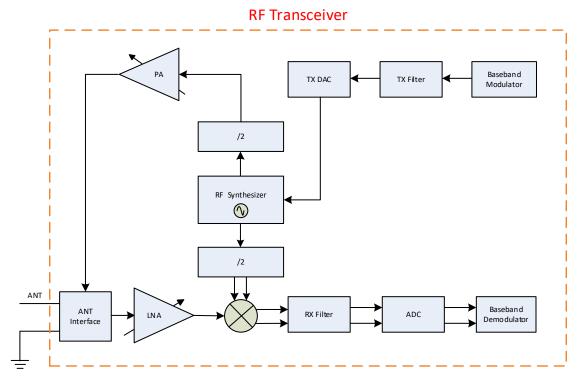

Figure 3-1 Block diagram of RF transceiver

To control external PA and LNA, first follow the GPIO lookup table (see section 7.1.1.1 GPIO lookup table) to configure the specific two pins as TX_CYC2PA and RX_CYC2LNA function, respectively. Note: To use TX_CYC2PA and RX_CYC2LNA function for the two pins, other functions with higher polarity should be disabled at the same time. After the two pins are configured as TX_CYC2PA and RX_CYC2LNA function, the output function is enabled. Generally the two pins are high active: When both the two pins output low level, the external PA and LNA are disabled; when one of the two pins output high level, the external PA/LNA are enabled correspondingly; the two pins won't output high level simultaneously.

| TX_CYC2PA | RX_CYC2LNA | External RF transceiver |
|-----------|------------|-------------------------|
| L | L | Both LNA and PA OFF |

Table 3-1External RF transceiver control example

| TX_CYC2PA | RX_CYC2LNA | External RF transceiver |
|-----------|------------|-------------------------|
| L | Н | LNA ON |
| н | L | PA ON |
| н | Н | N/A |

The internal PA can deliver a maximum 10dBm output power, avoiding the need for an external RF PA.

3.2 Air interface data rate and RF channel frequency

Air interface data rate, the modulated signaling rate for RF transceiver when transmitting and receiving data, is configurable via related register setting: 125kbps, 250kbps, 500kbps, 1Mbps, 2Mbps.

For the TLSR8253F512, RF transceiver can operate with frequency range from 2400MHz to 2483.5MHz ISM band, which can cover the frequency band for Bluetooth Low Energy(BLE)/IEEE 802.15.4-2.4G and 2.4Ghz proprietary protocol.

The frequency for a specific channel for BLE is $2402 + n^2 MHz$, where integer n is the channel number 0^{39} .

The frequency channel for IEEE 802.15.4-2.4G is 2400+(n-11)*5MHz, where integer n is channel number 11^{26} . And for 2.4Ghz proprietary protocols, any frequencies within the $2400 \sim 2483.5MHz$ ISM band can be used as the channel center, the normally used frequencies can vary depending on applications, but generally fall on the integer channels such as 2401 + n*1MHz.

3.3 Baseband

The baseband is disabled by default. The corresponding API is available for user to power on/down the baseband and enable/disable clock, so that the baseband can be turned on/off flexibly.

The baseband contains dedicated hardware logic to perform fast AGC control, access code correlation, CRC checking, data whitening, encryption/decryption and frequency hopping logic.

The baseband supports all features required by Bluetooth and 802.15.4 specification.

3.3.1 Packet format

Packet format in standard 1Mbps BLE mode is shown as Table 3-2:

Table 3-2 Packet Format in standard 1Mbps BLE mode

| LSB | | | MSB |
|-----------|----------------|------------------|------------|
| Preamble | Access Address | PDU | CRC |
| (1 octet) | (4 octets) | (2 ~ 257 octets) | (3 octets) |

Packet length 80bit ~ 2120bit (80~2120µs @ 1Mbps).

Packet format in standard 2Mbps BLE mode is shown as Table 3-3:

Table 3- 3 Packet format in standard 2Mbps BLE mode

| LSB | | | MSB |
|------------|----------------|------------------|------------|
| Preamble | Access Address | PDU | CRC |
| (2 octets) | (4 octets) | (2 ~ 257 octets) | (3 octets) |

Packet format in standard 500kbps/125kbps BLE mode is shown as Table 3-4.

Table 3- 4 Packet Format In Standard 500kbps/125kbps BLE Mode

| LSB | | | | | | MSB |
|-------------|----------------|----------|----------|------------------|------------|----------|
| Preamble | Access Address | CI | TERM1 | PDU | CRC | TERM2 |
| (10 octets) | (4 octets) | (2 bits) | (3 bits) | (2 ~ 257 octets) | (3 octets) | (3 bits) |

Packet format in 250kbps 802.15.4 mode is shown as Table 3-5.

Table 3- 5 Packet format in 802.15.4 Mode

| LSB | LSB | | | | | | |
|-----|------------|-----------|--------------|-------------------------|------------|--|--|
| Pi | reamble | SFD | Frame length | PSDU | CRC | | |
| (4~ | 16 octets) | (1 octet) | (1 octet) | (Variable 0~127 octets) | (2 octets) | | |
| | SHR | | PHR | PHY payload | | | |

Packet format in 2.4GHz Proprietary mode is shown as Table 3-6:

| LSB | | | MSB |
|----------|--------------------------|-----------------------------|-------------|
| Preamble | Address code | Packet Controller + Payload | CRC |
| (8 bits) | (configurable 3~5 bytes) | (1~63 bytes) | (1~2 bytes) |

3.3.2 BLE location function

In BLE 1M or 2M mode, BLE location features including AoA (Angle of Arrival) and AoD (Angle of Departure) are supported.

In the location mode of operation, the chip transmits a training sequence concatenated to the normal packet transmissions. In AoA mode of operation, the receiving side has multiple antennas and will be switched during the training sequence period. In AoD mode of operation, the transmitting side has multiple antennas and will be switched during the training sequence period. In either mode, the receiving side will be able to determine based on the phase variations of the received training sequences, the angle of location of the peer device.

3.3.3 RSSI and frequency offset

The TLSR8253F512 provides accurate RSSI (Receiver Signal Strength Indicator) and frequency offset indication.

- \diamond RSSI can be read from the 1byte at the tail of each received data packet.
- ☆ If no data packet is received (e.g. to perform channel energy measurement when no desired signal is present), real-time RSSI can also be read from specific registers which will be updated

```
DS-TLSR8253-E14
```

automatically.

- ♦ RSSI monitoring resolution can reach +/-1dB.
- Frequency offset can be read from the 2bytes at the tail of the data packet. Valid bits of actual frequency offset may be less than 16bits, and different valid bits correspond to different tolerance range.

Telink supplies corresponding drivers for user to read RSSI and frequency offset as needed.

4 Clock

4.1 Clock sources

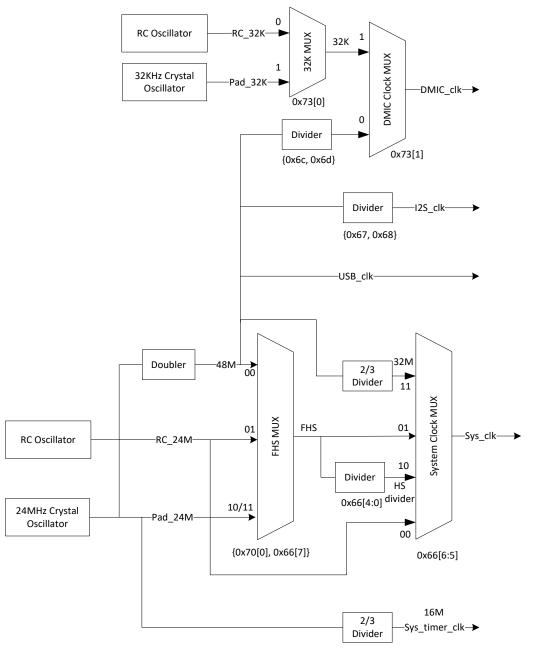

Figure 4-1 Block diagram of clock

The TLSR8253F512 embeds a 24MHz RC oscillator which can be used as clock source for system, as well as a 32kHz RC oscillator to provide clock source for DMIC and sleep state.

External 24MHz crystal is available via pin XC1 and XC2, which can provide a Pad_24MHz clock source for system and System Timer, and generate a 48M clock via a frequency doubler to provide clock source for DMIC, I2S and USB. External 32kHz crystal is available via pin PC<2:3>, which can provide a 32kHz clock source for DMIC.

4.2 System clock

There are four selectable clock sources for MCU system clock: **RC_24M** derived from 24MHz RC oscillator, High speed clock "**FHS**", **HS divider clock** (derived from "FHS" via a frequency divider), and **32MHz clock** derived from 48MHz clock via a 2/3 frequency divider (The 48M clock is derived from 24M crystal oscillator via a frequency doubler).

The high speed clock (FHS) is selectable via address {0x70[0], 0x66[7]} from the following sources: **48MHz** clock (derived from 24M crystal oscillator via a frequency doubler), **RC_24M** (derived from 24MHz RC oscillator), and **Pad_24M** (derived from 24M crystal oscillator).

The digital register CLKSEL (address 0x66) serves to set system clock: System clock source is selectable via bit[6:5].

♦ If address 0x66[6:5] is set to 2b'10 to select the HS divider clock, system clock frequency is adjustable via address 0x66[4:0]. The formula is shown as below:

F_{System clock} = F_{FHS} / (system clock divider value in address 0x66[4:0]).

Note that address 0x66[4:0] should not be set as 0 or 1.

4.3 Module clock

Registers CLKEN0~CLKEN2 (address 0x63~0x65) are used to enable or disable clock for various modules. By disable the clocks of unused modules, current consumption could be reduced.

4.3.1 System Timer clock

System Timer clock is derived from 24M crystal oscillator via a 2/3 frequency divider. The clock frequency is fixed as 16MHz.

4.3.2 USB clock

USB clock is derived from 48M clock. The 48M clock is derived from 24M crystal oscillator via a frequency doubler.

4.3.3 I2S clock

I2S clock is derived from 48M clock via a frequency divider. The 48M clock is derived from 24M crystal oscillator via a frequency doubler.

Address 0x67[7] should be set as 1b'1 to enable I2S clock. I2S clock frequency dividing factor contains step and mod. Address 0x67[6:0] and 0x68 serve to set I2S clock step[6:0] and mod[7:0] respectively, and mod should be no less than 2*step.

I2S clock frequency, F_{I2S clock}, equals to 48M * I2S_step[6:0] / I2S_mod[7:0].

4.3.4 DMIC clock

Address 0x6c[7] serves to enable DMIC clock.

DMIC clock pin can select 32kHz clock, or derive from 48M clock via a frequency divider. Address 0x73 serves to select DMIC clock source.

```
DS-TLSR8253-E14
```

In normal DMIC working mode, 0x73[1] needs to be set as 1b'0, DMIC clock divider is selected and frequency dividing factor should be further configured. DMIC clock frequency dividing factor contains step and mod. Address 0x6c[6:0] and 0x6d serve to set DMIC clock step[6:0] and mod[7:0], respectively, and mod should be no less than 2*step.

In this situation, DMIC clock frequency, $F_{\text{DMIC clock}}$ equals to 48M * DMIC_step[6:0] / DMIC_mod[7:0].

 When DMIC is not used, and a 32kHz clock is needed, address 0x73 bit[1] should be set as 1b'1 to select the 32kHz clock, while bit[0] can be configured to select either RC_32K from 32K RC oscillator or Pad_32K from 32K crystal oscillator.

Table 4-1 Register table related to clock

| Address | R/W | Description | Default Value |

5 Timers

5.1 Timer0~Timer2

The TLSR8253F512 supports three timers: Timer0 $^{\sim}$ Timer2. The three timers all support four modes: Mode 0 (System Clock Mode), Mode 1 (GPIO Trigger Mode), Mode 2 (GPIO Pulse Width Mode) and Mode 3 (Tick Mode), which are selectable via the register TMR_CTRL0 (address 0x620) $^{\sim}$ TMR_CTRL1 (address 0x621).

Timer 2 can also be configured as "watchdog" to monitor firmware running.

5.1.1 Register table

| Table 5-1 Register configuration for Timer0~Timer2 | | | | |
|--|-----|--|------------------|--|
| Address | R/W | Description | Default Value | |

| 0x63b | RW | Byte 3 of timer2 ticker | 0x00 |

5.1.2 Mode0 (System Clock Mode)

In Mode 0, system clock is employed as clock source.

After Timer is enabled, Timer Tick (i.e. counting value) is increased by 1 on each positive edge of system clock from preset initial Tick value. Generally the initial Tick value is set to 0.

Once current Timer Tick value matches the preset Timer Capture (i.e. timing value), an interrupt is generated, Timer stops counting and Timer status is updated.

Steps of setting Timer0 for Mode 0 is taken as an example.

1st: Set initial Tick value of Timer0

Set Initial value of Tick via registers TMR_TICK0_0~TMR_TICK0_3 (address 0x630~0x633). Address 0x630 is lowest byte and 0x633 is highest byte. It's recommended to clear initial Timer Tick value to 0.

2nd: Set Capture value of Timer0

Set registers TMR_CAPT0_0~TMR_CAPT0_3 (address 0x624~0x627). Address 0x624 is lowest byte and 0x627 is highest byte.

3rd: Set Timer0 to Mode 0 and enable Timer0

Set register TMR_CTRL0 (address 0x620) [2:1] to 2b'00 to select Mode 0; Meanwhile set address 0x620[0] to 1b'1 to enable Timer0. Timer0 starts counting upward, and Tick value is increased by 1 on each positive edge of system clock until it reaches Timer0 Capture value.

5.1.3 Mode1 (GPIO Trigger Mode)

In Mode 1, GPIO is employed as clock source. The "**m0**"/"**m1**"/"**m2**" register specifies the GPIO which generates counting signal for Timer0/Timer1/Timer2.

After Timer is enabled, Timer Tick (i.e. counting value) is increased by 1 on each positive/negative (configurable) edge of GPIO from preset initial Tick value. Generally the initial Tick

value is set to 0. The "**Polarity**" register specifies the GPIO edge when Timer Tick counting increases.

Note: Refer to Section 7.1.2 for corresponding "m0", "m1", "m2" and "Polarity" register address.

Once current Timer Tick value matches the preset Timer Capture (i.e. timing value), an interrupt is generated and timer stops counting.

Steps of setting Timer1 for Mode 1 is taken as an example.

1st: Set initial Tick value of Timer1

Set Initial value of Tick via registers TMR_TICK1_0~TMR_TICK1_3 (address 0x634~0x637). Address 0x634 is lowest byte and 0x637 is highest byte. It's recommended to clear initial Timer Tick value to 0.

2nd: Set Capture value of Timer1

Set registers TMR_CAPT1_0~TMR_CAPT1_3 (address 0x628~0x62b). Address 0x628 is lowest byte and 0x62b is highest byte.

3rd: Select GPIO source and edge for Timer1

Select certain GPIO to be the clock source via setting "m1" register.

Select positive edge or negative edge of GPIO input to trigger Timer1 Tick increment via setting "Polarity" register.

4th: Set Timer1 to Mode 1 and enable Timer1

Set address 0x620[5:4] to 2b'01 to select Mode 1; Meanwhile set address 0x620[3] to 1b'1 to enable Timer1. Timer1 starts counting upward, and Timer1 Tick value is increased by 1 on each positive/negative (specified during the 3rd step) edge of GPIO until it reaches Timer1 Capture value.

5.1.4 Mode2 (GPIO Pulse Width Mode)

In Mode 2, system clock is employed as the unit to measure the width of GPIO pulse. The "m0"/"m1"/"m2" register specifies the GPIO which generates control signal for Timer0/Timer1/Timer2.

After Timer is enabled, Timer Tick is triggered by a positive/negative (configurable) edge of GPIO pulse. Then Timer Tick (i.e. counting value) is increased by 1 on each positive edge of system clock from preset initial Tick value. Generally the initial Tick value is set to 0. The "**Polarity**" register specifies the GPIO edge when Timer Tick starts counting.

Note: Refer to Section 7.1.2 for corresponding "m0", "m1", "m2" and "Polarity" register address.

While a negative/positive edge of GPIO pulse is detected, an interrupt is generated and timer stops counting. The GPIO pulse width could be calculated in terms of tick count and period of system clock.

Steps of setting Timer2 for Mode 2 is taken as an example.

1st: Set initial Timer2 Tick value

Set Initial value of Tick via registers TMR_TICK2_0~TMR_TICK2_3 (address 0x638~0x63b). Address 0x638 is lowest byte and 0x63b is highest byte. It's recommended to clear initial Timer Tick value to 0.

2nd: Select GPIO source and edge for Timer2

Select certain GPIO to be the clock source via setting "m2" register.

Select positive edge or negative edge of GPIO input to trigger Timer2 counting start via setting "Polarity" register.

3rd: Set Timer2 to Mode 2 and enable Timer2

Set address 0x620[7:6] to 2b'01 and address 0x621 [0] to 1b'1.

Timer2 Tick is triggered by a positive/negative (specified during the 2nd step) edge of GPIO pulse. Timer2 starts counting upward and Timer2 Tick value is increased by 1 on each positive edge of system clock.

While a negative/positive edge of GPIO pulse is detected, an interrupt is generated and Timer2 tick stops.

4th: Read current Timer2 Tick value to calculate GPIO pulse width

Read current Timer2 Tick value from address 0x638~0x63b.

Then GPIO pulse width is calculated as follows:

GPIO pulse width = System clock period * (current Timer2 Tick – intial Timer2 Tick)

For initial Timer2 Tick value is set to the recommended value of 0, then:

GPIO pulse width = System clock period * current Timer2 Tick.

5.1.5 Mode3 (Tick Mode)

In Mode 3, system clock is employed.

After Timer is enabled, Timer Tick starts counting upward, and Timer Tick value is increased by 1 on each positive edge of system clock.

This mode could be used as time indicator. There will be no interrupt generated. Timer Tick keeps rolling from 0 to 0xffffffff. When Timer tick overflows, it returns to 0 and starts counting upward again.

Steps of setting Timer0 for Mode 3 is taken as an example.

1st: Set initial Tick value of Timer0

Set Initial value of Tick via address 0x630~0x633. Address 0x630 is lowest byte and address 0x633 is highest byte. It's recommended to clear initial Timer Tick value to 0.

2nd: Set Timer0 to Mode 3 and enable Timer0

Set address 0x620[2:1] to 2b'11 to select Mode 3, meanwhile set address 0x620[0] to 1b'1 to enable Timer0. Timer0 Tick starts to roll.

3rd: Read current Timer0 Tick value

Current Timer0 Tick value can be read from address 0x630~0x633.

5.1.6 Watchdog

Programmable watchdog could reset chip from unexpected hang up or malfunction.

Only Timer2 supports Watchdog.

Timer2 Tick has 32bits. Watchdog Capture has only 14bits, which consists of TMR_CTRL2 (address 0x622) [6:0] as higher bits and TMR_CTRL1 (address 0x621) [7:1] as lower bits. Chip will be reset when the Timer2 Tick[31:18] matches Watch dog capture.

1st: Clear Timer2 Tick value

Clear registers TMR_TICK2_0 ~TMR_TICK2_3 (address 0x638~0x63b). Address 0x638 is lowest byte and 0x63b is highest byte.

2nd: Enable Timer2

Set register TMR_CTRL0 (address 0x620) [6] to 1b'1 to enable Timer2.

3rd: Set 14-bit Watchdog Capture value and enable Watchdog

Set address 0x622[6:0] as higher bits of watchdog capture and 0x621[7:1] as lower bits. Meanwhile set address 0x622[7] to 1b'1 to enable Watchdog.

Then Timer2 Tick starts counting upwards from 0.

If bits[31:18] of Timer2 Tick value read from address 0x638~0x63b reaches watchdog capture, the chip will be reset, and the status bit in address 0x72[0] will be set as 1b'1 automatically. User can read the watchdog status bit after chip reset to check if the reset source is watchdog, and needs to write 1b'1 to this bit to manually clear the flag.

5.2 32K LTIMER

The TLSR8253F512 also supports a low frequency (32kHz) LTIMER in suspend mode or deep sleep mode. This timer can be used as one kind of wakeup source.

5.3 System Timer

The TLSR8253F512 also supports a System Timer. As introduced in section **4.3.1 System Timer clock**, the clock frequency for System Timer is fixed as 16MHz irrespective of system clock.

In suspend mode, both System Timer and Timer0~Timer2 stop counting, and 32K Timer starts counting. When the chip restores to active mode, Timer0~Timer2 will continue counting from the number when they stops; In contrast, System Timer will continue counting from an adjusted number which is a sum of the number when it stops and an offset calculated from the counting value of 32K Timer during suspend mode.

| Address | R/W | Function | Default Value |

6 Interrupt System

6.1 Interrupt structure

The interrupting function is applied to manage dynamic program sequencing based on realtime events triggered by timers, pins and etc.

For the TLSR8253F512, there are 24 interrupt sources in all: 16 types are level-triggered interrupt sources (listed in address 0x640~0x641) and 8 types are edge-triggered interrupt sources (listed in address 0x642).

When CPU receives an interrupt request (IRQ) from some interrupt source, it will determine whether to respond to the IRQ. If CPU decides to respond, it pauses current routine and starts to execute interrupt service subroutine. Program will jump to certain code address and execute IRQ commands. After finishing interrupt service subroutine, CPU returns to the breakpoint and continues to execute main function.

6.2 Register configuration

| Address | R/W | Description | Default Value |
|---------|-----|---|---------------|
| 0x640 | RW | Byte 0 interrupt mask, level-triggered type {irq_mix, irq_uart, irq_dfifo, irq_dma, usb_pwdn, time2, time1, time0} [7] irq_mix, i.e. irq_host_cmd [6] irq_uart [5] irq_dfifo [4] irq_dma [3] usb_pwdn [2] time2 [1] time1 [0] time0 | 0x00 |
| 0x641 | RW | Byte 1 interrupt mask, level-triggered type {rsvd, irq_pwm, irq_zb_rt, irq_udc[4:0]} [7] rsvd [6] irq_pwm [5] irq_zb_rt [4] irq_udc[4] [3] irq_udc[3] [2] irq_udc[2] [1] irq_udc[1] [0] irq_udc[0] | 0x00 |
| 0x642 | RW | Byte 2 interrupt mask, edge-triggered type {rsvd, gpio2risc[1:0], irq_stimer, pm_irq, irq_gpio, usb_reset, usb_250us} [7] rsvd [6] gpio2risc[1] [5] gpio2risc[0] [4] irq_stimer [3] pm_irq_tm | 0x00 |

Table 6- 1 Register table for Interrupt system

| 0 | D).4/ | Byte 0 of priority | 000 |
| 0x644 | RW | 1: High priority; 0: Low priority | 0x00 |
| 0x645 | RW | Byte 1 of priority | 0x00 |
| 0x646 | RW | Byte 2 of priority | 0x00 |
| 0x648 | R | Byte 0 of interrupt source | 0x00 |
| 0x649 | R | Byte 1 of interrupt source | 0x00 |
| 0x64a | R | Byte 2 of interrupt source | 0x00 |

6.2.1 Enable/Mask interrupt sources

Various interrupt sources could be enabled or masked by registers MASK_0~MASK_2 (address 0x640~0x642).

Interrupt sources of level-triggered type:

- irq_mix (0x640[7]): I2C Slave mapping mode or SPI Slave interrupt (irq_host_cmd)
- ♦ irq_uart (0x640[6]): UART interrupt
- ♦ irq_dfifo (0x640[5]): DFIFO interrupt
- ♦ irq_dma (0x640[4]): DMA interrupt
- ♦ usb_pwdn (0x640[3]): USB Host has sent power down signal
- time2, time1, timer0 (0x640[2]~0x640[0]): Timer2~Timer0 interrupt
- irq_pwm (0x641[6]): PWM interrupt
- ♦ irq_zb_rt (0x641[5]): Baseband interrupt

Interrupt sources of edge-triggered type:

- gpio2risc[1:0] (0x642[6]~0x642[5]): gpio2risc[1]~gpio2risc[0] interrupt, please refer to section
 7.1.2.
- ♦ irq_stimer (0x642[4]): System timer interrupt
- pm_irq_tm (0x642[3]): 32kHz timer wakeup interrupt
- ♦ irq_gpio (0x642[2]): GPIO interrupt, please refer to section 7.1.2.
- ♦ usb_reset (0x642[1]): USB Host has sent reset command.
- \diamond usb_250us (0x642[0]): USB has been in idle for 250 μ s.

6.2.2 Interrupt mode and priority

Interrupt mode is typically-used mode. Register IRQMODE (address 0x643)[0] should be set as 1b'1 to enable interrupt function.

IRQ tasks could be set as High or Low priority via registers PRIO_0~PRIO_2 (address 0x644~0x646). When more than one interrupt sources assert interrupt requests at the same time, CPU will respond depending on respective interrupt priority levels. It's recommended not to modify priority setting.

6.2.3 Interrupt source flag

Three bytes in registers IRQSRC_0~IRQSRC_2 (address 0x648~0x64a) serve to indicate IRQ sources. Once IRQ occurs from certain source, the corresponding IRQ source flag will be set as "1". User could identify IRQ source by reading address 0x648~0x64a.

When handling edge-triggered type interrupt, the corresponding IRQ source flag needs to be cleared via address 0x64a. Take the interrupt source usb_250us for example: First enable the interrupt source by setting address 0x642 bit[0] as 1b'1; then set address 0x643 bit[0] as 1b'1 to enable the interrupt. In interrupt handling function, 24-bit data is read from address 0x648~0x64a to check which IRQ source is valid; if data bit[16] is 1, it means the usb_250us IRQ source is valid. Clear this interrupt source by setting address 0x64a bit[0] as 1b'1.

As for level-type interrupt, IRQ interrupt source status needs to be cleared by setting corresponding module status register. Take TimerO IRQ interrupt source for example: First enable the interrupt source by setting address 0x640 bit[0] as 1b'1; then set address 0x643 bit[0] as 1b'1 to enable the interrupt. In interrupt handling function, 24-bit data is read from address 0x648~0x64a to check which IRQ source is valid; if data bit[0] is 1, it means the TimerO IRQ source is valid. Register TMR_STATUS (address 0x623) [0] should be written with 1b'1 to manually clear TimerO status (refer to section **5.1.1 Register table**).

7 Interface

7.1 GPIO

The TLSR8253F512ET48 and TLSR8253F512ET/AT32 support up to 32 and 17 GPIOs respectively. All digital IOs can be used as general purpose IOs.

All GPIOs (including PA<0>~PD<7>) have configurable pull-up/pull-down resistor. Please refer to section 7.1.3 Pull-up/Pull-down resistor for details.

7.1.1 Basic configuration

7.1.1.1 GPIO lookup table

| | | | GPIO Setting | | | | | | | | | |

*Notes:

- (1) IE: Input enable, high active. 1: enable input, 0: disable input.
- (2) OEN: Output enable, low active. 0: enable output, 1: disable output.
- (3) Register: Configure multiplexed functions in "Pad Function Mux" column.
- (4) Output: configure GPO output.
- (5) Input: read GPI input.
- (6) DS: Drive strength. Default: 1 (high DS level).
- (7) Act as GPIO: enable (1) or disable (0) GPIO function.
- (8) Polarity: see section 7.1.2 Connection relationship between GPIO and related modules.
- (9) Priority: "Act as GPIO" has the highest priority. To configure as multiplexed function, disable

DS-TLSR8253-E14

GPIO function first.

- (10) afe_0xbd, afe_0xbf, afe_0xc0 and afe_0xc2 marked in red color are analog registers; others are digital registers.
- (11) For all unused GPIOs, corresponding "IE" must be set as 0.
- (12) When SWS/PA<7> "IE" is set as 1, this pin must be fixed as pull-up/pull-down state (float state is not allowed).
- (13) To use PD<6>/CN as SPI Slave CN function, it's needed to enable GPIO function for PD<2>/SPI_CN, because PD<2> has higher priority than PD<6>.
- (14) To use SAR ADC/low power comparator/PGA pin function, please refer to corresponding module sections.
- (15) The GPIO pins with 7816_TRX function, including PC<2>, PD<3> and PD<7>, can also act as UART_TX, but DO NOT support UART_RX.

7.1.1.2 GPIO Logic Introductioin

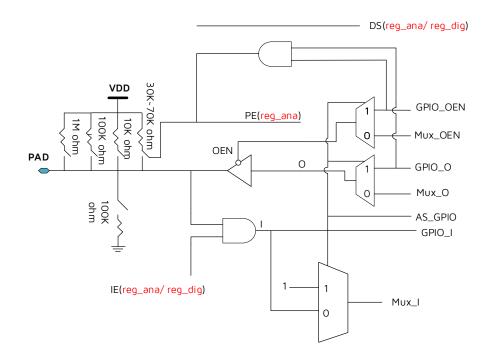

Figure 7-1 GPIO logic diagram

In the figure above,

- (1) DS: drive strength, 1: high drive strength; 0: low drive strength
- (2) PE: pull-up enable, 1: pull up; 0: no pull up
- (3) OEN: output enable, 1: high Z; 0: output
- (4) O: output value, when OEN is 0, output this value
- (5) I: input value
- (6) IE: input enable, if IE is 0, C is always zero

DS-TLSR8253-E14

(7) 1M, 10K, pull up and 100K pull down resistors are controlled by analog 3.3V register controller

*Notes:

- (1) When PAD is set as functional IO, no need to configure GPIO_OEN as the functional IO will enable Mux_OEN.
- (2) When PAD is input, IE should be enabled regardless of functional IO or GPIO, and output to I, AS_GPIO is 1, Mux_I is 1.
- (3) There are two methods to configure digital pull-up of 30k~70k ohm:
 - PC group and PD group (may vary for different chips), pad can configure analog register
 PE and enable digital pull-up.
 - ♦ Other group of pad, when GPIO_OEN=1 and GPIO_I=1, it enables digital pull-up.
- (4) Analog pull-up has three options: 1M, 100k, 10k ohm; analog pull-down has only 100k ohm. They can be configured via corresponding analog registers.
- (5) The GPIO configuration sequence should be: configure the MUX function, and then disable GPIO function. If disable GPIO first and then set function, the default function of the pad may be enabled and will cause false output level.

7.1.1.3 Multiplexed functions

Each pin listed in Table 7-1 acts as the function in the "Default Function" column by default.

- \diamond PA<7> acts as SWS function by default.
- ♦ PB<6:7>, PD<2,7> act as SPI function by default.
- ♦ The other digital IOs act as GPIO function by default.

If a pin with multiplexed functions does not act as GPIO function by default, to use it as GPIO, first set the bit in "Act as GPIO" column as 1b'1. After GPIO function is enabled, if the pin is used as output, both the bits in "IE" and "OEN" columns should be set as 1b'0, then set the register value in the "Output" column; if the pin is used as input, both the bits in "IE" and "OEN" columns should be set as 1b'1, and the input data can be read from the register in the "Input" column.

To use a pin as certain multiplexed function (neither the default function nor GPIO function), first clear the bit in "Act as GPIO" column to disable GPIO function, and then configure "Register" in "Pad Function Mux" column to enable multiplexed function correspondingly.

Example 1: DMIC_DI/ PWM0_N/ UART_RX/ PA<0>.

- (1) The pin acts as GPIO function by default.
- ♦ If the pin is used as general output, both address 0x581[0] (IE) and 0x582[0] (OEN) should be set as 1b'0, then configure address 0x583[0] (Output).
- ♦ If the pin is used as general input, both address 0x581[0] (IE) and 0x582[0] (OEN) should be set as 1b'1, and the input data can be read from address 0x580[0] (Input).
- (2) To use the pin as DMIC_DI function, address 0x586[0] (Act as GPIO) should be set as 1b'0, and 0x5a8[1:0] (Register) should be set as 2b'00.
- (3) To use the pin as PWM0_N function, address 0x586[0] (Act as GPIO) should be set as 1b'0, and

```
DS-TLSR8253-E14
```

0x5a8[1:0] (Register) should be set as 2b'01.

(4) To use the pin as UART_RX function, address 0x586[0] (Act as GPIO) should be set as 1b'0, and 0x5a8[1:0] (Register) should be set as 2b'10.

Example 2: SWS/ UART_RTS/ PA<7>.

- (1) The pin acts as SWS function by default.
- (2) To use it as GPIO function, first set address 0x586[7] (Act as GPIO) as 1b'1.
- ♦ If the pin is used as general output, both address 0x581[7] (IE) and 0x582[7] (OEN) should be set as 1b'0, then configure address 0x583[7] (Output).
- ♦ If the pin is used as general input, both address 0x581[7] (IE) and 0x582[7] (OEN) should be set to 1b'1, and the input data can be read from address 0x580[7] (Input).
- (3) To use it as UART_RTS function, set address 0x586[7] (Act as GPIO) as 1b'0, and set 0x5a9[7:6] (Register) to 2b'01.

I2C can also be multiplexed with SPI interface, i.e. I2C_SDA/I2C_SCK can be multiplexed with SPI_DI (DI)/SPI_CK (CK) respectively.

To select multiplexed SPI/I2C function, please follow the steps below:

- 1) Disable GPIO function by setting corresponding "Act as GPIO" as 1b'0.
- 2) Select SPI/I2C function by setting corresponding "Register".
- 3) Address 0x5b6 serve to select SPI or I2C output.
- 4) Address 0x5b7 serve to select SPI input or I2C input.

| Pin with multiplexed SPI/I2C | Act as GPIO | Register | SPI Input Select | I2C Input Select | SPI/I2C Output Select |
|------------------------------|-------------------------------|--|--|--|--|

7.1.1.4 Drive strength

The registers in the "DS" column are used to configure the corresponding pin's driving strength: "1" indicates maximum drive level, while "0" indicates minimal drive level.

The "DS" configuration will take effect when the pin is used as output. It's set as the strongest driving level by default. In actual applications, driving strength can be decreased to lower level if necessary.

- PA<5:7>, PB<0:3>: maximum=8mA ("DS"=1), minimum=4mA ("DS"=0)
- ♦ PB<4:7>: maximum=16mA ("DS"=1), minimum=12mA ("DS"=0)
- Other GPIOs (PA<0:4>, PC<0:7> and PD<0:7>): maximum=4mA ("DS"=1), minimum=2mA ("DS"=0)

7.1.2 Connection relationship between GPIO and related modules

GPIO can be used to generate GPIO interrupt signal for interrupt system, counting or control signal for Timer/Counter module, or GPIO2RISC interrupt signal for interrupt system.

For the "Exclusive Or (XOR)" operation result for input signal from any GPIO pin and respective "Polarity" value, on one hand, it takes "And" operation with "irq" and generates GPIO interrupt request signal; on the other hand, it takes "And" operation with "m0/m1/m2", and generates counting signal in Mode 1 or control signal in Mode 2 for Timer0/Timer1/Timer2, or generates GPIO2RISC[0]/GPIO2RISC[1] interrupt request signal.

GPIO interrupt request signal = | ((input ^ polarity) & irq);

Counting (Mode 1) or control (Mode 2) signal for Timer0 = | ((input ^ polarity) & m0);

Counting (Mode 1) or control (Mode 2) signal for Timer1 = | ((input ^ polarity) & m1);

Counting (Mode 1) or control (Mode 2) signal for Timer2 = | ((input ^ polarity) & m2);

```
DS-TLSR8253-E14
```

GPIO2RISC[0] interrupt request signal = | ((input ^ polarity) & m0);

GPIO2RISC[1] interrupt request signal = | ((input ^ polarity) & m1).

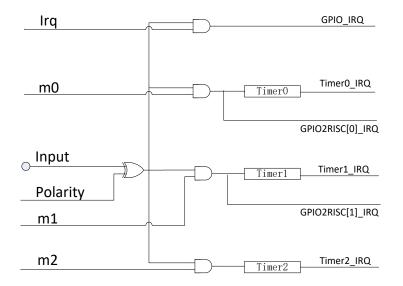

Figure 7-2 Logic relationship between GPIO and related modules

Please refer to Table 7-3 and Table 6-1 to learn how to configure GPIO for interrupt system or Timer/Counter (Mode 1 or Mode 2).

- (1) First enable GPIO function, enable IE and disable OEN. Please see section **7.1.1 Basic** configuration .
- (2) GPIO IRQ signal:

Select GPIO interrupt trigger edge (positive edge or negative edge) via configuring "**Polarity**", and set corresponding GPIO interrupt enabling bit "**Irq**".

Then set address 0x5b5[3] (irq_enable) to enable GPIO IRQ.

Finally enable GPIO interrupt (irq_gpio) via address 0x642[2].

User can read addresses 0x5e0 ~ 0x5e3 to see which GPIO asserts GPIO interrupt request signal. Note: 0x5e0[7:0] --> PA<7>~PA<0>, 0x5e1[7:0] --> PB<7>~PB<0>, 0x5e2[7:0] --> PC<7>~PC<0>, 0x5e3[7:0] --> PD<7>~PD<0>.

(3) Timer/Counter counting or control signal:

Configure "**Polarity**". In Timer Mode 1, it determines GPIO edge when Timer Tick counting increases. In Timer Mode 2, it determines GPIO edge when Timer Tick starts counting.

Then set "**m0/m1/m2**" to specify the GPIO which generates counting signal (Mode 1)/control signal (Mode 2) for Timer0/Timer1/Timer2.

User can read addresses 0x5e8~0x5eb/0x5f0~0x5f3/0x5f8~0x5fb to see which GPIO asserts counting signal (in Mode 1) or control signal (in Mode 2) for Timer0/Timer1/Timer2. Note: Timer0: 0x5e8[7:0] --> PA<7>~PA<0>, 0x5e9[7:0] --> PB<7>~PB<0>, 0x5ea[7:0] --> PC<7>~PC<0>, 0x5eb[7:0] --> PD<7>~PD<0>; Timer1: 0x5f0[7:0] --> PA<7>~PA<0>, 0x5f1[7:0] -

-> PB<7>~PB<0>, 0x5f2[7:0] --> PC<7>~PC<0>, 0x5f3[7:0] --> PD<7>~PD<0>; Timer2: 0x5f8[7:0] --> PA<7>~PA<0>, 0x5f9[7:0] --> PB<7>~PB<0>, 0x5fa[7:0] --> PC<7>~PC<0>, 0x5fb[7:0] --> PD<7>~PD<0>.

(4) GPIO2RISC IRQ signal:

Select GPIO2RISC interrupt trigger edge (positive edge or negative edge) via configuring "**Polarity**", and set corresponding GPIO enabling bit "m0"/"m1".

Enable GPIO2RISC[0]/GPIO2RISC[1] interrupt, i.e. "gpio2risc[0]" (address 0x642[5]) / "gpio2risc[1]"(address 0x642[6]).

7.1.3 Pull-up/Pull-down resistor

All GPIOs (including PA<0>~PD<7>) support configurable pull-up resistor of rank x1 and x100 or pull-down resistor of rank x10 which are all disabled by default. Analog registers afe_0x0e<7:0>~afe_0x15<7:0> serve to control the pull-up/pull-down resistor for each GPIO.

The DP pin also supports $1.5k\Omega$ pull-up resistor for USB use. The $1.5k\Omega$ pull up resistor is disabled by default and can be enabled by setting analog register afe_0x0b<7> as 1b'1. For the DP/PA<6> pin, user can only enable either $1.5k\Omega$ pull-up resistor or pull-up resistor of rank x1/x100 / pull-down resistor of rank x10 at the same time. Please refer to Table 7- 4 for details.

Take the PA<0> for example: Setting analog register afe_0x0e<1:0> to 2b'01/2b'11/2b'10 is to respectively enable pull-up resistor of rank x100/pull-up resistor of rank x1/pull-down resistor of rank x10 for PA<0>; Clearing the two bits (default value) disables pull-up and pull-down resistor for PA<0>.

| Address | Mnemonic | Default | Description |
|---------------|------------------|----------------|---|
| afe_0x0b<7> | dp_pullup_res_3v | 0x0 | 1.5k (Typ.) pull-up resistor for USB DP PAD 0: disable 1: enable |
| Rank | Typical value | (depend on act | tual application) |

7.2 SWM and SWS

The TLSR8253F512 supports Single Wire interface. SWM (Single Wire Master) and SWS (Single Wire Slave) represent the master and slave device of the single wire communication system developed by Telink. The maximum data rate can be up to 2Mbps.

7.3 I2C

The TLSR8253F512 embeds I2C hardware module, which could act as Master mode or Slave mode. I2C is a popular inter-IC interface requiring only 2 bus lines, a serial data line (SDA) and a serial clock line (SCL).

7.3.1 Communication protocol

Telink I2C module supports standard mode (100kbps) and Fast-mode (400kbps) with restriction that system clock must be by at least 10x of data rate.

Two wires, SDA and SCL (SCK) carry information between Master device and Slave device

connected to the bus. Each device is recognized by unique address (ID). Master device is the device which initiates a data transfer on the bus and generates the clock signals to permit that transfer. Slave device is the device addressed by a Master.

Both SDA and SCL are bidirectional lines connected to a positive supply voltage via a pull-up resister. It's recommended to use external 3.3kohm pull-up resistor. For standard mode, the internal pull-up resistor of rank x1 can be used instead of the external 3.3kohm pull-up.

When the bus is free, both lines are HIGH. It's noted that data in SDA line must keep stable when clock signal in SCL line is at high level, and level state in SDA line is only allowed to change when clock signal in SCL line is at low level.

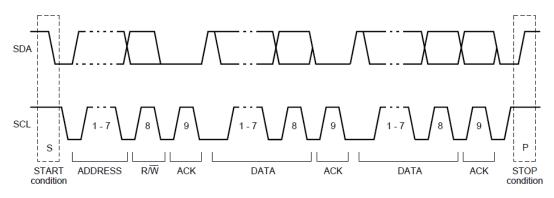

Figure 7-3 I2C timing chart

| Address | R/W | Description | Default Value |
|---------|-----|--|------------------|
| 0x00 | RW | I2C master clock speed | 0x1f |

| | | I2C host operation has happened. Write 1 to clear. | |
| 0xe4 | RW | [1]: host_rd_tag_o, | 0x00 |
| | | I2C host operation has happened and is read operation. | |
| | | Write 1 to clear. | |

7.3.3 I2C Slave mode

I2C module of the TLSR8253F512 acts as Slave mode by default. I2C slave address can be configured via register I2C_ID (address 0x01) [7:1].

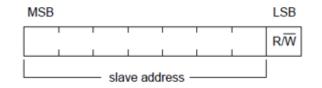

Figure 7-4Byte consisted of slave address and R/W flag bit

I2C slave mode supports two sub modes including Direct Memory Access (DMA) mode and Mapping mode, which is selectable via address 0x03[2].

In I2C Slave mode, Master could initiate transaction anytime. I2C slave module will reply with ACK automatically. To monitor the start of I2C transaction, user could set interrupt from GPIO for SCA or SCL.

7.3.3.1 DMA mode

In DMA mode, other devices (Master) could access (read/write) designated address in Register and/or SRAM of the TLSR8253F512 according to I2C protocol. I2C module of the TLSR8253F512 will execute the read/write command from I2C master automatically. But user needs to notice that the system clock shall be at least 10x faster than I2C bit rate.

The access address designated by Master is offset by 0x800000. In the TLSR8253F512, Register address starts from 0x800000 and SRAM address starts from 0x840000. For example, if Addr High (AddrH) is 0x04, Addr Middle (AddrM) is 0x00, and Addr Low (AddrL) is 0xcc, the real address of accessed data is 0x8400cc.

```
DS-TLSR8253-E14
```

In DMA mode, Master could read/write data byte by byte. The designated access address is initial address and it supports auto increment by setting address 0x03[0] to 1b'1.

Read Format in DMA mode

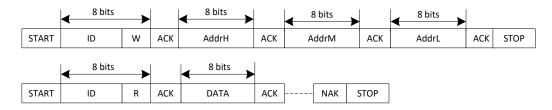

Figure 7-5 Read format in DMA mode

Write Format in DMA mode

Figure 7-6 Write format in DMA mode

7.3.3.2 Mapping mode

Mapping mode could be enabled via setting register I2CSCT0 (address 0x03)[2] to 1b'1.

In Mapping mode, data written and read by I2C master will be redirected to specified 128-byte buffer in SRAM. User could specify the initial address of the buffer by configuring registers HOSR_ADR_L (address 0xe1, lower byte), HOSR_ADR_M (address 0xe2, middle byte) and HOSR_ADR_H (address 0xe3, higher byte). The first 64-byte buffer is for written data and following 64-byte buffer is for read data. Every time the data access will start from the beginning of the Write-buffer/Read-buffer after I2C stop condition occurs. The last accessed data address could be checked in register I2CMAP_HADR (address 0xe0) [6:0] which is only updated after I2C STOP occurs.

Read Format in mapping mode

Figure 7-7 Read format in Mapping mode

Write Format in mapping mode

Figure 7-8 Write format in Mapping mode

7.3.4 I2C Master mode

Address 0x03[1] should be set to 1b'1 to enable I2C master mode for the TLSR8253F512.

Address 0x00 serves to set I2C Master clock: $F_{I2C} = (System Clock / (4 * clock speed configured in address 0x00).$

A complete I2C protocol contains START, Slave Address, R/W bit, data, ACK and STOP. Slave address could be configured via address 0x01[7:1].

I2C Master (i.e. I2C module of the TLSR8253F512) could send START, Slave Address, R/W bit, data and STOP cycle by configuring address 0x07. I2C master will send enabled cycles in the correct sequence.

Address 0x02 serves to indicate whether Master/Master packet is busy, as well as Master received status. Bit[0] will be set to 1 when one byte is being sent, and the bit can be automatically cleared after a start signal/ address byte/acknowledge signal/data /stop signal is sent. Bit[1] is set to 1 when the start signal is sent, and the bit will be automatically cleared after the stop signal is sent. Bit[2] indicates whether to succeed in sending acknowledgement signal.

7.3.4.1 I2C Master Write transfer

I2C Master has 3-byte buffer for write data, which are I2CAD (0x04), I2CDW (0x05) and I2CDR (0x06). Write transfer will be completed by I2C master module.

For example, to implement an I2C write transfer with 3-byte data, which contains START, Slave Address, Write bit, ack from Slave, 1st byte, ack from slave, 2nd byte, ack from slave, 3rd byte, ack from slave and STOP, user needs to configure I2C slave address to I2C_ID (0x01) [7:1], 1st byte data to I2CAD, 2nd byte data to I2CDW and 3rd byte to I2CDR. To start I2C write transfer, I2CSCT1 (0x07) is configured to 0x3f (0011 1111). I2C Master will launch START, Slave address, Write bit, load ACK to I2CMST (0x02) [2], send I2CAD data, load ACK to I2CMST[2], send I2CDW data, load ACK to I2CMST[2], send I2CDR data, load ACK to I2CMST[2] and then STOP sequentially.

For I2C write transfer whose data are more than 3 bytes, user could split the cycles according to I2C protocol.

7.3.4.2 I2C Master Read transfer

I2C Master has one byte buffer for read data, which is I2CDR (0x06). Read transfer will be completed by I2C Master.

For example, to implement an I2C read transfer with 1 byte data, which contains START, Slave Address, Read bit, Ack from Slave, 1st byte from Slave, Ack by master and STOP, user needs to configure I2C slave address to I2C_ID (0x01) [7:1]. To start I2C read transfer, I2CSCT1 (0x07) is

configured to 0xf9 (1111 1001). I2C Master will launch START, Slave address, Read bit, load ACK to I2CMST (0x02) [2], load data to I2CDR, reply ACK and then STOP sequentially.

For I2C read transfer whose data are more than 1 byte, user could split the cycles according to I2C protocol.

7.3.5 I2C and SPI Usage

I2C hardware and SPI hardware modules in the chip share part of the hardware, as a result, when both hardware interfaces are used, the restrictions listed within this section need to be taken into consideration.

I2C and SPI hardware cannot be used as Slave at the same time.

The other cases are supported, including:

- ♦ I2C Slave and SPI Master can be used at the same time.
- ♦ I2C Master and SPI Slave can be used at the same time.
- ♦ I2C and SPI can be used as Master at the same time.

Please refer to corresponding SDK instructions for details.

7.4 SPI

The TLSR8253F512 embeds SPI (Serial Peripheral interface), which could act as Master mode or Slave mode. SPI is a high-speed, half-duplex and synchronous communication bus requiring 4 bus lines including a chip select (CS) line, a data input (DI) line, a data output (DO) line and a clock (CK) line.

7.4.1 Register table

| Table 7- 6 | Register | configuration | for SPI |
|------------|----------|---------------|---------|
| Table /- 0 | Register | configuration | 101 371 |

| Address | R/W | Description | Default Value |
|---------|-----|--|---------------|
| 0x08 | RW | [7:0]: SPI data access | 0x00 |
| 0x09 | RW | [0]: mst_csn, control SPI_CSN output when SPI acts as Master [1]: enable master mode [2]: spi data output disable [3]: 1 for read command; 0 for write command [4]: address auto increase [5]: share_mode [6]: busy status | 0x11 |
| 0x0a | RW | [6:0]: SPI clock speed[7]: SPI function mode, p_csn, p_scl, p_sda and p_sdo function as SPI if 1 | 0x05 |
| 0x0b | RW | [0]: inverse SPI clock output [1]: data delay half clk | 0x00 |

7.4.2 SPI Master mode

SPI for the TLSR8253F512 supports both master mode and slave mode and acts as slave mode by default. Address 0x09 bit[1] should be set to 1b'1 to enable SPI Master mode. Register SPISP is to configure SPI pin and clock: setting address 0x0a bit[7] to 1 is to enable SPI function mode, and corresponding pins can be used as SPI pins; SPI clock = system clock/((clock speed configured in address 0x0a bit[6:0] +1)*2).

Address 0x08 serves as the data register. One reading/writing operation of 0x08 enables the SPI_CK pin to generate 8 SPI clock cycles.

Telink SPI supports four standard working modes: Mode 0~Mode 3. Register SPIMODE (address 0x0b) serves to select one of the four SPI modes:

| Table 7 7 STT Master Induc | | | | | |
|---|----------------------|------------------------------------|--|--|--|
| SPI mode | CPOL/CPHA | SPIMODE register (Address 0x0b) | | | |
| Mode 0 | CPOL=0, CPHA=0 | bit[0]=0, bit[1]=0 | | | |
| Mode 1 | CPOL=0, CPHA=1 | bit[0]=0, bit[1]=1 | | | |
| Mode 2 | CPOL=1, CPHA=0 | bit[0]=1, bit[1]=0 | | | |
| Mode 3 | CPOL=1, CPHA=1 | bit[0]=1, bit[1]=1 | | | |
| CPOL: Clock Pola | CPOL: Clock Polarity | | | | |
| When CPOL=0, SPI_CLK keeps low level in idle state; | | | | | |
| When CPOL=1, SPI_CLK keeps high level in idle state. | | | | | |
| CPHA: Clock Phase | | | | | |
| When CPHA=0, data is sampled at the first edge of clock period | | | | | |
| When CPHA=1, data is sampled at the latter edge of clock period | | | | | |

Address 0x09 bit[0] is to control the CS line: when the bit is set to 1, the CS level is high; when the bit is cleared, the CS level is low.

Address 0x09 bit[2] is the disabling bit for SPI Master output. When the bit is cleared, MCU writes data into address 0x08, then the SPI_DO pin outputs the data bit by bit during the 8 clock cycles generated by the SPI_CK pin. When the bit is set to 1b'1, SPI_DO output is disabled.

Address 0x09 bit[3] is the enabling bit for SPI Master reading data function. When the bit is set to 1b'1, MCU reads the data from address 0x08, then the input data from the SPI_DI pin is shifted into address 0x08 during the 8 clock cycles generated by the SPI_CK pin. When the bit is cleared, SPI Master reading function is disabled.

Address 0x09[5] is the enabling bit for share mode, i.e. whether SPI_DI and SPI_DO share one common line.

Users can read address 0x09 bit[6] to get SPI busy status, i.e. whether the 8 clock pulses have been sent.

7.4.3 SPI Slave mode

SPI for the TLSR8253F512 acts as slave mode by default. SPI Slave mode supports DMA. User could access registers of the TLSR8253F512 by SPI interface. It's noted that system clock of TLSR8253F512 shall be at least 5x faster than SPI clock for reliable connection. Address 0x0a should be written with data 0xa5 by the SPI host to activate SPI slave mode. SPI salve only supports Mode0

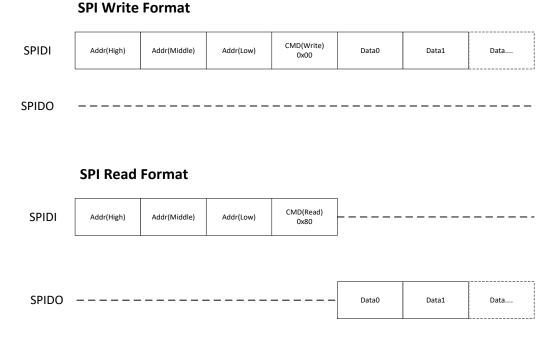

and Mode3.

Table 7-8SPI Slave mode

| SPI slave mode | CPOL/CPHA | | |
|--|----------------|--|--|
| Mode 0 | CPOL=0, CPHA=0 | | |
| Mode 3 | CPOL=1, CPHA=1 | | |
| Receive data at positive edge of SPI MCLK clock. | | | |
| Send data at negative edge of SPI MCLK clock. | | | |

Address 0x09[4] is dedicated for SPI Slave mode and indicates address auto increment. SPI write command format and read command format are illustrated in Figure 7-8:

7.4.4 I2C and SPI Usage

I2C hardware and SPI hardware modules in the chip share part of the hardware, as a result, when both hardware interfaces are used, certain restrictions apply.

See Section 7.3.5 I2C and SPI Usage for detailed instructions.

7.5 UART

The TLSR8253F512 embeds UART (Universal Asynchronous Receiver/Transmitter) to implement full-duplex transmission and reception via UART TX and RX interface. Both TX and RX interface are 4-layer FIFO (First In First Out) interface.

Hardware flow control is supported via RTS and CTS.

The UART module also supports ISO7816 protocol to enable communication with ISO/IEC 7816 integrated circuit card, especially smart card. In this mode, half-duplex communication

```
DS-TLSR8253-E14
```

(transmission or reception) is supported via the shared 7816_TRX interface.

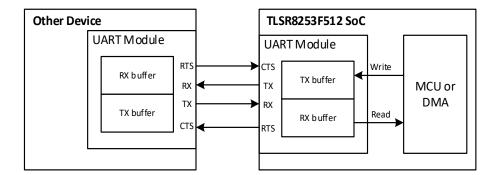

Figure 7-10 UART communication

As shown in Figure 7-9, data to be sent is first written into TX buffer by MCU or DMA, then UART module transmits the data from TX buffer to other device via pin TX. Data to be read from other device is first received via pin RX and sent to RX buffer, then the data is read by MCU or DMA.

If RX buffer of the TLSR8253F512 UART is close to full, the TLSR8253F512 will send a signal (configurable high or low level) via pin RTS to inform other device that it should stop sending data. Similarly, if the TLSR8253F512 receives a signal from pin CTS, it indicates that RX buffer of other device is close to full and the TLSR8253F512 should stop sending data.

Addresses 0x90~0x93 serve to write data into TX buffer or read data from RX buffer.

Addresses 0x94~0x95 serve to configure UART clock.

Address 0x96 serves to set baud rate (bit[3:0]), enable RX/TX DMA mode (bit[4:5]), and enable RX/TX interrupt (bit[6:7]).

Address 0x97 mainly serves to configure CTS. Bit[1] should be set to 1b'1 to enable CTS. Bit[0] serves to configure CTS signal level. Bit[2:3] serve to enable parity bit and select even/odd parity. Bit[5:4] serve to select 1/1.5/2 bits for stop bit. Bit[6] serves to configure whether RX/TX level should be inverted.

Address 0x98 serves to configure RTS. Bit[7] and Bit[3:0] serve to enable RTS and configure RTS signal level.

Address 0x99 serves to configure the number of bytes in RX/TX buffer to trigger interrupt.

The number of bytes in RX/TX buffer can be read from address 0x9c.

7.6 USB

The TLSR8253F512 has a full-speed (12Mbps) USB interface for communicating with other compatible digital devices. The USB interface acts as a USB peripheral, responding to requests from a master host controller. The chip contains internal 1.5kohm pull up resistor for the DP pin, which can be enabled via analog register afe_0x0b<7>.

Telink USB interface supports the Universal Serial Bus Specification, Revision v2.0 (USB v2.0 Specification).

The chip supports 9 endpoints, including control endpoint 0 and 8 configurable data endpoints. Endpoint 1, 2, 3, 4, 7 and 8 can be configured as input endpoint, while endpoint 5 and 6 can be configured as output endpoint. In audio class application, only endpoint 6 supports iso out mode, while endpoint 7 supports iso in mode. In other applications, each endpoint can be configured as bulk, interrupt and iso mode. For control endpoint 0, the chip's hardware vendor command is configurable.

Optional suspend mode:

- ♦ Selectable as USB suspend mode or chip suspend mode, support remote wakeup.
- ♦ Current draw in suspend mode complied with USB v2.0 Specification.
- ♦ USB pins (DM, DP) can be used as GPIO function in suspend mode.
- Resume and detach detect: Recognize USB device by detecting the voltage on the DP pin with configurable 1.5K pull-up resistor.
- ♦ USB pins configurable as wakeup GPIOs.

The USB interface belongs to an independent power domain, and it can be configured to power down independently.

8 PWM

The TLSR8253F512 supports 6-channel PWM (Pulse-Width-Modulation) output. Each PWM#n (n=0~5) has its corresponding inverted output at PWM#n_N pin.

8.2 Enable PWM

Register PWM_EN (address 0x780)[5:1] and PWM_ENO (address 0x781)[0] serves to enable PWM5~PWM0 respectively via writing "1" for the corresponding bits.

8.3 Set PWM clock

PWM clock derives from system clock. Register PWM_CLKDIV (address 0x782) serves to set the frequency dividing factor for PWM clock. Formula below applies:

F_{PWM}= F_{System clock} / (PWM_CLKDIV+1)

8.4 PWM waveform, polarity and output inversion

Each PWM channel has independent counter and 2 status including "Count" and "Remaining". Count and Remaining status form a signal frame.

8.4.1 Waveform of signal frame

When PWM#n is enabled, first PWM#n enters Count status and outputs High level signal by default. When PWM#n counter reaches cycles set in register PWM_TCMP#n (address 0x794~0x795, 0x798~0x799, 0x79c~0x79d, 0x7a0~0x7a1, 0x7a4~0x7a5, 0x7a8~0x7a9) / PWM_TCMP0_SHADOW (0x7c4~0x7c5), PWM#n enters Remaining status and outputs Low level till PWM#n cycle time configured in register PWM_TMAX#n (address 0x796~0x797, 0x79a~0x79b, 0x79e~0x79f, 0x7a2~0x7a3, 0x7a6~0x7a7, 0x7aa~0x7ab) / PWM_TMAX0_SHADOW (0x7c6~0x7c7) expires.

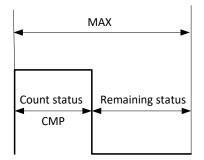

Figure 8-1 A signal frame

An interruption will be generated at the end of each signal frame if enabled via register PWM_MASK (address 0x7b0[2:7]).

8.4.2 Invert PWM output

PWM#n and PWM#n_N output could be inverted independently via register PWM_CC0 (address 0x784) and PWM_CC1 (address 0x785). When the inversion bit is enabled, waveform of the corresponding PWM channel will be inverted completely.

8.4.3 Polarity for signal frame

By default, PWM#n outputs High level at Count status and Low level at Remaining status. When the corresponding polarity bit is enabled via register PWM_CC2 (address 0x786[5:0]), PWM#n will output Low level at Count status and High level at Remaining status.

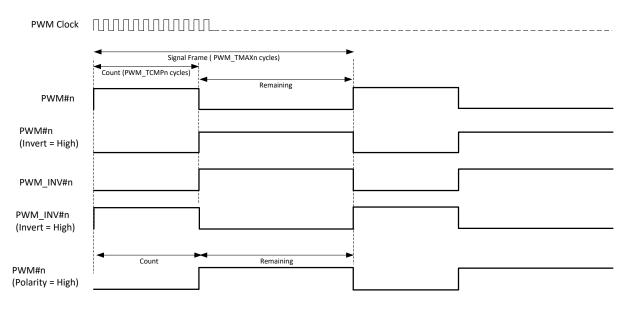

Figure 8-2 PWM output waveform chart

8.5 PWM mode

8.5.1 Select PWM mode

PWM0 supports five modes, including Continuous mode (normal mode, default), Counting mode, IR mode, IR FIFO mode, IR DMA FIFO mode.

PWM1~PWM5 only support Continuous mode.

Register PWM_MODE (address 0x783) serves to select PWM0 mode.

8.5.2 Continuous mode

PWM0~PWM5 all support Continuous mode. In this mode, PWM#n continuously sends out signal frames. PWM#n should be disabled via address 0x780/0x781 to stop it; when stopped, the PWM output will turn low immediately.

During Continuous mode, waveform could be changed freely via PWM_TCMP#n and PWM_TMAX#n. New configuration for PWM_TCMP#n and PWM_TMAX#n will take effect in the next signal frame.

After each signal frame is finished, corresponding PWM cycle done interrupt flag bit (0x7b1[2:7]) will be automatically set to 1b'1. If the interrupt is enabled by setting PWM_MASKO (address 0x7b0[2:7]) as 1b'1, a frame interruption will be generated. User needs to write 1b'1 to the flag bit to manually clear it.

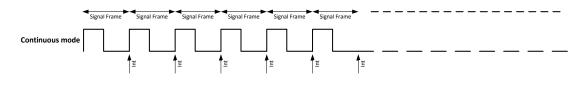

Figure 8-3 Continuous mode

8.5.3 Counting mode

Only PWM0 supports Counting mode. Address 0x783[3:0] should be set as 4b'0001 to select PWM0 counting mode.

In this mode, PWM0 sends out specified number of signal frames which is defined as a pulse group. The number is configured via register PWM_PNUM0 (address 0x7ac~0x7ad).

After each signal frame is finished, PWMO cycle done interrupt flag bit (0x7b1[2]) will be automatically set to 1b'1. If the interrupt is enabled by setting PWM_MASKO (address 0x7b0[2]) as 1b'1, a frame interruption will be generated. User needs to write 1b'1 to the flag bit to manually clear it.

After a pulse group is finished, PWMO will be disabled automatically, and PWMO pnum interrupt flag bit (0x7b1[0]) will be automatically set to 1b'1. If the interrupt is enabled by setting PWM_MASKO (address 0x7b0[0]) as 1b'1, a Pnum interruption will be generated. User needs to write 1b'1 to the flag bit to manually clear it.

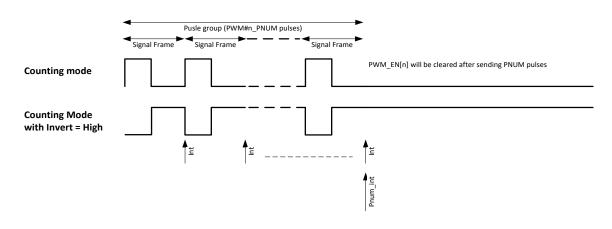

Figure 8-4 Counting mode (n=0)

Counting mode also serves to stop IR mode gracefully. Refer to section 8.5.4 for details.

8.5.4 IR mode

Only PWM0 supports IR mode. Address 0x783[3:0] should be set as 4b'0011 to select PWM0 IR mode.

In this mode, specified number of frames is defined as one pulse group. In contrast to Counting mode where PWMO stops after first pulse group is finished, PWMO will constantly send pulse groups in IR mode.

During IR mode, PWM0 output waveform could also be changed freely via WM_TCMP0, PWM_TMAX0 and PWM_PNUM0. New configuration for PWM_TCMP0, PWM_TMAX0 and PWM_PNUM0 will take effect in the next pulse group.

To stop IR mode and complete current pulse group, user can switch PWM0 from IR mode to Counting mode so that PWM0 will stop after current pulse group is finished. If PWM0 is disabled directly via PWM_EN0 (0x781[0]), PWM0 output will turn Low immediately despite of current pulse group.

After each signal frame/pulse group is finished, PWMO cycle done interrupt flag bit (0x7b1[2])/PWMO pnum interrupt flag bit (0x7b1[0]) will be automatically set to 1b'1. A frame interruption/Pnum interruption will be generated (if enabled by setting address 0x7b0[2]/0x7b0[0] as 1b'1).

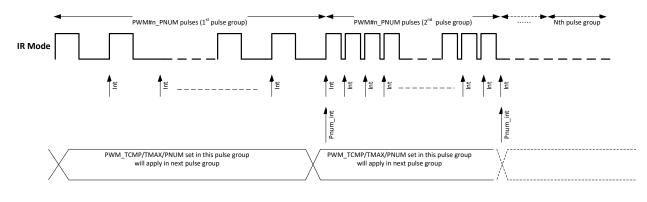

Figure 8-5 IR mode (n=0)

8.5.5 IR FIFO mode

IR FIFO mode is designed to allow IR transmission of long code patterns without the continued intervention of MCU, and it is designed as a selectable working mode on PWMO. The IR carrier frequency is divided down from the system clock and can be configured as any normal IR frequencies, e.g. 36kHz, 38kHz, 40kHz, or 56kHz.

Only PWM0 supports IR FIFO mode. Address 0x783[3:0] should be set as 4b'0111 to select PWM0 IR FIFO mode.

An element ("FIFO CFG Data") is defined as basic unit of IR waveform, and written into FIFO. This element consists of 16 bits, including:

- ♦ bit[13:0] defines PWM pulse number of current group.
- bit[14] determines duty cycle and period for current PWM pulse group.

```
DS-TLSR8253-E14
```

0: use configuration of TCMP0 and TMAX0 in 0x794~0x797;

1: use configuration of TCMP0_SHADOW and TMAX0_SHADOW in 0x7c4~0x7c7.

bit[15] determines whether current PWM pulse group is used as carrier, i.e. whether
 PWM will output pulse (1) or low level (0).

User should use FIFO_DATA_ENTRY in $0x7c8^{\circ}0x7cb$ to write the 16-bit "FIFO CFG Data" into FIFO by byte or half word or word.

- ♦ To write by byte, user should successively write 0x7c8, 0x7c9, 0x7ca and 0x7cb.
- ♦ To write by half word, user should successively write 0x7c8 and 0x7ca.
- \diamond To write by word, user should write 0x7c8.

FIFO depth is 8 bytes. User can read the register FIFO_SR in 0x7cd to view FIFO empty/full status and check FIFO data number.

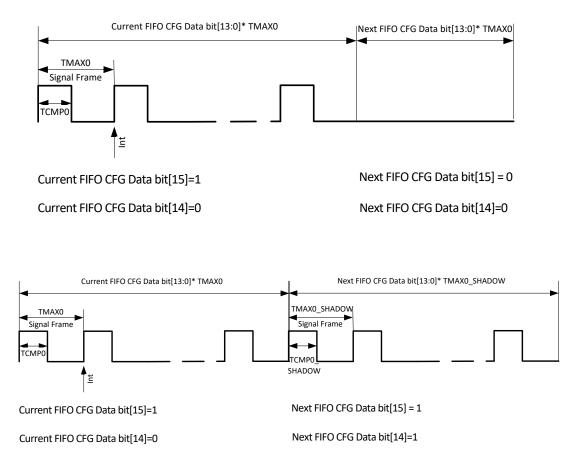

Figure 8-6 IR format examples

When "FIFO CFG Data" is configured in FIFO and PWM0 is enabled via PWM_EN0 (address 0x781[0]), the configured waveforms will be output from PWM0 in sequence. As long as FIFO doesn't overflow, user can continue to add waveforms during IR waveforms sending process, and long IR code that exceeds the FIFO depth can be implemented this way. After all waveforms are sent, FIFO becomes empty, PWM0 will be disabled automatically.

The FIFO_CLR register (address 0x7ce[0]) serves to clear data in FIFO. Writing 1b'1 to this register will clear all data in the FIFO. Note that the FIFO can only be cleared when not in active transmission.

8.5.6 IR DMA FIFO mode

IR DMA FIFO mode is designed to allow IR transmission of long code patterns without occupation of MCU, and it is designed as a selectable working mode on PWMO. The IR carrier frequency is divided down from the system clock and can be configured as any normal IR frequencies, e.g. 36kHz, 38kHz, 40kHz, or 56kHz.

Only PWM0 supports IR DMA FIFO mode. Address 0x783[3:0] should be set as 4b'1111 to select PWM0 IR DMA FIFO mode.

This mode is similar to IR FIFO mode, except that "FIFO CFG Data" is written into FIFO by DMA instead of MCU. User should write the configuration of "FIFO CFG Data" into RAM, and then enable DMA channel 5. DMA will automatically write the configuration into FIFO.

*Note: In this mode, when DMA channel 5 is enabled, PWM will automatically output configured waveform, without the need to manually enable PWMO via 0x781[0] (i.e. 0x781[0] will be set as 1b'1 automatically).

Example 1:

Suppose Mark carrier (pulse) frequency1(F1) = 40kHz, duty cycle 1/3

Mark carrier (pulse) frequency2(F2) = 50kHz, duty cycle 1/2

Space carrier (low level) frequency(F3) = 40kHz

If user wants to make PWM send waveforms in following format (PWM CLK =24MHz):

Burst(20[F1]), i.e. 20 F1 pulses Burst(30[F2]), Burst(50[F1]), Burst(50[F2]), Burst(20[F1],10[F3]),

Burst(30[F2],10[F3])

Step1: Set carrier F1 frequency as 40kHz, set duty cycle as 1/3.

Set **PWM_TMAX0** as 0x258 (i.e. 24MHz/40kHz=600=0x258). Since duty cycle is 1/3, set **PWM_TCMP0** as 0xc8 (i.e. 600/3=200=0xc8). Set carrier F2 frequency as 50kHz, set duty cycle as 1/2. Set **PWM_TMAX0_SHADOW** as 0x1e0 (i.e. 24MHz/50kHz=480=0x1e0). Since duty cycle is 1/2, set **PWM_TCMP0_SHADOW** as 0xf0 (i.e. 480/2=240=0xf0).

Step2: Generate "FIFO CFG Data" sequence.

Burst(20[F1]): {[15]: 1'b1, [14]: 1'b0, [13:0]: 'd20}=0x8014.

Burst(30[F2]): {[15]: 1'b1, [14]: 1'b1, [13:0]: 'd30}=0xc01e.

Burst(50[F1]) : {[15]: 1'b1, [14]: 1'b0, [13:0]: 'd50}=0x8032.

Burst(50[F2]): {[15]: 1'b1, [14]: 1'b1, [13:0]:'d50}=0xc032.

Burst(20[F1],10[F3]): {[15]: 1'b1, [14]: 1'b0, [13:0]: 'd20}=0x8014,

{[15]: 1'b0, [14]: 1'b0, [13:0]: 'd10}=0x000a.

Burst(30[F2],10[F3]): {[15]: 1'b1, [14]: 1'b1, [13:0]: 'd30}=0xc01e,

{[15]:1'b0, [14]: 1'b0, [13:0]: 'd10}=0x000a.

Step3: Write "FIFO CFG Data" into SRAM in DMA format.

DMA SOURCE ADDRESS+0x00: 0x0000_0010 (dma transfer-length: 16byte)

DMA SOURCE ADDRESS+0x04: 0xc01e_8014 (LITTLE ENDIAN)

DMA SOURCE ADDRESS+0x08: 0xc032_8032

DMA SOURCE ADDRESS+0x0c: 0x000a_8014

DMA SOURCE ADDRESS+0x10: 0x000a_c01e

Step4: Enable DMA channel 5 to send PWM waveforms.

Write 1'b1 to address 0x524[5] to enable DMA channel 5.

After all waveforms are sent, FIFO becomes empty, PWM0 will be disabled automatically (address 0x781[0] is automatically cleared). The FIFO mode stop interrupt flag bit (address 0x7b3[0]) will be automatically set as 1b'1. If the interrupt is enabled by setting PWM_MASK1 (address 0x7b2[0]) as 1b'1, a FIFO mode stop interrupt will be generated. User needs to write 1b'1 to the flag bit to manually clear it.

Example 2:

Suppose carrier frequency is 38kHz, system clock frequency is 24MHz, duty cycle is 1/3, and the format of IR code to be sent is shown as below:

- 1) Preamble waveform: 9ms carrier + 4.5ms low level.
- 2) Data 1 waveform: 0.56ms carrier + 0.56ms low level.
- 3) Data 0 waveform: 0.56ms carrier + 1.69ms low level.
- 4) Repeat waveform: 9ms carrier + 2.25ms low level + 0.56ms carrier. Repeat waveform duration is 11.81ms, interval between two adjacent repeat waveforms is 108ms.
- 5) End waveform: 0.56ms carrier.

User can follow the steps below to configure related registers:

Step1: Set carrier frequency as 38kHz, set duty cycle as 1/3.

Set PWM_TMAX0 as 0x277 (i.e. 24MHz/38kHz=631=0x277).

Since duty cycle is 1/3, set **PWM_TCMP0** as 0xd2 (i.e. 631/3=210=0xd2).

Step2: Generate "FIFO CFG Data" sequence.

Preamble waveform:

9ms carrier: {[15]:1'b1, [14]:1'b0, [13:0]: 9*38='d 342=14'h 156}=0x8156

4.5ms low level: {[15]:1'b0, [14]:1'b0, [13:0]: 4.5*38='d 171=14'h ab}=0x00ab

Data 1 waveform:

0.56ms carrier: {[15]:1'b1, [14]:1'b0, [13:0]: 0.56*38='d 21=14'h 15}=0x8015

0.56ms low level: {[15]:1'b0, [14]:1'b0, [13:0]: 0.56*38='d 21=14'h 15}=0x0015

Data 0 waveform:

0.56ms carrier: {[15]:1'b1, [14]:1'b0, [13:0]: 0.56*38='d 21=14'h 15}=0x8015

1.69ms low level: {[15]:1'b0, [14]:1'b0, [13:0]: 1.69*38='d 64=14'h 40}=0x0040

Repeat waveform:

9ms carrier: {[15]:1'b1, [14]:1'b0, [13:0]: 9*38='d 342=14'h 156}=0x8156

2.25ms low level: {[15]:1'b0, [14]:1'b0, [13:0]: 2.25*38='d 86=14'h 56}=0x0056

0.56ms carrier: {[15]:1'b1, [14]:1'b0, [13:0]: 0.56*38='d 21=14'h 15}=0x8015

108ms -11.81ms =96.19ms low level:

{[15]:1'b0, [14]:1'b0, [13:0]: 96.19*38='d 3655=14'h e47}=0x0e47

End waveform:

0.56ms carrier: {[15]:1'b1, [14]:1'b0, [13:0]: 0.56*38='d 21=14'h 15}=0x8015

Step3: Write "IR CFG Data" into SRAM in DMA format.

If user want PWM0 to send IR waveform in following format:

Preamble+0x5a+Repeat+End

Preamble: 0x8156, 0x00ab

0x5a=8'b01011010

Data 0: 0x8015, 0x0040

Data 1: 0x8015, 0x0015

Data 0: 0x8015, 0x0040

Data 1: 0x8015, 0x0015

Data 1: 0x8015, 0x0015

Data 0: 0x8015, 0x0040

Data 1: 0x8015, 0x0015 Data 0: 0x8015, 0x0040 Repeat: 0x8156, 0x0056, 0x8015, 0x0e47 End: 0x8015.

User needs to write the configuration information above into source address of DMA channel 5, as shown below:

DMA SOURCE ADDRESS+0x00: 0x0000_002e (dma transfer-length: 46byte) DMA SOURCE ADDRESS+0x04: 0x00ab_8156 (Preamble) (LITTLE ENDIAN) DMA SOURCE ADDRESS+0x08: 0x0040_8015 (Data 0) DMA SOURCE ADDRESS+0x0c: 0x0015_8015 (Data 1) DMA SOURCE ADDRESS+0x10: 0x0040_8015 (Data 0) DMA SOURCE ADDRESS+0x14: 0x0015_8015 (Data 1) DMA SOURCE ADDRESS+0x18: 0x0015_8015 (Data 1) DMA SOURCE ADDRESS+0x1c: 0x0040_8015 (Data 1) DMA SOURCE ADDRESS+0x20: 0x0015_8015 (Data 1) DMA SOURCE ADDRESS+0x20: 0x0015_8015 (Data 0) DMA SOURCE ADDRESS+0x24: 0x0040_8015 (Data 0) DMA SOURCE ADDRESS+0x28: 0x0056_8156 (Repeat) DMA SOURCE ADDRESS+0x20: 0x0047_8015 (Repeat) DMA SOURCE ADDRESS+0x30: 0x8015 (End)

Step4: Enable DMA channel 5 to send PWM waveforms.

Write 1'b1 to address 0x524[5] to enable DMA channel 5.

After all waveforms are sent, FIFO becomes empty, PWM0 will be disabled automatically (address 0x781[0] is automatically cleared). The FIFO mode stop interrupt flag bit (address 0x7b3[0]) will be automatically set as 1b'1. If the interrupt is enabled by setting PWM_MASK1 (address 0x7b2[0]) as 1b'1, a FIFO mode stop interrupt will be generated. User needs to write 1b'1 to the flag bit to manually clear it.

8.6 PWM interrupt

There are 9 interrupt sources from PWM function.

After each signal frame, PWM#n (n=0 5) will generate a frame-done IRQ (Interrupt Request) signal.

In Counting mode and IR mode, PWMO will generate a Pnum IRQ signal after completing a pulse group.

In IR FIFO mode, PWM0 will generate a FIFO mode count IRQ signal when the FIFO_NUM value is less than the FIFO_NUM_LVL, and will generate a FIFO mode stop IRQ signal after FIFO becomes

```
DS-TLSR8253-E14
```

empty.

In IR DMA FIFO mode, PWMO will generate an IR waveform send done IRQ signal, after DMA has sent all configuration data, FIFO becomes empty and final waveform is sent.

To enable PWM interrupt, the total enabling bit "irq_pwm" (address 0x641[6], see **section 6 Interrupt**) should be set as 1b'1. To enable various PWM interrupt sources, PWM_MASK0 (address 0x7b0[7:0]) and PWM_MASK1 (address 0x7b2[0]) should be set as 1b'1 correspondingly.

Interrupt status can be cleared via register PWM_INT0 (address 0x7b1[7:0]) and PWM_INT1 (address 0x7b3[0]).

9 Audio

9.1 Audio input path

There are four types of audio input path: digital microphone (DMIC), Codec (I2S) and analog input channel (AMIC), which is selectable by writing address 0xb11[3:2].

Address 0xb11[4] should be set as 1b'1/1b'0 to select mono/stereo input for audio input processing module.

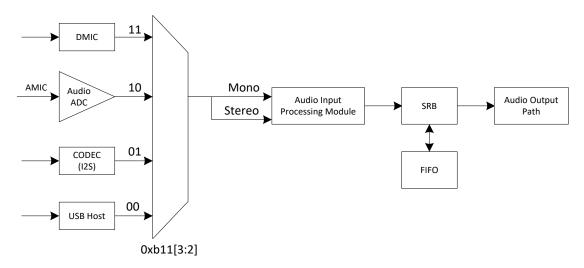

Figure 9-1 Audio input path

| Data Path | | Target SRAM | | |
|------------|---|--------------|--------------|--------------|
| | | FIFO0 | FIFO1 | FIFO2 |
| DMIC | Decimation filter /LPF/Down Sample/ HPF/ALC | \checkmark | \checkmark | × |
| 125 | | \checkmark | \checkmark | × |
| USB | | \checkmark | \checkmark | × |
| ANALOG CH0 | | \checkmark | \checkmark | × |
| ANALOG CH1 | | \checkmark | \checkmark | × |
| ANALOG CH2 | | × | × | \checkmark |

Table 9-1 Audio data flow direction

9.1.1 AMIC input

Address 0xb11[3:2] should be set as 2b'10 to select AMIC as audio input.

A programmable stereo PGA (Programmable Gain Amplifier) with adjustable gain is built in for AMIC. AMIC input channel can carry out signal amplification via the PGA.

After implementing AD conversion for selected AMIC input signal, data of 3 analog channels (CH0~CH2) will be generated. Data of CH0/CH1 are sent to the audio input processing module, while data of CH2 are directly written into FIFO.

9.1.2 DMIC input

Stereo digital microphone (DMIC) interface is also supported in the TLSR8253F512. Address 0xb11[3:2] should be set as 2b'11 to select DMIC as audio input.

DMIC interface includes one configurable clock line and one data line. Address 0xb11[1:0] serves to set the rising/falling edge of clock signal at which to sample data of DMIC, and it should not be set as 2b'11. Address 0xb11[7:6] serves to enable/mask the DMIC channel which samples data at rising/falling edge. Generally, address 0xb11 bit[0] is set as 1b'0 and bit[7:6] is set as 2b'01 to enable DMIC0 sampling at rising edge of clock.

After data sampling of DMIC interface, sign extension and audio input processing, the signal can be written into FIFO.

9.1.3 I2S input

Address 0xb11[3:2] should be set as 2b'01 to select I2S as audio input.

Digital I2S audio interface supports Master mode only, 16-bit data width, and variable sampling rate: 8K/16K/22.05K/24K/32K/44.1K/48K. The sampling rate is determined by I2S clock.

For I2S clock configuration, please refer to section **4.3.3 I2S clock**.

Address 0x560[5]/[4]/[1] should be set to "1" to enable I2S interface, I2S Recorder and I2S Player, respectively. I2S interface includes one configurable clock line, one data line and one channel selection line. Data generated by the audio codec will be written into FIFO after implementing conversion via I2S Recorder and audio input processing.

9.1.4 USB Host input

Address 0xb11[3:2] should be set as 2b'00 to select USB as audio input.

Packet transmitted by USB Host will be written into FIFO after implementing conversion via USB Interface and audio input processing.

Address 0x560[3] should be set to 1b'1 to enable ISO player.

9.1.5 DFIFO

As shown in Table 9-1, for any type of audio input path, the data will be finally written into DFIFO (DMA FIFO) 0, 1 or 2.

Address 0xb10[0]/[1]/[2] should be set as 1b'1 to enable audio input of DFIFO 0~2.

DFIFO supports auto mode and manual mode. It's highly recommended to clear address 0xb2c[0] to select auto mode.

Take DFIFO0 as an example:

♦ Address 0xb00, 0xb01 and 0xb03 serve to set base address for DFIFO0, i.e. starting address to

DS-TLSR8253-E14

write/read data into/from DFIFO0.

- ☆ Address 0xb02 serves to set depth (i.e. the maximum data number) for DFIFO0. Suppose address 0xb02 is set as 0x01, then the DFIFO0 depth is 4 words, i.e. 16 bytes.
- Current data number (difference value of write-pointer and read-pointer) in DFIFO0 can be read from address 0xb20 and 0xb21.
- User can check current DFIFO0 read pointer/write pointer location by reading address 0xb14~0xb15/0xb16~0xb17.
- When current data number in DFIFOO is less than the underflow threshold set in address 0xb0c, address 0xb13 bit[0] and bit[4] will be set as 1b'1 successively, and a FIFOO low interrupt will be generated if enabled via 0xb10[4].

Address 0xb13[4] will be automatically cleared when the data number in DFIFO0 is no less than the threshold; address 0xb13[0] needs to be cleared manually.

When current data number in DFIFO0 is more than the overflow threshold set in address 0xb0d, address 0xb13 bit[1] and bit[5] will be set as 1b'1 successively, and a FIFO0 high interrupt will be generated if enabled via 0xb10[5].

Address 0xb13[5] will be automatically cleared when the data number in DFIFO0 is no more than the threshold; address 0xb13[1] needs to be cleared manually.

When current data number in DFIFO1 is more than the overflow threshold set in address 0xb0e, address 0xb13 bit[2] and bit[6] will be set as 1b'1 successively, and a FIFO0 high interrupt will be generated if enabled via 0xb10[6].

Address 0xb13[6] will be automatically cleared when the data number in DFIFO0 is no more than the threshold; address 0xb13[2] needs to be cleared manually.

When current data number in DFIFO2 is more than the overflow threshold set in address 0xb0f, address 0xb13 bit[3] and bit[7] will be set as 1b'1 successively, and a FIFO0 high interrupt will be generated if enabled via 0xb10[7].

Address 0xb13[7] will be automatically cleared when the data number in DFIFO0 is no more than the threshold; address 0xb13[3] needs to be cleared manually.

9.2 Audio input processing

Audio input processing mainly includes configurable decimation filter, LPF (Low Pass Filter), Down-sample module, HPF (High Pass Filter) and ALC (Automatic Level Control). The decimation filter, LPF, Down-sample module, HPF and ALC can be enabled or bypassed via address 0xb11[5] and 0xb40 [6]/[7]/[4]/[5].

Figure 9-2 Audio input processing

9.2.1 Decimation filter

Address 0xb11[5] should be cleared to enable decimation filter.

The decimation filter serves to down-sample the mono or stereo input (e.g. DMIC) data to

```
DS-TLSR8253-E14
```

required audio data playback rate (e.g. 48K or 32K).

Down-sampling rate is configurable as 1~8, 16, 32, 64, 128 or 256 by writing address 0xb12[3:0].

Address 0xb12[7:4] serves to adjust decimation filter output by right shift, so that the data after down-sampling won't exceed data bit width.

9.2.2 LPF

Address 0xb40[6] should be cleared to enable the LPF. The LPF serves to conduct frequency compensation.

9.2.3 Down-sample

If the Down-sample module is enabled by setting address 0xb40[7] to 1b'1, it will downsample the data from LPF with fixed ratio of 2.

9.2.4 HPF

Address 0xb40[4] should be cleared to enable the HPF.

The HPF serves to eliminate internal DC offset to ensure audio amplification range.

The HPF output is adjustable via setting the parameter in address 0xb40[3:0].

9.2.5 ALC

The ALC supports analog mode and digital mode, and it mainly serves to regulate input volume level automatically or manually in each mode.

The analog mode is designed only for AMIC input, while the digital mode applies to all audio input types.

In analog mode, input volume level is regulated via PGA; while in digital mode, input volume level is regulated via Multiplier/Divider.

9.2.5.1 Auto regulate in analog mode

In this case, address 0xb54[0] should be set as 1b'1, and 0xb41[7]/0xb42[7] should be set as 1b'1 to enable auto regulation mode for left/right channel.

The result of (AMIC input * current PGA gain) is compared with high volume target (ALC_VOL_THH) and low volume target (ALC_VOL_THL); meanwhile, it will be compared with volume noise level (ALC_VOL_THN) to judge noise signal and help to regulate the PGA gain. The PGA gain will be automatically adjusted according to the comparison results, and it should be within the range from minimum PGA gain (ALC_VOL_L/ALC_VOL_R) to maximum PGA gain (ALC_VOL_H).

- Address 0xb44[6:1] serve to set integer part of high volume target in unit of dB; while address
 0xb44[0] serve to set fractional part of high volume target in unit of dB.
- Address 0xb46[6:1] serve to set integer part of low volume target in unit of dB; while address

DS-TLSR8253-E14

0xb46[0] serve to set fractional part of low volume target in unit of dB.

- Address 0xb48[6:1] serve to set integer part of volume noise level in unit of dB; while address
 0xb48[0] serve to set fractional part of volume noise level in unit of dB.
- Address 0xb43[6:0] (ALC_VOL_H) serves to set the maximum PGA gain, while 0xb41[6:0]/0xb42[6:0] (ALC_VOL_L/ALC_VOL_R) serves to set the minimum PGA gain in left/right channel.
- ♦ User can check current PGA gain in left/right channel by reading address 0xb5e/0xb5f.

9.2.5.2 Manual regulate in analog mode

In this case, PGA gain can be adjusted by either of the following two manual modes.

- Manual mode 1: Address 0xb63[7] should be set as 1b'1 to select manual mode 1. In this mode, the PGA consists of two stages of amplifiers including pre-amplifier and post-amplifier, and each stage has configurable gain. Address 0xb63[6] serves to set gain for the pre-amplifier (Boost-stage) as 18dB (1b'0, default) or 38dB (1b'1); while address 0xb63[5:0] serves to set gain for the post-amplifier (Gain-stage) as -10dB (0x0, default) ~ 14dB (0x30) with step of 0.5dB.
- Manual mode 2: Address 0xb63[7] and 0xb54[0] should be cleared to select manual mode 2. In this mode, address 0xb61[6:0]/0xb65[6:0] serves to set target gain value for left/right channel, while 0xb60 serves to set the speed for PGA gain to reach the target gain value. Current PGA gain can be read from address 0xb62[6:0]/0xb66[6:0] which changes until the target gain value is reached. When PGA gain reaches the target value, address 0xb61[7]/0xb65[7] will be set as 1b'1.

9.2.5.3 Auto regulate in digital mode

In this case, address 0xb54[0] should be set as 1b'0, and 0xb41[7]/0xb42[7] should be set as 1b'1 to enable auto regulation mode for left/right channel.

The result of (Audio input * current digital gain) is compared with high volume target (ALC_VOL_THH), low volume target (ALC_VOL_THL); meanwhile, it will be compared with volume noise level (ALC_VOL_THN) to judge noise signal and help to regulate the digital gain. The digital gain will be automatically adjusted according to the comparison results, and it should be within the range from minimum digital gain (ALC_VOL_L/ALC_VOL_R) to maximum digital gain (ALC_VOL_H).

- Address 0xb44[6:1] serve to set integer part of high volume target in unit of dB; while address
 0xb44[0] serve to set fractional part of high volume target in unit of dB.
- Address 0xb46[6:1] serve to set integer part of low volume target in unit of dB; while address 0xb46[0] serve to set fractional part of low volume target in unit of dB.
- Address 0xb48[6:1] serve to set integer part of volume noise level in unit of dB; while address
 0xb48[0] serve to set fractional part of volume noise level in unit of dB.
- Address 0xb43[6:0] (ALC_VOL_H) serves to set the maximum digital gain, while 0xb41[6:0]/0xb42[6:0] (ALC_VOL_L/ALC_VOL_R) serves to set the minimum digital gain in left/right channel.

User can check current digital gain in left/right channel by reading address 0xb4d/0xb4e.

9.2.5.4 Manual regulate in digital mode

In this case, address 0xb54[0] should be set as 1b'0, and 0xb41[7]/0xb42[7] should be set as 1b'0 to enable manual regulation mode for left/right channel.

The coefficient of multiplier/divider is configurable via the register ALC_VOL_L (address 0xb41[5:0] / ALC_VOL_R (address 0xb42[5:0]) for left/right channel.

In manual mode (either analog mode or digital mode), the volume of the signal sent to the ALC module can be read via the address 0xb4d/0xb4e for left/right channel.

9.3 Audio output path

Audio output path mainly includes Rate Matching module, SDMDAC (Sigma-Delta Modulation DAC) and I2S Player. The audio data fetched from SRAM is processed by the Rate Matching module, then transferred to the SDM/I2S Player as the input signal.

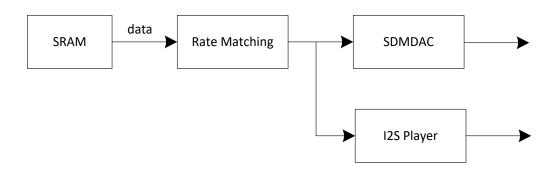

Figure 9-3 Audio output path

9.3.1 Rate Matching

The rate matching block performs clock rate conversion and data synchronization between two domains: the input audio data is fetched from SRAM which works in system clock domain with 24Mhz/32Mhz/48Mhz clocks and the SDM/I2S which works between 4Mhz and 8Mhz.

When needed, the audio data from SRAM is interpolated to the SDM/I2S input rate. If the audio sampling rate is ClkUsbIn (e.g. 48kHz), and the working clock of SDM/I2S is aclk_i, then the interpolation ratio is given as follows:

$$\frac{ClkUsbIn}{aclk_i} = \frac{step_i}{0x80000}$$

Where step_i[19:0] is configured in addresses 0x567~0x565.

Linear interpolation or delay interpolation is used as shown below.

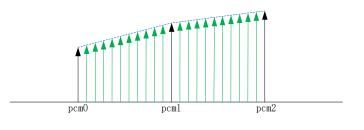

Figure 9-4 Linear interpolation

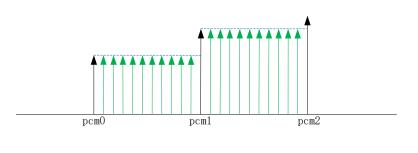

Figure 9-5 Delay interpolation

9.3.2 SDM

The SDM takes 16bits audio data from SRAM and provides 1bit modulated output. Only a simple passive filter network is needed to drive audio device directly.

Dither control can be added to the SDM to avoid spurs in output data. There are three dithering options: PN sequence, PN sequence with Shapping, and DC constant; only one type of input is allowed any time.

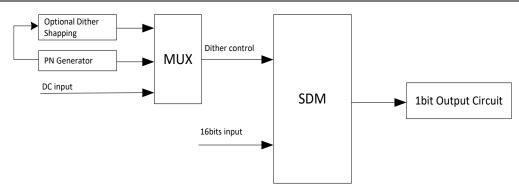

Figure 9-6 Block diagram of SDM

9.3.3 Register configuration

Address 0x560[4:1] should be set to "1" to enable I2S recorder/ISO player/SDM player/I2S player, while bit[0] is to select either mono or stereo audio output. Address 0x560[7] should be set to "1" to enable the HPF in audio output path.

Register VOL_CTRL (address 0x562) serves to adjust volume level.

Address 0x563[2] serves to select either linear interpolation or delay interpolation for the rate matching block: Setting bit[2] to "1" is to select linear interpolation, while clearing the bit is to select delay interpolation.

Input for SDM Dither control is selectable via addresses 0x56b[6:5]), 0x563[6:5] and 0x568~0x569.

For the **left channel**:

- 1. Address 0x56b[5] should be set to 1b'1 to select constant DC input. When DC input is used, addresses 0x56c~0x56d serve to configure the input constant value.
- 2. Address 0x56b[5] should be set to 1b'0 to use PN generator. Address 0x563[5] serves to enable/mask dither shapping module. There are two PN generators to generate random dithering sequence; address 0x568 bit[6]/bit[5] is enabling bit of the two PN generators.
 - 1) To select PN sequence as input, address 0x56b[5] and 0x563[5] should be set to 0, 0x568[6]/[5]/[6:5] should be set to 1.
 - 2) To select PN sequence with Shapping as input, address 0x56b[5] should be set to 0, 0x563[5] and 0x568[6]/[5]/[6:5] should be set to 1.

When PN sequence or PN with Shapping is used, address 0x568[4:0]/0x569[4:0] determines the number of bits (ranging from 0 to 16) used in PN1/PN2 generator.

For the **right channel**:

- 1. Address 0x56b[6] should be set to 1b'1 to select constant DC input. When DC input is enabled, addresses 0x56e~0x56f serve to configure the input constant value.
- 2. Address 0x56b[6] should be set to 1b'0 to use PN generator. Address 0x563[6] serves to enable/mask dither shapping module. There are two PN generators to generate random dithering sequence; address 0x569 bit[6]/bit[5] is enabling bit of the two PN generators.

- 1) To select PN sequence as input, address 0x56b[6] and 0x563[6] should be set to 0, 0x569[6]/[5]/[6:5] should be set to 1.
- 2) To select PN sequence with Shapping as input, address 0x56b[6] should be set to 0, 0x563[6] and 0x569[6]/[5]/[6:5] should be set to 1.

When PN sequence or PN with Shapping is used, address 0x56a[4:0]/0x56b[4:0] determines the number of bits (ranging from 0 to 16) used in PN1/PN2 generator.

Address 0x567, 0x566 and 0x565[7:4] are to set step_i[19:0] for the rate matching block, while address 0x564 is to tune the step_i value. The step_i should be in accordance with the aclk_i provided by SDM/I2S clock.

10 Quadrature Decoder

The TLSR8253F512 embeds one quadrature decoder (QDEC) which is designed mainly for applications such as wheel. The QDEC implements debounce function to filter out jitter on the two phase inputs, and generates smooth square waves for the two phase.

10.1 Input pin selection

The QDEC supports two phase input; each input is selectable from the 5 pins of PortD, PortC, and PortB via setting address 0xd2[2:0] (for channel a)/0xd3[2:0] (for channel b).

| Address 0xd2[2:0]/0xd3[2:0] | Pin |
|-----------------------------|-------|
| 0 | PA<2> |
| 1 | PA<3> |
| 2 | PB<6> |
| 3 | PB<7> |
| 4 | PC<2> |
| 5 | PC<3> |
| 6 | PD<6> |
| 7 | PD<7> |

Table 10-1 Input pin selection

Note: To use corresponding IO as QDEC input pin, it's needed first to enable GPIO function, enable "IE" (1) and disable "OEN" (1) for this IO.

10.2 Common mode and double accuracy mode

The QDEC embeds an internal hardware counter, which is not connected with bus.

Address 0xd7[0] serves to select common mode or double accuracy mode.

For each wheel rolling step, two pulse edges (rising edge or falling edge) are generated.

If address 0xd7[0] is cleared to select common mode, the QDEC Counter value (real time counting value) is increased/decreased by 1 only when the same rising/falling edges are detected from the two phase signals.

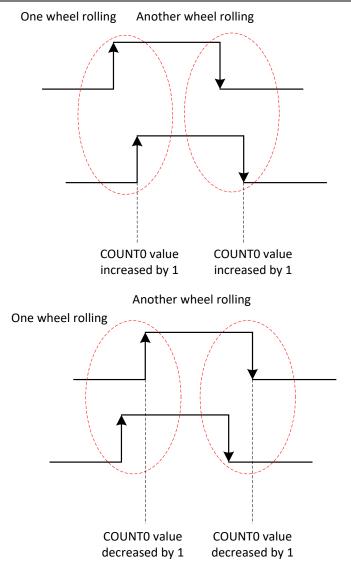

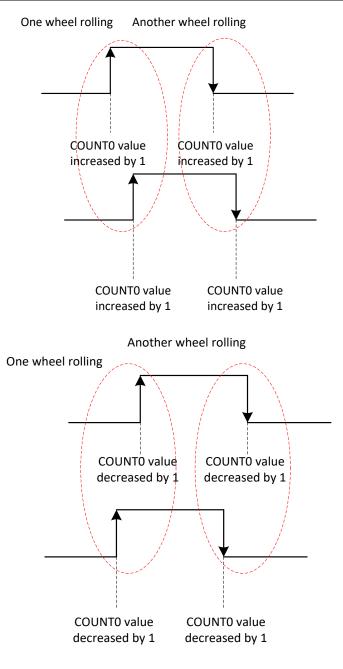

Figure 10-1 Common mode

If address 0xd7[0] is set to 1b'1 to select double accuracy mode, the QDEC Counter value (real time counting value) is increased/decreased by 1 on each rising/falling edge of the two phase signals; the COUNTO will be increased/decreased by 2 for one wheel rolling.

10.3 Read real time counting value

Neither can Hardware Counter value be read directly via software, nor can the counting value in address 0xd0 be updated automatically.

To read real time counting value, first write address 0xd8[0] with 1b'1 to load Hardware Counter data into the QDEC_COUNT register, then read address 0xd0.

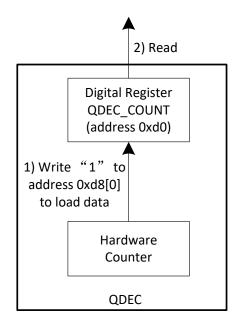

Figure 10- 3 Read real time counting value

10.4 QDEC reset

Address 0x60[5] serves to reset the QDEC. The QDEC Counter value is cleared to zero.

10.5 Other configuration

The QDEC supports hardware debouncing. Address 0xd1[2:0] serves to set filtering window duration. All jitter with period less than the value will be filtered out and thus does not trigger count change.

Address 0xd1[4] serves to set input signal initial polarity.

Address 0xd1[5] serves to enable shuttle mode. Shuttle mode allows non-overlapping two phase signals as shown in the following figure.

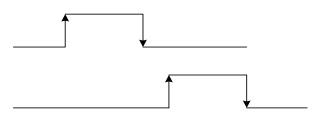

Figure 10- 4 Shuttle mode

10.6 Timing sequence

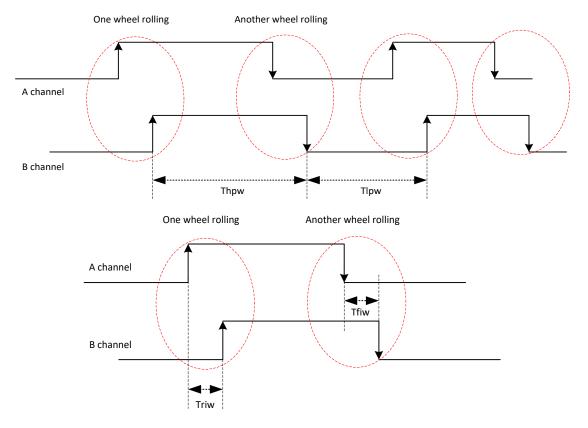

Figure 10-5 Timing sequence chart

Table 10- 2 Timing

| Time interval | Min Value |
|---|-------------------------------------|
| Thpw (High-level pulse width) | 2^(n+1) *clk_32kHz *3 (n=0xd1[2:0]) |
| Tlpw (Low-level pulse width) | 2^(n+1) *clk_32kHz *3 (n=0xd1[2:0]) |
| Triw (Interval width between two rising edges) | 2^(n+1) *clk_32kHz (n=0xd1[2:0]) |
| Tfiw (Interval width between two falling edges) | 2^(n+1) *clk_32kHz (n=0xd1[2:0]) |

QDEC module works based on 32kHz clock to ensure it can work in suspend mode. QDEC module supports debouncing function, and any signal with width lower than the threshold (i.e. "2^(n+1) *clk_32kHz *3 (n=0xd1[2:0])) will be regarded as jitter. Therefore, effective signals input from Channel A and B should contain high/low level with width Thpw/Tlpw more than the threshold. The 2^n *clk_32kHz clock is used to synchronize input signal of QDEC module, so the interval between two adjacent rising/falling edges from Channel A and B, which are marked as Triw and Tfiw, should exceed "2^(n+1) *clk_32kHz".

Only when the timing requirements above are met, can QDEC module recognize wheel rolling times correctly.

10.7 Register table

| Address | R/W | Description | Default Value |
|---------|-----|---|------------------|
| | | QDEC Counting value (read to clear): | |
| 0xd0 | R | Pulse edge number | 0x00 |

Table 10- 3Register table for QDEC

11 SAR ADC

The TLSR8253F512 integrates one SAR ADC module, which can be used to sample analog input signals such as battery voltage, mono or stereo audio signals.

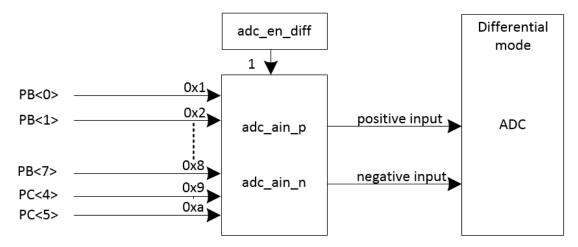

Figure 11-1 Block diagram of ADC

11.1 Power on/down

The SAR ADC is disabled by default. To power on the ADC, the analog register adc_pd (afe_0xfc<5>) should be set as 1b'0.

11.2 ADC clock

ADC clock is derived from external 24MHz crystal source, with frequency dividing factor configurable via the analog register adc_clk_div (afe_0xf4<2:0>).

ADC clock frequency (marked as F_{ADC_clk}) = 24MHz/(adc_clk_div+1)

11.3 ADC control in auto mode

11.3.1 Set max state and enable channel

The SAR ADC supports up to three channels including left channel, right channel and Misc channel. The left, right and Misc channels all consist of one "Set" state and one "Capture" state.

☆ The analog register r_max_scnt (afe_0xf2<6:4>) serves to set the max state index. As shown in the example below, the r_max_scnt should be set as 0x06.

- The left/Misc channel can be enabled independently via r_en_left (afe_0xf2<0>), r_en_misc (afe_0xf2<2>).
- Only when the left channel is enabled, can the right channel be enabled via r_en_right (afe_0xf2<1>).

☆ To sample mono audio signals, the left channel should be enabled. To sample stereo audio signals, both the left channel and the right channel should be enabled.

11.3.2 "Set" state

The length of "Set" state for left, right and Misc channel is configurable via the analog register r_max_s (afe_0xf1<3:0>).

"Set" state duration (marked as T_{sd}) = r_max_s / 24MHz.

Each "Set" state serves to set ADC control signals for current channel via corresponding analog registers, including:

- adc_en_diff: afe_0xec<4> (left channel), afe_0xec<5> (right channel), afe_0xec<6> (Misc channel). MUST set as 1b'1 to select differential input mode.
- ☆ adc_ain_p: afe_0xe8<7:4> (Misc channel), afe_0xe9<7:4> (left channel), afe_0xea<7:4> (right channel). Select positive input in differential mode.
- adc_ain_n: afe_0xe8<3:0> (Misc channel), afe_0xe9<3:0> (left channel), afe_0xea<3:0> (right channel). Select negative input in differential mode.
- → adc_vref: afe_0xe7<1:0> (left channel), afe_0xe7<3:2> (right channel), afe_0xe7<5:4> (Misc channel). Set reference voltage V_{REF}. ADC maximum input range is determined by the ADC reference voltage.
- ♦ adc_sel_ai_scale: afe_0xfa<7:6>. Set scaling factor for ADC analog input as 1 (default), or 1/8.

By setting this scaling factor, ADC maximum input range can be extended based on the V_{REF}.

For example, suppose the V_{REF} is set as 1.2V:

Since the scaling factor is 1 by default, the ADC maximum input range should be $0^{-1.2V}$ (negative input is GND) / -1.2V^{+1.2V} (negative input is ADC GPIO pin).

If the scaling factor is set as 1/8, in theory ADC maximum input range should change to $0^{9.6V}$ (negative input is GND) / $-9.6V^{+9.6V}$ (negative input is ADC GPIO pin). But limited by input voltage of the chip's PAD, the actual range is narrower.

adc_res: afe_0xeb<1:0> (left channel), afe_0xeb<5:4> (right channel), afe_0xec<1:0> (Misc channel). Set resolution as 8/10/12/14 bits.

ADC data is always 15-bit format no matter what the resolution is set. For example, 14 bits resolution indicates ADC data consists of 14-bit valid data and 1-bit sign extension bit.

adc_tsamp: afe_0xed<3:0> (left channel), afe_0xed<7:4> (right channel), afe_0xee<3:0> (Misc channel). Set sampling time which determines the speed to stabilize input signals.

Sampling time (marked as T_{samp}) = adc_tsamp / F_{ADC_clk} .

The lower sampling cycle, the shorter ADC convert time.

♦ pga_boost, pga_gain: Set PGA gain in Boost stage and Gain stage. See PGA section.

11.3.3 "Capture" state

For the left, right and Misc channels, at the beginning of each "Capture" state, run signal is issued automatically to start an ADC sampling and conversion process; at the end of each "Capture" state, ADC output data is captured.

☆ The length of "Capture" state for Misc channel is configurable via the analog register r_max_mc[9:0] (afe_0xf1<7:6>, afe_0xef<7:0>).

"Capture" state duration for Misc channel (marked as T_{cd}) = r_max_mc / 24MHz.

☆ The length of "Capture" state for left and right channel is configurable via the analog register r_max_c[9:0] (afe_0xf1<5:4>, afe_0xf0<7:0>).

"Capture" state duration for left & right channel (marked as T_{cd}) = r_max_c / 24MHz.

- The "VLD" bit (afe_0xf8<7>) will be set as 1b'1 at the end of "Capture" state to indicate the ADC data is valid, and this flag bit will be cleared automatically.
- The 15-bit ADC output data for Misc channel can be read from the analog register adc_dat[14:0] (afe_0xf8<6:0>, afe_0xf7<7:0>).

Note: The total duration " T_{td} ", which is the sum of the length of "Set" state and "Capture" state for all channels available, determines the sampling rate.

Sampling frequency (marked as F_s) = 1 / T_{td}

11.3.4 Usage cases

11.3.4.1 Case 1: 3-channel sampling for stereo audio and Misc

In this case, afe_0xf2<3:0> should be set as 0x7, so as to enable the left, right and Misc channels, the max state index should be set as "6" by setting afe_0xf2<6:4> as 0x6.

The total duration (marked as T_{td}) = (1*r_max_mc+3*r_max_s+2*r_max_c) / 24MHz.

| r_max_s 1 | r_max_c 2 | r_max_s 3 | r_max_c 4 | r_max_s 5 | r_max_mc 6 |
|--------------|--------------|---------------|--------------|---------------|---------------|
| Set | Capture | Set | Capture | Set | Capture |
| Le | eft | ≺ —Rig | ght> | ◄ ───M | isc |

11.3.4.2 Case 2: 2-channel sampling for mono audio and Misc

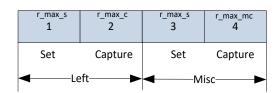

In this case, afe_0xf2<3:0> should be set as 0x5, so as to enable the left and Misc channels and

```
DS-TLSR8253-E14
```

disable the right channel, the max state index should be set as "4" by setting afe_0xf2<6:4> as 0x4.

The total duration (marked as T_{td}) = (1*r_max_mc+2*r_max_s+1*r_max_c) / 24MHz.

11.3.4.3 Case 3: 2-channel sampling for stereo audio

In this case, afe_0xf2<3:0> should be set as 0x3, so as to enable the left and right channels and disable the Misc channel, the max state index should be set as "4" by setting afe_0xf2<6:4> as 0x4.

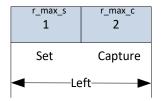

The total duration (marked as T_{td}) = (2*r_max_s+2*r_max_c) / 24MHz.

| r_max_s 1 | r_max_c 2 | r_max_s 3 | r_max_c 4 |
|--------------|--------------|---------------|--------------|
| Set | Capture | Set | Capture |
| -Le | eft 🕒 🕨 | ⊲ —Rig | ght — 🕨 🕨 |

11.3.4.4 Case 4: 1-channel sampling for mono audio

In this case, afe_0xf2<3:0> should be set as 0x1, so as to enable the left channel and disable the right and Misc channels, the max state index should be set as "2" by setting afe_0xf2<6:4> as 0x2.

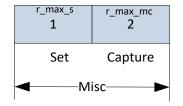

The total duration (marked as T_{td}) = (1*r_max_s+1*r_max_c) / 24MHz.

11.3.4.5 Case 5: 1-channel sampling for Misc

In this case, afe_0xf2<3:0> should be set as 0x4, so as to enable the Misc channel and disable the left and right channels, the max state index should be set as "2" by setting afe_0xf2<6:4> as 0x2.

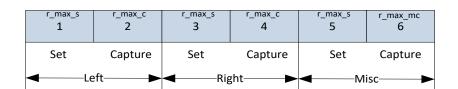

The total duration (marked as T_{td}) = (1*r_max_s+1*r_max_mc) / 24MHz.

11.3.4.6 Case 6 with detailed register setting

This case introduces the register setting details for 3-channel sampling of left, right and Misc channels.

| Function | Register setting |
|---|---|
| Power on the ADC | afe_0xfc<5> = 1b'0 |
| Set $F_{ADC_{clk}}$ (ADC clock frequency) as 4MHz | afe_0xf4<2:0> = 5 $F_{ADC_clk} = 24MHz/(5+1)=4MHz$ |
| Enable the left, right and Misc channels | afe_0xf2<3:0> = 0x7 |
| Set the max state index as "6" | afe_0xf2<6:4> = 0x6 |

12 PGA

The TLSR8253F512 integrates a PGA (Programmable Gain Amplifier) module.

The PGA supports two channels including left channel and right channel, and each channel consists of Boost stage pre-amplifier and Gain stage post-amplifier.

The PGA is used in combination with the audio and ADC module: By adjusting the gain of preamplifier and post-amplifier, the PGA can amplify mono or stereo differential input audio signals from specific AMIC pins before ADC sampling.

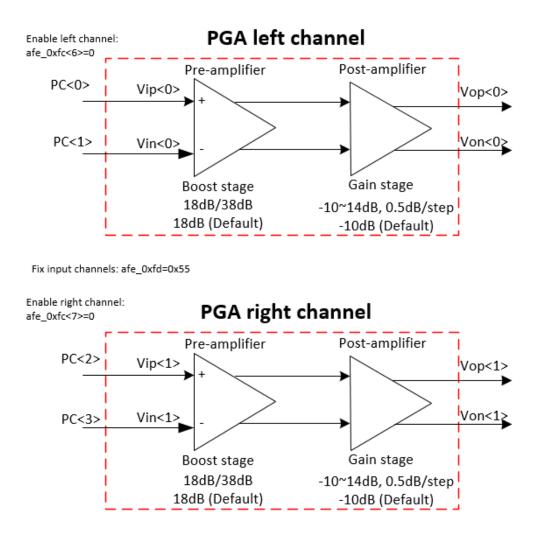

Figure 12-1 Block diagram of PGA

*Note:

Vip<0>, Vin<0>: Positive/Negative input of PGA left channel;

Vop<0>, Von<0>: Positive/Negative output of PGA left channel;

Vip<1>, Vin<1>: Positive/Negative input of PGA right channel;

Vop<1>, Von<1>: Positive/Negative output of PGA right channel.

12.1 Power on/down

Both PGA left channel and right channel are disabled by default.

To power on PGA left/right channel, the analog register pga_pd_l (afe_0xfc<6>) / pga_pd_r (afe_0xfc<7>) should be set as 1b'0.

12.2 Input channel

The analog register afe_0xfd must be set as 0x55, i.e. PGA input channel is fixed as $PC<0>^PC<3>$.

- ♦ PC<0>: positive input for PGA left channel.
- ♦ PC<1>: negative input for PGA left channel.
- ♦ PC<2>: positive input for PGA right channel.
- ♦ PC<3>: negative input for PGA right channel.

12.3 Adjust gain

***NOTE:** Since the ADC right channel cannot be used independently, gain of the PGA right channel is only adjustable when enabling both the ADC left channel and right channel.

To adjust the PGA gain, the ALC of the audio module should be configured as analog mode, and the following three cases can apply:

1) Auto regulate

If auto regulate function is enabled, user can set an initial PGA gain. The (AMIC input * current PGA gain) is compared with the pre-configured high volume target, low volume target and volume noise level, and the PGA gain will be automatically adjusted within the pre-configured range accordingly.

Please refer to section 9.2.5.1 Auto regulate in analog mode for details.

2) Manual mode 1

If manual mode 1 is enabled, the PGA gain is directly adjustable via digital register 0xb63: Address 0xb63[6] serves to set gain for the pre-amplifier as 18dB (1b'0, default) or 38dB (1b'1); while address 0xb63[5:0] serves to set gain for the post-amplifier as -10dB (0x0, default) ~ 14dB (0x30) with step of 0.5dB. The total PGA gain should be the sum of the two gain values.

Please refer to section 9.2.5.2 Manual regulate in analog mode for details.

3) Manual mode 2

If manual mode 2 is enabled, the PGA gain will be automatically adjusted to the pre-configured target gain value with the pre-configured speed.

Please refer to section 9.2.5.2 Manual regulate in analog mode for details.

Table 12-1 Analog register table related to PGA

For digital registers related to the PGA, please refer to section **9.2.5** and **9.2.6**.

13 Low Power Comparator

The TLSR8253F512 embeds a low power comparator. This comparator takes two inputs: input derived from external PortB (PB<1>~PB<7>), and reference input derived from internal reference, PB<0>, PB<3>, AVDD3 or float.

By comparing the input voltage multiplied by selected scaling coefficient with reference input voltage, the low power comparator will output high or low level accordingly.

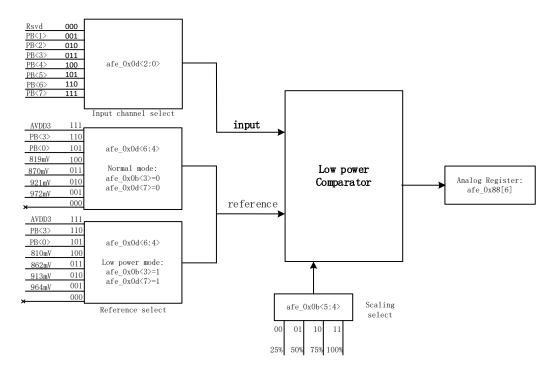

Figure 13-1 Block diagram of low power comparator

13.1 Power on/down

The low power comparator is powered down by default.

The analog register afe_0x07<3> serves to control power state of the low power comparator: By clearing this bit, this comparator will be powered on; by setting this bit to 1b'1, this comparator will be powered down.

To use the low power comparator, first set afe_0x07<3> as 1b'0, then the 32K RC clock source is enabled as the comparator clock.

13.2 Select input channel

Input channel is selectable from the PortB (PB<1>~PB<7>) via the analog register afe_0x0d<2:0>.

13.3 Select mode and input channel for reference

Generally, it's needed to clear both the afe_0x0b<3> and afe_0x0d<7> to select the normal mode. In normal mode, the internal reference is derived from UVLO and has higher accuracy, but current bias is larger (10 μ A); reference voltage input channel is selectable from internal reference of 972mV, 921mV, 870mV and 819mV, as well as PB<0>, PB<3>, AVDD3 and float.

To select the low power mode, both the afe_0x0b<3> and afe_0x0d<7> should be set as 1b'1. In low power mode, the internal reference is derived from Bandgap and has lower accuracy, but current bias is decreased to 50nA; reference voltage input channel is selectable from internal reference of 964mV, 913mV, 862mV and 810mV, as well as PB<0>, PB<3>, AVDD3 and float.

13.4 Select scaling coefficient

Equivalent reference voltage equals the selected reference input voltage divided by scaling coefficient.

The analog register afe_0x0b<5:4> serves to select one of the four scaling options: 25%, 50%, 75% and 100%.

13.5 Low power comparator output

The low power comparator output is determined by the comparison result of the value of [input voltage *scaling] and reference voltage input. The comparison principle is shown as below:

- ☆ If the value of [input voltage *scaling] is larger than reference voltage input, the output will be low ("0").
- If the value of [input voltage *scaling] is lower than reference voltage input, the output will be high ("1").
- If the value of [input voltage *scaling] equals reference voltage input, or input channel is selected as float, the output will be uncertain.

User can read the output of the low power comparator via the analog register afe_0x88[6].

The output of the low power comparator can be used as signal to wakeup system from low power modes.

13.6 Register table

| Address | R/W | Description | Default Value |

14 AES

The TLSR8253F512 embeds AES module with encryption and decryption function. The input 128bit plaintext in combination of key is converted into the final output ciphertext via encryption; the 128bit ciphertext in combination of key can also be converted into 128bit plaintext via decryption.

The AES hardware accelerator provides automatic encryption and decryption. It only takes (1000*system clock cycles) to implement AES encryption/decryption. Suppose system clock is 20MHz, the time needed for AES encryption/decryption is 50µs.

Both RISC mode and DMA mode are supported for AES operation.

14.1 RISC mode

For RISC mode, configuration of related registers is as follows:

- 1) Set the value of key via writing registers AES_KEY0~ AES_KEY15 (address 0x550~0x55f).
- 2) Set operation method of AES module via register AES_CTRL: set address 0x540[0] as 1b'1 for decryption method, while clear this bit for encryption method.
- For encryption method, write registers AES-DAT0~ AES-DAT3 (address 0x548~0x54b) for four times to set the 128bit plaintext. After encryption, the 128bit ciphertext can be obtained by reading address 0x548~0x54b for four times.
- 4) For decryption method, write registers AES-DAT0~ AES-DAT3 (address 0x548~0x54b) for four times to set the 128bit ciphertext. After decryption, the 128bit plaintext can be obtained by reading address 0x548~0x54b for four times.
- 5) Address 0x540 bit[1] and bit[2] are read only bits: bit[1] will be cleared automatically after quartic writing of address 0x548~0x54b; bit[2] will be set as 1 automatically after encryption/decryption, and then cleared automatically after quartic reading of address 0x548~0x54b.

14.2 DMA mode

As for DMA mode, it is only needed to configure the value of key and encryption/decryption method for AES module. Please refer to point 1) \sim 2) in section **15.1**.

14.3 AES-CCM

The AES-CCM (Counter with the CBC-MAC) mode is disabled by default. AES output is directly determined by current encryption and decryption, irrespective of previous encryption and decryption result.

If 0x540[7] is set as 1b'1 to enable AES-CCM mode, AES output will also take previous encryption and decryption result into consideration.

15 Key Electrical Specifications

Note: The electrical characteristics currently listed in this section are target specifications and only supplied for reference. Some data may be updated according to actual test results.

15.1 Absolute maximum ratings

| Characteristics | Sym. | Min. | Max | Unit | Test Condition |
|------------------------------|------------------|------|-------------|------|---|
| Supply Voltage | VDD | -0.3 | 3.6 | V | All AVDD, DVDD and VDD_IO pin must have the same voltage |
| Voltage on Input Pin | V _{In} | -0.3 | VDD+ 0.3 | V | |
| Output Voltage | V _{Out} | 0 | VDD | V | |
| Storage temperature Range | T _{Str} | -65 | 150 | °C | |
| Soldering Temperature | T_{Sld} | | 260 | °C | |

Table 15-1 Absolute Maximum Ratings

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

15.2 Recommended operating condition

| Table 15- 2 | Recommended operation condition |
|-------------|---------------------------------|
|-------------|---------------------------------|

| Item | Sym. | Min | Тур. | Max | Unit | Condition |
|--------------------------------------|------------------|-----|------|-----|------|---|
| Power-supply voltage | VDD | 1.8 | 3.3 | 3.6 | V | All AVDD, DVDD and VDD_IO pin must have the |
| | | | | | | same voltage. |
| Supply rise time (from 1.6V to 1.8V) | t _R | | | 10 | ms | |
| Operating Temperature | Ŧ | -40 | | 85 | °C | ET version |
| Range | T _{Opr} | -40 | | 125 | °C | AT version |

15.3 DC characteristics

Unless otherwise stated, the general test conditions are: VDD=3.3V, Ta=25 $^{\circ}$ C, L_{DCDC}=47µH, C_{DCDC}=4.7µF, VDD=3.3V, VOUT1=1.4V, VOUT2=1.8V, Ipeak=80mA(inductor), I(max,1.4V)=20mA, I(max,1.8V)=20mA.

| Item | Sym. | Min | Тур. | Max | Unit | Remark |
|------------|-----------------|-----|------|-----|------|--|
| RX current | I _{Rx} | | 5.3 | | mA | Whole Chip, load RX bin file, switch to frequency, disable |
| TX current | I _{Tx} | | 4.8 | | mA | whole chip @ 0dBm with DCDC |

| Table 15- 3 | DC characteristics |

|--------------|-----------------------------|

| ltem | Sym. | Min | Тур. | Max | Unit | Condition |
|---------------------------------|----------------|------|---------|---------|-------|--|
| Retention period | | 20 | | | year | |
| Number of erase cycles | | 100k | | | cycle | |
| VDD for programming | | 1.65 | | 2.0 | V | Note this refers to the SoC supply |
| Sector size | | | 4 | | kB | |
| Page programming time | ТРР | | 1.6 | 6 | ms | |
| Sector erase time | TSE | | 150 | 500 | ms | |
| Block erase time (32kB/64kB) | TBE | | 0.5/0.8 | 2.0/3.0 | S | |
| Program current | Ι _Ρ | | | 10 | mA | |
| Erase current | Ι _Ε | | | 10 | mA | |

15.8 Thermal characteristics

Thermal parameters are measured according to JEDEC standard.

| Table 15-8 | Thermal characteristics |
|------------|-------------------------|
| | |

(Ambient Temp=105°C, 1SOP:2-layer PCB)

| Parameter | Min | Тур | Max | Unit |
|-----------|-----|-------|-----|------|
| Theta-Ja | - | 139.3 | - | °C/W |
| Tj | - | 113.5 | - | °C |
| Тс | - | 113.4 | - | °C |

Table 15- 9Thermal characteristics

| Parameter | Min | Тур | Max | Unit |
|-----------|-----|-------|-----|------|
| Theta-Ja | - | 85.2 | - | °C/W |
| Tj | - | 110.2 | - | °C |
| Тс | - | 109.9 | - | °C |

(Ambient Temp=105 $^\circ\!\mathrm{C}$, 1S0P:4-layer PCB)

15.9 ESD characteristics

| Model | Pin Combinations | ESD Sensitivity Pass:+/-2KV | V Class:2 |
|-------|------------------|-----------------------------|------------------------|
| | IO vs VSS(+) | +2KV | ESDA/JEDEC JS-001-2017 |
| | IO vs VSS(-) | -2KV | |
| | IO vs VDD(+) | +2KV | Class-0A:0V-<125V |
| | IO vs VDD(-) | -2KV | Class-0B:125V-<250V |
| | IO vs IO(+) | +2KV | Class-1A:250V-<500V |
| HBM | IO vs IO(-) | -2KV | Class-1B:500V-<1000V |
| | VDD vs VSS(+) | +2KV | Class-1C:1000V-<2000V |
| | | | Class-2:2000V-<4000V |
| | | -2KV | Class-3A:4000V-<8000V |
| | VDD vs VSS(-) | | Class-3B: >=8000V |
| | | | |

Datasheet for Telink TLSR8253

| Model | Pin Combinations | ESD Sensitivity Pass:+/-2KV | V Class:2 |
|-------|------------------|-----------------------------|------------------------|
| | ALL Pin(+) | +500V | ESDA/JEDEC JS-002-2014 |
| | | | |
| | | | C0A:0V-<125V |
| CDM | ALL Pin(-) | -500V | C0B:125V-<250V |
| CDM | | | C1:250V-<500V |
| | | | C2A:500V-<750V |
| | | | C2B:750V-<1000V |
| | | | C3:>=1000V |

Table 15- 11 LU Test Result

| Latch-Up | Test Item | Mode | Spec | Value | Pass/Fail |
|----------|----------------------|----------|---------|--------|-----------|
| | I-Test | Positive | +100mA | +100mA | Pass |
| | 1-1650 | Negative | -100mA | -100mA | Pass |
| | Vsupply Over Voltage | Positive | 1.5Vmax | 5.445V | Pass |

15.10 Storage condition

- 1. Shelf life in sealed moisture barrier bag(MBB): 12 months at <30 $^\circ\!{\rm C}$ and <90% relative humidity(RH).
- 2. After bag is open, devices that will be subjected to reflow or other high temperature process must be:
 - \diamond Mounted with 72 hours of factory conditions <30 $^\circ C$ and \leqslant 60% relative humidity(RH), and
 - ♦ Stored per conditions of 10RH, and
 - $\diamond~$ Devices require bake for 24 hour at 125 $^\circ\!\!\mathrm{C}$, before mounting.

16 Reference Design

16.1 Application example for TLSR8253F512ET48

16.1.1 Schematic

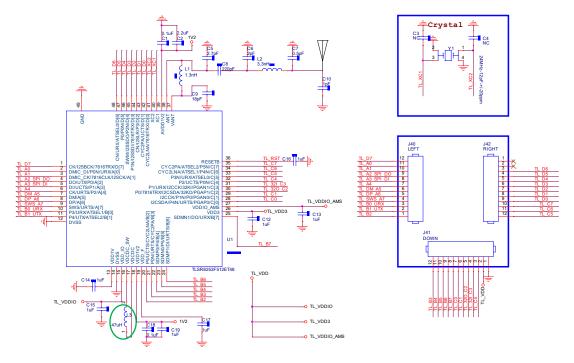

Figure 16-1 Schematic for TLSR8253F512ET48

*Note:

In the reference design, the L3 adopts 47μ H inductor, which can ensure sensitivity index given in this Datasheet. User can also select 10μ H or 6.8μ H inductor instead as needed, but note that sensitivity will have 1^{2} dB or so difference.

16.1.2 BOM (Bill of Material)

| Quantity | Reference | Value | Description | PCB Footprint |
|----------|-----------------------------|-------|--|----------------------|
| 2 | C1,C18 | 0.1µF | Capacitance,X5R,±10% | 0402 |
| 1 | C2 | 2.2µF | Capacitance,X5R,±10% | 0402 |
| 2 | C3,C4 | N.C. | Not mounted | 0402 |
| 1 | C5 | 2.7pF | Capacitance,C0G,±0.1pF | 0402 |
| 1 | C6 | 2pF | Capacitance,C0G,±0.1pF | 0402 |
| 1 | C7 | 0.5pF | Capacitance,C0G,±0.05pF | 0402 |
| 1 | C8 | 220pF | Capacitance,X7R,±10% | 0402 |
| 1 | C9 | 18pF | Capacitance,C0G,±5% | 0402 |
| 1 | C10 | 1pF | Capacitance,C0G,±0.25pF | 0402 |
| 6 | C12,C13,C14, C15,C16,C17 | 1µF | Capacitance,X5R,±10% | 0402 |
| 1 | C19 | 1µF | Capacitance,X5R,±10% | 0402 |
| 1 | J40 | LEFT | Pin headers | hdr254f- 1x12x850 |
| 1 | J41 | DOWN | Pin headers | hdr254f- 1x12x850 |
| 1 | J42 | RIGHT | Pin headers | hdr254f- 1x12x850 |
| 1 | L1 | 1.3nH | High frequency chip inductor,±0.3nH | 0402 |
| 1 | L2 | 3.3nH | High frequency chip inductor,±0.3nH | 0402 |
| 1 | L3 | 47μΗ | High frequency chip | 0805 |

Datasheet for Telink TLSR8253

| Quantity | Reference | Value | Description | PCB Footprint |
|----------|-----------|----------------------|--|------------------|
| | | | inductor,±20% | |
| 1 | U1 | TLSR8253F 512ET48 | Multi-Standard Wireless on chip | QFN-48 |
| 1 | Y1 | 24MHz | XTAL SMD 3225,24 MHz,Cl=12pF,total tol.±20ppm | XTAL_3225 |

16.2 Application example for TLSR8253F512ET32

16.2.1 Schematic

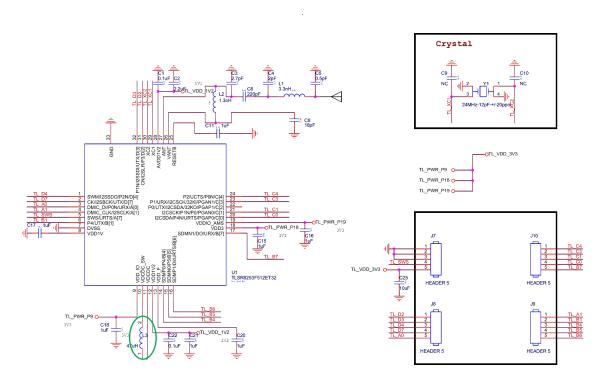

Figure 16-2 Schematic for TLSR8253F512ET32

*Note:

In the reference design, the L3 adopts 47μ H inductor, which can ensure sensitivity index given in this Datasheet.

16.2.2 BOM (Bill of Material)

| Quantity | Reference | Value | Description | PCB Footprint |
|----------|-----------------------------|----------------------|--|---------------------|
| 2 | C1,C22 | 0.1µF | Capacitance,X5R,±10% | 0402 |
| 1 | C2 | 2.2µF | Capacitance,X5R,±10% | 0603 |
| 1 | C3 | 2.7pF | Capacitance,COG,±0.25pF | 0402 |
| 1 | C4 | 2pF | Capacitance,COG,±0.1pF | 0402 |
| 1 | C5 | 0.5pF | Capacitance,COG,±0.1pF | 0402 |
| 1 | C6 | 220pF | Capacitance,X7R,±10% | 0402 |
