2 Introduction

This Pseudo-SRAM device features a high speed, low pin count interface. It has 4 SDR I/O pins and operates in SPI(serial peripheral interface) or QPI (quad peripheral interface) mode with frequencies up to 144 MHz. The data input (A/DQ) to the memory relies on clock (CLK) to latch all instructions, addresses and data. It is most suitable for low-power and low cost portable applications. It incorporates a seamless self-managed refresh mechanism. Hence it does not require the support of DRAM refresh from system host. The self-refresh feature is a special design to maximize performance of memory read operation.

7 Power-Up Initialization

SPI/QPI products include an on-chip voltage sensor used to start the self-initialization process. When VDD reaches a stable level at or above minimum VDD, the device will require 150μs and user-issued RESET Operation (see section 12) to complete its self-initialization process. From the beginning of power ramp to the end of the 150μs period, CLK should remain LOW, CE# should remain HIGH (track VDD within 200mV) and SI/SO/SIO[3:0] should remain LOW.

After the 150μs period the device is ready for normal operation.

Figure 1. Power-Up Initialization Timing

8 Interface Description

8.1 Address Space

SPI/QPI PSRAM device is byte-addressable. 64M device is addressed with A[22:0].

8.2 Page Size

Page size is 1K (CA[9:0]). The device operates in a bursting address sequence back to starting address of same page in a wrap manner.

8.3 Drive Strength

The device powers up in 50Ω.

8.4 Power-on Status

The device powers up in SPI Mode. It is required to have CE# high before beginning any operations.

8.5 Command/Address Latching Truth Table

The device recognizes the following commands specified by the various input methods.

Command	Code	SPI Mode (QE=0)					QPI Mode (QE=1)				
		Cmd	Addr	Wait Cycle	DIO	Max Freq.	Cmd	Addr	Wait Cycle	DIO	Max Freq.
Read	'h03	S	S	0	S	33	N/A				
Fast Read	'h0B	S	S	8	S	144	Q	Q	4	Q	66
Fast Read Quad	'hEB	S	Q	6	Q	144	Q	Q	6	Q	144
Write	'h02	S	S	0	S	144	Q	Q	0	Q	144
Quad Write	'h38	S	Q	0	Q	144	same as 'h02				
Enter Quad Mode	'h35	S	-	-	-	144	N/A				
Exit Quad Mode	'hF5	N/A					Q	-	-	-	144
Reset Enable	'h66	S	-	-	-	144	Q	-	-	-	144
Reset	'h99	S	-	-	-	144	Q	-	-	-	144
Half Sleep Entry	'hC0	S	-	-	-	144	N/A				
Read ID	'h9F	S	S	0	S	33	N/A				

Remark: S = Serial IO, Q = Quad IO

8.6 Command Termination

All Reads & Writes must be completed by raising CE# high immediately afterwards in order to terminate the active command and set the device into standby. Not doing so will block internal refresh operations and cause memory failure.

Figure 2: Write Command Termination

For a memory controller to correctly latch the last piece of data prior to read termination, it is recommended to provide a longer CE# hold time ($t_{CHD} > t_{ACLK} + t_{CLK}$) for a sufficient data window.

Figure 3: Read Command Termination

9 Half Sleep mode Operation

Half Sleep Mode is a feature which puts the device in an ultra-low power state, while the stored data is retained. Half Sleep Mode Entry can be entered by issuing a command 'hC0 in SPI. CE# going high initiates the Half Sleep mode and must be maintained for the minimum duration of t_{HS} . The Half Sleep Entry command sequences are shown below.

Figure 4: SPI Half Sleep Entry 'hC0, SPI only Command.

Half Sleep Exit is initiated by a low pulsed CE#. Afterwards, CE# can be held high with or without clock toggling until the first operation begins (observing minimum t_{XHS}).

Figure 5: Half Sleep Exit

10 SPI Mode Operations

The device powers up into SPI mode by default but can also be switched into QPI mode.

10.1 SPI Read Operations

For all reads, data will be available t_{ACLK} after the falling edge of CLK.

SPI Reads can be done in three ways:

1. 'h03: Serial CMD, Serial Addr/IO, slow frequency.
2. 'h0B: Serial CMD, Serial Addr/IO, fast frequency.
3. 'hEB: Serial CMD, Quad Addr/IO, fast frequency.

Figure 7: SPI Fast Read 'h0B (max freq 144 MHz)

Figure 8: SPI Fast Quad Read 'hEB (max freq 144 MHz)

10.2 SPI Write Operations

SPI write command can be input as 'h02 or 'h38.

Figure 9: SPI Write 'h02

Figure 10: SPI Quad Write 'h38

10.3 SPI Quad Mode Enable Operation

This command switches the device into quad IO mode.

Figure 11: Quad Mode Enable 'h35 (available only in SPI mode)

10.4 SPI Read ID Operation

This command is similar to Fast Read, but without the wait cycles and the device outputs EID value instead of data.

Figure 12: SPI Read ID 'h9F (available only in SPI mode)

Table 3: Known Good Die (KGD)

KGD[7:0]	Known Good Die
'b0101_0101	FAIL
'b0101_1101	PASS

*Note: Default is FAIL die, and only mark PASS after all tests passed.

11 QPI Mode Operations

11.1 QPI Read Operation

For all reads, data will be available t_{ACLK} after the falling edge of CLK.

QPI Reads can be done in one of two ways:

1. 'h0B: Quad CMD, Quad Addr/IO, slow frequency
2. 'hEB: Quad CMD, Quad Addr/IO, fast frequency

Figure 13: QPI Fast Read 'h0B (max freq 66 MHz)

Figure 14: QPI Fast Quad Read 'hEB (max freq 144 MHz)

11.2 QPI Write Operation(s)

QPI write command can be input as 'h02 or 'h38.

Figure 15: QPI Write 'h02 or 'h38

11.3 QPI Quad Mode Exit operation

This command will switch the device back into serial IO mode.

Figure 16: Quad Mode Exit 'hF5 (only available in QPI mode)

12 Reset Operation

The Reset operation is used as a system (software) reset that puts the device in SPI standby mode which is also the default mode after power-up. This operation consists of two commands: Reset-Enable (RSTEN) and Reset (RST).

Figure 17: SPI Reset

Figure 18: QPI Reset

Reset command has to immediately follow the Reset-Enable command in order for the reset operation to take effect. Any command other than the Reset command after the Reset-Enable command will cause the device to exit Reset-Enable state and abandon reset operation.

The timing diagram illustrates the relationship between the clock (CLK), chip enable (CE#), serial input (SI), and serial output (SO) signals. Key timing parameters are defined as follows:

- t'_{CH} : Clock high pulse width.
- t'_{CL} : Clock low pulse width.
- t'_{CLK} : Clock period.
- t'_{KHKL} : Clock high-to-low and low-to-high transition times.
- t'_{CSP} : Setup time for CE# before CLK.
- t'_{CEM} : Hold time for CE# after CLK.
- t'_{CHD} : Delay from CE# to CHD.
- t'_{HD} : Hold time for SI after CLK.
- t'_{PH} : Pulse width for SI.
- t'_{SP} : Setup time for SI before CLK.
- High-Z**: State where the SO signal is disabled.

14.3 Decoupling Capacitor Requirement

System designers need to take care of power integrity considering voltage regulator response and the memory peak currents/usage modes.

14.3.1 Low ESR cap C1:

It is recommended to place a low ESR decoupling capacitor of $\leq 1\mu\text{F}$ close to the device to absorb transient peaks.

14.3.2 Large cap C2:

During Half-sleep modes even though half-sleep average currents are very small (less than $100\mu\text{A}$), device will internally have low duty cycle burst refresh for an extended period of time of a few tens of microseconds. These refresh current peaks are large. During this period if the system regulator cannot supply large peaks for several microseconds, it is important to place a $4.7\mu\text{F}$ - $10\mu\text{F}$ cap to take care of burst refresh currents and replenish the charge before next burst of refreshes.
