

High Performance 1:5 LVPECL Fanout Buffer

Features

- 5 LVPECL outputs
- Up to 1.5GHz output frequency
- Ultra low additive phase jitter: < 0.03 ps (typ) (differential 156.25MHz, 12KHz to 20MHz integration range)
- Two selectable inputs
- Low delay from input to output (Tpd typ. 1.5ns)
- Separate Input output supply voltage for level shifting
- 2.5V / 3.3V power supply
- Industrial temperature support
- TSSOP-20 package

Description

The PI6C4911505-07 is a high performance fanout buffer device which supports up to 1.5GHz frequency. The device has 2 selectable clock inputs that can accept most differential clock sources. This device is ideal for systems that need to distribute low jitter clock signals to multiple destinations.

Applications

- Networking systems including switches and Routers
- High frequency backplane based computing and telecom platforms

Note:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Application Information

Wiring the differential input to accept single ended levels

Figure 1 shows how the differential input can be wired to accept single ended levels. The reference voltage $V_{REF} = V_{DD}/2$ is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio of R1 and R2 might need to be adjusted to position the V_{REF} in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and $V_{DD} = 3.3V$, V_{REF} should be 1.25V and $R1/R2 = 0.609$.
