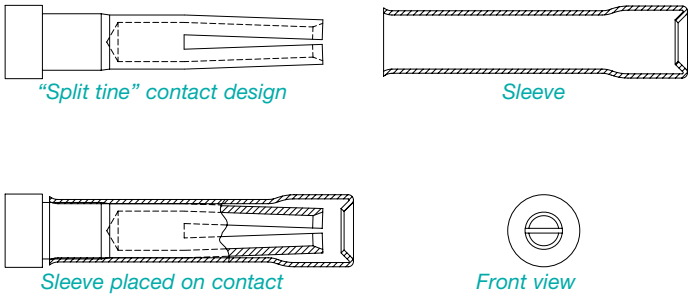
What Makes Positronic's "PosiBand®" Contact Interface a Significant Improvement?

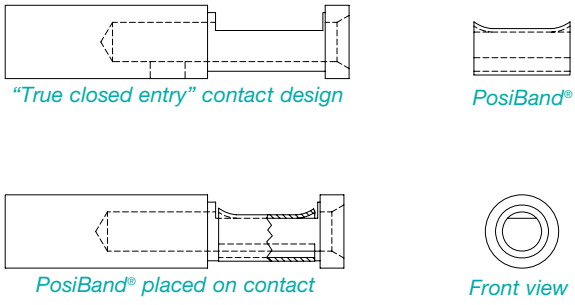
High reliability connectors utilize female **closed entry contacts** that provide an unbroken ring of solid material at the face of the contact. The closed entry feature is **crucial in preventing damage** to female contacts used in harsh environments, repeated mating cycles, blind mate applications and applications requiring highest reliability.

FIGURE 1



The most common **closed entry design** utilized by connector manufacturers is a split tine and sleeve concept. **See figure 1.** With this design, both the mechanical forces and electrical interface are provided only at the tip of the female contact.

FIGURE 2



Positronic's **PosiBand technology** takes a unique approach for closed entry female contacts. **PosiBand** contacts utilize a two-piece contact design. **See figure 2.** Each piece serves a separate function, providing a more mechanically robust contact and more consistent electrical performance.

The main body of the **PosiBand** contact provides a true closed entry opening to enhance robustness. The **PosiBand** spring clip provides normal force on the male contact. Consistent electrical performance is supported through a larger area of contact interface between the male and female contact along the entire "floor" of the contact body. **PosiBand** contacts are QPL listed under **SAE AS39029** and **MIL-DLT-24308** specifications. **PosiBand** is also qualified under **GSFC S-311-P4/08 Rev C** and **GSFC S-311-P4/10 Rev C** to the higher 40 gram contact separation test requirement.

The PosiBand® contact system has many advantages over the legacy split tine design.

- **PosiBand** is more robust than split tine contact, which can be pried open in harsh environments, resulting in reduced normal force and degradation of electrical performance.
- **PosiBand** has greater surface area at the male and female contact interface, resulting in more consistent electrical performance.
- **PosiBand** has lower average insertion forces, resulting in greater ease in mating, especially in larger high density connectors. The average lower insertion force is accomplished while meeting or exceeding performance requirements.
- The **PosiBand's** contact body does not require annealing of the crimp barrels, as does the split tine design. This eliminates concern of unintentionally heat-treating the mating end of the contact, which can cause electrical failure.
- **PosiBand** is qualified under **SAE AS39029** and **MIL-DTL-24308** specifications. **PosiBand** is also qualified under **GSFC S-311-P4/08 Rev C** and **GSFC S-311-P4/10 Rev C** to the higher 40 gram contact separation test requirement.
- **PosiBand** is protected by US Patent 7,115,002.

CONNECTOR COMPONENT DESCRIPTION AND TERMINOLOGY

See "Supplemental Definitions" for clarification of "italicized" terms.

FOR ILLUSTRATIONS, SEE PAGE 3.

A1 – Connector contact: The primary electrically conductive element of connectors. The contact system is comprised of a *male contact* and a *female contact.* In general, contacts are available in a wide variety of sizes. The contacts in this catalog are size 22 (0.030 inches [0.76mm] in diameter). Contacts can be provided with multiple *termination* types, including wire *crimp* and solder; printed circuit board (pcb) solder, straight and right angle mount; and straight mount *compliant press-in.* A male crimp termination contact is shown in the example.

A2 – See definitions outlined in A1. A female crimp termination contact is shown in the example.

A3 – See definitions outlined in A1. A female right angle pcb solder termination is shown in the example.

A4 – See definitions outlined in A1. A female straight pcb solder termination is shown in the example.

B1 – Connector insert: The connector insulating element which also supports and positions the contacts in the connector system. Connectors can be supplied as a *free connector* or a *fixed connector.* Connector systems are available with a wide variety of *contact variants* and *termination types.* A 26 contact variant free connector for use with size 22 male crimp contacts is shown in the example.

B2 – See definitions outlined for B1. A 26 contact variant fixed connector with size 22 female contacts and right angle solder terminations is shown in the example.

B3 – A 26 contact variant free connector for use with size 22 male crimp contacts is shown in the example.

B4 – See definitions outlined for B1. A 26 contact variant fixed connector with size 22 female contacts and straight solder terminations is shown in the example.

B5 – See definitions outlined for B1. A 104 contact variant fixed bulkhead or panel mount connector for use with size 22 female crimp contacts is shown in the example.

B6 – A 104 contact variant free connector for use with size 22 male crimp contacts is shown in the example.

C1 – Male and female guides – Used to guide the mating of connector pairs and ensure proper alignment of contacts. A *polarized* guide system is shown in the example. Guide systems can also be used as a *coding device* for 75 and 104 variant connectors when used in corner position mounting holes.

C2 – Jackscrew system – A *locking device* which uses the mechanical advantage of male and female screw threads to couple and uncouple connector pairs. The system consists of a fixed jackscrew and a rotating jackscrew. A *polarized* jackscrew system is shown in the example. Jackscrew systems can also be used as a *coding device* for connectors.

C3 – Quick disconnect locking device – Device which allows for rapid connect and disconnect of connector pairs. The system shown in the example consists of fixed lock tabs and actuation levers.

C4 – Backshell – Connector accessory (commonly referred to as a "hood" or "cable adapter") which is used on *free connectors* to support cable or wires and to protect contact terminations. Backshell may be used with other accessories such as jackscrew and quick disconnect locking systems, guides, and connector housings as shown in the examples.

C5 – Connector Housing – Connector accessory (commonly referred to as a "shell" or "shroud") which protects the mating portion of the connector contacts. Connector housings are capable of serving as a *coding device* with the use of pin and slot system shown in this catalog, *see page 34 for details.*

C6 – Mounting bracket – Connector accessory used to mechanically fix a connector to a mounting surface. The example shows a mounting bracket used to secure a right angle solder connector to a pcb.

SUPPLEMENTAL DEFINITIONS

Male contact - Contact gender in which mechanical and electrical engagement is made on the outer surface of the contact.

Female contact – Contact gender in which mechanical and electrical engagement is made on the inner surface of the contact.

Size (contact) – A designation to differentiate one contact from another. Numbers are commonly used for this purpose. The designator numbers are associated with a specific male contact diameter; the smaller the designator, the larger the contact size.

Termination type - Means of making connection between the contact and external conductors.

Compliant press-in termination – A termination with a specially shaped section designed to provide an electrically secure solderless connection when pressed into a printed circuit board (pcb).

Crimp contact termination – A contact having a barrel which accepts a conductor and the barrel is designed to be crimped.

Free connector – The portion of connector system designed for attachment to the free end of wire or cable.

Fixed connector – The portion of connector system designed for attachment to a rigid surface.

Contact variant – The number, size, and arrangement of contacts.

Polarization (connector mating) - Integral feature within a connector system to ensure corresponding male and female contacts are engaged when the connectors are mated.

Coding device – Means of preventing the mating of a connector to any connector other than its intended mate. Also referred to as "keying".

Locking device (connector) – An accessory that provides mechanical retention of mated connectors.

Connector component terminology is based on I.E.C. (International Electrotechnical Commission) language. See http://www.electropedia.org/ for more information.

CONNECTOR HOUSING (SHELLS)

CODE R OR CODE P

QUALIFIED TO MIL-DTL-28748

CODING (KEYING) DEVICE OPTIONS

Coding (keying) is accomplished with connector housings by a pin and slot system. Female connector housings are slotted to accept stainless steel polarizing pins mounted on the male connector housings.

There are seven coding positions available which are designated by the letters A, B, C, D, E, F or G. Non-coded connector housings are designated by "0" and are supplied without slot and pin. See ordering chart. For non Mil-Spec shells the polarization feature location shall be: slot to the left, pin to the right, when the connector is held vertically with contact position A or 1 at the top and the mating face visible.
