

#### 4-Bit Bi-directional Level Shifter for open-drain and Push-Pull Application

#### **Features**

- →  $V_{CCA}$  can be Less than, Greater than or Equal to  $V_{CCB}$
- $\rightarrow$  1.1V to 3.6V on A Port and 1.1V to 3.6V on B Port
- ➔ High-Speed with 24 Mb/s Data Rate for push-pull application
- ➔ High-Speed with 2 Mb/s Data Rate for open-drain application
- ➔ No Direction-Control Signal Needed
- → Low Bit-to-Bit Skew
- → Non-preferential Power-up Sequencing
- ➔ ESD protection exceeds 8000V HBM per JESD22-A114
- → Integrated 10 k $\Omega$  Pull-up Resistors
- → Package: TSSOP-14, TQFN3.5x3.5-14, CSP-12

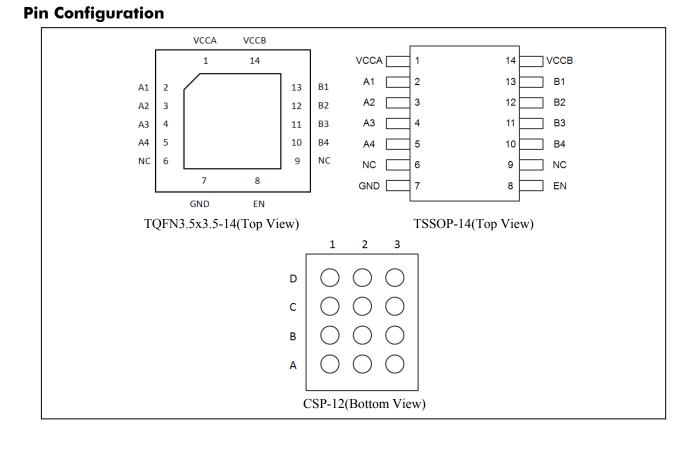

### **Applications**

- ➔ I2C, SMBus, MDIO
- → Low Voltage ASIC Level Translation
- ➔ Mobile Phones, PDAs, Camera

#### Description

The PI4ULS3V204 is a 4-bit configurable dual supply bidirectional auto sensing translator that does not require a directional control pin. The A and B ports are designed to track two different power supply rails, VCCA and VCCB respectively. Both the VCCA and VCCB supply rails are configurable from 1.1V to 3.6V. This allows voltage logic signals on the VCCA side to be translated into lower, higher or equal value voltage logic signals on the VCCB side, and vice-versa.

The translator has integrated 10 k $\Omega$  pull-up resistors on the I/O lines. The integrated pull-up resistors are used to pull-up the I/O lines to either VCCA or VCCB. The PI4ULS3V204 is an excellent match for open-drain applications such as the I2C communication bus.

### **Block Diagram**

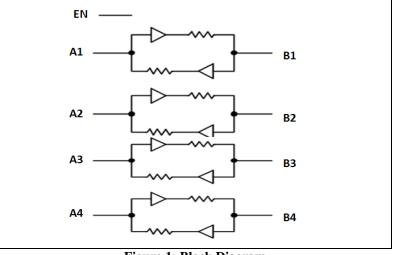

Figure 1: Block Diagram

#### **Maximum Ratings**

Storage Temperature	65°C to +150°C
DC Supply Voltage port B	-0.3V to +5.5V
DC Supply Voltage port A	-0.3V to+5.5V
Vi(A) referenced DC Input / Output Voltage	-0.3V to +5.5V
Vi(B) referenced DC Input / Output Voltage	-0.3V to+5.5V
Enable Control Pin DC Input Voltage	0.3V to+5.5V
Short circuit duration (I/O to GND)	40mA

#### Note:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

### **Pin Description**

### **Functional Description**

The PI4ULS3V204 is a 4-bit configurable dual-supply bidirectional auto sensing translator that does not require a directional control pin. The A and B ports are designed to track two different power supply rails,  $V_{CCA}$  and  $V_{CCB}$  respectively. Both the  $V_{CCA}$  and  $V_{CCB}$  supply rails are configurable from 1.1 V to 3.6V. This allows voltage logic signals on the  $V_{CCA}$  side to be translated into lower, higher or equal value voltage logic signals on the  $V_{CCB}$  side, and vice-versa.

The translator has integrated 10 k $\Omega$  pull-up resistors on the I/O lines. The integrated pull-up resistors are used to pull-up the I/O lines to either V<sub>CCA</sub> or V<sub>CCB</sub>. The PI4ULS3V204 is an excellent match for open-drain applications such as the I<sup>2</sup>C communication bus.

### **Application Information**

#### **Level Translator Architecture**

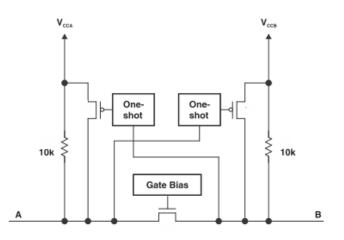

The PI4ULS3V204 auto sense translator provides bidirectional voltage level shifting to transfer data in multiple supply voltage systems. This device has two supply voltages,  $V_{CCA}$  and  $V_{CCB}$ , which set the logic levels on the input and output sides of the translator. When used to transfer data from A port to B port, input signals referenced to the  $V_{CCA}$  supply are translated to output signals with a logic level matched to  $V_{CCB}$ . In a similar manner, translation shifts input signals with a logic level compatible to  $V_{CCB}$  to an output signal matched to  $V_{CCA}$ . The PI4ULS3V204 consists of two bidirectional channels that independently determine the direction of the data flow without requiring a directional pin. The one-shot circuits are used to detect the rising or falling input signals. In addition, the one shots decrease the rise and fall time of the output signal for high-to-low and low-to-high transitions. Each input/output channel has an internal 10 k $\Omega$  pull. The magnitude of the pull-up resistors can be reduced by connecting external resistors in parallel to the internal 10 k $\Omega$  resistors.

PI4ULS3V204

#### **Input Driver Requirements**

The rise (tR) and fall (tF) timing parameters of the open drain outputs depend on the magnitude of the pull-up resistors. In-addition, the propagation times (tPD), skew (tPSKEW) and maximum data rate depend on the impedance of the device that is connected to the translator. The timing parameters listed in the data sheet assume that the output impedance of the drivers connected to the translator is less than 50 k $\Omega$ .

#### Enable Input (EN)

The PI4ULS3V204 has an Enable pin (EN) that provides tri-state operation at the I/O pins. Driving the Enable pin to a low logic level minimizes the power consumption of the device and drives the I/O VCCB and I/O VCCA pins to a high impedance state. Normal translation operation occurs when the EN pin is equal to a logic high signal. The EN pin is referenced to the VCCA supply and has overvoltage tolerant protection.

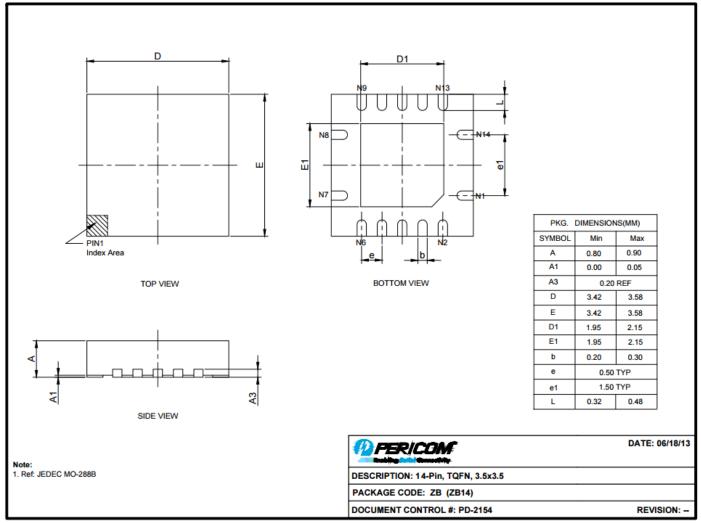

#### **Power Supply Guidelines**

During normal operation, supply voltage VCCA can be greater than, less than or equal to VCCB. The sequencing of the power supplies will not damage the device during the power up operation. For optimal performance,  $0.01\mu$ F to  $0.1\mu$ F decoupling capacitors should be used on the VCCA and VCCB power supply pins. Ceramic capacitors are a good design choice to filter and bypass any noise signals on the voltage lines to the ground plane of the PCB. The noise immunity will be maximized by placing the capacitors as close as possible to the supply and ground pins, along with minimizing the PCB connection traces.

#### LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or

2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the

failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
