

The **ES9028Q2M SABRE<sup>32</sup> Reference DAC** is a very high-performance, 32-bit, Stereo audio D/A converter designed for; audiophile-grade portable power sensitive applications such as digital music players, Blu-ray players, audio pre-amplifiers and A/V receivers, and professional applications such as recording systems, mixer consoles and digital audio workstations.

Using the critically acclaimed ESS patented 32-bit HyperStream™ DAC architecture and Time Domain Jitter Eliminator, the **ES9028Q2M SABRE<sup>32</sup> Reference DAC** delivers a DNR of up to 129dB and THD+N of –120dB, a performance level that will satisfy the most demanding audio enthusiasts.

The **ES9028Q2M SABRE<sup>32</sup> Reference DAC**'s 32-bit HyperStream™ architecture handles up to 32-bit 384kHz PCM data via I<sup>2</sup>S, DSD-22.6MHz data as well as a mono mode for highest performance applications. Both synchronous and ASRC (asynchronous sample rate conversion) modes are supported.

The **ES9028Q2M SABRE<sup>32</sup> Reference DAC** sets the standard, **SABRE SOUND™**, for HD audio performance, typically consumes 83mW in normal operation mode (< 1mW in standby mode), and comes in an easy-to-use, 32-QFN package.

# ES9028Q2M Datasheet

## FUNCTIONAL DESCRIPTION

### NOTATATIONS for Sampling Rates

| Mode                         | fs (target sample rate) | FSR (raw sample rate) |
|------------------------------|-------------------------|-----------------------|
| DSD                          | DATA_CLK / 64           | DSD data rate         |
| Serial (PCM) Normal Mode     | Frame Clock Rate        | Frame Clock Rate      |
| Serial (PCM) OSF Bypass Mode | Frame Clock Rate / 8    | Frame Clock Rate      |
| SPDIF                        | SPDIF Sampling Rate     | SPDIF Sampling Rate   |

### PCM, SPDIF and DSD Pin Connections

#### PCM Audio Format

##### Notes:

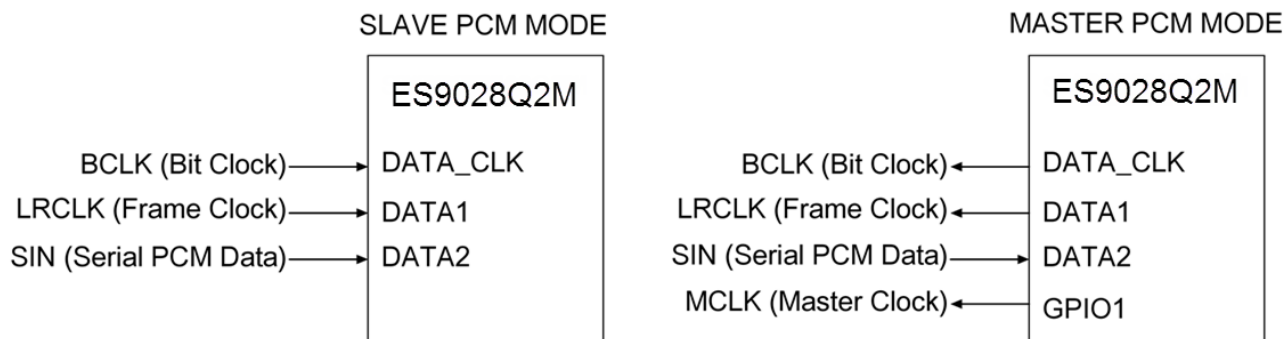

**XI clock (MCLK) must be > 192 x FSR when using PCM input (normal mode), or 128 x FSR (synchronous MCLK).**

**XI clock (MCLK) must be > 24 x FSR when using PCM input (OSF bypass mode).**

| Pin Name | Description                    |
|----------|--------------------------------|
| DATA1    | Frame clock                    |
| DATA2    | 2-channel PCM serial data      |
| DATA_CLK | Bit clock for PCM audio format |

#### Master Mode (32-bit data only)

When Register #1 'input\_select' is set to 2'd0 (I<sup>2</sup>S) and 'i2s\_length' is set to 2'd2 (32-bit), the DAC can become a master for Bit Clock and Frame Clock by setting Register #10 'master clock enable' to 1'b1. The Bit Clock frequency can be configured to MCLK / 4, MCLK / 8 or MCLK / 16 by setting Register #10 'clock divider select' to 2'b00, 2'b01 or 2'b10. GPIO 1 (or 2) can be configured to output MCLK by setting Register #8 gpio1\_cfg (or gpio2\_cfg) to 4'd3.

**SPDIF Audio Formant**

**Note: XI clock (MCLK) must be > 386 x FSR when using the SPDIF input.**

Up to three SPDIF inputs can be connected to the 3-to-1 mux, selectable via register “spdif\_sel”. The SPDIF can also be sourced from GPIO pins configured as inputs.

| Pin Name | Description   |
|----------|---------------|
| GPIO2    | SPDIF input 5 |
| GPIO1    | SPDIF input 4 |
| DATA1    | SPDIF input 3 |
| DATA2    | SPDIF input 2 |
| DATA_CLK | SPDIF input 1 |

**DSD Audio Format**

**Note: XI clock (MCLK) must be > 3 x FSR when using the DSD input.**

| Pin Name  | Description                  |
|-----------|------------------------------|
| DATA[1:2] | 2-channel DSD data input     |
| DATA_CLK  | Bit clock for DSD data input |

The MCLK will run at 100MHz which means that the maximum DSD clock frequency supported is 33.3MHz. Hence, octuple-rate DSD or DSD-22.6MHz is supported by the ES9028Q2M. Note that it is essential to meet the requirement of  $MCLK > 3 \times DSD\_CLK$  or the circuit will not function correctly.

# ES9028Q2M Datasheet

## FEATURE DESCRIPTIONS

### Soft Mute

When Mute is asserted the output signal will ramp to the  $-\infty$  level. When Mute is reset the attenuation level will ramp back up to the previous level set by the volume control register. Asserting Mute will not change the value of the volume control register. The ramp rate is  $0.0078125 \times fs / 2^{(vol\_rate-5)}$  dB/s.

### Automute

During an automute condition the ramping of the volume of each DAC to  $-\infty$  can now be programmatically enabled or disabled.

- In PCM serial mode, "AUTOMUTE" will become active once the audio data is continuously below the threshold set by <Register Automute\_lev>, for a length of time defined by  $2096896 / (<Register\#4> \times 64 \times fs)$  Seconds.
- In SPDIF mode, "AUTOMUTE" will become active once the audio data is continuously below the threshold set by <Register Automute\_lev>, for a length of time defined by  $2096896 / (<Register\#4> \times 64 \times fs)$  Seconds.
- In the DSD Mode, "AUTOMUTE" will become active when any 8 consecutive values in the DSD stream have as many 1's and 0's for a length of time defined by  $2096896 / (<Register Automute\_time> \times DATA\_CLK)$  seconds. The following table summarizes the conditions.

| Mode  | Detection Condition                                      | Time                                                          |
|-------|----------------------------------------------------------|---------------------------------------------------------------|
| PCM   | Data is continuously lower than <Register Automute_lev > | $2096896 / (<Register Automute\_time> \times 64 \times fs)$   |
| SPDIF | Data is continuously lower than <Register Automute_lev > | $2096896 / (<Register Automute\_time> \times (64 \times fs))$ |
| DSD   | Equal number of 1s and 0s in every 8 bits of data        | $2096896 / (<Register Automute\_time> \times DATA\_CLK)$      |

### Volume Control

Each output channel has its own attenuation circuit. The attenuation for each channel is controlled independently. Each channel can be attenuated from 0dB to  $-127$ dB in 0.5dB steps.

Each 0.5dB step transition takes up to 64 intermediate levels, depending on the vol\_rate register setting. The result being that the level changes are done using small enough steps so that no switching noise occurs during the transition of the volume control. When a new volume level is set, the attenuation circuit will ramp softly to the new level.

### Master Trim

The master trim sets the 0dB reference level for the volume control of each DAC. The master trim is programmable via registers 17-20 and is a 32-bit signed number. Therefore it should never exceed 32'h7FFFFFFF (as this is full-scale signed).

### All Mono Mode

An all mono mode where all DACs are driven from the same source is supported. This can be useful for high-end audio applications. The source data for all DACs can be programmatically configured to be either CH1 or CH2.

### De-emphasis

The de-emphasis feature is included for audio data that has utilized the 50/15 $\mu$ s pre-emphasis for noise reduction. There are three de-emphasis filters, one for 32kHz, one for 44.1kHz, and one for 48kHz.

### SPDIF Data Select

An SPDIF source multiplexer allows for up to three SPDIF sources to be connected to the data pins. An internal programmable register (spdif\_sel) is used to select the appropriate data pin to decode. The SPDIF can also be sourced from GPIO pins configured as inputs.

## System Clock (XI / MCLK)

A system clock is required for proper operation of the digital filters and modulation circuitry. See page 34, Note 2 for the maximum MCLK frequencies supported. The minimum system clock frequency must also satisfy:

| Data Type              | Minimum MCLK Frequency                                                                                                         | Note                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| DSD Data               | $MCLK > 3 \times FSR$ , $FSR = 2.8224\text{MHz}$ (x 1, 2 or 4)                                                                 | The maximum FSR frequency is further limited by the maximum MCLK frequencies supported as shown on page 34, Note 2. |
| Serial Normal Mode     | $MCLK > 192 \times FSR$ , $FSR \leq 384\text{kHz}$<br>$MCLK = 128 \times FSR$ (synchronous MCLK) with $FSR \leq 384\text{kHz}$ |                                                                                                                     |
| Serial OSF Bypass Mode | $MCLK > 24 \times FSR$ , $FSR \leq 1.536\text{MHz}$                                                                            |                                                                                                                     |
| SPDIF Data             | $MCLK > 386 \times FSR$ , $FSR \leq 200\text{kHz}$                                                                             |                                                                                                                     |

## Data Clock

DATA\_CLOCK must be  $(2 \times i2s\_length) \times FSR$  for SERIAL, and FSR for DSD modes. For SPDIF mode, this pin is used for SPDIF input. The DATA\_CLK pin should be pulled low if not used.

## Built-in Digital Filters

Three digital filters are included for PCM data, a fast roll-off filter, a slow roll-off filter, and a minimum phase filter. See 'PCM Filter Characteristics' for more information.

## Standby Mode

For lowest power consumption, the following should be performed to enter the stand-by mode:

- Set the soft\_start bit in register 14 to 1'b0 to ramp the DAC outputs (DACL, DACLB, DACR, DACRB) to ground.
- RESETB pin should be brought to low digital level to:
  - Shut off the DACs, Oscillator and internal regulator.
  - Force digital I/O pins (DATA\_CLK, DATA1, GPIO1, GPIO2, SDA) into tri-state mode
  - Reset all registers to default states
- If XI/MCLK is supplied externally, it should be stopped at a logic low level
- If DVDD is supplied by an external regulator, it should be shut down during standby.

To resume from standby mode, bring RESETB to high digital level and reinitialize all registers.

## DVDD Supply

The ES9028Q2M is equipped with a regulated DVDD supply powered from DVCC. The internal DVDD regulator must be decoupled to DGND with a capacitor that maintains a minimum value of  $1\mu\text{F}$  at 1.2V over the target operating temperature range. The recommended capacitor for decoupling DVDD is a  $4.7\mu\text{F} \pm 20\%$ , X5R 6.3V 0402.

- The internal DVDD should be used except under the following conditions:
  - PCM (SPDIF, I<sup>2</sup>S with OSF Bypass off or on) with  $MCLK > 50\text{MHz}$  or  $FSR > 192\text{kHz}$
  - DSD with  $MCLK > 50\text{MHz}$  or  $FSR > 11.2\text{MHz}$
- Please refer to page 31, Note 2 for the maximum supported MCLK frequencies.  
An External DVDD ( $+1.3\text{V} \pm 5\%$ ) supply must be used above those frequencies.  
The external supply voltage should be greater than the internal supply of +1.2V so the internal regulator is disabled.

## SLIMbus Mode

The ES9028Q2M supports the Serial Low-power Inter-chip Media Bus (SLIMbus) standard, which is a common interface between application processors and peripheral components in mobile devices. SLIMbus is implemented as a synchronous 2-wire configurable interface. The ES9028Q2M acts as a slave device on the SLIMbus interface, relying on a master to be present to generate clocks and frames.

To enable the SLIMbus mode the DMODE pin is pulled high. When DMODE is high, the DATA\_CLK pin becomes SLIMBUS\_CLK and the DATA\_2 pin becomes SLIMBUS\_DATA. The ES9028Q2M now reports itself as 3 valid SLIMbus devices if a valid clock and framer exist.

## ES9028Q2M Datasheet

The ES9028Q2M identifies under the following SLIMbus address space:

0x0145C0C70XYY where X is the device and YY is either 00 (ADDR = 0) or 01 (ADDR = 1).

Once the ES9028Q2M has reported that it is present, it is ready to stream audio to the data endpoint. The first step is to assign logical addresses to each of the three devices initialized in the ES9028Q2M.

```
ASSIGN_LOGICAL_ADDRESS Dst = 0x0145C0C70000 LA = 5
ASSIGN_LOGICAL_ADDRESS Dst = 0x0145C0C70100 LA = 6
ASSIGN_LOGICAL_ADDRESS Dst = 0x0145C0C70300 LA = 8
```

For 44.1kHz audio, a root clock that is divisible by 44.1kHz is required. For this we can select the common SLIMbus clock of 22.5792MHz.

```
BEGIN_RECONFIGURATION
NEXT_ROOT_FREQUENCY RF = 2
RECONFIGURE_NOW
```

Now the source audio device is configured, which depends on the baseband or application processor used. Next the SINKs are configured, assuming the same channel and port numbers are used (the same numbers should be used when configuring the audio sources).

```
CONNECT_SINK Src = 0xFF, Dst = 6, CN = 1, PN = 0
CONNECT_SINK Src = 0xFF, Dst = 6, CN = 2, PN = 1
```

The type of audio to be transmitted on the selected channel(s) is now setup. For this example, the transmission is streaming 44.1KHz audio in isochronous mode.

```
BEGIN_RECONFIGURATION
NEXT_DEFINE_CHANNEL CN = 1, SD = 3140, TP = 0, SL = 6 (Channel 1, 3140 segment distribution, iso protocol,
segment length 6)
NEXT_DEFINE_CONTENT CN = 1, FL = 1, PR = 11, AF = 0, DT = 1, CL = 0, DL = 6 (Channel 1, frequency locked, 44.1kHz,
LPCM audio, data length 6)
NEXT_ACTIVATE_CHANNEL CN = 1
RECONFIGURE_NOW
BEGIN_RECONFIGURATION
NEXT_DEFINE_CHANNEL CN = 2, SD = 3146, TP = 0, SL = 6 (Channel 2, 3146 segment distribution, iso protocol,
segment length 6)
NEXT_DEFINE_CONTENT CN = 2, FL = 1, PR = 11, AF = 0, DT = 1, CL = 0, DL = 6 (Channel 1, frequency locked, 44.1kHz,
LPCM audio, data length 6)
NEXT_ACTIVATE_CHANNEL CN = 2
RECONFIGURE_NOW
```

Audio should now be configured to stream between the application processor.

Register reads and writes are also accomplished via SLIMbus by writing to 0x0145C0C703XX. Registers are offset from byte address 0x900. For example, register 0 is at 0x900, register 1 is at 0x901, etc. An example of writing to register 1 is as follows:

```
CHANGE_VALUE Src = 0xFF, Dst = 8, AM = 1, BA = 0x901, SS = 0, VU = 0xF2
```

## Programmable FIR filter

A two stage interpolating FIR design is used. The interpolating FIR filter is generated using MATLAB, and can then be downloaded using a custom C code.

### Example Source Code for Loading a Filter

```
// only accept 128 or 16 coefficients
// Note: The coefficients must be quantized to 24 bits for this method!
// Note: Stage 1 consists of 128 values (0-127 being the coefficients)
// Note: Stage 2 consists of 16 values (0-13 being the coefficients, 14-15 are zeros)
// Note: Stage 2 is symmetric about coefficient 13. See the example filters for more information.
byte reg26 = (byte)(coeffs.Count == 128 ? 0 : 128);
for (int i = 0; i < coeffs.Count; i++)
{
    // stage 1 contains 128 coefficients, while stage 2 contains 16 coefficients
    registers.WriteRegister(26, (byte)(reg26 + i));

    // write the coefficient data
    registers.WriteRegister(27, (byte)(coeffs[i] & 0xff));
    registers.WriteRegister(28, (byte)((coeffs[i] >> 8) & 0xff));
    registers.WriteRegister(29, (byte)((coeffs[i] >> 16) & 0xff));

    registers.WriteRegister(30, 0x02); // set the write enable bit
}
// disable the write enable bit when we're done
registers.WriteRegister(30, (byte)(setEvenBit ? 0x04 : 0x00));
```

## OSF Bypass

The oversampling FIR filter can be bypassed, sourcing data directly into the IIR filter. ESS recommends using 8 x FSR as the input. For example, an external signal at 44.1kHz can be oversampled externally to 8 x 44.1kHz = 352.8kHz and then applied to the serial decoder in either I<sup>2</sup>S or LJ format. The maximum sample rate that can be applied is 1.536MHz (8 x 192kHz).

## THD Compensation

Sabre2M THD Compensation removes the non-linearity of the DAC resistors and to a lesser degree the non-linearity of passive components in the output stage. Taking the I-V characteristic curve of a real resistor you will notice that it has a slight downward curvature. As more current flows, more power dissipates the resistor heats and the resistance rises.

Non-linearity of the DAC output resistors can lead to output distortion in two ways:

- Amplitude modulation of the output current from the DAC
- Gain modulation of the output stage as the output impedance of the DAC swings with the audio signal

The Sabre2M includes models for its output resistors and can compensate for their characteristic curve by finely adjusting the DAC codes for large and small signal amplitudes.

THD Compensation is effective if the base THD+N measurement with no compensation is less than approximately 70dB. If your system performs worse than this, check for other errors with the circuit before applying the THD Compensation.

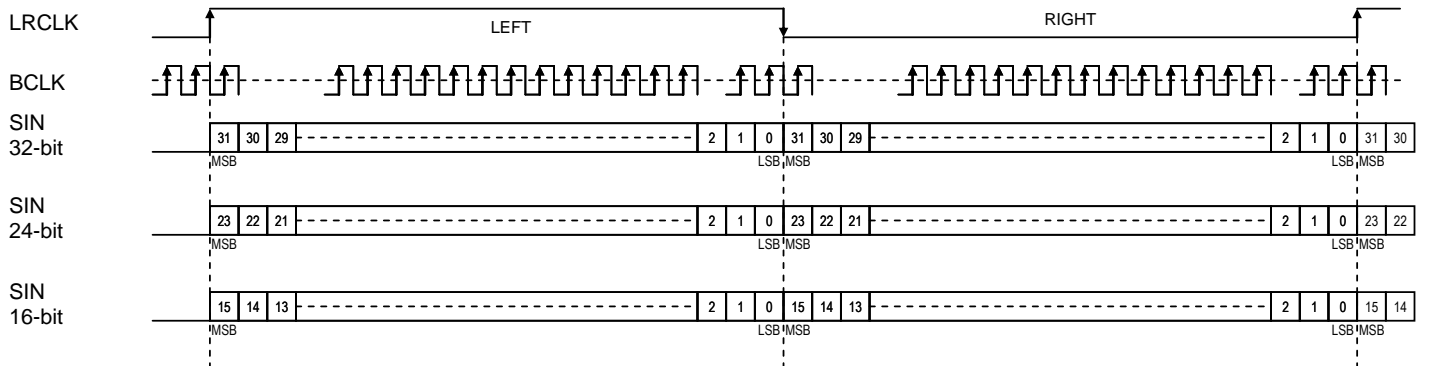

Registers #13, #22 to #25, and #34 to #38 are used for THD Compensation.

# ES9028Q2M Datasheet

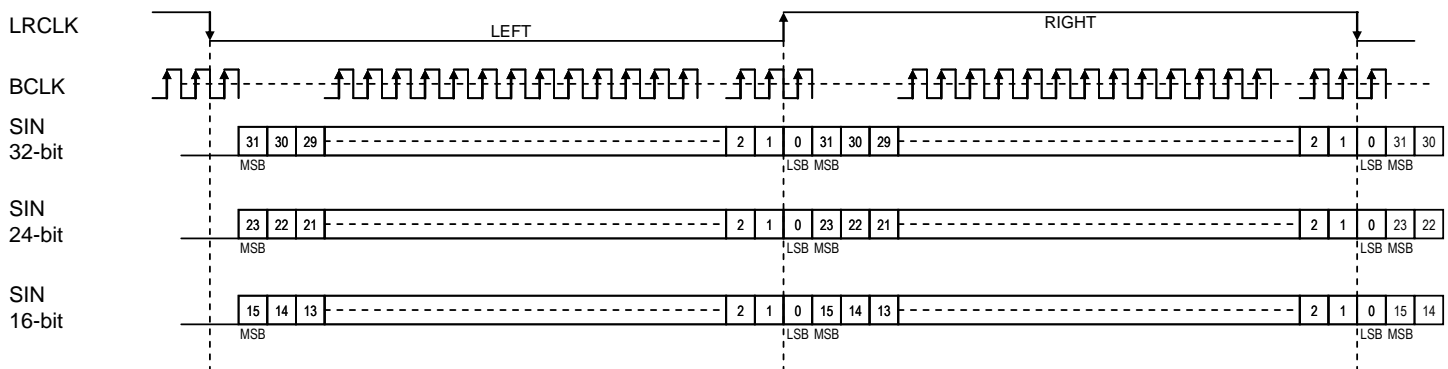

## Audio Interface Formats

Several interface formats are provided so that direct connection to common audio processors is possible. The available formats are shown in the following diagrams. The audio interface format can be set by programming the registers.

**LEFT JUSTIFIED FORMAT**

**I2S FORMAT**

**Note:** for Left-Justified and I<sup>2</sup>S formats, the following number of BCLKs is present per (left plus right) frame:

- 16-bit mode: 32 BCLKs
- 24-bit mode: 48 BCLKs
- 32-bit mode: 64 BCLKs

**DSD NORMAL MODE**

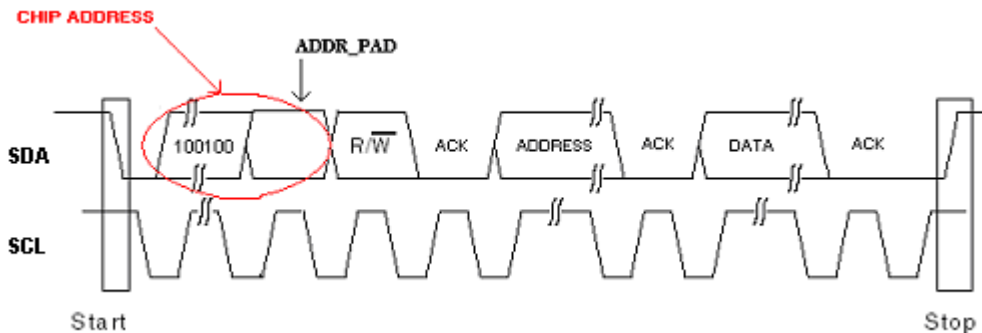

**DSD PHASE MODE**

## SERIAL CONTROL INTERFACE

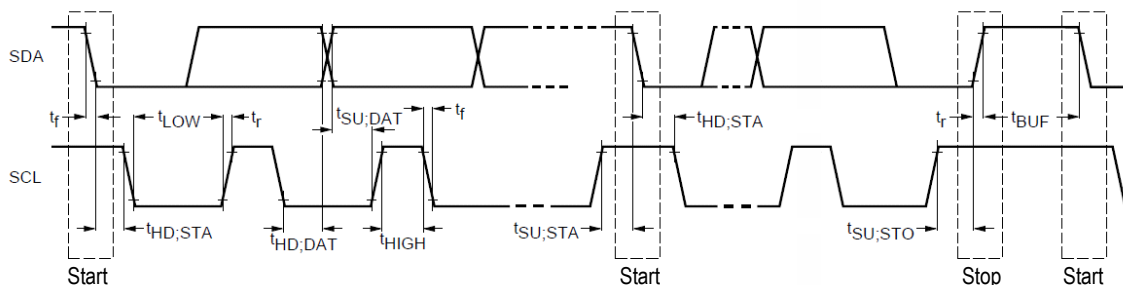

The registers inside the chip are programmed via an I<sup>2</sup>C interface. The diagram below shows the timing for this interface. The chip address can be set to 2 different settings via the “ADDR” pin. The table below summarizes this.

| ADDR | CHIP ADDRESS |
|------|--------------|
| 0    | 0x90         |
| 1    | 0x92         |

### Notes:

1. The “ADDR” pin is used to create the CHIP ADDRESS. (0x90, 0x92)
2. The first byte after the chip address is the “ADDRESS” this is the register address.
3. The second byte after the CHIP ADDRESS is the “DATA” this is the data to be programmed into the register at the previous “ADDRESS”.

| Parameter                           | Symbol              | Standard Mode |      | Fast-Mode |     | Unit |
|-------------------------------------|---------------------|---------------|------|-----------|-----|------|
|                                     |                     | MIN           | MAX  | MIN       | MAX |      |

For correct operation, master mode should only be enabled when the DAC's input mode is set to I<sup>2</sup>S, and when i2s\_length is set to 32-bit and i2s\_mode is set to I<sup>2</sup>S in register 1.

When master mode is enabled, the DATA\_CLK pin will output Bit Clock and the DATA1 pin will output Frame Clock at frequencies specified by clock divider select.

When PCM data with FSR > 96kHz is used, stop\_div should be set to 4'd0 (16384 FSR edges).

| [3:0] | dpll_bw_dsd | DPLL bandwidth setting for DSD mode (16 settings)<br>4'b0000 : OFF<br>4'b0001 : Lowest Bandwidth<br><br>4'b0101 :<br><br>4'b1010 : (default)<br><br>4'b1111 : Highest Bandwidth                         |

The ES9028Q2M contains a Jitter Eliminator block, which employs the use of a digital phase locked loop (DPLL) to lock to the incoming audio clock rate. When in I<sup>2</sup>S or SPDIF mode, the DPLL will lock to the frame clock (1 x fs). However, when in DSD mode, the DPLL has no frame clock information, and must instead lock to the bit clock rate (BCK). For this reason, there are two bandwidth settings for the DPLL.

Register #12 [7:4] (0x05 default) contains the bandwidth setting for I<sup>2</sup>S / SPDIF mode.

Register #12 [3:0] (0x0A default) contains the bandwidth setting for DSD mode.

The DPLL bandwidth sets how quickly the DPLL can adjust its internal representation of the audio clock. The higher the jitter or frequency drift on the audio clock, the higher the DPLL bandwidth must be so that the DPLL can react.

## Register #13: THD Compensation

8-bit, Read-Write Register, Default = 0x40

| Bits     | [7]        | [6]        | [5]        | [4] | [3] | [2] | [1] | [0] |

| [5:0] | reserved   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

\* All reserved Bits in Register #13 must be set to the indicated logic level to ensure correct device operation

THD compensation can be used to reduce the 2<sup>nd</sup> and 3<sup>rd</sup> harmonic distortion introduced by external output drivers. A system level tuning is required to arrive at the optimum coefficients for thd\_comp\_c2 and thd\_comp\_c3.

### Notes

- To get the same gain (output = input) for PCM and DSD modes without THD compensation, bypass\_thd should be set to 1'b0 with thd\_comp\_c2 and thd\_comp\_c3 set to 16'd0 (default)
- Erroneous compensation can lead to higher distortion than the one without compensation. If accurate tuning cannot be performed, thd\_comp\_c2 and thd\_comp\_c3 should be set to 16'd0 (default) if bypass\_thd is set to 1'b0.

## Register #14: Soft Start Settings

8 bit, Read-Write Register, Default = 0x8A

| Bits     | [7]        | [6]                | [5]          | [4]             | [3] | [2] | [1] | [0] |

## ES9028Q2M Datasheet

### Register #15: Volume 1 (usually selected for the Left Channel, but can be reversed using Register #11)

8 bit, Read-Write Register, Default = 0x50

| Bits     | [7]     | [6] | [5] | [4] | [3] | [2] | [1] | [0] |
|----------|---------|-----|-----|-----|-----|-----|-----|-----|
| Mnemonic | volume1 |     |     |     |     |     |     |     |
| Default  | 0       | 1   | 0   | 1   | 0   | 0   | 0   | 0   |

| Bit   | Mnemonic | Description                                                |
|-------|----------|------------------------------------------------------------|
| [7:0] | volume1  | Default to 8'd80 (−40dB)<br>0dB to −127.5dB in 0.5dB steps |

### Register #16: Volume 2 (usually selected for the Right Channel, but can be reversed using Register #11)

8 bit, Read-Write Register, Default = 0x50

| Bits     | [7]     | [6] | [5] | [4] | [3] | [2] | [1] | [0] |
|----------|---------|-----|-----|-----|-----|-----|-----|-----|
| Mnemonic | volume2 |     |     |     |     |     |     |     |
| Default  | 0       | 1   | 0   | 1   | 0   | 0   | 0   | 0   |

| Bit   | Mnemonic | Description                                                |
|-------|----------|------------------------------------------------------------|
| [7:0] | volume2  | Default to 8'd80 (−40dB)<br>0dB to −127.5dB in 0.5dB steps |

### Register #20-17: Master Trim

32 bit, Read-Write Register, Default = 32'h7ffffff. Reg 20 are the MSB's, Reg 17 are the LSBs.

| Bits     | [31:0]      |
|----------|-------------|
| Mnemonic | master_trim |
| Default  | 32'h7ffffff |

This is a 32 bit value that sets the 0dB level for all volume controls. This is a signed number, so it should never exceed 32'h7ffffff (which is  $2^{31} - 1$ ).

## Register #21: GPIO Input Selection and OSF Bypass

8 bit, Read-Write Register, Default = 0x00

| Bits     | [7:6]           |   | [5:4]           |   | [3]        | [2]        | [1]        | [0]        |
|----------|-----------------|---|-----------------|---|------------|------------|------------|------------|
| Mnemonic | gpio_input_sel2 |   | gpio_input_sel1 |   | reserved * | bypass_iir | reserved * | bypass_osf |

\* All Reserved Bits in Register #21 must be set to the indicated logic level to ensure correct device operation.

**Note:** Any of the GPIO can be configured to be used as an input select. This allows an external MCU or controller to set the input type by setting the GPIO to either logic high (1'b1) or logic low (1'b0). To set this feature, the first step is to enable one of the GPIO as an input select by setting gpio\_cfg to 4'd9. Once a GPIO is configured as an input select it has the ability to select between two different inputs. The first input (logic low) is set via register 21[5:4]. The second input (logic high) is set via register 21[7:6]. Only one GPIO should be configured as an input select, and the ES9028Q2M will only use the first GPIO if multiple GPIOs are configured as an input selection.

# ES9028Q2M Datasheet

## Register #23-22: 2<sup>nd</sup> Harmonic Compensation Coefficients (both channels)

16 bit, Read-Write Register, Default = 0x0000 (no compensation). Register #23 is MSB.  
See Registers #13 and #34-38 for more details.

|          |             |
|----------|-------------|
| Bits     | [15:0]      |
| Mnemonic | Thd_comp_c2 |
| Default  | 16'd0       |

## Register #25-24: 3<sup>rd</sup> Harmonic Compensation Coefficients (both channels)

16 bit, Read-Write Register, Default = 0x0000 (no compensation). Register #25 is MSB.  
See Registers #13 and #34-38 for more details.

|          |             |
|----------|-------------|
| Bits     | [15:0]      |
| Mnemonic | Thd_comp_c3 |
| Default  | 16'd0       |

The THD Compensation registers are signed integer values split into two memory locations each.

| THD Compensation Coefficient | MSB         | LSB         |
|------------------------------|-------------|-------------|
| $x^3$ (third harmonic)       | Register 25 | Register 24 |
| $x^2$ (second harmonic)      | Register 23 | Register 22 |

Table 1: THD Compensation Registers

1. Configure the output stage gain for the maximum desired output level. ***If any component values are later changed on the output audio signal path you will need to re-tune the THD Compensation to achieve peak performance.***

2. Set the input level, Sabre2M Volume and Master Trim for the maximum desired output level.

***If the output level is later increased beyond this level you will need to re-tune the THD Compensation to achieve peak performance.***

3. Adjust registers 0x23 and 0x25 to achieve peak THD performance. Use the I<sup>2</sup>C interface or the Sabre2M GUI to make the adjustments while watching the THD+N measurement.

In the GUI, adjust the THD Compensation sliders as shown in figure 1. The sliders are linked to the MSB of the THD Compensation registers so they are somewhat coarse.

Both channels are tuned simultaneously; keep an eye on both measurements.

***Typical register values are very close to zero.***

4. For finer adjustments use registers 0x22 and 0x24. Use the I<sup>2</sup>C interface or the Sabre2M GUI to make large changes of 50 or so while watching the THD+N measurement. Switch to smaller increments when you're close to peak performance.

In the GUI, open the register listing (see figure 2) and click Update Registers to make sure the most up-to-date values are displayed. There are no sliders for the fine-adjust registers (see figure 3).

The Sabre2M GUI is available for download from the ESS website at:

64-Bit: [http://www.esstech.com/software/Sabre2M\\_signed\\_x64.zip](http://www.esstech.com/software/Sabre2M_signed_x64.zip)

32-Bit: [http://www.esstech.com/software/Sabre2M\\_signed\\_x86.zip](http://www.esstech.com/software/Sabre2M_signed_x86.zip)

## Register #26: Programmable Filter Address

8 bit, Read-Write Register, Default = 0x00

|          |                  |                 |
|----------|------------------|-----------------|
| Bits     | [7]              | [6:0]           |
| Mnemonic | prog_coeff_stage | prog_coeff_addr |
| Default  | 0                | 0 0 0 0 0 0 0   |

| Bit   | Mnemonic         | Description                                                                                                                                                                  |
|-------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [7]   | prog_coeff_stage | Selects which stage of the filter to write.<br>1'b0 = Stage 1 of the oversampling filter (128 coefficients).<br>1'b1 = Stage 2 of the oversampling filter (16 coefficients). |
| [6:0] | prog_coeff_addr  | Selects the coefficient address when writing custom coefficients for the oversampling filter.                                                                                |

## Register #29-27: Programmable Filter Coefficient

8 bit, Read-Write Register, Default = 0x000000

|          |            |
|----------|------------|
| Bits     | [23:0]     |
| Mnemonic | prog_coeff |
| Default  | 24'd0      |

| Bit    | Mnemonic   | Description                                                                    |
|--------|------------|--------------------------------------------------------------------------------|
| [23:0] | prog_coeff | A 24-bit filter coefficient that will be written to address 'prog_coeff_addr'. |

## Register #30: Programmable Filter Control

8 bit, Read-Write Register, Default = 0x00

|          |            |                   |               |               |
|----------|------------|-------------------|---------------|---------------|
| Bits     | [7:3]      | [2]               | [1]           | [0]           |
| Mnemonic | reserved * | even_stage2_coeff | prog_coeff_we | prog_coeff_en |
| Default  | 0 0 0 0 0  | 0                 | 0             | 0             |

| Bit   | Mnemonic          | Description                                                                                                                                                                                                                             |
|-------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [7:3] | reserved *        |                                                                                                                                                                                                                                         |
| [2]   | even_stage2_coeff | Sets the type of symmetry of the stage 2 programmable filter.<br>1'b0 = Uses a sine symmetric filter (27 coefficients).<br>1'b1 = Uses a cosine symmetric filter (28 coefficients).                                                     |
| [1]   | prog_coeff_we     | 1'b0 = Disable writing to the custom filter coefficients.<br>1'b1 = Enable writing to the custom filter coefficients.<br>Note: When set to 1'b1 the custom filter will be bypassed regardless of the state of register 21[0].           |
| [0]   | prog_coeff_en     | 1'b0 = Use one of the built-in oversampling filters.<br>1'b1 = Use the custom oversampling filter.<br>Note: The custom filter is not programmed to anything on reset, valid coefficients must be written to the filter before enabling. |

\* All Reserved Bits in Register #30 must be set to the indicated logic level to ensure correct device operation.

**Note:** even\_stage2\_coeff sets the type of symmetry used by the second stage filter. The actual RAM is 16 coefficients, but only the first 14 coefficients are used when applying the oversampling filter. The first 14 coefficients are mirrored using either sine or cosine symmetry, resulting in a filter length of either 27 or 28 taps. This means that the second stage RAM should only contain half of the impulse response of the second stage filter, and the impulse peak value will be contained in the 14<sup>th</sup> coefficient. Also note that, due to the symmetry of the filter, only linear phase filters may be used in the second stage.

### Register #35-34: Right Channel 2<sup>nd</sup> Harmonic Compensation Coefficients

16-bit, Read-Write Register, Default = 0x0000 (no compensation). Register #35 is MSB.  
See Registers #13, #22-25, and #38 for more details.

|          |                   |
|----------|-------------------|
| Bits     | [15:0]            |
| Mnemonic | Thd_comp_c2_right |
| Default  | 16'd0             |

### Register #37-36: Right Channel 3<sup>rd</sup> Harmonic Compensation Coefficients

16-bit, Read-Write Register, Default = 0x0000 (no compensation). Register #37 is MSB.  
See Registers #13, #22-25, and #38 for more details.

|          |                   |
|----------|-------------------|

## Register #65: GPIO Status

8 bit, Read-Only Register

| Bits     | [7]      | [6]      | [5]      | [4]      | [3]      | [2]      | [1]         | [0] |
|----------|----------|----------|----------|----------|----------|----------|-------------|-----|
| Mnemonic | reserved | reserved | reserved | reserved | reserved | reserved | gpio_l[1:0] |     |

| Bit   | Mnemonic  | Description         |
|-------|-----------|---------------------|
| [7:2] | reserved  |                     |
| [1]   | gpio_l[1] | Status of pin GPIO2 |
| [0]   | gpio_l[0] | Status of pin GPIO1 |

## Register #69-66: DPLL Ratio

32 bit, Read-Only Register. Register #69 contains the MSBs, Register #66 contains the LSBs

|          |          |
|----------|----------|
| Bits     | [31:0]   |
| Mnemonic | dpll_num |

This is a read-only 32bit value that can be used to calculate the sample rate. The raw sample rate (FSR) can be calculated using:  $FSR = (DPLL\_NUM \times F_{MCLK}) / 2^{32}$ .

Note that the DPLL number (register 66-69) should be read from LSB to MSB as it is latched on the LSBs (register 66).

## Register #74-70: Channel Status

Register #74 contains the MSBs, Register #70 contains the LSBs Format is [191:0]

These registers allow read back of the SPDIF channel status. The status definition is different for the consumer configuration and professional configuration. Please refer to the following two tables for details.

## ES9028Q2M Datasheet

| <b>SPDIF CHANNEL STATUS – Consumer configuration</b> |                                                                                                                                                                                                                                                                                   |          |                                                                                                                   |          |                                                                                                                                                                                                                                                                   |                                  |                     |                                                   |

## ABSOLUTE MAXIMUM RATINGS

| PARAMETER                                            | RATING                    |
|------------------------------------------------------|---------------------------|
| Positive Supply Voltage (VCCA, AVCC_L, AVCC_R, DVCC) | +4.7V with respect to GND |
| Positive Supply Voltage (DVDD)                       | +1.8V with respect to GND |
| Output Voltage Range (DACL, DACR, DACLB, DACRB)      | GND < Vout < AVCC         |
| Storage Temperature Range                            | –65°C to +150°C           |
| Operating Junction Temperature                       | +125°C                    |
| Voltage range for Digital Input Pins                 | –0.3V to DVCC+ 0.3V       |
| ESD Protection                                       |                           |
| Human Body Model (HBM)                               | 2000V                     |
| Machine Model (MM)                                   | 200V                      |
| Charged Device Model (CDM)                           | 500V                      |

**WARNING:** Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.

**WARNING:** Electrostatic Discharge (ESD) can damage this device. Proper procedures must be followed to avoid ESD when handling this device.

## RECOMMENDED OPERATING CONDITIONS

| PARAMETER             | SYMBOL         | CONDITIONS     |

### Notes

- 1) f<sub>s</sub> = 44.1kHz, external MCLK = 40MHz, 0dB 1kHz output, I<sup>2</sup>S input, output unloaded, internal DVDD, all external supply voltages at nominal center values
- 2) Measured with RESETB held low after setting the soft\_start bit in register 14 to 1'b0 to fully ramp the DAC outputs to ground
- 3) Internal DVDD should be used except under the conditions described on page 8. External +1.3V DVDD is required above the operating frequencies described on page 8. The external supply voltage should be greater than the internal +1.2V supply so the internal regulator is disabled. DVDD current is measured with MCLK = 100MHz.

## DC ELECTRICAL CHARACTERISTICS

| Symbol | Parameter                 | Minimum        | Maximum | Unit | Comments    |
|--------|---------------------------|----------------|---------|------|-------------|
| VIH    | High-level input voltage  | DVCC / 2 + 0.4 |         | V    |             |
| VIL    | Low-level input voltage   |                | 0.4     | V    |             |
| VOH    | High-level output voltage | DVCC - 0.2     |         | V    | IOH = 100μA |
| VOL    | Low-level output voltage  |                | 0.2     | V    | IOL = 100μA |

## XI / MCLK Timing

| Parameter             | Symbol    | Min   | Max   | Unit |
|-----------------------|-----------|-------|-------|------|
| MCLK pulse width high | $T_{MCH}$ | 4.5   |       | ns   |
| MCLK pulse width low  | $T_{MCL}$ | 4.5   |       | ns   |
| MCLK cycle time       | $T_{MCY}$ | 10    |       | ns   |
| MCLK duty cycle       |           | 45:55 | 55:45 |      |

## Audio Interface Timing

| Parameter                                | Symbol    | Min   | Max   | Unit |
|------------------------------------------|-----------|-------|-------|------|
| DATA_CLK pulse width high                | $t_{DCH}$ | 4.5   |       | ns   |
| DATA_CLK pulse width low                 | $t_{DCL}$ | 4.5   |       | ns   |
| DATA_CLK cycle time                      | $t_{DCY}$ | 10    |       | ns   |
| DATA_CLK duty cycle                      |           | 45:55 | 55:45 |      |
| DATA set-up time to DATA_CLK rising edge | $t_{DS}$  | 4.1   |       | ns   |
| DATA hold time to DATA_CLK rising edge   | $t_{DH}$  | 2     |       | ns   |

### Notes:

- Audio data on DATA[2:1] are sampled at the rising edges of DATA\_CLK and must satisfy the setup and hold time requirements relative to the rising edge of DATA\_CLK
- For DSD Phase mode, the normal data (D0, D1, D2... on p.10) must satisfy the setup and hold time requirements relative to the rising edge of DATA\_CLK. The complimentary data ( $\bar{D}0$ ,  $\bar{D}1$ , etc.) will be ignored.

## ANALOG PERFORMANCE

### Test Conditions (unless otherwise stated)

1.  $T_A = 25^\circ\text{C}$ ,  $AVCC = VCCA = DVCC = +3.3\text{V}$ , internal DVDD with  $4.7\mu\text{F} \pm 20\%$  decoupling,  $f_s = 44.1\text{kHz}$ ,  $MCLK = 27\text{MHz}$  & 32-bit data
2. SNR/DNR: A-weighted over 20Hz-20kHz in averaging mode  
THD+N: un-weighted over 20Hz-20kHz bandwidth

### Notes

1. Differential (+ or -) current output is equivalent to a differential (+ or -) voltage source in series with a  $403\Omega \pm 11\%$  resistor. The differential (+ or -) voltage source has a peak-to-peak output range of  $(0.867 \times AVCC)$  & an output offset of  $(AVCC / 2)$ .
2. With internal DVDD, maximum MCLK frequency is 50MHz ( $DVCC = +1.8\text{V}$ ).  
MCLK can be up to 100MHz ( $DVCC = +3.3\text{V}$ ) using an external  $+1.3\text{V} \pm 5\%$  DVDD supply.
3. ES9028Q2M also supports synchronous MCLK at  $128 \times \text{FSR}$ .

## Example 32-Pin QFN Land Pattern

### Notes:

1. Thermal vias should be 0.3mm to 0.33mm in diameter, with the barrel plated to 1oz copper.
2. For maximum solder mask in the corners, round the inner corners of each row.
3. Exposed pad should be solder mask defined.
4. Pad width can be reduced to 0.25mm if additional pad to pad clearance is required.
5. For applications where solder loss through vias is a concern, plugging or tenting of the vias should be used. The solder mask diameter for each via should be 0.1mm larger than the via diameter.

# ES9028Q2M Datasheet

## Reflow Process Considerations

For lead-free soldering, the characterization and optimization of the reflow process is the most important factor you need to consider.

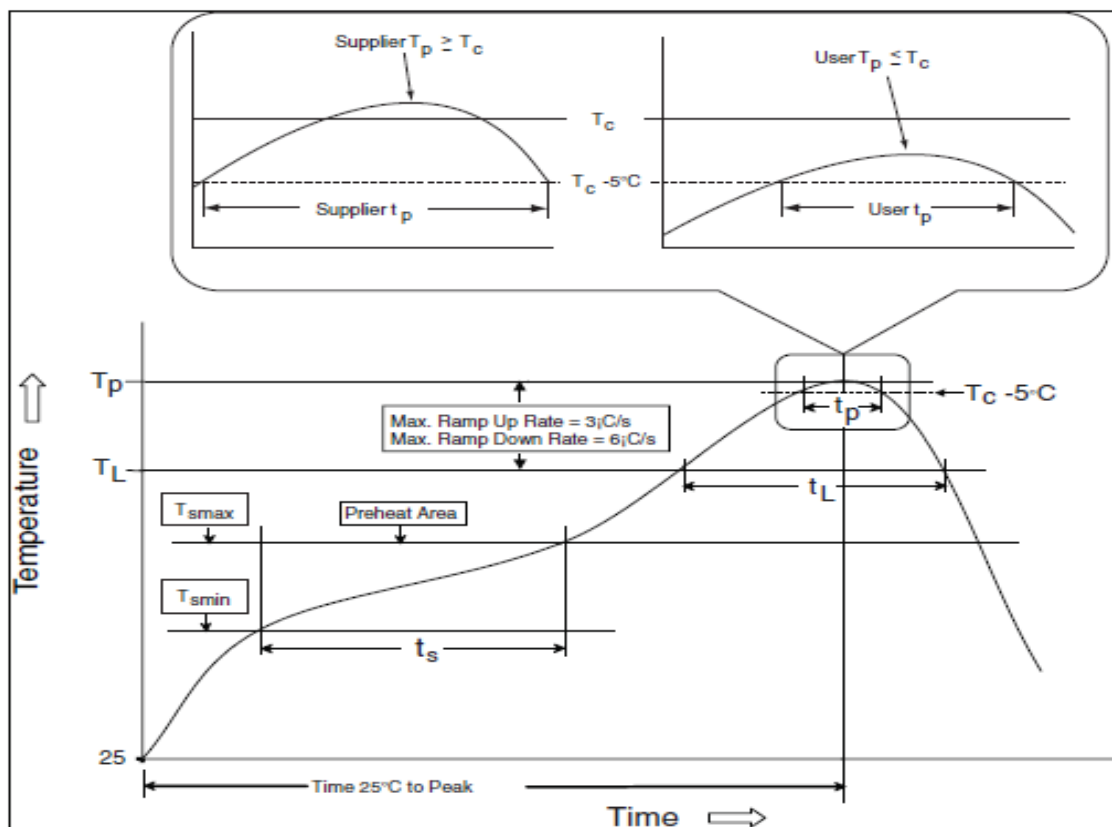

The lead-free alloy solder has a melting point of 217°C. This alloy requires a minimum reflow temperature of 235°C to ensure good wetting. The maximum reflow temperature is in the 245°C to 260°C range, depending on the package size (*Table RPC-2*). This narrows the process window for lead-free soldering to 10°C to 20°C.

The increase in peak reflow temperature in combination with the narrow process window makes the development of an optimal reflow profile a critical factor for ensuring a successful lead-free assembly process. The major factors contributing to the development of an optimal thermal profile are the size and weight of the assembly, the density of the components, the mix of large and small components, and the paste chemistry being used.

Reflow profiling needs to be performed by attaching calibrated thermocouples well adhered to the device as well as other critical locations on the board to ensure that all components are heated to temperatures above the minimum reflow temperatures and that smaller components do not exceed the maximum temperature limits (*Table RPC-2*).

To ensure that all packages can be successfully and reliably assembled, the reflow profiles studied and recommended by ESS are based on the JEDEC/IPC standard J-STD-020 revision D.1.

**Figure RPC-1.** IR/Convection Reflow Profile (IPC/JEDEC J-STD-020D.1)

Note: Reflow is allowed 3 times. Caution must be taken to ensure time between re-flow runs does not exceed the allowed time by the moisture sensitivity label. If the time elapsed between the re-flows exceeds the moisture sensitivity time bake the board according to the moisture sensitivity label instructions.

### Manual Soldering:

Allowed up to 2 times with maximum temperature of 350 degrees no longer than 3 seconds.

Table RPC-1 Classification reflow profile

| Profile Feature                                                                                    | Pb-Free Assembly                                                                                                                                      |
|----------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Preheat/Soak</b>                                                                                |                                                                                                                                                       |
| Temperature Min (T <sub>smin</sub> )                                                               | 150°C                                                                                                                                                 |
| Temperature Max (T <sub>smax</sub> )                                                               | 200°C                                                                                                                                                 |
| Time (ts) from (T <sub>smin</sub> to T <sub>smax</sub> )                                           | 60-120 seconds                                                                                                                                        |
| Ramp-up rate (TL to Tp)                                                                            | 3°C / second max.                                                                                                                                     |
| Liquidous temperature (TL)                                                                         | 217°C                                                                                                                                                 |
| Time (tL) maintained above TL                                                                      | 60-150 seconds                                                                                                                                        |
| Peak package body temperature (Tp)                                                                 | For users Tp must not exceed the classification temp in Table RPC-2.<br>For suppliers Tp must equal or exceed the Classification temp in Table RPC-2. |
| Time (tp)* within 5°C of the specified classification temperature (Tc), see Figure RPC-1           | 30* seconds                                                                                                                                           |
| Ramp-down rate (Tp to TL)                                                                          | 6°C / second max.                                                                                                                                     |
| Time 25°C to peak temperature                                                                      | 8 minutes max.                                                                                                                                        |
| * Tolerance for peak profile temperature (Tp) is defined as a supplier minimum and a user maximum. |                                                                                                                                                       |

**Note 1:** All temperatures refer to the center of the package, measured on the package body surface that is facing up during assembly reflow (e.g., live-bug). If parts are reflowed in other than the normal live-bug assembly reflow orientation (i.e., dead-bug), Tp **shall** be within  $\pm 2^\circ\text{C}$  of the live-bug Tp and still meet the Tc requirements, otherwise, the profile **shall** be adjusted to achieve the latter. To accurately measure actual peak package body temperatures refer to JEP140 for recommended thermocouple use.

**Note 2:** Reflow profiles in this document are for classification/preconditioning and are not meant to specify board assembly profiles. Actual board assembly profiles should be developed based on specific process needs and board designs and should not exceed the parameters in Table RPC-1.

For example, if Tc is 260°C and time tp is 30 seconds, this means the following for the supplier and the user.

For a supplier: The peak temperature must be at least 260°C. The time above 255°C must be at least 30 seconds.

For a user: The peak temperature must not exceed 260°C. The time above 255°C must not exceed 30 seconds.

**Note 3:** All components in the test load **shall** meet the classification profile requirements.

Table RPC-2 Pb-Free Process – Classification Temperatures (Tc)

| Package Thickness | Volume mm <sup>3</sup> , <350 | Volume mm <sup>3</sup> , 350 to 2000 | Volume mm <sup>3</sup> , >2000 |
|-------------------|-------------------------------|--------------------------------------|--------------------------------|
| <1.6 mm           | 260°C                         | 260°C                                | 260°C                          |
| 1.6 mm – 2.5 mm   | 260°C                         | 250°C                                | 245°C                          |
| >2.5 mm           | 250°C                         | 245°C                                | 245°C                          |

**Note 1:** At the discretion of the device manufacturer, but not the board assembler/user, the maximum peak package body temperature (Tp) can exceed the values specified in Table RPC-2. The use of a higher Tp does not change the classification temperature (Tc).

**Note 2:** Package volume excludes external terminals (e.g., balls, bumps, lands, leads) and/or non-integral heat sinks.

**Note 3:** The maximum component temperature reached during reflow depends on package thickness and volume. The use of convection reflow processes reduces the thermal gradients between packages. However, thermal gradients due to differences in thermal mass of SMD packages may still exist.
