## TABLE OF CONTENTS

<b>LIST OF FIGURES .....</b>	<b>8</b>
<b>LIST OF TABLES .....</b>	<b>13</b>
<b>1 GENERAL DESCRIPTION .....</b>	<b>14</b>
<b>2 FEATURES .....</b>	<b>15</b>
2.1 NuMicro™ NUC230 Features – Automotive Line .....	15
2.2 NuMicro™ NUC240 Features – Connectivity Line .....	19
<b>3 ABBREVIATIONS .....</b>	<b>23</b>
<b>4 PARTS INFORMATION LIST AND PIN CONFIGURATION .....</b>	<b>25</b>
4.1 NuMicro™ NUC230/240xxxAE Selection Guide .....	25
4.1.1 NuMicro™ NUC230 Automotive Line Selection Guide .....	25
4.1.2 NuMicro™ NUC240 Connectivity Line Selection Guide .....	25
4.2 Pin Configuration .....	27
4.2.1 NuMicro™ NUC230 Pin Diagram .....	27
4.2.2 NuMicro™ NUC240 Pin Diagram .....	30
4.3 Pin Description .....	33
4.3.1 NuMicro™ NUC230 Pin Description .....	33
4.3.2 NuMicro™ NUC240 Pin Description .....	41
<b>5 BLOCK DIAGRAM .....</b>	<b>49</b>
5.1 NuMicro™ NUC230 Block Diagram .....	49
5.2 NuMicro™ NUC240 Block Diagram .....	50
<b>6 FUNCTIONAL DESCRIPTION .....</b>	<b>51</b>
6.1 ARM® Cortex™-M0 Core .....	51
6.2 System Manager .....	53
6.2.1 Overview .....	53
6.2.2 System Reset .....	53
6.2.3 System Power Distribution .....	54
6.2.4 System Memory Map .....	56
6.2.5 Register Map .....	58
6.2.6 Register Description .....	59
6.2.7 Register Write Protection Register (REGWRPROT) .....	103
6.2.8 System Timer (SysTick) .....	106
6.2.9 Nested Vectored Interrupt Controller (NVIC) .....	111
6.2.10 System Control .....	137

6.3	Clock Controller.....	145
6.3.1	Overview .....	145
6.3.2	System Clock and SysTick Clock .....	148
6.3.3	Power-down Mode Clock.....	149
6.3.4	Frequency Divider Output .....	150
6.3.5	Register Map .....	152
6.3.6	Register Description.....	153
6.4	Flash Memory Controller (FMC) .....	177
6.4.1	Overview .....	177
6.4.2	Features.....	177
6.4.3	Block Diagram.....	178
6.4.4	Functional Description .....	179
6.4.5	Register Map .....	189
6.4.6	Register Description.....	190
6.5	External Bus Interface (EBI) .....	198
6.5.1	Overview .....	199
6.5.2	Features.....	199
6.5.3	Block Diagram.....	200
6.5.4	Functional Description .....	201
6.5.5	Register Map .....	207
6.5.6	Register Description.....	207
6.6	General Purpose I/O (GPIO) .....	212
6.6.1	Overview .....	212
6.6.2	Features.....	212
6.6.3	Basic Configuration.....	212
6.6.4	Functional Description .....	213
6.6.5	Register Map .....	216
6.6.6	Register Description.....	219
6.7	PDMA Controller (PDMA) .....	231
6.7.1	Overview .....	231
6.7.2	Features.....	232
6.7.3	Block Diagram.....	233
6.7.4	Basic Configuration.....	235
6.7.5	Functional Description .....	235
6.7.6	Register Map .....	237
6.7.7	Register Description.....	239

6.8	Timer Controller (TIMER)	271
6.8.1	Overview	271
6.8.2	Features	271
6.8.3	Block Diagram	272
6.8.4	Basic Configuration	273
6.8.5	Functional Description	273
6.8.6	Register Map	277
6.8.7	Register Description	279
6.9	PWM Generator and Capture Timer (PWM)	288
6.9.1	Overview	288
6.9.2	Features	289
6.9.3	Block Diagram	290
6.9.4	Basic Configuration	294
6.9.5	Functional Description	295
6.9.6	Register Map	306
6.9.7	Register Description	308
6.10	Watchdog Timer (WDT)	335
6.10.1	Overview	335
6.10.2	Features	335
6.10.3	Block Diagram	336
6.10.4	Basic Configuration	337
6.10.5	Functional Description	337
6.10.6	Register Map	339
6.10.7	Register Description	340
6.11	Window Watchdog Timer (WWDT)	343
6.11.1	Overview	343
6.11.2	Features	343
6.11.3	Block Diagram	343
6.11.4	Basic Configuration	344
6.11.5	Functional Description	344
6.11.6	Register Map	346
6.11.7	Register Description	347
6.12	Real Time Clock (RTC)	352
6.12.1	Overview	352
6.12.2	Features	352
6.12.3	Block Diagram	353

6.12.4 Basic Configuration.....	354
6.12.5 Functional Description .....	354
6.12.6 Register Map .....	358
6.12.7 Register Description.....	360
6.13 UART Interface Controller (UART) .....	376
6.13.1 Overview .....	376
6.13.2 Features.....	376
6.13.3 Block Diagram.....	377
6.13.4 Basic Configuration.....	378
6.13.5 Functional Description .....	379
6.13.6 Register Map .....	402
6.13.7 Register Description.....	404
6.14 Smart Card Host Interface (SC).....	431
6.14.1 Overview .....	431
6.14.2 Features.....	431
6.14.3 Block Diagram.....	432
6.14.4 Basic Configuration.....	433
6.14.5 Functional Description .....	433
6.14.6 Register Map .....	443
6.14.7 Register Description.....	445
6.15 PS/2 Device Controller (PS2D) .....	473
6.15.1 Overview .....	473
6.15.2 Features.....	473
6.15.3 Block Diagram.....	474
6.15.4 Basic Configuration.....	475
6.15.5 Functional Description .....	475
6.15.6 Register Map .....	480
6.15.7 Register Description.....	481
6.16 I <sup>2</sup> C Serial Interface Controller (I <sup>2</sup> C) .....	488
6.16.1 Overview .....	488
6.16.2 Features.....	488
6.16.3 Basic Configuration.....	488
6.16.4 Block Diagram.....	489
6.16.5 Functional Description .....	489
6.16.6 Example for Random Read on EEPROM .....	502
6.16.7 Register Map .....	505

6.16.8 Register Description.....	506
6.17 Serial Peripheral Interface (SPI) .....	516
6.17.1 Overview .....	516
6.17.2 Features.....	516
6.17.3 Block Diagram.....	517
6.17.4 Basic Configuration.....	517
6.17.5 Functional Description .....	519
6.17.6 Timing Diagram .....	528
6.17.7 Programming Examples .....	531
6.17.8 Register Map .....	533
6.17.9 Register Description.....	534
6.18 I <sup>2</sup> S Controller (I <sup>2</sup> S).....	550
6.18.1 Overview .....	550
6.18.2 Features.....	550
6.18.3 Block Diagram.....	551
6.18.4 Basic Configuration.....	551
6.18.5 Functional Description .....	552
6.18.6 Register Map .....	557
6.18.7 Register Description.....	558
6.19 USB Device Controller (USBD) .....	569
6.19.1 Overview .....	569
6.19.2 Features.....	569
6.19.3 Block Diagram.....	570
6.19.4 Basic Configuration.....	570
6.19.5 Functional Description .....	571
6.19.6 Register Map .....	575
6.19.7 Register Description.....	577
6.20 Controller Area Network (CAN) .....	593
6.20.1 Overview .....	593
6.20.2 Features.....	593
6.20.3 Block Diagram.....	593
6.20.4 Basic Configuration.....	594
6.20.5 Functional Description .....	595
6.20.6 Test Mode.....	596
6.20.7 CAN Communications .....	598
6.20.8 CAN Interface Reset State .....	616

6.20.9 Register Description.....	620
6.20.10 Register Map.....	620
6.21 Analog-to-Digital Converter (ADC) .....	657
6.21.1 Overview .....	657
6.21.2 Features.....	657
6.21.3 Block Diagram.....	658
6.21.4 Basic Configuration.....	658
6.21.5 Functional Description .....	659
6.21.6 Register Map .....	667
6.21.7 Register Description.....	668
6.22 Analog Comparator (ACMP).....	678
6.22.1 Overview .....	678
6.22.2 Features.....	678
6.22.3 Block Diagram.....	678
6.22.4 Basic Configuration.....	679
6.22.5 Functional Description .....	679
6.22.6 Register Map .....	680
6.22.7 Register Description.....	681
<b>7 ELECTRICAL CHARACTERISTICS.....</b>	<b>683</b>
<b>8 PACKAGE DIMENSIONS .....</b>	<b>684</b>
8.1 100-pin LQFP (14x14x1.4 mm footprint 2.0 mm) .....	684
8.2 64-pin LQFP (7x7x1.4 mm footprint 2.0 mm) .....	685
8.3 48-pin LQFP (7x7x1.4 mm footprint 2.0 mm) .....	686
<b>9 REVISION HISTORY.....</b>	<b>687</b>

## 1 GENERAL DESCRIPTION

The NuMicro™ NUC230/240 series 32-bit microcontrollers are embedded with the ARM® Cortex™-M0 core with a cost equivalent to traditional 8-bit MCU for industrial control and applications requiring rich communication interfaces. The NuMicro™ NUC230/240 series includes NUC230 and NUC240 product lines.

The NuMicro™ NUC230 CAN Line is embedded with the Cortex™-M0 core running up to 72 MHz and features 32K/64K/128K bytes flash, 8K/16K bytes embedded SRAM, and 8 Kbytes loader ROM for the ISP. It is also equipped with plenty of peripheral devices, such as Timers, Watchdog Timer, Window Watchdog Timer, RTC, PDMA with CRC calculation unit, UART, SPI, I<sup>2</sup>C, I<sup>2</sup>S, PWM Timer, GPIO, LIN, CAN, PS/2, Smart Card Host, 12-bit ADC, Analog Comparator, Low Voltage Reset Controller and Brown-out Detector.

The NuMicro™ NUC240 Connectivity Line with USB 2.0 full-speed and CAN functions is embedded with the Cortex™-M0 core running up to 72 MHz and features 32K/64K/128K bytes flash, 8K/16K bytes embedded SRAM, and 8 Kbytes loader ROM for the ISP. It is also equipped with plenty of peripheral devices, such as Timers, Watchdog Timer, Window Watchdog Timer, RTC, PDMA with CRC calculation unit, UART, SPI, I<sup>2</sup>C, I<sup>2</sup>S, PWM Timer, GPIO, LIN, CAN, PS/2, USB 2.0 FS Device, Smart Card Host, 12-bit ADC, Analog Comparator, Low Voltage Reset Controller and Brown-out Detector.

Table 1-1 NuMicro™ NUC230/240 Series Connectivity Support Table

## 2 FEATURES

The equipped features are dependent on the product line and their sub products.

### 2.1 NuMicro™ NUC230 Features – Automotive Line

- ARM® Cortex™-M0 core
  - Runs up to 72 MHz
  - One 24-bit system timer
  - Supports low power sleep mode
  - Single-cycle 32-bit hardware multiplier
  - NVIC for the 32 interrupt inputs, each with 4-levels of priority
  - Serial Wire Debug supports with 2 watchpoints/4 breakpoints
- Built-in LDO for wide operating voltage ranged from 2.5 V to 5.5 V
- Flash Memory
  - 32K/64K/128K bytes Flash for program code
  - 8 KB flash for ISP loader
  - Supports In-System-Program (ISP) and In-Application-Program (IAP) application code update
  - 512 byte page erase for flash
  - Configurable Data Flash address and size for 128 KB system, fixed 4 KB Data Flash for the 32 KB and 64 KB system
  - Supports 2-wired ICP update through SWD/ICE interface
  - Supports fast parallel programming mode by external programmer
- SRAM Memory
  - 8K/16K bytes embedded SRAM
  - Supports PDMA mode
- PDMA (Peripheral DMA)
  - Supports 9 channels PDMA for automatic data transfer between SRAM and peripherals
  - Supports CRC calculation with four common polynomials, CRC-CCITT, CRC-8, CRC-16 and CRC-32
- Clock Control
  - Flexible selection for different applications
  - Built-in 22.1184 MHz high speed oscillator for system operation
    - Trimmed to  $\pm 1\%$  at  $+25\text{ }^{\circ}\text{C}$  and  $V_{DD} = 5\text{ V}$
    - Trimmed to  $\pm 3\%$  at  $-40\text{ }^{\circ}\text{C} \sim +105\text{ }^{\circ}\text{C}$  and  $V_{DD} = 2.5\text{ V} \sim 5.5\text{ V}$
  - Built-in 10 kHz low speed oscillator for Watchdog Timer and Wake-up operation
  - Supports one PLL, up to 72 MHz, for high performance system operation
  - External 4~24 MHz high speed crystal input for precise timing operation
  - External 32.768 kHz low speed crystal input for RTC function and low power system operation
- GPIO
  - Four I/O modes:
    - Quasi-bidirectional
    - Push-pull output
    - Open-drain output
    - Input only with high impedance
  - TTL/Schmitt trigger input selectable
  - I/O pin configured as interrupt source with edge/level setting
- Timer
  - Supports 4 sets of 32-bit timers with 24-bit up-timer and one 8-bit prescale counter
  - Independent clock source for each timer
  - Provides one-shot, periodic, toggle and continuous counting operation modes
  - Supports event counting function
  - Supports input capture function
- Watchdog Timer
  - Multiple clock sources

- 8 selectable time-out period from 1.6 ms ~ 26.0 sec (depending on clock source)
  - Wake-up from Power-down or Idle mode
  - Interrupt or reset selectable on watchdog time-out
  - Supports 4 selectable Watchdog Timer reset delay period(1026, 130, 18 or 3 WDT\_CLK)
- Window Watchdog Timer
  - 6-bit down counter with 11-bit prescale for wide range window selected
- RTC
  - Supports software compensation by setting frequency compensate register (FCR)
  - Supports RTC counter (second, minute, hour) and calendar counter (day, month, year)
  - Supports Alarm registers (second, minute, hour, day, month, year)
  - Selectable 12-hour or 24-hour mode
  - Automatic leap year recognition
  - Supports periodic time tick interrupt with 8 period options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 and 1 second
  - Supports battery power pin (VBAT)
  - Supports wake-up function
- PWM/Capture
  - Up to four built-in 16-bit PWM generators providing eight PWM outputs or four complementary paired PWM outputs
  - Each PWM generator equipped with one clock source selector, one clock divider, one 8-bit prescaler and one Dead-Zone generator for complementary paired PWM
  - Supports One-shot or Auto-reload mode
  - Up to eight 16-bit digital capture timers (shared with PWM timers) providing eight rising/falling capture inputs
  - Supports Capture interrupt
- UART
  - Up to six UART controllers (three UART controllers are shared with SC)
  - UART ports with flow control (TXD, RXD, nCTS and nRTS)
  - UART0 with 64-byte FIFO is for high speed
  - UART1/2(optional) with 16-byte FIFO for standard device
  - Supports IrDA (SIR) and LIN function
  - Supports RS-485 9-bit mode and direction control
  - Programmable baud-rate generator up to 1/16 system clock
  - Supports CTS wake-up function (UART0 and UART1 support)
  - Supports PDMA mode
- Smart Card Host (SC)
  - Supports up to three ISO-7816-3 ports
    - Compliant to ISO-7816-3 T=0, T=1
    - Separate receive / transmit 4 bytes entry FIFO for data payloads
    - Programmable transmission clock frequency
    - Programmable receiver buffer trigger level
    - Programmable guard time selection (11 ETU ~ 266 ETU)
    - One 24-bit and two 8-bit time-out counters for Answer to Request (ATR) and waiting times processing
    - Supports auto inverse convention function
    - Supports transmitter and receiver error retry and error limit function
    - Supports hardware activation sequence process
    - Supports hardware warm reset sequence process
    - Supports hardware deactivation sequence process
    - Supports hardware auto deactivation sequence when detecting the card is removal
  - Supports up to three UART ports
    - Full duplex, asynchronous communications
    - Supports receiving / transmitting 4-bytes FIFO
    - Supports programmable baud rate generator for each channel
    - Programmable even, odd or no parity bit generation and detection
    - Programmable stop bit, 1 or 2 stop bit generation

- SPI
  - Up to four sets of SPI controllers
  - The maximum SPI clock rate of Master can up to 36 MHz (chip working at 5V)
  - The maximum SPI clock rate of Slave can up to 18 MHz (chip working at 5V)
  - Supports SPI Master/Slave mode
  - Full duplex synchronous serial data transfer
  - Variable length of transfer data from 8 to 32 bits
  - MSB or LSB first data transfer
  - Rx and Tx on both rising or falling edge of serial clock independently
  - Two slave/device select lines in Master mode, and one slave/device select line in Slave mode
  - Supports Byte Suspend mode in 32-bit transmission
  - Supports PDMA mode
  - Supports three wire, no slave select signal, bi-direction interface
- I<sup>2</sup>C
  - Up to two sets of I<sup>2</sup>C devices
  - Master/Slave mode
  - Bidirectional data transfer between masters and slaves
  - Multi-master bus (no central master)
  - Arbitration between simultaneously transmitting masters without corruption of serial data on the bus
  - Serial clock synchronization allowing devices with different bit rates to communicate via one serial bus
  - Serial clock synchronization used as a handshake mechanism to suspend and resume serial transfer
  - Programmable clocks allowing for versatile rate control
  - Supports multiple address recognition (four slave address with mask option)
  - Supports wake-up function
- I<sup>2</sup>S
  - Interface with external audio CODEC
  - Operate as either Master or Slave mode
  - Capable of handling 8-, 16-, 24- and 32-bit word sizes
  - Supports mono and stereo audio data
  - Supports I<sup>2</sup>S and MSB justified data format
  - Provides two 8 word FIFO data buffers, one for transmitting and the other for receiving
  - Generates interrupt requests when buffer levels cross a programmable boundary
  - Supports two DMA requests, one for transmitting and the other for receiving
- PS/2 Device
  - Host communication inhibit and request to send detection
  - Reception frame error detection
  - Programmable 1 to 16 bytes transmit buffer to reduce CPU intervention
  - Double buffer for data reception
  - Software override bus
- CAN 2.0
  - Supports CAN protocol version 2.0 part A and B
  - Bit rates up to 1M bit/s
  - 32 Message Objects
  - Each Message Object has its own identifier mask
  - Programmable FIFO mode (concatenation of Message Object)
  - Maskable interrupt
  - Disabled Automatic Re-transmission mode for Time Triggered CAN applications
  - Support wake-up function
- ADC
  - 12-bit SAR ADC with 1 MSPS (chip working at 5V)
  - Up to 8-ch single-end input or 4-ch differential input
  - Single scan/single cycle scan/continuous scan

- Each channel with individual result register
- Scan on enabled channels
- Threshold voltage detection
- Conversion started by software programming, external input or PWM Center-aligned trigger
- Supports PDMA mode
- Analog Comparator
  - Up to two analog comparators
  - External input or internal Band-gap voltage selectable at negative node
  - Interrupt when compare result change
  - Supports Power-down wake-up
- EBI (External bus interface)
  - Accessible space: 64 KB in 8-bit mode or 128 KB in 16-bit mode
  - Supports 8-/16-bit data width
  - Supports byte write in 16-bit data width mode
- 96-bit unique ID (UID)
- 128-bit unique customer ID(UCID)
- One built-in temperature sensor with 1°C resolution
- Brown-out Detector
  - With 4 levels: 4.4 V/3.7 V/2.7 V/2.2 V
  - Supports Brown-out Interrupt and Reset option
- Low Voltage Reset
  - Threshold voltage level: 2.0 V
- Operating Temperature: -40°C ~ 105°C
- Packages:
  - All Green package (RoHS)
  - LQFP 100-pin / 64-pin / 48-pin

## 2.2 NuMicro™ NUC240 Features – Connectivity Line

- ARM® Cortex™-M0 core
  - Runs up to 72 MHz
  - One 24-bit system timer
  - Supports low power sleep mode
  - Single-cycle 32-bit hardware multiplier
  - NVIC for the 32 interrupt inputs, each with 4-levels of priority
  - Serial Wire Debug supports with 2 watchpoints/4 breakpoints
- Built-in LDO for wide operating voltage ranges from 2.5 V to 5.5 V
- Flash Memory
  - 32K/64K/128K bytes Flash for program code
  - 8 KB flash for ISP loader
  - Supports In-System-Program (ISP) and In-Application-Program (IAP) application code update
  - 512 byte page erase for flash
  - Configurable Data Flash address and size for 128 KB system, fixed 4 KB Data Flash for the 32 KB and 64 KB system
  - Supports 2-wired ICP update through SWD/ICE interface
- SRAM Memory
  - 8K/16K bytes embedded SRAM
  - Supports PDMA mode
- PDMA (Peripheral DMA)
  - Supports 9 channels PDMA for automatic data transfer between SRAM and peripherals
  - Supports CRC calculation with four common polynomials, CRC-CCITT, CRC-8, CRC-16 and CRC-32
- Clock Control
  - Flexible selection for different applications
  - Built-in 22.1184 MHz high speed oscillator for system operation
    - Trimmed to  $\pm 1\%$  at  $+25\text{ }^{\circ}\text{C}$  and  $V_{DD} = 5\text{ V}$
    - Trimmed to  $\pm 3\%$  at  $-40\text{ }^{\circ}\text{C} \sim +105\text{ }^{\circ}\text{C}$  and  $V_{DD} = 2.5\text{ V} \sim 5.5\text{ V}$
  - Built-in 10 kHz low speed oscillator for Watchdog Timer and Wake-up operation
  - Supports one PLL, up to 72 MHz, for high performance system operation
  - External 4~24 MHz high speed crystal input for USB and precise timing operation
  - External 32.768 kHz low speed crystal input for RTC function and low power system operation
- GPIO
  - Four I/O modes:
    - Quasi-bidirectional
    - Push-pull output
    - Open-drain output
    - Input only with high impedance
  - TTL/Schmitt trigger input selectable
  - I/O pin configured as interrupt source with edge/level setting
- Timer
  - Supports 4 sets of 32-bit timers with 24-bit up-timer and one 8-bit prescale counter
  - Independent clock source for each timer
  - Provides one-shot, periodic, toggle and continuous counting operation modes
  - Supports event counting function
  - Supports input capture function
- Watchdog Timer
  - Multiple clock sources
  - 8 selectable time-out period from 1.6 ms ~ 26.0 sec (depending on clock source)
  - Wake-up from Power-down or Idle mode
  - Interrupt or reset selectable on watchdog time-out

- Supports 4 selectable Watchdog Timer reset delay period(1026, 130, 18 or 3 WDT\_CLK)
- Window Watchdog Timer
  - 6-bit down counter with 11-bit prescale for wide range window selected
- RTC
  - Supports software compensation by setting frequency compensate register (FCR)
  - Supports RTC counter (second, minute, hour) and calendar counter (day, month, year)
  - Supports Alarm registers (second, minute, hour, day, month, year)
  - Selectable 12-hour or 24-hour mode
  - Automatic leap year recognition
  - Supports periodic time tick interrupt with 8 period options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 and 1 second
  - Supports battery power pin (VBAT)
  - Supports wake-up function
- PWM/Capture
  - Up to four built-in 16-bit PWM generators providing eight PWM outputs or four complementary paired PWM outputs
  - Each PWM generator equipped with one clock source selector, one clock divider, one 8-bit prescaler and one Dead-Zone generator for complementary paired PWM
  - Supports One-shot or Auto-reload mode
  - Up to eight 16-bit digital capture timers (shared with PWM timers) providing eight rising/falling capture inputs
  - Supports Capture interrupt
- UART
  - Up to six UART controllers (three UART controllers are shared with SC)
  - UART ports with flow control (TXD, RXD, nCTS and nRTS)
  - UART0 with 64-byte FIFO is for high speed
  - UART1/2(optional) with 16-byte FIFO for standard device
  - Supports IrDA (SIR) and LIN function
  - Supports RS-485 9-bit mode and direction control
  - Programmable baud-rate generator up to 1/16 system clock
  - Supports CTS wake-up function (UART0 and UART1 support)
  - Supports PDMA mode
- Smart Card Host (SC)
  - Supports up to three ISO-7816-3 ports
    - Compliant to ISO-7816-3 T=0, T=1
    - Separate receive / transmit 4 bytes entry FIFO for data payloads
    - Programmable transmission clock frequency
    - Programmable receiver buffer trigger level
    - Programmable guard time selection (11 ETU ~ 266 ETU)
    - One 24-bit and two 8-bit time-out counters for Answer to Request (ATR) and waiting times processing
    - Supports auto inverse convention function
    - Supports transmitter and receiver error retry and error limit function
    - Supports hardware activation sequence process
    - Supports hardware warm reset sequence process
    - Supports hardware deactivation sequence process
    - Supports hardware auto deactivation sequence when detecting the card is removal
  - Supports up to three UART ports
    - Full duplex, asynchronous communications
    - Supports receiving / transmitting 4-bytes FIFO
    - Supports programmable baud rate generator for each channel
    - Programmable even, odd or no parity bit generation and detection
    - Programmable stop bit, 1 or 2 stop bit generation
- SPI
  - Up to four sets of SPI controllers
  - The maximum SPI clock rate of Master can up to 36 MHz (chip working at 5V)

- The maximum SPI clock rate of Slave can up to 18 MHz (chip working at 5V)
- Supports SPI Master/Slave mode
- Full duplex synchronous serial data transfer
- Variable length of transfer data from 8 to 32 bits
- MSB or LSB first data transfer
- Rx and Tx on both rising or falling edge of serial clock independently
- Two slave/device select lines in Master mode, and one slave/device select line in Slave mode
- Supports Byte Suspend mode in 32-bit transmission
- Supports PDMA mode
- Supports three wire, no slave select signal, bi-direction interface
- I<sup>2</sup>C
  - Up to two sets of I<sup>2</sup>C devices
  - Master/Slave mode
  - Bidirectional data transfer between masters and slaves
  - Multi-master bus (no central master)
  - Arbitration between simultaneously transmitting masters without corruption of serial data on the bus
  - Serial clock synchronization allowing devices with different bit rates to communicate via one serial bus
  - Serial clock synchronization used as a handshake mechanism to suspend and resume serial transfer
  - Programmable clocks allowing for versatile rate control
  - Supports multiple address recognition (four slave address with mask option)
  - Supports wake-up function
- I<sup>2</sup>S
  - Interface with external audio CODEC
  - Operate as either Master or Slave mode
  - Capable of handling 8-, 16-, 24- and 32-bit word sizes
  - Supports mono and stereo audio data
  - Supports I<sup>2</sup>S and MSB justified data format
  - Provides two 8 word FIFO data buffers, one for transmitting and the other for receiving
  - Generates interrupt requests when buffer levels cross a programmable boundary
  - Supports two DMA requests, one for transmitting and the other for receiving
- PS/2 Device
  - Host communication inhibit and request to send detection
  - Reception frame error detection
  - Programmable 1 to 16 bytes transmit buffer to reduce CPU intervention
  - Double buffer for data reception
  - Software override bus
- CAN 2.0
  - Supports CAN protocol version 2.0 part A and B
  - Bit rates up to 1M bit/s
  - 32 Message Objects
  - Each Message Object has its own identifier mask
  - Programmable FIFO mode (concatenation of Message Object)
  - Maskable interrupt
  - Disabled Automatic Re-transmission mode for Time Triggered CAN applications
  - Supports Power-down wake-up function
- USB 2.0 Full-Speed Device
  - One set of USB 2.0 FS Device 12 Mbps
  - On-chip USB Transceiver
  - Provides 1 interrupt source with 4 interrupt events
  - Supports Control, Bulk In/Out, Interrupt and Isochronous transfers
  - Auto suspend function when no bus signaling for 3 ms
  - Provides 8 programmable endpoints

- Includes 512 Bytes internal SRAM as USB buffer
- Provides remote wake-up capability
- ADC
  - 12-bit SAR ADC with 1 MSPS(chip working at 5V)
  - Up to 8-ch single-end input or 4-ch differential input
  - Single scan/single cycle scan/continuous scan
  - Each channel with individual result register
  - Scan on enabled channels
  - Threshold voltage detection
  - Conversion started by software programming, external input or PWM Center-aligned trigger
  - Supports PDMA mode
- Analog Comparator
  - Up to two analog comparators
  - External input or internal Band-gap voltage selectable at negative node
  - Interrupt when compare result change
  - Supports Power-down wake-up
- EBI (External bus interface)
  - Accessible space: 64 KB in 8-bit mode or 128 KB in 16-bit mode
  - Supports 8-/16-bit data width
  - Supports byte write in 16-bit data width mode
- 96-bit unique ID (UID)
- 128-bit unique customer ID(UCID)
- One built-in temperature sensor with 1°C resolution
- Brown-out Detector
  - With 4 levels: 4.4 V/3.7 V/2.7 V/2.2 V
  - Supports Brown-out Interrupt and Reset option
- Low Voltage Reset
  - Threshold voltage level: 2.0 V
- Operating Temperature: -40°C ~ 105°C
- Packages:
  - All Green package (RoHS)
  - LQFP 100-pin / 64-pin / 48-pin

### 3 ABBREVIATIONS

Acronym	Description
ACMP	Analog Comparator Controller
ADC	Analog-to-Digital Converter
AES	Advanced Encryption Standard
APB	Advanced Peripheral Bus
AHB	Advanced High-Performance Bus
BOD	Brown-out Detection
CAN	Controller Area Network
DAP	Debug Access Port
DES	Data Encryption Standard
EBI	External Bus Interface
EPWM	Enhanced Pulse Width Modulation
FIFO	First In, First Out
FMC	Flash Memory Controller
FPU	Floating-point Unit
GPIO	General-Purpose Input/Output
HCLK	The Clock of Advanced High-Performance Bus
HIRC	22.1184 MHz Internal High Speed RC Oscillator
HXT	4~24 MHz External High Speed Crystal Oscillator
IAP	In Application Programming
ICP	In Circuit Programming
ISP	In System Programming
LDO	Low Dropout Regulator
LIN	Local Interconnect Network
LIRC	10 kHz internal low speed RC oscillator (LIRC)
MPU	Memory Protection Unit
NVIC	Nested Vectored Interrupt Controller
PCLK	The Clock of Advanced Peripheral Bus
PDMA	Peripheral Direct Memory Access
PLL	Phase-Locked Loop
PWM	Pulse Width Modulation
QEI	Quadrature Encoder Interface
SDIO	Secure Digital Input/Output
SPI	Serial Peripheral Interface

SPS	Samples per Second
TDES	Triple Data Encryption Standard
TMR	Timer Controller
UART	Universal Asynchronous Receiver/Transmitter
UCID	Unique Customer ID
USB	Universal Serial Bus
WDT	Watchdog Timer
WWDT	Window Watchdog Timer

Table 3-1 List of Abbreviations

## 4.3 Pin Description

### 4.3.1 NuMicro™ NUC230 Pin Description

Pin No.			Pin Name	Pin Type	Description
LQFP 100-pin	LQFP 64-pin	LQFP 48-pin			
1			PE.15	I/O	General purpose digital I/O pin.
2			PE.14	I/O	General purpose digital I/O pin.
3			PE.13	I/O	General purpose digital I/O pin.
4	1		PB.14	I/O	General purpose digital I/O pin.
			AD0	I/O	EBI Address/Data bus bit0
			INT0	I	External interrupt0 input pin.
			SPI3_SS1	I/O	2 <sup>nd</sup> SPI3 slave select pin.
5	2		PB.13	I/O	General purpose digital I/O pin.
			AD1	I/O	EBI Address/Data bus bit1
			ACMP1_O	O	Comparator1 output pin.
6	3	1	V <sub>BAT</sub>	P	Power supply by batteries for RTC.
7	4	2	X32_OUT	O	External 32.768 kHz (low speed) crystal output pin.
8	5	3	X32_IN	I	External 32.768 kHz (low speed) crystal input pin.
9	6	4	PA.11	I/O	General purpose digital I/O pin.
			I2C1_SCL	I/O	I <sup>2</sup> C1 clock pin.
			CAN1_RXD	I	Data receiver input pin for CAN1.
			nRD	O	EBI read enable output pin
10	7	5	PA.10	I/O	General purpose digital I/O pin.
			I2C1_SDA	I/O	I <sup>2</sup> C1 data input/output pin.
			CAN1_TXD	O	Data transmitter output pin for CAN1.
			nWR	O	EBI write enable output pin
11	8	6	PA.9	I/O	General purpose digital I/O pin.
			I2C0_SCL	I/O	I <sup>2</sup> C0 clock pin.
12	9	7	PA.8	I/O	General purpose digital I/O pin.
			I2C0_SDA	I/O	I <sup>2</sup> C0 data input/output pin.
13			PD.8	I/O	General purpose digital I/O pin.
			SPI3_SS0	I/O	1 <sup>st</sup> SPI3 slave select pin.
14			PD.9	I/O	General purpose digital I/O pin.
			SPI3_CLK	I/O	SPI3 serial clock pin.

Pin No.			Pin Name	Pin Type	Description
LQFP 100-pin	LQFP 64-pin	LQFP 48-pin			
15			PD.10	I/O	General purpose digital I/O pin.
			SPI3_MISO0	I/O	1 <sup>st</sup> SPI3 MISO (Master In, Slave Out) pin.
16			PD.11	I/O	General purpose digital I/O pin.
			SPI3_MOSI0	I/O	1 <sup>st</sup> SPI3 MOSI (Master Out, Slave In) pin.
17			PD.12	I/O	General purpose digital I/O pin.
			SPI3_MISO1	I/O	2 <sup>nd</sup> SPI3 MISO (Master In, Slave Out) pin.
18			PD.13	I/O	General purpose digital I/O pin.
			SPI3_MOSI1	I/O	2 <sup>nd</sup> SPI3 MOSI (Master Out, Slave In) pin.
19	10	8	PB.4	I/O	General purpose digital I/O pin.
			UART1_RXD	I	Data receiver input pin for UART1.
20	11	9	PB.5	I/O	General purpose digital I/O pin.
			UART1_TXD	O	Data transmitter output pin for UART1.
21	12		PB.6	I/O	General purpose digital I/O pin.
			ALE	O	EBI address latch enable output pin
			UART1_nRTS	O	Request to Send output pin for UART1.
22	13		PB.7	I/O	General purpose digital I/O pin.
			nCS	O	EBI chip select enable output pin
			UART1_nCTS	I	Clear to Send input pin for UART1.
23	14	10	LDO_CAP	P	LDO output pin.
24	15	11	V <sub>DD</sub>	P	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
25	16	12	V <sub>SS</sub>	P	Ground pin for digital circuit.
26			PE.12	I/O	General purpose digital I/O pin.
27			PE.11	I/O	General purpose digital I/O pin.
28			PE.10	I/O	General purpose digital I/O pin.
29			PE.9	I/O	General purpose digital I/O pin.
30			PE.8	I/O	General purpose digital I/O pin.
31			PE.7	I/O	General purpose digital I/O pin.
32	17	13	PB.0	I/O	General purpose digital I/O pin.
			UART0_RXD	I	Data receiver input pin for UART0.
33	18	14	PB.1	I/O	General purpose digital I/O pin.
			UART0_TXD	O	Data transmitter output pin for UART0.
34	19	15	PB.2	I/O	General purpose digital I/O pin.

Pin No.			Pin Name	Pin Type	Description
LQFP 100-pin	LQFP 64-pin	LQFP 48-pin			
			UART0_nRTS	O	Request to Send output pin for UART0.
			TM2_EXT	I	Timer2 external capture input pin.
			ACMP0_O	O	Comparator0 output pin.
			nWRL	O	EBI low byte write enable output pin
35	20	16	PB.3	I/O	General purpose digital I/O pin.
			UART0_nCTS	I	Clear to Send input pin for UART0.
			TM3_EXT	I	Timer3 external capture input pin.
			SC2_CD	I	SmartCard2 card detect pin.
			nWRH	O	EBI high byte write enable output pin
36	21	17	PD.6	I/O	General purpose digital I/O pin.
			CAN0_RXD	I	Data receiver input pin for CAN0.
37	22	18	PD.7	I/O	General purpose digital I/O pin.
			CAN0_TXD	O	Data transmitter output pin for CAN0.
38	23	19	PD.14	I/O	General purpose digital I/O pin.
			UART2_RXD	I	Data receiver input pin for UART2.
			CAN1_RXD	I	Data receiver input pin for CAN1.
39	24	20	PD.15	I/O	General purpose digital I/O pin.
			UART2_TXD	O	Data transmitter output pin for UART2.
			CAN1_TXD	O	Data transmitter output pin for CAN1.
40			PC.5	I/O	General purpose digital I/O pin.
			SPI0_MOSI1	I/O	2 <sup>nd</sup> SPI0 MOSI (Master Out, Slave In) pin.
41			PC.4	I/O	General purpose digital I/O pin.
			SPI0_MISO1	I/O	2 <sup>nd</sup> SPI0 MISO (Master In, Slave Out) pin.
42	25	21	PC.3	I/O	General purpose digital I/O pin.
			SPI0_MOSI0	I/O	1 <sup>st</sup> SPI0 MOSI (Master Out, Slave In) pin.
			I2S_DO	O	I <sup>2</sup> S data output.
43	26	22	PC.2	I/O	General purpose digital I/O pin.
			SPI0_MISO0	I/O	1 <sup>st</sup> SPI0 MISO (Master In, Slave Out) pin.
			I2S_DI	I	I <sup>2</sup> S data input.
44	27	23	PC.1	I/O	General purpose digital I/O pin.
			SPI0_CLK	I/O	SPI0 serial clock pin.
			I2S_BCLK	I/O	I <sup>2</sup> S bit clock pin.

Pin No.			Pin Name	Pin Type	Description
LQFP 100-pin	LQFP 64-pin	LQFP 48-pin			
45	28	24	PC.0	I/O	General purpose digital I/O pin.
			SPI0_SS0	I/O	1 <sup>st</sup> SPI0 slave select pin.
			I2S_LRCLK	I/O	I <sup>2</sup> S left right channel clock.
46			PE.6	I/O	General purpose digital I/O pin.
47	29		PE.5	I/O	General purpose digital I/O pin.
			PWM5	I/O	PWM5 output/Capture input.
			TM1_EXT	I	Timer1 external capture input pin.
			TM1	O	Timer1 toggle output pin.
48	30		PB.11	I/O	General purpose digital I/O pin.
			TM3	I/O	Timer3 event counter input / toggle output.
			PWM4	I/O	PWM4 output/Capture input.
49	31		PB.10	I/O	General purpose digital I/O pin.
			TM2	I/O	Timer2 event counter input / toggle output.
			SPI0_SS1	I/O	2 <sup>nd</sup> SPI0 slave select pin.
50	32		PB.9	I/O	General purpose digital I/O pin.
			TM1	I/O	Timer1 event counter input / toggle output.
			SPI1_SS1	I/O	2 <sup>nd</sup> SPI1 slave select pin.
51			PE.4	I/O	General purpose digital I/O pin.
52			PE.3	I/O	General purpose digital I/O pin.
53			PE.2	I/O	General purpose digital I/O pin.
54			PE.1	I/O	General purpose digital I/O pin.
			PWM7	I/O	PWM7 output/Capture input.
55			PE.0	I/O	General purpose digital I/O pin.
			PWM6	I/O	PWM6 output/Capture input.
56			PC.13	I/O	General purpose digital I/O pin.
			SPI1_MOSI1	I/O	2 <sup>nd</sup> SPI1 MOSI (Master Out, Slave In) pin.
57			PC.12	I/O	General purpose digital I/O pin.
			SPI1_MISO1	I/O	2 <sup>nd</sup> SPI1 MISO (Master In, Slave Out) pin.
58	33		PC.11	I/O	General purpose digital I/O pin.
			SPI1_MOSI0	I/O	1 <sup>st</sup> SPI1 MOSI (Master Out, Slave In) pin.
59	34		PC.10	I/O	General purpose digital I/O pin.
			SPI1_MISO0	I/O	1 <sup>st</sup> SPI1 MISO (Master In, Slave Out) pin.

Pin No.			Pin Name	Pin Type	Description
LQFP 100-pin	LQFP 64-pin	LQFP 48-pin			
60	35		PC.9	I/O	General purpose digital I/O pin.
			SPI1_CLK	I/O	SPI1 serial clock pin.
61	36		PC.8	I/O	General purpose digital I/O pin.
			MCLK	O	EBI clock output
			SPI1_SS0	I/O	1 <sup>st</sup> SPI1 slave select pin.
62	37	25	PA.15	I/O	General purpose digital I/O pin.
			PWM3	I/O	PWM3 output/Capture input.
			I2S_MCLK	O	I <sup>2</sup> S master clock output pin.
			SC2_PWR	O	SmartCard2 power pin.
63	38	26	PA.14	I/O	General purpose digital I/O pin.
			PWM2	I/O	PWM2 output/Capture input.
			SC2_RST	O	SmartCard2 reset pin.
			AD15	I/O	EBI Address/Data bus bit15
64	39	27	PA.13	I/O	General purpose digital I/O pin.
			PWM1	I/O	PWM1 output/Capture input.
			SC2_CLK	O	SmartCard2 clock pin.
			UART5_TXD	O	Data transmitter output pin for UART5.
			AD14	I/O	EBI Address/Data bus bit14
65	40	28	PA.12	I/O	General purpose digital I/O pin.
			PWM0	I/O	PWM0 output/Capture input.
			SC2_DAT	O	SmartCard2 data pin.
			UART5_RXD	I	Data receiver input pin for UART5.
			AD13	I/O	EBI Address/Data bus bit13
66	41	29	ICE_DAT	I/O	Serial wire debugger data pin. <b>Note:</b> It is recommended to use 100 kΩ pull-up resistor on ICE_DAT pin
67	42	30	ICE_CLK	I	Serial wire debugger clock pin. <b>Note:</b> It is recommended to use 100 kΩ pull-up resistor on ICE_CLK pin
68			V <sub>DD</sub>	P	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
69			V <sub>SS</sub>	P	Ground pin for digital circuit.
70	43	31	AV <sub>SS</sub>	AP	Ground pin for analog circuit.
71	44	32	PA.0	I/O	General purpose digital I/O pin.

Pin No.			Pin Name	Pin Type	Description
LQFP 100-pin	LQFP 64-pin	LQFP 48-pin			
			ADC0	<b>AI</b>	ADC0 analog input.
			SC0_PWR	<b>O</b>	SmartCard0 power pin.
72	45	33	PA.1	<b>I/O</b>	General purpose digital I/O pin.
			ADC1	<b>AI</b>	ADC1 analog input.
			SC0_RST	<b>O</b>	SmartCard0 reset pin.
			AD12	<b>I/O</b>	EBI Address/Data bus bit12
73	46	34	PA.2	<b>I/O</b>	General purpose digital I/O pin.
			ADC2	<b>AI</b>	ADC2 analog input.
			SC0_CLK	<b>O</b>	SmartCard0 clock pin.
			UART3_TXD	<b>O</b>	Data transmitter output pin for UART3.
			AD11	<b>I/O</b>	EBI Address/Data bus bit11
74	47	35	PA.3	<b>I/O</b>	General purpose digital I/O pin.
			ADC3	<b>AI</b>	ADC3 analog input.
			SC0_DAT	<b>O</b>	SmartCard0 data pin.
			UART3_RXD	<b>I</b>	Data receiver input pin for UART3.
			AD10	<b>I/O</b>	EBI Address/Data bus bit10
75	48	36	PA.4	<b>I/O</b>	General purpose digital I/O pin.
			ADC4	<b>AI</b>	ADC4 analog input.
			AD9	<b>I/O</b>	EBI Address/Data bus bit9
			SC1_PWR	<b>O</b>	SmartCard1 power pin.
76	49	37	PA.5	<b>I/O</b>	General purpose digital I/O pin.
			ADC5	<b>AI</b>	ADC5 analog input.
			AD8	<b>I/O</b>	EBI Address/Data bus bit8
			SC1_RST	<b>O</b>	SmartCard1 reset pin.
77	50	38	PA.6	<b>I/O</b>	General purpose digital I/O pin.
			ADC6	<b>AI</b>	ADC6 analog input.
			AD7	<b>I/O</b>	EBI Address/Data bus bit7
			SC1_CLK	<b>I/O</b>	SmartCard1 clock pin.
			UART4_TXD	<b>O</b>	Data transmitter output pin for UART4.
78			PA.7	<b>I/O</b>	General purpose digital I/O pin.
			ADC7	<b>AI</b>	ADC7 analog input.
			AD6	<b>I/O</b>	EBI Address/Data bus bit6
			SC1_DAT	<b>O</b>	SmartCard1 data pin.

Pin No.			Pin Name	Pin Type	Description
LQFP 100-pin	LQFP 64-pin	LQFP 48-pin			
			UART4_RXD	I	Data receiver input pin for UART4.
			SPI2_SS1	I/O	2 <sup>nd</sup> SPI2 slave select pin.
79	51	39	V <sub>REF</sub>	AP	Voltage reference input for ADC.
80	52	40	AV <sub>DD</sub>	AP	Power supply for internal analog circuit.
81			PD.0	I/O	General purpose digital I/O pin.
			SPI2_SS0	I/O	1 <sup>st</sup> SPI2 slave select pin.
82			PD.1	I/O	General purpose digital I/O pin.
			SPI2_CLK	I/O	SPI2 serial clock pin.
83			PD.2	I/O	General purpose digital I/O pin.
			SPI2_MISO0	I/O	1 <sup>st</sup> SPI2 MISO (Master In, Slave Out) pin.
84			PD.3	I/O	General purpose digital I/O pin.
			SPI2_MOSI0	I/O	1 <sup>st</sup> SPI2 MOSI (Master Out, Slave In) pin.
85			PD.4	I/O	General purpose digital I/O pin.
			SPI2_MISO1	I/O	2 <sup>nd</sup> SPI2 MISO (Master In, Slave Out) pin.
86			PD.5	I/O	General purpose digital I/O pin.
			SPI2_MOSI1	I/O	2 <sup>nd</sup> SPI2 MOSI (Master Out, Slave In) pin.
87	53	41	PC.7	I/O	General purpose digital I/O pin.
			CMP0_N	AI	Comparator0 negative input pin.
			AD5	I/O	EBI Address/Data bus bit5
			SC1_CD	I	SmartCard1 card detect pin.
88	54	42	PC.6	I/O	General purpose digital I/O pin.
			ACMP0_P	AI	Comparator0 positive input pin.
			SC0_CD	I	SmartCard0 card detect pin.
			AD4	I/O	EBI Address/Data bus bit4
89	55		PC.15	I/O	General purpose digital I/O pin.
			AD3	I/O	EBI Address/Data bus bit3
			ACMP1_N	AI	Comparator1 negative input pin.
90	56		PC.14	I/O	General purpose digital I/O pin.
			AD2	I/O	EBI Address/Data bus bit2
			ACMP1_P	AI	Comparator1 positive input pin.
91	57	43	PB.15	I/O	General purpose digital I/O pin.
			INT1	I	External interrupt1 input pin.
			TM0_EXT	I	Timer0 external capture input pin.

Pin No.			Pin Name	Pin Type	Description
LQFP 100-pin	LQFP 64-pin	LQFP 48-pin			
			TM0	O	Timer0 toggle output pin.
			AD6	I/O	EBI Address/Data bus bit6
92	58	44	PF.0	I/O	General purpose digital I/O pin.
			XT1_OUT	O	External 4~24 MHz (high speed) crystal output pin.
93	59	45	PF.1	I/O	General purpose digital I/O pin.
			XT1_IN	I	External 4~24 MHz (high speed) crystal input pin.
94	60	46	nRESET	I	External reset input: active LOW, with an internal pull-up. Set this pin low reset chip to initial state. <b>Note:</b> It is recommended to use 10 kΩ pull-up resistor and 10 uF capacitor on nRESET pin.
95	61		V <sub>SS</sub>	P	Ground pin for digital circuit.
96	62		V <sub>DD</sub>	P	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
97			PF.2	I/O	General purpose digital I/O pin.
			PS2_DAT	I/O	PS/2 data pin.
98			PF.3	I/O	General purpose digital I/O pin.
			PS2_CLK	I/O	PS/2 clock pin.
99	63	47	PV <sub>SS</sub>	P	PLL ground.
100	64	48	PB.8	I/O	General purpose digital I/O pin.
			STADC	I	ADC external trigger input.
			TM0	I/O	Timer0 event counter input / toggle output.
			CLKO	O	Frequency divider clock output pin.

**Note:** Pin Type I = Digital Input, O = Digital Output; AI = Analog Input; P = Power Pin; AP = Analog Power

### 4.3.2 NuMicro™ NUC240 Pin Description

Pin No.			Pin Name	Pin Type	Description
LQFP 100-pin	LQFP 64-pin	LQFP 48-pin			
1			PE.15	I/O	General purpose digital I/O pin.
2			PE.14	I/O	General purpose digital I/O pin.
3			PE.13	I/O	General purpose digital I/O pin.
4	1		PB.14	I/O	General purpose digital I/O pin.
			AD0	I/O	EBI Address/Data bus bit0
			INT0	I	External interrupt0 input pin.
			SPI3_SS1	I/O	2 <sup>nd</sup> SPI3 slave select pin.
5	2		PB.13	I/O	General purpose digital I/O pin.
			AD1	I/O	EBI Address/Data bus bit1
			ACMP1_O	O	Comparator1 output pin.
6	3	1	V <sub>BAT</sub>	P	Power supply by batteries for RTC.
7	4	2	X32_OUT	O	External 32.768 kHz (low speed) crystal output pin.
8	5	3	X32_IN	I	External 32.768 kHz (low speed) crystal input pin.
9	6	4	PA.11	I/O	General purpose digital I/O pin.
			I2C1_SCL	I/O	I <sup>2</sup> C1 clock pin.
			CAN1_RXD	I	Data receiver input pin for CAN1.
			nRD	O	EBI read enable output pin
10	7	5	PA.10	I/O	General purpose digital I/O pin.
			I2C1_SDA	I/O	I <sup>2</sup> C1 data input/output pin.
			CAN1_TXD	O	Data transmitter output pin for CAN1.
			nWR	O	EBI write enable output pin
11	8	6	PA.9	I/O	General purpose digital I/O pin.
			I2C0_SCL	I/O	I <sup>2</sup> C0 clock pin.
12	9	7	PA.8	I/O	General purpose digital I/O pin.
			I2C0_SDA	I/O	I <sup>2</sup> C0 data input/output pin.
13			PD.8	I/O	General purpose digital I/O pin.
			SPI3_SS0	I/O	1 <sup>st</sup> SPI3 slave select pin.
14			PD.9	I/O	General purpose digital I/O pin.
			SPI3_CLK	I/O	SPI3 serial clock pin.
15			PD.10	I/O	General purpose digital I/O pin.
			SPI3_MISO0	I/O	1 <sup>st</sup> SPI3 MISO (Master In, Slave Out) pin.

Pin No.			Pin Name	Pin Type	Description
LQFP 100-pin	LQFP 64-pin	LQFP 48-pin			
16			PD.11	I/O	General purpose digital I/O pin.
			SPI3_MOSI0	I/O	1 <sup>st</sup> SPI3 MOSI (Master Out, Slave In) pin.
17			PD.12	I/O	General purpose digital I/O pin.
			SPI3_MISO1	I/O	2 <sup>nd</sup> SPI3 MISO (Master In, Slave Out) pin.
18			PD.13	I/O	General purpose digital I/O pin.
			SPI3_MOSI1	I/O	2 <sup>nd</sup> SPI3 MOSI (Master Out, Slave In) pin.
19	10	8	PB.4	I/O	General purpose digital I/O pin.
			UART1_RXD	I	Data receiver input pin for UART1.
20	11	9	PB.5	I/O	General purpose digital I/O pin.
			UART1_TXD	O	Data transmitter output pin for UART1.
21	12		PB.6	I/O	General purpose digital I/O pin.
			ALE	O	EBI address latch enable output pin
			UART1_nRTS	O	Request to Send output pin for UART1.
22	13		PB.7	I/O	General purpose digital I/O pin.
			nCS	O	EBI chip select enable output pin
			UART1_nCTS	I	Clear to Send input pin for UART1.
23	14	10	LDO_CAP	P	LDO output pin.
24	15	11	V <sub>DD</sub>	P	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
25	16	12	V <sub>SS</sub>	P	Ground pin for digital circuit.
26			PE.8	I/O	General purpose digital I/O pin.
27			PE.7	I/O	General purpose digital I/O pin.
28	17	13	USB_VBUS	USB	Power supply from USB host or HUB.
29	18	14	USB_V <sub>DD</sub> 33_CAP	USB	Internal power regulator output 3.3V decoupling pin.
30	19	15	USB_D-	USB	USB differential signal D-.
31	20	16	USB_D+	USB	USB differential signal D+.
32	21	17	PB.0	I/O	General purpose digital I/O pin.
			UART0_RXD	I	Data receiver input pin for UART0.
33	22	18	PB.1	I/O	General purpose digital I/O pin.
			UART0_TXD	O	Data transmitter output pin for UART0.
34	23		PB.2	I/O	General purpose digital I/O pin.
			nWRL	O	EBI low byte write enable output pin
			UART0_nRTS	O	Request to Send output pin for UART0.

Pin No.			Pin Name	Pin Type	Description
LQFP 100-pin	LQFP 64-pin	LQFP 48-pin			
			TM2_EXT	I	Timer2 external capture input pin.
			TM2	O	Timer2 toggle output pin.
			ACMP0_O	O	Comparator0 output pin.
35	24		PB.3	I/O	General purpose digital I/O pin.
			UART0_nCTS	I	Clear to Send input pin for UART0.
			nWRH	O	EBI high byte write enable output pin
			TM3_EXT	I	Timer3 external capture input pin.
			TM3	O	Timer3 toggle output pin.
			SC2_CD	I	SmartCard2 card detect pin.
36	25	19	PD.6	I/O	General purpose digital I/O pin.
			CAN0_RXD	I	Data receiver input pin for CAN0.
37	26	20	PD.7	I/O	General purpose digital I/O pin.
			CAN0_TXD	O	Data transmitter output pin for CAN0.
38	27		PD.14	I/O	General purpose digital I/O pin.
			UART2_RXD	I	Data receiver input pin for UART2.
			CAN1_RXD	I	Data receiver input pin for CAN1.
39	28		PD.15	I/O	General purpose digital I/O pin.
			UART2_TXD	O	Data transmitter output pin for UART2.
			CAN1_TXD	O	Data transmitter output pin for CAN1.
40			PC.5	I/O	General purpose digital I/O pin.
			SPI0_MOSI1	I/O	2 <sup>nd</sup> SPI0 MOSI (Master Out, Slave In) pin.
41			PC.4	I/O	General purpose digital I/O pin.
			SPI0_MISO1	I/O	2 <sup>nd</sup> SPI0 MISO (Master In, Slave Out) pin.
42	29	21	PC.3	I/O	General purpose digital I/O pin.
			SPI0_MOSI0	I/O	1 <sup>st</sup> SPI0 MOSI (Master Out, Slave In) pin.
			I2S_DO	O	I <sup>2</sup> S data output.
43	30	22	PC.2	I/O	General purpose digital I/O pin.
			SPI0_MISO0	I/O	1 <sup>st</sup> SPI0 MISO (Master In, Slave Out) pin.
			I2S_DI	I	I <sup>2</sup> S data input.
44	31	23	PC.1	I/O	General purpose digital I/O pin.
			SPI0_CLK	I/O	SPI0 serial clock pin.
			I2S_BCLK	I/O	I <sup>2</sup> S bit clock pin.

Pin No.			Pin Name	Pin Type	Description
LQFP 100-pin	LQFP 64-pin	LQFP 48-pin			
45	32	24	PC.0	I/O	General purpose digital I/O pin.
			SPI0_SS0	I/O	1 <sup>st</sup> SPI0 slave select pin.
			I2S_LRCLK	I/O	I <sup>2</sup> S left right channel clock.
46			PE.6	I/O	General purpose digital I/O pin.
47			PE.5	I/O	General purpose digital I/O pin.
			PWM5	I/O	PWM5 output/Capture input.
			TM1_EXT	I	Timer1 external capture input pin.
			TM1	O	Timer1 toggle output pin.
48			PB.11	I/O	General purpose digital I/O pin.
			TM3	I/O	Timer3 event counter input / toggle output.
			PWM4	I/O	PWM4 output/Capture input.
49			PB.10	I/O	General purpose digital I/O pin.
			TM2	I/O	Timer2 event counter input / toggle output.

83			PD.2	I/O	General purpose digital I/O pin.
			SPI2_MISO0	I/O	1 <sup>st</sup> SPI2 MISO (Master In, Slave Out) pin.
84			PD.3	I/O	General purpose digital I/O pin.
			SPI2_MOSI0	I/O	1 <sup>st</sup> SPI2 MOSI (Master Out, Slave In) pin.
85			PD.4	I/O	General purpose digital I/O pin.
			SPI2_MISO1	I/O	2 <sup>nd</sup> SPI2 MISO (Master In, Slave Out) pin.
86			PD.5	I/O	General purpose digital I/O pin.
			SPI2_MOSI1	I/O	2 <sup>nd</sup> SPI2 MOSI (Master Out, Slave In) pin.
87	53	41	PC.7	I/O	General purpose digital I/O pin.
			ACMP0_N	AI	Comparator0 negative input pin.
			AD5	I/O	EBI Address/Data bus bit5
			SC1_CD	I	SmartCard1 card detect pin.
88	54	42	PC.6	I/O	General purpose digital I/O pin.
			ACMP0_P	AI	Comparator0 positive input pin.
			SC0_CD	I	SmartCard0 card detect pin.
			AD4	I/O	EBI Address/Data bus bit4
89	55		PC.15	I/O	General purpose digital I/O pin.
			AD3	I/O	EBI Address/Data bus bit3
			ACMP1_N	AI	Comparator1 negative input pin.
90	56		PC.14	I/O	General purpose digital I/O pin.
			AD2	I/O	EBI Address/Data bus bit2
			ACMP1_P	AI	Comparator1 positive input pin.
91	57	43	PB.15	I/O	General purpose digital I/O pin.
			INT1	I	External interrupt1 input pin.

Pin No.			Pin Name	Pin Type	Description
LQFP 100-pin	LQFP 64-pin	LQFP 48-pin			
			TM0_EXT	I	Timer 0 external capture input pin.
			TM0	O	Timer0 toggle output pin.
			AD6	I/O	EBI Address/Data bus bit6
92	58	44	PF.0	I/O	General purpose digital I/O pin.
			XT1_OUT	O	External 4~24 MHz (high speed) crystal output pin.
93	59	45	PF.1	I/O	General purpose digital I/O pin.
			XT1_IN	I	External 4~24 MHz (high speed) crystal input pin.
94	60	46	nRESET	I	External reset input: active LOW, with an internal pull-up. Set this pin low reset chip to initial state. <b>Note:</b> It is recommended to use 10 kΩ pull-up resistor and 10 uF capacitor on nRESET pin.
95	61		V <sub>SS</sub>	P	Ground pin for digital circuit.
96	62		V <sub>DD</sub>	P	Power supply for I/O ports and LDO source for internal PLL and digital circuit.
97			PF.2	I/O	General purpose digital I/O pin.
			PS2_DAT	I/O	PS/2 data pin.
98			PF.3	I/O	General purpose digital I/O pin.
			PS2_CLK	I/O	PS/2 clock pin.
99	63	47	PV <sub>SS</sub>	P	PLL ground.
100	64	48	PB.8	I/O	General purpose digital I/O pin.
			STADC	I	ADC external trigger input.
			TM0	I/O	Timer0 event counter input / toggle output.
			CLKO	O	Frequency divider clock output pin.

**Note:** Pin Type I = Digital Input, O = Digital Output; AI = Analog Input; P = Power Pin; AP = Analog Power

## 6 FUNCTIONAL DESCRIPTION

### 6.1 ARM® Cortex™-M0 Core

The Cortex™-M0 processor is a configurable, multistage, 32-bit RISC processor, which has an AMBA AHB-Lite interface and includes an NVIC component. It also has optional hardware debug functionality. The processor can execute Thumb code and is compatible with other Cortex™-M profile processor. The profile supports two modes -Thread mode and Handler mode. Handler mode is entered as a result of an exception. An exception return can only be issued in Handler mode. Thread mode is entered on Reset, and can be entered as a result of an exception return.

Figure 6-1 shows the functional controller of processor.

Figure 6-1 Functional Controller Diagram

The implemented device provides the following components and features:

- A low gate count processor:
  - ARMv6-M Thumb® instruction set
  - Thumb-2 technology
  - ARMv6-M compliant 24-bit SysTick timer
  - A 32-bit hardware multiplier
  - System interface supported with little-endian data accesses
  - Ability to have deterministic, fixed-latency, interrupt handling
  - Load/store-multiples and multicycle-multiplies that can be abandoned and restarted to facilitate rapid interrupt handling
  - C Application Binary Interface compliant exception model. This is the ARMv6-M, C Application Binary Interface (C-ABI) compliant exception model that enables the use of pure C functions as interrupt handlers
  - Low Power Sleep mode entry using Wait For Interrupt (WFI), Wait For Event (WFE) instructions, or the return from interrupt sleep-on-exit feature

- **NVIC:**
  - 32 external interrupt inputs, each with four levels of priority
  - Dedicated Non-maskable Interrupt (NMI) input
  - Supports for both level-sensitive and pulse-sensitive interrupt lines
  - Supports Wake-up Interrupt Controller (WIC) and, providing Ultra-low Power Sleep mode
- **Debug support**
  - Four hardware breakpoints
  - Two watchpoints
  - Program Counter Sampling Register (PCSR) for non-intrusive code profiling
  - Single step and vector catch capabilities
- **Bus interfaces:**
  - Single 32-bit AMBA-3 AHB-Lite system interface that provides simple integration to all system peripherals and memory
  - Single 32-bit slave port that supports the DAP (Debug Access Port)

## 6.2 System Manager

### 6.2.1 Overview

System management includes the following sections:

- System Resets
- System Memory Map
- System management registers for Part Number ID, chip reset and on-chip controllers reset , multi-functional pin control
- System Timer (SysTick)
- Nested Vectored Interrupt Controller (NVIC)
- System Control registers

### 6.2.2 System Reset

The system reset can be issued by one of the following listed events. For these reset event flags can be read by RSTSRC register.

- Power-on Reset
- Low level on the nRESET pin
- Watchdog Time-out Reset
- Low Voltage Reset
- Brown-out Detector Reset
- CPU Reset
- System Reset

System Reset and Power-on Reset all reset the whole chip including all peripherals. The difference between System Reset and Power-on Reset is external crystal circuit and BS(ISPCON[1]) bit. System Reset does not reset external crystal circuit and BS(ISPCON[1]) bit, but Power-on Reset does.

### 6.2.3 System Power Distribution

In this chip, the power distribution is divided into three segments.

- Analog power from  $AV_{DD}$  and  $AV_{SS}$  provides the power for analog components operation.
- Digital power from  $V_{DD}$  and  $V_{SS}$  supplies the power to the internal regulator which provides a fixed 1.8 V power for digital operation and I/O pins.
- USB transceiver power from  $V_{BUS}$  offers the power for operating the USB transceiver.
- Battery power from  $V_{BAT}$  supplies the RTC and external 32.768 kHz crystal.

The outputs of internal voltage regulators, LDO and  $V_{DD33}$ , require an external capacitor which should be located close to the corresponding pin. Analog power ( $AV_{DD}$ ) should be the same voltage level with the digital power ( $V_{DD}$ ). 錯誤! 找不到參照來源。 Figure 6-2 shows the NuMicro™ NUC230 power distribution, and Figure 6-3 shows the NuMicro™ NUC240 power distribution.

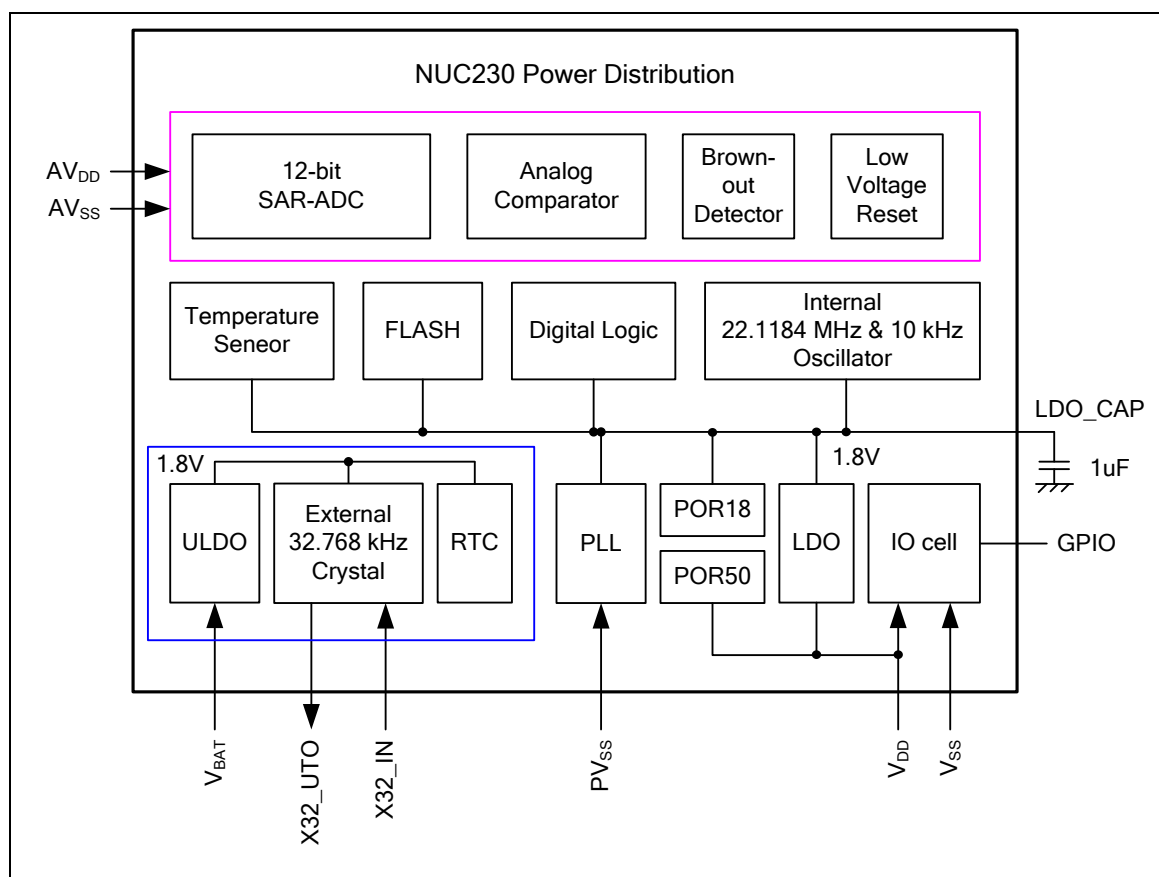

Figure 6-2 NuMicro™ NUC230 Power Distribution Diagram

Figure 6-3 NuMicro™ NUC240 Power Distribution Diagram

## 6.2.4 System Memory Map

The NuMicro™ NUC230/240 series provides 4G-byte addressing space. The memory locations assigned to each on-chip controllers are shown in the following table. The detailed register definition, memory space, and programming detailed will be described in the following sections for each on-chip peripheral. The NuMicro™ NUC230/240 series only supports little-endian data format.

Address Space	Token	Controllers
<b>Flash and SRAM Memory Space</b>		
0x0000_0000 – 0x0001_FFFF	FLASH_BA	FLASH Memory Space (128 KB)
0x2000_0000 – 0x2000_3FFF	SRAM_BA	SRAM Memory Space (16 KB)
<b>AHB Controllers Space (0x5000_0000 – 0x501F_FFFF)</b>		
0x5000_0000 – 0x5000_01FF	GCR_BA	System Global Control Registers
0x5000_0200 – 0x5000_02FF	CLK_BA	Clock Control Registers
0x5000_0300 – 0x5000_03FF	INT_BA	Interrupt Multiplexer Control Registers
0x5000_4000 – 0x5000_7FFF	GPIO_BA	GPIO Control Registers
0x5000_8000 – 0x5000_BFFF	PDMA_BA	Peripheral DMA Control Registers
0x5000_C000 – 0x5000_FFFF	FMC_BA	Flash Memory Control Registers
0x5001_0000 – 0x5001_03FF	EBI_BA	External Bus Interface Control Registers
<b>APB1 Controllers Space (0x4000_0000 ~ 0x400F_FFFF)</b>		
0x4000_4000 – 0x4000_7FFF	WDT_BA	Watchdog Timer Control Registers
0x4000_8000 – 0x4000_BFFF	RTC_BA	Real Time Clock (RTC) Control Register
0x4001_0000 – 0x4001_3FFF	TMR01_BA	Timer0/Timer1 Control Registers
0x4002_0000 – 0x4002_3FFF	I2C0_BA	I <sup>2</sup> C0 Interface Control Registers
0x4003_0000 – 0x4003_3FFF	SPI0_BA	SPI0 with master/slave function Control Registers
0x4003_4000 – 0x4003_7FFF	SPI1_BA	SPI1 with master/slave function Control Registers
0x4004_0000 – 0x4004_3FFF	PWMA_BA	PWM0/1/2/3 Control Registers
0x4005_0000 – 0x4005_3FFF	UART0_BA	UART0 Control Registers
0x4006_0000 – 0x4006_3FFF	USBD_BA	USB 2.0 FS device Controller Registers
0x400D_0000 – 0x400D_3FFF	ACMP_BA	Analog Comparator Control Registers
0x400E_0000 – 0x400E_FFFF	ADC_BA	Analog-Digital-Converter (ADC) Control Registers
<b>APB2 Controllers Space (0x4010_0000 ~ 0x401F_FFFF)</b>		
0x4010_0000 – 0x4010_3FFF	PS2_BA	PS/2 Interface Control Registers
0x4011_0000 – 0x4011_3FFF	TMR23_BA	Timer2/Timer3 Control Registers
0x4012_0000 – 0x4012_3FFF	I2C1_BA	I <sup>2</sup> C1 Interface Control Registers
0x4013_0000 – 0x4013_3FFF	SPI2_BA	SPI2 with master/slave function Control Registers
0x4013_4000 – 0x4013_7FFF	SPI3_BA	SPI3 with master/slave function Control Registers

0x4014_0000 – 0x4014_3FFF	PWMB_BA	PWM4/5/6/7 Control Registers
0x4015_0000 – 0x4015_3FFF	UART1_BA	UART1 Control Registers
0x4015_4000 – 0x4015_7FFF	UART2_BA	UART2 Control Registers
0x4018_0000 – 0x4018_3FFF	CAN0_BA	CAN0 Bus Control Registers
0x4018_4000 – 0x4018_7FFF	CAN1_BA	CAN1 Bus Control Registers
0x4019_0000 – 0x4019_3FFF	SC0_BA	SC0 Control Registers
0x4019_4000 – 0x4019_7FFF	SC1_BA	SC1 Control Registers
0x4019_8000 – 0x4019_BFFF	SC2_BA	SC2 Control Registers
0x401A_0000 – 0x401A_3FFF	I2S_BA	I <sup>2</sup> S Interface Control Registers
<b>System Controllers Space (0xE000_E000 ~ 0xE000_EFFF)</b>		
0xE000_E010 – 0xE000_E0FF	SCS_BA	System Timer Control Registers
0xE000_E100 – 0xE000_ECFF	SCS_BA	External Interrupt Controller Control Registers
0xE000_ED00 – 0xE000_ED8F	SCS_BA	System Control Registers

Table 6-1 Address Space Assignments for On-Chip Controllers

## 6.2.5 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
GCR Base Address: GCR_BA = 0x5000_0000				
PDID	GCR_BA+0x00	R	Part Device Identification Number Register	0x2014_0018 <sup>[1]</sup>

IRCTRMINT	GCR_BA+0x88	R/W	IRC Trim Interrupt Status Register	0x0000_0000
REGWRPROT	GCR_BA+0x100	R/W	Register Write Protection Register	0x0000_0000

Note: [1] It depends on the part number.

## 6.2.6 Register Description

### Part Device ID Code Register (PDID)

Register	Offset	R/W	Description	Reset Value
PDID	GCR_BA+0x00	R	Part Device Identification Number Register	0x2014_0018 <sup>[1]</sup>

[1] Each part number has a unique default reset value.

31	30	29	28	27	26	25	24
PDID[31:24]							
23	22	21	20	19	18	17	16
PDID[23:16]							
15	14	13	12	11	10	9	8
PDID[15:8]							
7	6	5	4	3	2	1	0
PDID[7:0]							

Bits	Description
[31:0]	<b>PDID</b> <b>Part Device Identification Number</b> This register reflects device part number code. Software can read this register to identify which device is used.

### System Reset Source Register (RSTSRC)

This register provides specific information for software to identify this chip's reset source from last operation.

Register	Offset	R/W	Description	Reset Value
RSTSRC	GCR_BA+0x04	R/W	System Reset Source Register	0x0000_00XX

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
RSTS_CPU	Reserved	RSTS_SYS	RSTS_BOD	RSTS_LVR	RSTS_WDT	RSTS_RESET	RSTS_POR

Bits	Description	
[31:8]	Reserved	Reserved.
[7]	RSTS_CPU	<b>CPU Reset Flag</b> The RSTS_CPU flag is set by hardware if software writes CPU_RST (IPRSTC1[1]) 1 To reset Cortex™-M0 kernel and flash memory controller (FMC). 0 = No reset from CPU. 1 = Cortex™-M0 CPU kernel and FMC are reset by software setting CPU_RST(IPRSTC1[1]) to 1. <b>Note:</b> Write 1 to clear this bit to 0.
[6]	Reserved	Reserved.
[5]	RSTS_SYS	<b>SYS Reset Flag</b> The RSTS_SYS flag is set by the "Reset Signal" from the Cortex™-M0 kernel to indicate the previous reset source. 0 = No reset from Cortex™-M0. 1 = The Cortex™-M0 had issued the reset signal to reset the system by writing 1 to bit SYSRESETREQ (AIRC[2], Application Interrupt and Reset Control Register, address = 0xE00ED0C) in system control registers of Cortex™-M0 kernel. <b>Note:</b> Write 1 to clear this bit to 0.
[4]	RSTS_BOD	<b>Brown-Out Detector Reset Flag</b> The RSTS_BOD flag is set by the "Reset Signal" from the Brown-Out Detector to indicate the previous reset source. 0 = No reset from BOD. 1 = The BOD had issued the reset signal to reset the system. <b>Note:</b> Write 1 to clear this bit to 0.
[3]	RSTS_LVR	<b>Low Voltage Reset Flag</b> The RSTS_LVR flag is set by the "Reset Signal" from the Low-Voltage-Reset controller to indicate the previous reset source.

		<p>0 = No reset from LVR.  1 = The LVR controller had issued the reset signal to reset the system.  <b>Note:</b> Write 1 to clear this bit to 0.</p>
[2]	RSTS_WDT	<p><b>Watchdog Timer Reset Flag</b>  The RSTS_WDT flag is set by the "Reset Signal" from the watchdog timer or window watchdog timer to indicate the previous reset source.  0 = No reset from watchdog timer or window watchdog timer.  1 = The watchdog timer or window watchdog timer had issued the reset signal to reset the system.  <b>Note1:</b> Write 1 to clear this bit to 0.  <b>Note2:</b> Watchdog Timer register WTRF(WTCR[2]) bit is set if the system has been reset by WDT time-out reset. Window Watchdog Timer register WWDTRF(WWDTSR) bit is set if the system has been reset by WWDT time-out reset.</p>
[1]	RSTS_RESET	<p><b>Reset Pin Reset Flag</b>  The RSTS_RESET flag is set by the "Reset Signal" from the nRESET Pin to indicate the previous reset source  0 = No reset from nRESET pin.  1 = The Pin nRESET had issued the reset signal to reset the system.  <b>Note:</b> Write 1 to clear this bit to 0.</p>
[0]	RSTS_POR	<p><b>Power-On Reset Flag</b>  The RSTS_POR Flag is set by the "Reset Signal" from the Power-On Reset (POR) controller or bit CHIP_RST (IPRSTC1[0]) to indicate the previous reset source  0 = No reset from POR or CHIP_RST (IPRSTC1[0]).  1 = Power-on Reset (POR) or CHIP_RST (IPRSTC1[0]) had issued the reset signal to reset the system.  <b>Note:</b> Write 1 to clear this bit to 0.</p>

### Peripheral Reset Control Register 1 (IPRSTC1)

Register	Offset	R/W	Description	Reset Value
IPRSTC1	GCR_BA+0x08	R/W	Peripheral Reset Control Register 1	0x0000_0000

31	30	29	28	27	26	25	24

23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved				EBI_RST	PDMA_RST	CPU_RST	CHIP_RST

Bits	Description
[31:4]	<b>Reserved</b> Reserved.
[3]	<b>EBI_RST</b> <b>EBI Controller Reset (Write-protection Bit)</b> Set this bit to 1 will generate a reset signal to the EBI. User need to set this bit to 0 to release from the reset state. This bit is the protected bit, It means programming this bit needs to write "59h", "16h", "88h" to address 0x5000_0100 to disable register protection. Refer to the register REGWRPROT at address GCR_BA+0x100 1 = EBI controller reset 0 = EBI controller normal operation
[2]	<b>PDMA_RST</b> <b>PDMA Controller Reset (Write Protect)</b> Setting this bit to 1 will generate a reset signal to the PDMA. User needs to set this bit to 0 to release from reset state. 0 = PDMA controller normal operation. 1 = PDMA controller reset. <b>Note1:</b> This bit is the protected bit, and programming it needs to write "59h", "16h", and "88h" to address 0x5000_0100 to disable register protection. Refer to the register REGWRPROT at address GCR_BA+0x100. <b>Note2:</b> Setting PDMA_RST bit to 1 will generate asynchronous reset signal to PDMA module. Users need to set PDMA_RST to 0 to release PDMA module from reset state.
[1]	<b>CPU_RST</b> <b>CPU Kernel One-Shot Reset (Write Protect)</b> Setting this bit will only reset the CPU kernel and Flash Memory Controller(FMC), and this bit will automatically return 0 after the two clock cycles 0 = CPU normal operation. 1 = CPU one-shot reset. <b>Note:</b> This bit is the protected bit, and programming it needs to write "59h", "16h", and "88h" to address 0x5000_0100 to disable register protection. Refer to the register REGWRPROT at address GCR_BA+0x100.
[0]	<b>CHIP_RST</b> <b>CHIP One-Shot Reset (Write Protect)</b> Setting this bit will reset the whole chip, including CPU kernel and all peripherals, and this bit will automatically return to 0 after the 2 clock cycles.

		<p>The CHIP_RST is the same as the POR reset, all the chip controllers are reset and the chip setting from flash are also reload.</p> <p>For the difference between CHIP_RST and SYSRESETREQ, please refer to section 5.2.2</p> <p>0 = CHIP normal operation.</p> <p>1 = CHIP one-shot reset.</p> <p><b>Note:</b> This bit is the protected bit, and programming it needs to write "59h", "16h", and "88h" to address 0x5000_0100 to disable register protection. Refer to the register REGWRPROT at address GCR_BA+0x100.</p>

[0]	SC0_RST	<b>SC0 Controller Reset</b> 0 = SC0 controller normal operation. 1 = SC0 controller reset.

### Brown-out Detector Control Register (BODCR)

Partial of the BODCR control registers values are initiated by the flash configuration and partial bits are write-protected bit. Programming write-protected bits needs to write “59h”, “16h”, “88h” to address 0x5000\_0100 to disable register protection. Refer to the register REGWRPROT at address GCR\_BA+0x100.

Register	Offset	R/W	Description	Reset Value
BODCR	GCR_BA+0x18	R/W	Brown-out Detector Control Register	0x0000_008X

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
LVR_EN	BOD_OUT	BOD_LPM	BOD_INTF	BOD_RSTEN	BOD_VL		BOD_EN

Bits	Description
[31:8]	Reserved
[7]	<p><b>Low Voltage Reset Enable Bit (Write Protect)</b></p> <p>The LVR function reset the chip when the input power voltage is lower than LVR circuit setting. LVR function is enabled by default.</p> <p>0 = Low Voltage Reset function Disabled.</p> <p>1 = Low Voltage Reset function Enabled – After enabling the bit, the LVR function will be active with 100us delay for LVR output stable (default).</p> <p><b>Note:</b> This bit is the protected bit, and programming it needs to write “59h”, “16h”, and “88h” to address 0x5000_0100 to disable register protection. Refer to the register REGWRPROT at address GCR_BA+0x100.</p>
[6]	<p><b>Brown-Out Detector Output Status</b></p> <p>0 = Brown-out Detector output status is 0. It means the detected voltage is higher than BOD_VL setting or BOD_EN is 0.</p> <p>1 = Brown-out Detector output status is 1. It means the detected voltage is lower than BOD_VL setting. If the BOD_EN is 0, BOD function disabled, this bit always responds to 0.</p>
[5]	<p><b>Brown-Out Detector Low Power Mode (Write Protect)</b></p> <p>0 = BOD operated in Normal mode (default).</p> <p>1 = BOD Low Power mode Enabled.</p> <p><b>Note1:</b> The BOD consumes about 100 uA in Normal mode, and the low power mode can reduce the current to about 1/10 but slow the BOD response.</p> <p><b>Note2:</b> This bit is the protected bit, and programming it needs to write “59h”, “16h”, and “88h” to address 0x5000_0100 to disable register protection. Refer to the register REGWRPROT at address GCR_BA+0x100.</p>
[4]	<p><b>Brown-Out Detector Interrupt Flag</b></p> <p>0 = Brown-out Detector does not detect any voltage draft at V<sub>DD</sub> down through or up through the voltage of BOD_VL setting.</p>

		<p>1 = When Brown-out Detector detects the <math>V_{DD}</math> is dropped down through the voltage of BOD_VL setting or the <math>V_{DD}</math> is raised up through the voltage of BOD_VL setting, this bit is set to 1 and the Brown-out interrupt is requested if Brown-out interrupt is enabled.</p> <p><b>Note:</b> Write 1 to clear this bit to 0.</p>
[3]	BOD_RSTEN	<p><b>Brown-Out Reset Enable Bit (Write Protect)</b></p> <p>0 = Brown-out "INTERRUPT" function Enabled.</p> <p>1 = Brown-out "RESET" function Enabled.</p> <p>While the Brown-out Detector function is enabled (BOD_EN high) and BOD reset function is enabled (BOD_RSTEN high), BOD will assert a signal to reset chip when the detected voltage is lower than the threshold (BOD_OUT high).</p> <p><b>Note1:</b> While the BOD function is enabled (BOD_EN high) and BOD interrupt function is enabled (BOD_RSTEN low), BOD will assert an interrupt if BOD_OUT is high. BOD interrupt will keep till to the BOD_EN set to 0. BOD interrupt can be blocked by disabling the NVIC BOD interrupt or disabling BOD function (set BOD_EN low).</p> <p><b>Note2:</b> The default value is set by flash controller user configuration register CBORST(CONFIG0[20]) bit.</p> <p><b>Note3:</b> This bit is the protected bit. It means programming this needs to write "59h", "16h", "88h" to address 0x5000_0100 to disable register protection. Refer to the register REGWRPROT at address GCR_BA+0x100.</p>
[2:1]	BOD_VL	<p><b>Brown-Out Detector Threshold Voltage Selection (Write Protect)</b></p> <p>The default value is set by flash memory controller user configuration register CBOV(CONFIG0[22:21]) bit.</p> <p>00 = Brown-out voltage is 2.2V.</p> <p>01 = Brown-out voltage is 2.7V.</p> <p>10 = Brown-out voltage is 3.7V.</p> <p>11 = Brown-out voltage is 4.4V.</p> <p><b>Note:</b> This bit is the protected bit. It means programming this needs to write "59h", "16h", "88h" to address 0x5000_0100 to disable register protection. Refer to the register REGWRPROT at address GCR_BA+0x100.</p>
[0]	BOD_EN	<p><b>Brown-Out Detector Enable Bit (Write Protect)</b></p> <p>The default value is set by flash memory controller user configuration register CBODEN(CONFIG0[23]) bit.</p> <p>0 = Brown-out Detector function Disabled.</p> <p>1 = Brown-out Detector function Enabled.</p> <p><b>Note:</b> This bit is the protected bit. It means programming this needs to write "59h", "16h", "88h" to address 0x5000_0100 to disable register protection. Refer to the register REGWRPROT at address GCR_BA+0x100.</p>

[31:16]	<b>GPB_TYPEn</b> <b>Trigger Function Selection</b> 0 = GPIOB[15:0] I/O input Schmitt Trigger function Disabled. 1 = GPIOB[15:0] I/O input Schmitt Trigger function Enabled.
[15]	<b>GPB_MFP15</b> <b>PB.15 Pin Function Selection</b> Bits PB14_15_EBI (ALT_MFP2[1]), PB15_T0EX (ALT_MFP[24]), PB15_TM0 (ALT_MFP2[2]) and GPB_MFP[15] determine the PB.15 function. (PB14_15_EBI, PB15_T0EX, PB15_TM0, GPB_MFP15) value and function mapping is as following list. (0, 0, 0, 0) = GPIO function is selected. (0, 0, 0, 1) = INT1 function is selected. (0, 0, 1, 1) = TM0 function is selected. (0, 1, 0, 1) = TM0_EXT function is selected. (1, 0, 0, 1) = AD6 function is selected.
[14]	<b>GPB_MFP14</b> <b>PB.14 Pin Function Selection</b> Bits PB14_15_EBI (ALT_MFP2[1]), PB14_S31 (ALT_MFP[3]) and GPB_MFP[14] determine the PB.14 function. (PB14_15_EBI, PB14_S31, GPB_MFP14) value and function mapping is as following list (0, 0, 0) = GPIO function is selected. (0, 0, 1) = INT0 function is selected. (0, 1, 1) = SPI3_SS1 function is selected. (1, 0, 1) = AD0 function is selected.
[13]	<b>GPB_MFP13</b> <b>PB.13 Pin Function Selection</b> Bit EBI_EN (ALT_MFP[11]), GPB_MFP[13] determines the PB.13 function. (EBI_EN, GPB_MFP13) value and function mapping is as following list (0, 0) = GPIO function is selected to the pin PB.13. (0, 1) = ACMP1_O function is selected to the pin PB.13. (1, 1) = AD1 function is selected.
[12]	<b>GPB_MFP12</b> Reserved

[11]	GPB_MFP11	<b>PB.11 Pin Function Selection</b> Bits PB11_PWM4 (ALT_MFP[4]) and GPB_MFP[11] determine the PB.11 function. (PB11_PWM4, GPB_MFP11) value and function mapping is as following list. (0, 0) = GPIO function is selected. (0, 1) = TM3 function is selected. (1, 1) = PWM4 function is selected.
[10]	GPB_MFP10	<b>PB.10 Pin Function Selection</b> Bits PB10_S01 (ALT_MFP[0]) and GPB_MFP[10] determine the PB.10 function. (PB10_S01, GPB_MFP10) value and function mapping is as following list. (0, 0) = GPIO function is selected. (0, 1) = TM2 function is selected. (1, 1) = SPI0_SS1 function is selected.
[9]	GPB_MFP9	<b>PB.9 Pin Function Selection</b> Bits PB9_S11 (ALT_MFP[1]) and GPB_MFP[9] determine the PB.9 function. (PB9_S11, GPB_MFP9) value and function mapping is as following list. (0, 0) = GPIO function is selected. (0, 1) = TM1 function is selected. (1, 1) = SPI1_SS1 function is selected.
[8]	GPB_MFP8	<b>PB.8 Pin Function Selection</b> Bits PB8_CLKO (ALT_MFP[29]) and GPB_MFP[8] determine the PB.8 function. (PB8_CLKO, GPB_MFP8) value and function mapping is as following list. (0, 0) = GPIO function is selected. (0, 1) = TM0 function is selected to the pin PB.8. (1, 1) = CLKO function is selected to the pin PB.8.
[7]	GPB_MFP7	<b>PB.7 Pin Function Selection</b> Bit EBI_EN (ALT_MFP[11]), GPB_MFP[7] determines the PB.7 function. (EBI_EN, GPB_MFP7) value and function mapping is as following list. (0, 0) = GPIO function is selected to the pin PB.7. (0, 1) = UART1_nCTS function is selected to the pin PB.7. (1, 1) = nCS(EBI) function is selected to the pin PB.7.
[6]	GPB_MFP6	<b>PB.6 Pin Function Selection</b> Bit EBI_EN (ALT_MFP[11]), GPB_MFP[6] determines the PB.6 function. (EBI_EN, GPB_MFP6) value and function mapping is as following list. (0, 0) = GPIO function is selected to the pin PB.6. (0, 1) = UART1_nRTS function is selected to the pin PB.6. (1, 1) = ALE(EBI) function is selected to the pin PB.6.
[5]	GPB_MFP5	<b>PB 5 Pin Function Selection</b> Bit GPB_MFP[5] determines the PB.5 function. 0 = GPIO function is selected to the pin PB.5. 1 = UART1_TXD function is selected to the pin PB.5.
[4]	GPB_MFP4	<b>PB.4 Pin Function Selection</b> Bit GPB_MFP[4] determines the PB.4 function. 0 = GPIO function is selected to the pin PB.4. 1 = UART1_RXD function is selected to the pin PB.4.
[3]	GPB_MFP3	<b>PB.3 Pin Function Selection</b> Bits EBI_nWRH_EN (ALT_MFP[14]), EBI_EN (ALT_MFP[11]), PB3_TM3 (ALT_MFP2[5]),

		<p>PB3_SC2CD (ALT_MFP1[14]), PB3_T3EX (ALT_MFP[27]) and GPB_MFP[3] determine the PB.3 function.</p> <p>(EBI_nWRH_EN, EBI_EN, PB3_TM3, PB3_SC2CD, PB3_T3EX, GPB_MFP3) value and function mapping is as following list.</p> <p>(0, 0, 0, 0, 0, 0) = GPIO function is selected.</p> <p>(0, 0, 0, 0, 0, 1) = UART0_nCTS function is selected.</p> <p>(0, 0, 0, 0, 1, 1) = TM3_EXT function is selected.</p> <p>(0, 0, 0, 1, 0, 1) = SC2_CD function is selected.</p> <p>(0, 0, 1, 0, 0, 1) = TM3 function is selected.</p> <p>(1, 1, 0, 0, 0, 1) = nWRH(EBI) function is selected.</p>

[31:16]	GPC_TYPEn	<b>Trigger Function Selection</b> 0 = GPIOC[15:0] I/O input Schmitt Trigger function Disabled. 1 = GPIOC[15:0] I/O input Schmitt Trigger function Enabled.
[15]	GPC_MFP15	<b>PC.15 Pin Function Selection</b> Bits EBI_EN (ALT_MFP[11]) and GPC_MFP[15] determine the PC.15 function. (EBI_EN, GPC_MFP15) value and function mapping is as following list (0, 0) = GPIO function is selected. (0, 1) = ACMP1_N function is selected. (1, 1) = AD3 function is selected.
[14]	GPC_MFP14	<b>PC.14 Pin Function Selection</b> Bits EBI_EN (ALT_MFP[11]) and GPC_MFP[14] determine the PC.14 function. (EBI_EN, GPC_MFP14) value and function mapping is as following list (0, 0) = GPIO function is selected. (0, 1) = ACMP1_P function is selected. (1, 1) = AD2 function is selected.
[13]	GPC_MFP13	<b>PC.13 Pin Function Selection</b> Bit GPC_MFP[13] determines the PC.13 function. 0 = GPIO function is selected to the pin PC.13. 1 = SPI1_MOSI1 function is selected to the pin PC.13.
[12]	GPC_MFP12	<b>PC.12 Pin Function Selection</b> Bit GPC_MFP[12] determines the PC.12 function. 0 = GPIO function is selected to the pin PC.12. 1 = SPI1_MISO1 function is selected to the pin PC.12.
[11]	GPC_MFP11	<b>PC.11 Pin Function Selection</b> Bit GPC_MFP[11] determines the PC.11 function. 0 = GPIO function is selected to the pin PC.11. 1 = SPI1_MOSI0 function is selected to the pin PC.11.

[10]	GPC_MFP10	<b>PC.10 Pin Function Selection</b> Bit GPC_MFP[10] determines the PC.10 function. 0 = GPIO function is selected to the pin PC.10. 1 = SPI1_MISO0 function is selected to the pin PC.10.
[9]	GPC_MFP9	<b>PC.9 Pin Function Selection</b> Bit GPC_MFP[9] determines the PC.9 function. 0 = GPIO function is selected to the pin PC.9. 1 = SPI1_CLK function is selected to the pin PC.9.
[8]	GPC_MFP8	<b>PC.8 Pin Function Selection</b> Bits EBI_MCLK_EN (ALT_MFP[12]), EBI_EN (ALT_MFP[11]), GPC_MFP[8] determine the PC.8 function. (EBI_MCLK_EN, EBI_EN, GPC_MFP8) value and function mapping is as following list. (0, 0, 0) = GPIO function is selected to the pin PC.8. (0, 0, 1) = SPI1_SS0 function is selected to the pin PC.8. (1, 1, 1) = MCLK(EBI) function is selected to the pin PC.8.
[7]	GPC_MFP7	<b>PC.7 Pin Function Selection</b> Bits EBI_EN (ALT_MFP[11]), PC7_SC1CD (ALT_MFP1[9]) and GPC_MFP[7] determine the PC.7 function. (EBI_EN, PC7_SC1CD, GPC_MFP7) value and function mapping is as following list. (0, 0, 0) = GPIO function is selected. (0, 0, 1) = ACMP0_N function is selected. (0, 1, 1) = SC1_CD function is selected. (1, 0, 1) = AD5 function is selected.
[6]	GPC_MFP6	<b>PC.6 Pin Function Selection</b> Bits EBI_EN (ALT_MFP[11]), PC6_SC0CD (ALT_MFP1[4]) and GPC_MFP[6] determine the PC.6 function. (EBI_EN, PC6_SC0CD, GPC_MFP6) value and function mapping is as following list. (0, 0, 0) = GPIO function is selected. (0, 0, 1) = ACMP0_P function is selected. (0, 1, 1) = SC0_CD function is selected. (1, 0, 1) = AD4 function is selected.
[5]	GPC_MFP5	<b>PC.5 Pin Function Selection</b> Bit GPC_MFP[5] determines the PC.5 function. 0 = GPIO function is selected to the pin PC.5. 1 = SPI0_MOSI1 function is selected to the pin PC.5.
[4]	GPC_MFP4	<b>PC.4 Pin Function Selection</b> Bit GPC_MFP[4] determines the PC.4 function. 0 = GPIO function is selected to the pin PC.4. 1 = SPI0_MISO1 function is selected to the pin PC.4.
[3]	GPC_MFP3	<b>PC.3 Pin Function Selection</b> Bits PC3_I2SDO (ALT_MFP[8]) and GPC_MFP[3] determine the PC.3 function. (PC3_I2SDO, GPC_MFP3) value and function mapping is as following list. (0, 0) = GPIO function is selected. (0, 1) = SPI0_MOSI0 function is selected. (1, 1) = I2S_DO function is selected.

[2]	GPC_MFP2	<b>PC.2 Pin Function Selection</b> Bits PC2_I2SDI (ALT_MFP[7]) and GPC_MFP[2] determine the PC.2 function. (PC2_I2SDI, GPC_MFP2) value and function mapping is as following list. (0, 0) = GPIO function is selected. (0, 1) = SPI0_MISO0 function is selected. (1, 1) = I2S_DI function is selected.
[1]	GPC_MFP1	<b>PC.1 Pin Function Selection</b> Bits PC1_I2SBCLK (ALT_MFP[6]) and GPC_MFP[1] determine the PC.1 function. (PC1_I2SBCLK, GPC_MFP1) value and function mapping is as following list. (0, 0) = GPIO function is selected. (0, 1) = SPI0_CLK function is selected. (1, 1) = I2S_BCLK function is selected.
[0]	GPC_MFP0	<b>PC.0 Pin Function Selection</b> Bits PC0_I2SLRCLK (ALT_MFP[5]) and GPC_MFP[0] determine the PC.0 function. (PC0_I2SLRCLK, GPC_MFP0) value and function mapping is as following list. (0, 0) = GPIO function is selected. (0, 1) = SPI0_SS0 function is selected. (1, 1) = I2S_LRCLK function is selected.

Bits	Description
[31]	Reserved
[30]	<b>PB.2 Pin Alternative Function Selection</b> Bits PB2_TM2 (ALT_MFP[4]), PB2_CPO0 (ALT_MFP[30]), PB2_T2EX (ALT_MFP[26]) and GPB_MFP[2] determine the PB.2 function. (PB2_TM2, PB2_CPO0, PB2_T2EX, GPB_MFP2) value and function mapping is as following list. (0, 0, 0, 0) = GPIO function is selected. (0, 0, 0, 1) = UART0_nRTS function is selected. (0, 0, 1, 1) = TM2_EXT function is selected. (0, 1, 0, 1) = ACMP0_O function is selected. (1, 0, 0, 1) = TM2 function is selected.
[29]	<b>PB.8 Pin Alternative Function Selection</b> Bits PB8_CLKO (ALT_MFP[29]) and GPB_MFP[8] determine the PB.8 function. (PB8_CLKO, GPB_MFP8) value and function mapping is as following list. (0, 0) = GPIO function is selected. (0, 1) = TM0 function is selected to the pin PB.8. (1, 1) = CLKO function is selected to the pin PB.8.

[28]	PA10_11_CAN1	<p><b>PA.10 And PA.11 Pin Alternative Function Selection</b></p> <p>Bits PA10_11_CAN1 (ALT_MFP[28]) and GPA_MFP[11] determine the PA.11 function. (PA10_11_CAN1, GPA_MFP11) value and function mapping is as following list.</p> <p>(0, 0) = GPIO function is selected.</p> <p>(0, 1) = I2C1_SCL function is selected.</p> <p>(1, 1) = CAN1_RXD function is selected.</p> <p>Bits PA10_11_CAN1 (ALT_MFP[28]) and GPA_MFP[10] determine the PA.10 function. (PA10_11_CAN1, GPA_MFP10) value and function mapping is as following list.</p> <p>(0, 0) = GPIO function is selected.</p> <p>(0, 1) = I2C1_SDA function is selected.</p> <p>(1, 1) = CAN1_TXD function is selected.</p>
[27]	PB3_T3EX	<p><b>PB.3 Pin Alternative Function Selection</b></p> <p>Bits PB3_TM3 (ALT_MFP[5]), PB3_SC2CD (ALT_MFP1[14]), PB3_T3EX (ALT_MFP[27]) and GPB_MFP[3] determine the PB.3 function. (PB3_TM3, PB3_SC2CD, PB3_T3EX, GPB_MFP3) value and function mapping is as following list.</p> <p>(0, 0, 0, 0) = GPIO function is selected.</p> <p>(0, 0, 0, 1) = UART0_nCTS function is selected.</p> <p>(0, 0, 1, 1) = TM3_EXT function is selected.</p> <p>(0, 1, 0, 1) = SC2_CD function is selected.</p> <p>(1, 0, 0, 1) = TM3 function is selected.</p>
[26]	PB2_T2EX	<p><b>PB.2 Pin Alternative Function Selection</b></p> <p>Bits PB2_TM2 (ALT_MFP[4]), PB2_CPO0 (ALT_MFP[30]), PB2_T2EX (ALT_MFP[26]) and GPB_MFP[2] determine the PB.2 function. (PB2_TM2, PB2_CPO0, PB2_T2EX, GPB_MFP2) value and function mapping is as following list.</p> <p>(0, 0, 0, 0) = GPIO function is selected.</p> <p>(0, 0, 0, 1) = UART0_nRTS function is selected.</p> <p>(0, 0, 1, 1) = TM2_EXT function is selected.</p> <p>(0, 1, 0, 1) = ACMP0_O function is selected.</p> <p>(1, 0, 0, 1) = TM2 function is selected.</p>
[25]	PE5_T1EX	<p><b>PE.5 Pin Alternative Function Selection</b></p> <p>Bits PE5_T1EX (ALT_MFP[25]), PE5_TM1 (ALT_MFP2[3]) and GPE_MFP5 determine the PE.5 function. (PE5_T1EX, PE5_TM1, GPE_MFP5) value and function mapping is as following list.</p> <p>(0, 0, 0) = GPIO function is selected.</p> <p>(0, 0, 1) = PWM5 function is selected.</p> <p>(1, 0, 1) = TM1_EXT function is selected.</p> <p>(0, 1, 1) = TM1 function is selected.</p>
[24]	PB15_T0EX	<p><b>PB.15 Pin Alternative Function Selection</b></p> <p>Bits PB14_15_EBI (ALT_MFP2[1]), PB15_T0EX (ALT_MFP[24]), PB15_TM0 (ALT_MFP2[2]) and GPB_MFP[15] determine the PB.15 function. (PB14_15_EBI, PB15_T0EX, PB15_TM0, GPB_MFP15) value and function mapping is as following list.</p> <p>(0, 0, 0, 0) = GPIO function is selected.</p> <p>(0, 0, 0, 1) = INT1 function is selected.</p> <p>(0, 0, 1, 1) = TM0 function is selected.</p> <p>(0, 1, 0, 1) = TM0_EXT function is selected.</p> <p>(1, 0, 0, 1) = AD6 function is selected.</p>

[23]	<b>EBI_HB_EN[7]</b>	<p>Bits EBI_HB_EN[7] (ALT_MFP[23]), EBI_EN (ALT_MFP[11]), PA14_SC2RST (ALT_MFP1[13]) and GPA_MFP[14] determine the PA.14 function.</p> <p>(EBI_HB_EN, EBI_EN, PA14_SC2RST, GPA_MFP14) value and function mapping is as following list.</p> <p>(0, 0, 0, 0) = GPIO function is selected.</p> <p>(0, 0, 0, 1) = PWM2 function is selected.</p> <p>(0, 0, 1, 1) = SC2_RST function is selected.</p> <p>(1, 1, 0, 1) = AD15 function is selected.</p>
[22]	<b>EBI_HB_EN[6]</b>	<p>Bits EBI_HB_EN[6] (ALT_MFP[22]), EBI_EN (ALT_MFP[11]), PA13_SC2CLK (ALT_MFP1[10]) and GPA_MFP[13] determine the PA.13 function.</p> <p>(EBI_HB_EN, EBI_EN, PA13_SC2CLK, GPA_MFP13) value and function mapping is as following list.</p> <p>(0, 0, 0, 0) = GPIO function is selected.</p> <p>(0, 0, 0, 1) = PWM1 function is selected.</p> <p>(0, 0, 1, 1) = SC2_CLK/UART5_TXD function is selected.</p> <p>(1, 1, 0, 1) = AD14 function is selected.</p>
[21]	<b>EBI_HB_EN[5]</b>	<p>Bits EBI_HB_EN[5] (ALT_MFP[21]), EBI_EN (ALT_MFP[11]), PA12_SC2DAT (ALT_MFP1[11]) and GPA_MFP[12] determine the PA.12 function.</p> <p>(EBI_HB_EN, EBI_EN, PA12_SC2DAT, GPA_MFP12) value and function mapping is as following list.</p> <p>(0, 0, 0, 0) = GPIO function is selected.</p> <p>(0, 0, 0, 1) = PWM0 function is selected.</p> <p>(0, 0, 1, 1) = SC2_DAT/UART5_RXD function is selected.</p> <p>(1, 1, 0, 1) = AD13 function is selected.</p>
[20]	<b>EBI_HB_EN[4]</b>	<p>Bit EBI_HB_EN[4] (ALT_MFP[20]), EBI_EN (ALT_MFP[11]), PA1_SC0RST (ALT_MFP1[3]) and GPA_MFP[1] determine the PA.1 function.</p> <p>(EBI_HB_EN, EBI_EN, PA1_SC0RST, GPA_MFP1) value and function mapping is as following list.</p> <p>(0, 0, 0, 0) = GPIO function is selected.</p> <p>(0, 0, 0, 1) = ADC1 function is selected.</p> <p>(0, 0, 1, 1) = SC0_RST function is selected.</p> <p>(1, 1, 0, 1) = AD12 function is selected.</p>
[19]	<b>EBI_HB_EN[3]</b>	<p>Bits EBI_HB_EN[3] (ALT_MFP[19]), EBI_EN (ALT_MFP[11]), PA2_SC0CLK (ALT_MFP1[0]) and GPA_MFP[2] determine the PA.2 function.</p> <p>(EBI_HB_EN, EBI_EN, PA2_SC0CLK, GPA_MFP2) value and function mapping is as following list.</p> <p>(0, 0, 0, 0) = GPIO function is selected.</p> <p>(0, 0, 0, 1) = ADC2 function is selected.</p> <p>(0, 0, 1, 1) = SC0_CLK/UART3_TXD function is selected.</p> <p>(1, 1, 0, 1) = AD11 function is selected.</p>
[18]	<b>EBI_HB_EN[2]</b>	<p>Bits EBI_HB_EN[2] (ALT_MFP[18]), EBI_EN (ALT_MFP[11]), PA3_SC0DAT (ALT_MFP1[1]) and GPA_MFP[3] determine the PA.3 function.</p> <p>(EBI_HB_EN, EBI_EN, PA3_SC0DAT, GPA_MFP3) value and function mapping is as following list.</p> <p>(0, 0, 0, 0) = GPIO function is selected.</p> <p>(0, 0, 0, 1) = ADC3 function is selected.</p> <p>(0, 0, 1, 1) = SC0_DAT/UART3_RXD function is selected.</p> <p>(1, 1, 0, 1) = AD10 function is selected.</p>

[17]	<b>EBI_HB_EN[1]</b>	<p>Bits EBI_HB_EN[1] (ALT_MFP[17]), EBI_EN (ALT_MFP[11]), PA4_SC1PWR (ALT_MFP[7]) and GPA_MFP[4] determine the PA.4 function.</p> <p>(EBI_HB_EN, EBI_EN, PA4_SC1PWR, GPA_MFP4) value and function mapping is as following list.</p> <p>(0, 0, 0, 0) = GPIO function is selected.</p> <p>(0, 0, 0, 1) = ADC4 function is selected.</p> <p>(0, 0, 1, 1) = SC1_PWR function is selected.</p> <p>(1, 1, 0, 1) = AD9 function is selected.</p>
[16]	<b>EBI_HB_EN[0]</b>	<p>Bits EBI_HB_EN[0] (ALT_MFP[16]), EBI_EN (ALT_MFP[11]), PA5_SC1RST (ALT_MFP[8]) and GPA_MFP[5] determine the PA.5 function.</p> <p>(EBI_HB_EN, EBI_EN, PA5_SC1RST, GPA_MFP5) value and function mapping is as following list,</p> <p>(0, 0, 0, 0) = GPIO function is selected.</p> <p>(0, 0, 0, 1) = ADC5 function is selected.</p> <p>(0, 0, 1, 1) = SC1_RST function is selected.</p> <p>(1, 1, 0, 1) = AD8 function is selected.</p>
[15]	<b>Reserved</b>	Reserved
[14]	<b>EBI_nWRH_EN</b>	<p>Bits EBI_nWRH_EN (ALT_MFP[14]), EBI_EN (ALT_MFP[11]), PB3_TM3 (ALT_MFP[25]), PB3_SC2CD (ALT_MFP[14]), PB3_T3EX (ALT_MFP[27]) and GPB_MFP[3] determine the PB.3 function.</p> <p>(EBI_nWRH_EN, EBI_EN, PB3_TM3, PB3_SC2CD, PB3_T3EX, GPB_MFP3) value and function mapping is as following list.</p> <p>(0, 0, 0, 0, 0, 0) = GPIO function is selected.</p> <p>(0, 0, 0, 0, 0, 1) = UART0_nCTS function is selected.</p> <p>(0, 0, 0, 0, 1, 1) = TM3_EXT function is selected.</p> <p>(0, 0, 0, 1, 0, 1) = SC2_CD function is selected.</p> <p>(0, 0, 1, 0, 0, 1) = TM3 function is selected.</p> <p>(1, 1, 0, 0, 0, 1) = nWRH(EBI) function is selected.</p>
[13]	<b>EBI_nWRL_EN</b>	<p>Bits EBI_nWRL_EN (ALT_MFP[13]), EBI_EN (ALT_MFP[11]), PB2_TM2 (ALT_MFP[24]), PB2_CPO0 (ALT_MFP[30]), PB2_T2EX (ALT_MFP[26]) and GPB_MFP[2] determine the PB.2 function.</p> <p>(EBI_nWRL_EN, EBI_EN, PB2_TM2, PB2_CPO0, PB2_T2EX, GPB_MFP2) value and function mapping is as following list.</p> <p>(0, 0, 0, 0, 0, 0) = GPIO function is selected.</p> <p>(0, 0, 0, 0, 0, 1) = UART0_nRTS function is selected.</p> <p>(0, 0, 0, 0, 1, 1) = TM2_EXT function is selected.</p> <p>(0, 0, 0, 1, 0, 1) = ACMP0_O function is selected.</p> <p>(0, 0, 1, 0, 0, 1) = TM2 function is selected.</p> <p>(1, 1, 0, 0, 0, 1) = nWRL(EBI) function is selected.</p>
[12]	<b>EBI_MCLK_EN</b>	<p>Bits EBI_MCLK_EN (ALT_MFP[12]), EBI_EN (ALT_MFP[11]), GPC_MFP[8] determine the PC.8 function.</p> <p>(EBI_MCLK_EN, EBI_EN, GPC_MFP8) value and function mapping is as following list.</p> <p>(0, 0, 0) = GPIO function is selected to the pin PC.8.</p> <p>(0, 0, 1) = SPI1_SS0 function is selected to the pin PC.8.</p> <p>(1, 1, 1) = MCLK(EBI) function is selected to the pin PC.8.</p>
[11]	<b>EBI_EN</b>	EBI_EN is use to switch GPIO function to EBI function (AD[15:0], ALE, RE, WE, CS, MCLK), it need additional registers EBI_EN[7:0] and EBI_MCLK_EN for some GPIO to switch to EBI function(AD[15:8], MCLK)
[15]	<b>Reserved</b>	Reserved

[9]	PA15_I2SMCLK	<b>PA.15 Pin Alternative Function Selection</b> Bits PA15_SC2PWR (ALT_MFP[12]), PA15_I2SMCLK (ALT_MFP[9]) and GPA_MFP[15] determine the PA.15 function. (PA15_SC2PWR, PA15_I2SMCLK, GPA_MFP15) value and function mapping is as following list. (0, 0, 0) = GPIOA function is selected. (0, 0, 1) = PWM3 function is selected. (0, 1, 1) = I2S_MCLK function is selected. (1, 0, 1) = SC2_PWR function is selected.
[8]	PC3_I2SDO	<b>PC.3 Pin Alternative Function Selection</b> Bits PC3_I2SDO (ALT_MFP[8]) and GPC_MFP[3] determine the PC.3 function. (PC3_I2SDO, GPC_MFP3) value and function mapping is as following list. (0, 0) = GPIO function is selected. (0, 1) = SPI0_MOSI0 function is selected. (1, 1) = I2S_DO function is selected.
[7]	PC2_I2SDI	<b>PC.2 Pin Alternative Function Selection</b> Bits PC2_I2SDI (ALT_MFP[7]) and GPC_MFP[2] determine the PC.2 function. (PC2_I2SDI, GPC_MFP2) value and function mapping is as following list. (0, 0) = GPIO function is selected. (0, 1) = SPI0_MISO0 function is selected. (1, 1) = I2S_DI function is selected.
[6]	PC1_I2SBCLK	<b>PC.1 Pin Alternative Function Selection</b> Bits PC1_I2SBCLK (ALT_MFP[6]) and GPC_MFP[1] determine the PC.1 function. (PC1_I2SBCLK, GPC_MFP1) value and function mapping is as following list. (0, 0) = GPIO function is selected. (0, 1) = SPI0_CLK function is selected. (1, 1) = I2S_BCLK function is selected.
[5]	PC0_I2SLRCLK	<b>Bits PC0_I2SLRCLK (ALT_MFP[5]) And GPC_MFP[0] Determine The PC.0 Function</b> Bits PC0_I2SLRCLK (ALT_MFP[5]) and GPC_MFP[0] determine the PC.0 function. (PC0_I2SLRCLK, GPC_MFP0) value and function mapping is as following list. (0, 0) = GPIO function is selected. (0, 1) = SPI0_SS0 function is selected. (1, 1) = I2S_LRCLK function is selected.
[4]	PB11_PWM4	<b>PB.11 Pin Alternative Function Selection</b> Bits PB11_PWM4 (ALT_MFP[4]) and GPB_MFP[11] determine the PB.11 function. (PB11_PWM4, GPB_MFP11) value and function mapping is as following list. (0, 0) = GPIO function is selected. (0, 1) = TM3 function is selected. (1, 1) = PWM4 function is selected.
[3]	PB14_S31	<b>PB.14 Pin Alternative Function Selection</b> Bits PB14_15_EBI (ALT_MFP2[1]), PB14_S31 (ALT_MFP[3]) and GPB_MFP[14] determine the PB.14 function. (PB14_15_EBI , PB14_S31, GPB_MFP14) value and function mapping is as following list (0, 0, 0) = GPIO function is selected. (0, 0, 1) = INT0 function is selected. (0, 1, 1) = SPI3_SS1 function is selected. (1, 0, 1) = AD0 function is selected.

[2]	<b>PA7_S21</b>	<p><b>PA.7 Pin Alternative Function Selection</b></p> <p>Bits EBI_EN (ALT_MFP[11]), PA7_SC1DAT (ALT_MFP[6]), PA7_S21 (ALT_MFP[2]) and GPA_MFP[7] determine the PA.7 function.</p> <p>(EBI_EN, PA7_SC1DAT, PA7_S21, GPA_MFP7) value and function mapping is as following list.</p> <p>(0, 0, 0, 0) = GPIO function is selected.</p> <p>(0, 0, 0, 1) = ADC7 function is selected.</p> <p>(0, 0, 1, 1) = SPI2_SS1 function is selected.</p> <p>(0, 1, 0, 1) = SC1_DAT\UART4_RXD function is selected.</p> <p>(1, 0, 0, 1) = AD6 function is selected.</p>
[1]	<b>PB9_S11</b>	<p><b>PB.9 Pin Alternative Function Selection</b></p> <p>Bits PB9_S11 (ALT_MFP[1]) and GPB_MFP[9] determine the PB.9 function.</p> <p>(PB9_S11, GPB_MFP9) value and function mapping is as following list.</p> <p>(0, 0) = GPIO function is selected.</p> <p>(0, 1) = TM1 function is selected.</p> <p>(1, 1) = SPI1_SS1 function is selected.</p>
[0]	<b>PB10_S01</b>	<p><b>PB.10 Pin Alternative Function Selection</b></p> <p>Bits PB10_S01 (ALT_MFP[0]) and GPB_MFP[10] determine the PB.10 function.</p> <p>(PB10_S01, GPB_MFP10) value and function mapping is as following list.</p> <p>(0, 0) = GPIO function is selected.</p> <p>(0, 1) = TM2 function is selected.</p> <p>(1, 1) = SPI0_SS1 function is selected.</p>

23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							CLKERR_STOP_EN
7	6	5	4	3	2	1	0
TRIM_RETRY_CNT		TRIM_LOOP		Reserved		TRIM_SEL	

Bits	Description
[31:9]	<b>Reserved</b> Reserved.
[8]	<b>CLKERR_STOP_EN</b> <b>Clock Error Stop Enable Bit</b> 0 = The trim operation is kept going if clock is inaccuracy. 1 = The trim operation is stopped if clock is inaccuracy.
[7:6]	<b>TRIM_RETRY_CNT</b> <b>Trim Value Update Limitation Count</b> The field defines that how many times of HIRC trim value is updated by auto trim circuit before the HIRC frequency locked. Once the HIRC locked, the internal trim value update counter will be reset. If the trim value update counter reached this limitation value and frequency of HIRC still doesn't lock, the auto trim operation will be disabled and TRIM_SEL will be cleared to 00. 00 = Trim retry count limitation is 64. 01 = Trim retry count limitation is 128. 10 = Trim retry count limitation is 256. 11 = Trim retry count limitation is 512.
[5:4]	<b>TRIM_LOOP</b> <b>Trim Calculation Loop</b> This field defines that trim value calculation is based on how many 32.768 kHz clocks in. For example, if TRIM_LOOP is set as 00, auto trim circuit will calculate trim value based on the average frequency difference in 4 32.768 kHz clock. 00 = Trim value calculation is based on average difference in 4 clocks. 01 = Trim value calculation is based on average difference in 8 clocks. 10 = Trim value calculation is based on average difference in 16 clocks. 11 = Trim value calculation is based on average difference in 32 clocks.
[3:2]	<b>Reserved</b> Reserved.
[1:0]	<b>TRIM_SEL</b> <b>Trim Frequency Selection</b> This field indicates the target frequency of internal 22.1184 MHz high speed oscillator will trim to precise 22.1184MHz or 24MHz automatically. If no any target frequency is selected (TRIM_SEL is 00), the HIRC auto trim function is

		<p>disabled.</p> <p>During auto trim operation, if clock error detected because of CLKERR_STOP_EN is set to 1 or trim retry limitation counts reached, this field will be cleared to 00 automatically.</p> <p>00 = HIRC auto trim function Disabled.</p> <p>01 = HIRC auto trim function Enabled and HIRC trimmed to 22.1184 MHz.</p> <p>10 = HIRC auto trim function Enabled and HIRC trimmed to 24 MHz.</p> <p>11 = Reserved.</p>

Reserved					CLKERR_IEN	TRIM_FAIL_IEN	Reserved

Bits	Description
[31:3]	<b>Reserved</b> Reserved.
[2]	<b>CLKERR_IEN</b> <b>Clock Error Interrupt Enable Bit</b> This bit controls if CPU would get an interrupt while clock is inaccuracy during auto trim operation. If this bit is set to 1, and CLKERR_INT (IRCTRIMINT[2]) is set during auto trim operation. An interrupt will be triggered to notify the clock frequency is inaccuracy. 0 = CLKERR_INT (IRCTRIMINT[2]) status to trigger an interrupt to CPU Disabled. 1 = CLKERR_INT (IRCTRIMINT[2]) status to trigger an interrupt to CPU Enabled.
[1]	<b>TRIM_FAIL_IEN</b> <b>Trim Failure Interrupt Enable Bit</b> This bit controls if an interrupt will be triggered while HIRC trim value update limitation count reached and HIRC frequency still not locked on target frequency set by TRIM_SEL (IRCTRIMCTL[1:0]). If this bit is high and TRIM_FAIL_INT (IRCTRIMINT[1]) is set during auto trim operation. An interrupt will be triggered to notify that HIRC trim value update limitation count was reached. 0 = TRIM_FAIL_INT (IRCTRIMINT[1]) status to trigger an interrupt to CPU Disabled. 1 = TRIM_FAIL_INT (IRCTRIMINT[1]) status to trigger an interrupt to CPU Enabled.
[0]	<b>Reserved</b> Reserved.

### HIRC Trim Interrupt Status Register (IRCTRIMINT)

Reserved					CLKERR_INT	TRIM_FAIL_INT	FREQ_LOCK

Bits	Description	
[31:3]	Reserved	Reserved.
[2]	CLKERR_INT	<p><b>Clock Error Interrupt Status</b></p> <p>When the frequency of external 32.768 kHz low speed crystal or internal 22.1184 MHz high speed oscillator is shift larger to unreasonable value, this bit will be set and to be an indicate that clock frequency is inaccuracy</p> <p>Once this bit is set to 1, the auto trim operation stopped and TRIM_SEL (IRCTRIMCTL[1:0]) will be cleared to 00 by hardware automatically if CLKERR_STOP_EN (IRCTRIMCTL[8]) is set to 1.</p> <p>If this bit is set and CLKERR_IEN (IRCTRIMIEN [2]) is high, an interrupt will be triggered to notify the clock frequency is inaccuracy. Write 1 to clear this to 0.</p> <p>0 = Clock frequency is accurate. 1 = Clock frequency is inaccurate.</p>
[1]	TRIM_FAIL_INT	<p><b>Trim Failure Interrupt Status</b></p> <p>This bit indicates that internal 22.1184 MHz high speed oscillator trim value update limitation count reached and the internal 22.1184 MHz high speed oscillator clock frequency still doesn't be locked. Once this bit is set, the auto trim operation stopped and TRIM_SEL (IRCTRIMCTL[1:0]) will be cleared to 00 by hardware automatically.</p> <p>If this bit is set and TRIM_FAIL_IEN (IRCTRIMIEN[1]) is high, an interrupt will be triggered to notify that HIRC trim value update limitation count was reached. Write 1 to clear this to 0.</p> <p>0 = Trim value update limitation count did not reach. 1 = Trim value update limitation count reached and internal 22.1184 MHz high speed oscillator frequency was still not locked.</p>
[0]	FREQ_LOCK	<p><b>HIRC Frequency Lock Status</b></p> <p>This bit indicates the internal 22.1184 MHz high speed oscillator frequency is locked. This is a status bit and doesn't trigger any interrupt.</p>

### 6.2.7 Register Write Protection Register (REGWRPROT)

Some of the system control registers need to be protected to avoid inadvertent write and disturb the chip operation. These system control registers are protected after the power on reset till user to disable register protection. For user to program these protected registers, a register protection disable sequence needs to be followed by a special programming. The register protection disable sequence is writing the data “59h”, “16h” “88h” to the register REGWRPROT address at 0x5000\_0100 continuously. Any different data value, different sequence or any other write to other address during these three data writing will abort the whole sequence.

After the protection is disabled, user can check the protection disable bit at address 0x5000\_0100 bit0, 1 is protection disable, and 0 is protection enable. Then user can update the target protected register value and then write any data to the address “0x5000\_0100” to enable register protection.

The protected registers are listed as following table.

Register	Bit	Description
IPRSTC1	[3] EBI_RST	EBI Controller Reset (Write-protection Bit)
IPRSTC1	[2] PDMA_RST	PDMA Controller Reset (Write Protect)
IPRSTC1	[1] CPU_RST	CPU Kernel One-Shot Reset (Write Protect)
IPRSTC1	[0] CHIP_RST	CHIP One-Shot Reset (Write Protect)
BODCR	[7] LVR_EN	Low Voltage Reset Enable Bit (Write Protect)
BODCR	[5] BOD_LPM	Brown-Out Detector Low Power Mode (Write Protect)
BODCR	[3] BOD_RSTEN	Brown-Out Reset Enable Bit (Write Protect)
BODCR	[2:1] BOD_VL	Brown-Out Detector Threshold Voltage Selection (Write Protect)
BODCR	[0] BOD_EN	Brown-Out Detector Enable Bit (Write Protect)
PORCR	[15:0] POR_DIS_CODE	Power-On-Reset Enable Bit (Write Protect)
REGWRPROT	[7:0] REGWRPROT	Register Write-Protection Code (Write Only)
REGWRPROT	[0] REGPROTDIS	Register Write-Protection Disable Index (Read Only)
NMI_SEL	[8] NMI_EN	NMI Interrupt Enable Bit (Write Protect)
PWRCON	[8] PD_WAIT_CPU	Power-Down Entry Condition Control (Write Protect)
PWRCON	[7] PWR_DOWN_EN	System Power-Down Enable Bit (Write Protect)
PWRCON	[5] PD_WU_INT_EN	Power-Down Mode Wake-Up Interrupt Enable Bit (Write Protect)
PWRCON	[4] PD_WU_DLY	Wake-Up Delay Counter Enable Bit (Write Protect)
PWRCON	[3] OSC10K_EN	10 KHz Internal Low Speed RC Oscillator (LIRC) Enable Bit (Write Protect)

Bits	Description	
[31:16]	Reserved	Reserved.
[7:0]	REGWRPROT	<b>Register Write-Protection Code (Write Only)</b> Some registers have write-protection function. Writing these registers have to disable the protected function by writing the sequence value "59h", "16h", "88h" to this field. After this sequence is completed, the REGPROTDIS bit will be set to 1 and write-protection registers can be normal write.
[0]	REGPROTDIS	<b>Register Write-Protection Disable Index (Read Only)</b> 0 = Write-protection is enabled for writing protected registers. Any write to the protected register is ignored. 1 = Write-protection is disabled for writing protected registers. The Protected registers are: <b>IPRSTC1</b> : address 0x5000_0008 <b>BODCR</b> : address 0x5000_0018 <b>PORCR</b> : address 0x5000_0024 <b>PWRCON</b> : address 0x5000_0200 (bit[6] is not protected for power wake-up interrupt clear) <b>APBCLK bit[0]</b> : address 0x5000_0208 (bit[0] is Watchdog Timer clock enable) <b>CLKSEL0</b> : address 0x5000_0210 (for HCLK and CPU STCLK clock source selection) <b>CLKSEL1 bit[1:0]</b> : address 0x5000_0214 (for Watchdog Timer clock source selection) <b>NMI_SEL bit[8]</b> : address 0x5000_0380 (for NMI_EN interrupt enable) <b>ISPCON</b> : address 0x5000_C000 (Flash ISP Control register) <b>ISPTRG</b> : address 0x5000_C010 (ISP Trigger Control register) <b>WTCR</b> : address 0x4000_4000 <b>FATCON</b> : address 0x5000_C018 <b>Note</b> : The bits which are write-protected will be noted as " (Write Protect)" beside the description.

### 6.2.8 System Timer (SysTick)

The Cortex™-M0 includes an integrated system timer, SysTick, which provides a simple, 24-bit clear-on-write, decrementing, wrap-on-zero counter with a flexible control mechanism. The counter can be used as a Real Time Operating System (RTOS) tick timer or as a simple counter.

When system timer is enabled, it will count down from the value in the SysTick Current Value Register (SYST\_CVR) to 0, and reload (wrap) to the value in the SysTick Reload Value Register (SYST\_RVR) on the next clock cycle, then decrement on subsequent clocks. When the counter transitions to 0, the COUNTFLAG status bit is set. The COUNTFLAG bit clears on reads.

The SYST\_CVR value is UNKNOWN on reset. Software should write to the register to clear it to 0 before enabling the feature. This ensures the timer will count from the SYST\_RVR value rather than an arbitrary value when it is enabled.

If the SYST\_RVR is 0, the timer will be maintained with a current value of 0 after it is reloaded with this value. This mechanism can be used to disable the feature independently from the timer enable bit.

For more detailed information, please refer to the “ARM® Cortex™-M0 Technical Reference Manual” and “ARM® v6-M Architecture Reference Manual”.

### 6.2.8.1 System Timer Control Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
<b>SYST Base Address:</b> <b>SCS_BA = 0xE000_E000</b>				
<b>SYST_CSR</b>	SCS_BA+0x10	R/W	SysTick Control and Status Register	0x0000_0000
<b>SYST_RVR</b>	SCS_BA+0x14	R/W	SysTick Reload Value Register	0xFFFF_FFFF
<b>SYST_CVR</b>	SCS_BA+0x18	R/W	SysTick Current Value Register	0xFFFF_FFFF

### 6.2.8.2 System Timer Control Register Description

#### SysTick Control and Status (SYST\_CSR)

Register	Offset	R/W	Description	Reset Value
SYST_CSR	SCS_BA+0x10	R/W	SysTick Control and Status Register	0x0000_0000

31	30	29	28	27	26	25	24

CURRENT[15:8]							
7	6	5	4	3	2	1	0
CURRENT[7:0]							

Bits	Description	
[31:24]	Reserved	Reserved.
[23:0]	CURRENT	<b>System Tick Current Value</b> Current counter value. This is the value of the counter at the time it is sampled. The counter does not provide read-modify-write protection. The register is write-clear. A software write of any value will clear the register to 0.

### 6.2.9 Nested Vectored Interrupt Controller (NVIC)

The Cortex™-M0 provides an interrupt controller as an integral part of the exception mode, named as “Nested Vectored Interrupt Controller (NVIC)”, which is closely coupled to the processor kernel and provides following features:

- Nested and Vectored interrupt support
- Automatic processor state saving and restoration
- Reduced and deterministic interrupt latency

The NVIC prioritizes and handles all supported exceptions. All exceptions are handled in “Handler Mode”. This NVIC architecture supports 32 (IRQ[31:0]) discrete interrupts with 4 levels of priority. All of the interrupts and most of the system exceptions can be configured to different priority levels. When an interrupt occurs, the NVIC will compare the priority of the new interrupt to the current running one’s priority. If the priority of the new interrupt is higher than the current one, the new interrupt handler will override the current handler.

When an interrupt is accepted, the starting address of the interrupt service routine (ISR) is fetched from a vector table in memory. There is no need to determine which interrupt is accepted and branch to the starting address of the correlated ISR by software. While the starting address is fetched, NVIC will also automatically save processor state including the registers “PC, PSR, LR, R0~R3, R12” to the stack. At the end of the ISR, the NVIC will restore the mentioned registers from stack and resume the normal execution. Thus it will take less and deterministic time to process the interrupt request.

The NVIC supports “Tail Chaining” which handles back-to-back interrupts efficiently without the overhead of states saving and restoration and therefore reduces delay time in switching to pending ISR at the end of current ISR. The NVIC also supports “Late Arrival” which improves the efficiency of concurrent ISRs. When a higher priority interrupt request occurs before the current ISR starts to execute (at the stage of state saving and starting address fetching), the NVIC will give priority to the higher one without delay penalty. Thus it advances the real-time capability.

For more detailed information, please refer to the “ARM® Cortex™-M0 Technical Reference Manual” and “ARM® v6-M Architecture Reference Manual”.

### 6.2.9.1 Exception Model and System Interrupt Map

The following table lists the exception model supported by NuMicro™ NUC230/240 series. Software can set four levels of priority on some of these exceptions as well as on all interrupts. The highest user-configurable priority is denoted as “0” and the lowest priority is denoted as “3”. The default priority of all the user-configurable interrupts is “0”. Note that priority “0” is treated as the fourth priority on the system, after three system exceptions “Reset”, “NMI” and “Hard Fault”.

Exception Name	Vector Number	Priority
Reset	1	-3
NMI	2	-2
Hard Fault	3	-1
Reserved	4 ~ 10	Reserved
SVCall	11	Configurable
Reserved	12 ~ 13	Reserved
PendSV	14	Configurable
SysTick	15	Configurable
Interrupt (IRQ0 ~ IRQ31)	16 ~ 47	Configurable

Table 6-2 Exception Model

Vector Number	Interrupt Number (Bit In Interrupt Registers)	Interrupt Name	Source Module	Interrupt Description
1 ~ 15	-	-	-	System exceptions
16	0	<b>BOD_INT</b>	Brown-out	Brown-out low voltage detected interrupt
17	1	<b>WDT_INT</b>	WDT	Watchdog Timer interrupt
18	2	<b>EINT0</b>	GPIO	External signal interrupt from PB.14 pin
19	3	<b>EINT1</b>	GPIO	External signal interrupt from PB.15 pin
20	4	<b>GPAB_INT</b>	GPIO	External signal interrupt from PA[15:0]/PB[13:0]
21	5	<b>GPCDEF_INT</b>	GPIO	External interrupt from PC[15:0]/PD[15:0]/PE[15:0]/PF[3:0]
22	6	<b>PWMA_INT</b>	PWM0~3	PWM0, PWM1, PWM2 and PWM3 interrupt
23	7	<b>PWMB_INT</b>	PWM4~7	PWM4, PWM5, PWM6 and PWM7 interrupt

26	10	<b>TMR2_INT</b>	TMR2	Timer 2 interrupt
27	11	<b>TMR3_INT</b>	TMR3	Timer 3 interrupt
28	12	<b>UART02_INT</b>	UART0/2	UART0 and UART2 interrupt
29	13	<b>UART1_INT</b>	UART1	UART1 interrupt
30	14	<b>SPI0_INT</b>	SPI0	SPI0 interrupt

31	15	<b>SPI1_INT</b>	SPI1	SPI1 interrupt
32	16	<b>SPI2_INT</b>	SPI2	SPI2 interrupt
33	17	<b>SPI3_INT</b>	SPI3	SPI3 interrupt
34	18	<b>I2C0_INT</b>	I <sup>2</sup> C0	I <sup>2</sup> C0 interrupt
35	19	<b>I2C1_INT</b>	I <sup>2</sup> C1	I <sup>2</sup> C1 interrupt
36	20	-	-	Reserved
37	21	-	-	Reserved
38	22	<b>SC012_INT</b>	SC0/1/2	SC0, SC1 and SC2 interrupt
39	23	<b>USB_INT</b>	USBD	USB 2.0 FS Device interrupt
40	24	<b>PS2_INT</b>	PS/2	PS/2 interrupt
41	25	<b>ACMP_INT</b>	ACMP	Analog Comparator interrupt
42	26	<b>PDMA_INT</b>	PDMA	PDMA interrupt
43	27	<b>I2S_INT</b>	I <sup>2</sup> S	I <sup>2</sup> S interrupt
44	28	<b>PWRWU_INT</b>	CLKC	Clock controller interrupt for chip wake-up from Power-down state
45	29	<b>ADC_INT</b>	ADC	ADC interrupt
46	30	<b>IRC_INT</b>	IRC	IRC TRIM interrupt
47	31	<b>RTC_INT</b>	RTC	Real Time Clock interrupt

Table 6-3 System Interrupt Map

### 6.2.9.2 Vector Table

When an interrupt is accepted, the processor will automatically fetch the starting address of the interrupt service routine (ISR) from a vector table in memory. For ARMv6-M, the vector table base address is fixed at 0x00000000. The vector table contains the initialization value for the stack pointer on reset, and the entry point addresses for all exception handlers. The vector number on previous page defines the order of entries in the vector table associated with exception handler entry as illustrated in previous section.

Vector Table Word Offset	Description
0	SP_main – The Main stack pointer
Vector Number	Exception Entry Pointer using that Vector Number

Table 6-4 Vector Table Format

### 6.2.9.3 Operation Description

NVIC interrupts can be enabled and disabled by writing to their corresponding Interrupt Set-Enable or Interrupt Clear-Enable register bit-field. The registers use a write-1-to-enable and write-1-to-clear policy, both registers reading back the current enabled state of the corresponding interrupts. When an interrupt is disabled, interrupt assertion will cause the interrupt to become Pending, however, the interrupt will not activate. If an interrupt is Active when it is disabled, it remains in its Active state until cleared by reset or an exception return. Clearing the enable bit prevents new activations of the associated interrupt.

NVIC interrupts can be pended/un-pended using a complementary pair of registers to those used to enable/disable the interrupts, named the Set-Pending Register and Clear-Pending Register respectively. The registers use a write-1-to-enable and write-1-to-clear policy, both registers reading back the current pended state of the corresponding interrupts. The Clear-Pending Register has no effect on the execution status of an Active interrupt.

NVIC interrupts are prioritized by updating an 8-bit field within a 32-bit register (each register supporting four interrupts).

The general registers associated with the NVIC are all accessible from a block of memory in the System Control Space and will be described in next section.

#### 6.2.9.4 NVIC Control Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

PRI_29[1:0]		Reserved					
7	6	5	4	3	2	1	0
PRI_28[1:0]		Reserved					

Bits	Description	
[31:30]	PRI_31	<b>Priority Of IRQ31</b> "0" denotes the highest priority and "3" denotes the lowest priority.
[29:24]	Reserved	Reserved.
[23:22]	PRI_30	<b>Priority Of IRQ30</b> "0" denotes the highest priority and "3" denotes the lowest priority.
[21:16]	Reserved	Reserved.
[15:14]	PRI_29	<b>Priority Of IRQ29</b> "0" denotes the highest priority and "3" denotes the lowest priority.
[13:8]	Reserved	Reserved.
[7:6]	PRI_28	<b>Priority Of IRQ28</b> "0" denotes the highest priority and "3" denotes the lowest priority.
[5:0]	Reserved	Reserved.

### 6.2.9.6 Interrupt Source Register Map

Besides the interrupt control registers associated with the NVIC, the NuMicro™ NUC230/240 series also implement some specific control registers to facilitate the interrupt functions, including “interrupt source identification”, “NMI source selection” and “interrupt test mode”, which are described below.

**R:** read only, **W:** write only, **R/W:** both read and write

Register	Offset	R/W	Description	Reset Value
<b>INT Base Address:</b> <b>INT_BA = 0x5000_0300</b>				
<b>IRQ0_SRC</b>	INT_BA+0x00	R	IRQ0 (BOD) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ1_SRC</b>	INT_BA+0x04	R	IRQ1 (WDT) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ2_SRC</b>	INT_BA+0x08	R	IRQ2 (EINT0) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ3_SRC</b>	INT_BA+0x0C	R	IRQ3 (EINT1) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ4_SRC</b>	INT_BA+0x10	R	IRQ4 (GPA/B) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ5_SRC</b>	INT_BA+0x14	R	IRQ5 (GPC/D/E/F) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ6_SRC</b>	INT_BA+0x18	R	IRQ6 (PWMA) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ7_SRC</b>	INT_BA+0x1C	R	IRQ7 (PWMB) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ8_SRC</b>	INT_BA+0x20	R	IRQ8 (TMR0) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ9_SRC</b>	INT_BA+0x24	R	IRQ9 (TMR1) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ10_SRC</b>	INT_BA+0x28	R	IRQ10 (TMR2) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ11_SRC</b>	INT_BA+0x2C	R	IRQ11 (TMR3) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ12_SRC</b>	INT_BA+0x30	R	IRQ12 (UART0/2) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ13_SRC</b>	INT_BA+0x34	R	IRQ13 (UART1) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ14_SRC</b>	INT_BA+0x38	R	IRQ14 (SPI0) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ15_SRC</b>	INT_BA+0x3C	R	IRQ15 (SPI1) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ16_SRC</b>	INT_BA+0x40	R	IRQ16 (SPI2) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ17_SRC</b>	INT_BA+0x44	R	IRQ17 (SPI3) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ18_SRC</b>	INT_BA+0x48	R	IRQ18 (I <sup>2</sup> C0) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ19_SRC</b>	INT_BA+0x4C	R	IRQ19 (I <sup>2</sup> C1) Interrupt Source Identity	0XXXXX_XXXX
<b>IRQ20_SRC</b>	INT_BA+0x50	R	Reserved	0XXXXX_XXXX
<b>IRQ21_SRC</b>	INT_BA+0x54	R	Reserved	0XXXXX_XXXX
<b>IRQ22_SRC</b>	INT_BA+0x58	R	IRQ22 (SC0/1/2) Interrupt Source Identity	0XXXXX_XXXX

<b>IRQ23_SRC</b>	INT_BA+0x5C	R	IRQ23 (USBD) Interrupt Source Identity	0xFFFF_XXXX
<b>IRQ24_SRC</b>	INT_BA+0x60	R	IRQ24 (PS/2) Interrupt Source Identity	0xFFFF_XXXX
<b>IRQ25_SRC</b>	INT_BA+0x64	R	IRQ25 (ACMP) Interrupt Source Identity	0xFFFF_XXXX
<b>IRQ26_SRC</b>	INT_BA+0x68	R	IRQ26 (PDMA) Interrupt Source Identity	0xFFFF_XXXX
<b>IRQ27_SRC</b>	INT_BA+0x6C	R	IRQ27 (I <sup>2</sup> S) Interrupt Source Identity	0xFFFF_XXXX
<b>IRQ28_SRC</b>	INT_BA+0x70	R	IRQ28 (PWRWU) Interrupt Source Identity	0xFFFF_XXXX
<b>IRQ29_SRC</b>	INT_BA+0x74	R	IRQ29 (ADC) Interrupt Source Identity	0xFFFF_XXXX
<b>IRQ30_SRC</b>	INT_BA+0x78	R	IRQ30 (IRC) Interrupt Source Identity	0xFFFF_XXXX
<b>IRQ31_SRC</b>	INT_BA+0x7C	R	IRQ31 (RTC) Interrupt Source Identity	0xFFFF_XXXX
<b>NMI_SEL</b>	INT_BA+0x80	R/W	NMI Source Interrupt Select Control Register	0x0000_0000
<b>MCU_IRQ</b>	INT_BA+0x84	R/W	MCU Interrupt Request Source Register	0x0000_0000
<b>MCU_IRQCR</b>	INT_BA+0x88	R/W	MCU Interrupt Request Control Register	0x0000_0000

### 6.2.9.7 Interrupt Source Register Description

#### Interrupt Source Identity Register (IRQn\_SRC)

Register	Offset	R/W	Description	Reset Value
IRQ0_SRC	INT_BA+0x00	R	IRQ0 (BOD) Interrupt Source Identity	0XXXXX_XXXX
IRQ1_SRC	INT_BA+0x04	R	IRQ1 (WDT) Interrupt Source Identity	0XXXXX_XXXX
IRQ2_SRC	INT_BA+0x08	R	IRQ2 (EINT0) Interrupt Source Identity	0XXXXX_XXXX
IRQ3_SRC	INT_BA+0x0C	R	IRQ3 (EINT1) Interrupt Source Identity	0XXXXX_XXXX
IRQ4_SRC	INT_BA+0x10	R	IRQ4 (GPA/B) Interrupt Source Identity	0XXXXX_XXXX
IRQ5_SRC	INT_BA+0x14	R	IRQ5 (GPC/D/E/F) Interrupt Source Identity	0XXXXX_XXXX
IRQ6_SRC	INT_BA+0x18	R	IRQ6 (PWMA) Interrupt Source Identity	0XXXXX_XXXX
IRQ7_SRC	INT_BA+0x1C	R	IRQ7 (PWMB) Interrupt Source Identity	0XXXXX_XXXX
IRQ8_SRC	INT_BA+0x20	R	IRQ8 (TMR0) Interrupt Source Identity	0XXXXX_XXXX
IRQ9_SRC	INT_BA+0x24	R	IRQ9 (TMR1) Interrupt Source Identity	0XXXXX_XXXX
IRQ10_SRC	INT_BA+0x28	R	IRQ10 (TMR2) Interrupt Source Identity	0XXXXX_XXXX
IRQ11_SRC	INT_BA+0x2C	R	IRQ11 (TMR3) Interrupt Source Identity	0XXXXX_XXXX
IRQ12_SRC	INT_BA+0x30	R	IRQ12 (UART0/2) Interrupt Source Identity	0XXXXX_XXXX
IRQ13_SRC	INT_BA+0x34	R	IRQ13 (UART1) Interrupt Source Identity	0XXXXX_XXXX
IRQ14_SRC	INT_BA+0x38	R	IRQ14 (SPI0) Interrupt Source Identity	0XXXXX_XXXX
IRQ15_SRC	INT_BA+0x3C	R	IRQ15 (SPI1) Interrupt Source Identity	0XXXXX_XXXX
IRQ16_SRC	INT_BA+0x40	R	IRQ16 (SPI2) Interrupt Source Identity	0XXXXX_XXXX
IRQ17_SRC	INT_BA+0x44	R	IRQ17 (SPI3) Interrupt Source Identity	0XXXXX_XXXX
IRQ18_SRC	INT_BA+0x48	R	IRQ18 (I <sup>2</sup> C0) Interrupt Source Identity	0XXXXX_XXXX
IRQ19_SRC	INT_BA+0x4C	R	IRQ19 (I <sup>2</sup> C1) Interrupt Source Identity	0XXXXX_XXXX
IRQ20_SRC	INT_BA+0x50	R	Reserved	0XXXXX_XXXX
IRQ21_SRC	INT_BA+0x54	R	Reserved	0XXXXX_XXXX
IRQ22_SRC	INT_BA+0x58	R	IRQ22 (SC0/1/2) Interrupt Source Identity	0XXXXX_XXXX
IRQ23_SRC	INT_BA+0x5C	R	IRQ23 (USBD) Interrupt Source Identity	0XXXXX_XXXX
IRQ24_SRC	INT_BA+0x60	R	IRQ24 (PS/2) Interrupt Source Identity	0XXXXX_XXXX
IRQ25_SRC	INT_BA+0x64	R	IRQ25 (ACMP) Interrupt Source Identity	0XXXXX_XXXX
IRQ26_SRC	INT_BA+0x68	R	IRQ26 (PDMA) Interrupt Source Identity	0XXXXX_XXXX

<b>IRQ27_SRC</b>	INT_BA+0x6C	R	IRQ27 (I <sup>2</sup> S) Interrupt Source Identity	0xFFFF_XXXX
<b>IRQ28_SRC</b>	INT_BA+0x70	R	IRQ28 (PWRWU) Interrupt Source Identity	0xFFFF_XXXX
<b>IRQ29_SRC</b>	INT_BA+0x74	R	IRQ29 (ADC) Interrupt Source Identity	0xFFFF_XXXX
<b>IRQ30_SRC</b>	INT_BA+0x78	R	IRQ30 (IRC) Interrupt Source Identity	0xFFFF_XXXX
<b>IRQ31_SRC</b>	INT_BA+0x7C	R	IRQ31 (RTC) Interrupt Source Identity	0xFFFF_XXXX

23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved							FAST_IRQ

Bits	Description	
[31:1]	Reserved	Reserved.
[0]	FAST_IRQ	<b>Fast IRQ Latency Enable Bit</b> 0 = MCU IRQ latency is fixed at 13 clock cycles of HCLK, MCU will enter IRQ handler after this fixed latency when interrupt happened. 1 = MCU IRQ latency will not fixed, MCU will enter IRQ handler as soon as possible when interrupt happened.

### 6.2.10 System Control

The Cortex™-M0 status and operating mode control are managed by System Control Registers. Including CPUID, Cortex™-M0 interrupt priority and Cortex™-M0 power management can be controlled through these system control registers.

For more detailed information, please refer to the “ARM® Cortex™-M0 Technical Reference Manual” and “ARM® v6-M Architecture Reference Manual”.

#### 6.2.10.1 System Control Register Map

**R**: read only, **W**: write only, **R/W**: both read and write

Register	Offset	R/W	Description	Reset Value

### Interrupt Control State Register (ICSR)

Register	Offset	R/W	Description	Reset Value
ICSR	SCS_BA+0xD04	R/W	Interrupt Control and State Register	0x0000_0000

31	30	29	28	27	26	25	24
NMIPENDSET	Reserved		PENDSVSET	PENDSVCLR	PENDSTSET	PENDSTCLR	Reserved
23	22	21	20	19	18	17	16
ISRPREEMPT	ISRPENDING	Reserved				VECTPENDING[5:4]	
15	14	13	12	11	10	9	8
VECTPENDING[3:0]				Reserved			
7	6	5	4	3	2	1	0
Reserved		VECTACTIVE[5:0]					

Bits	Description	
[31]	NMIPENDSET	<b>NMI Set-Pending Bit</b> Write Operation: 0 = No effect. 1 = Changes NMI exception state to pending. Read Operation: 0 = NMI exception not pending. 1 = NMI exception pending. Because NMI is the highest-priority exception, normally the processor enters the NMI exception handler as soon as it detects a write of 1 to this bit. Entering the handler then clears this bit to 0. This means a read of this bit by the NMI exception handler returns 1 only if the NMI signal is reasserted while the processor is executing that handler.
[30:29]	Reserved	Reserved.
[28]	PENDSVSET	<b>PendSV Set-Pending Bit</b> Write Operation: 0 = No effect. 1 = Changes PendSV exception state to pending. Read Operation: 0 = PendSV exception is not pending. 1 = PendSV exception is pending. <b>Note:</b> Writing 1 to this bit is the only way to set the PendSV exception state to pending.
[27]	PENDSVCLR	<b>PendSV Clear-Pending Bit</b> Write Operation: 0 = No effect. 1 = Removes the pending state from the PendSV exception. This is a write only bit. When you want to clear PENDSV bit, you must "write 0 to PENDSVSET and write 1 to PENDSVCLR" at the same time.
[26]	PENDSTSET	<b>SysTick Exception Set-Pending Bit</b> Write Operation:

		<p>0 = No effect.  1 = Changes SysTick exception state to pending.  Read Operation:  0 = SysTick exception is not pending.  1 = SysTick exception is pending.</p>
[25]	PENDSTCLR	<p><b>SysTick Exception Clear-Pending Bit</b>  Write Operation:  0 = No effect.  1 = Removes the pending state from the SysTick exception.  This is a write only bit. When you want to clear PENDST bit, you must “write 0 to PENDSTSET and write 1 to PENDSTCLR” at the same time.</p>
[24]	Reserved	Reserved.
[23]	ISRPREEMPT	<p><b>If Set, A Pending Exception Will Be Serviced On Exit From The Debug Halt State</b>  This bit is read only.</p>
[22]	ISRPENDING	<p><b>Interrupt Pending Flag, Excluding NMI And Faults:</b>  0 = Interrupt not pending.  1 = Interrupt pending.  This bit is read only.</p>
[21:18]	Reserved	Reserved.
[17:12]	VECTPENDING	<p><b>Indicates The Exception Number Of The Highest Priority Pending Enabled Exception:</b>  0 = No pending exceptions.  Non-zero = Exception number of the highest priority pending enabled exception.</p>
[11:6]	Reserved	Reserved.
[5:0]	VECTACTIVE	<p><b>Contains The Active Exception Number</b>  0 = Thread mode.  Non-zero = Exception number of the currently active exception.</p>

### Application Interrupt and Reset Control Register (AIRCR)

Register	Offset	R/W	Description	Reset Value
AIRCR	SCS_BA+0xD0C	R/W	Application Interrupt and Reset Control Register	0xFA05_0000

31	30	29	28	27	26	25	24

## 6.3 Clock Controller

### 6.3.1 Overview

The clock controller generates the clocks for the whole chip, including system clocks and all peripheral clocks. The clock controller also implements the power control function with the individually clock ON/OFF control, clock source selection and clock divider. The chip enters Power-down mode when Cortex™-M0 core executes the WFI instruction only if the PWR\_DOWN\_EN (PWRCON[7]) bit and PD\_WAIT\_CPU (PWRCON[8]) bit are both set to 1. After that, chip enters Power-down mode and wait for wake-up interrupt source triggered to leave Power-down mode. In the Power-down mode, the clock controller turns off the 4~24 MHz external high speed crystal oscillator and 22.1184 MHz internal high speed RC oscillator to reduce the overall system power consumption. The following figures show the clock generator and the overview of the clock source control.

The clock generator consists of 5 clock sources as listed below:

- 32.768 kHz external low speed crystal oscillator (LXT)
- 4~24 MHz external high speed crystal oscillator (HXT)
- Programmable PLL output clock frequency (PLL source can be selected from external 4~24 MHz external high speed crystal oscillator (HXT) or 22.1184 MHz internal high speed RC oscillator (HIRC)) (PLL FOUT)
- 22.1184 MHz internal high speed RC oscillator (HIRC)
- 10 kHz internal low speed RC oscillator (LIRC)

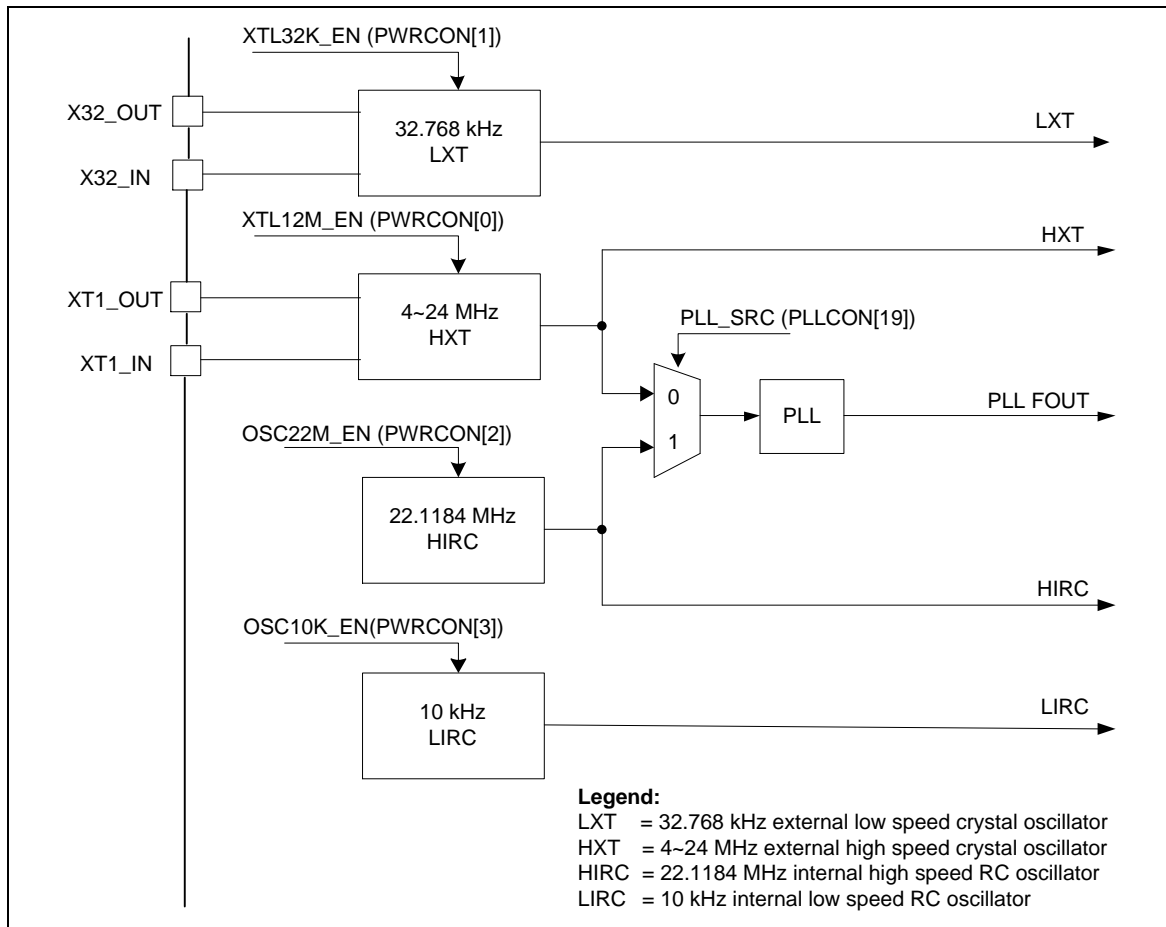

Figure 6-4 Clock Generator Block Diagram

Figure 6-5 Clock Generator Global View Diagram

### 6.3.2 System Clock and SysTick Clock

The system clock has 5 clock sources which were generated from clock generator block. The clock source switch depends on the register HCLK\_S (CLKSEL0[2:0]). The block diagram is shown in Figure 6-6.

Figure 6-6 System Clock Block Diagram

The clock source of SysTick in Cortex™-M0 core can use CPU clock or external clock (SYST\_CSR[2]). If using external clock, the SysTick clock (STCLK) has 5 clock sources. The clock source switch depends on the setting of the register STCLK\_S (CLKSEL0[5:3]). The block diagram is shown in Figure 6-7.

Figure 6-7 SysTick Clock Control Block Diagram

### 6.3.3 Power-down Mode Clock

When chip enters Power-down mode, system clocks, some clock sources, and some peripheral clocks will be disabled. Some clock sources and peripherals clocks are still active in Power-down mode.

The clocks still kept active are listed below:

- Clock Generator
  - 10 kHz internal low speed RC oscillator clock
  - 32.768 kHz external low speed crystal oscillator clock
- RTC/WDT/Timer/PWM Peripherals Clock (when 32.768 kHz external low speed crystal oscillator or 10 kHz internal low speed RC oscillator is adopted as clock source)

### 6.3.4 Frequency Divider Output

This device is equipped with a power-of-2 frequency divider which is composed by 16 chained divide-by-2 shift registers. One of the 16 shift register outputs selected by a sixteen to one multiplexer is reflected to CLKO function pin. Therefore there are 16 options of power-of-2 divided clocks with the frequency from  $F_{in}/2^1$  to  $F_{in}/2^{16}$  where  $F_{in}$  is input clock frequency to the clock divider.

The output formula is  $F_{out} = F_{in}/2^{(N+1)}$ , where  $F_{in}$  is the input clock frequency,  $F_{out}$  is the clock divider output frequency and N is the 4-bit value in FSEL (FRQDIV[3:0]).

When writing 1 to DIVIDER\_EN (FRQDIV[4]), the chained counter starts to count. When writing 0 to DIVIDER\_EN (FRQDIV[4]), the chained counter continuously runs till divided clock reaches low state and stay in low state.

If DIVIDER1 (FRQDIV[5]) is set to 1, the frequency divider clock (FRQDIV\_CLK) will bypass power-of-2 frequency divider. The frequency divider clock will be output to CLKO pin directly.

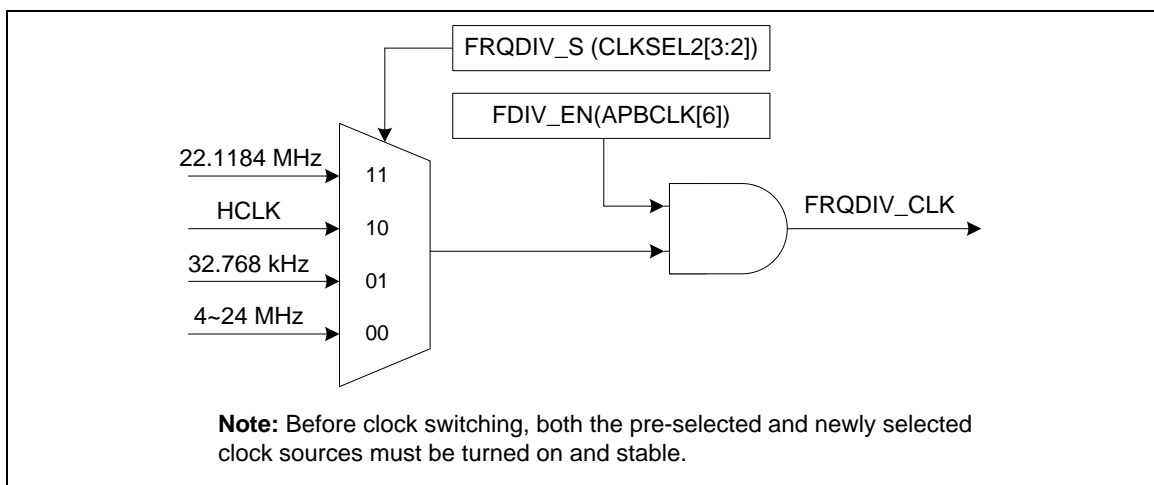

Figure 6-8 Clock Source of Frequency Divider

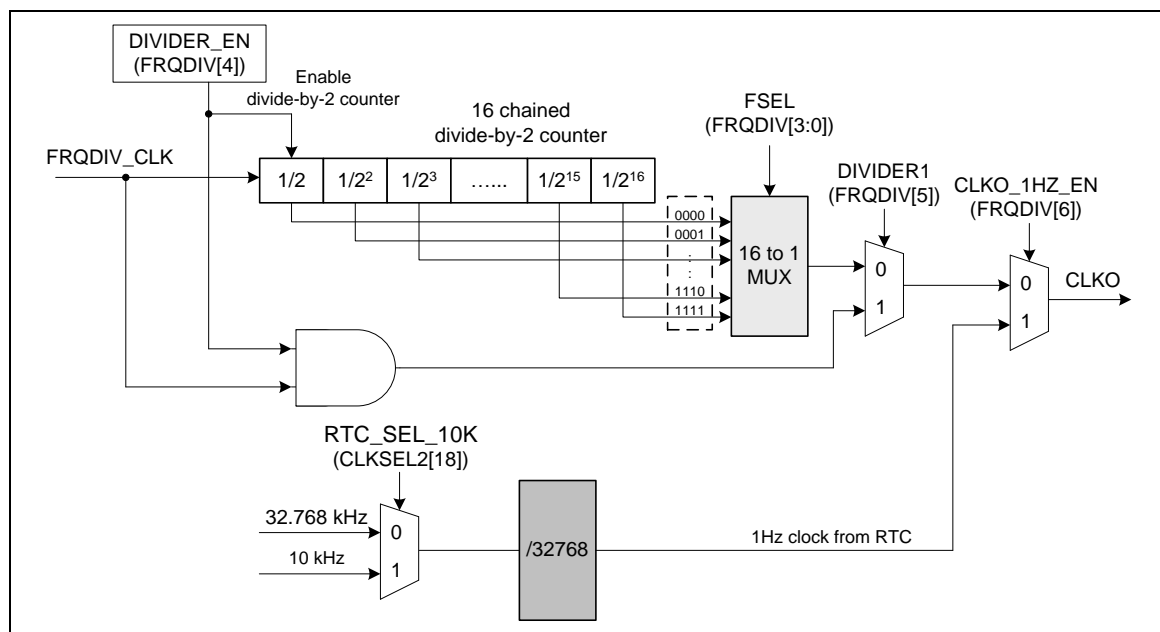

Figure 6-9 Frequency Divider Block Diagram

### 6.3.5 Register Map

### Output Clock Frequency Setting

$$F_{OUT} = F_{IN} \times \frac{NF}{NR} \times \frac{1}{NO}$$

Constraint:

1.  $3.2MHz < F_{IN} < 150MHz$
2.  $800KHz < \frac{F_{IN}}{2 * NR} < 7.5MHz$
3.  $100MHz < F_{CO} = F_{IN} * \frac{NF}{NR} < 200MHz$   
 $120MHz < F_{CO}$  is preferred

Symbol	Description
FOUT	Output Clock Frequency
FIN	Input (Reference) Clock Frequency
NR	Input Divider (IN_DV + 2)
NF	Feedback Divider (FB_DV + 2)
NO	OUT_DV = "00" : NO = 1 OUT_DV = "01" : NO = 2 OUT_DV = "10" : NO = 2 OUT_DV = "11" : NO = 4

### Default Frequency Setting

The default value: 0xC22E

FIN = 12 MHz

NR = (1+2) = 3

NF = (46+2) = 48

NO = 4

FOUT = 12/4 x 48 x 1/3 = 48 MHz

## 6.4 Flash Memory Controller (FMC)

### 6.4.1 Overview

The NuMicro™ NUC230/240 series has 128/64/32K bytes on-chip embedded Flash for application program memory (APROM) that can be updated through ISP procedure. The In-System-Programming (ISP) function enables user to update program memory when chip is soldered on PCB. After chip is powered on, Cortex™-M0 CPU fetches code from APROM or LDROM decided by boot select (CBS) in CONFIG0. By the way, the NuMicro™ NUC230/240 series also provides additional Data Flash for user to store some application dependent data. For 128K bytes APROM device, the Data Flash is shared with original 128K program memory and its start address is configurable in CONFIG1. For 64K/32K bytes APROM device, the Data Flash is fixed at 4KB.

### 6.4.2 Features

- Runs up to 50 MHz with zero wait cycle for continuous address read access and runs up to 72MHz with one wait cycle for continuous address read.
- All embedded flash memory supports 512 bytes page erase
- 128/64/32 KB application program memory (APROM)
- 8KB In-System-Programming (ISP) loader program memory (LDROM)
- 4KB Data Flash for 64/32 KB APROM device
- Configurable Data Flash size for 128KB APROM device
- Configurable or fixed 4 KB Data Flash with 512 bytes page erase unit
- Supports In-Application-Programming (IAP) to switch code between APROM and LDROM without reset
- In-System-Programming (ISP) to update on-chip Flash

### 6.4.3 Block Diagram

The flash memory controller consists of AHB slave interface, ISP control logic, writer interface and flash macro interface timing control logic. The block diagram of flash memory controller is shown as follows:

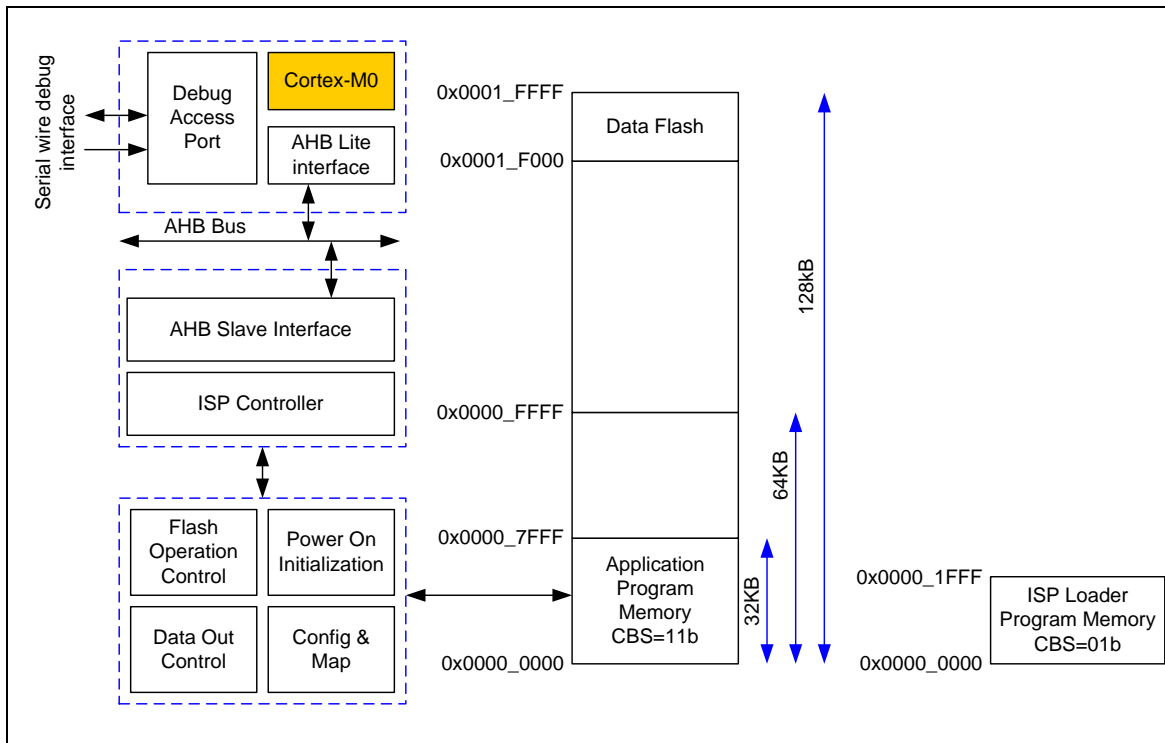

Figure 6-10 Flash Memory Control Block Diagram

## 6.4.4 Functional Description

### 6.4.4.1 Flash Memory Organization

The NuMicro™ NUC230/240 series flash memory consists of program memory (APROM), Data Flash, ISP loader program memory (LDROM), and user configuration.

Program memory is main memory for user applications and called APROM. User can write their application to APROM and set system to boot from APROM.

ISP loader program memory is designed for a loader to implement In-System-Programming function. LDROM is independent to APROM and system can also be set to boot from LDROM. Therefore, user can use LDROM to avoid system boot fail when code of APROM was corrupted.

Data Flash is used for user to store data. It can be read by ISP read or memory read and programmed through ISP procedure. The size of each erase unit is 512 bytes. For 128 KB APROM device, the Data Flash and application program share the same 128 KB memory, if DFEN (Data Flash Enable) bit in CONFIG0 is enabled, the Data Flash base address is defined by DFBADR and its size is (0x20000 - DFBADR), At the same time, the APROM size will be (128 KB – Data Flash size). For 64/32 KB APROM devices, Data Flash size is always 4 KB and start address is fixed at 0x0001\_F000.

User configuration provides several bytes to control system logic, such as flash security lock, boot select, Brown-out voltage level, Data Flash base address, etc.... User configuration works like a fuse for power on setting and loaded from flash memory to its corresponding control registers during chip powered on.

In NuMicro™ Family, the flash memory organization is different to system memory map. Flash memory organization is used when user using ISP command to read, program or erase flash memory. System memory map is used when CPU access flash memory to fetch code or data. For example, When system is set to boot from LDROM by CBS = 01b, CPU will be able to fetch code of LDROM from 0x0 ~ 0x1FFF. However, if user want to read LDROM by ISP, they still need to read the address of LDROM as 0x0010\_0000 ~ 0x0010\_1FFF.

Table 6-6 and Figure 6-11 show the address mapping information of APROM, LDROM, Data Flash and user configuration for 32/64 and 128 KB devices.

Block Name	Device Type	Size		Start Address	End Address
APROM	32 KB	32 KB		0x0000_0000	0x0000_7FFF
	64 KB	64 KB		0x0000_0000	0x0000_FFFF
	128 KB	Data Flash Enable	128 KB - Data Flash Size	0x0000_0000	0x20000 – Data Flash Size - 1
		Data Flash Disable	128 KB	0x0000_0000	0x0001_FFFF
Data Flash	32 KB	4 KB		0x0001_F000	0x0001_FFFF
	64 KB	4 KB		0x0001_F000	
	128 KB	Data Flash Enable	0x20000-DFBADR	DFBADR	
		Data Flash Disable	0 KB	N/A	N/A
LDROM	32/64/128 KB	8 KB		0x0010_0000	0x0010_1FFF

User Configuration	32/64/128 KB	2 words	0x0030_0000	0x0030_0004
--------------------	--------------	---------	-------------	-------------

Table 6-6 Memory Address Map

The Flash memory organization is shown as Figure 6-11:

Figure 6-11 Flash Memory Organization

#### 6.4.4.2 User Configuration

User configuration is internal programmable configuration area for boot options. The user configuration is located at 0x300000 of Flash Memory Organization and they are two 32 bits words. Any change on user configuration will take effect after system reboot.

#### CONFIG0 (Address = 0x0030\_0000)

31	30	29	28	27	26	25	24
CWDTEN	CWDTPDEN	Reserved		CGPFMFP	CFOSC		
23	22	21	20	19	18	17	16
CBODEN	CBOV		CBORST	Reserved			
15	14	13	12	11	10	9	8
Reserved					CIOINI	Reserved	
7	6	5	4	3	2	1	0
CBS		Reserved				LOCK	DFEN

CONFIG0	Address = 0x0030_0000	
Bits	Description	
[31]	CWDTEN	<b>Watchdog Enable Bit</b> 0 = Watchdog Timer Enabled and force Watchdog Timer clock source as OSC10K after chip powered on. 1 = Watchdog Timer Disabled after chip powered on.
[30]	CWDTPDEN	<b>Watchdog Clock Power-down Enable Bit</b> 0 = OSC10K Watchdog Timer clock source is forced to be always enabled. 1 = OSC10K Watchdog Timer clock source is controlled by OSC10K_EN (PWRCON[3]) when chip enters Power-down. <b>Note:</b> This bit only works at CWDTEN is set to 0
[29:28]	Reserved	Reserved
[27]	CGPFMFP	<b>GPF Multi-function Selection</b> 0 = XT1_IN and XT1_OUT pin is configured as GPIO function. 1 = XT1_IN and XT1_OUT pin is used as external 4~24MHz crystal oscillator pin. <b>Note:</b> XT1_IN, XT1_OUT multi-function can only be changed by CGPFMFP.
[26:24]	CFOSC	<b>CPU Clock Source Selection after Reset</b> 000 = External 4~24 MHz high speed crystal oscillator clock. 111 = Internal RC 22.1184 MHz high speed oscillator clock. Others = Reserved. The value of CFOSC will be load to HCLK_S (CLKSEL0[2:0]) in system register after any reset occurs.
[23]	CBODEN	<b>Brown-out Detector Enable Bit</b> 0= Brown-out detect Enabled after powered on. 1= Brown-out detect Disabled after powered on.

[22:21]	CBOV	<b>Brown-out Voltage Selection</b> 00 = 2.2 V 01 = 2.7 V 10 = 3.7 V 11 = 4.4 V
[20]	CBORST	<b>Brown-out Reset Enable Bit</b> 0 = Brown-out reset Enabled after powered on. 1 = Brown-out reset Disabled after powered on.
[19:11]	Reserved	Reserved
[10]	CIOINI	<b>I/O Initial State Select</b> 0 = All GPIO default to be input tri-state mode after powered on 1 = All GPIO default to be Quasi-bidirectional mode after chip is powered on <b>Note:</b> It is recommended to use 100 kΩ pull-up resistor on both ICE_DAT and ICE_CLK pin.
[9:8]	Reserved	Reserved
[7:6]	CBS	<b>Chip Boot Selection</b> 00 = Boot from LDROM with IAP function 01 = Boot from LDROM without IAP function 10 = Boot from APROM with IAP function 11 = Boot from APROM without IAP function IAP function means APROM and LDROM can be executed and access by CPU without reset. When IAP function enabled, APROM base address is 0x0 and LDROM base address is 0x100000.
[5:2]	Reserved	Reserved
[1]	LOCK	<b>Security Lock</b> 0 = Flash data is locked 1 = Flash data is not locked When flash data is locked, only device ID, CONFIG0 and CONFIG1 can be read by writer and ICP through serial debug interface. Others data is locked as 0xFFFFFFFF. ISP can read data anywhere regardless of LOCK bit value. User need to erase whole chip by ICP/Writer tool or erase user configuration by ISP to unlock.
[0]	DFEN	<b>Data Flash Enable Bit</b> 0 = Data Flash Enabled. 1 = Data Flash Disabled. <b>Note:</b> This bit only for 128 KB APROM Device

Brown-out detection function is for monitoring the voltage on  $V_{DD}$  pin. If  $V_{DD}$  voltage falls below level setting of CBOV, the BOD event will be triggered when BOD enabled. User can decide to use BOD reset by enable CBORST or just enable BOD interrupt by NVIC when BOD detected. Because BOD reset is issued whenever  $V_{DD}$  voltage falls below the level setting of CBOV, user must make sure the CBOV setting to avoid BOD reset right after BOD reset enabled. For example, if the  $V_{DD}$  is 3.3V, CBOV could only be 00'b or 01'b. Otherwise, the system will be halted in BOD reset state when BOD reset is enabled and CBOV is 10'b or 11'b.

**CONFIG1 (Address = 0x0030\_0004)**

7	6	5	4	3	2	1	0
DFBADR.7	DFBADR.6	DFBADR.5	DFBADR.4	DFBADR.3	DFBADR.2	DFBADR.1	DFBADR.0

Config	Address = 0x0030_0004	
Bits	Description	
[31:20]	Reserved	Reserved (It is mandatory to program 0x00 to these Reserved bits)
[19:0]	DFBADR	<b>Data Flash Base Address (Only for 128 KB APROM Device)</b> For 128 KB APROM device, its Data Flash base address is defined by user. Since on-chip flash erase unit is 512 bytes, it is mandatory to keep bit 8-0 as 0. This configuration is only valid for 128 KB flash device.

#### 6.4.4.3 Boot Selection

The NuMicro™ NUC230/240 series provides In-System-Programming (ISP) feature to enable user to update program memory by a stand-alone ISP firmware. A dedicated 8 KB program memory (LDROM) is used to store ISP firmware. User can select to start program fetch from APROM or LDROM by CBS[1] in CONFIG0.

In addition to setting boot from APROM or LDROM, CBS in CONFIG0 is also used to control system memory map after booting. When CBS[0] = 1 and set CBS[1] = 1 to boot from APROM, the application in APROM will not be able to access LDROM by memory read. In other words, when CBS[0] = 1 and CBS[1] = 0 are set to boot from LDROM, the software executed in LDROM will not be able to access APROM by memory read. Figure 6-12 shows the memory map when booting from APROM and LDROM.

Figure 6-12 Program Executing Range for Booting from APROM and LDROM

For the application that software needs to execute code in APROM and call the functions in LDROM or to execute code in LDROM and call the APROM function without changing boot mode, CBS[0] needs to be set as 0 and this is called In-Application-Programming(IAP).

#### 6.4.4.4 In-Application-Programming (IAP)

The NuMicro™ NUC230/240 series provides In-application-programming (IAP) function for user to switch the code executing between APROM and LDROM without a reset. User can enable the IAP function by re-booting chip and setting the chip boot selection bits in CONFIG0 (CBS[1:0]) as 10b or 00b.

In the case that the chip boots from APROM with the IAP function enabled (CBS[1:0] = 10b), the executable range of code includes all of APROM and LDROM. The address space of APROM is kept as the original size but the address space of the 8 KB LDROM is mapped to 0x0010\_0000~0x0010\_1FFF.

In the case that the chip boots from LDROM with the IAP function enabled (CBS[1:0] = 00b), the executable range of code includes all of LDROM and almost all of APROM except for its first page. User cannot access the first page of APROM by CPU because the first page of executable code range becomes the mirror of the first page of LDROM as set by default. Meanwhile, the address space of 8 KB LDROM is mapped to 0x0010\_0000~0x0010\_1FFF.

Please refer to Figure 6-13 for the address map while IAP is activating.

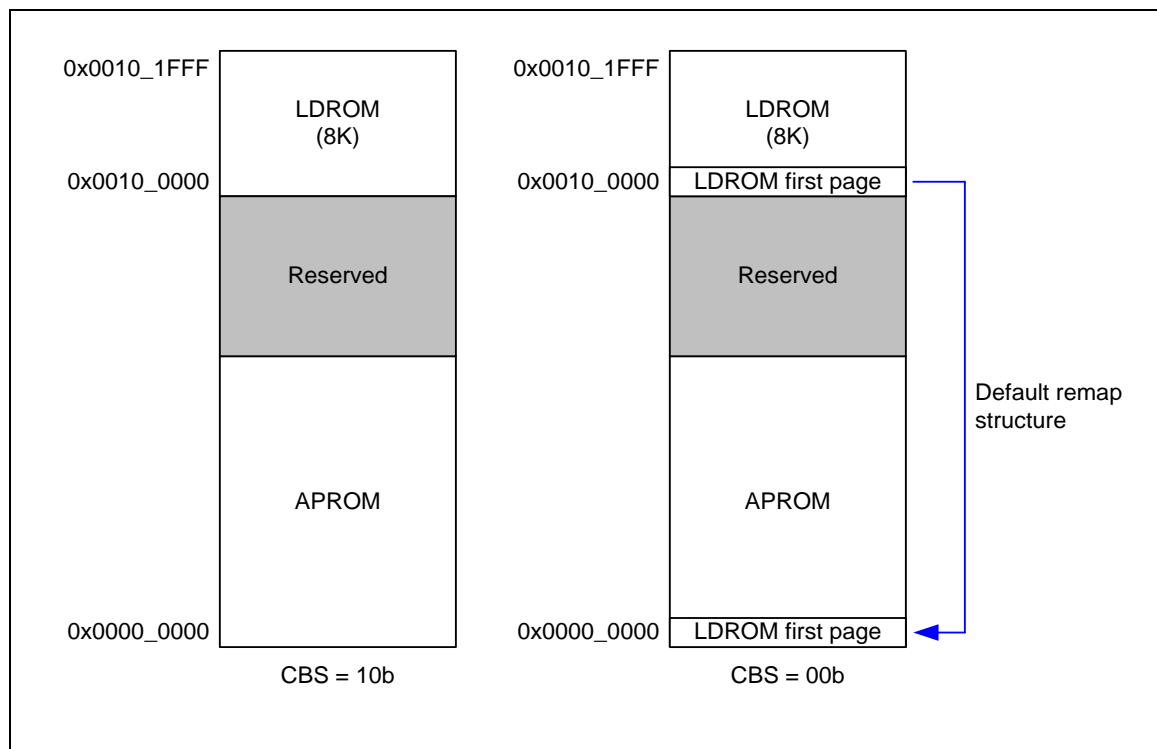

Figure 6-13 Executable Range of Code with IAP Function Enabled

When chip boots with the IAP function enabled, any other page within the executable range of code can be mirrored to the first page of executable code (0x0000\_0000~0x0000\_01FF) any time. User can change the remap address of the first executing page by filling the target remap address to ISPADR and then go through ISP procedure with the Vector Page Re-map command. After changing the remap address, user can check if the change is successful by reading the VECMAP field in the ISPSTA register.

#### 6.4.4.5 In-System-Programming (ISP)

The NuMicro™ NUC230/240 series supports ISP mode which allows a device to be reprogrammed under software control and avoids system fail risk when download or programming fail. Furthermore, the capability to update the application firmware makes a wide range of applications possible.

ISP provides the ability to update system firmware on board. Various peripheral interfaces let ISP loader in LDROM to update application program code easily. The most common method to perform ISP is via UART along with the ISP loader in LDROM. General speaking, PC transfers the new APROM code through serial port. Then ISP loader receives it and re-programs into APROM through ISP commands.

#### 6.4.4.6 ISP Procedure

The NuMicro™ NUC230/240 series supports booting from APROM or LDROM initially defined by user configuration. The change of user configuration needs to reboot system to make it take effect. If user wants to switch between APROM or LDROM mode without changing user configuration, he needs to control BS bit of ISPCON control register, then reset CPU by IPRSTC1 control register. The boot switching flow by BS bit is shown in the following figure.

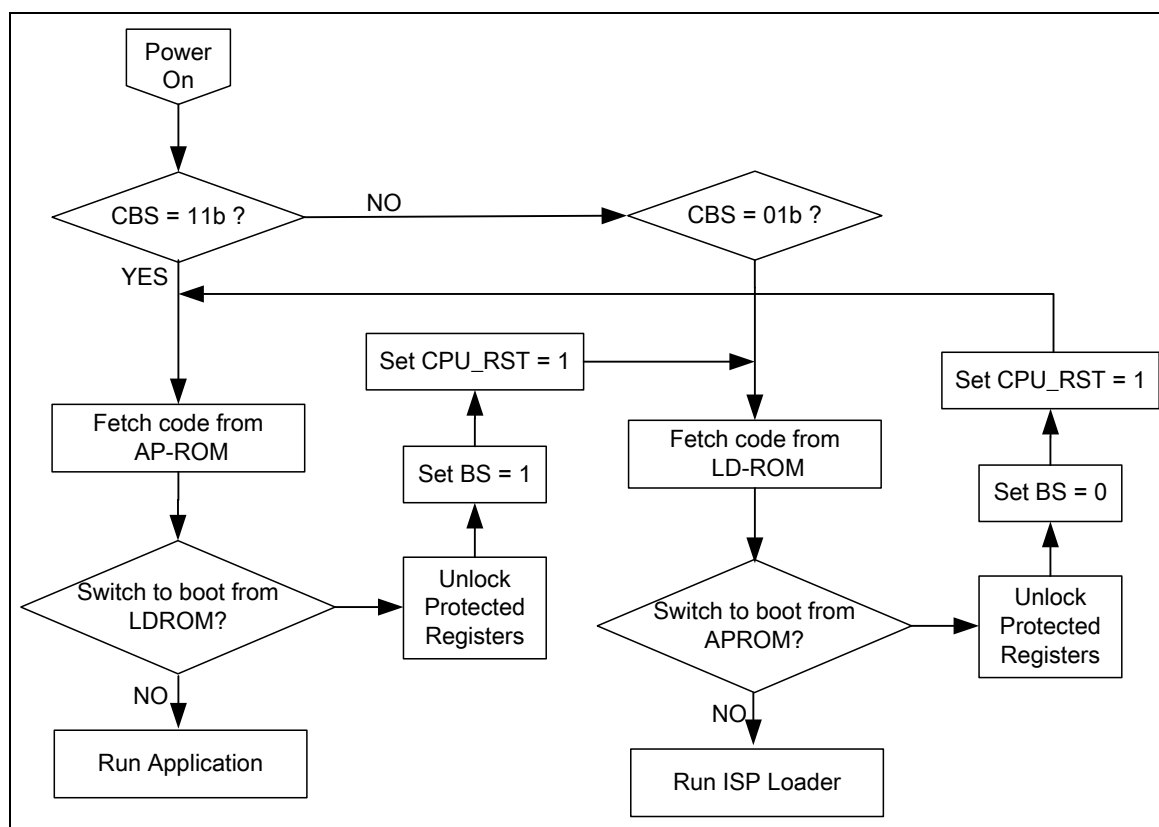

Figure 6-14 Example Flow of Boot Selection by BS Bit

Updating APROM by software in LDROM or updating LDROM by software in APROM can avoid a system failure when update fails.

The ISP controller supports to read, erase and program embedded flash memory. Several control bits of ISP controller are write-protected, thus it is necessary to unlock before we can set them. To unlock the protected register bits, software needs to write 0x59, 0x16 and 0x88 sequentially to

REGWRPROT. If register is unlocked successfully, the value of REGWRPROT will be 1. The unlock sequence must not be interrupted by other access; otherwise it may fail to unlock.

After unlocking the protected register bits, user needs to set the ISPCON control register to decide to update LDROM, User Configuration, APROM and enable ISP controller.

Once the ISPCON register is set properly, user can set ISPCMD for erase, read or programming. Set ISPADR for target flash memory based on flash memory origination. ISPDAT can be used to set the data to program or used to return the read data according to ISPCMD.

Finally, set ISPGO bit of ISPTRG control register to perform the relative ISP function. The ISPGO bit is self-cleared when ISP function has been done. To make sure ISP function has been finished before CPU goes ahead, ISB instruction is used right after ISPGO setting.

Several error conditions are checked after ISP is completed. If an error condition occurs, ISP operation is not started and the ISP fail flag will be set instead. ISPFF flag can only be cleared by software. The next ISP procedure can be started even ISPFF bit is kept as 1. Therefore, it is recommended to check the ISPFF bit and clear it after each ISP operation if it is set to 1.

When the ISPGO bit is set, CPU will wait for ISP operation to finish during this period; the peripheral still keeps working as usual. If any interrupt request occurs, CPU will not service it till ISP operation is finished. When ISP operation is finished, the ISPGO bit will be cleared by hardware automatically. User can check whether ISP operation is finished or not by the ISPGO bit. User should add ISB instruction next to the instruction in which ISPGO bit is set 1 to ensure correct execution of the instructions following ISP operation.

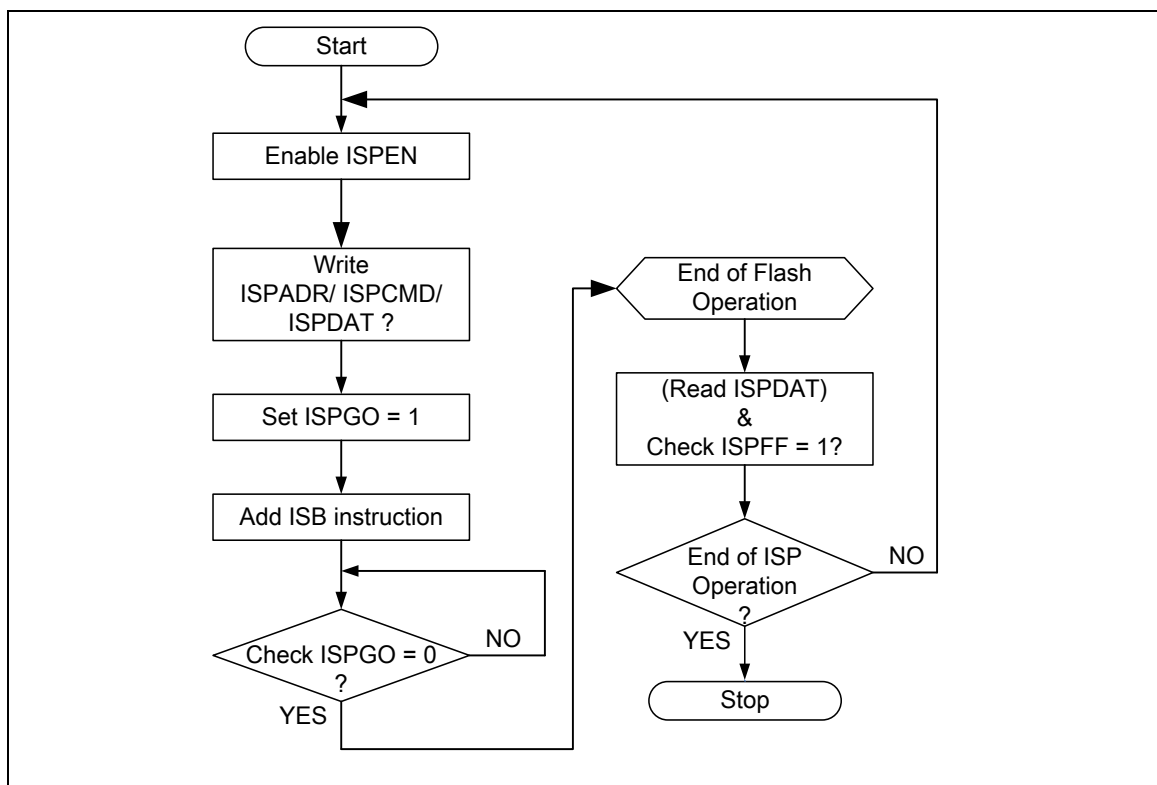

Figure 6-15 ISP Flow Example

ISP Command	ISPCMD	ISPADR	ISPDAT
FLASH Page Erase	0x22	Valid address of flash memory origination. It must be 512 bytes page alignment.	N/A

FLASH Program	0x21	Valid address of flash memory origination	Programming Data
FLASH Read	0x00	Valid address of flash memory origination	Return Data
Read Unique ID	0x04	0x0000_0000	Unique ID Word 0

## 6.5 External Bus Interface (EBI)

### 6.5.1 Overview

The NuMicro™ NUC100 series LQFP-64 and LQFP-100 package equips an external bus interface (EBI) for access external device.

To save the connections between external device and this chip, EBI supports address bus and data bus multiplex mode. And, address latch enable (ALE) signal is used to differentiate the address and data cycle.

### 6.5.2 Features

External Bus Interface has the following functions:

- Supports external devices with max. 64 KB size (8-bit data width)/128 KB (16-bit data width)
- Supports variable external bus base clock (MCLK) which based on HCLK
- Supports 8-bit or 16-bit data width
- Supports variable data access time (tACC), address latch enable time (tALE) and address hold time (tAHD)
- Supports address bus and data bus multiplex mode to save the address pins
- Supports configurable idle cycle for different access condition: Write command finish (W2X), Read-to-Read (R2R)

### 6.5.3 Block Diagram

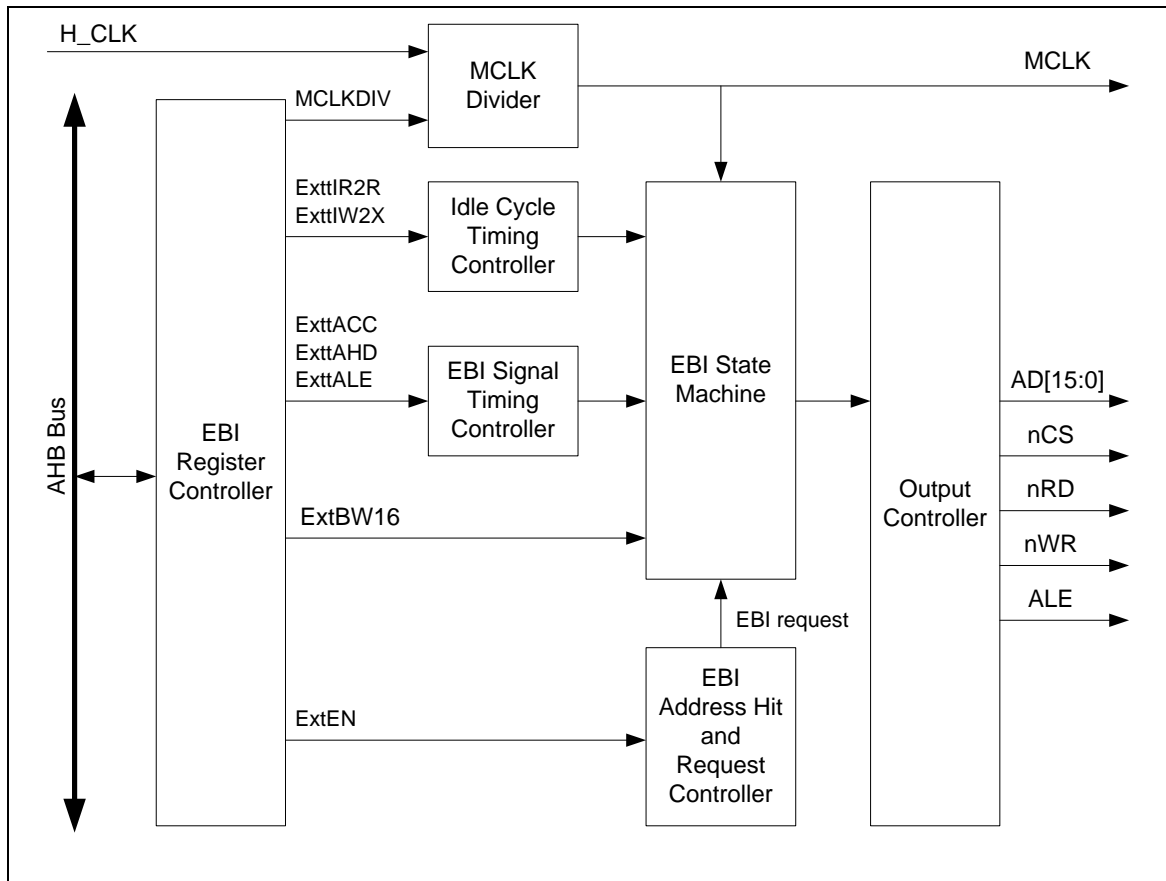

Figure 6-16 EBI Block Diagram

## 6.5.4 Functional Description

### 6.5.4.1 EBI Area and Address Hit

The EBI mapping address is located at 0x6000\_0000 ~ 0x6001\_FFFF and the maximum available memory space is 128 Kbytes. When the system request address hits EBI's memory space, the corresponding EBI chip select signal (nCS) is assert and EBI state machine operates.

For an 8-bit device (64 Kbytes), EBI mapped this 64 Kbytes device to 0x6000\_0000 ~ 0x6000\_FFFF and 0x6001\_0000 ~ 0x6001\_FFFF simultaneously.

For a 16-bit device (128 Kbytes), EBI mapped this 128 Kbytes device to 0x6000\_0000 ~ 0x6001\_FFFF.

### 6.5.4.2 EBI Data Width Connection

The EBI controller supports to connect the external device whose address bus and data bus are multiplexed. For the external device with separated address and data bus, the connection to device needs additional logic (latch device) to latch the address. In this case, pin ALE is connected to the latch device to latch the address value. Pins AD0~AD15 for 16-bit data width / Pins AD0~AD7 for 8-bit data width are the input pins of the latch device, and the output pins of the latch device are connected to the Addr[15:0] of external device.

For 16-bit device, the AD [15:0] shared by address (Addr [15:0]) and 16-bit data (Data [15:0]). For 8-bit device, only AD [7:0] shared by address (Addr [7:0]) and 8-bit data (Data [7:0]), AD [15:8] is dedicated for address (Addr [15:8]) and could be connected to 8-bit device directly.

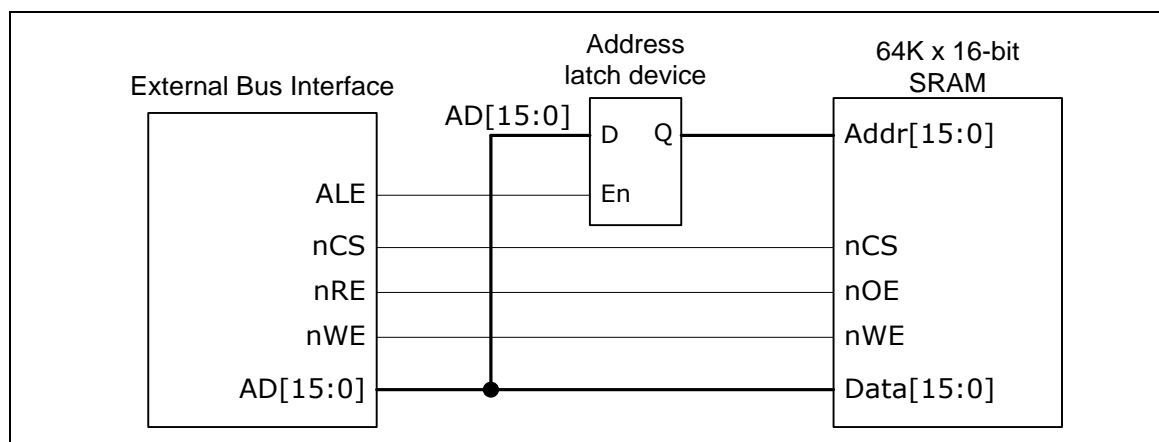

Figure 6-17 Connection of 16-bit EBI Data Width with 16-bit Device

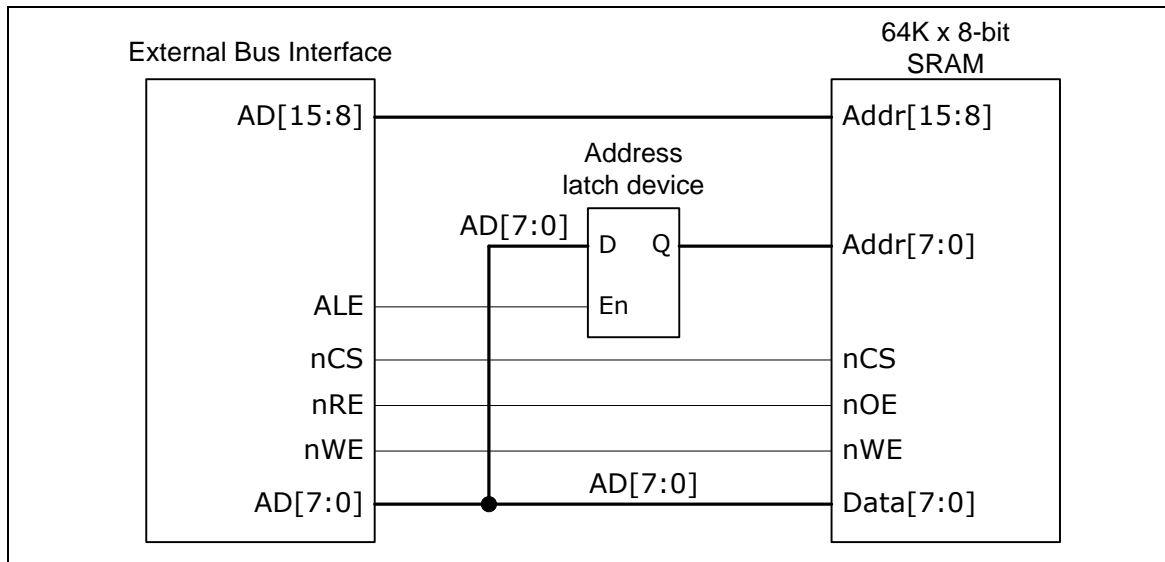

Figure 6-18 Connection of 8-bit EBI Data Width with 8-bit Device

When the system access data width is larger than EBI data width (8-bit / 16 bit data width), the EBI controller will finish a system access command by operating EBI access more than once. For example, if system requests a 32-bit data through EBI device, the EBI controller will operate accessing four times when setting EBI data width with 8-bit data width.

#### 6.5.4.3 EBI Operating Control

##### MCLK Control

In the chip, all EBI signals will be synchronized by MCLK when EBI is operating. When the chip connects to the external device with slower operating frequency, the MCLK can divide most to 32 from HCLK by setting MCLKDIV[2:0] (EBICON [10:8] External Output Clock Divider). Therefore, the EBI controller is suitable for a wide frequency range of EBI device. If MCLK frequency is setting as HCLK/1, EBI signals are synchronized by positive edge of MCLK, else by negative edge of MCLK.

##### Operation and Access Timing Control

In the start of EBI access, chip select signal (nCS) asserts to low and waits one MCLK for address setup time (tASU) for address stable. Then ALE signal asserts to high after address is stable and keeps for a period of time (tALE) for latch address. After latch address, ALE signal asserts to low and wait one MCLK for address latch hold time (tLHD) and another one MCLK cycle (tA2D) that is inserted behind address latch hold time (tLHD) to be the bus turn-around time for address change to data. Then nRD signal asserts to low when read access or nWR signal asserts to low when write access. Then nRD or nWR signal asserts to high after keeps access time (tACC) for reading output stable or writing finish. After that, EBI signals keep for data access hold time (tAHD) and chip select signal (nCS) asserts to high then address is released by current access control.

The EBI controller provides a flexible timing control for different external devices. In EBI timing control, tASU, tLHD and tA2D are all fixed to 1 MCLK cycle, tAHD can modulate to 1~8 MCLK cycles by setting ExttAHD[2:0] (EXTIME [10:8] EBI Data Access Hold Time), tACC can modulate to 1~32 MCLK cycles by setting ExttACC[4:0] (EXTIME [7:3] EBI Data Access Time), and tALE can modulate to 1~8 MCLK cycles by setting ExttALE [2:0] (EBICON [18:16] Expand Time of ALE).

Parameter	Value	Unit	Description
tASU	1	MCLK	Address Latch Setup Time.
tALE	1 ~ 8	MCLK	ALE High Period. Controlled by ExttALE[2:0] of EBICON[18:16].
tLHD	1	MCLK	Address Latch Hold Time.
tA2D	1	MCLK	Address To Data Delay (Bus Turn-Around Time).
tACC	1 ~ 32	MCLK	Data Access Time. Controlled by ExttACC[4:0] of EXTIME[7:3].
tAHD	1 ~ 8	MCLK	Data Access Hold Time. Controlled by ExttAHD[2:0] of EXTIME[10:8].
IDLE	0 ~ 15	MCLK	Idle Cycle. Controlled by ExttR2R[3:0] of EXTIME[27:24] and ExttW2X[3:0] of EXTIME[15:12].

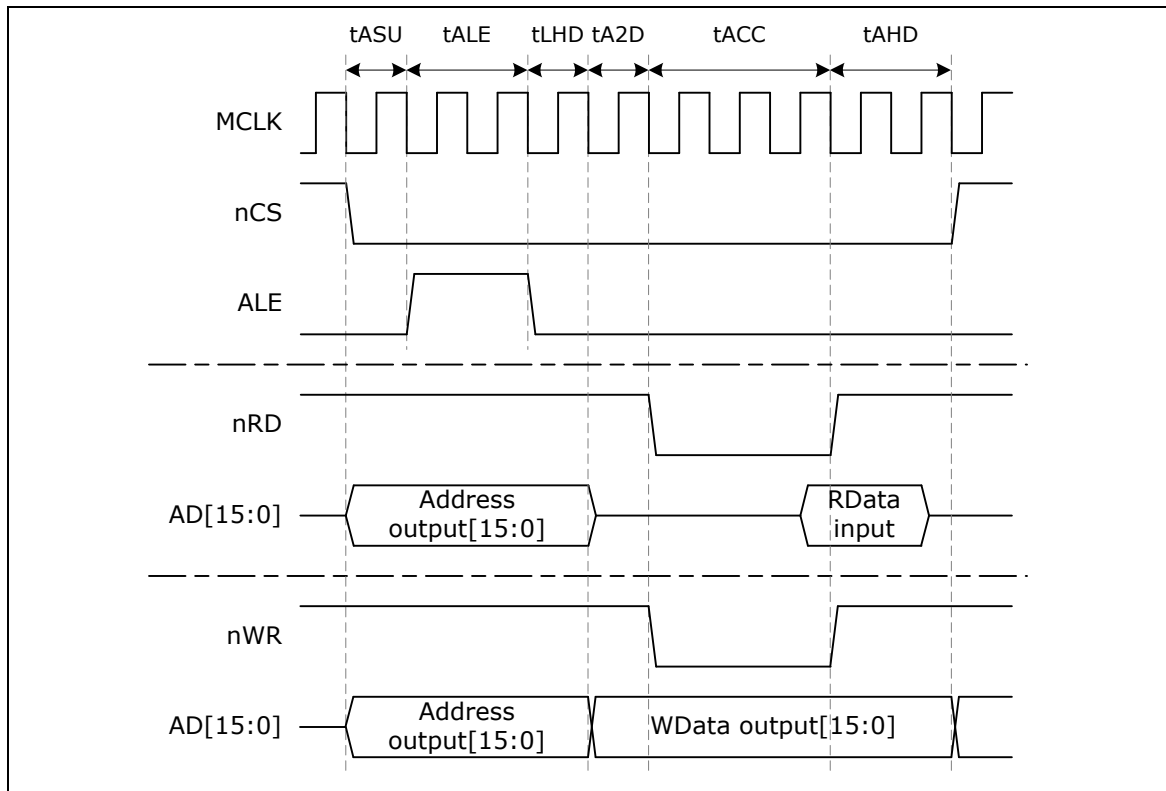

Figure 6-19 Timing Control Waveform for 16-bit Data Width

The figure above shows an example of setting 16-bit data width for EBI application. In this example, AD0~AD15 are used to be address[15:0] and data[15:0]. When ALE signal asserts to high, AD0~AD15 are the address output. After address is latched (tLHD), ALE signal asserts to low and the AD bus changes to high impedance to wait device output data in read access operation, or it is used to be write data output.

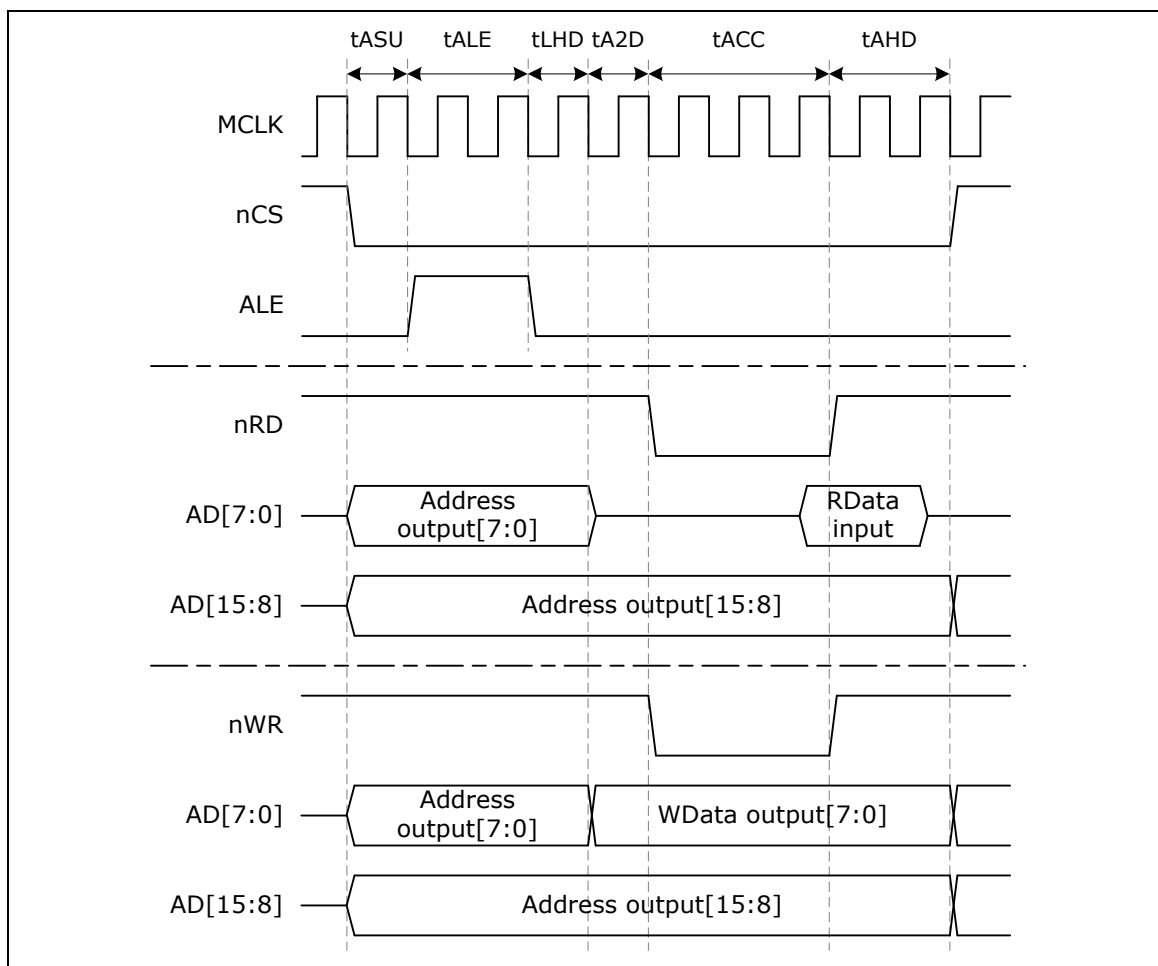

Figure 6-20 Timing Control Waveform for 8-bit Data Width

The figure above shows an example of setting 8-bit data width for EBI application. The difference between 8-bit and 16-bit data width is AD8~AD15. In 8-bit data width setting, and AD8~AD15 are always the Address[15:8] output so that the external latch needs only 8-bit width.

### Insert Idle Cycle

When EBI is accessing continuously, bus conflict may occur if the device access time is much longer compared with system clock frequency. The EBI controller supplies additional idle cycle to solve this problem. During idle cycle period, all control signals of EBI bus are inactive. The following figure shows idle cycle.

Figure 6-21 Timing Control Waveform for Insert Idle Cycle

There are two conditions that EBI can insert idle cycle by timing control:

1. After write access
2. After read access and before the next read access

By setting ExtIW2X[3:0] of EXTIME [15:12] and ExtIR2R[3:0] of the register EXTIME[27:24], the time of idle cycle can be specified from 0~15 MCLK.

### 6.5.5 Register Map

## 6.6 General Purpose I/O (GPIO)

### 6.6.1 Overview

The NuMicro™ NUC230/240 series has up to 84 General Purpose I/O pins to be shared with other function pins depending on the chip configuration. These 84 pins are arranged in 6 ports named as GPIOA, GPIOB, GPIOC, GPIOD, GPIOE and GPIOF. The GPIOA/B/C/D/E port has the maximum of 16 pins and GPIOF port has the maximum of 4 pins. Each of the 84 pins is independent and has the corresponding register bits to control the pin mode function and data.

The I/O type of each of I/O pins can be configured by software individually as input, output, open-drain or Quasi-bidirectional mode. After reset, the I/O mode of all pins are depending on Config0[10] setting. In Quasi-bidirectional mode, I/O pin has a very weak individual pull-up resistor which is about 110~300 K $\Omega$  for  $V_{DD}$  is from 5.0 V to 2.5 V.

### 6.6.2 Features

- Four I/O modes:
  - Quasi-bidirectional
  - Push-Pull output
  - Open-Drain output
  - Input only with high impendence
- TTL/Schmitt trigger input selectable by GPx\_TYPE[15:0] in GPx\_MFP[31:16]
- I/O pin configured as interrupt source with edge/level setting
- Configurable default I/O mode of all pins after reset by Config0[10] setting
  - If Config[10] is 0, all GPIO pins in input tri-state mode after chip reset
  - If Config[10] is 1, all GPIO pins in Quasi-bidirectional mode after chip reset
- I/O pin internal pull-up resistor enabled only in Quasi-bidirectional I/O mode
- Enabling the pin interrupt function will also enable the pin wake-up function.

### 6.6.3 Basic Configuration

The GPIO pin functions are configured in GPA\_MFP, GPB\_MFP, GPC\_MFP, GPD\_MFP, GPE\_MFP, ALT\_MFP, ALT\_MFP1 and ALT\_MFP2 registers.

## 6.6.4 Functional Description

### 6.6.4.1 Input Mode Explanation

Set GPIOx\_PMD (PMDn[1:0]) to 00b as the GPIOx port [n] pin is in Input mode and the I/O pin is in tri-state (high impedance) without output drive capability. The GPIOx\_PIN value reflects the status of the corresponding port pins.

### 6.6.4.2 Push-pull Output Mode Explanation

Set GPIOx\_PMD (PMDn[1:0]) to 01b as the GPIOx port [n] pin is in Push-pull Output mode and the I/O pin supports digital output function with source/sink current capability. The bit value in the corresponding bit [n] of GPIOx\_DOUT is driven on the pin.

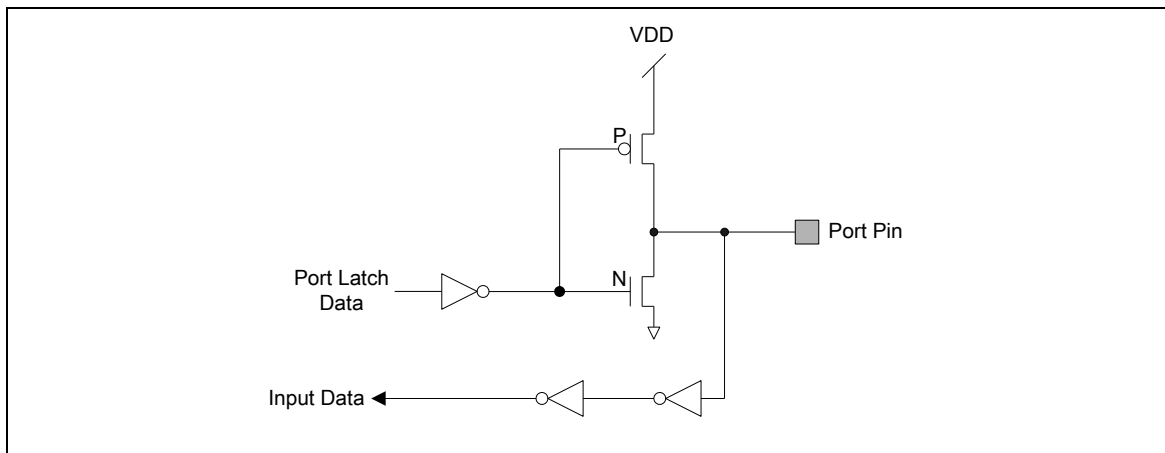

Figure 6-22 Push-Pull Output

#### 6.6.4.3 Open-drain Output Mode Explanation

Set GPIOx\_PMD (PMDn[1:0]) to 10b as the GPIOx port [n] pin is in Open-drain mode and the digital output function of I/O pin supports only sink current capability, an additional pull-up resistor is needed for driving high state. If the bit value in the corresponding bit [n] of GPIOx\_DOUT is 0, the pin drive a “low” output on the pin. If the bit value in the corresponding bit [n] of GPIOx\_DOUT is 1, the pin output drives high that is controlled by external pull-up resistor.

Figure 6-23 Open-Drain Output

#### 6.6.4.4 Quasi-bidirectional Mode Explanation

Set GPIOx\_PMD (PMDn[1:0]) to 11b as the GPIOx port [n] pin is in Quasi-bidirectional mode and the I/O pin supports digital output and input function at the same time but the source current is only up to hundreds of uA. Before the digital input function is performed the corresponding bit in GPIOx\_DOUT must be set to 1. The Quasi-bidirectional output is common on the 80C51 and most of its derivatives. If the bit value in the corresponding bit [n] of GPIOx\_DOUT is 0, the pin drive a “low” output on the pin. If the bit value in the corresponding bit [n] of GPIOx\_DOUT is 1, the pin will check the pin value. If pin value is high, no action takes. If pin state is low, then pin will drive strong high with 2 clock cycles on the pin and then disable the strong output drive and then the pin status is control by internal pull-up resistor. Note that the source current capability in Quasi-bidirectional mode is only about 200 uA to 30 uA for V<sub>DD</sub> is form 5.0 V to 2.5 V.

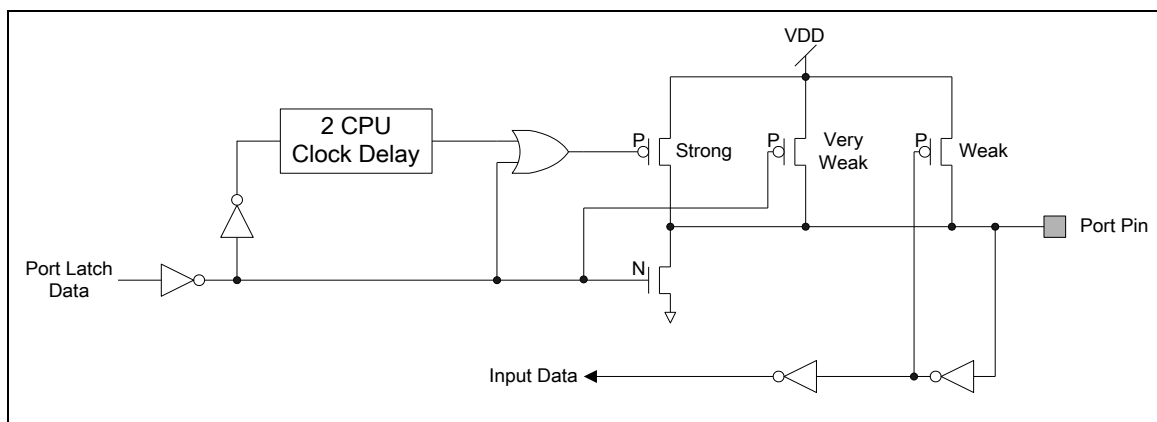

Figure 6-24 Quasi-bidirectional I/O Mode

#### 6.6.4.5 GPIO Interrupt and Wake-up Function

Each GPIO pin can be set as chip interrupt source by setting correlative GPIOx\_IEN bit and GPIOx\_IMD. There are four types of interrupt condition can be selected: low level trigger, high level trigger, falling edge trigger and rising edge trigger. For edge trigger condition, user can enable input signal de-bounce function to prevent unexpected interrupt happened which caused by noise. The de-bounce clock source and sampling cycle can be set through DEBOUNCE register.

The GPIO can also be the chip wake-up source when chip enters Idle mode or Power-down mode. The setting of wake-up trigger condition is the same as GPIO interrupt trigger, but there is one thing need to be noticed if using GPIO as chip wake-up source

- **To ensure the I/O status before enter into Power-down mode**

When using toggle GPIO to wake-up system, user must make sure the I/O status before entering Idle mode or Power-down mode according to the relative wake-up settings.

For example, if configuring the wake-up event occurred by I/O rising edge/high level trigger, user must make sure the I/O status of specified pin is at low level before entering to Idle/Power-down mode; and if configure I/O falling edge/low level trigger to trigger a wake-up event, user must make sure the I/O status of specified pin is at high level before entering to Power-down mode.

### 6.6.5 Register Map

Bits	Description
[0]	<p><b>Pxn_PDIO</b></p> <p><b>GPIO Px.N Pin Data Input/Output</b> Write this bit can control one GPIO pin output value 0 = Corresponding GPIO pin set to low. 1 = Corresponding GPIO pin set to high. Read this register to get GPIO pin status. For example: writing PA0_PDIO will reflect the written value to bit GPIOA_DOUT[0], read PA0_PDIO will return the value of GPIOA_PIN[0] <b>Note:</b> The write operation will not be affected by register GPIOx_DMASK</p>

## 6.7 PDMA Controller (PDMA)

### 6.7.1 Overview

The NuMicro™ NUC230/240 series DMA contains nine-channel peripheral direct memory access (PDMA) controller and a cyclic redundancy check (CRC) generator.

The PDMA that transfers data to and from memory or transfer data to and from APB devices. For PDMA channel (PDMA CH0~CH8), there is one-word buffer as transfer buffer between the Peripherals APB devices and Memory. Software can stop the PDMA operation by disable PDMA PDMACEN (PDMA\_CSRx[0]). The CPU can recognize the completion of a PDMA operation by software polling or when it receives an internal PDMA interrupt. The PDMA controller can increase source or destination address or fixed them as well.

The DMA controller contains a cyclic redundancy check (CRC) generator that can perform CRC calculation with programmable polynomial settings. The CRC engine supports CPU PIO mode and DMA transfer mode.

### 6.7.2 Features

- Supports nine PDMA channels and one CRC channel. Each PDMA channel can support a unidirectional transfer
- AMBA AHB master/slave interface compatible, for data transfer and register read/write
- Hardware round robin priority scheme. DMA channel 0 has the highest priority and channel 8 has the lowest priority
- PDMA operation
  - Peripheral-to-memory, memory-to-peripheral, and memory-to-memory transfer
  - Supports word/half-word/byte transfer data width from/to peripheral
  - Supports address direction: increment, fixed.
- Cyclic Redundancy Check (CRC)
  - Supports four common polynomials CRC-CCITT, CRC-8, CRC-16, and CRC-32
    - CRC-CCITT:  $X^{16} + X^{12} + X^5 + 1$
    - CRC-8:  $X^8 + X^2 + X + 1$
    - CRC-16:  $X^{16} + X^{15} + X^2 + 1$
    - CRC-32:  $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$
  - Supports programmable CRC seed value.
  - Supports programmable order reverse setting for input data and CRC checksum.
  - Supports programmable 1's complement setting for input data and CRC checksum.
  - Supports CPU PIO mode or DMA transfer mode.
  - Supports the follows write data length in CPU PIO mode
    - 8-bit write mode (byte): 1-AHB clock cycle operation.
    - 16-bit write mode (half-word): 2-AHB clock cycle operation.
    - 32-bit write mode (word): 4-AHB clock cycle operation.
  - Supports byte alignment transfer data length and word alignment transfer source address in CRC DMA mode.

### 6.7.3 Block Diagram

Figure 6-25 DMA Controller Block Diagram

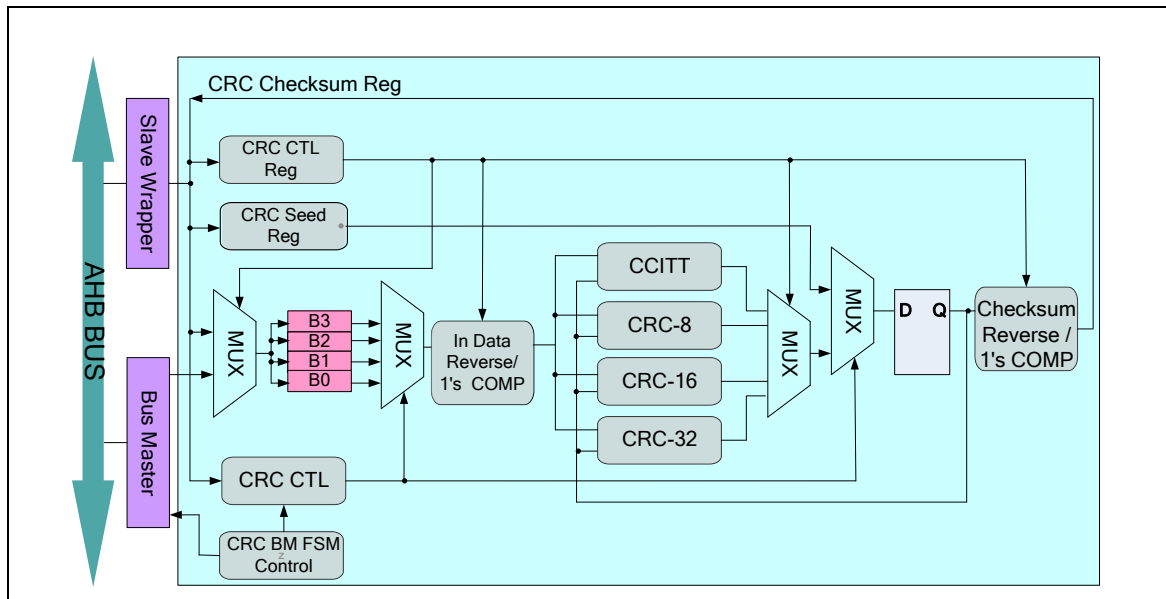

Figure 6-26 CRC Generator Block Diagram

#### 6.7.4 Basic Configuration

The PDMA controller peripheral clock can be enabled in PDMA\_EN (AHBCLK[1]).

#### 6.7.5 Functional Description

The direct memory access (DMA) controller module transfers data from one address to another address, without CPU intervention. The DMA controller contains nine PDMA (Peripheral-to-Memory or Memory-to-Peripheral or Memory-to-Memory) channels and one CRC generator channel.

The CPU can recognize the completion of a DMA operation by software polling or when it receives an internal DMA interrupt.

##### 6.7.5.1 PDMA

The DMA controller has nine channels PDMA (Peripheral-to-Memory or Memory-to-Peripheral or Memory-to-Memory). As to the source and destination address, the PDMA controller has two modes: increased and fixed.

Every PDMA channel behavior is not pre-defined, users must configure the channel service settings of PDMA\_PDSSR0, PDMA\_PDSSR1 and PDMA\_PDSSR2 registers before starting the related PDMA channel.

Software must enable PDMA channel by setting PDMACEN (PDMA\_CSRx[0]) bit and then write a valid source address to the PDMA\_SARx register, a destination address to the PDMA\_DARx register, and a transfer count to the PDMA\_BCRx register. Next, trigger the TRIG\_EN (PDMA\_CSRx[23]). PDMA will continue the transfer until PDMA\_CBCRx counts down to 0. The following sequence is a program sequence example.

- Enable PDMA peripheral clock by setting PDMA\_EN (AHBCLK[1]) bit.
- Configure the channel service setting by setting PDMA\_PDSSR0/ PDMA\_PDSSR1/ PDMA\_PDSSR2 register.
- Configure PDMA\_CSRx register:
  - Enable PDMA channel(PDMACEN (PDMA\_CSRx[0]))
  - Set source/destination address direction(SAD\_SEL (PDMA\_CSRx[5:4]) / DAD\_SEL (PDMA\_CSRx[7:6]))
  - Configure PDMA mode selection(MODE\_SEL (PDMA\_CSRx[3:2]))
  - Configure peripheral transfer width selection (APB\_TWS (PDMA\_CSRx[20:19])).
- Configure source/destination address by setting PDMA\_SARx/PDMA\_DARx registers.
- Configure PDMA\_transfer byte count by setting PDMA\_BCRx register.
- Enable PDMA block transfer done interrupt by setting BLKD\_IE(PDMA\_IERx [1]). (optional)
- Enable PDMA NVIC by setting NVIC\_IUSER register bit 26 to “1”. (optional)
- Enable PDMA read/write transfer by setting TRIG\_EN (PDMA\_CSRx[23]) bit.
- If PDMA block transfer done interrupt is generated, write “1” to BLKD\_IF (PDMA\_ISRx[1])by software to clear interrupt flag.

- Enable PDMA read/write transfer by setting the TRIG\_EN (PDMA\_CSRx[23]) bit for the next block transfer.

If an error occurs during the PDMA operation, the channel stops unless software clears the error condition and sets the SW\_RST (PDMA\_CSRx[1]) to reset the PDMA channel and set PDMA\_CEN (PDMA\_CSRx[0]) and TRIG\_EN (PDMA\_CSRx[23]) bits field to start again.

In PDMA (Peripheral-to-Memory or Memory-to-Peripheral) mode, DMA can transfer data between the Peripherals (e.g. UART, SPI, ADC) and Memory.

#### 6.7.5.2 CRC

The DMA controller contains a cyclic redundancy check (CRC) generator that can perform CRC calculation with programmable polynomial settings. The operation polynomial includes CRC-CCITT, CRC-8, CRC-16 and CRC-32; Software can choose the CRC operation polynomial mode by setting CRC polynomial mode (CRC\_MODE (CRC\_CTL[31:30])).

The CRC engine supports CPU PIO mode if CRC channel enable bit CRCCEN (CRC\_CLT[0]) is 1, CRC DMA trigger enable bit TRIG\_EN (CRC\_CTL[23]) is 0 and DMA transfer mode if CRC channel enable bit CRCCEN (CRC\_CLT[0]) is 1, CRC DMA trigger enable bit TRIG\_EN (CRC\_CTL[23]) is 1. The following sequence is a program sequence example.

Procedure when operating in CPU PIO mode:

- Enable CRC engine by setting CRC channel enable bit CRCCEN (CRC\_CLT[0]) to 1.
- Set the transfer data format to enable write data order reverse (WDATA\_RVS (CRC\_CTL[24])), checksum reverse (CHECKSUM\_RVS (CRC\_CTL[25])), write data 1's complement (WDATA\_COM (CRC\_CTL[26])), checksum 1's complement (CHECKSUM\_COM (CRC\_CTL[27])), initial seed value in CRC seed register (CRC\_SEED (CRC\_SEED[31:0])) and select write data length by setting CPU write data length (CPU\_WDLN (CRC\_CTL[29:28])).
- Set the CRC engine reset bit CRC\_RST (CRC\_CTL[1]) to 1 to load the initial seed value to CRC circuit but others contents of CRT\_CTL register will not be cleared. This bit will be cleared automatically.
- Write data to CRC write data register (CRC\_WDATA (CRC\_WDATA[31:0])) to perform CRC calculation.
- Then, get the CRC checksum results by reading the CRC checksum register (CRC\_CHECKSUM (CRC\_CHECKSUM[31:0])).

Procedure when operating in CRC DMA mode:

- Enable CRC engine by setting CRC Channel Enable bit CRCCEN (CRC\_CLT[0]) to 1.
- Set the transfer data format to enable write data order reverse (WDATA\_RVS (CRC\_CTL[24])), checksum reverse (CHECKSUM\_RVS (CRC\_CTL[25])), write data 1's complement (WDATA\_COM (CRC\_CTL[26])), checksum 1's complement (CHECKSUM\_COM (CRC\_CTL[27])) and initial seed value in CRC seed register (CRC\_SEED (CRC\_SEED[31:0])).
- Specify a valid source address (word alignment) and transfer counts by setting CRC DMA transfer source address register (CRC\_DMASAR (CRC\_DMASAR[31:0])) and CRC DMA transfer byte count register (CRC\_DMABCR (CRC\_DMABCR[15:0])).
- Set CRC DMA trigger enable bit TRIG\_EN (CRC\_CTL[23]) to 1 to perform CRC calculation.
- Wait CRC DMA transfer and check if CRC DMA transfer is done by the CRC DMA block transfer done interrupt flag (CRC\_BLKD\_IF (CRC\_DMAISR[1])), and then get

the CRC checksum results by reading the CRC checksum register (CRC\_CHECKSUM (CRC\_CHECKSUM[31:0])).

### 6.7.6 Register Map

R: read only, W: write only, R/W: both read and write

DAD_SEL		SAD_SEL		MODE_SEL		SW_RST	PDMACEN

Bits	Description
[31:24]	<b>Reserved</b> Reserved.
[23]	<b>TRIG_EN</b> <b>Trigger Enable Bit</b> 0 = No effect. 1 = PDMA data read or write transfer Enabled. <b>Note:</b> When PDMA transfer completed, this bit will be cleared automatically. If the bus error occurs, all PDMA transfer will be stopped. Software must reset all PDMA channel, and then trigger again.
[22:21]	<b>Reserved</b> Reserved.
[20:19]	<b>APB_TWS</b> <b>Peripheral Transfer Width Selection</b> 00 = One word (32-bit) is transferred for every PDMA operation. 01 = One byte (8-bit) is transferred for every PDMA operation. 10 = One half-word (16-bit) is transferred for every PDMA operation. 11 = Reserved. <b>Note:</b> This field is meaningful only when MODE_SEL (PDMA_CSRx[3:2]) is Peripheral to Memory mode (Peripheral-to-Memory) or Memory to Peripheral mode (Memory-to-Peripheral).
[18:8]	<b>Reserved</b> Reserved.
[7:6]	<b>DAD_SEL</b> <b>Transfer Destination Address Direction Selection</b> 00 = Transfer destination address is increasing successively. 01 = Reserved. 10 = Transfer destination address is fixed. (This feature can be used when data where transferred from multiple sources to a single destination). 11 = Reserved.

[5:4]	<b>SAD_SEL</b>	<b>Transfer Source Address Direction Selection</b> 00 = Transfer source address is increasing successively. 01 = Reserved. 10 = Transfer source address is fixed (This feature can be used when data where transferred from a single source to multiple destinations). 11 = Reserved.
[3:2]	<b>MODE_SEL</b>	<b>PDMA Mode Selection</b> 00 = Memory to Memory mode (Memory-to-Memory). 01 = Peripheral to Memory mode (Peripheral-to-Memory). 10 = Memory to Peripheral mode (Memory-to-Peripheral).
[1]	<b>SW_RST</b>	<b>Software Engine Reset</b> 0 = No effect. 1 = Reset the internal state machine, pointers and internal buffer. The contents of control register will not be cleared. This bit will be automatically cleared after few clock cycles.
[0]	<b>PDMACEN</b>	<b>PDMA Channel Enable Bit</b> Setting this bit to 1 enables PDMA operation. If this bit is cleared, PDMA will ignore all PDMA request and force Bus Master into IDLE state. <b>Note:</b> SW_RST(PDMA_CSRx[1], x= 0~8) will clear this bit.

**PDMA Channel x Source Address Register (PDMA\_SARx)**

7	6	5	4	3	2	1	0
Reserved						BLKD_IF	TABORT_IF

Bits	Description	
[31:2]	Reserved	Reserved.
[1]	BLKD_IF	<b>PDMA Block Transfer Done Interrupt Flag</b> This bit indicates that PDMA has finished all transfers. 0 = Not finished. 1 = Done. Write 1 to clear this bit to 0.
[0]	TABORT_IF	<b>PDMA Read/Write Target Abort Interrupt Flag</b> Write 1 to clear this bit to 0. 0 = No bus ERROR response received. 1 = Bus ERROR response received. <b>Note:</b> This bit filed indicates bus master received ERROR response or not. If bus master received ERROR response, it means that target abort is happened. PDMA controller will stop transfer and respond this event to software then goes to IDLE state. When target abort occurred, software must reset PDMA, and then transfer those data again.

### PDMA Shared Buffer FIFO 0 Register (PDMA\_SBUF0\_Cx)

Register	Offset	R/W	Description	Reset Value
PDMA_SBUF0_Cx x=0,1 .. 8	PDMA_CHx_BA+0x80	R	PDMA Channel x Shared Buffer FIFO 0 Register	0x0000_0000

31	30	29	28	27	26	25	24
PDMA_SBUF0 [31:24]							
23	22	21	20	19	18	17	16

PDMA_SBUF0 [15:8]							
7	6	5	4	3	2	1	0
PDMA_SBUF0 [7:0]							

Bits	Description
[31:0]	<b>PDMA_SBUF0</b> <b>PDMA Shared Buffer FIFO 0 (Read Only)</b> Each channel has its own 1 word internal buffer.

### CRC Control Register (CRC\_CTL)

Register	Offset	R/W	Description	Reset Value
CRC_CTL	CRC_BA+0x00	R/W	CRC Control Register	0x2000_0000

31	30	29	28	27	26	25	24
CRC_MODE		CPU_WDLEN		CHECKSUM_COM	WDATA_COM	CHECKSUM_RVS	WDATA_RVS
23	22	21	20	19	18	17	16
TRIG_EN	Reserved						
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved						CRC_RST	CRCCEN

Bits	Description
[31:30]	<b>CRC_MODE</b> <b>CRC Polynomial Mode</b> This field indicates the CRC operation polynomial mode. 00 = CRC-CCITT Polynomial Mode. 01 = CRC-8 Polynomial Mode. 10 = CRC-16 Polynomial Mode. 11 = CRC-32 Polynomial Mode.
[29:28]	<b>CPU_WDLEN</b> <b>CPU Write Data Length</b> This field indicates the CPU write data length only when operating in CPU PIO mode. 00 = The write data length is 8-bit mode. 01 = The write data length is 16-bit mode. 10 = The write data length is 32-bit mode. 11 = Reserved. <b>Note1:</b> This field is only valid when operating in CPU PIO mode. <b>Note2:</b> When the write data length is 8-bit mode, the valid data in CRC_WDATA register is only CRC_WDATA [7:0] bits; if the write data length is 16-bit mode, the valid data in CRC_WDATA register is only CRC_WDATA [15:0].
[27]	<b>CHECKSUM_COM</b> <b>Checksum 1's Complement</b> This bit is used to enable the 1's complement function for checksum result in CRC_CHECKSUM register. 0 = 1's complement for CRC checksum Disabled. 1 = 1's complement for CRC checksum Enabled.
[26]	<b>WDATA_COM</b> <b>Write Data 1's Complement</b> This bit is used to enable the 1's complement function for write data value in CRC_WDATA register. 0 = 1's complement for CRC write data in Disabled. 1 = 1's complement for CRC write data in Enabled.

[25]	CHECKSUM_RVS	<p><b>Checksum Reverse</b></p> <p>This bit is used to enable the bit order reverse function for write data value in CRC_CHECKSUM register.</p> <p>0 = Bit order reverse for CRC checksum Disabled.</p> <p>1 = Bit order reverse for CRC checksum Enabled.</p> <p><b>Note:</b> If the checksum result is 0XDD7B0F2E, the bit order reverse for CRC checksum is 0x74F0DEBB</p>
[24]	WDATA_RVS	<p><b>Write Data Order Reverse</b></p> <p>This bit is used to enable the bit order reverse function for write data value in CRC_WDATA register.</p> <p>0 = Bit order reverse for CRC write data in Disabled.</p> <p>1 = Bit order reverse for CRC write data in Enabled (per byte).</p> <p><b>Note:</b> If the write data is 0xAABBCCDD, the bit order reverse for CRC write data in is 0x55DD33BB</p>
[23]	TRIG_EN	<p><b>Trigger Enable Bit</b></p> <p>This bit is used to trigger the CRC DMA transfer.</p> <p>0 = No effect.</p> <p>1 = CRC DMA data read or write transfer Enabled.</p> <p><b>Note1:</b> If this bit asserts which indicates the CRC engine operation in CRC DMA mode, do not fill in any data in CRC_WDATA register.</p> <p><b>Note2:</b> When CRC DMA transfer completed, this bit will be cleared automatically.</p> <p><b>Note3:</b> If the bus error occurs when CRC DMA transfer data, all CRC DMA transfer will be stopped. Software must reset all DMA channel before trigger DMA again.</p>
[22:2]	Reserved	Reserved.
[1]	CRC_RST	<p><b>CRC Engine Reset</b></p> <p>0 = No effect.</p> <p>1 = Reset the internal CRC state machine and internal buffer. The others contents of CRC_CTL register will not be cleared. This bit will be cleared automatically.</p> <p><b>Note:</b> When operated in CPU PIO mode, setting this bit will reload the initial seed value (CRC_SEED register).</p>
[0]	CRCCEN	<p><b>CRC Channel Enable Bit</b></p> <p>0 = No effect.</p> <p>1 = CRC operation Enabled.</p> <p><b>Note1:</b> When operating in CRC DMA mode (TRIG_EN (CRC_CTL[23]) = 1), if user clears this bit, the DMA operation will be continuous until all CRC DMA operation is done, and the TRIG_EN (CRC_CTL[23]) bit will keep 1 until all CRC DMA operation done. But in this case, the CRC_BLKD_IF (CRC_DMAISR[1]) flag will inactive, user can read CRC checksum result only if TRIG_EN (CRC_CTL[23]) clears to 0</p> <p><b>Note2:</b> When operating in CRC DMA mode (TRIG_EN (CRC_CTL[23]) = 1), if user wants to stop the transfer immediately, user can write 1 to CRC_RST (CRC_CTL [1]) bit to stop the transmission.</p>

### CRC DMA Source Address Register (CRC\_DMASAR)

Register	Offset	R/W	Description	Reset Value
CRC_DMASAR	CRC_BA+0x04	R/W	CRC DMA Source Address Register	0x0000_0000

31	30	29	28	27	26	25	24
CRC_DMASAR [31:24]							
23	22	21	20	19	18	17	16

15	14	13	12	11	10	9	8
CRC_DMABCR [15:8]							
7	6	5	4	3	2	1	0
CRC_DMABCR [7:0]							

Bits	Description
[31:16]	Reserved Reserved.
[15:0]	CRC_DMABCR CRC DMA Transfer Byte Count Register This field indicates a 16-bit total transfer byte count number of CRC DMA (CRC_DMASAR + CRC_DMABCR) = (CRC_DMACSAR + CRC_DMACBCR).

**CRC DMA Current Source Address Register (CRC\_DMACSAR)**

Register	Offset	R/W	Description	Reset Value
<b>CRC_DMACSAR</b>	CRC_BA+0x14	R	CRC DMA Current Source Address Register	0x0000_0000

31	30	29	28	27	26	25	24
CRC_DMACSAR [31:24]							
23	22	21	20	19	18	17	16
CRC_DMACSAR [23:16]							
15	14	13	12	11	10	9	8
CRC_DMACSAR [15:8]							
7	6	5	4	3	2	1	0
CRC_DMACSAR [7:0]							

Bits	Description	
[31:0]	<b>CRC_DMACSAR</b>	<b>CRC DMA Current Source Address Register (Read Only)</b> This field indicates the current source address where the CRC DMA transfer just occurs. $(CRC\_DMASAR + CRC\_DMABCR) = (CRC\_DMACSAR + CRC\_DMACBCR)$ .

### CRC DMA Current Transfer Byte Count Register (CRC\_DMABCR)

Register	Offset	R/W	Description	Reset Value
CRC_DMABCR	CRC_BA+0x1C	R	CRC DMA Current Transfer Byte Count Register	0x0000_0000

31	30	29	28	27	26	25	24

15	14	13	12	11	10	9	8
CRC_DMABCR [15:8]							
7	6	5	4	3	2	1	0
CRC_DMABCR [7:0]							

Bits	Description
[31:16]	Reserved
[15:0]	<p><b>CRC DMA Current Remained Byte Count Register (Read Only)</b></p> <p>This field indicates the current remained byte count of CRC DMA.</p> <p><math>(CRC\_DMASAR + CRC\_DMABCR) = (CRC\_DMACSAR + CRC\_DMABCR)</math>.</p> <p><b>Note:</b> Setting CRC_RST (CRC_CTL[1]) bit to 1 will clear this register value.</p>

**CRC DMA Interrupt Enable Register (CRC\_DMAIER)**

Register	Offset	R/W	Description	Reset Value
CRC_DMAIER	CRC_BA+0x20	R/W	CRC DMA Interrupt Enable Register	0x0000_0001

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved						CRC_BLKD_ IE	CRC_TABOR T_IE

Bits	Description	
[31:2]	Reserved	Reserved.
[1]	CRC_BLKD_IE	<b>CRC DMA Block Transfer Done Interrupt Enable Bit</b> Enable this bit will generate the CRC DMA Transfer Done interrupt signal while CRC_BLKD_IF (CRC_DMAISR[1]) bit is set to 1. 0 = Interrupt generator Disabled when CRC DMA transfer done. 1 = Interrupt generator Enabled when CRC DMA transfer done.
[0]	CRC_TABORT_IE	<b>CRC DMA Read/Write Target Abort Interrupt Enable Bit</b> Enable this bit will generate the CRC DMA Target Abort interrupt signal while CRC_TARBOT_IF (CRC_DMAISR[0]) bit is set to 1. 0 = Target abort interrupt generation Disabled during CRC DMA transfer. 1 = Target abort interrupt generation Enabled during CRC DMA transfer.

**CRC DMA Interrupt Status Register (CRC\_DMAISR)**

Register	Offset	R/W	Description	Reset Value
CRC_DMAISR	CRC_BA+0x24	R/W	CRC DMA Interrupt Status Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved						CRC_BLKD_I F	CRC_TABOR T_IF

Bits	Description	
[31:2]	Reserved	Reserved.
[1]	CRC_BLKD_IF	<b>CRC DMA Block Transfer Done Interrupt Flag</b> This bit indicates that CRC DMA transfer has finished or not. 0 = Not finished if TRIG_EN (CRC_CTL[23]) bit has enabled. 1 = CRC transfer done if TRIG_EN (CRC_CTL[23]) bit has enabled. It is cleared by writing 1 to it through software.. (When CRC DMA transfer done, TRIG_EN (CRC_CTL[23]) bit will be cleared automatically)
[0]	CRC_TABORT_IF	<b>CRC DMA Read/Write Target Abort Interrupt Flag</b> This bit indicates that CRC bus has error or not during CRC DMA transfer. 0 = No bus error response received during CRC DMA transfer. 1 = Bus error response received during CRC DMA transfer. It is cleared by writing 1 to it through software. <b>Note:</b> The bit filed indicate bus master received error response or not. If bus master received error response, it means that CRC transfer target abort is happened. DMA will stop transfer and respond this event to software then CRC state machine goes to IDLE state. When target abort occurred, software must reset DMA before transfer those data again.

**CRC Write Data Register (CRC\_WDATA)**

Register	Offset	R/W	Description	Reset Value
CRC_WDATA	CRC_BA+0x80	R/W	CRC Write Data Register	0x0000_0000

31	30	29	28	27	26	25	24
CRC_WDATA [31:24]							
23	22	21	20	19	18	17	16
CRC_WDATA [23:16]							
15	14	13	12	11	10	9	8
CRC_WDATA [15:8]							
7	6	5	4	3	2	1	0
CRC_WDATA [7:0]							

Bits	Description
[31:0]	<p><b>CRC Write Data Register</b></p> <p>When operating in CPU PIO mode, software can write data to this field to perform CRC operation.</p> <p>When operating in DMA mode, this field indicates the DMA read data from memory and cannot be written.</p> <p><b>Note:</b> When the write data length is 8-bit mode, the valid data in CRC_WDATA register is only CRC_WDATA [7:0] bits; if the write data length is 16-bit mode, the valid data in CRC_WDATA register is only CRC_WDATA [15:0].</p>

### CRC Seed Register (CRC\_SEED)

Register	Offset	R/W	Description	Reset Value
CRC_SEED	CRC_BA+0x84	R/W	CRC Seed Register	0xFFFF_FFFF

31	30	29	28	27	26	25	24
CRC_SEED [31:24]							
23	22	21	20	19	18	17	16
CRC_SEED [23:16]							
15	14	13	12	11	10	9	8
CRC_SEED [15:8]							
7	6	5	4	3	2	1	0
CRC_SEED [7:0]							

Bits	Description
[31:0]	<b>CRC_SEED</b> <b>CRC Seed Register</b> This field indicates the CRC seed value.

**CRC Checksum Register (CRC\_CHECKSUM)**

Register	Offset	R/W	Description	Reset Value
CRC_CHECKSUM	CRC_BA+0x88	R	CRC Checksum Register	0xFFFF_FFFF

31	30	29	28	27	26	25	24
CRC_CHECKSUM [31:24]							
23	22	21	20	19	18	17	16
CRC_CHECKSUM [23:16]							
15	14	13	12	11	10	9	8
CRC_CHECKSUM [15:8]							
7	6	5	4	3	2	1	0
CRC_CHECKSUM [7:0]							

Bits	Description
[31:0]	<b>CRC_CHECKSUM</b> <b>CRC Checksum Register</b> This fields indicates the CRC checksum result

### PDMA Global Control Register (PDMA\_GCRCSR)

Register	Offset	R/W	Description	Reset Value
PDMA_GCRCSR	PDMA_GCR_BA+0x00	R/W	PDMA Global Control Register	0x0000_0000

[15]	CLK7_EN	<b>PDMA Controller Channel 7 Clock Enable Bit</b> 0 = Disabled. 1 = Enabled.
[14]	CLK6_EN	<b>PDMA Controller Channel 6 Clock Enable Bit</b> 0 = Disabled. 1 = Enabled.
[13]	CLK5_EN	<b>PDMA Controller Channel 5 Clock Enable Bit</b> 0 = Disabled. 1 = Enabled.
[12]	CLK4_EN	<b>PDMA Controller Channel 4 Clock Enable Bit</b> 0 = Disabled. 1 = Enabled.
[11]	CLK3_EN	<b>PDMA Controller Channel 3 Clock Enable Bit</b> 0 = Disabled. 1 = Enabled.

[10]	<b>CLK2_EN</b>	<b>PDMA Controller Channel 2 Clock Enable Bit</b> 0 = Disabled. 1 = Enabled.
[9]	<b>CLK1_EN</b>	<b>PDMA Controller Channel 1 Clock Enable Bit</b> 0 = Disabled. 1 = Enabled.
[8]	<b>CLK0_EN</b>	<b>PDMA Controller Channel 0 Clock Enable Bit</b> 0 = Disabled. 1 = Enabled.
[7:0]	<b>Reserved</b>	Reserved.

**PDMA Service Selection Control Register 0 (PDMA\_PDSSR0)**

Register	Offset	R/W	Description	Reset Value
PDMA_PDSSR0	PDMA_GCR_BA+0x04	R/W	PDMA Service Selection Control Register 0	0xFFFF_FFFF

31	30	29	28	27	26	25	24
SPI3_TXSEL				SPI3_RXSEL			
23	22	21	20	19	18	17	16
SPI2_TXSEL				SPI2_RXSEL			
15	14	13	12	11	10	9	8
SPI1_TXSEL				SPI1_RXSEL			
7	6	5	4	3	2	1	0
SPI0_TXSEL				SPI0_RXSEL			

Bits	Description	
[31:28]	<b>SPI3_TXSEL</b>	<b>PDMA SPI3 TX Selection</b> This field defines which PDMA channel is connected to the on-chip peripheral SPI3 TX. Software can configure the TX channel setting by this field. The channel configuration is the same as SPI0_RXSEL (PDMA_PDSSR0[3:0]) field. Please refer to the explanation of SPI0_RXSEL (PDMA_PDSSR0[3:0]).
[27:24]	<b>SPI3_RXSEL</b>	<b>PDMA SPI3 RX Selection</b> This field defines which PDMA channel is connected to the on-chip peripheral SPI3 RX. Software can configure the RX channel setting by this field. The channel configuration is the same as SPI0_RXSEL (PDMA_PDSSR0[3:0]) field. Please refer to the explanation of SPI0_RXSEL (PDMA_PDSSR0[3:0]).
[23:20]	<b>SPI2_TXSEL</b>	<b>PDMA SPI2 TX Selection</b> This field defines which PDMA channel is connected to the on-chip peripheral SPI2 TX. Software can configure the TX channel setting by this field. The channel configuration is the same as SPI0_RXSEL (PDMA_PDSSR0[3:0]) field. Please refer to the explanation of SPI0_RXSEL (PDMA_PDSSR0[3:0]).
[19:16]	<b>SPI2_RXSEL</b>	<b>PDMA SPI2 RX Selection</b> This field defines which PDMA channel is connected to the on-chip peripheral SPI2 RX. Software can configure the RX channel setting by this field. The channel configuration is the same as SPI0_RXSEL (PDMA_PDSSR0[3:0]) field. Please refer to the explanation of SPI0_RXSEL (PDMA_PDSSR0[3:0]).
[15:12]	<b>SPI1_TXSEL</b>	<b>PDMA SPI1 TX Selection</b> This field defines which PDMA channel is connected to the on-chip peripheral SPI1 TX. Software can configure the TX channel setting by this field. The channel configuration is the same as SPI0_RXSEL (PDMA_PDSSR0[3:0]) field. Please refer to the explanation of SPI0_RXSEL (PDMA_PDSSR0[3:0]).
[11:8]	<b>SPI1_RXSEL</b>	<b>PDMA SPI1 RX Selection</b> This field defines which PDMA channel is connected to the on-chip peripheral SPI1 RX. Software can configure the RX channel setting by this field. The channel configuration is the same as SPI0_RXSEL (PDMA_PDSSR0[3:0]) field. Please refer to the explanation of SPI0_RXSEL (PDMA_PDSSR0[3:0]).

[7:4]	<b>SPI0_TXSEL</b>	<b>PDMA SPI0 TX Selection</b> This field defines which PDMA channel is connected to the on-chip peripheral SPI0 TX. Software can configure the TX channel setting by this field. The channel configuration is the same as SPI0_RXSEL (PDMA_PDSSR0[3:0]) field. Please refer to the explanation of SPI0_RXSEL (PDMA_PDSSR0[3:0]).
[3:0]	<b>SPI0_RXSEL</b>	<b>PDMA SPI0 RX Selection</b> This field defines which PDMA channel is connected to the on-chip peripheral SPI0 RX. Software can change the channel RX setting by this field. For example, SPI0_RXSEL (PDMA_PDSSR0[3:0]) = 0110, that means SPI0_RX is connected to PDMA_CH6. 0000: CH0 0001: CH1 0010: CH2 0011: CH3 0100: CH4 0101: CH5 0110: CH6 0111: CH7 1000: CH8 Others : Reserved

Bits	Description
[31:8]	<b>Reserved</b> Reserved.
[7:4]	<b>I2S_TXSEL</b> <b>PDMA I<sup>2</sup>S TX Selection</b> This field defines which PDMA channel is connected to the on-chip peripheral I <sup>2</sup> S TX. Software can configure the TX channel setting by this field. The channel configuration is the same as I2S_RXSEL (PDMA_PDSSR2[3:0]) field. Please refer to the explanation of I2S_RXSEL (PDMA_PDSSR2[3:0]).
[3:0]	<b>I2S_RXSEL</b> <b>PDMA I<sup>2</sup>S RX Selection</b> This field defines which PDMA channel is connected to the on-chip peripheral I <sup>2</sup> S RX. Software can change the channel RX setting by this field. For example: I2S_RXSEL (PDMA_PDSSR2[3:0]) = 0110, that means I2S_RX is connected to PDMA_CH6. 0000: CH0 0001: CH1 0010: CH2 0011: CH3 0100: CH4 0101: CH5 0110: CH6 0111: CH7 1000: CH8 Others : Reserved

## 6.8 Timer Controller (TIMER)

### 6.8.1 Overview

The timer controller includes four 32-bit timers, TIMER0 ~ TIMER3, allowing user to easily implement a timer control for applications. The timer can perform functions, such as frequency measurement, delay timing, clock generation, and event counting by external input pins, and interval measurement by external capture pins.

### 6.8.2 Features

- Four sets of 32-bit timers with 24-bit up counter and one 8-bit prescale counter
- Independent clock source for each timer
- Provides four timer counting modes: one-shot, periodic, toggle and continuous counting
- Time-out period = (Period of timer clock input) \* (8-bit prescale counter + 1) \* (24-bit TCMP)
- Maximum counting cycle time =  $(1 / T \text{ MHz}) * (2^8) * (2^{24})$ , T is the period of timer clock
- 24-bit up counter value is readable through TDR (Timer Data Register)
- Supports event counting function to count the event from external counter pin (TM0~TM3)
- Supports external pin capture (TM0\_EXT~TM3\_EXT) for interval measurement
- Supports external pin capture (TM0\_EXT~TM3\_EXT) for reset 24-bit up counter
- Supports chip wake-up from Idle/Power-down mode if a timer interrupt signal is generated

### 6.8.3 Block Diagram

The Timer Controller block diagram and clock control are shown as follows.

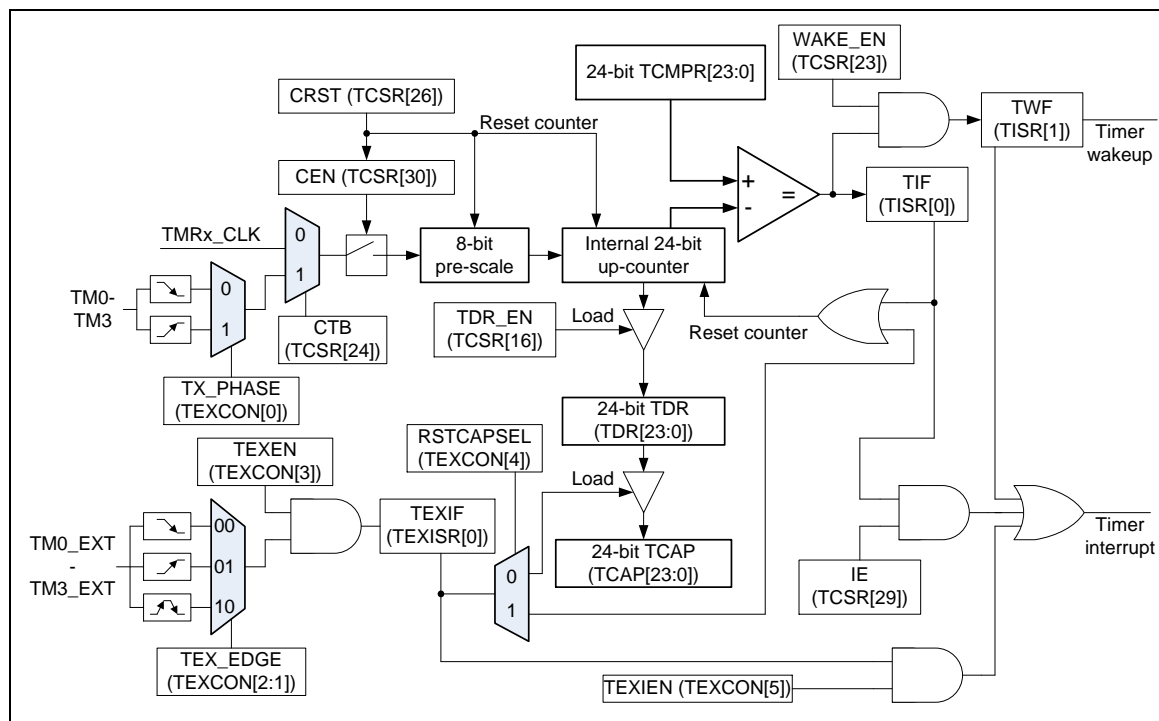

Figure 6-27 Timer Controller Block Diagram

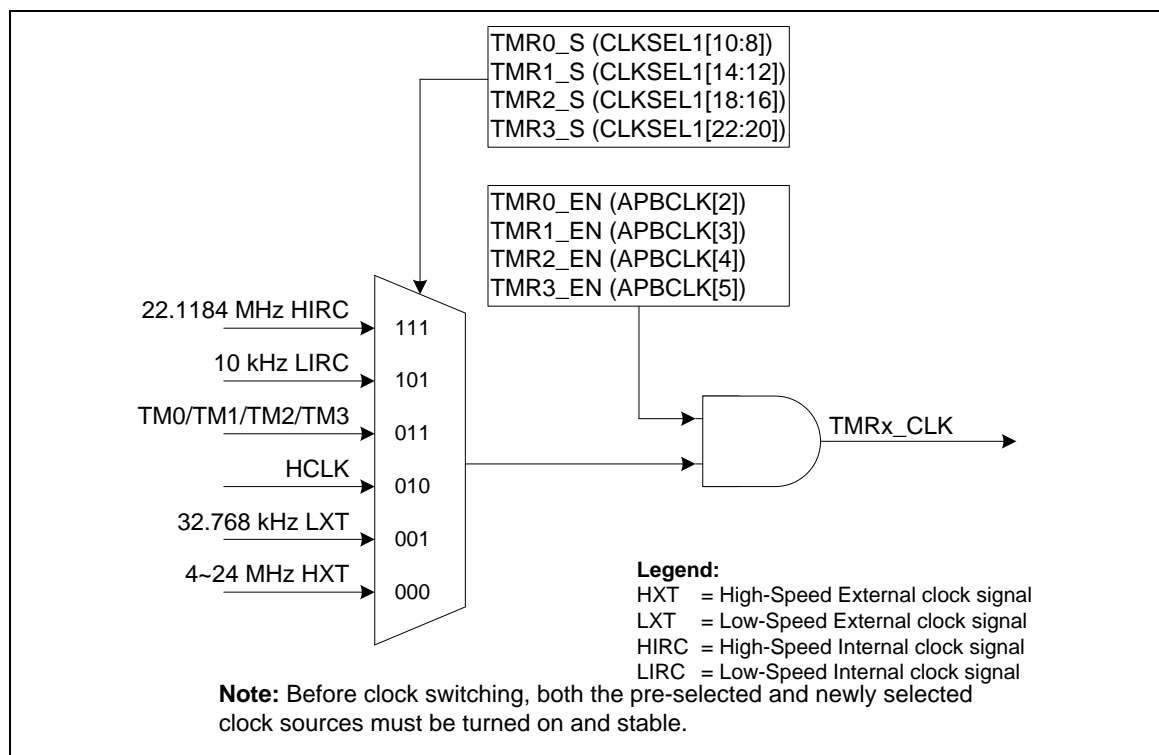

Figure 6-28 Clock Source of Timer Controller

## 6.8.4 Basic Configuration

The peripheral clock source of Timer0 ~ Timer3 can be enabled in APBCLK[5:2] and selected as different frequency in CLKSEL1[10:8] for Timer0, CLKSEL1[14:12] for Timer1, CLKSEL1[18:16] for Timer2 and CLKSEL1[22:20] for Timer3.

## 6.8.5 Functional Description

### 6.8.5.1 Timer Interrupt Flag

Timer controller supports two interrupt flags; one is TIF flag and its set while timer counter value (TDR) matches the timer compared value (TCMP), the other is TEXIF flag and its set when the transition on the TMx\_EXT pin associated TEX\_EDGE setting.

### 6.8.5.2 One-shot Mode

If timer controller is configured at one-shot mode (TCSR[28:27] is 00) and CEN (TCSR[30]) bit is set, the timer counter starts up counting. Once the TDR value reaches TCMP value, the TIF flag will be set to 1, TDR value and CEN bit is cleared by timer controller then timer counting operation stops. In the meantime, if the IE (TCSR[29]) bit is enabled, the timer interrupt signal is generated and sent to NVIC to inform CPU also.

### 6.8.5.3 Periodic Mode

If timer controller is configured at periodic mode (TCSR[28:27] is 01) and CEN bit is set, the timer counter starts up counting. Once the TDR value reaches TCMP value, the TIF flag will be set to 1, TDR value will be cleared by timer controller and timer counter operates counting again. In the meantime, if the IE bit is enabled, the timer interrupt signal is generated and sent to NVIC to inform CPU also. In this mode, timer controller operates counting and compares with TCMP value periodically until the CEN bit is cleared by software.

### 6.8.5.4 Toggle-output Mode

If timer controller is configured at toggle-output mode (TCSR[28:27] is 10) and CEN bit is set, the timer counter starts up counting. The counting operation of toggle-output mode is almost the same as periodic mode, except toggle-output mode has associated TM0~MT3 pin to output signal while specify TIF bit is set. Thus, the toggle-output signal on TM0~TM3 pin is changing back and forth with 50% duty cycle.

### 6.8.5.5 Continuous Counting Mode

If timer controller is configured at continuous counting mode (TCSR[28:27] is 11) and CEN bit is set, the timer counter starts up counting. Once the TDR value reaches TCMP value, the TIF flag will be set to 1 and TDR value keeps up counting. In the meantime, if the IE bit is enabled, the timer interrupt signal is generated and sent to NVIC to inform CPU also. User can change different TCMP value immediately without disabling timer counting and restarting timer counting in this mode.

For example, TCMP value is set as 80, first. The TIF flag will set to 1 when TDR value is equal to 80, timer counter is kept counting and TDR value will not goes back to 0, it continues to count 81, 82, 83, ... to  $2^{24}-1$ , 0, 1, 2, 3, ... to  $2^{24}-1$  again and again. Next, if software programs TCMP value as 200 and clears TIF flag, the TIF flag will set to 1 again when TDR value reaches to 200. At last, software programs TCMP as 500 and clears TIF flag, the TIF flag will set to 1 again when TDR value reaches to 500.

In this mode, the timer counting is continuous. So, this operation mode is called as continuous counting mode.

Figure 6-29 Continuous Counting Mode

#### 6.8.5.6 Event Counting Mode

Timer controller also provides an application which can count the input event from TMx pin (x= 0~3) and the number of event will reflect to TDR value. It is also called as event counting function. In this function, CTB (TCSR[24]) bit should be set and the timer peripheral clock source should be set as HCLK.

Software can enable or disable TMx pin de-bounce circuit by TCDB (TEXCON[7]) bit. The input event frequency should be less than 1/3 HCLK if TMx pin de-bounce disabled or less than 1/8 HCLK if TMx pin de-bounce enabled to assure the returned TDR value is incorrect, and software can also select edge detection phase of TMx pin by TX\_PHASE (TEXCON[0]) bit.

In event counting mode, the timer counting operation mode can be selected as one-shot, periodic and continuous counting mode to counts the TDR value by input event from TMx pin.

#### 6.8.5.7 External Capture Mode

The event capture function is used to capture Timer Capture Data Register (TDR) value to TCAP value while edge transition detected on TMx\_EXT pin (x= 0~3). In this mode, RSTCAPSEL (TEXCON[4]) bit should be as 0 for select TMx\_EXT transition is using as the event capture function and the timer peripheral clock source should be set as HCLK.

Software can enable or disable TxEX pin de-bounce circuit by TEXDB (TEXCON[6]) bit. The transition frequency of TMx\_EXT pin should be less than 1/3 HCLK if TMx\_EXT pin de-bounce disabled or less than 1/8 HCLK if TMx\_EXT pin de-bounce enabled to assure the capture function can be work normally, and software can also select edge transition detection of TMx\_EXT pin by TEX\_EDGE (TEXCON[2:1]) bits.

In event capture mode, software does not consider what timer counting operation mode is selected, the capture event occurred only if edge transition on TMx\_EXT pin is detected.

#### 6.8.5.8 Event Reset Counter Mode

It also provides event reset counter function to reset TDR value while edge transition detected on TMx\_EXT pin (x= 0~3). In this mode, most the settings are the same as event capture function except RSTCAPSEL (TEXCON[4]) bit should be as 1 for select TMx\_EXT transition is using as the event reset counter.

PB.15, PE.5, PB.2 and PB.4 only support toggle output function if their multifunction pin setting is changed to TMx.

Pin Name	Timer multifunction	Description
PB.8	TM0	Timer0 event counter input / toggle output.
PB.9	TM1	Timer1 event counter input / toggle output.
PB.10	TM2	Timer2 event counter input / toggle output.
PB.11	TM3	Timer3 event counter input / toggle output.
PB.15	TM0	Timer0 toggle output pin.
PE.5	TM1	Timer1 toggle output pin.
PB.2	TM2	Timer2 toggle output pin.
PB.3	TM3	Timer3 toggle output pin.

PB.15	TM0_EXT	Timer 0 external capture input pin.
PE.5	TM1_EXT	Timer 1 external capture input pin.
PB.2	TM2_EXT	Timer 2 external capture input pin.
PB.3	TM3_EXT	Timer 3 external capture input pin.

15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
PRESCALE[7:0]							

Bits	Description
[31]	<b>DBGACK_TMR</b> <b>ICE Debug Mode Acknowledge Disable Bit (Write Protect)</b> 0 = ICE debug mode acknowledgement effects TIMER counting. TIMER counter will be held while CPU is held by ICE. 1 = ICE debug mode acknowledgement Disabled. TIMER counter will keep going no matter CPU is held by ICE or not.
[30]	<b>CEN</b> <b>Timer Enable Bit</b> 0 = Stops/Suspends counting. 1 = Starts counting. <b>Note1:</b> In stop status, and then set CEN to 1 will enable the 24-bit up counter to keep counting from the last stop counting value. <b>Note2:</b> This bit is auto-cleared by hardware in one-shot mode (TCSR [28:27] = 00) when the timer interrupt flag TIF (TISR[0]) is generated.
[29]	<b>IE</b> <b>Interrupt Enable Bit</b> 0 = Timer Interrupt function Disabled. 1 = Timer Interrupt function Enabled. If this bit is enabled, when the timer interrupt flag TIF (TISR[0]) is set to 1, the timer interrupt signal is generated and inform to CPU.

[28:27]	MODE	<b>Timer Operating Mode</b> 00 = The Timer controller is operated in One-shot mode. 01 = The Timer controller is operated in Periodic mode. 10 = The Timer controller is operated in Toggle-output mode. 11 = The Timer controller is operated in Continuous Counting mode.
[26]	CRST	<b>Timer Reset</b> 0 = No effect. 1 = Reset 8-bit prescale counter, 24-bit up counter value and CEN bit if CACT is 1.
[25]	CACT	<b>Timer Active Status (Read Only)</b> This bit indicates the 24-bit up counter status. 0 = 24-bit up counter is not active. 1 = 24-bit up counter is active.
[24]	CTB	<b>Counter Mode Enable Bit</b> This bit is for external counting pin function enabled. When timer is used as an event counter, this bit should be set to 1 and select HCLK as timer clock source. Please refer to 6.8.5.6 for detail description. 0 = External counter mode Disabled. 1 = External counter mode Enabled.
[23]	WAKE_EN	<b>Wake Up Function Enable Bit</b> 0 = Wake-up trigger event Disabled. 1 = Wake-up trigger event Enabled.
[22:17]	Reserved	Reserved.
[16]	TDR_EN	<b>Data Load Enable Bit</b> When TDR_EN is set, TDR (Timer Data Register) will be updated continuously with the 24-bit up-timer value as the timer is counting. 0 = Timer Data Register update Disabled. 1 = Timer Data Register update Enabled while Timer counter is active.
[15:8]	Reserved	Reserved.
[7:0]	PRESCALE	<b>Prescale Counter</b> Timer input clock source is divided by (PRESCALE+1) before it is fed to the Timer up counter. If this field is 0 (PRESCALE = 0), then there is no scaling.

### Timer Compare Register (TCMPR)

Register	Offset	R/W	Description	Reset Value
TCMPR0	TMR01_BA+0x04	R/W	Timer0 Compare Register	0x0000_0000
TCMPR1	TMR01_BA+0x24	R/W	Timer1 Compare Register	0x0000_0000
TCMPR2	TMR23_BA+0x04	R/W	Timer2 Compare Register	0x0000_0000

## 6.9 PWM Generator and Capture Timer (PWM)

### 6.9.1 Overview

The NuMicro™ NUC230/240 series has 2 sets of PWM group supporting a total of 4 sets of PWM generators that can be configured as 8 independent PWM outputs, PWM0~PWM7, or as 4 complementary PWM pairs, (PWM0, PWM1), (PWM2, PWM3), (PWM4, PWM5) and (PWM6, PWM7) with 4 programmable Dead-zone generators.

Each PWM generator has one 8-bit prescaler, one clock divider with 5 divided frequencies (1, 1/2, 1/4, 1/8, 1/16), two PWM Timers including two clock selectors, two 16-bit PWM counters for PWM period control, two 16-bit comparators for PWM duty control and one Dead-zone generator. The 4 sets of PWM generators provide eight independent PWM interrupt flags set by hardware when the corresponding PWM period down counter reaches 0. Each PWM interrupt source with its corresponding enable bit can cause CPU to request PWM interrupt. The PWM generators can be configured as one-shot mode to produce only one PWM cycle signal or auto-reload mode to output PWM waveform continuously.

When DZEN01 (PCR[4]) is set, PWM0 and PWM1 perform complementary PWM paired function; the paired PWM period, duty and Dead-time are determined by PWM0 timer and Dead-zone generator 0. Similarly, the complementary PWM pairs of (PWM2, PWM3), (PWM4, PWM5) and (PWM6, PWM7) are controlled by PWM2, PWM4 and PWM6 timers and Dead-zone generator 2, 4 and 6, respectively. Refer to Figure 6-30 and Figure 6-37 for the architecture of PWM Timers.

To prevent PWM driving output pin with unsteady waveform, the 16-bit period down counter and 16-bit comparator are implemented with double buffer. When user writes data to counter/comparator buffer registers the updated value will be load into the 16-bit down counter/comparator at the time down counter reaching 0. The double buffering feature avoids glitch at PWM outputs.

When the 16-bit period down counter reaches 0, the interrupt request is generated. If PWM-timer is set as auto-reload mode, when the down counter reaches 0, it is reloaded with PWM Counter Register (CNRx) automatically then start decreasing, repeatedly. If the PWM-timer is set as one-shot mode, the down counter will stop and generate one interrupt request when it reaches 0.

The value of PWM counter comparator is used for pulse high width modulation. The counter control logic changes the output to high level when down-counter value matches the value of compare register.

The alternate feature of the PWM-timer is digital input Capture function. If Capture function is enabled the PWM output pin is switched as capture input mode. The Capture0 and PWM0 share one timer which is included in PWM0 and the Capture1 and PWM1 share PWM1 timer, and etc. Therefore user must setup the PWM-timer before enable Capture feature. After capture feature is enabled, the capture always latched PWM-counter to Capture Rising Latch Register (CRLR) when input channel has a rising transition and latched PWM-counter to Capture Falling Latch Register (CFLR) when input channel has a falling transition. Capture channel 0 interrupt is programmable by setting CRL\_IE0 (CCR0[1]) (Rising latch Interrupt enable) and CFL\_IE0 (CCR0[2]) (Falling latch Interrupt enable) to decide the condition of interrupt occur. Capture channel 1 has the same feature by setting CRL\_IE1 (CCR0[17]) and CFL\_IE1 (CCR0[18]). And capture channel 2 to channel 3 on each group have the same feature by setting the corresponding control bits in CCR2. For each group, whenever Capture issues Interrupt 0/1/2/3, the PWM counter 0/1/2/3 will be reload at this moment.

The maximum captured frequency that PWM can capture is confined by the capture interrupt latency. When capture interrupt occurred, software will do at least three steps, including: Read PIIR to get interrupt source and Read CRLRx/CFLRx(x=0~3) to get capture value and finally write 1 to clear PIIR to 0. If interrupt latency will take time T0 to finish, the capture signal mustn't transition during this interval (T0). In this case, the maximum capture frequency will be 1/T0. For example:

HCLK = 50 MHz, PWM\_CLK = 25 MHz, Interrupt latency is 900 ns

So the maximum capture frequency will be  $1/900\text{ns} \approx 1000 \text{ kHz}$

## 6.9.2 Features

### 6.9.2.1 PWM Function:

- Up to 2 PWM groups (PWMA/PWMB) to support 8 PWM channels or 4 complementary PWM paired channels
- Each PWM group has two PWM generators with each PWM generator supporting one 8-bit prescaler, two clock divider, two PWM-timers, one Dead-zone generator and two PWM outputs.
- Up to 16-bit resolution
- PWM Interrupt request synchronized with PWM period
- One-shot or Auto-reload mode
- Edge-aligned type or Center-aligned type option
- PWM trigger ADC start-to-conversion

### 6.9.2.2 Capture Function:

- Timing control logic shared with PWM Generators
- Supports 8 Capture input channels shared with 8 PWM output channels
- Each channel supports one rising latch register (CRLR), one falling latch register (CFLR) and Capture interrupt flag (CAPIFx)

### 6.9.3 Block Diagram

Figure 6-30 to Figure 6-37 illustrate the architecture of PWM in pair (e.g. PWM-Timer 0/1 are in one pair and PWM-Timer 2/3 are in another one).

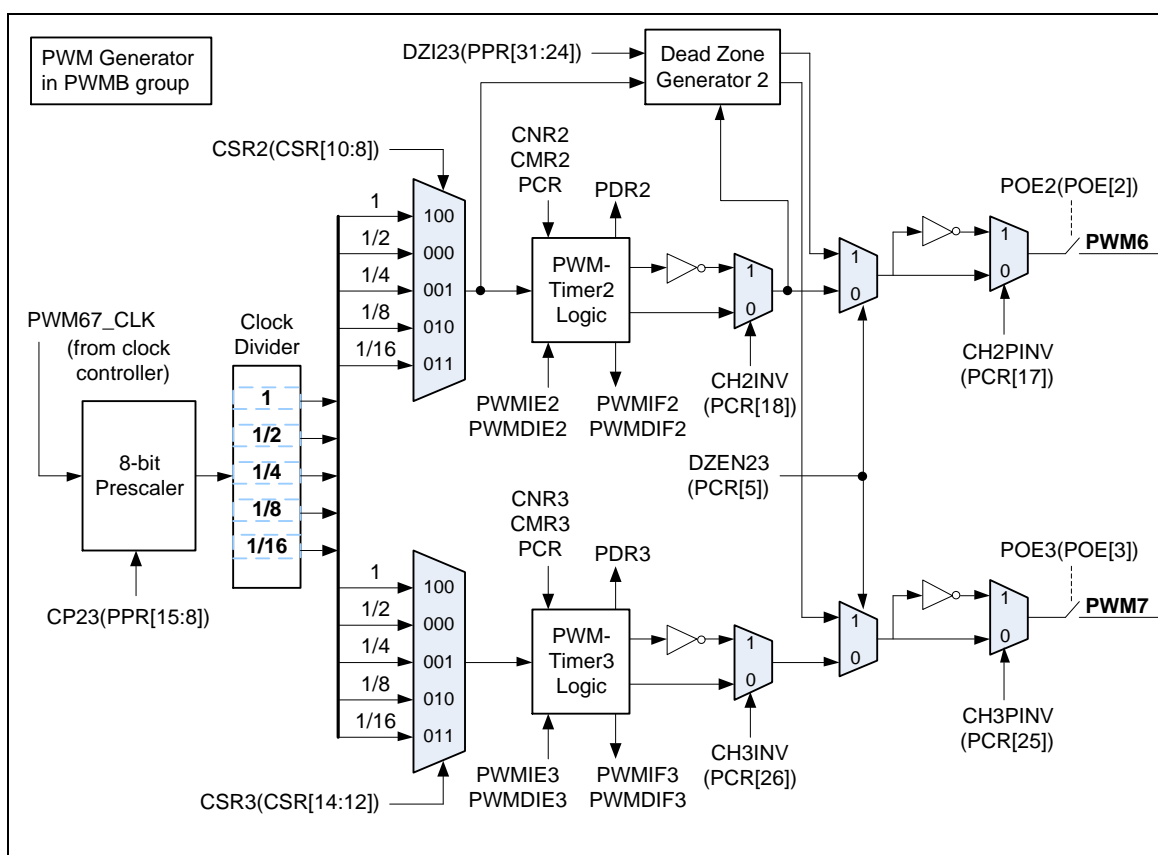

Figure 6-37 PWM Generator 6 Architecture Diagram

#### 6.9.4 Basic Configuration

The PWM pin functions are configured in GPA\_MFP, GPB\_MFP and GPE\_MFP registers.

The PWM clock can be enabled in APBCLK[23:20]. The PWM clock source is selected by CLKSEL1[31:28], CLKSEL2[7:4] and CLKSEL2[11:8].

## 6.9.5 Functional Description

### 6.9.5.1 PWM-Timer Operation

The PWM controller supports 2 operation types: Edge-aligned and Center-aligned type.

#### 6.9.5.2 Edge-aligned PWM (down-counter)

In Edge-aligned PWM Output mode, the 16 bits PWM counter will starts down-counting from CNRn to match with the value of the duty cycle CMRn (old), when this happen it will toggle the PWMn generator output to low. The counter will continue down-counting to 0, at this moment, it toggles the PWMn generator output to high and CMRn(new) and CNRn(new) are updated with CHnMODE=1 and request the PWM interrupt if PWM interrupt is enabled(PWMIEn (PIER[3:0]) = 1).

The PWM period and duty control are configured by PWM down-counter register (CNR) and PWM comparator register (CMR). The PWM-timer timing operation is shown in Figure 6-39. The pulse width modulation follows the formula below and the legend of PWM-Timer Comparator is shown as Figure 6-38. Note that the corresponding GPIO pins must be configured as PWM function (enable POE and disable CAPENR) for the corresponding PWM channel.

- PWM frequency =  $\text{PWMxy\_CLK} / [(\text{prescale} + 1) * (\text{clock divider}) * (\text{CNR} + 1)]$ ; where xy, could be 01, 23, 45 or 67, depends on selected PWM channel.
- Duty ratio =  $(\text{CMR} + 1) / (\text{CNR} + 1)$
- $\text{CMR} \geq \text{CNR}$ : PWM output is always high
- $\text{CMR} < \text{CNR}$ : PWM low width =  $(\text{CNR} - \text{CMR}) \text{ unit}^{[1]}$ ; PWM high width =  $(\text{CMR} + 1) \text{ unit}$
- $\text{CMR} = 0$ : PWM low width =  $(\text{CNR}) \text{ unit}$ ; PWM high width = 1 unit

**Note** [1]: unit = one PWM clock cycle.

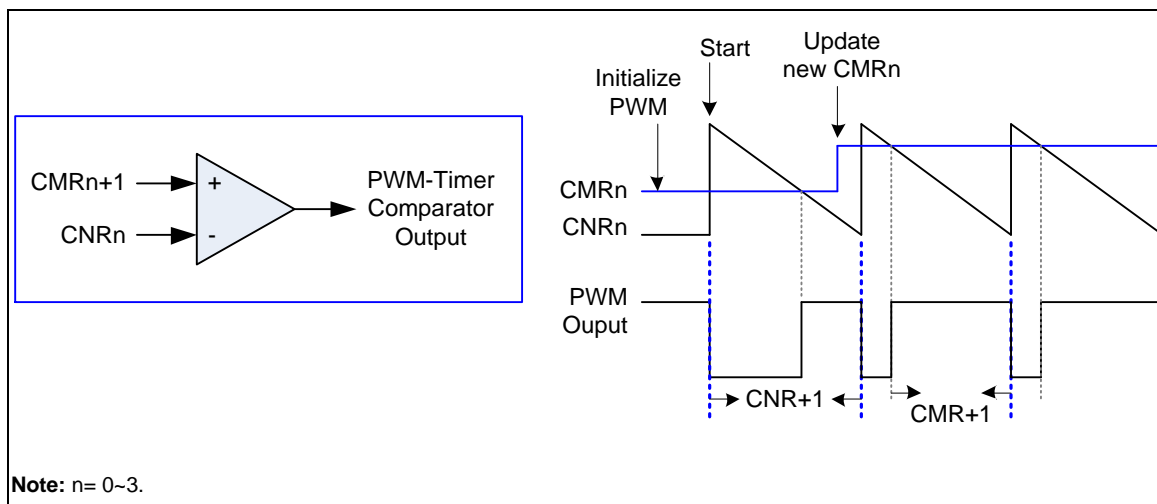

Figure 6-38 Legend of Internal Comparator Output of PWM-Timer

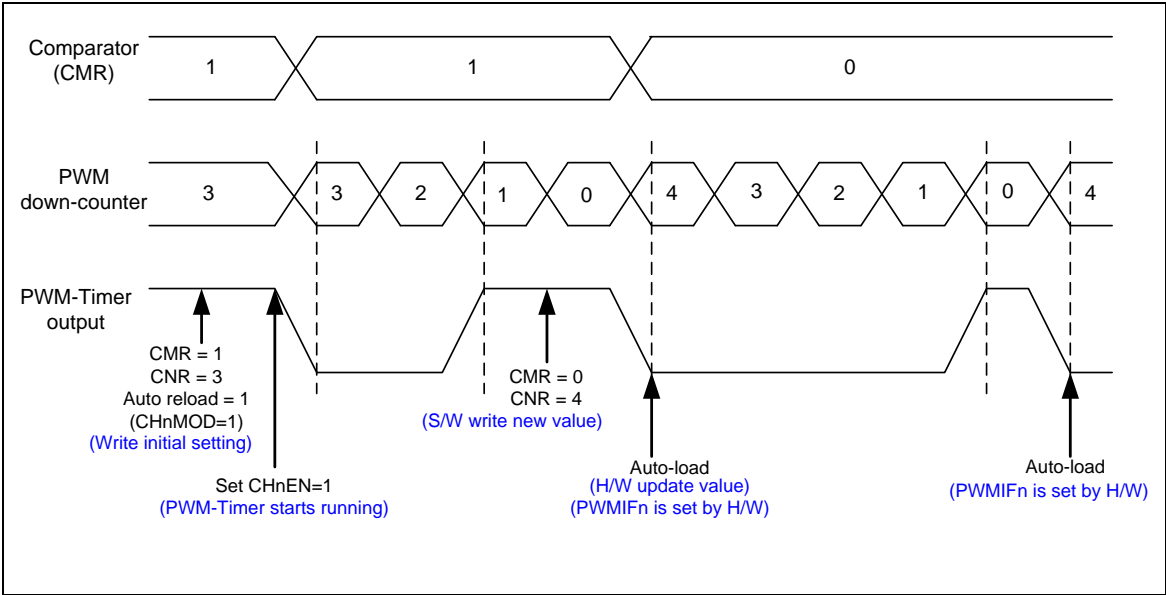

Figure 6-39 PWM-Timer Operation Timing

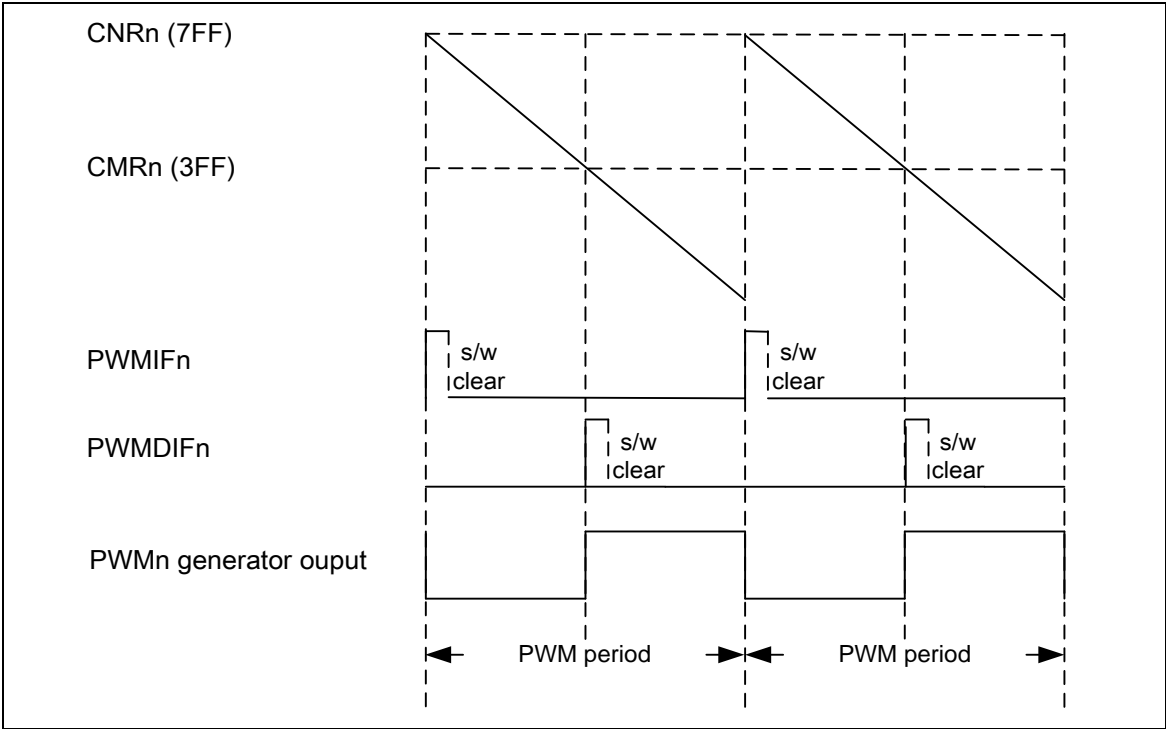

Figure 6-40 PWM Edge-aligned Interrupt Generate Timing Waveform

### 6.9.5.3 Center-aligned PWM (up/down-counter)

The Center-aligned PWM signals are produced by the module when the PWM time base is configured in an Up/Down Counting mode. The PWM counter will start counting-up from 0 to match the value of CMRn (old); this will cause the toggling of the PWMn generator output to low. The counter will continue counting to match with the CNRn (old). Upon reaching this states counter is configured automatically to down counting, when PWM counter matches the CMRn (old) value again the PWMn generator output toggles to high. Once the PWM counter underflows it will update the PWM period register CNRn(new) and duty cycle register CMRn(new) with CHnMODE = 1.

In Center-aligned type, the PWM period interrupt is requested at down-counter underflow if INTxxTYPE (PIER[17:16]) = 0, i.e. at start (end) of each PWM cycle or at up-counter matching with CNRn if INTxxTYPE (PIER[17:16]) = 1, i.e. at center point of PWM cycle.

- PWM frequency =  $\text{PWM}_{xy\_CLK} / [(\text{prescale} + 1) * (\text{clock divider}) * (\text{CNR} + 1)]$ ; where xy, could be 01, 23, 45 or 67, depends on selected PWM channel.
- Duty ratio =  $[(2 \times \text{CMR}) + 1] / [2 \times (\text{CNR} + 1)]$
- $\text{CMR} > \text{CNR}$ : PWM output is always high
- $\text{CMR} \leq \text{CNR}$ : PWM low width =  $2 \times (\text{CNR} - \text{CMR}) + 1$  unit<sup>[1]</sup>; PWM high width =  $(2 \times \text{CMR}) + 1$  unit
- $\text{CMR} = 0$ : PWM low width =  $2 \times \text{CNR} + 1$  unit; PWM high width = 1 unit

**Note [1]:** unit = one PWM clock cycle.

Figure 6-41 Center-aligned Type Output Waveform

In Center-aligned type, system can generate period interrupt, at two specified timings. PWM period interrupt is generated at counter equals zero on down-count if INTxxTYPE (PIER[17:16]) = 0 or at counter equals CNRn on up-count if INTxxTYPE (PIER[17:16]) = 1, i.e. at center point of

PWM cycle.

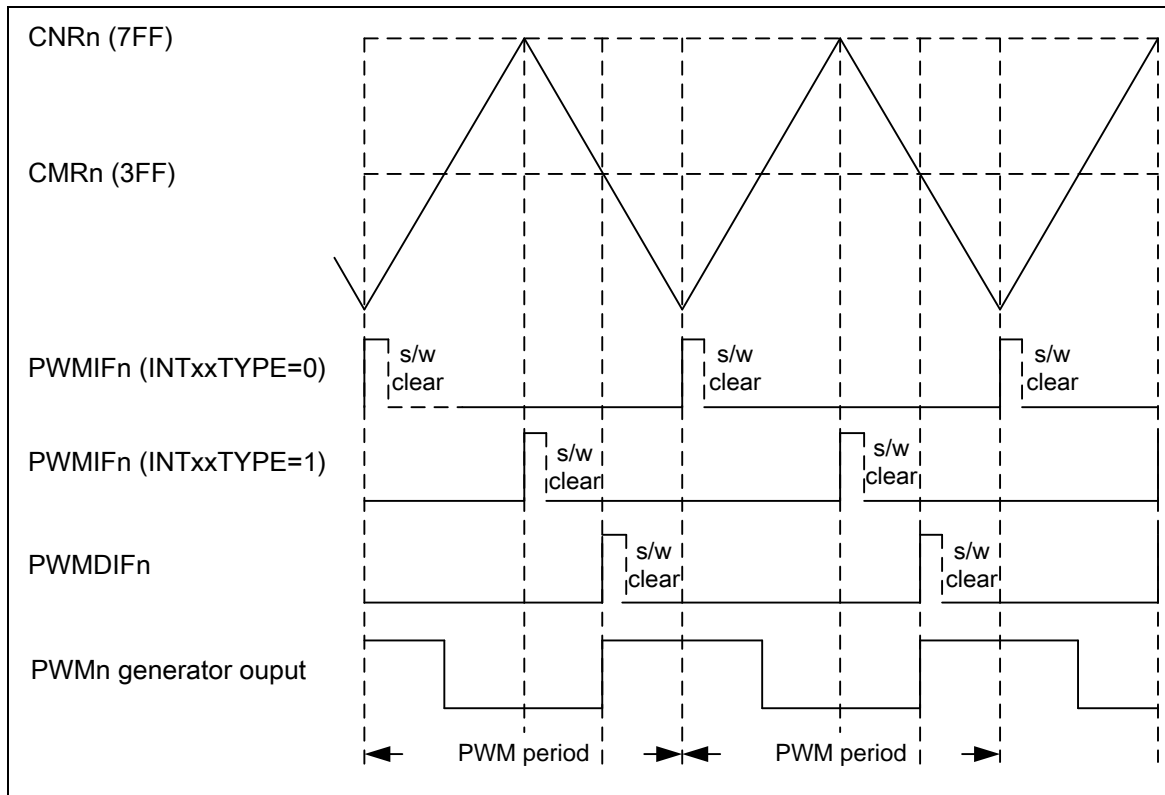

Figure 6-42 PWM Center-aligned Interrupt Generate Timing Waveform

#### 6.9.5.4 PWM Double Buffering, Auto-reload and One-shot Operation

PWM Timers have double buffering function and the reload value is updated at the start of next period without affecting current timer operation. The PWM counter value can be written into CNRx and current PWM counter value can be read from PDRx.

PWM0 will operate at One-shot mode if CH0MOD (PCR[3]) bit is set to 0, and operate at Auto-reload mode if CH0MOD (PCR[3]) bit is set to 1. It is recommend that switch PWM0 operating mode before set CH0EN (PCR[0]) bit to 1 to enable PWM0 counter start running because the content of CNR0 and CMR0 will be cleared to 0 to reset the PWM0 period and duty setting when PWM0 operating mode is changed. As PWM0 operate at One-shot mode, CMR0 and CNR0 should be written first and then set CH0EN (PCR[0]) bit to 1 to enable PWM0 counter start running. After PWM0 counter down count from CNR0 value to 0, CNR0 and CMR0 will be cleared to 0 by hardware and PWM counter will be held. Software need to write new CMR0 and CNR0 value to set next one-shot period and duty. When re-start next one-shot operation, the CMR0 should be written first because PWM0 counter will auto re-start counting when CNR0 is written a non-zero value. As PWM0 operates at auto-reload mode, CMR0 and CNR0 should be written first and then set CH0EN (PCR[0]) bit to 1 to enable PWM0 counter start running. The value of CNR0 will reload to PWM0 counter when it down count reaches 0. If CNR0 is set to 0, PWM0 counter will be held. PWM1~PWM7 performs the same function as PWM0.

Figure 6-43 PWM Double Buffering Illustration

6.9.5.5 Modulate Duty Ratio

The double buffering function allows CMRn written at any point in current cycle. The loaded value will take effect from next cycle.

Figure 6-44 PWM Controller Output Duty Ratio

6.9.5.6 Dead-Zone Generator

The PWM controller is implemented with Dead-zone generator. They are built for power device protection. This function generates a programmable time gap to delay PWM rising output. User can program DZlxx (PPR[31:16]) to determine the Dead-zone interval.

Figure 6-45 Paired-PWM Output with Dead-zone Generation Operation

### 6.9.5.7 PWM Center-aligned Trigger ADC Function

PWM can trigger ADC to start conversion when PWM counter up count to CNR in Center-aligned type by setting PWMnTEN (TCON[3:0]) to "1".

Figure 6-46 PWM trigger ADC to conversion in Center-aligned type Timing Waveform

### 6.9.5.8 Capture Operation

The Capture 0 and PWM 0 share one timer that included in PWM 0; and the Capture 1 and PWM 1 share another timer, and etc. The capture always latches PWM-counter to CRLRn when input channel has a rising transition and latches PWM-counter to CFLRn when input channel has a falling transition. Capture channel 0 interrupt is programmable by setting CRL\_IE0 (CCR0[1]) (Rising latch Interrupt enable) and CFL\_IE0 (CCR0[2]) (Falling latch Interrupt enable) to decide the condition of interrupt occur. Capture channel 1 has the same feature by setting CRL\_IE1 (CCR0[17]) and CFL\_IE1 (CCR0[18]), and etc. Whenever the Capture controller issues a capture interrupt, the corresponding PWM counter will be reloaded with CNRn at this moment. Note that the corresponding GPIO pins must be configured as capture function (POE disabled and CAPENR enabled) for the corresponding capture channel.

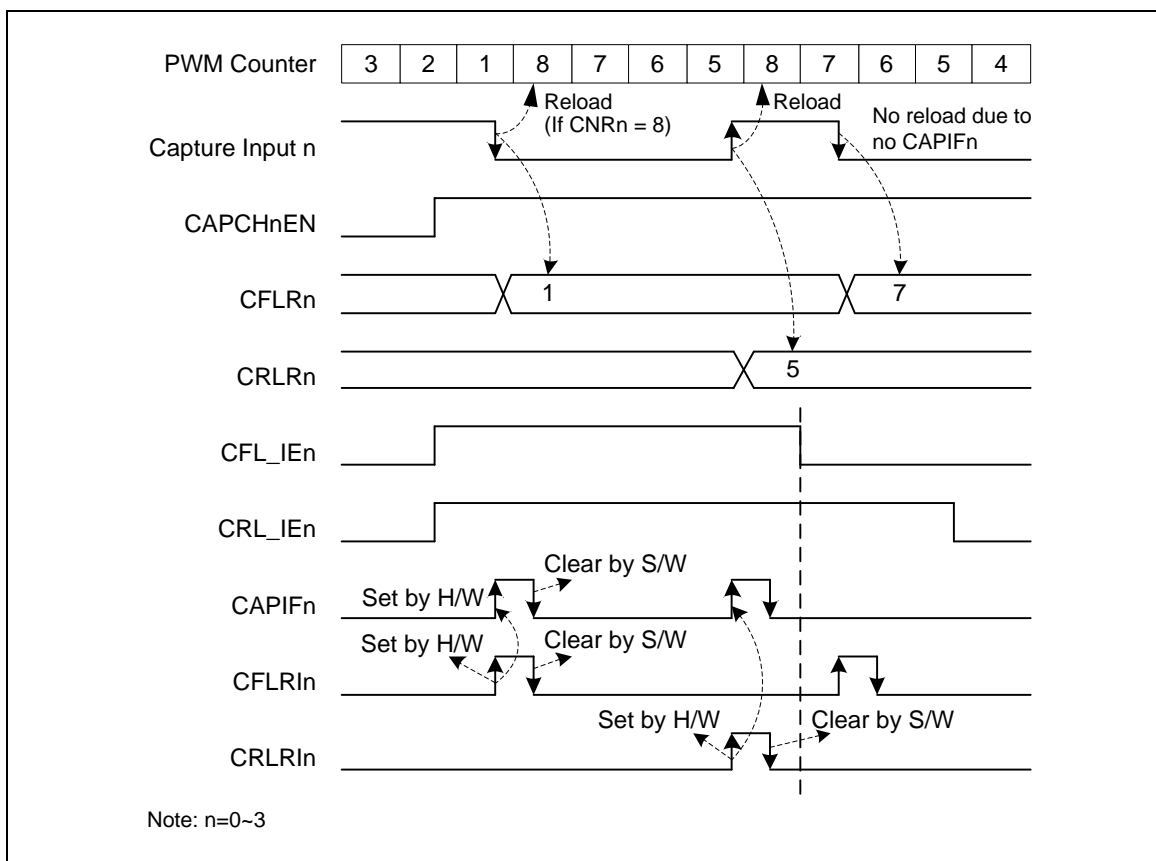

Figure 6-47 Capture Operation Timing

In this case, the CNR is 8:

- The PWM counter will be reloaded with CNRn when a capture interrupt flag (CAPIFn) is set.
- The channel low pulse width is  $(CNR + 1 - CRLR)$ .
- The channel high pulse width is  $(CNR + 1 - CFLR)$ .

### 6.9.5.9 PWM-Timer Interrupt Architecture

There are eight PWM interrupts, PWM0\_INT~PWM7\_INT, which are divided into PWMA\_INT and PWMB\_INT for Advanced Interrupt Controller (AIC). PWM 0 and Capture 0 share one interrupt, PWM1 and Capture 1 share the same interrupt and so on. Therefore, PWM function and Capture

function in the same channel cannot be used at the same time. Figure 6-48 and Figure 5-48 demonstrates the architecture of PWM-Timer interrupts.

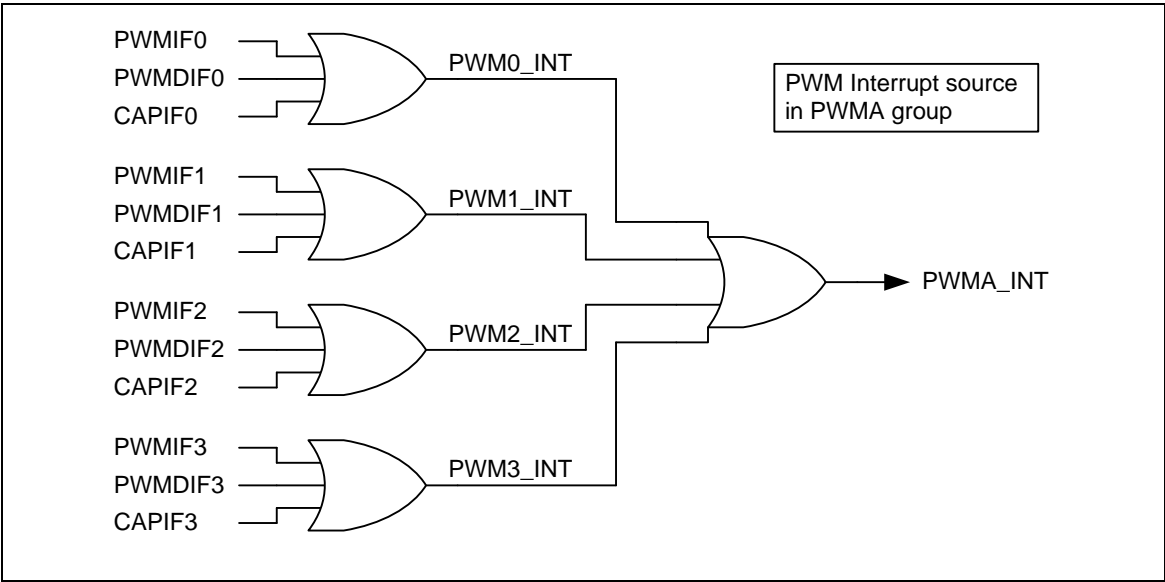

Figure 6-48 PWM Group A PWM-Timer Interrupt Architecture Diagram

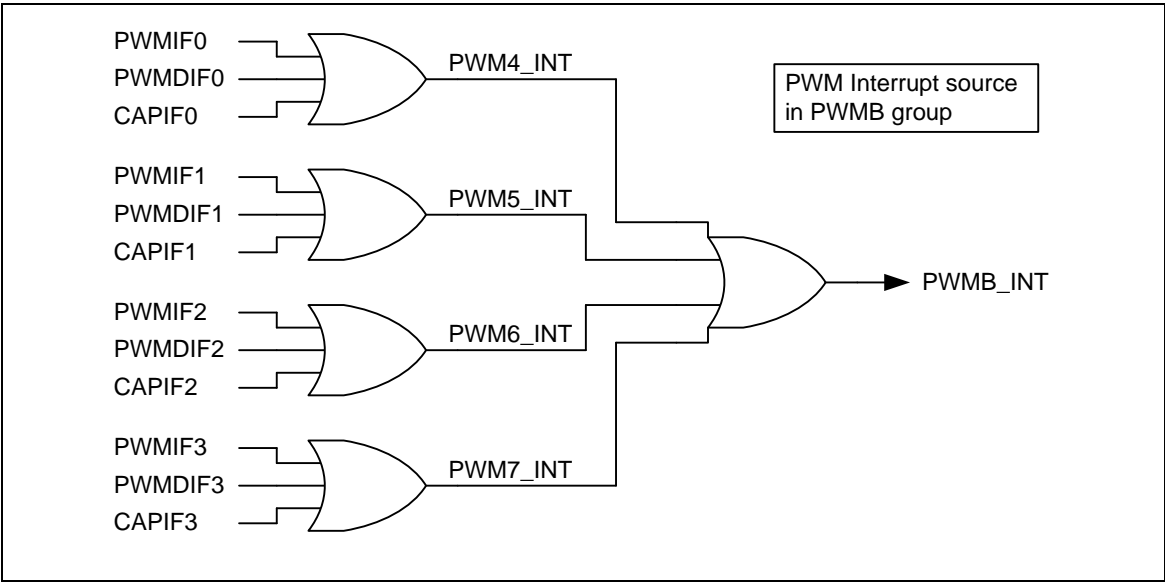

Figure 6-49 PWM Group B PWM-Timer Interrupt Architecture Diagram

#### 6.9.5.10 PWM-Timer Start Procedure

The following procedure is recommended for starting a PWM drive.

1. Setup clock source divider select register (CSR)
2. Wait until SYNCBUSYn be set to 0 by hardware (if PWM clock source is not from HCLK)
3. Setup prescaler (PPR)
4. Wait until SYNCBUSYn be set to 0 by hardware (if PWM clock source is not from HCLK)
5. Setup inverter on/off, Dead-zone generator on/off, Auto-reload/One-shot mode and Stop PWM-timer (PCR)
6. Wait until SYNCBUSYn be set to 0 by hardware (if PWM clock source is not from HCLK)
7. Setup comparator register (CMR) for setting PWM duty.
8. Wait until SYNCBUSYn be set to 0 by hardware (if PWM clock source is not from HCLK)
9. Setup PWM down-counter register (CNR) for setting PWM period.
10. Setup interrupt enable register (PIER) (optional)
11. Setup corresponding GPIO pins as PWM function (enable POE and disable CAPENR) for the corresponding PWM channel.
12. Enable PWM timer start running (Set CHnEN = 1 in PCR)

#### 6.9.5.11 Modify PWM counter register (CNR), comparator register (CMR), Clock prescaler(CP01/CP23) and PWM operation mode(CHnMOD in PCR register bit3) Procedure

The following procedure is recommended for modifying CNR/CMR/Clock prescaler/PWM operation mode.

1. Wait until SYNCBUSYn be set to 0 by hardware (if PWM clock source is not from HCLK)
2. Modify CMRn/CNRn/CHnMOD/CP01/CP23

#### 6.9.5.12 PWM-Timer Re-Start Procedure in Single-shot mode

After PWM waveform is generated once in PWM One-shot mode, PWM-Timer will be stopped automatically and both of CNR and CMR will be cleared by hardware. Software must fill CMR and CNR value again to re-start another PWM one-shot waveform. The following procedure is recommended for re-starting PWM one-shot waveform.

1. Wait until SYNCBUSYn be set to 0 by hardware (if PWM clock source is not from HCLK)
2. Setup comparator register (CMR) for setting PWM duty.
3. Wait until SYNCBUSYn be set to 0 by hardware (if PWM clock source is not from HCLK)
4. Setup PWM down-counter register (CNR) for setting PWM period. After setup CNR, PWM wave will be generated.

#### 6.9.5.13 PWM-Timer Stop Procedure

##### Method 1:

Set 16-bit counter (CNR) as 0, and monitor PDR (current value of 16-bit down-counter). When PDR reaches to 0, disable PWM-Timer (CHnEN in PCR). **(Recommended)**

##### Method 2:

Set 16-bit counter (CNR) as 0. When interrupt request happened, disable PWM-Timer (CHnEN in PCR). **(Recommended)**

##### Method 3:

Disable PWM-Timer directly ((CHnEN in PCR). **(Not recommended)**

The reason why method 3 is not recommended is that disable CHnEN will immediately stop PWM output signal and lead to change the duty of the PWM output, this may cause damage to the control circuit of motor

#### 6.9.5.14 Capture Start Procedure

1. Setup clock source divider select register (CSR)
2. Wait until SYNCBUSYn be set to 0 by hardware (if PWM clock source is not from HCLK)
3. Setup prescaler (PPR)
4. Setup channel enabled, rising/falling interrupt enable and input signal inverter on/off (CCR0, CCR2)
5. Wait until SYNCBUSYn be set to 0 by hardware (if PWM clock source is not from HCLK)
6. Setup Auto-reload mode, Edge-aligned type and Stop PWM-timer (PCR)
7. Wait until SYNCBUSYn be set to 0 by hardware (if PWM clock source is not from HCLK)
8. Setup PWM down-counter (CNR)
9. Enable PWM timer start running (Set CHnEN = 1 in PCR)
10. Setup corresponding GPIO pins as capture function (disable POE and enable CAPENR) for the corresponding PWM channel.

15	14	13	12	11	10	9	8
Reserved				PWMDIF3	PWMDIF2	PWMDIF1	PWMDIF0
7	6	5	4	3	2	1	0
Reserved				PWMIF3	PWMIF2	PWMIF1	PWMIF0

Bits	Description	
[31:12]	Reserved	Reserved.
[11]	PWMDIF3	<b>PWM Channel 3 Duty Interrupt Flag</b> Flag is set by hardware when channel 3 PWM counter down count and reaches CMR3, software can clear this bit by writing a one to it. <b>Note:</b> If CMR equal to CNR, this flag is not working in Edge-aligned type selection
[10]	PWMDIF2	<b>PWM Channel 2 Duty Interrupt Flag</b> Flag is set by hardware when channel 2 PWM counter down count and reaches CMR2, software can clear this bit by writing a one to it. <b>Note:</b> If CMR equal to CNR, this flag is not working in Edge-aligned type selection
[9]	PWMDIF1	<b>PWM Channel 1 Duty Interrupt Flag</b> Flag is set by hardware when channel 1 PWM counter down count and reaches CMR1, software can clear this bit by writing a one to it. <b>Note:</b> If CMR equal to CNR, this flag is not working in Edge-aligned type selection
[8]	PWMDIF0	<b>PWM Channel 0 Duty Interrupt Flag</b> Flag is set by hardware when channel 0 PWM counter down count and reaches CMR0, software can clear this bit by writing a one to it. <b>Note:</b> If CMR equal to CNR, this flag is not working in Edge-aligned type selection
[7:4]	Reserved	Reserved.
[3]	PWMIF3	<b>PWM Channel 3 Period Interrupt Status</b> This bit is set by hardware when PWM3 counter reaches the requirement of interrupt (depend on INT23TYPE bit of PIER register), software can write 1 to clear this bit to 0.
[2]	PWMIF2	<b>PWM Channel 2 Period Interrupt Status</b> This bit is set by hardware when PWM2 counter reaches the requirement of interrupt (depend on INT23TYPE bit of PIER register), software can write 1 to clear this bit to 0.
[1]	PWMIF1	<b>PWM Channel 1 Period Interrupt Status</b> This bit is set by hardware when PWM1 counter reaches the requirement of interrupt (depend on INT01TYPE bit of PIER register), software can write 1 to clear this bit to 0.

[0]	PWMIF0	<b>PWM Channel 0 Period Interrupt Status</b> This bit is set by hardware when PWM0 counter reaches the requirement of interrupt (depend on INT01TYPE bit of PIER register), software can write 1 to clear this bit to 0.
-----	--------	---

**Note:** User can clear each interrupt flag by writing 1 to corresponding bit in PIIR.

### Capture Control Register (CCR0)

Register	Offset	R/W	Description	Reset Value
CCR0	PWMA_BA+0x50 PWMB_BA+0x50	R/W	PWM Capture Control Register 0	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
CFLR1	CRLR1	Reserved	CAPIF1	CAPCH1EN	CFL_IE1	CRL_IE1	INV1
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
CFLR0	CRLR0	Reserved	CAPIF0	CAPCH0EN	CFL_IE0	CRL_IE0	INV0

Bits	Description
[31:24]	<b>Reserved</b> Reserved.
[23]	<b>CFLR1</b> <b>CFLR1 Latched Indicator Bit</b> When PWM group input channel 1 has a falling transition, CFLR1 was latched with the value of PWM down-counter and this bit is set by hardware. Software can write 0 to clear this bit to 0 if BCn bit is 0, and can write 1 to clear this bit to 0 if BCn bit is 1.
[22]	<b>CRLR1</b> <b>CRLR1 Latched Indicator Bit</b> When PWM group input channel 1 has a rising transition, CRLR1 was latched with the value of PWM down-counter and this bit is set by hardware. Software can write 0 to clear this bit to 0 if BCn bit is 0, and can write 1 to clear this bit to 0 if BCn bit is 1.
[5]	<b>Reserved</b> Reserved.
[20]	<b>CAPIF1</b> <b>Channel 1 Capture Interrupt Indication Flag</b> If PWM group channel 1 rising latch interrupt is enabled (CRL_IE1 = 1), a rising transition occurs at PWM group channel 1 will result in CAPIF1 to high; Similarly, a falling transition will cause CAPIF1 to be set high if PWM group channel 1 falling latch interrupt is enabled (CFL_IE1 = 1). Write 1 to clear this bit to 0.
[19]	<b>CAPCH1EN</b> <b>Channel 1 Capture Function Enable Bit</b> 0 = Capture function on PWM group channel 1 Disabled. 1 = Capture function on PWM group channel 1 Enabled. When Enabled, Capture latched the PWM-counter and saved to CRLR (Rising latch) and CFLR (Falling latch). When Disabled, Capture does not update CRLR and CFLR, and disable PWM group channel 1 Interrupt.
[18]	<b>CFL_IE1</b> <b>Channel 1 Falling Latch Interrupt Enable Bit</b> 0 = Falling latch interrupt Disabled. 1 = Falling latch interrupt Enabled. When Enabled, if Capture detects PWM group channel 1 has falling transition, Capture will

		issue an Interrupt.
[17]	CRL_IE1	<b>Channel 1 Rising Latch Interrupt Enable Bit</b> 0 = Rising latch interrupt Disabled. 1 = Rising latch interrupt Enabled. When Enabled, if Capture detects PWM group channel 1 has rising transition, Capture will issue an Interrupt.
[16]	INV1	<b>Channel 1 Inverter Enable Bit</b> 0 = Inverter Disabled. 1 = Inverter Enabled. Reverse the input signal from GPIO before fed to Capture timer
[15:8]	Reserved	Reserved.
[7]	CFLRI0	<b>CFLR0 Latched Indicator</b> When PWM group input channel 0 has a falling transition, CFLR0 was latched with the value of PWM down-counter and this bit is set by hardware. Software can write 0 to clear this bit to 0 if the BCn bit is 0, and can write 1 to clear this bit to 0 if BCn bit is 1.
[6]	CRLRI0	<b>CRLR0 Latched Indicator</b> When PWM group input channel 0 has a rising transition, CRLR0 was latched with the value of PWM down-counter and this bit is set by hardware. Software can write 0 to clear this bit to 0 if the BCn bit is 0, and can write 1 to clear this bit to 0 if the BCn bit is 1.
[5]	Reserved	Reserved.
[4]	CAPIF0	<b>Channel 0 Capture Interrupt Indication Flag</b> If PWM group channel 0 rising latch interrupt is enabled (CRL_IE0 = 1), a rising transition occurs at PWM group channel 0 will result in CAPIF0 to high; Similarly, a falling transition will cause CAPIF0 to be set high if PWM group channel 0 falling latch interrupt is enabled (CFL_IE0 = 1). Write 1 to clear this bit to 0.
[3]	CAPCH0EN	<b>Channel 0 Capture Function Enable</b> 0 = Capture function on PWM group channel 0 Disabled. 1 = Capture function on PWM group channel 0 Enabled. When Enabled, Capture latched the PWM-counter value and saved to CRLR (Rising latch) and CFLR (Falling latch). When Disabled, Capture does not update CRLR and CFLR, and disable PWM group channel 0 Interrupt.
[2]	CFL_IE0	<b>Channel 0 Falling Latch Interrupt Enable Bit</b> 0 = Falling latch interrupt Disabled. 1 = Falling latch interrupt Enabled. When Enabled, if Capture detects PWM group channel 0 has falling transition, Capture will issue an Interrupt.
[1]	CRL_IE0	<b>Channel 0 Rising Latch Interrupt Enable Bit</b> 0 = Rising latch interrupt Disabled. 1 = Rising latch interrupt Enabled. When Enabled, if Capture detects PWM group channel 0 has rising transition, Capture will issue an Interrupt.
[0]	INV0	<b>Channel 0 Inverter Enable Bit</b> 0 = Inverter Disabled. 1 = Inverter Enabled. Reverse the input signal from GPIO before fed to Capture timer

## 6.10 Watchdog Timer (WDT)

### 6.10.1 Overview

The purpose of Watchdog Timer is to perform a system reset when system runs into an unknown state. This prevents system from hanging for an infinite period of time. Besides, this Watchdog Timer supports the function to wake-up system from Idle/Power-down mode.

### 6.10.2 Features

- 18-bit free running up counter for Watchdog Timer time-out interval.
- Selectable time-out interval ( $2^4 \sim 2^{18}$ ) WDT\_CLK cycle and the time-out interval period is 104 ms ~ 26.3168 s if WDT\_CLK = 10 kHz.
- System kept in reset state for a period of  $(1 / \text{WDT\_CLK}) * 63$
- Supports Watchdog Timer reset delay period
  - Selectable it includes (1026、130、18 or 3) \* WDT\_CLK reset delay period.
- Supports to force Watchdog Timer enabled after chip powered on or reset while CWDTEN (CONFIG0[31] Watchdog Enable) bit is set to 0.
- Supports Watchdog Timer time-out wake-up function only if WDT clock source is selected as 10 kHz

### 6.10.3 Block Diagram

The Watchdog Timer clock control and block diagram are shown as follows.

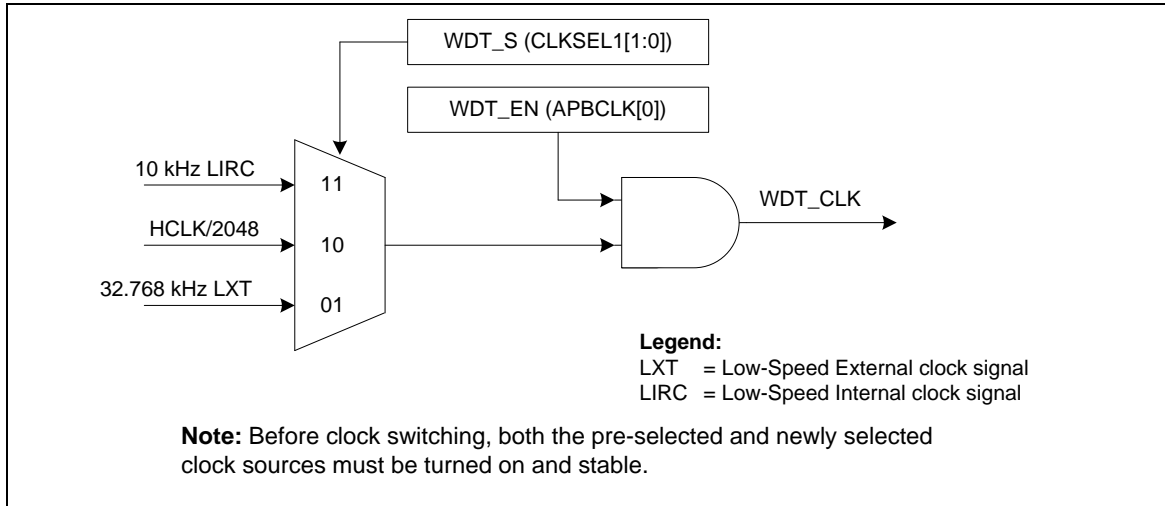

Figure 6-50 Watchdog Timer Clock Control

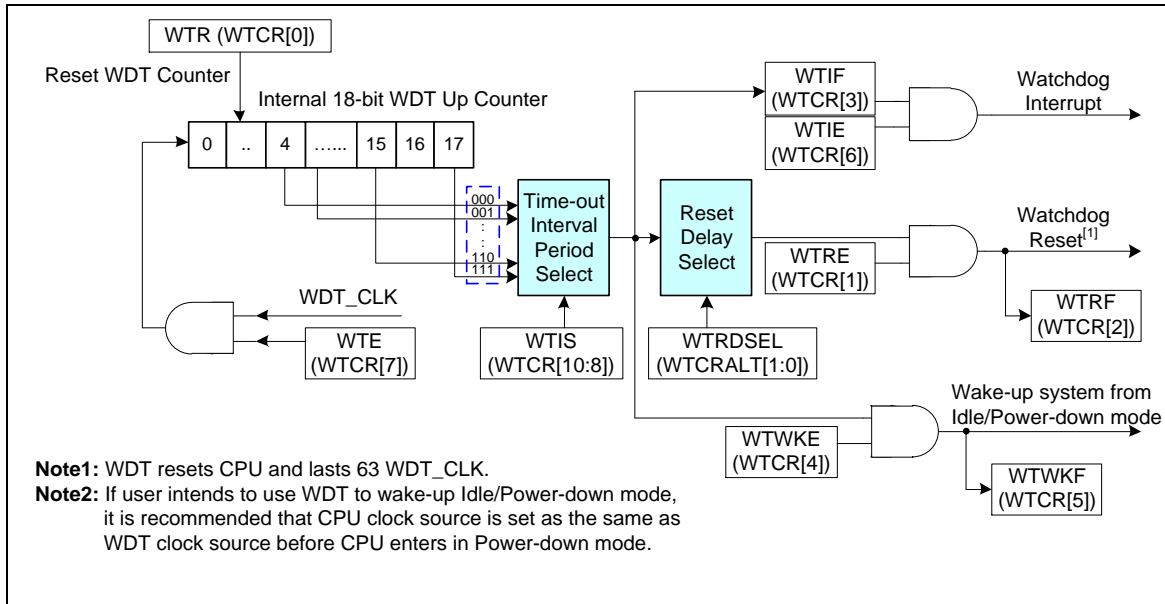

Figure 6-51 Watchdog Timer Block Diagram

#### 6.10.4 Basic Configuration

The WDT peripheral clock is enabled in APBCLK[0] and clock source can be selected in CLKSEL1[1:0].  
Or user can setting CONFIG0[31] is 0 to force Watchdog Timer enabled and active in 10 kHz after chip powered on or reset.

#### 6.10.5 Functional Description

The Watchdog Timer (WDT) includes an 18-bit free running up counter with programmable time-out intervals. Table 5-29 shows the WDT time-out interval period selection and Figure 6-52 Watchdog Timer Time-out Interval and Reset Period Timing shows the WDT time-out interval and reset period timing.

- WDT Time-out Interrupt

Setting WTE bit to 1 will enable the WDT function and the WDT counter to start counting up. There are eight time-out interval period can be selected by setting WTIS. When the WDT up counter reaches the WTIS settings, WDT time-out interrupt will occur then WTIF flag will be set to 1 immediately.

- WDT Reset Delay Period and Reset System

There is a specified  $T_{RSTD}$  delay period follows the WTIF flag is setting to 1. User should set WTR bit to reset the 18-bit WDT up counter value to avoid generate WDT time-out reset signal before the  $T_{RSTD}$  delay period expires. If the WDT up counter value has not been cleared after the specific  $T_{RSTD}$  delay period expires, the WDT control will set WTRF flag to 1 if WTRE bit is enabled, then chip enters to reset state immediately. Refer to Figure 6-52 Watchdog Timer Time-out Interval and Reset Period Timing, the  $T_{RST}$  reset period will keep last 63 WDT clocks then chip restart executing program from reset vector (0x0000\_0000). The WTRF flag will keep 1 after WDT time-out reset the chip, user can check WTRF flag by software to recognize the system has been reset by WDT time-out reset or not.

- WDT Wake-up

If WDT clock source is selected to 10 kHz, system can be waken-up from Power-down mode while WDT time-out interrupt signal is generated and WTWKE bit enabled. In the meanwhile, the WTWKF flag will set to 1 automatically, user can check WTWKF flag by software to recognize the system has been waken-up by WDT time-out interrupt or not.

WTIS	Time-Out Interval Period $T_{TIS}$	Reset Delay Period $T_{RSTD}$
000	$2^4 * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
001	$2^6 * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
010	$2^8 * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
011	$2^{10} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
100	$2^{12} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
101	$2^{14} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
110	$2^{16} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$
111	$2^{18} * T_{WDT}$	$(3/18/130/1026) * T_{WDT}$

Bits	Description
[31:2]	Reserved
[1:0]	<p><b>WTRDSEL</b></p> <p><b>Watchdog Timer Reset Delay Selection (Write Protect)</b>  When WDT time-out happened, user has a time named WDT Reset Delay Period to clear WDT counter to prevent WDT time-out reset happened. User can select a suitable value of WDT Reset Delay Period for different WDT time-out period.</p> <p>These bits are protected bit. It means programming this bit needs to write "59h", "16h", "88h" to address 0x5000_0100 to disable register protection. Reference the register REGWRPROT at address GCR_BA+0x100.</p> <p>00 = Watchdog Timer Reset Delay Period is 1026 * WDT_CLK.  01 = Watchdog Timer Reset Delay Period is 130 * WDT_CLK.  10 = Watchdog Timer Reset Delay Period is 18 * WDT_CLK.  11 = Watchdog Timer Reset Delay Period is 3 * WDT_CLK.</p> <p><b>Note:</b> This register will be reset to 0 if WDT time-out reset happened.</p>

## 6.11 Window Watchdog Timer (WWDT)

### 6.11.1 Overview

The Window Watchdog Timer is used to perform a system reset within a specified window period to prevent software run to uncontrollable status by any unpredictable condition.

### 6.11.2 Features

- 6-bit down counter value (WWDTVAL[5:0]) and 6-bit compare window value (WWDTCCR[21:16]) to make the WWDT time-out window period flexible
- Supports 4-bit value to programmable maximum 11-bit prescale counter period of WWDT counter

### 6.11.3 Block Diagram

The Window Watchdog Timer clock control and block diagram are shown as follows.

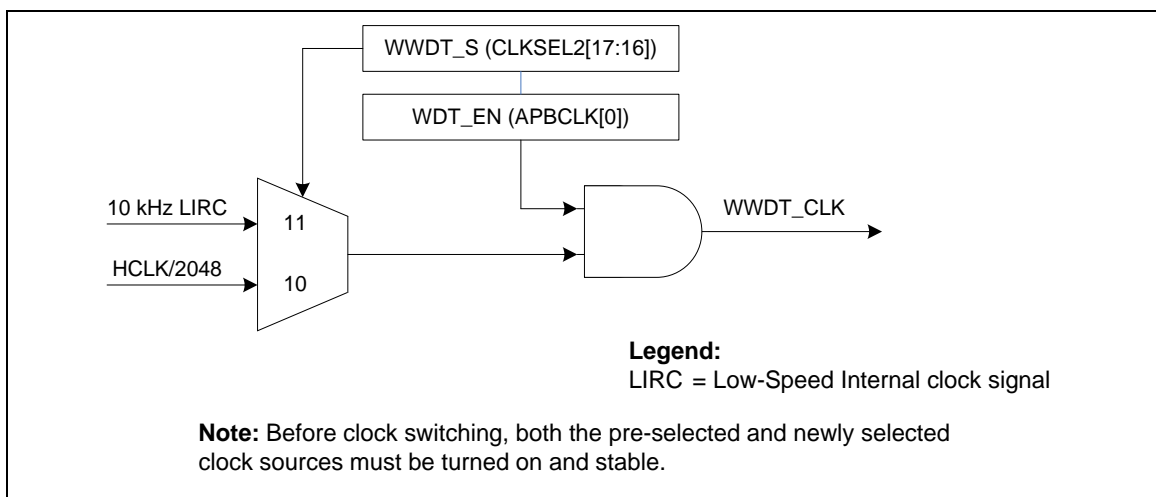

Figure 6-53 Window Watchdog Timer Clock Control

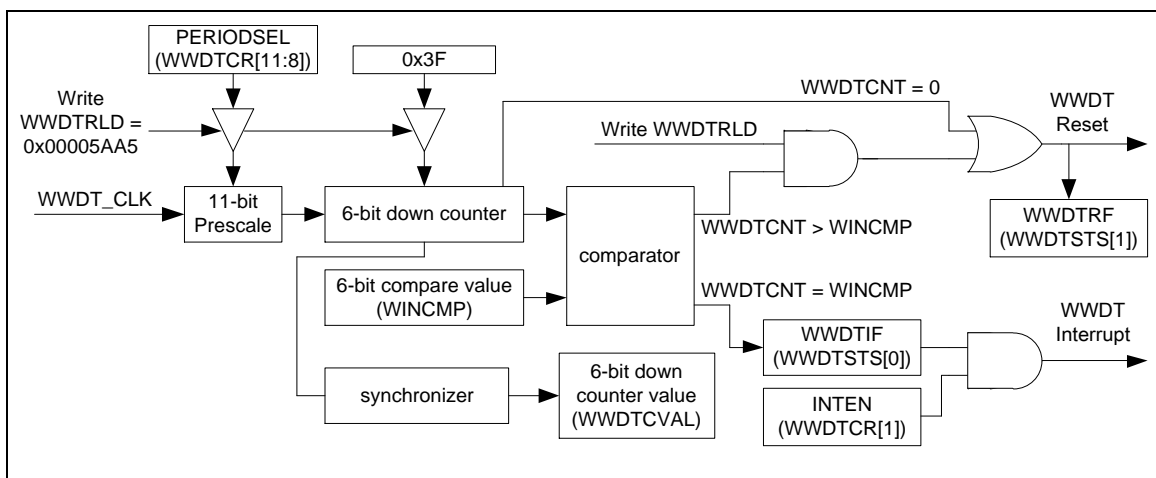

Figure 6-54 Window Watchdog Timer Block Diagram

#### 6.11.4 Basic Configuration

The WWDT peripheral clock is enabled in APBCLK[0] and clock source can be selected in CLKSEL2[17:16].

#### 6.11.5 Functional Description

The Window Watchdog Timer (WWDT) includes a 6-bit down counter with programmable prescale value to define different WWDT time-out intervals. The clock source of 6-bit WWDT is based on system clock divide 2048 (HCLK/2048) or internal 10 kHz oscillator with a programmable 11-bit prescale counter value which controlled by PERIODSEL (WWDTCRL[11:8]) setting. Also, the correlate of PERIODSEL and prescale value are listed in the following table.

PERIODSEL	Prescaler Value	Max. Time-Out Period	Max. Time-Out Interval (WWDT_CLK=10 KHz)
0000	1	$1 * 64 * T_{WWDT}$	6.4 ms
0001	2	$2 * 64 * T_{WWDT}$	12.8 ms
0010	4	$4 * 64 * T_{WWDT}$	25.6 ms
0011	8	$8 * 64 * T_{WWDT}$	51.2 ms
0100	16	$16 * 64 * T_{WWDT}$	102.4 ms
0101	32	$32 * 64 * T_{WWDT}$	204.8 ms
0110	64	$64 * 64 * T_{WWDT}$	409.6 ms
0111	128	$128 * 64 * T_{WWDT}$	819.2 ms
1000	192	$192 * 64 * T_{WWDT}$	1.2288 s
1001	256	$256 * 64 * T_{WWDT}$	1.6384 s
1010	384	$384 * 64 * T_{WWDT}$	2.4576 s
1011	512	$512 * 64 * T_{WWDT}$	3.2768 s
1100	768	$768 * 64 * T_{WWDT}$	4.9152 s
1101	1024	$1024 * 64 * T_{WWDT}$	6.5536 s
1110	1536	$1536 * 64 * T_{WWDT}$	9.8304 s
1111	2048	$2048 * 64 * T_{WWDT}$	13.1072 s

Table 6-10 Window Watchdog Timer Prescale Value Selection

#### ● WWDT Counting

When the WWDTEN bit is set, WWDT down counter will start counting from 0x3F to 0. To prevent program runs to disable WWDT counter counting unexpected, the WWDT control register WWDTCR can only be written once after chip is powered on or reset. User cannot disable WWDT counter counting (WWDTEN), change counter prescale period (PERIODSEL) or change window compare value (WINCMP) while WWDTEN (WWDTCR[0]) bit has been enabled by software unless chip is reset.

- WWDT Compare Match Interrupt

During down counting by the WWDT counter, the WWDTIF is set to 1 while the WWDT counter value (WWDTCVAL) is equal to WINCMP value and WWDTIF can be cleared by software; if WWDTIE is also set to 1 by software, the WWDT compare match interrupt signal is generated also while WWDTIF is set to 1 by hardware.

- WWDT Reset System

When WWDTIF is generated, user must reload WWDT internal counter value to 0x3F by writing 0x00005AA5 to WWDTRLD, and also to prevent WWDT counter value reached to 0 and generate WWDT reset system signal to info system reset.

If current WWDTCVAL value is larger than WINCMP value and user writes 0x00005AA5 to the WWDTRLD register, the WWDT reset system signal will be generated immediately to cause chip reset also.

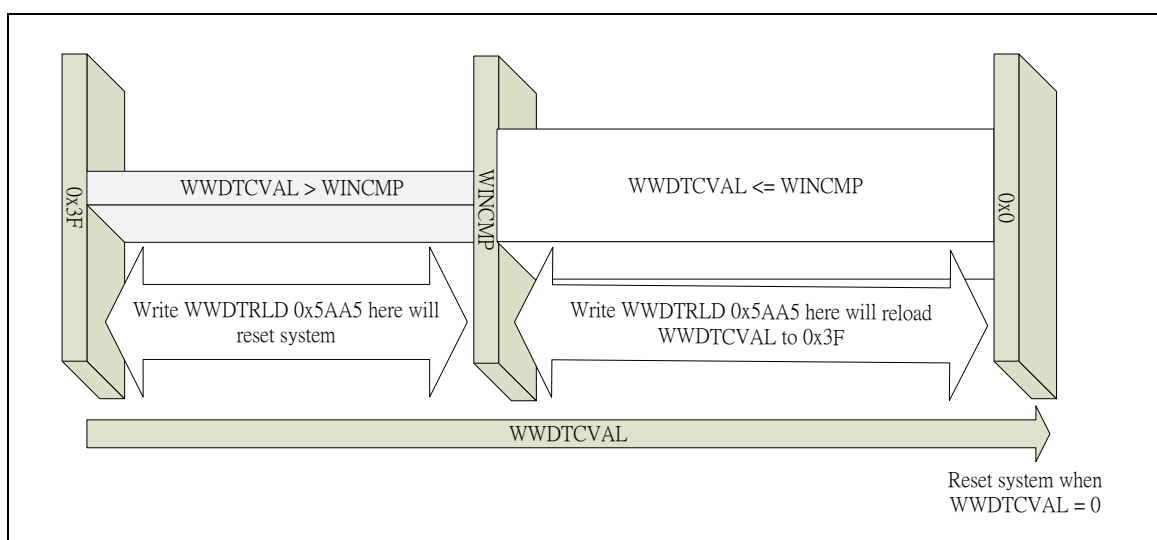

Figure 6-55 Window Watchdog Timer Reset and Reload Behavior

- WWDT Window Setting Limitation

When user writes 0x00005AA5 to WWDTRLD register to reload WWDT counter value to 0x3F, it needs 3 WWDT clocks to sync the reload command to actually perform reload action.

This means if user set PERIODSEL to 0000, the counter prescale value should be as 1, and the WINCMP value must be larger than 2; otherwise, writing WWDTRLD to reload WWDT counter value to 0x3F is unavailable while WWDTIF is generated and WWDT reset system event always happened.

PERIODSEL	Prescale Value	Valid WINCMP Value
0000	1	0x3 ~ 0x3F
0001	2	0x2 ~ 0x3F
Others	Others	0x0 ~ 0x3F

Table 6-11 WINCMP Setting Limitation

### 6.11.6 Register Map

R: read only, W: write only, R/W: both read and write

## 6.12 Real Time Clock (RTC)

### 6.12.1 Overview

The Real Time Clock (RTC) controller provides the real time and calendar message. The RTC offers programmable time tick and alarm match interrupts. The data format of time and calendar messages are expressed in BCD format. A digital frequency compensation feature is available to compensate external crystal oscillator frequency accuracy.

The RTC controller also offers 80 bytes spare registers to store user's important information.

### 6.12.2 Features

- Supports real time counter in Time Loading Register (TLR) (hour, minute, second) and calendar counter in Calendar Loading Register (CLR) (year, month, day) for RTC time and calendar check
- Supports alarm time (hour, minute, second) and calendar (year, month, day) settings in Time Alarm Register (TAR) and Calendar Alarm Register (CAR) register
- Selectable 12-hour or 24-hour time scale in Time Scale Selection Register (TSSR) register
- Supports Leap Year indication in Leap Year Indicator Register (LIR) register
- Supports Day of the Week counter in Day of the Week Register (DWR) register
- Frequency of RTC clock source compensate by RTC Frequency Compensation Register (FCR) register
- All time and calendar message expressed in BCD format
- Supports periodic RTC Time Tick interrupt with 8 period interval options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 and 1 second
- Supports RTC Time Tick and Alarm Match interrupt
- Supports chip wake-up from Idle or Power-down mode while a RTC interrupt signal is generated
- Supports 80 bytes spare registers

### 6.12.3 Block Diagram

The block diagram of Real Time Clock is depicted as follows:

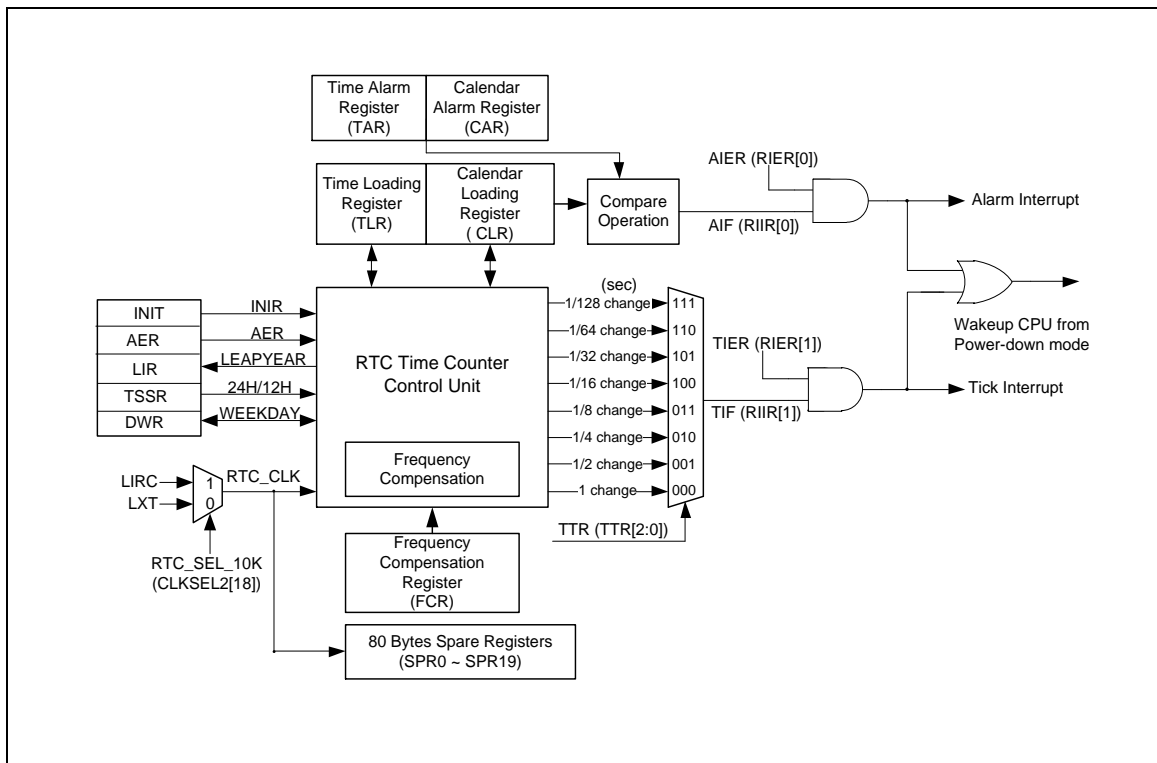

Figure 6-56 RTC Block Diagram

## 6.12.4 Basic Configuration

RTC controller clock enable is in RTC\_EN (APBCLK[1]) and low speed 32 kHz oscillator is enabled by XTL32K\_EN (PWRCON[1]).

## 6.12.5 Functional Description

### 6.12.5.1 RTC Initiation

When a RTC block is powered on, RTC is at reset state. User has to write a number 0xa5eb1357 to INIR (INIR [31:0] RTC Initiation) register to make RTC leaving reset state. Once the INIR is written as 0xa5eb1357, the RTC will be in normal active state permanently. User can read Active bit (INIR[0] RTC Active Status) to check the RTC is at normal active state or reset state.

### 6.12.5.2 Access to RTC register

Due to clock frequency difference between RTC clock and system clock, when user write new data to any one of the RTC registers, the data will not be updated until 2 RTC clocks later (about 60us).

In addition, user must be aware that RTC controller does not check whether loaded data is out of bounds or not in TLR, CLR, TAR and CAR registers. RTC does not check rationality between DWR and CLR either.

### 6.12.5.3 RTC Read/Write Enable

AER (AER[15:0] RTC Register Access Enable Password) is served as read/write access of RTC registers to unlock register read/write protection function. If AER[15:0] is written to 0xA965, user can read ENF (AER[16] RTC Register Access Enable Flag) bit status to check the RTC registers are read/write accessible or locked. Once ENF bit enabled, RTC access enable function will keep effect at least 1024 RTC clocks (about 30ms) and ENF bit will be cleared automatically after 1024 RTC clocks.

The RTC control registers access attribute when ENF is 1 and 0 are shown in below table.

Register	ENF=1	ENF=0
INIR	R/W	R/W
AER	R/W	R/W
FCR	R/W	Not available
TLR	R/W	R
CLR	R/W	R
TSSR	R/W	R/W
DWR	R/W	R
TAR	R/W	Not available
CAR	R/W	Not available
LIR	R	R
RIER	R/W	R/W
RIIR	R/W	R/W
TTR	R/W	Not available
SPRCTL	R/W	Not available

SPR0-SPR19	R/W	Not available
------------	-----	---------------

#### 6.12.5.4 Frequency Compensation

The RTC source clock may not precise to exactly 32768 Hz and the FCR register (Frequency Compensation Register) allows user to make digital compensation to the RTC source clock only if the frequency of RTC source clock is in the range from 32761 Hz to 32776 Hz.

Integer Part Of Detected Value	INTEGER (FCR[11:8])	Integer Part Of Detected Value	INTEGER (FCR[11:8])
32776	1111	32768	0111
32775	1110	32767	0110
32774	1101	32766	0101
32773	1100	32765	0100
32772	1011	32764	0011
32771	1010	32763	0010
32770	1001	32762	0001
32769	1000	32761	0000

Following are the compensation examples for the real RTC source clock is higher or lower than 32768 Hz.

**Example 1: (RTC Source Clock > 32768 Hz)**  
 RTC Source Clock Measured: 32773.65 Hz (> 32768 Hz)  
 Integer Part: 32773 => 0x8005  
 INTEGER (FCR [11:8] Integer Part) = 0x05 – 0x01 + 0x08 = 0x0c  
 Fraction Part: 0.65  
 FRACTION (FCR [5:0] Fraction Part) = 0.65 X 60 = 39 = 0x27  
 RTC FCR Register Should Be As 0xC27.

**Example 2: (RTC source clock ≤ 32768 Hz)**  
 RTC source clock measured: 32765.27 Hz (≤ 32768 Hz)  
 Integer part: 32765 => 0x7FFD  
 INTEGER (FCR [11:8] Integer Part) = 0x0D – 0x01 – 0x08 = 0x04  
 Fraction part: 0.27  
 FRACTION (FCR [5:0] Fraction Part) = 0.27 x 60 = 16.2 = 0x10  
 RTC FCR register should be as 0x410.

#### 6.12.5.5 Time and Calendar counter

TLR and CLR register are used to load the real time and calendar. TAR and CAR register are used for setup alarm time and calendar.

#### 6.12.5.6 12/24 hour Time Scale Selection

The 12/24 hour time scale selection depends on 24H\_12H bit (TSSR[0] 24-Hour / 12-Hour Time Scale Selection).

24-Hour Time Scale (24H_12H = 1)	12-Hour Time Scale (24H_12H = 0)	24-Hour Time Scale (24H_12H = 1)	12-Hour Time Scale (PM Time + 20) (24H_12H = 0)
00	12 (AM12)	12	32 (PM12)
01	01 (AM01)	13	21 (PM01)
02	02 (AM02)	14	22 (PM02)
03	03 (AM03)	15	23 (PM03)
04	04 (AM04)	16	24 (PM04)
05	05 (AM05)	17	25 (PM05)
06	06 (AM06)	18	26 (PM06)
07	07 (AM07)	19	27 (PM07)
08	08 (AM08)	20	28 (PM08)
09	09 (AM09)	21	29 (PM09)
10	10 (AM10)	22	30 (PM10)
11	11 (AM11)	23	31 (PM11)

#### 6.12.5.7 Day of the Week counter

The RTC controller provides day of week in DWR (DWR[2:0] Day of the Week Register). The value is defined from 0 to 6 to represent Sunday to Saturday respectively.

#### 6.12.5.8 Periodic Time Tick Interrupt

The Periodic Time Tick interrupt has 8 period interval options 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2 and 1 second that are selected by TTR (TTR[2:0] Time Tick Register). When Periodic Time Tick interrupt is enabled by setting TIER (RIER[1] Time Tick Interrupt Enable) to 1, the Periodic Time Tick interrupt is requested periodically in the period selected by TTR[2:0] settings.

#### 6.12.5.9 Alarm Interrupt

When the real time and calendar message in TLR and CLR registers are equal to alarm time and calendar values in RTC TAR and CAR registers, the AIF (RIIR[0] RTC Alarm Interrupt Flag) is set to 1 and the RTC alarm interrupt signal asserted if the AIER (RIER[0] Alarm Interrupt Enable) is enabled.

#### 6.12.5.10 Application Note

1. All data in TAR, CAR, TLR and CLR registers are all expressed in BCD format.
2. User has to make sure that the loaded values are reasonable. For example, load CLR as 201a (year), 13 (month), 00 (day), or CLR does not match with DWR, etc.
3. Registers value after powered on or reset:

Register	Reset State
AER	0
CLR	05/1/1 (year/month/day)
TLR	00:00:00 (hour : minute : second)
CAR	00/00/00 (year/month/day)

TAR	00:00:00 (hour : minute : second)
TSSR	1 (24-hour mode)
DWR	6 (Saturday)
RIER	0
RIIR	0
LIR	0
TTR	0

4. In CLR and CAR, only 2 BCD digits are used to express "year". The 2 BCD digits of xy means 20xy, rather than 19xy or 21xy.

#### 6.12.5.11 Spare registers

The RTC module is equipped 80 bytes spare registers to store user's important information. These spare registers are located in RTC clock domain, user needs to enable SPREN (SPRCTL[2] SPR Register Enable) before writing one of 20 spare registers (SPR0 ~ SPR19). User could read SPRRDY (SPRCTL[7] SPR Register Ready) to check if data has been written into registers or not. User could only access the spare registers again once SPRRDY is 1. Any access to spare registers is available if SPRRDY is 0.

If external 32 kHz clock (LXT) is not available in system design, user can choose RTC\_SEL\_10K (CLKSEL2[18]) to 1 to use on chip 10 kHz clock (LIRC) instead of for spare registers read and write operations.

### 6.12.6 Register Map

R: read only, W: write only, R/W: both read and write

### 6.12.7 Register Description

#### RTC Initiation Register (INIR)

Register	Offset	R/W	Description	Reset Value
INIR	RTC_BA+0x00	R/W	RTC Initiation Register	0x0000_0000

31	30	29	28	27	26	25	24
INIR							
23	22	21	20	19	18	17	16
INIR							
15	14	13	12	11	10	9	8
INIR							
7	6	5	4	3	2	1	0
INIR							

Bits	Description
[31:1]	<b>INIR[31:1]</b> <b>RTC Initiation</b> When RTC block is powered on, RTC is at reset state. User has to write a number (0xa5eb1357) to INIR to make RTC leaving reset state. Once the INIR is written as 0xa5eb1357, the RTC will be in un-reset state permanently. The INIR is a write-only field and read value will be always 0.
[0]	<b>INIR[0]/Active</b> <b>RTC Active Status (Read Only)</b> 0 = RTC is at reset state. 1 = RTC is at normal active state.

**RTC Access Enable Register (AER)**

Register	Offset	R/W	Description	Reset Value
AER	RTC_BA+0x04	R/W	RTC Access Enable Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							ENF
15	14	13	12	11	10	9	8
AER							
7	6	5	4	3	2	1	0
AER							

Bits	Description	
[31:17]	Reserved	Reserved.
[16]	ENF	<b>RTC Register Access Enable Flag (Read Only)</b> 0 = RTC register read/write access Disabled. 1 = RTC register read/write access Enabled. <b>Note:</b> This bit will be set after AER[15:0] is load a 0xA965, and will be cleared automatically after 1024 RTC clocks.
[15:0]	AER	<b>RTC Register Access Enable Password (Write Only)</b> Writing 0xA965 to this register will enable RTC access and keep 1024 RTC clocks.

### RTC Frequency Compensation Register (FCR)

Register	Offset	R/W	Description	Reset Value
FCR	RTC_BA+0x08	R/W	RTC Frequency Compensation Register	0x0000_0700

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved				INTEGER			
7	6	5	4	3	2	1	0
Reserved		FRACTION					

Bits	Description	
[31:12]	Reserved	Reserved.
[11:8]	INTEGER	Integer Part Please refer to 5.14.5.4 .
[5:0]	FRACTION	Fraction Part Formula = (fraction part of detected value) x 60. <b>Note:</b> Digit in FCR must be expressed as hexadecimal number..

**Note:** This register can be read back after the ENF (AER[16] RTC Register Access Enable Flag) is active.

### RTC Time Loading Register (TLR)

Register	Offset	R/W	Description	Reset Value
TLR	RTC_BA+0x0C	R/W	Time Loading Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved		10HR		1HR			
15	14	13	12	11	10	9	8
Reserved	10MIN			1MIN			
7	6	5	4	3	2	1	0
Reserved	10SEC			1SEC			

Bits	Description
[31:22]	<b>Reserved</b> Reserved.
[21:20]	<b>10HR</b> 10-Hour Time Digit (0~2)
[19:16]	<b>1HR</b> 1-Hour Time Digit (0~9)
[15]	<b>Reserved</b> Reserved.
[14:12]	<b>10MIN</b> 10-Min Time Digit (0~5)
[11:8]	<b>1MIN</b> 1-Min Time Digit (0~9)
[7]	<b>Reserved</b> Reserved.
[6:4]	<b>10SEC</b> 10-Sec Time Digit (0~5)
[3:0]	<b>1SEC</b> 1-Sec Time Digit (0~9)

**Note:**

1. TLR is a BCD digit counter and RTC controller will not check the loaded data is reasonable or not.
2. The reasonable value range is listed in the parenthesis.
3. When RTC runs as 12-hour time scale mode, the high bit of 10HR field means AM/PM.

### RTC Calendar Loading Register (CLR)

Register	Offset	R/W	Description	Reset Value
CLR	RTC_BA+0x10	R/W	Calendar Loading Register	0x0005_0101

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
10YEAR				1YEAR			
15	14	13	12	11	10	9	8
Reserved			10MON	1MON			
7	6	5	4	3	2	1	0
Reserved		10DAY		1DAY			

Bits	Description
[31:24]	<b>Reserved</b> Reserved.
[23:20]	<b>10YEAR</b> 10-Year Calendar Digit (0~9)
[19:16]	<b>1YEAR</b> 1-Year Calendar Digit (0~9)
[15:13]	<b>Reserved</b> Reserved.
[12]	<b>10MON</b> 10-Month Calendar Digit (0~1)
[11:8]	<b>1MON</b> 1-Month Calendar Digit (0~9)
[7:6]	<b>Reserved</b> Reserved.
[5:4]	<b>10DAY</b> 10-Day Calendar Digit (0~3)
[3:0]	<b>1DAY</b> 1-Day Calendar Digit (0~9)

**Note:**

- CLR is a BCD digit counter and RTC will not check the loaded data is reasonable or not.
- The reasonable value range is listed in the parenthesis.

### RTC Time Scale Selection Register (TSSR)

Register	Offset	R/W	Description	Reset Value
TSSR	RTC_BA+0x14	R/W	Time Scale Selection Register	0x0000_0001

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved							24H_12H

Bits	Description	
[31:1]	Reserved	Reserved.
[0]	24H_12H	<b>24-Hour / 12-Hour Time Scale Selection</b> It indicates that RTC TLR and TAR counter are in 24-hour time scale or 12-hour time scale. Please refer to 5.14.5.6 . 0 = 24-hour time scale selected. 1 = 24-hour time scale selected.

### RTC Day of the Week Register (DWR)

Register	Offset	R/W	Description	Reset Value
DWR	RTC_BA+0x18	R/W	Day of the Week Register	0x0000_0006

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved					DWR		

Bits	Description	
[31:3]	Reserved	Reserved.
[2:0]	DWR	<b>Day Of The Week Register</b> 000 = Sunday. 001 = Monday. 010 = Tuesday. 011 = Wednesday. 100 = Thursday. 101 = Friday. 110 = Saturday. 111 = Reserved.

### RTC Time Alarm Register (TAR)

Register	Offset	R/W	Description	Reset Value
TAR	RTC_BA+0x1C	R/W	Time Alarm Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved		10HR		1HR			
15	14	13	12	11	10	9	8
Reserved	10MIN			1MIN			
7	6	5	4	3	2	1	0
Reserved	10SEC			1SEC			

Bits	Description	
[31:22]	Reserved	Reserved.
[21:20]	10HR	10-Hour Time Digit of Alarm Setting (0~2)
[19:16]	1HR	1-Hour Time Digit of Alarm Setting (0~9)
[15]	Reserved	Reserved.
[14:12]	10MIN	10-Min Time Digit of Alarm Setting (0~5)
[11:8]	1MIN	1-Min Time Digit of Alarm Setting (0~9)
[7]	Reserved	Reserved.
[6:4]	10SEC	10-Sec Time Digit of Alarm Setting (0~5)
[3:0]	1SEC	1-Sec Time Digit of Alarm Setting (0~9)

**Note:**

1. This register can be read back after the ENF (AER[16] RTC Register Access Enable Flag) is active.
2. TAR is a BCD digit counter and RTC controller will not check the loaded data is reasonable or not.
3. The reasonable value range is listed in the parenthesis.
4. When RTC runs as 12-hour time scale mode, the high bit of 10HR field means AM/PM.

### RTC Calendar Alarm Register (CAR)

Register	Offset	R/W	Description	Reset Value
CAR	RTC_BA+0x20	R/W	Calendar Alarm Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
10YEAR				1YEAR			
15	14	13	12	11	10	9	8
Reserved			10MON	1MON			
7	6	5	4	3	2	1	0
Reserved		10DAY		1DAY			

Bits	Description
[31:24]	<b>Reserved</b> Reserved.
[23:20]	<b>10YEAR</b> 10-Year Calendar Digit of Alarm Setting (0~9)
[19:16]	<b>1YEAR</b> 1-Year Calendar Digit of Alarm Setting (0~9)
[15:13]	<b>Reserved</b> Reserved.
[12]	<b>10MON</b> 10-Month Calendar Digit of Alarm Setting (0~1)
[11:8]	<b>1MON</b> 1-Month Calendar Digit of Alarm Setting (0~9)
[7:6]	<b>Reserved</b> Reserved.
[5:4]	<b>10DAY</b> 10-Day Calendar Digit of Alarm Setting (0~3)
[3:0]	<b>1DAY</b> 1-Day Calendar Digit of Alarm Setting (0~9)

**Note:**

1. This register can be read back after the ENF (AER [16] RTC Register Access Enable Flag) is active.
2. CAR is a BCD digit counter and RTC will not check the loaded data is reasonable or not.
3. The reasonable value range is listed in the parenthesis.

**RTC Leap Year Indication Register (LIR)**

Register	Offset	R/W	Description	Reset Value
LIR	RTC_BA+0x24	R	Leap Year Indicator Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved							LIR

Bits	Description	
[31:1]	Reserved	Reserved.
[0]	LIR	<b>Leap Year Indication Register (Read Only)</b> 0 = This year is not a leap year. 1 = This year is a leap year.

### RTC Interrupt Enable Register (RIER)

Register	Offset	R/W	Description	Reset Value
RIER	RTC_BA+0x28	R/W	RTC Interrupt Enable Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved						TIER	AIER

Bits	Description	
[31:2]	Reserved	Reserved.
[1]	TIER	<b>Time Tick Interrupt Enable Bit</b> This bit is used to enable/disable RTC Time Tick Interrupt, and generate an interrupt signal if TIF (RIIR[1] RTC Time Tick Interrupt Flag) is set to 1. 0 = RTC Time Tick Interrupt Disabled. 1 = RTC Time Tick Interrupt Enabled. <b>Note:</b> This bit will also trigger a wake-up event while system runs in Idle/Power-down mode and RTC Time Tick Interrupt signal generated.
[0]	AIER	<b>Alarm Interrupt Enable Bit</b> This bit is used to enable/disable RTC Alarm Interrupt, and generate an interrupt signal if AIF (RIIR[0] RTC Alarm Interrupt Flag) is set to 1. 0 = RTC Alarm Interrupt Disabled. 1 = RTC Alarm Interrupt Enabled. <b>Note:</b> This bit will also trigger a wake-up event while system runs in Idle/Power-down mode and RTC Alarm Interrupt signal generated.

### RTC Interrupt Indication Register (RIIR)

Register	Offset	R/W	Description	Reset Value
RIIR	RTC_BA+0x2C	R/W	RTC Interrupt Indicator Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved						TIF	AIF

Bits	Description	
[31:2]	Reserved	Reserved.
[1]	TIF	<b>RTC Time Tick Interrupt Flag</b> When RTC time tick happened, this bit will be set to 1 and an interrupt will be generated if RTC Tick Interrupt enabled TIER (RIER[1]) is set to 1. Chip will also be wake-up if RTC Tick Interrupt is enabled and this bit is set to 1 when chip is running at Power-down mode. 0 = Tick condition does not occur. 1 = Tick condition occur. <b>Note:</b> Write 1 to clear this bit.
[0]	AIF	<b>RTC Alarm Interrupt Flag</b> When RTC time counters TLR and CLR match the alarm setting time registers TAR and CAR, this bit will be set to 1 and an interrupt will be generated if RTC Alarm Interrupt enabled AIER (RIER[0]) is set to 1. Chip will be wake-up if RTC Alarm Interrupt is enabled when chip is at Power-down mode. 0 = Alarm condition is not matched. 1 = Alarm condition is matched. <b>Note:</b> Write 1 to clear this bit.

### RTC Time Tick Register (TTR)

Register	Offset	R/W	Description	Reset Value
TTR	RTC_BA+0x30	R/W	RTC Time Tick Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved					TTR[2:0]		

Bits	Description
[31:3]	<b>Reserved</b> Reserved.
[2:0]	<b>TTR</b> <b>Time Tick Register</b> These bits are used to select RTC time tick period for Periodic Time Tick Interrupt request. 000 = Time tick is 1 second. 001 = Time tick is 1/2 second. 010 = Time tick is 1/4 second. 011 = Time tick is 1/8 second. 100 = Time tick is 1/16 second. 101 = Time tick is 1/32 second. 110 = Time tick is 1/64 second. 111 = Time tick is 1/28 second. <b>Note:</b> This register can be read back after the RTC register access enable bit ENF (AER[16]) is active.

**RTC Spare Functional Control Register (SPRCTL)**

Register	Offset	R/W	Description	Reset Value
<b>SPRCTL</b>	RTC_BA+0x3C	R/W	RTC Spare Functional Control Register	0x0000_0080

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
<b>SPRRDY</b>	Reserved				<b>SPREN</b>	Reserved	

Bits	Description	
[31:8]	<b>Reserved</b>	Reserved.
[7]	<b>SPRRDY</b>	<b>SPR Register Ready</b> This bit indicates if the registers SPRCTL, SPR0 ~ SPR19 are ready to be accessed. After user writing registers SPRCTL, SPR0 ~ SPR19, read this bit to check if these registers are updated done is necessary. 0 = SPRCTL, SPR0 ~ SPR19 updating is in progress. 1 = SPRCTL, SPR0 ~ SPR19 are updated done and ready to be accessed. <b>Note:</b> This bit is read only and any write to it won't take any effect.
[6:3]	<b>Reserved</b>	Reserved.
[2]	<b>SPREN</b>	<b>SPR Register Enable Bit</b> 0 = Spare register is Disabled. 1 = Spare register is Enabled. <b>Note:</b> When spare register is disabled, RTC SPR0 ~ SPR19 cannot be accessed.
[1:0]	<b>Reserved</b>	Reserved.

### RTC Spare Register (SPRx)

Register	Offset	R/W	Description	Reset Value
SPR0	RTC_BA+0x40	R/W	RTC Spare Register 0	0x0000_0000
SPR1	RTC_BA+0x44	R/W	RTC Spare Register 1	0x0000_0000
SPR2	RTC_BA+0x48	R/W	RTC Spare Register 2	0x0000_0000
SPR3	RTC_BA+0x4C	R/W	RTC Spare Register 3	0x0000_0000
SPR4	RTC_BA+0x50	R/W	RTC Spare Register 4	0x0000_0000
SPR5	RTC_BA+0x54	R/W	RTC Spare Register 5	0x0000_0000
SPR6	RTC_BA+0x58	R/W	RTC Spare Register 6	0x0000_0000
SPR7	RTC_BA+0x5C	R/W	RTC Spare Register 7	0x0000_0000
SPR8	RTC_BA+0x60	R/W	RTC Spare Register 8	0x0000_0000
SPR9	RTC_BA+0x64	R/W	RTC Spare Register 9	0x0000_0000
SPR10	RTC_BA+0x68	R/W	RTC Spare Register 10	0x0000_0000
SPR11	RTC_BA+0x6C	R/W	RTC Spare Register 11	0x0000_0000
SPR12	RTC_BA+0x70	R/W	RTC Spare Register 12	0x0000_0000
SPR13	RTC_BA+0x74	R/W	RTC Spare Register 13	0x0000_0000
SPR14	RTC_BA+0x78	R/W	RTC Spare Register 14	0x0000_0000
SPR15	RTC_BA+0x7C	R/W	RTC Spare Register 15	0x0000_0000
SPR16	RTC_BA+0x80	R/W	RTC Spare Register 16	0x0000_0000
SPR17	RTC_BA+0x84	R/W	RTC Spare Register 17	0x0000_0000
SPR18	RTC_BA+0x88	R/W	RTC Spare Register 18	0x0000_0000
SPR19	RTC_BA+0x8C	R/W	RTC Spare Register 19	0x0000_0000

31	30	29	28	27	26	25	24
SPARE[31:24]							
23	22	21	20	19	18	17	16
SPARE[23:16]							
15	14	13	12	11	10	9	8
SPARE[15:8]							
7	6	5	4	3	2	1	0
SPARE[7:0]							

Bits	Descriptions	
[31:0]	<b>SPARE</b>	<b>Spare Register</b> This field is used to store back-up information defined by user.. Before storing back-up information in to SPARE register, user should write 0xA965 to AER[15:0] to make sure register read/write enable bit ENF (AER[16]) is active.

## 6.13 UART Interface Controller (UART)

### 6.13.1 Overview

The NuMicro NUC230/240 series provides up to three channels of Universal Asynchronous Receiver/Transmitters (UART). UART0 supports High Speed UART and UART1~2 perform Normal Speed UART. Besides, only UART0 and UART1 support the flow control function. The UART Controller performs a serial-to-parallel conversion on data received from the peripheral, and a parallel-to-serial conversion on data transmitted from the CPU. The UART controller also supports IrDA SIR Function, LIN master/slave function and RS-485 function mode. Each UART Controller channel supports seven types of interrupts.

### 6.13.2 Features

- Full duplex, asynchronous communications
- Separates receive / transmit 64/16/16 bytes (UART0/UART1/UART2) entry FIFO for data payloads
- Supports hardware auto flow control/flow control function (CTS, RTS) and programmable RTS flow control trigger level (UART0 and UART1 support)
- Programmable receiver buffer trigger level
- Supports programmable baud-rate generator for each channel individually
- Supports CTS wake-up function (UART0 and UART1 support)
- Supports 7-bit receiver buffer time-out detection function
- UART0/UART1 can through DMA channels to receive/transmit data
- Programmable transmitting data delay time between the last stop and the next start bit by setting UA\_TOR [DLY] register
- Supports break error, frame error, parity error and receive / transmit buffer overflow detect function
- Fully programmable serial-interface characteristics
  - Programmable data bit length, 5-, 6-, 7-, 8-bit character
  - Programmable parity bit, even, odd, no parity or stick parity bit generation and detection
  - Programmable stop bit length, 1, 1.5, or 2 stop bit generation
- IrDA SIR function mode
  - Supports 3-/16-bit duration for normal mode
- LIN function mode
  - Supports LIN master/slave mode
  - Supports programmable break generation function for transmitter
  - Supports break detect function for receiver
- RS-485 function mode.
  - Supports RS-485 9-bit mode

- Supports hardware or software direct enable control provided by RTS pin (UART0 and UART1 support)

### 6.13.3 Block Diagram

The UART clock control and block diagram are shown in Figure 5-67 and Figure 5-68 respectively.

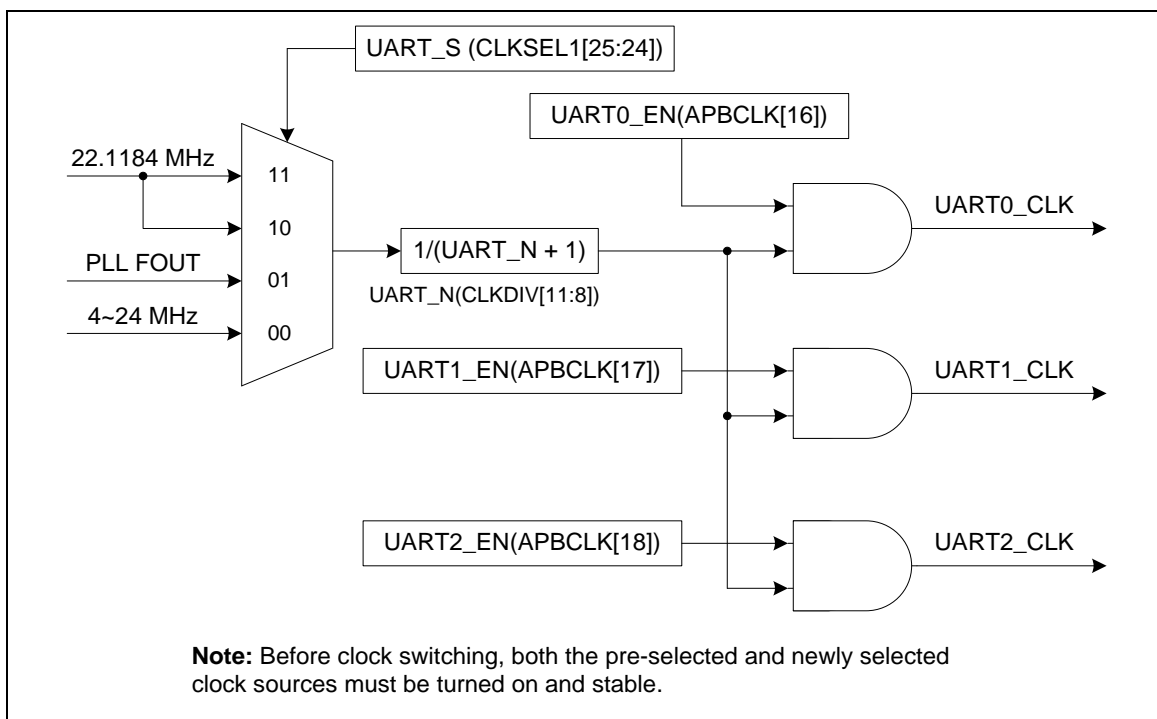

Figure 6-57 UART Clock Control Diagram

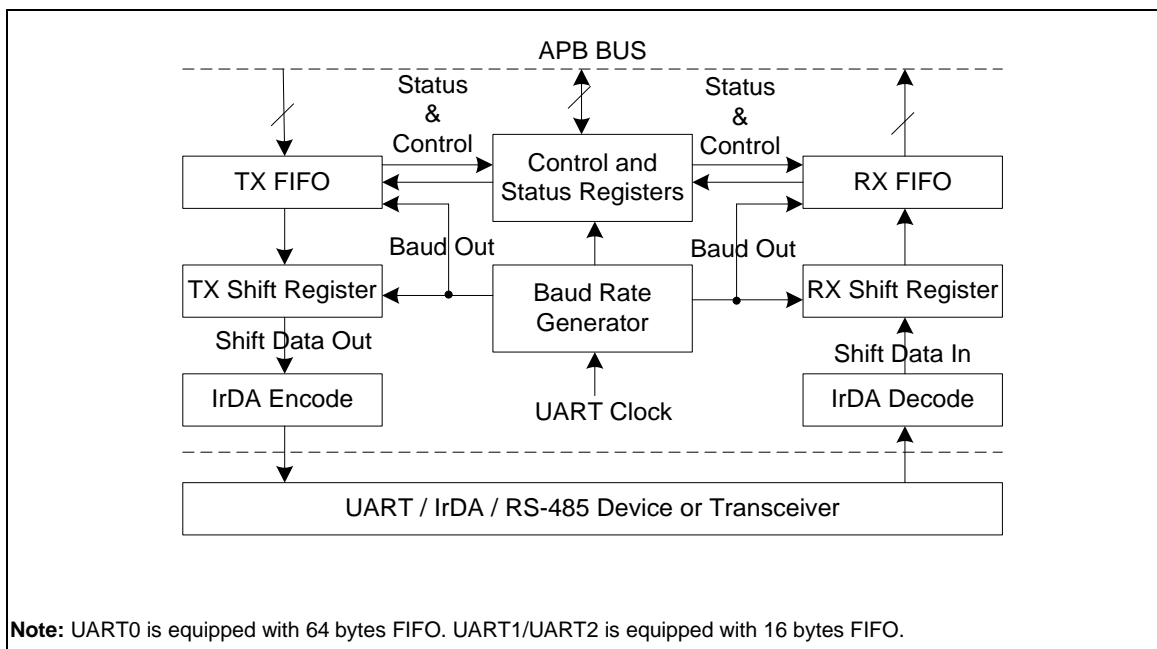

Figure 6-58 UART Block Diagram

Each block is described in detail as follows:

- TX\_FIFO**  
The transmitter is buffered with a 64/16 byte FIFO to reduce the number of interrupts presented to the CPU.
- RX\_FIFO**  
The receiver is buffered with a 64/16 byte FIFO (plus three error bits per byte) to reduce the number of interrupts presented to the CPU.
- TX shift Register**  
This block is the shifting the transmitting data out of serially control.
- RX shift Register**  
This block is the shifting the receiving data in of serially control.
- Modem Control Register**  
This register controls the interface to the MODEM or data set (or a peripheral device emulating a MODEM).
- Baud Rate Generator**  
Divide the external clock by the divisor to get the desired baud rate. Refer to baud rate equation.
- IrDA Encode**  
This block is IrDA encode control block.
- IrDA Decode**  
This block is IrDA decode control block.
- Control and Status Register**  
This field is register set that including the FIFO control registers (UA\_FCR), FIFO status registers (UA\_FSR), and line control register (UA\_LCR) for transmitter and receiver. The time-out control register (UA\_TOR) identifies the condition of time-out interrupt. This register set also includes the interrupt enable register (UA\_IER) and interrupt status register (UA\_ISR) to enable or disable the responding interrupt and to identify the occurrence of the responding interrupt. There are seven types of interrupts, transmitter FIFO empty interrupt(THRE\_INT), receiver threshold level reaching interrupt (RDA\_INT), line status interrupt (parity error or framing error or break interrupt) (RLS\_INT), time-out interrupt (TOUT\_INT), MODEM/Wake-up status interrupt (MODEM\_INT), Buffer error interrupt (BUF\_ERR\_INT) and LIN receiver break field detected interrupt (LIN\_INT).

6.13.4 Basic Configuration

- The UART Controller function pins are configured in PB\_MFP, PD\_MFP, ALT\_MFP, ALT\_MFP1 and ALT\_MFP2 registers.
- The UART Controller clock are enabled in UART0\_EN(APBCLK[16]) for UART0 and UART1\_EN (APBCLK[17]) for UART1.
- The UART Controller clock source is selected by UART\_S(CLKSEL[25:24]).
- The UART Controller clock prescaler is determined by UART\_N(CLKDIV[11:8]).

UART Interface Controller Pin description is shown as following:

Pin	Type	Description
-----	------	-------------

UART_TXD	Output	UART transmit
UART_RXD	Input	UART receive
UART_nCTS	Input	UART modem clear to send
UART_nRTS	Output	UART modem request to send

Table 6-12 UART Interface Controller Pin

### 6.13.5 Functional Description

The UART Controller supports four function modes including UART, IrDA, LIN and RS-485 mode. User can select a function by setting the UA\_FUN\_SEL register. The four function modes will be described in following section.

#### 6.13.5.1 UART Controller Baud Rate Generator

The UART Controller includes a programmable baud rate generator capable of dividing clock input by divisors to produce the serial clock that transmitter and receiver need. The baud rate equation is  $\text{Baud Rate} = \text{UART\_CLK} / M * [\text{BRD} + 2]$ , where M and BRD are defined in Baud Rate Divider Register (UA\_BAUD). The following tables list the UART baud rate equations in the various conditions and UART baud rate parameter settings. There is no error for the baud rate results calculated through the baud rate parameter and register setting below. In IrDA function mode, the baud rate generator must be set in Mode 0.

Mode	DIV_X_EN	DIV_X_ONE	Divider X	BRD	Baud Rate Equation
0	0	0	Don't care	A	$\text{UART\_CLK} / [16 * (A+2)]$ .
1	1	0	B	A	$\text{UART\_CLK} / [(B+1) * (A+2)]$ , B must $\geq 8$ .
2	1	1	Don't care	A	$\text{UART\_CLK} / (A+2)$ , If UART peripheral clock $\leq \text{HCLK}$ , A must $\geq 9$ . If $\text{HCLK} < \text{UART peripheral clock} \leq 2 * \text{HCLK}$ , A must $\geq 15$ . If $2 * \text{HCLK} < \text{UART peripheral clock} \leq 3 * \text{HCLK}$ , A must $\geq 21$ . If UART peripheral clock $> 3 * \text{HCLK}$ , it is unsupported. $\text{UART peripheral clock} = \text{UART clock source} / (\text{UART clock divider number} + 1)$ .

Table 6-13 UART Baud Rate Equation

UART Peripheral Clock = 22.1184 MHz			
Baud Rate	Mode 0	Mode 1	Mode 2
921600	Not support	A=0, B=11	A=22
460800	A=1	A=1, B=15 A=2, B=11	A=46
230400	A=4	A=4, B=15 A=6, B=11	A=94

Table 6-15 UART Controller Baud Rate Register (UA\_BAUD) Setting Table

#### 6.13.5.2 UART Controller Transmit Delay Time Value

The UART Controller programs DLY (UA\_TOR [15:8]) to control the transfer delay time between the last stop bit and next start bit in transmission. The unit is baud. The operation is shown in Figure

Figure 6-59 Transmit Delay Time Operation

#### 6.13.5.3 UART Controller FIFO Control and Status

The UART0 is built-in with a 64-byte transmitter FIFO (TX\_FIFO) and a 64-byte receiver FIFO (RX\_FIFO) that reduces the number of interrupts presented to the CPU. The UART1~2 are equipped with 16-byte transmitter FIFO (TX\_FIFO) and 16-byte receiver FIFO (RX\_FIFO). The

CPU can read the status of the UART at any time during operation. The reported status information includes the type and condition of the transfer operations being performed by the UART, as well as 3 error conditions (parity error, framing error, break interrupt) probably occur while receiving data. This FIFO control and status also support all of UART, IrDA, LIN and RS-485 function mode.

#### 6.13.5.4 UART Controller Wake-up Function

When the chip is in Power-down mode, an external CTS change will wake up chip from Power-down mode. This wake-up function is available in every function mode and it is supported for UART0 and UART1. User must enable the MODEN\_INT interrupt to use the wake-up function.

### 6.13.5 UART Controller Interrupt and Status

Each UART Controller supports seven types of interrupts including:

- Receiver threshold level reached interrupt (RDA\_INT)
- Transmitter FIFO empty interrupt (THRE\_INT)
- Line status interrupt (parity error, frame error or break interrupt) (RLS\_INT)
- MODEM/Wake-up status interrupt (MODEM\_INT)
- Receiver buffer time-out interrupt (TOUT\_INT)
- Buffer error interrupt (BUF\_ERR\_INT)
- LIN bus interrupt (LIN\_INT)

The following tables describe the interrupt sources and flags. The interrupt is generated when the interrupt flag is generated and the interrupt enable bit is set. User must clear the interrupt flag after the interrupt is generated.

Interrupt Source	Interrupt Indicator	Interrupt Enable Bit	Interrupt Flag	Flag Cleared By
Receive Data Available Interrupt	RDA_INT	RDA_IEN	RDA_IF	Read UA_RBR
Transmit Holding Register Empty Interrupt	THRE_INT	THRE_IEN	THRE_IF	Write UA_THR
Receive Line Status Interrupt	RLS_INT	RLS_IEN	RLS_IF = BIF	Writing "1" to BIF
			RLS_IF = FEF	Writing "1" to FEF
			RLS_IF = PEF	Writing "1" to PEF
			RLS_IF = RS485_ADD_DETF	Writing '1' to RS485_ADD_DETF
Modem Status Interrupt	MODEM_INT	MODEM_IEN	MODEM_IF = DCTSF	Write "1" to DCTSF
RX Time-out Interrupt	TOUT_INT	RTO_IEN	TOUT_IF	Read UA_RBR
Buffer Error Interrupt	BUF_ERR_INT	BUF_ERR_IEN	BUF_ERR_IF = TX_OVER_IF	Write "1" to TX_OVER_IF
			BUF_ERR_IF = RX_OVER_IF	Write "1" to RX_OVER_IF
LIN Bus Interrupt	LIN_INT	LIN_IEN	LIN_IF = LIN_BKDET_F	Write "1" to LIN_IF and Write "1" to LIN_BKDET_F
			LIN_IF = BIT_ERR_F	Write "1" to BIT_ERR_F
			LIN_IF = LIN_IDPERR_F	Write "1" to LIN_IDPERR_F
			LIN_IF = LINS_HERR_F	Write "1" to LINS_HERR_F
			LIN_IF = LINS_HDET_F	Write "1" to LINS_HDET_F

Table 6-16 UART Controller Interrupt Source and Flag List

UART Interrupt Source	Interrupt Enable Bit	Interrupt Indicator To Interrupt Controller	Interrupt Flag	Flag Cleared By
Receive Data Available Interrupt	RDA_INT	RDA_IEN	HW_RDA_IF	Read UA_RBR
Transmit Holding Register Empty Interrupt	THRE_INT	THRE_IEN	HW_THRE_IF	Write UA_THR
Receive Line Status Interrupt	RLS_INT	RLS_IEN	HW_RLS_IF = BIF	Write '1' to RFR
			HW_RLS_IF = FEF	
			HW_RLS_IF = PEF	
			HW_RLS_IF=RS485_ADD_DET	
Modem Status Interrupt	MODEM_INT	MODEM_IEN	MODEM_IF = DCTSF	Write "1" to DCTSF
RX Time-out Interrupt	TOUT_INT	RTO_IEN	HW_TOUT_IF	Read UA_RBR
Buffer Error Interrupt	BUF_ERR_INT	BUF_ERR_IEN	HW_BUF_ERR_IF = TX_OVER_IF	Write "1" to RFR
			HW_BUF_ERR_IF = RX_OVER_IF	

Table 6-17 Controller Interrupt Source and Flag in DMA Mode List

#### 6.13.5.6 UART Function Mode

The UART Controller provides UART function (user must set UA\_FUN\_SEL [1:0] to "00" to enable UART function mode). The UART baud rate is up to 1 Mbps.

The UART provides full-duplex and asynchronous communications. The transmitter and receiver contain 16 bytes FIFO for payloads. User can program receiver buffer trigger level and receiver buffer time-out detection for receiver. The transmitting data delay time between the last stop and the next start bit can be programed by setting DLY (UA\_TOR [15:8]) register. The UART supports hardware auto-flow control and flow control function (CTS, RTS), programmable RTS flow control trigger level and fully programmable serial-interface characteristics.

#### UART Line Control Function

The UART Controller supports fully programmable serial-interface characteristics by setting the UA\_LCR register. Software can use the UA\_LCR register to program the word length, stop bit and parity bit. The following tables list the UART word and stop bit length settings and the UART parity bit settings.

NSB (UA_LCR[2])	WLS (UA_LCR[1:0])	Word Length (Bit)	Stop Length (Bit)
0	00	5	1
0	01	6	1
0	10	7	1
0	11	8	1
1	00	5	1.5

1	01	6	2
1	10	7	2
1	11	8	2

Table 6-18 UART Line Control of Word and Stop Length Setting

Parity Type	SPE (UA_LCR[5])	EPE (UA_LCR[4])	PBE (UA_LCR[3])	Description
No Parity	x	x	0	No parity bit output.
Odd Parity	0	0	1	Odd Parity is calculated by adding all the "1's" in a data stream and adding a parity bit to the total bits, to make the total count an odd number.
Even Parity	0	1	1	Even Parity is calculated by adding all the "1's" in a data stream and adding a parity bit to the total bits, to make the count an even number.
Forced Mask Parity	1	0	1	Parity bit always logic 1. Parity bit on the serial byte is set to "1" regardless of total number of "1's" (even or odd counts).
Forced Space Parity	1	1	1	Parity bit always logic 0. Parity bit on the serial byte is set to "0" regardless of total number of "1's" (even or odd counts).

Table 6-19 UART Line Control of Parity Bit Setting

### UART Auto-Flow Control Function

The UART supports auto-flow control function that uses two signals, CTS (clear-to-send) and RTS (request-to-send), to control the flow of data transfer between the UART and external devices (e.g. Modem). When auto flow is enabled, the UART is not allowed to receive data until the UART asserts RTS to external device. When the number of bytes in the RX FIFO equals the value of RTS\_TRI\_LEV (UA\_FCR [19:16]), the RTS is de-asserted. The UART sends data out when UART detects CTS is asserted from external device. If the valid asserted CTS is not detected, the UART will not send data out.

The following diagram demonstrates the auto-flow control block.

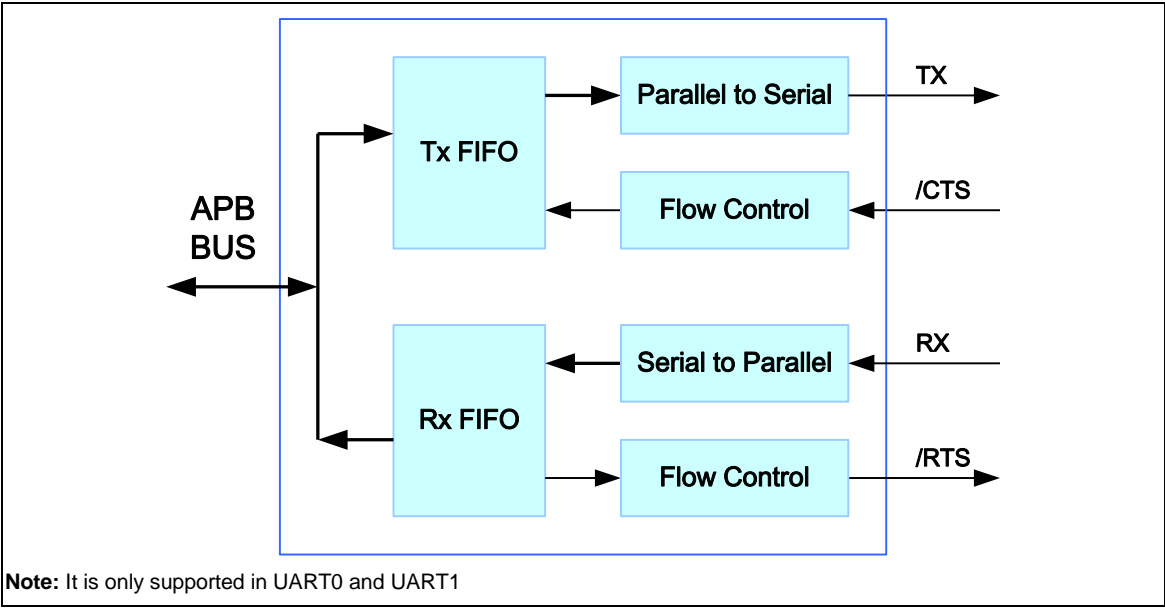

Figure 6-60 Auto Flow Control Block Diagram

The following diagram demonstrates the CTS auto flow control of UART function mode. User must set AUTO\_CTS\_EN (UA\_IER [13]) to enable CTS auto flow control function. The LEV\_CTS (UA\_MCR [8]) can set CTS pin input active state. The DCTSFS (UA\_MSR [0]) is set when any state change of CTS pin input has occurred, and then TX data will be automatically transmitted from TX FIFO.

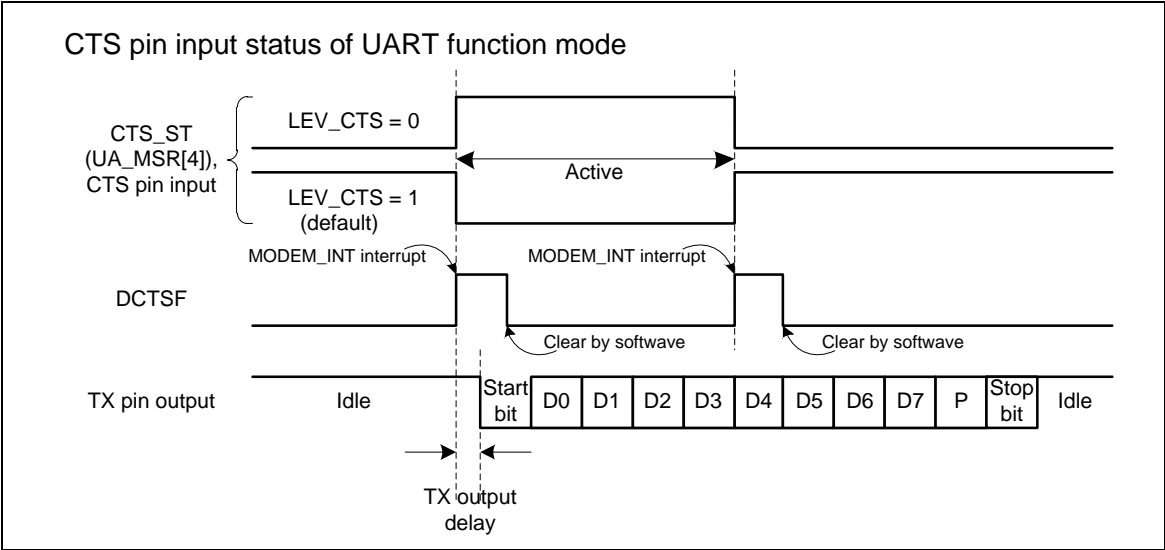

Figure 6-61 UART CTS Auto Flow Control Enabled

As shown in the following figure, in UART RTS Auto Flow control mode (AUTO\_RTS\_EN (UA\_IER[12])=1), the RTS internal signal is controlled by UART FIFO controller with RTS\_RTI\_LEV(UA\_FCR[19:16]) trigger level.

Setting LEV\_RTS(UA\_MCR[9]) can control the RTS pin output is inverse or non-inverse from RTS signal. User can read the RTS\_ST(UA\_MCR[13]) bit to get real RTS pin output voltage logic status.

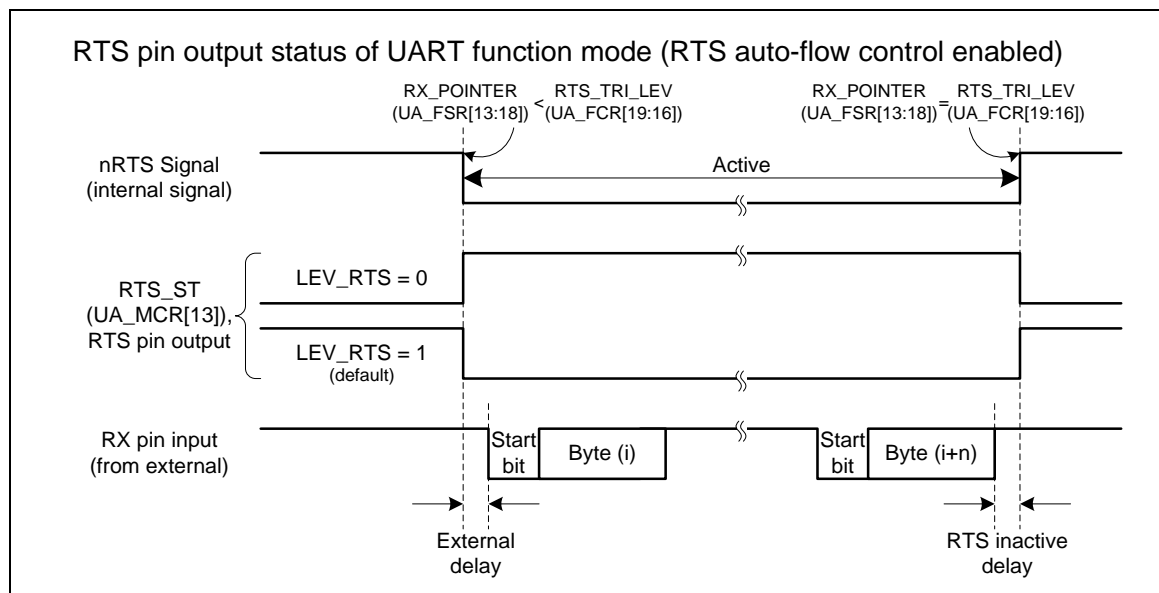

Figure 6-62 UART RTS Auto Flow Control Enabled

As shown in the following figure, in software mode (AUTO\_RTS\_EN(UA\_IER[12])=0) the RTS flow is directly controlled by software programming of RTS(UA\_MCR[1]) control bit.

Setting LEV\_RTS(UA\_MCR[9]) can control the RTS pin output is inverse or non-inverse from RTS(UA\_MCR[1]) control bit. User can read the RTS\_ST(UA\_MCR[13]) bit to get real RTS pin output voltage logic status.

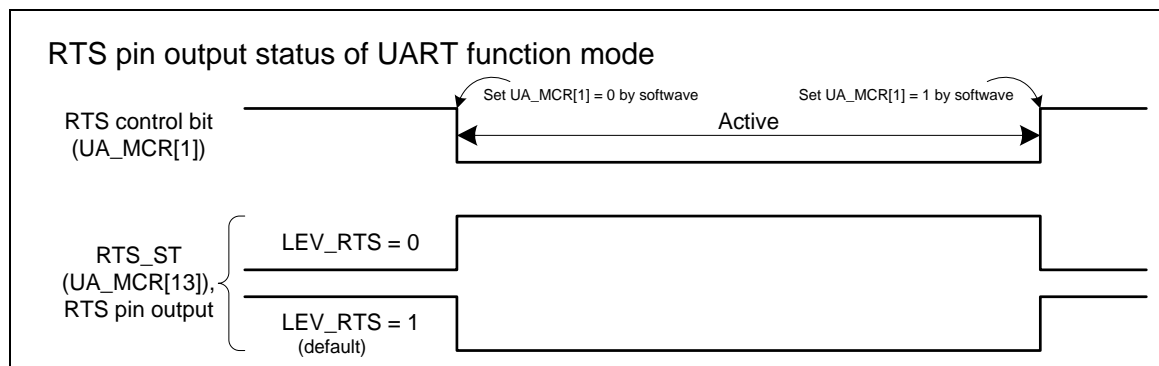

Figure 6-63 UART RTS Flow with Software Control

#### 6.13.5.7 IrDA Function Mode

The UART Controller also provides Serial IrDA (SIR, Serial Infrared) function (user must set UA\_FUN\_SEL [1:0] to '10' to enable the IrDA function). The SIR specification defines a short-

range infrared asynchronous serial transmission mode with one start bit, 8 data bits, and 1 stop bit. The maximum data rate is 115.2 kbps. The IrDA SIR block contains an IrDA SIR protocol encoder/decoder. The IrDA SIR protocol is half-duplex only. So it cannot transmit and receive data at the same time. The IrDA SIR physical layer specifies a minimum 10 ms transfer delay between transmission and reception, and this delay feature must be implemented by software.

In IrDA mode, the DIV\_X\_EN (UA\_BAUD [29]) register must be disabled.

**Baud Rate = Clock / (16 \* BRD)**, where BRD is Baud Rate Divider in UA\_BAUD register.

The following diagram demonstrates the IrDA control block diagram.

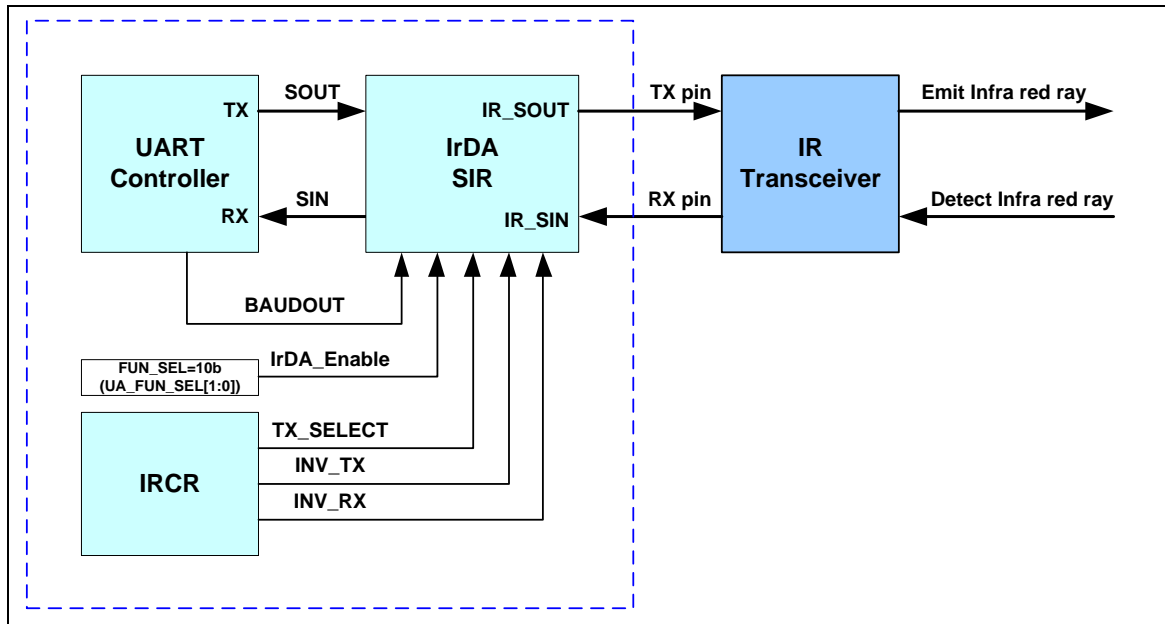

Figure 6-64 IrDA Control Block Diagram

### IrDA SIR Transmit Encoder

The IrDA SIR Transmit Encoder modulates Non-Return-to Zero (NRZ) transmit bit stream output from UART. The IrDA SIR physical layer specifies the use of Return-to-Zero, Inverted (RZI) modulation scheme which represents logic 0 as an infra light pulse. The modulated output pulse stream is transmitted to an external output driver and infrared light emitting diode.

In Normal mode, the transmitted pulse width is specified as 3/16 period of baud rate.

### IrDA SIR Receive Decoder

The IrDA SIR Receive Decoder demodulates the Return-to-Zero bit stream from the input detector and outputs the NRZ serial bits stream to the UART received data input. The decoder input is normally high in idle state. (Because of this, IRCR (INV\_RX [6]) should be set as 1 by default).

A start bit is detected when the decoder input is LOW.

### IrDA SIR Operation

The IrDA SIR encoder/decoder provides functionality which converts between UART data stream

and half-duplex serial SIR interface. The following diagram is IrDA encoder/decoder waveform.

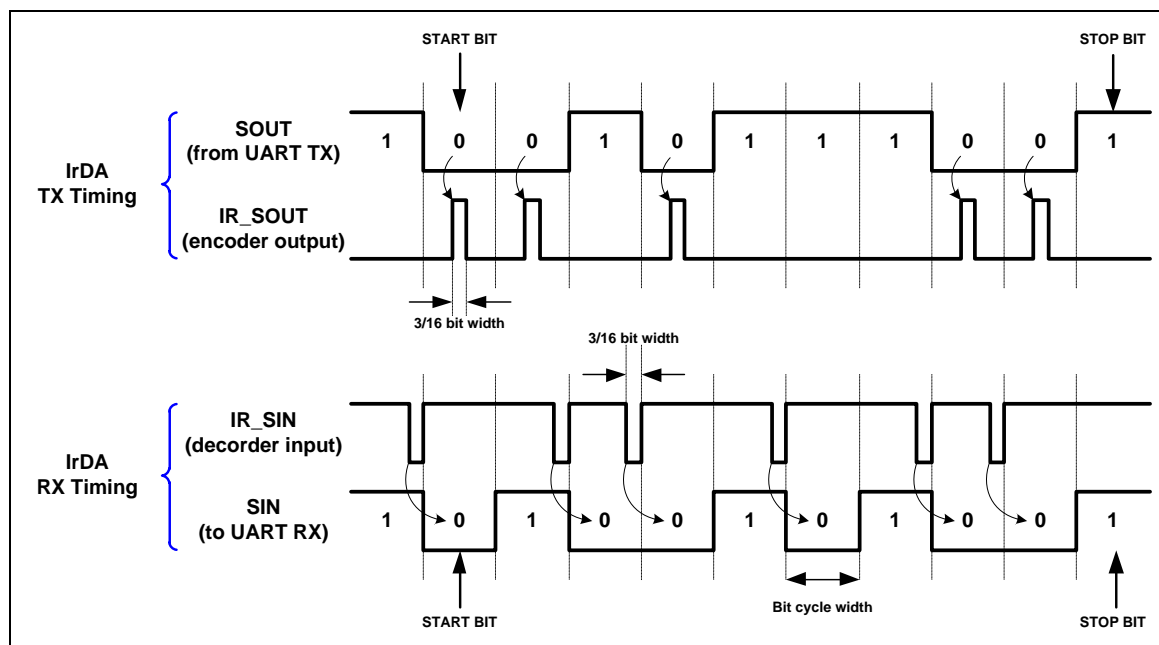

Figure 6-65 IrDA TX/RX Timing Diagram

#### 6.13.5.8 LIN (Local Interconnection Network) Mode

The UART0~UART2 supports LIN function. Setting FUN\_SEL (UA\_FUN\_SEL[1:0]) to '01' to select LIN mode operation. The UART0~UART2 supports LIN break/delimiter generation and break/delimiter detection in LIN master mode, and supports header detection and automatic resynchronization in LIN Slave mode.

##### 6.13.5.8.1 Structure of LIN Frame

According to the LIN protocol, all information transmitted is packed as frames; a frame consists of a header (provided by the master task) and a response (provided by a slave task), followed by a response (provided by a slave task). The header (provided by the master task) consists of a break field and a sync field followed by a frame identifier (frame ID). The frame identifier uniquely defines the purpose of the frame. The slave task is appointed for providing the response associated with the frame ID. The response consists of a data field and a checksum field. The following diagram is the structure of LIN Frame.

Figure 6-66 Structure of LIN Frame

#### 6.13.5.8.2 Structure of LIN Byte

In LIN mode, each byte field is initiated by a START bit with value 0 (dominant), followed by 8 data bits and no parity bit, LSB is first and ended by 1 stop bit with value 1 (recessive) in accordance with the LIN standard. The structure of Byte is shown as follows.

Figure 6-67 Structure of LIN Byte

#### 6.13.5.8.3 LIN Master Mode

The UART0~UART2 controller supports LIN Master mode. To enable and initialize the LIN Master mode, the following steps are necessary:

1. Setting the UA\_BAUD register to select the desired baud rate.
2. Setting WLS (UA\_LCR[1:0]) to "11" to configure the data length with 8 bits, clearing PBE (UA\_LCR[3]) bit to disable parity check and clearing NSB (UA\_LCR[2]) bit to configure with one stop bit.
3. Setting FUN\_SEL (UA\_FUN\_SEL[1:0]) to "01" to select LIN function mode operation.

A complete header consists of a break field and sync field followed by a frame identifier (frame ID). The UART0/UART1 controller can be selected header sending by three header selected modes. The header selected mode can be "break field" or "break field and sync field" or "break field, sync field and frame ID field" by setting LIN\_HEAD\_SEL (UA\_LIN\_CTL[23:22]). If the selected header is "break field", software must handle the following sequence to send a complete header to bus by filling sync data (0x55) and frame ID data to the UA\_THR register. If the selected header is "break field and sync field", software must handle the sequence to send a complete header to bus by filling the frame ID data to UA\_THR register, and if the selected header is "break field, sync field and frame ID field", hardware will control the header sending sequence automatically but software must filled frame ID data to LIN\_PID (UA\_LIN\_CTL [31:24]). When operating in header selected mode in which the selected header is "break field, sync field and frame ID field", the frame ID parity bit can be calculated by software or hardware depending whether the LIN\_IDPEN (UA\_LIN\_CTL[9]) bit is set or not.

LIN_HEAD_SEL	Break Field	Sync Field	ID Field
0	Generated by Hardware	Handled by Software	Handled by Software
1	Generated by Hardware	Generated by Hardware	Handled by Software
2	Generated by Hardware	Generated by Hardware	Generated by Hardware (But Software needs to fill ID to LIN_PID (UA_LIN_CTL[31:24]) first

Table 6-20 LIN Header Selection in Master Mode

When UART is operated in LIN data transmission, LIN bus transfer state can be monitored by hardware or software. User can enable hardware monitoring by setting BIT\_ERR\_EN (UA\_LIN\_CTL [12]) to "1", if the input pin (UART\_RX) state is not equal to the output pin

(UART\_TX) state in LIN transmitter state that hardware will generate an interrupt to CPU. Software can also monitor the LIN bus transfer state by checking the read back data in UA\_RBR register. The following sequence is a program sequence example.

The procedure without software error monitoring in Master mode:

1. Fill Protected Identifier to LIN\_PID (UA\_LIN\_CTL[31:24]).
2. Select the hardware transmission header field including “break field + sync field + protected identifier field” by setting LIN\_HEAD\_SEL (UA\_LIN\_CTL [23:22]) to 10
3. Setting LIN\_SHD (UA\_LIN\_CTL[8]) bit to 1 for requesting header transmission.
4. Wait until LIN\_SHD (UA\_LIN\_CTL[8]) bit cleared by hardware.
5. Wait until TE\_FLAG (UA\_FSR[28]) set to 1 by hardware.

**Note1:** The default setting of break field is 12 dominant bits (break field) and 1 recessive bit break/sync delimiter. Setting LIN\_BKFL (UA\_LIN\_CTL [19:16]) and LIN\_BS\_LEN (UA\_LIN\_CTL[21:20]) to change the LIN break field length and break/sync delimiter length.

**Note2:** The default setting of break/sync delimiter length is 1-bit time and the inter-byte spaces default setting is also 1-bit time. Setting LIN\_BS\_LEN (UA\_LIN\_CTL[21:20]) and DLY(UA\_TOR[7:0]) can change break/sync delimiter length and inter-byte spaces.

**Note3:** If the header includes the “break field, sync field and frame ID field”, software must fill frame ID to LIN\_PID (UA\_LIN\_CTL[31:24]) before trigger header transmission (setting the LIN\_SHD (UA\_LIN\_CTL[8])). The frame ID parity can be generated by software or hardware depending on LIN\_IDPEN (UA\_LIN\_CTL[9]) setting. If the parity generated by software with LIN\_IDPEN (UA\_LIN\_CTL[9]) is set to ‘0’, software must fill 8 bit data (include 2 bit parity) in this field. If the parity generated by hardware with LIN\_IDPEN (UA\_LIN\_CTL[9]) is set to ‘1’, software fill ID0~ID5 and hardware calculates P0 and P1.

Procedure with software error monitoring in Master mode:

1. Choose the hardware transmission header field only including “break field” by setting LIN\_HEAD\_SEL (UA\_LIN\_CTL [23:22]) to ‘00’.
2. Enable break detection function by setting LIN\_BKDET\_EN (UA\_LIN\_CTL[10]).
3. Request break + break/sync delimiter transmission by setting the LIN\_SHD (UA\_LIN\_CTL[8])
4. Wait until the LIN\_BKDET\_F (UA\_LIN\_SR[8]) flag is set to “1” by hardware..
5. Request sync field transmission by writing 0x55 into UA\_THR register.
6. Wait until the RDA\_IF (UA\_ISR[0]) is set to “1” by hardware and then read back the UA\_RBR register.
7. Request header frame ID transmission by writing the protected identifier value to UA\_THR register.
8. Wait until the RDA\_IF (UA\_ISR[0]) is set to “1” by hardware and then read back the UA\_RBR register.

LIN break and delimiter detection

When software enables the break detection function by setting LIN\_BKDET\_EN (UA\_LIN\_CTL[10]), the break detection circuit is activated. The break detection circuit is totally independent from the UART0/UART1 receiver.

When the break detection function is enabled, the circuit looks at the input UART\_RX pin for a start signal. If UART LIN controller detects consecutive dominant is greater than 11 bits dominant followed by a recessive bit (delimiter), the LIN\_BKDET\_F (UA\_LIN\_SR[8]) flag is set at the end of break field. If the LIN\_IEN (UA\_IER[8]) bit is set to 1, an interrupt LIN\_INT (UA\_ISR[15]) will be generated. The behavior of the break detection and break flag are shown in the following figure.

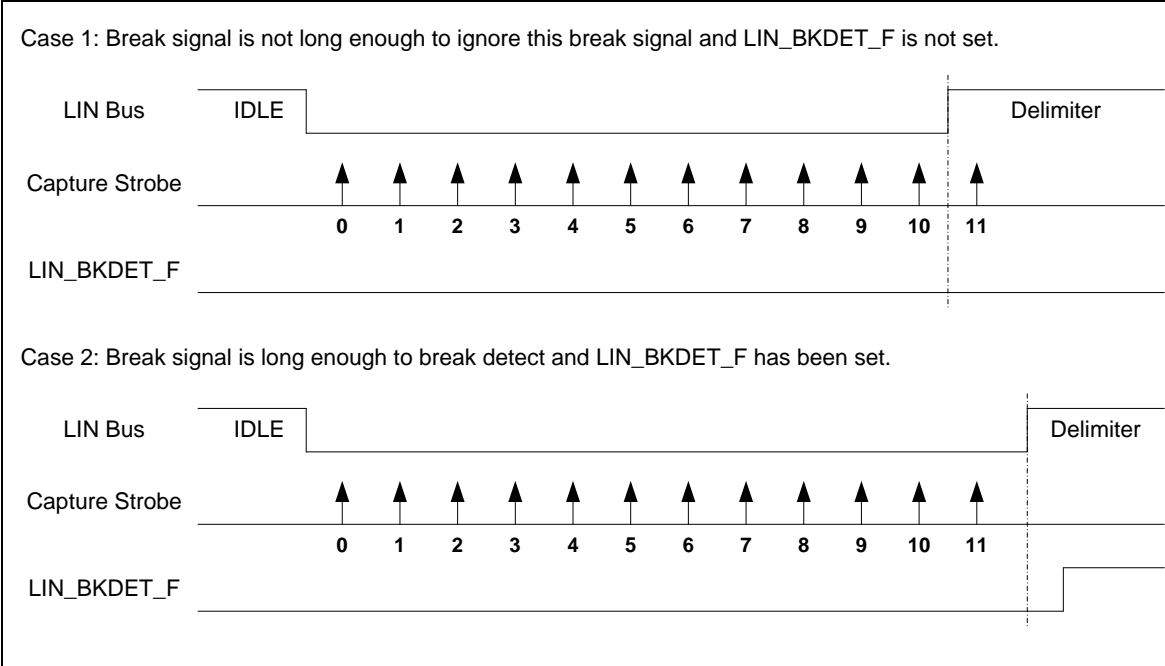

Figure 6-68 Break Detection in LIN Mode

LIN break and delimiter detection

The LIN master can transmit response (master is the publisher of the response) and receive response (master is the subscriber of the response). When the master is the publisher of the response, the master sends response by writing the UA\_THR register. If the master is the subscriber of the response, the master will receive response from other slave node.

LIN Frame ID and Parity Format

The LIN frame ID value in LIN function mode is shown, the frame ID parity can be generated by software or hardware depends on IDPEN (UART\_LINCTL[9]) = 1.

If the parity generated by hardware, user fill ID0~ID5, (UART\_LINCTL [29:24] )hardware will calculate P0 (UART\_LINCTL[30]) and P1 (UART\_LINCTL[31]), otherwise user must filled frame ID and parity in this field.

Figure 6-69 LIN Frame ID and Parity Format

#### 6.13.5.8.4 LIN Slave Mode

The UART0/UART1 controller supports LIN Slave mode. To enable and initialize the LIN Slave mode, the following steps are necessary:

1. Setting the UA\_BAUD register to select the desired baud rate.
2. Configure the data length to 8 bits by setting WLS (UA\_LCR[1:0]) to '11' and disable parity check by clearing PBE (UA\_LCR[3]) bit and configure with one stop bit by clearing NSB (UA\_LCR[2]) bit.
3. Select LIN function mode by setting FUN\_SEL (UA\_FUN\_SEL[1:0]) to "01".
4. Enable LIN slave mode by setting the LINS\_EN (UA\_LIN\_CTL[0]) to 1.

#### LIN header reception

According to the LIN protocol, a slave node must wait for a valid header which comes from the master node. Next the slave task will take one of following actions (depend on the master header frame ID value).

- Receive the response.
- Transmit the response.
- Ignore the response and wait for next header.

In LIN Slave mode, user can enable the slave header detection function by setting the LINS\_HDET\_EN (UA\_LIN\_CTL[10]) to detect complete frame header (receive "break field", "sync field" and "frame ID field"). When a LIN header is received, the LINS\_HDET\_F (UA\_LIN\_SR[0]) flag will be set. If the LIN\_IEN (UA\_IER[8]) bit is set to 1, an interrupt will be generated. User can enable the frame ID parity check function by setting LIN\_IDPEN (UA\_LIN\_CTL[9]). If only received frame ID parity is not correct (break and sync filed are correct), the LIN\_IDPERR\_F (UA\_LIN\_SR[2]) flag is set to '1'. If the LIN\_IEN(UA\_IER[8]) is set to 1, an interrupt will be generated and LINS\_HDET\_F ( UA\_LIN\_SR[0]) is set to '1'. User can also put LIN in mute mode by setting LIN\_MUTE\_EN (UA\_LIN\_CTL[4]) to '1'. This mode allows detection of headers only (break + sync + frame ID) and prevents the reception of any other characters. In order to avoid bit rate tolerance, the controller supports automatic resynchronization function to avoid clock deviation error, user can enable this feature by setting LINS\_ARS\_EN (UA\_LIN\_CTL[2]).

#### LIN response transmission

The LIN slave node can transmit response and receive response. When slave node is the publisher of the response, the slave node sends response by filling data to the UA\_THR register. If the slave node is the subscriber of the response, the slave node receives data from LIN bus.

### LIN header time-out error

The LIN slave controller contains a header time-out counter. If the entire header is not received within the maximum time limit of 57 bit times, the header error flag LINS\_HERR\_F (UA\_LIN\_SR[1]) will be set. The time-out counter is enabled at each break detect edge and stopped in the following conditions.

- A LIN frame ID field has been received.
- The header error flag asserts.
- Writing 1 to the LINS\_SYNC\_F (UA\_LIN\_SR[3]) to re-search a new frame header.

### Mute mode and LIN exit from mute mode condition

In Mute mode, a LIN slave node will not receive any data until specified condition occurred. It allows header detection only and prevents the reception of any other characters. User can enable Mute mode by setting the LIN\_MUTE\_EN (UA\_LIN\_CTL[4]) and exiting from Mute mode condition can be selected by LIN\_HEAD\_SEL (UA\_LIN\_CTL[23:22]).

**Note:** It is recommended to set LIN slave node to Mute mode after checksum transmission.

The LIN slave controller exiting from Mute mode is described as follows: If LIN\_HEAD\_SEL (UA\_LIN\_CTL[23:22]) is set to “break field”, when LIN slave controller detects a valid LIN break + delimiter, the controller will enable the receiver (exit from Mute mode) and subsequent data (sync data, frame ID data, response data) are received in RX-FIFO.

If LIN\_HEAD\_SEL (UA\_LIN\_CTL[23:22]) is set to “break field and sync field”, when the LIN slave controller detects a valid LIN break + delimiter followed by a valid sync field without frame error, the controller will enable the receiver (exit from mute mode) and subsequent data (ID data, response data) are received in RX-FIFO. If LIN\_HEAD\_SEL (UA\_LIN\_CTL[23:22]) is set to “break field, sync field and ID field”, when the LIN slave controller detects a valid LIN break + delimiter and valid sync field without frame error followed by ID data without frame error and received ID data matched LIN\_PID (UA\_LIN\_CTL[31:24]) value. The controller will enable the receiver (exit from mute mode) and subsequent data (response data) are received in RX-FIFO.

### Slave mode non-automatic resynchronization

User can disable the automatic resynchronization function to fix the communication baud rate. When operating in Non-Automatic Resynchronization mode, software needs some initial process, and the initialization process flow of Non-Automatic Resynchronization mode is shown as follows:

1. Select the desired baud rate by setting the UA\_BAUD register.
2. Select LIN function mode by setting UA\_FUN\_SEL (UA\_FUN\_SEL[1:0]) to '01'.
3. Disable automatic resynchronization function by setting LINS\_ARS\_EN (UA\_LIN\_CTL[2]) is set to 0.
4. Enable LIN slave mode by setting the LINS\_EN (UA\_LIN\_CTL[0]) is set to 1.

### Slave mode with automatic resynchronization

In Automatic Resynchronization mode, the controller will adjust the baud rate generator after each sync field reception. The initialization process flow of Automatic Resynchronization mode is shown as follows:

1. Select the desired baud rate by setting the UA\_BAUD register.
2. Select LIN function mode by setting UA\_FUN\_SEL (UA\_FUN\_SEL[1:0]) to "01".
3. Enable automatic resynchronization function by setting LINS\_ARS\_EN (UA\_LIN\_CTL[2]) to 1.
4. Enable LIN slave mode by setting the LINS\_EN (UA\_LIN\_CTL[0]) is set to 1.

When the automatic resynchronization function is enabled, after each LIN break field, the time duration between five falling edges is sampled on UART peripheral clock and the result of this measurement is stored in an internal 13-bit register and the UA\_BAUD register value will be automatically updated at the end of the fifth falling edge. If the measure timer (13-bit) overflows before five falling edges, then the header error flag LIN\_HERR\_F (UA\_LIN\_SR [1]) will be set.

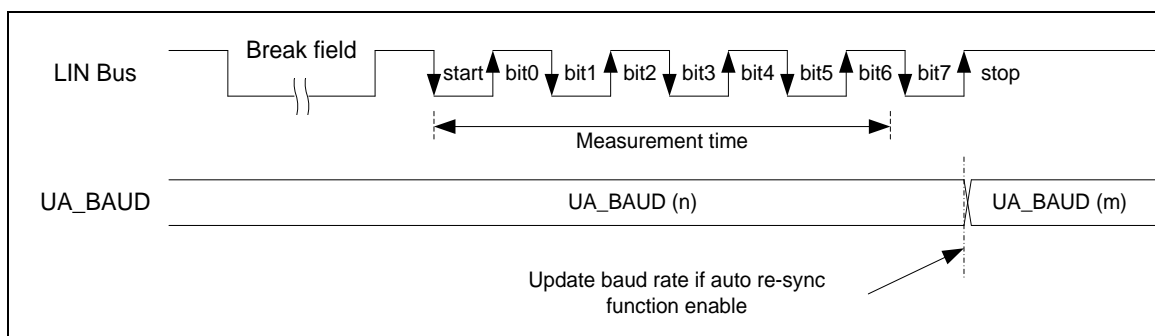

Figure 6-70 LIN Sync Field Measurement

When operating in Automatic Resynchronization mode, software must select the desired baud rate by setting the UA\_BAUD register and hardware will store it at internal TEMP\_REG register, after each LIN break field, the time duration between five falling edges is sampled on UART peripheral clock and the result of this measurement is stored in an internal 13-bit register BAUD\_LIN and the result will be updated to UA\_BAUD register automatically.

In order to guarantee the transmission baud rate, the baud rate generator must reload the initial value before each new break reception. The initial value is programmed by the application during initialization (TEMP\_REG). User can set LINS\_DUM\_EN (UA\_LIN\_CTL [3]) to enable auto reload initial baud rate value function. If the LINS\_DUM\_EN (UA\_LIN\_CTL [3]) is set, when received the next character, hardware will auto reload the initial value to UA\_BAUD, and when the UA\_BAUD be updated, the LINS\_DUM\_EN (UA\_LIN\_CTL [3]) will be cleared automatically. The behavior of LIN updated method as shown in the following figure.

**Note1:** It is recommended to set the LINS\_DUM\_EN bit before every checksum reception.

**Note2:** When a header error is detected, user must write 1 to LINS\_SYNC\_F (UA\_LIN\_SR[3]) to re-search new frame header. When writing 1 to it, hardware will reload the initial baud rate TEMP\_REG and re-search new frame header.

**Note3:** When operating in Automatic Resynchronization mode, the baud rate setting must be operated at mode2 (DIV\_X\_EN (UA\_BAUD [29]) and DIV\_X\_ONE (UA\_BAUD[28]) must be 1).

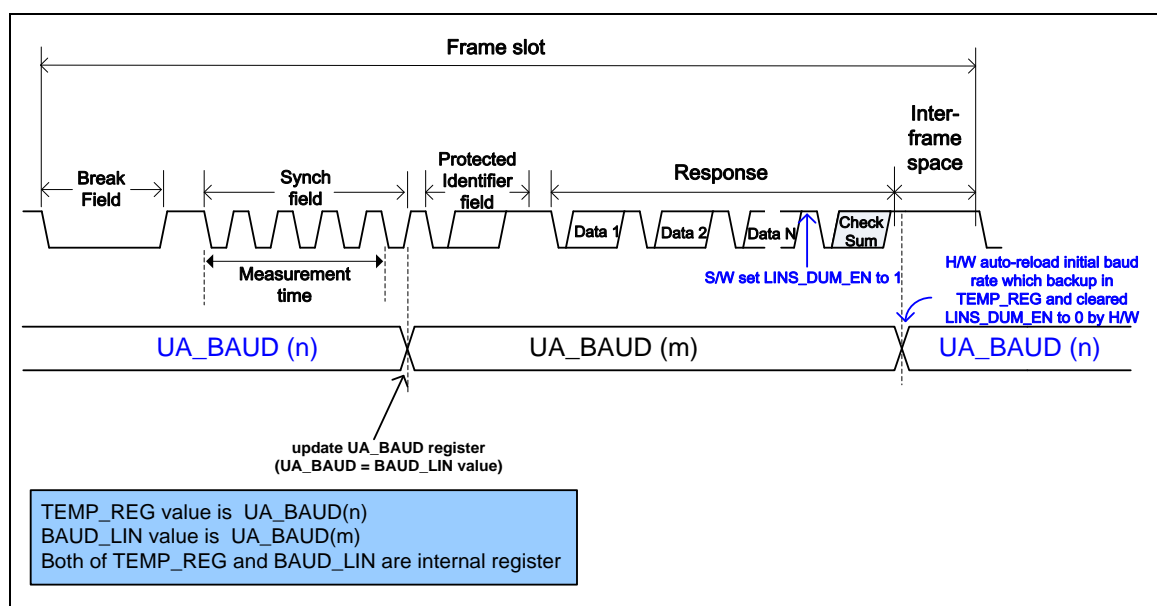

Figure 6-71 UA\_BAUD Update Sequence in Automatic Resynchronization Mode when LINS\_DUM\_EN (UA\_LIN\_CTL[3]) = 1

Figure 6-72 UA\_BAUD Update Sequence in Automatic Resynchronization Mode when LINS\_DUM\_EN (UA\_LIN\_CTL[3]) = 0

### Deviation error on the sync field

When operating in Automatic Resynchronization mode, the controller will check the deviation error on the sync field. The deviation error is checked by comparing the current baud rate with the received sync field. Two checks are performed in parallel.

Check1: Based on measurement between the first falling edge and the last falling edge of the sync field.

- If the difference is more than 14.84%, the header error flag LINS\_HERR\_F (UA\_LIN\_SR[1]) will be set.
- If the difference is less than 14.06%, the header error flag LINS\_HERR\_F (UA\_LIN\_SR[1]) will not be set.
- If the difference is between 14.84% and 14.06%, the header error flag LINS\_HERR\_F (UA\_LIN\_SR[1]) may either set or not.

Check2: Based on measurement of time between each falling edge of the sync field.

- If the difference is more than 18.75%, the header error flag LINS\_HERR\_F (UA\_LIN\_SR[1]) will be set.
- If the difference is less than 15.62%, the header error flag LINS\_HERR\_F (UA\_LIN\_SR[1]) will not be set.
- If the difference is between 18.75% and 15.62%, the header error flag LINS\_HERR\_F (UA\_LIN\_SR[1]) may either set or not.

**Note:** The deviation check is based on the current baud rate clock. Therefore, in order to guarantee correct deviation checking, the baud rate must reload the nominal value before each new break reception by setting LINS\_DUM\_EN (UA\_LIN\_CTL[3]) register (It is recommend setting the LINS\_DUM\_EN (UA\_LIN\_CTL[3]) bit before every checksum reception)

### LIN header error detection

In LIN Slave function mode, when user enables the header detection function by setting the LINS\_HDET\_EN (UA\_LIN\_CTL[1]), hardware will handle the header detect flow. If the header has an error, the LIN header error flag LIN\_HERR\_F (UA\_LIN\_SR[1]) will be set and an interrupt is generated if the LIN\_IEN (UA\_IER[8]) bit is set. When header error is detected, user must reset the detect circuit to re-search a new frame header by writing 1 to LINS\_SYNC\_F (UA\_LIN\_SR[3]) to re-search a new frame header.

The LIN header error flag LIN\_HERR\_F (UA\_LIN\_SR[1]) is set if one of the following conditions occurs:

- Break Delimiter is too short (less than 0.5-bit time).
- Frame error in sync field or Identifier field.
- The sync field data is not 0x55 (Non-Automatic Resynchronization mode).
- The sync field deviation error (With Automatic Resynchronization mode).
- The sync field measure time-out (With Automatic Resynchronization mode).
- LIN header reception time-out.

#### 6.13.5.9 RS-485 Function Mode

Another alternate function of UART Controller is RS-485 function (user must set UA\_FUN\_SEL [1:0] to "11" to enable RS-485 function), and direction control provided by RTS pin from an asynchronous serial port. The RS-485 transceiver control is implemented by using the RTS control signal to enable the RS-485 driver. Many characteristics of the RX and TX are same as UART in RS-485 mode.

The UART controller can be configured as an RS-485 addressable slave and the RS-485 master transmitter will identify an address character by setting the parity (9-th bit) to 1. For data characters, the parity is set to 0. Software can use UA\_LCR register to control the 9-th bit (When the PBE(UA\_LCR[3]), EPE(UA\_LCR[4]) and SPE(UA\_LCR[5]) are set, the 9-th bit is transmitted 0 and when PBE and SPE are set and EPE is cleared, the 9-th bit is transmitted 1).

The controller supports three operation modes: RS-485 Normal Multidrop Operation Mode (NMM), RS-485 Auto Address Detection Operation Mode (AAD) and RS-485 Auto Direction Control Operation Mode (AUD). Software can choose any operation mode by programming the UA\_ALT\_CSR register, and drive the transfer delay time between the last stop bit leaving the TX FIFO and the de-assertion of by setting DLY (UA\_TOR [15:8]) register.

##### 6.13.5.9.1 RS-485 Normal Multidrop Operation Mode (NMM)

In RS-485 Normal Multidrop Operation Mode (RS485\_NMM(UA\_ALT\_CSR[8]) = 1), in first, software must decide the data which before the address byte be detected will be stored in RX FIFO or not. If software wants to ignore any data before address byte detected, the flow is set RX\_DIS (UA\_FCR [8]) then enable RS485\_NMM (UA\_ALT\_CSR [8]) and the receiver will ignore any data until an address byte is detected (bit 9 = 1) and the address byte data will be stored in the RX FIFO. If software wants to receive any data before address byte detected, the flow is disables RX\_DIS (UA\_FCR [8]) then enable RS485\_NMM (UA\_ALT\_CSR [8]) and the receiver will received any data.

If an address byte is detected (bit 9 = 1), it will generate an interrupt to CPU and RX\_DIS (UA\_FCR [8]) can decide whether accepting the following data bytes are stored in the RX FIFO. If software disables receiver by setting RX\_DIS (UA\_FCR [8]) register, when a next address byte is detected, the controller will clear the RX\_DIS (UA\_FCR [8]) bit and the address byte data will be stored in the RX FIFO.

##### 6.13.5.9.2 RS-485 Auto Address Detection Operation Mode (AAD)

In RS-485 Auto Address Detection Operation Mode (RS485\_AAD(UA\_ALT\_CSR[9]) = 1), the receiver will ignore any data until an address byte is detected (bit 9 = 1) and the address byte data matches the ADDR\_MATCH (UA\_ALT\_CSR[31:24]) value. The address byte data will be stored in the RX FIFO. The all received byte data will be accepted and stored in the RX FIFO until an address byte data not match the ADDR\_MATCH (UA\_ALT\_CSR[31:24]) value.

##### 6.13.5.9.3 RS-485 Auto Direction Mode (AUD)

Another option function of RS-485 controllers is RS-485 auto direction control function (RS485\_AUD(UA\_ALT\_CSR[10]) = 1). The RS-485 transceiver control is implemented by using the RTS control signal from an asynchronous serial port. The RTS line is connected to the RS-485 transceiver enable pin such that setting the RTS line to high (logic 1) enables the RS-485 transceiver. Setting the RTS line to low (logic 0) puts the transceiver into the tri-state condition to disabled. User can set LEV\_RTS in UA\_MCR register to change the RTS driving level.

The following diagram demonstrates the RS-485 RTS driving level in AUD mode. The RTS pin will be automatically driven during TX data transmission.

Setting LEV\_RTS(UA\_MCR[9]) can control RTS pin output driving level. User can read the RTS\_ST(UA\_MCR[13]) bit to get real RTS pin output voltage logic status.

Figure 6-73 RS-485 RTS Driving Level in Auto Direction Mode

The following diagram demonstrates the RS-485 RTS driving level in software control (RS485\_AUD(UA\_ALT\_CSR[10])=0). The RTS driving level is controlled by programming the RTS(UA\_MCR[1]) control bit.

Setting LEV\_RTS(UA\_MCR[9]) can control the RTS pin output is inverse or non-inverse from RTS(UA\_MCR[1]) control bit. User can read the RTS\_ST(UA\_MCR[13]) bit to get real RTS pin output voltage logic status.

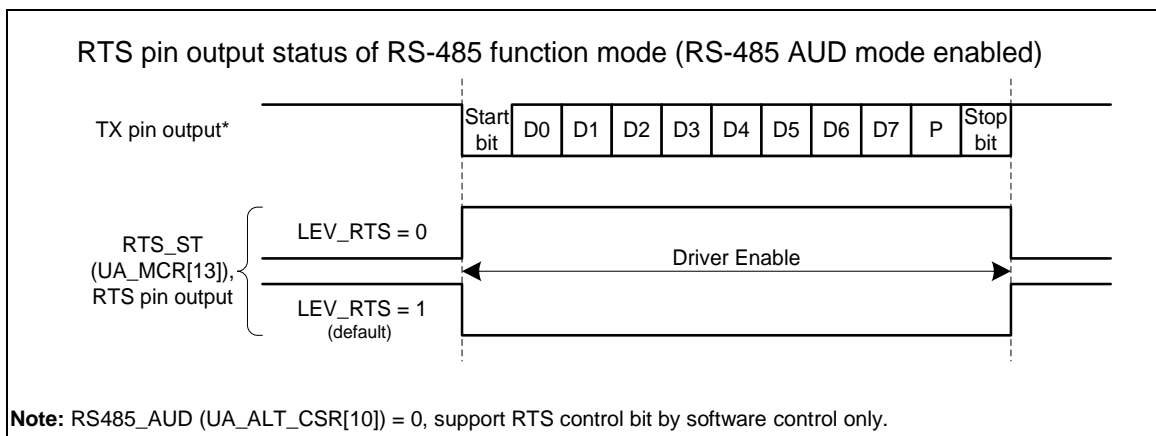

Figure 6-74 RS-485 RTS Driving Level with Software Control

#### Program Sequence Example:

1. Program FUN\_SEL in UA\_FUN\_SEL to select RS-485 function.
2. Program the RX\_DIS (UA\_FCR[8]) to determine enable or disable the receiver RS-485 receiver
3. Program the RS485\_NMM (UA\_ALT\_CSR[8]) or RS485\_AAD (UA\_ALT\_CSR[9]) mode.
4. If the RS485\_AAD (UA\_ALT\_CSR[9]) mode is selected, the ADDR\_MATCH (UA\_ALT\_CSR[31:24]) is programmed for auto address match value.
5. Determine auto direction control by programming RS485\_AUD (UA\_ALT\_CSR[10]).

Figure 6-75 Structure of RS-485 Frame

### 6.13.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
<b>UART Base Address:</b> <b>UART0_BA = 0x4005_0000</b> <b>UART1_BA = 0x4015_0000</b> <b>UART2_BA = 0x4015_4000</b>

### 6.13.7 Register Description

#### UART Receive Buffer Register (UA\_RBR)

Register	Offset	R/W	Description	Reset Value
UA_RBR x=0,1,2	UARTx_BA+0x00	R	UART Receive Buffer Register	Undefined

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
RBR							

Bits	Description
[31:8]	Reserved
[7:0]	<b>Receive Buffer Register (Read Only)</b> By reading this register, the UART will return the 8-bit data received from RX pin (LSB first).

### UART Transmit Holding Register (UA\_THR)

Register	Offset	R/W	Description	Reset Value
UA_THR x=0,1,2	UARTx_BA+0x00	W	UART Transmit Holding Register	Undefined

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
THR							

Bits	Description	
[31:8]	Reserved	Reserved.
[7:0]	THR	<b>Transmit Holding Register</b> By writing one byte to this register, the data byte will be stored in transmitter FIFO. The UART Controller will send out the data stored in transmitter FIFO top location through the TX pin.

### UART Interrupt Enable Register (UA\_IER)

Register	Offset	R/W	Description	Reset Value
UA_IER x=0,1,2	UARTx_BA+0x04	R/W	UART Interrupt Enable Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
DMA_RX_EN	DMA_TX_EN	AUTO_CTS_EN	AUTO_RTS_EN	TIME_OUT_EN	Reserved		LIN_IEN
7	6	5	4	3	2	1	0
Reserved	WAKE_EN	BUF_ERR_IEN	TOUT_IEN	MODEM_IEN	RLS_IEN	THRE_IEN	RDA_IEN

Bits	Description
[31:16]	Reserved
[15]	<b>DMA_RX_EN</b> <b>RX DMA Enable Bit (Not Available In UART2 Channel)</b> This bit can enable or disable RX DMA service. 0 = RX DMA Disabled. 1 = RX DMA Enabled.
[14]	<b>DMA_TX_EN</b> <b>TX DMA Enable Bit (Not Available In UART2 Channel)</b> This bit can enable or disable TX DMA service. 0 = TX DMA Disabled. 1 = TX DMA Enabled.
[13]	<b>AUTO_CTS_EN</b> <b>CTS Auto Flow Control Enable Bit (Not Available In UART2 Channel)</b> 0 = CTS auto flow control Disabled. 1 = CTS auto flow control Enabled. When CTS auto-flow is enabled, the UART will send data to external device when CTS input assert (UART will not send data to device until CTS is asserted).
[12]	<b>AUTO_RTS_EN</b> <b>RTS Auto Flow Control Enable Bit (Not Available In UART2 Channel)</b> 0 = RTS auto flow control Disabled. 1 = RTS auto flow control Enabled. When RTS auto-flow is enabled, if the number of bytes in the RX FIFO equals the RTS_TRI_LEV (UA_FCR [19:16]), the UART will de-assert RTS signal.
[11]	<b>TIME_OUT_EN</b> <b>Time-Out Counter Enable Bit</b> 0 = Time-out counter Disabled. 1 = Time-out counter Enabled.
[10:9]	Reserved
[8]	<b>LIN_IEN</b> <b>LIN Bus Interrupt Enable Bit</b>

		0 = Lin bus interrupt Disabled. 1 = Lin bus interrupt Enabled. <b>Note:</b> This field is used for LIN function mode.
[7]	<b>Reserved</b>	Reserved.
[6]	<b>WAKE_EN</b>	<b>UART Wake-Up Function Enable Bit (Not Available In UART2 Channel)</b> 0 = UART wake-up function Disabled. 1 = UART wake-up function Enabled, when the chip is in Power-down mode, an external CTS change will wake-up chip from Power-down mode.
[5]	<b>BUF_ERR_IEN</b>	<b>Buffer Error Interrupt Enable Bit</b> 0 = BUF_ERR_INT Masked off. 1 = BUF_ERR_INT Enabled.
[4]	<b>TOUT_IEN</b>	<b>RX Time-Out Interrupt Enable Bit</b> 0 = TOUT_INT Masked off. 1 = TOUT_INT Enabled.
[3]	<b>MODEM_IEN</b>	<b>Modem Status Interrupt Enable Bit (Not Available In UART2 Channel)</b> 0 = MODEM_INT Masked off. 1 = MODEM_INT Enabled..
[2]	<b>RLS_IEN</b>	<b>Receive Line Status Interrupt Enable Bit</b> 0 = RLS_INT Masked off. 1 = RLS_INT Enabled.
[1]	<b>THRE_IEN</b>	<b>Transmit Holding Register Empty Interrupt Enable Bit</b> 0 = THRE_INT Masked off. 1 = THRE_INT Enabled.
[0]	<b>RDA_IEN</b>	<b>Receive Data Available Interrupt Enable Bit</b> 0 = RDA_INT Masked off. 1 = RDA_INT Enabled.

# UART FIFO Control Register (UA\_FCR)

Register	Offset	R/W	Description	Reset Value
UA_FCR x=0,1,2	UARTx_BA+0x08	R/W	UART FIFO Control Register	0x0000_0101

Reserved	BCB	SPE	EPE	PBE	NSB	WLS	

Bits	Description	
[31:7]	Reserved	Reserved.
[6]	BCB	<b>Break Control Bit</b> When this bit is set to logic 1, the serial data output (TX) is forced to the Spacing State (logic 0). This bit acts only on TX and has no effect on the transmitter logic.
[5]	SPE	<b>Stick Parity Enable Bit</b> 0 = Stick parity Disabled. 1 = If PBE (UA_LCR[3]) and EBE (UA_LCR[4]) are logic 1, the parity bit is transmitted and checked as logic 0. If PBE (UA_LCR[3]) is 1 and EBE (UA_LCR[4]) is 0 then the parity bit is transmitted and checked as 1.
[4]	EPE	<b>Even Parity Enable Bit</b> 0 = Odd number of logic 1's is transmitted and checked in each word. 1 = Even number of logic 1's is transmitted and checked in each word. This bit has effect only when PBE (UA_LCR[3]) is set.
[3]	PBE	<b>Parity Bit Enable Bit</b> 0 = No parity bit. 1 = Parity bit is generated on each outgoing character and is checked on each incoming data.
[2]	NSB	<b>Number Of "STOP Bit"</b> 0 = One "STOP bit" is generated in the transmitted data. 1 = When select 5-bit word length, 1.5 "STOP bit" is generated in the transmitted data. When select 6-, 7- and 8-bit word length, 2 "STOP bit" is generated in the transmitted data.
[1:0]	WLS	<b>Word Length Selection</b> 00 = Word length is 5-bit. 01 = Word length is 6-bit. 10 = Word length is 7-bit. 11 = Word length is 8-bit.

**UART MODEM Control Register (UA\_MCR) (Not Available in UART2 Channel)**

Register	Offset	R/W	Description	Reset Value
UA_MCR x=0,1	UARTx_BA+0x10	R/W	UART Modem Control Register	0x0000_0200

Bits	Description
[31:29]	Reserved
[28]	<b>TE_FLAG</b> <b>Transmitter Empty Flag (Read Only)</b> This bit is set by hardware when TX FIFO (UA_THR) is empty and the STOP bit of the last byte has been transmitted. 0 = TX FIFO is not empty. 1 = TX FIFO is empty. <b>Note:</b> This bit is cleared automatically when TX FIFO is not empty or the last byte transmission has not completed.
[27:25]	Reserved
[24]	<b>TX_OVER_IF</b> <b>TX Overflow Error Interrupt Flag (Read Only)</b> If TX FIFO (UA_THR) is full, an additional write to UA_THR will cause this bit to logic 1. 0 = TX FIFO is not overflow. 1 = TX FIFO is overflow. <b>Note:</b> This bit is read only, but can be cleared by writing "1" to it.
[23]	<b>TX_FULL</b> <b>Transmitter FIFO Full (Read Only)</b> This bit indicates TX FIFO full or not. 0 = TX FIFO is not full. 1 = TX FIFO is full. This bit is set when the number of usage in TX FIFO Buffer is equal to 64/16/16(UART0/UART1/UART2), otherwise is cleared by hardware.
[22]	<b>TX_EMPTY</b> <b>Transmitter FIFO Empty (Read Only)</b> This bit indicates TX FIFO empty or not. 0 = TX FIFO is not empty. 1 = TX FIFO is empty. <b>Note:</b> When the last byte of TX FIFO has been transferred to Transmitter Shift Register, hardware sets this bit high. It will be cleared when writing data into THR (TX FIFO not

		empty).
[21:16]	<b>TX_POINTER</b>	<b>TX FIFO Pointer (Read Only)</b> This field indicates the TX FIFO Buffer Pointer. When CPU writes one byte into UA_THR, then TX_POINTER increases one. When one byte of TX FIFO is transferred to Transmitter Shift Register, then TX_POINTER decreases one. The Maximum value shown in TX_POINTER is 63/15/15 (UART0/UART1/UART2). When the using level of TX FIFO Buffer equal to 64/16/16, the TX_FULL bit is set to 1 and TX_POINTER will show 0. As one byte of TX FIFO is transferred to Transmitter Shift Register, the TX_FULL bit is cleared to 0 and TX_POINTER will show 63/15/15 (UART0/UART1/UART2).
[15]	<b>RX_FULL</b>	<b>Receiver FIFO Full (Read Only)</b> This bit initiates RX FIFO is full or not. 0 = RX FIFO is not full. 1 = RX FIFO is full. <b>Note:</b> This bit is set when the number of usage in RX FIFO Buffer is equal to 64/16/16(UART0/UART1/UART2), otherwise is cleared by hardware.
[14]	<b>RX_EMPTY</b>	<b>Receiver FIFO Empty (Read Only)</b> This bit initiate RX FIFO empty or not. 0 = RX FIFO is not empty. 1 = RX FIFO is empty. <b>Note:</b> When the last byte of RX FIFO has been read by CPU, hardware sets this bit high. It will be cleared when UART receives any new data.
[13:8]	<b>RX_POINTER</b>	<b>RX FIFO Pointer (Read Only)</b> This field indicates the RX FIFO Buffer Pointer. When UART receives one byte from external device, then RX_POINTER increases one. When one byte of RX FIFO is read by CPU, then RX_POINTER decreases one. The Maximum value shown in RX_POINTER is 63/15/15 (UART0/UART1/UART2). When the using level of RX FIFO Buffer equal to 64/16/16, the RX_FULL bit is set to 1 and RX_POINTER will show 0. As one byte of RX FIFO is read by CPU, the RX_FULL bit is cleared to 0 and RX_POINTER will show 63/15/15 (UART0/UART1/UART2).
[7]	<b>Reserved</b>	Reserved.
[6]	<b>BIF</b>	<b>Break Interrupt Flag (Read Only)</b> This bit is set to logic 1 whenever the received data input(RX) is held in the "spacing state" (logic 0) for longer than a full word transmission time (that is, the total time of "start bit" + data bits + parity + stop bits) and is reset whenever the CPU writes 1 to this bit. 0 = No Break interrupt is generated. 1 = Break interrupt is generated. <b>Note:</b> This bit is read only, but can be cleared by writing "1" to it.
[5]	<b>FEF</b>	<b>Framing Error Flag (Read Only)</b> This bit is set to logic 1 whenever the received character does not have a valid "stop bit" (that is, the stop bit following the last data bit or parity bit is detected as logic 0), and is reset whenever the CPU writes 1 to this bit. 0 = No framing error is generated. 1 = Framing error is generated. <b>Note:</b> This bit is read only, but can be cleared by writing "1" to it.
[4]	<b>PEF</b>	<b>Parity Error Flag (Read Only)</b> This bit is set to logic 1 whenever the received character does not have a valid "parity bit", and is reset whenever the CPU writes 1 to this bit. 0 = No parity error is generated. 1 = Parity error is generated. <b>Note:</b> This bit is read only, but can be cleared by writing "1" to it.

[3]	RS485_ADD_DETF	<b>RS-485 Address Byte Detection Flag (Read Only)</b> 0 = Receiver detects a data that is not an address bit (bit 9 = '1'). 1 = Receiver detects a data that is an address bit (bit 9 = '1'). <b>Note1:</b> This field is used for RS-485 function mode and RS485_ADD_EN (UA_ALT_CSR[15]) is set to 1 to enable Address detection mode. <b>Note2:</b> This bit is read only, but can be cleared by writing '1' to it.
[2:1]	Reserved	Reserved.
[0]	RX_OVER_IF	<b>RX Overflow Error IF (Read Only)</b> This bit is set when RX FIFO overflow. If the number of bytes of received data is greater than RX_FIFO (UA_RBR) size, 64/16/16 bytes of UART0/UART1/UART2, this bit will be set. 0 = RX FIFO is not overflow. 1 = RX FIFO is overflow. <b>Note:</b> This bit is read only, but can be cleared by writing "1" to it.

### UART Interrupt Status Control Register (UA\_ISR)

Register	Offset	R/W	Description	Reset Value

7	6	5	4	3	2	1	0
LIN_IF	Reserved	BUF_ERR_IF	TOUT_IF	MODEM_IF	RLS_IF	THRE_IF	RDA_IF

Bits	Description	
[31:30]	Reserved	Reserved.
[29]	HW_BUF_ERR_ INT	<b>In DMA Mode, Buffer Error Interrupt Indicator (Read Only)</b> This bit is set if BUF_ERR_IEN (UA_IER[5]) and HW_BUF_ERR_IF (UA_ISR[5]) are both set to 1. 0 = No buffer error interrupt is generated in DMA mode. 1 = Buffer error interrupt is generated in DMA mode.
[28]	HW_TOUT_INT	<b>In DMA Mode, Time-Out Interrupt Indicator (Read Only)</b> This bit is set if TOUT_IEN (UA_IER[4]) and HW_TOUT_IF (UA_ISR[20]) are both set to 1. 0 = No Tout interrupt is generated in DMA mode. 1 = Tout interrupt is generated in DMA mode.
[27]	HW_MODEM_INT	<b>In DMA Mode, MODEM Status Interrupt Indicator (Read Only) (Not Available In UART2 Channel)</b> This bit is set if MODEM_IEN (UA_IER[3]) and HW_MODEM_IF (UA_ISR[3]) are both set to 1. 0 = No Modem interrupt is generated in DMA mode. 1 = Modem interrupt is generated in DMA mode.
[26]	HW_RLS_INT	<b>In DMA Mode, Receive Line Status Interrupt Indicator (Read Only)</b> This bit is set if RLS_IEN (UA_IER[2]) and HW_RLS_IF (UA_ISR[18]) are both set to 1. 0 = No RLS interrupt is generated in DMA mode. 1 = RLS interrupt is generated in DMA mode.
[25:22]	Reserved	Reserved.
[21]	HW_BUF_ERR_IF	<b>In DMA Mode, Buffer Error Interrupt Flag (Read Only)</b> This bit is set when the TX or RX FIFO overflows (TX_OVER_IF (UA_FSR[24]) or RX_OVER_IF (UA_FSR[0]) is set). When BUF_ERR_IF (UA_ISR[5]) is set, the transfer maybe is not correct. If BUF_ERR_IEN (UA_IER [5]) is enabled, the buffer error interrupt

		<p>will be generated.</p> <p>0 = No buffer error interrupt flag is generated.</p> <p>1 = Buffer error interrupt flag is generated.</p> <p><b>Note:</b> This bit is cleared when both TX_OVER_IF (UA_FSR[24]) and RX_OVER_IF (UA_FSR[0]) are cleared.</p>
[20]	HW_TOUT_IF	<p><b>In DMA Mode, Time-Out Interrupt Flag (Read Only)</b></p> <p>This bit is set when the RX FIFO is not empty and no activities occurred in the RX FIFO and the time-out counter equal to TOIC (UA_TOR[7:0]). If TOUT_IEN (UA_IER [4]) is enabled, the Tout interrupt will be generated.</p> <p>0 = No Time-out interrupt flag is generated.</p> <p>1 = Time-out interrupt flag is generated.</p> <p><b>Note:</b> This bit is read only and user can read UA_RBR (RX is in active) to clear it.</p>
[19]	HW_MODEM_IF	<p><b>In DMA Mode, MODEM Interrupt Flag (Read Only) (Not Available In UART2 Channel)</b></p> <p>This bit is set when the CTS pin has state change (DCTSF (US_MSR[0] =1)). If MODEM_IEN (UA_IER [3]) is enabled, the Modem interrupt will be generated.</p> <p>0 = No Modem interrupt flag is generated.</p> <p>1 = Modem interrupt flag is generated.</p> <p><b>Note:</b> This bit is read only and reset to 0 when the bit DCTSF(US_MSR[0]) is cleared by writing 1 on DCTSF (US_MSR[0]).</p>
[18]	HW_RLS_IF	<p><b>In DMA Mode, Receive Line Status Flag (Read Only)</b></p> <p>This bit is set when the RX receive data have parity error, frame error or break error (at least one of 3 bits, BIF (UA_FSR[6]), FEF (UA_FSR[5]) and PEF (UA_FSR[4]) is set). If RLS_IEN (UA_IER [2]) is enabled, the RLS interrupt will be generated.</p> <p>0 = No RLS interrupt flag is generated.</p> <p>1 = RLS interrupt flag is generated.</p> <p><b>Note1:</b> In RS-485 function mode, this field include "receiver detect any address byte received address byte character (bit9 = '1') bit".</p> <p><b>Note2:</b> In UART function mode, this bit is read only and reset to 0 when all bits of BIF(UA_FSR[6]) , FEF(UA_FSR[5]) and PEF(UA_FSR[4]) are cleared.</p> <p><b>Note3:</b> In RS-485 function mode, this bit is read only and reset to 0 when all bits of BIF(UA_FSR[6]) , FEF(UA_FSR[5]) and PEF(UA_FSR[4]) and RS485_ADD_DETF (UA_FSR[3]) are cleared.</p>
[17:16]	Reserved	Reserved.
[15]	LIN_INT	<p><b>LIN Bus Interrupt Indicator (Read Only)</b></p> <p>This bit is set if LIN_IEN (UA_IER[8]) and LIN_IF(UA_ISR[7]) are both set to 1.</p> <p>0 = No LIN Bus interrupt is generated.</p> <p>1 = The LIN Bus interrupt is generated.</p>
[14]	Reserved	Reserved.
[13]	BUF_ERR_INT	<p><b>Buffer Error Interrupt Indicator (Read Only)</b></p> <p>This bit is set if BUF_ERR_IEN(UA_IER[5]) and BUF_ERR_IF(UA_ISR[5]) are both set to 1.</p> <p>0 = No buffer error interrupt is generated.</p> <p>1 = Buffer error interrupt is generated.</p>
[12]	TOUT_INT	<p><b>Time-Out Interrupt Indicator (Read Only)</b></p> <p>This bit is set if TOUT_IEN(UA_IER[4]) and TOUT_IF(UA_ISR[4]) are both set to 1.</p> <p>0 = No Tout interrupt is generated.</p> <p>1 = Tout interrupt is generated.</p>
[11]	MODEM_INT	<b>MODEM Status Interrupt Indicator (Read Only) (Not Available In UART2 Channel)</b>

		This bit is set if MODEM_IEN(UA_IER[3] and MODEM_IF(UA_ISR[4]) are both set to 1 0 = No Modem interrupt is generated. 1 = Modem interrupt is generated.
[10]	RLS_INT	<b>Receive Line Status Interrupt Indicator (Read Only)</b> This bit is set if RLS_IEN (UA_IER[2]) and RLS_IF(UA_ISR[2]) are both set to 1. 0 = No RLS interrupt is generated. 1 = RLS interrupt is generated.
[9]	THRE_INT	<b>Transmit Holding Register Empty Interrupt Indicator (Read Only)</b> This bit is set if THRE_IEN (UA_IER[1]) and THRE_IF(UA_ISR[1]) are both set to 1. 0 = No THRE interrupt is generated. 1 = THRE interrupt is generated.
[8]	RDA_INT	<b>Receive Data Available Interrupt Indicator (Read Only)</b> This bit is set if RDA_IEN (UA_IER[0]) and RDA_IF (UA_ISR[0]) are both set to 1. 0 = No RDA interrupt is generated. 1 = RDA interrupt is generated.
[7]	LIN_IF	<b>LIN Bus Flag (Read Only)</b> This bit is set when LIN slave header detect (LINS_HDET_F (UA_LIN_SR[0] =1)), LIN break detect (LIN_BKDET_F(UA_LIN_SR[9]=1)), bit error detect (BIT_ERR_F(UA_LIN_SR[9]=1), LIN slave ID parity error (LINS_IDPERR_F(UA_LIN_SR[2] = 1) or LIN slave header error detect (LINS_HERR_F (UA_LIN_SR[1])). If LIN_IEN (UA_IER [8]) is enabled the LIN interrupt will be generated. 0 = None of LINS_HDET_F, LIN_BKDET_F, BIT_ERR_F, LINS_IDPERR_F and LINS_HERR_F is generated. 1 = At least one of LINS_HDET_F, LIN_BKDET_F, BIT_ERR_F, LINS_IDPERR_F and LINS_HERR_F is generated. <b>Note:</b> This bit is read only. This bit is cleared when LINS_HDET_F(UA_LIN_SR[0]), LIN_BKDET_F(UA_LIN_SR[9]), BIT_ERR_F(UA_LIN_SR[9]), LINS_IDPENR_F (UA_LIN_SR[2]) and LINS_HERR_F(UA_LIN_SR[1]) all are cleared.
[6]	Reserved	Reserved.
[5]	BUF_ERR_IF	<b>Buffer Error Interrupt Flag (Read Only)</b> This bit is set when the TX FIFO or RX FIFO overflows (TX_OVER_IF (UA_FSR[24]) or RX_OVER_IF (UA_FSR[0]) is set). When BUF_ERR_IF (UA_ISR[5]) is set, the transfer is not correct. If BUF_ERR_IEN (UA_IER [8]) is enabled, the buffer error interrupt will be generated. 0 = No buffer error interrupt flag is generated. 1 = Buffer error interrupt flag is generated. 0 = No buffer error interrupt flag is generated. 1 = Buffer error interrupt flag is generated. <b>Note:</b> This bit is read only and reset to 0 when all bits of TX_OVER_IF(UA_FSR[24]) and RX_OVER_IF(UA_FSR[0]) are cleared.
[4]	TOUT_IF	<b>Time-Out Interrupt Flag (Read Only)</b> This bit is set when the RX FIFO is not empty and no activities occurred in the RX FIFO and the time-out counter equal to TOIC. If TOUT_IEN (UA_IER [4]) is enabled, the Tout interrupt will be generated. 0 = No Time-out interrupt flag is generated. 1 = Time-out interrupt flag is generated. <b>Note:</b> This bit is read only and user can read UA_RBR (RX is in active) to clear it
[3]	MODEM_IF	<b>MODEM Interrupt Flag (Read Only) (Not Available In UART2 Channel)</b> This bit is set when the CTS pin has state change (DCTS_F (UA_MSR[0]) = 1). If MODEM_IEN (UA_IER [3]) is enabled, the Modem interrupt will be generated. 0 = No Modem interrupt flag is generated.

		<p>1 = Modem interrupt flag is generated.</p> <p><b>Note:</b> This bit is read only and reset to 0 when bit DCTSF is cleared by a write 1 on DCTSF(UA_MSR[0]).</p>
[2]	RLS_IF	<p><b>Receive Line Interrupt Flag (Read Only)</b></p> <p>This bit is set when the RX receive data have parity error, frame error or break error (at least one of 3 bits, BIF(UA_FSR[6]), FEF(UA_FSR[5]) and PEF(UA_FSR[4]), is set). If RLS_IEN (UA_IER [2]) is enabled, the RLS interrupt will be generated.</p> <p>0 = No RLS interrupt flag is generated.</p> <p>1 = RLS interrupt flag is generated.</p> <p><b>Note1:</b> In RS-485 function mode, this field is set include "receiver detect and received address byte character (bit9 = '1') bit". At the same time, the bit of UA_FSR[RS485_ADD_DETF] is also set.</p> <p><b>Note2:</b> This bit is read only and reset to 0 when all bits of BIF(UA_FSR[6]), FEF(UA_FSR[5]) and PEF(UA_FSR[4]) are cleared.</p> <p><b>Note3:</b> In RS-485 function mode, this bit is read only and reset to 0 when all bits of BIF(UA_FSR[6]), FEF(UA_FSR[5]) and PEF(UA_FSR[4]) and RS485_ADD_DETF (UA_FSR[3]) are cleared.</p>
[1]	THRE_IF	<p><b>Transmit Holding Register Empty Interrupt Flag (Read Only)</b></p> <p>This bit is set when the last data of TX FIFO is transferred to Transmitter Shift Register. If THRE_IEN (UA_IER[1]) is enabled, the THRE interrupt will be generated.</p> <p>0 = No THRE interrupt flag is generated.</p> <p>1 = THRE interrupt flag is generated.</p> <p><b>Note:</b> This bit is read only and it will be cleared when writing data into THR (TX FIFO not empty).</p>
[0]	RDA_IF	<p><b>Receive Data Available Interrupt Flag (Read Only)</b></p> <p>When the number of bytes in the RX FIFO equals the RFITL then the RDA_IF(UA_ISR[0]) will be set. If RDA_IEN (UA_IER [0]) is enabled, the RDA interrupt will be generated.</p> <p>0 = No RDA interrupt flag is generated.</p> <p>1 = RDA interrupt flag is generated.</p> <p><b>Note:</b> This bit is read only and it will be cleared when the number of unread bytes of RX FIFO drops below the threshold level (RFITL(UA_FCR[7:4])).</p>

### UART Time-out Register (UA\_TOR)

Register	Offset	R/W	Description	Reset Value
UA_TOR x=0,1,2	UARTx_BA+0x20	R/W	UART Time-out Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
DLY							
7	6	5	4	3	2	1	0
TOIC							

Bits	Description	
[31:16]	Reserved	Reserved.
[15:8]	DLY	<b>TX Delay Time Value</b> This field is used to programming the transfer delay time between the last stop bit and next start bit.
[7:0]	TOIC	<b>Time-Out Interrupt Comparator</b> The time-out counter resets and starts counting (the counting clock = baud rate) whenever the RX FIFO receives a new data word. Once the content of time-out counter is equal to that of time-out interrupt comparator (TOIC (UA_TOR[7:0])), a receiver time-out interrupt (INT_TOUT) is generated if TOUT_IEN (UA_IER [4]) enabled. A new incoming data word or RX FIFO empty will clear TOUT_INT(UA_IER[9]). In order to avoid receiver time-out interrupt generation immediately during one character is being received, TOIC (UA_TOR[7:0]) value should be set between 40 and 255. So, for example, if TOIC (UA_TOR[7:0]) is set with 40, the time-out interrupt is generated after four characters are not received when 1 stop bit and no parity check is set for UART transfer.

### UART Baud Rate Divider Register (UA\_BAUD)

Register	Offset	R/W	Description	Reset Value
UA_BAUD x=0,1,2	UARTx_BA+0x24	R/W	UART Baud Rate Divisor Register	0x0F00_0000

31	30	29	28	27	26	25	24
Reserved		DIV_X_EN	DIV_X_ONE	DIVIDER_X

Reserved							
15	14	13	12	11	10	9	8
BRD							
7	6	5	4	3	2	1	0
BRD							

Bits	Description	
[31:30]	Reserved	Reserved.
[29]	DIV_X_EN	<b>Divider X Enable Bit</b> The BRD = Baud Rate Divider, and the baud rate equation is $\text{Baud Rate} = \text{Clock} / [M * (\text{BRD} + 2)]$ ; The default value of M is 16. 0 = Divider X Disabled (the equation of $M = 16$ ). 1 = Divider X Enabled (the equation of $M = X+1$ , but DIVIDER_X [27:24] must $\geq 8$ ). Refer to Table 6-13 for more information. <b>Note:</b> In IrDA mode, this bit must disable.
[28]	DIV_X_ONE	<b>Divider X Equal To 1</b> 0 = Divider $M = X$ (the equation of $M = X+1$ , but DIVIDER_X[27:24] must $\geq 8$ ). 1 = Divider $M = 1$ (the equation of $M = 1$ , but BRD [15:0] must $\geq 3$ ). Refer to Table 6-13 for more information.
[27:24]	DIVIDER_X	<b>Divider X</b> The baud rate divider $M = X+1$ .
[23:16]	Reserved	Reserved.
[15:0]	BRD	<b>Baud Rate Divider</b> The field indicates the baud rate divider

### UART IrDA Control Register (IRCR)

Register	Offset	R/W	Description	Reset Value

Bits	Description
[31:10]	<b>Reserved</b> Reserved.
[9]	<b>BIT_ERR_F</b> <b>Bit Error Detect Status Flag (Read Only)</b> At TX transfer state, hardware will monitoring the bus state, if the input pin (SIN) state not equals to the output pin (SOUT) state, BIT_ERR_F (UA_LIN_SR[9]) will be set. When occur bit error, if the LIN_IEN (UA_IER[8]) = 1, an interrupt will be generated. <b>Note1:</b> This bit is read only, but it can be cleared by writing 1 to it. <b>Note2:</b> This bit is only valid when enable bit error detection function (BIT_ERR_EN (UA_LIN_CTL [12]) = 1).
[8]	<b>LIN_BKDET_F</b> <b>LIN Break Detection Flag (Read Only)</b> This bit is set by hardware when a break is detected and be cleared by writing 1 to it through software. 0 = LIN break not detected. 1 = LIN break detected. <b>Note1:</b> This bit is read only, but it can be cleared by writing 1 to it. <b>Note2:</b> This bit is only valid when LIN break detection function is enabled (LIN_BKDET_EN (UA_LIN_CTL[10]) =1).
[7:4]	<b>Reserved</b> Reserved.
[3]	<b>LINS_SYNC_F</b> <b>LIN Slave Sync Field</b> This bit indicates that the LIN sync field is being analyzed in Automatic Resynchronization mode. When the receiver header have some error been detect, user must reset the internal circuit to re-search new frame header by writing 1 to this bit. 0 = The current character is not at LIN sync state. 1 = The current character is at LIN sync state. <b>Note1:</b> This bit is only valid when in LIN Slave mode (LINS_EN(UA_LIN_CTL[0]) = 1). <b>Note2:</b> This bit is read only, but it can be cleared by writing 1 to it. <b>Note3:</b> When writing 1 to it, hardware will reload the initial baud rate and re-search a new frame header.

[2]	LINS_IDPERR_F	<p><b>LIN Slave ID Parity Error Flag (Read Only)</b></p> <p>This bit is set by hardware when receipted frame ID parity is not correct.</p> <p>0 = No active.</p> <p>1 = Receipted frame ID parity is not correct.</p> <p><b>Note1:</b> This bit is read only, but it can be cleared by writing "1" to it.</p> <p><b>Note2:</b> This bit is only valid when in LIN slave mode (LINS_EN (UA_LIN_CTL [0])= 1) and enable LIN frame ID parity check function LIN_IDPEN (UA_LIN_CTL [9]).</p>
[1]	LINS_HERR_F	<p><b>LIN Slave Header Error Flag (Read Only)</b></p> <p>This bit is set by hardware when a LIN header error is detected in LIN slave mode and be cleared by writing 1 to it. The header errors include "break delimiter is too short (less than 0.5 bit time)", "frame error in sync field or Identifier field", "sync field data is not 0x55 in Non-Automatic Resynchronization mode", "sync field deviation error with Automatic Resynchronization mode", "sync field measure time-out with Automatic Resynchronization mode" and "LIN header reception time-out".</p> <p>0 = LIN header error not detected.</p> <p>1 = LIN header error detected.</p> <p><b>Note1:</b> This bit is read only, but it can be cleared by writing 1 to it.</p> <p><b>Note2:</b> This bit is only valid when UART is operated in LIN slave mode (LINS_EN (UA_LIN_CTL [0]) = 1) and enables LIN slave header detection function (LINS_HDET_EN (UA_LIN_CTL [1])).</p>
[0]	LINS_HDET_F	<p><b>LIN Slave Header Detection Flag (Read Only)</b></p> <p>This bit is set by hardware when a LIN header is detected in LIN slave mode and be cleared by writing 1 to it.</p> <p>0 = LIN header not detected.</p> <p>1 = LIN header detected (break + sync + frame ID).</p> <p><b>Note1:</b> This bit is read only, but it can be cleared by writing 1 to it.</p> <p><b>Note2:</b> This bit is only valid when in LIN slave mode (LINS_EN (UA_LIN_CTL [0]) = 1) and enable LIN slave header detection function (LINS_HDET_EN (UA_LIN_CTL [1])).</p> <p><b>Note3:</b> When enable ID parity check LIN_IDPEN (UA_LIN_CTL [9]), if hardware detect complete header ("break + sync + frame ID"), the LINS_HDET_F will be set whether the frame ID correct or not.</p>

## 6.14 Smart Card Host Interface (SC)

### 6.14.1 Overview

The Smart Card Interface controller (SC controller) is based on ISO/IEC 7816-3 standard and fully compliant with PC/SC Specifications. It also provides status of card insertion/removal. It also support UART mode for full duplex asynchronous communications.

### 6.14.2 Features

- Supports up to three ISO7816-3 ports (SC0, SC1 and SC2)
  - ISO7816-3 T=0, T=1 compliant
  - EMV2000 compliant
  - Separates receive/ transmit 4 byte entry FIFO for data payloads.
  - Programmable transmission clock frequency.
  - Programmable receiver buffer trigger level.
  - Programmable guard time selection (11 ETU ~ 267 ETU).
  - A 24-bit and two 8-bit times for Answer to Request (ATR) and waiting times processing.
  - Supports auto inverse convention function.
  - Supports transmitter and receiver error retry and error number limiting function.
  - Supports hardware activation sequence, hardware warm reset sequence and hardware deactivation sequence process.
  - Supports hardware auto deactivation sequence when detecting the card removal.
- Supports up to three UART ports (UART3, UART4, UART5)
  - Full duplex, asynchronous communications.
  - Programmable data bit length, 5-, 6-, 7-, 8-bit character.
  - Separates receiving / transmitting 4 bytes entry FIFO for data payloads.
  - Supports programmable baud rate generator for each channel.
  - Supports programmable receiver buffer trigger level.
  - Programmable transmitting data delay time between the last stop bit leaving the TX-FIFO and the de-assertion by setting SCx\_EGTR [EGT] register.
  - Programmable even, odd or no parity bit generation and detection.
  - Programmable stop bit, 1 or 2 stop bit generation.

### 6.14.3 Block Diagram

The SC clock control and block diagram are shown as follows. The SC controller is completely asynchronous design with two clock domains, PCLK and peripheral clock (SC\_CLK). Note that PCLK frequency should be higher than the frequency of peripheral clock.

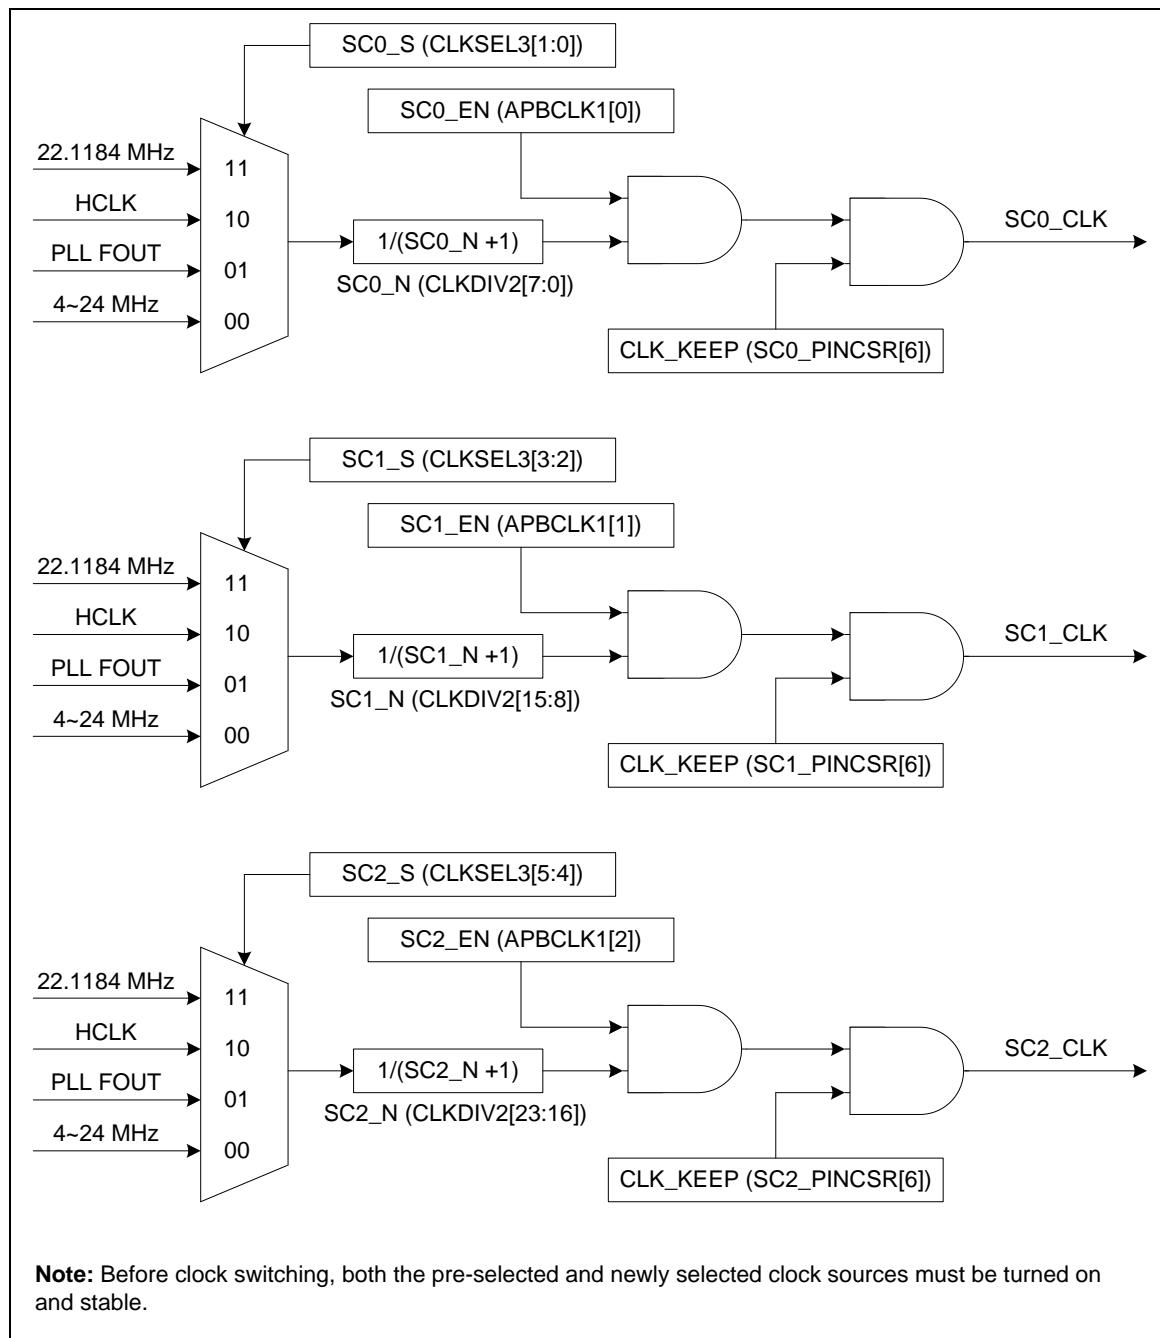

Figure 6-76 SC Clock Control Diagram (8-bit Prescale Counter in Clock Controller)

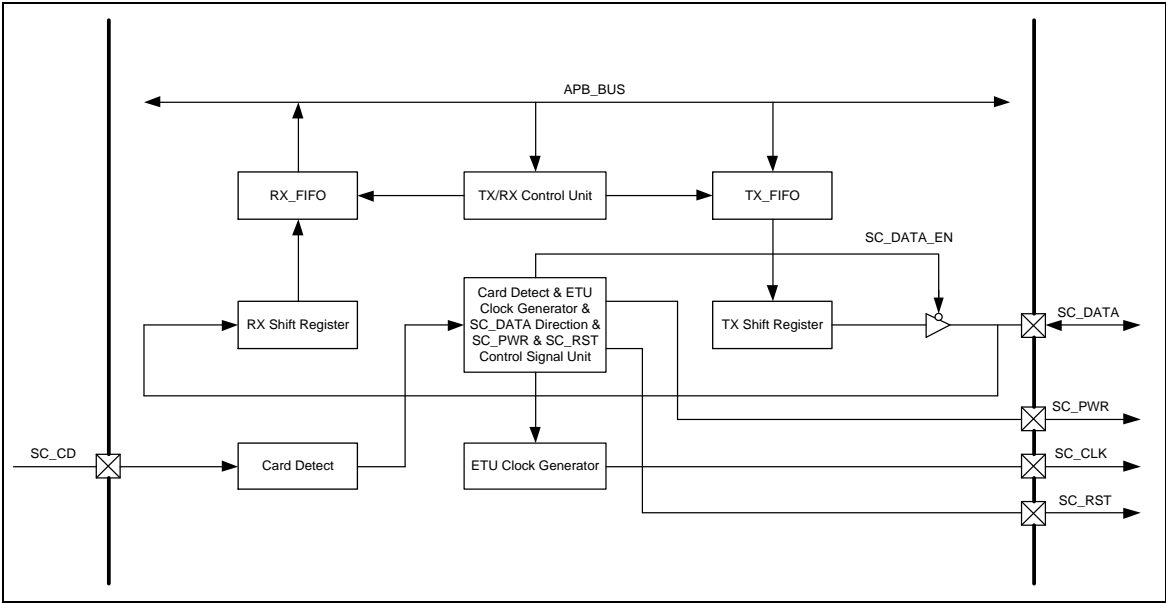

Figure 6-77 SC Controller Block Diagram

6.14.4 Basic Configuration

The SC function pins are configured in GPA\_MFP, GPB\_MFP, GPC\_MFP Multiple Function Pin Registers.

SC Host Controller Pin description is shown as following:

Pin	Type	Description
SC_DATA	Bi-direction	SC Host Controller DATA
SC_CD	Input	SC Host Controller Card Detect
SC_PWR	Output	SC Host Controller Power ON/OFF Switch for CARD
SC_CLK	Output	SC Host Controller Clock
SC_RST	Output	SC Host Controller Reset

Table 6-21 SC Host Controller Pin

UART Pin description is shown as following:

Pin	Type	Description
SC_DATA	Input	UART Receive Data
SC_CLK	Output	UART Transmit Data

Table 6-22 UART Pin

6.14.5 Functional Description

Basically, the smart card interface acts as a half-duplex asynchronous communication port and its data format is composed of ten consecutive bits, which is shown as follows.

Figure 6-78 SC Data Character

#### 6.14.5.1 Activation, Warm Reset and Deactivation Sequence

The Smart Card Interface controller supports hardware activation, warm reset and deactivation sequence. The activation, Warm Reset and Deactivation and sequence are shown as following.

##### Activation

- Set SC\_RST to low
- Set SC\_PWR at high level and SC\_DAT at high level (reception mode).
- Enable SC\_CLK clock
- De-assert SC\_RST to high

The activation sequence can be controlled by two ways. The procedure is shown as following:

##### Software Timing Control:

Software sets SC\_PINCSR and SC\_TMRx (x = 0, 1, 2) to process the activation sequence. SC\_PWR, SC\_CLK, SC\_RST and SC\_DATA pin state can be programmed by SC\_PINCSR. The activation sequence timing can be controlled by setting SC\_TMRx (x = 0, 1, 2). This programming procedure provides user has a flexible timing setting for activation sequence.

##### Hardware Timing Control:

Software sets ACT\_EN (SC\_ALTCTL[3]) to '1' and the interface will perform the activation sequence by hardware. The SC\_PWR to SC\_CLK start (T1) and SC\_CLK\_start to SC\_RST assert (T2) can be selected by programming INIT\_SEL (SC\_ALTCTL[9:8]). This programming procedure provides user has a simple setting for activation sequence.

Following is activation control sequence generation by hardware:

- Set activation timing by setting INIT\_SEL (SC\_ALTCTL[9:8]).
- TMR0 can be selected by setting TMR\_SEL (SC\_CTL[14:13]) to '01', '10' or '11'.
- Set operation mode MODE (SC\_TMR0[27:24]) to '0011' and give an Answer to Request (ATR) value by setting CNT (SC\_TMR0 [23:0]) register.
- When hardware de-asserts SC\_RST to high, hardware will generator an interrupt INIT\_IS (SC\_ISR[8]) to CPU at the same time INIT\_IE(SC\_IER[8]) = "1".
- If the TMR0 decreases the counter to '0' (start from SC\_RST de-assert) and the card does not response ATR before that time, hardware will generate interrupt TMR0\_IS (SC\_ISR[3]) to CPU.

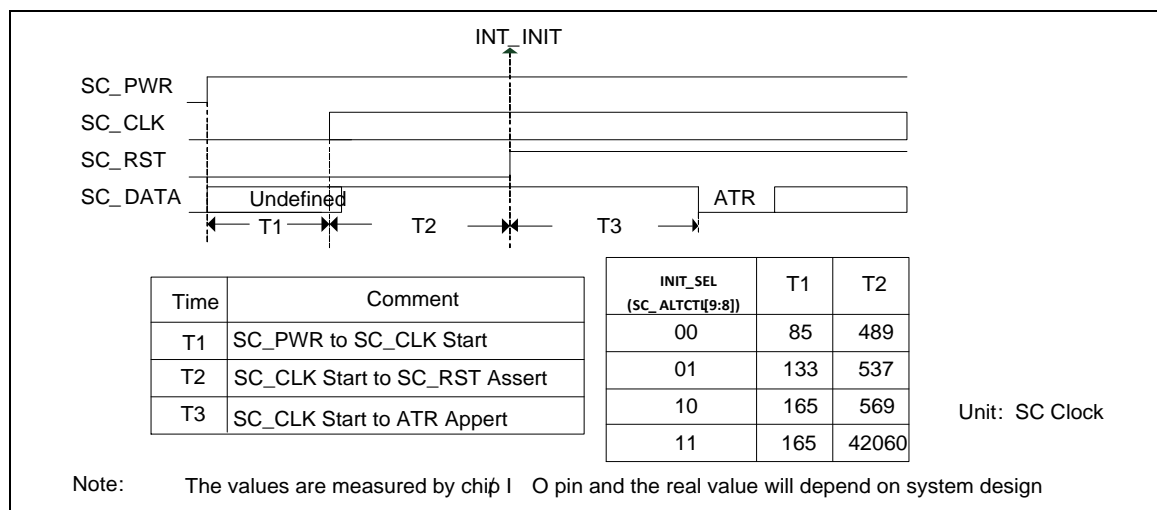

Figure 6-79 SC Activation Sequence

## Warm Reset

The warm reset sequence is showed as follows.

- Set SC\_RST to low and set SC\_DATA to high.
- Set SC\_RST to high.

The warm reset sequence can be controlled by two ways. The procedure is shown as following.

Software Timing Control:

Software sets SC\_PINCSR and SC\_TMRx (x = 0, 1, 2) to process the warm reset sequence. SC\_RST and SC\_DATA pin state can be programmed by SC\_PINCSR. The warm reset sequence timing can be controlled by setting SC\_TMRx (x = 0, 1, 2). This programming procedure provides user has a flexible timing setting for warm reset sequence.

Hardware Timing Control:

Software sets WARST\_EN (SC\_ALTCTL[4]) to '1' and the interface will perform the warm reset sequence by hardware. The SC\_RST to SC\_DATA reception mode (T4) and SC\_DATA reception mode to SC\_RST assert (T5) can be selected by programming INIT\_SEL (SC\_ALTCTL[9:8]). This programming procedure provides user has a simple setting for warm reset sequence.

Following is warm reset control sequence by hardware:

- Set warm reset timing by setting INIT\_SEL (SC\_ALTCTL[9:8]).
- Select TMR0 by setting TMR\_SEL (SC\_CTL[14:13]) register (TMR\_SEL can be set to '01', '10', or '11').
- Set operation mode MODE (SC\_TMR0[27:24]) to '0011' and give an Answer to Request value by setting CNT (SC\_TMR0[23:0]) register.
- Set TM0\_SEN (SC\_ALTCTL[5]) and WARST\_EN (SC\_ALTCTL[4]) to start counting.
- When hardware de-asserts SC\_RST to high, hardware will generate an interrupt INIT\_IS (SC\_ISR[8]) to CPU at the same time (INIT\_IE(SC\_IER[8] = '1')).
- If the TMR0 decrease the counter to '0' (start from SC\_RST) and the card does not response ATR before that time, hardware will generate interrupt TMR0\_IS (SC\_ISR[3]) to CPU.

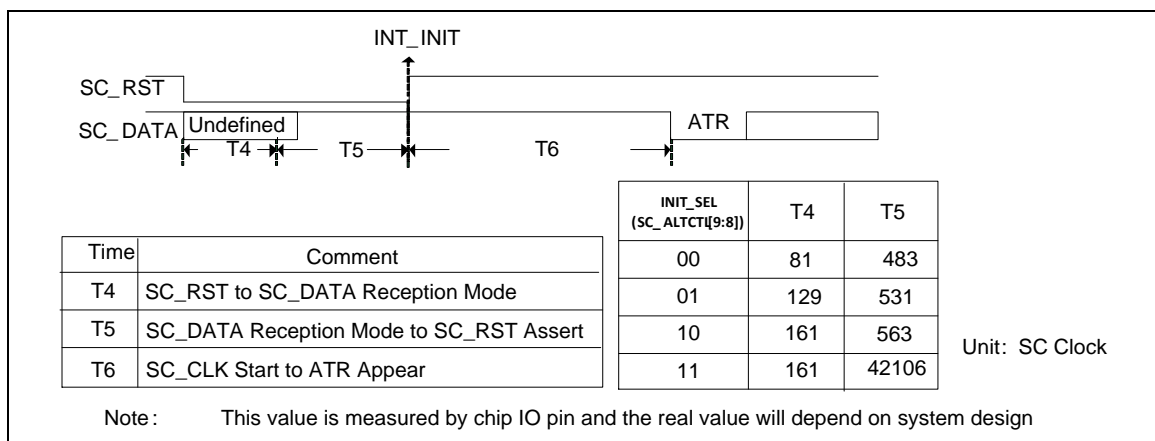

Figure 6-80 SC Warm Reset Sequence

## Deactivation

The deactivation sequence is showed as follows:

- Set SC\_RST to low.
- Stop SC\_CLK.
- Set SC\_DATA to state low.
- Deactivated SC\_PWR.

The deactivation sequence can be controlled by two ways. The procedure is shown as following.

Software Timing Control:

Software sets SC\_PINCSR and SC\_TMR0 to process the deactivation sequence. SC\_PWR, SC\_CLK, SC\_RST and SC\_DATA pin state can be programmed by SC\_PINCSR. The deactivation sequence timing can be controlled by setting SC\_TMR0. This programming procedure provides user has a flexible timing setting for deactivation sequence.

Hardware Timing Control:

Software sets DACT\_EN (SC\_ALTCTL[2]) to '1' and the interface will perform the deactivation sequence by hardware. The Deactivation Trigger to SC\_RST low (T7), SMC\_RST low to SC\_CLK (T8) and stop SC\_CLK to stop SC\_PWR (T9) time can be selected by programming INIT\_SEL (SC\_ALTCTL[9:8]). This programming procedure provides user has a simple setting for deactivation sequence.

The SC controller also supports auto deactivation sequence when the card removal detection is enabled by setting ADAC\_CDEN (SC\_ALTCTL[11]).

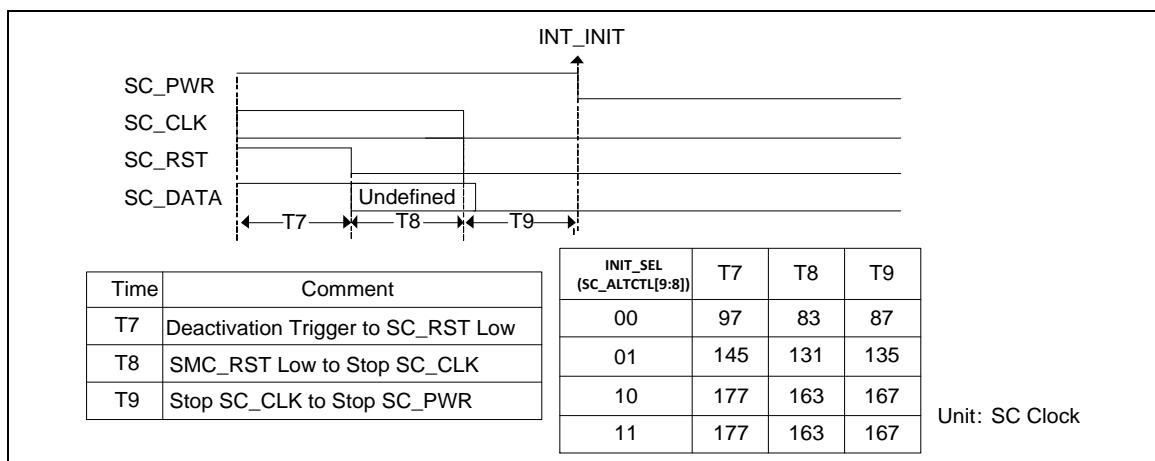

Figure 6-81 SC Deactivation Sequence

#### 6.14.5.2 Initial Character TS

According to 7816-3, the initial character TS has two possible patterns (as shown in the following figure). If the TS pattern is 1100\_0000, it is inverse convention. When decoded by inverse convention, the conveyed byte is equal to 0x3F. If the TS pattern is 1101\_1100, it is direct convention. When decoded by direct convention, the conveyed byte is equal to 0x3B. Software can set AUTO\_CON\_EN (SC\_CTL[3]) and then the operating convention will be decided by hardware. Software can also set the CON\_SEL (SC\_CTL[5:4]) register (set to '00' or '11') to change the operating convention after SC received TS of answer to request (ATR).

If software enables auto convention function by setting AUTO\_CON\_EN (SC\_CTL[3]) register, the setting step must be done before Answer to Request state and the first data must be 0x3B or 0x3F. After hardware received first data and stored it at buffer, the hardware will decide the convention and change the CON\_SEL (SC\_CTL[5:4]) register automatically. If the first data is neither 0x3B nor 0x3F, the hardware will generate an interrupt INT\_ACON\_ERR (if ACON\_ERR\_IE (SC\_IER [10]) = '1') to CPU.

Figure 6-82 Initial Character TS

### 6.14.5.3 Error signal and character repetition

According to ISO7816-3 T=0 mode description, as shown in following, if the receiver receives a wrong parity bit, it will pull the SC\_DAT to low by 1.5 bit period to inform the transmitter parity error. Then the transmitter will retransmit the character. The SC interface controller supports hardware error detection function in receiver and supports hardware re-transmit function in transmitter. Software can enable re-transmit function by setting TX\_ERETRY\_EN(SC\_CTL[23]). Software can also define the retry (re-transmit) number limitation in TX\_ERETRY(SC\_CTL[22:20]). The re-transmit number is up to TX\_ERETRY +1 and if the re-transmit number is equal to TX\_ERETRY +1, TX\_OVER\_REERR flag will be set by hardware and if TERR\_IE (SC\_IER [2]), SC controller will generate a transfer error interrupt to CPU. Software can also define the received retry number limitation in RX\_ERETRY(SC\_CTL[18:16]) register. The receiver retry number is up to RX\_ERETRY +1, if the number of received errors by receiver is equal to RX\_ERETRY +1, receiver will receive this error data to buffer and RX\_OVER\_REERR flag will be set by hardware and if TERR\_IE(SC\_IER[2]), SC controller will generate a transfer error interrupt to CPU.

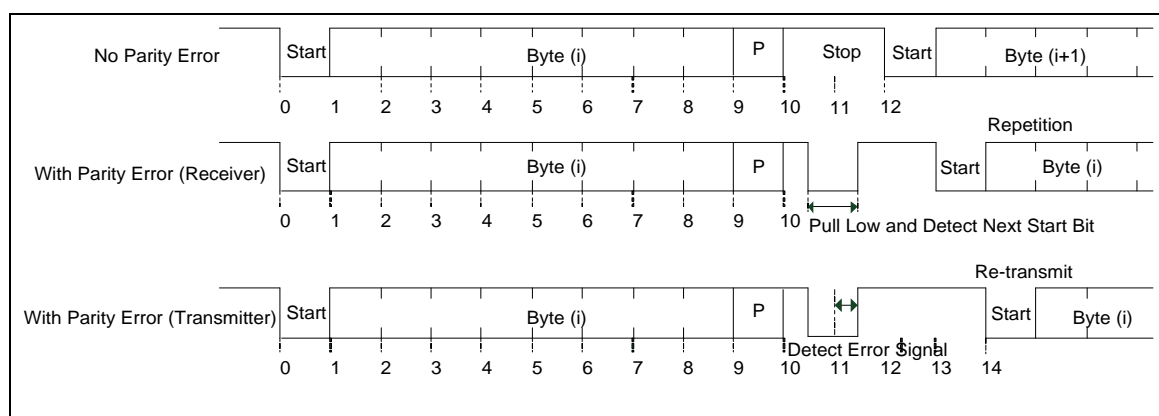

Figure 6-83 SC Error Signal

Figure 6-84 SC Transmitter Retry Number and Retry Over Flag

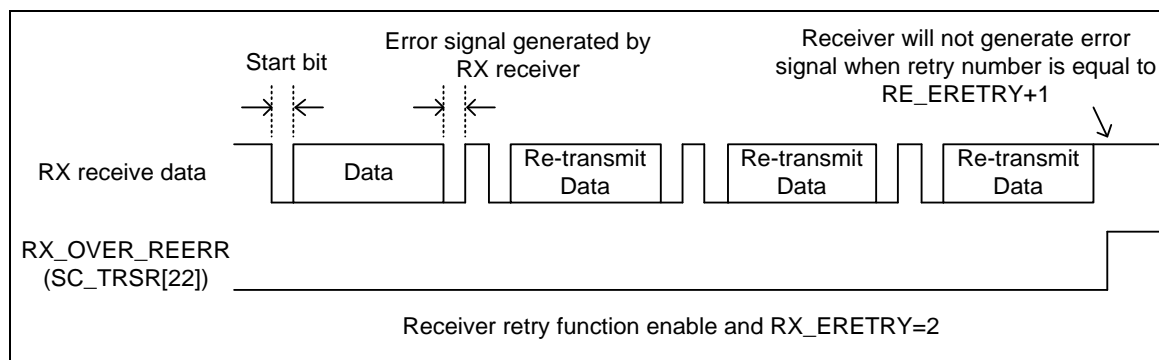

Figure 6-85 SC Receiver Retry Number and Retry Over Flag

#### 6.14.5.4 Internal time-out counter

The smart card interface includes a 24-bit time-out counter and two 8 bit time-out counters. These counters help the controller in processing different real-time interval. Each counter can be set to start counting once the trigger enable bit has been written or a START bit has been detected.

The following is the programming flow:

Enable counter by setting TMR\_SEL (SC\_CTL[14:13]). Select operation mode MODE (SC\_TMRx[27:24]) and give a count value CNT(SC\_TMRx[23:0]) by setting SC\_TMRx register. Set TMR0\_SEN (SC\_ALTCTL [5]), TMR1\_SEN (SC\_ALTCTL [6]) or TMR2\_SEN (SC\_ALTCTL [7]) is to start counting.

The SC\_TMR0, SC\_TMR1 and SC\_TMR2 timer operation mode are listed below table

**Note:** Only SC\_TMR0 supports mode 0011.

TMRx_SEL (X=0 ~2)	Operation Description	
0000	The down counter started when TMRx_SEN (SC_ALTCTL[7:5]) enabled and ended when counter time-out. The time-out value will be CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0])+1	
	Start	Start counting when TMRx_SEN (SC_ALTCTL[7:5]) enabled
	End	When the down counter equals to 0, hardware will set TMRx_IS(SC_ISR[5:3]) and clear TMRx_SEN (SC_ALTCTL[7:5]) automatically.
0001	The down counter started when the first START bit (reception or transmission) detected and ended when counter time-out. The time-out value will be CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0])+1.	
	Start	Start counting when the first START bit (reception or transmission) detected after TMRx_SEN (SC_ALTCTL[7:5]) set to 1.
	End	When the down counter equals to 0, hardware will set TMRx_IS(SC_ISR[5:3]) and clear TMRx_SEN (SC_ALTCTL[7:5]) automatically.
0010	The down counter started when the first START bit (reception) detected and ended when counter time-out. The time-out value will be CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0])+1.	
	Start	Start counting when the first START bit (reception) detected bit after TMRx_SEN (SC_ALTCTL[7:5]) set to 1.
	End	When the down counter equals to 0, hardware will set TMRx_IS(SC_ISR[5:3]) and clear TMRx_SEN (SC_ALTCTL[7:5]) automatically.
0011	The down counter is only used for hardware activation, warm reset sequence to measure ATR timing.	

	The timing starts when SC_RST de-assertion and ends when ATR response received or time-out. If the counter decreases to 0 before ATR response received, hardware will generate an interrupt to CPU. The time-out value will be CNT (SC_TMR0[23:0])+1.	
	Start	Start counting when SC_RST de-assertion after TMR0_SEN (SC_ALTCTL[5]) set to 1. It is used for hardware activation, warm reset mode.
	End	When the down counter equals to 0 before ATR response received, hardware will set TMR0_IS and clear TMR0_SEN (SC_ALTCTL[5]) automatically. When ATR received and down counter does not equal to 0, hardware will clear TMR0_SEN (SC_ALTCTL[5]) automatically.
0100	Same as 0000, but when the down counter equals to 0, hardware will set TMRx_IS(SC_ISR[5:3]) and counter will re-load the CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0]) value and re-count until software clears TMRx_SEN (SC_ALTCTL[7:5]). When TMRx_ATV (SC_ALTCTL[15:13]) =1, software can change CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0]) value at any time. When the down counter equals to 0, counter will reload the new value of CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0]) and re-count. The time-out value will be CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0])+1.	
0101	Same as 0001, but when the down counter equals to 0, hardware will set TMRx_IS(SC_ISR[5:3]) and counter will re-load the CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0]) value. When the next START bit is detected, counter will re-count until software clears TMRx_ATV (SC_ALTCTL[15:13]). When TMRx_ATV (SC_ALTCTL[15:13]) =1 software can change CNT (SC_TMR0[23:0], SC_TMR0[7:0], SC_TMR0[7:0]) value at any time. When the down counter equal to 0, it will reload the new value of CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0]) and re-counting. The time-out value will be CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0])+1.	
0110	Same as 0010, but when the down counter equals to 0, it will set TMRx_IS(SC_ISR[5:3]) and counter will re-load the CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0]) value. When the next START bit is detected, counter will re-count until software clears TMRx_SEN (SC_ALTCTL[7:5]). When TMRx_ATV (SC_ALTCTL[15:13]) =1, software can change CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0]) value at any time. When the down counter equals to 0, counter will reload the new value of CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0]) and re-count. The time-out value will be CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0])+1.	
0111	The down counter started when the first START bit (reception or transmission) detected and ended when software clears TMRx_SEN (SC_ALTCTL[7:5]) bit. If next START bit detected, counter will reload the new value of CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0]) and re-counting. If the counter decreases to 0 before the next START bit detected, hardware will generate an interrupt to CPU. The time-out value will be CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0])+1.	
	Start	Start counting when the first START bit detected after TMRx_SEN (SC_ALTCTL[7:5]) set to 1.
	End	Stop counting after TMRx_SEN (SC_ALTCTL[7:5]) set to 0.
1000	The up counter starts when TMRx_SEN (SC_ALTCTL[7:5]) enabled and ends when TMRx_SEN (SC_ALTCTL[7:5]) disabled. This count value will be stored in TDRx(SC_TDRA [23:0], SC_TDRB[7:0], SC_TDRB[15:8]). In this mode, hardware cannot generate any interrupt to CPU. The real count value will be TDRx(SC_TDRA [23:0], SC_TDRB[7:0], SC_TDRB[15:8]) +1.	
	Start	Start counting after TMRx_SEN (SC_ALTCTL[7:5]) set to 1, and the start count value is 0 (hardware will ignore CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0]) value).
	End	Stop counting after TMRx_SEN (SC_ALTCTL[7:5]) set to 0 and the value stored to TDRx(SC_TDRA [23:0], SC_TDRB[7:0], SC_TDRB[15:8]) register.
1111	Down counter starts when software set TMRx_SEN (SC_ALTCTL[7:5]) bit or any START bit been detected and ends when software clears TMRx_SEN (SC_ALTCTL[7:5]) bit. If next START bit detected, counter will reload the new value of CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0]) and re-counting. If the counter decreases to "0" before the next START bit be detected, hardware will generate an interrupt to CPU. The time-out value will be CNT (SC_TMR0[23:0], SC_TMR1[7:0], SC_TMR2[7:0])+1.	
	Start	Start count when the TMRx_SEN (SC_ALTCTL[7:5]) set to "1" or any START bit (TMRx_SEN (SC_ALTCTL[7:5]) must be set) be detected

	End	Stop count after TMRx_SEN (SC_ALTCTL[7:5]) set to "0".
--	-----	--

Table 6-23 Timer2/Timer1/Timer0 Operation Mode

6.14.5.5Block Guard Time and Extended Guarg Time

Block guard time means the minimum bit length between the leading edges of two consecutive characters between different transfer directions. This field indicates the counter for the bit length of block guard time. According to ISO7816-3, in T = 0 mode, software must fill 15 (real block guard time = 16.5) to this field; in T = 1 mode, software must fill 21 (real block guard time = 22.5) to it.

In transmit direction, the smart card sends data to smart card host controller, first. After the period is greater than BGT (SC\_CTL[12:8]), the smart card host controller begin to send the data.

Figure 6-86 Transmit Direction Block Guard Time Operation

In receive direction, the smart card host controller sends data to smart card, first. If the smart card sends data to smart card host controller at the time which is less than BGT (SC\_CTL[12:8]),the block guard time interrupt BGT\_IS (SC\_ISR[6]) is generated when RX\_BGT\_EN (SC\_ALTCTL[12]) is enabled.

Figure 6-87 Receive Direction Block Guard Time Operation

Extended Guard Time is two ETU plus EGT (SC\_EGTR[7:0]), the format is shown as following:

Figure 6-88 Extended Guard Time Operation

#### 6.14.5.6 UART Mode

When the UA\_MODE\_EN (SC\_UACTL[0]) bit set, the Smart Card Interface controller can also be used as base UART function. The following is the program example for UART mode.

Program example:

1. Software can entry UART mode by setting UA\_MODE\_EN (SC\_UACTL[0]) bit.
2. Do software reset by setting RX\_RST (SC\_ALTCTL[1]) and TX\_RST(SC\_ALTCTL[0]) bit to ensure that all state machine return idle state.
3. Filled "0" to CON\_SEL (SC\_CTL[5:4]) and AUTO\_CON\_EN (SC\_CTL[3]) field. (In UART mode, those fields must be "0")
4. Select the UART baud rate by setting ETU\_RDIV (SC\_ETUCR[11:0]) fields. For example, if smartcard module clock is 12 MHZ and target baud rate is 115200bps, ETU\_RDIV should fill with  $(12000000 / 115200 - 1)$ .
5. Select the data format include data length (by setting DATA\_LEN (SC\_UACTL [5:4]), parity format (by setting OPE(SC\_UACTL[7]) and PBDIS(SC\_UACTL[6]) ) and stop bit length (by setting SLEN(SC\_CTL[15] or EGT(SC\_EGTR[7:0])).
6. Select the receiver buffer trigger level by setting RX\_FTRI\_LEV (SC\_CTL[7:6]) field and select the receiver buffer time-out value by setting RFTMR (SC\_RFTMR[8:0]) field.

Write SC\_THR (SC\_THR[7:0]) (TX) register or read SC\_RBR (SC\_RBR[7:0]) (RX) register can perform UART function.

### 6.14.6 Register Map

R: read only, W: write only, R/W: both read and write

**Note:** The post-fix “x” of SCx represents the SC channel.

### 6.14.7 Register Description

#### SC Receiving Buffer Register (SC\_RBR)

Register	Offset	R/W	Description	Reset Value
SC_RBR	SCx_BA+0x00	R	SC Receiving Buffer Register.	Undefined

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
RBR							

Bits	Description	
[31:8]	Reserved	Reserved.
[7:0]	RBR	<b>Receiving Buffer</b> By reading RBR, the SC will return an 8-bit received data.

### SC Transmit Holding Register (SC\_THR)

Register	Offset	R/W	Description	Reset Value
SC_THR	SCx_BA+0x00	W	SC Transmit Holding Register	Undefined

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
THR							

Bits	Description	
[31:8]	Reserved	Reserved.
[7:0]	THR	<b>Transmit Holding Buffer</b> By writing data to THR, the SC will send out an 8-bit data. <b>Note:</b> If SC_CEN(SC_CTL[0]) is not enabled, THR cannot be programmed.

### SC Control Register (SC\_CTL)

Register	Offset	R/W	Description	Reset Value
SC_CTL	SCx_BA+0x04	R/W	SC Control Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved	SYNC	Reserved				CD_DEB_SEL	
23	22	21	20	19	18	17	16
TX_ERETRY_EN	TX_ERETRY			RX_ERETRY_EN	RX_ERETRY		
15	14	13	12	11	10	9	8
SLEN	TMR_SEL		BGT				
7	6	5	4	3	2	1	0
RX_FTRI_LEV		CON_SEL		AUTO_CON_EN	DIS_TX	DIS_RX	SC_CEN

Bits	Description	
[31]	Reserved	Reserved.
[30]	SYNC	<b>SYNC Flag Indicator</b> Due to synchronization, software should check this bit before writing a new value to RX_ERETRY and TX_ERETRY. 0 = synchronizing is completion, user can write new data to RX_ERETRY and TX_ERETRY. 1 = Last value is synchronizing. <b>Note:</b> This bit is read only.
[30:26]	Reserved	Reserved.
[25:24]	CD_DEB_SEL	<b>Card Detect De-Bounce Selection</b> This field indicates the card detect de-bounce selection. 00 = De-bounce sample card insert once per 384 (128 * 3) SC peripheral clocks and de-bounce sample card removal once per 128 SC peripheral clocks. 01 = De-bounce sample card insert once per 192 (64 * 3) SC peripheral clocks and de-bounce sample card removal once per 64 SC peripheral clocks. 10 = De-bounce sample card insert once per 96 (32 * 3) SC peripheral clocks and de-bounce sample card removal once per 32 SC peripheral clocks. 11 = De-bounce sample card insert once per 48 (16 * 3) SC peripheral clocks and de-bounce sample card removal once per 16 SC peripheral clocks.
[23]	TX_ERETRY_EN	<b>TX Error Retry Enable Bit</b> This bit enables transmitter retry function when parity error has occurred. 0 = TX error retry function Disabled. 1 = TX error retry function Enabled.
[22:20]	TX_ERETRY	<b>TX Error Retry Count Number</b> This field indicates the maximum number of transmitter retries that are allowed when parity error has occurred. <b>Note1:</b> The real retry number is TX_ERETRY + 1, so 8 is the maximum retry number. <b>Note2:</b> This field cannot be changed when TX_ERETRY_EN enabled. The change flow is

		to disable TX_ETRTY_EN first and then fill in new retry value.
[19]	RX_ERETRY_EN	<b>RX Error Retry Enable Bit</b> This bit enables receiver retry function when parity error has occurred. 0 = RX error retry function Disabled. 1 = RX error retry function Enabled. <b>Note:</b> Software must fill in the RX_ERETRY value before enabling this bit.
[18:16]	RX_ERETRY	<b>RX Error Retry Count Number</b> This field indicates the maximum number of receiver retries that are allowed when parity error has occurred <b>Note1:</b> The real retry number is RX_ERETRY + 1, so 8 is the maximum retry number. <b>Note2:</b> This field cannot be changed when RX_ERETRY_EN enabled. The change flow is to disable RX_ETRTY_EN first and then fill in new retry value.
[15]	SLEN	<b>Stop Bit Length</b> This field indicates the length of stop bit. 0 = The stop bit length is 2 ETU. 1 = The stop bit length is 1 ETU. <b>Note:</b> The default stop bit length is 2. SMC and UART adopts SLEN to program the stop bit length
[14:13]	TMR_SEL	<b>Timer Selection</b> 00 = All internal timer function Disabled. 01 = Internal 24 bit timer Enabled. Software can configure it by setting SC_TMR0 [23:0]. SC_TMR1 and SC_TMR2 will be ignored in this mode. 10 = internal 24 bit timer and 8 bit internal timer Enabled. Software can configure the 24 bit timer by setting SC_TMR0 [23:0] and configure the 8 bit timer by setting SC_TMR1[7:0]. SC_TMR2 will be ignored in this mode. 11 = Internal 24 bit timer and two 8 bit timers Enabled. Software can configure them by setting SC_TMR0 [23:0], SC_TMR1 [7:0] and SC_TMR2 [7:0].
[12:8]	BGT	<b>Block Guard Time (BGT)</b> Block guard time means the minimum bit length between the leading edges of two consecutive characters between different transfer directions. This field indicates the counter for the bit length of block guard time. According to ISO7816-3, in T = 0 mode, software must fill 15 (real block guard time = 16.5) to this field; in T = 1 mode, software must fill 21 (real block guard time = 22.5) to it. <b>Note:</b> The real block guard time is BGT + 1.
[7:6]	RX_FTRI_LEV	<b>Rx Buffer Trigger Level</b> When the number of bytes in the receiving buffer equals the RX_FTRI_LEV, the RDA_IF will be set (if IER [RDA_IEN] is enabled, an interrupt will be generated). 00 = INTR_RDA Trigger Level with 01 Bytes. 01 = INTR_RDA Trigger Level with 02 Bytes. 10 = INTR_RDA Trigger Level with 03 Bytes. 11 = Reserved.
[5:4]	CON_SEL	<b>Convention Selection</b> 00 = Direct convention. 01 = Reserved. 10 = Reserved. 11 = Inverse convention. <b>Note:</b> If AUTO_CON_EN(SC_CTL[3]) enabled, this fields are ignored.
[3]	AUTO_CON_EN	<b>Auto Convention Enable Bit</b> 0 = Auto-convention Disabled. 1 = Auto-convention Enabled. When hardware receives TS in answer to reset state and

		<p>the TS is direct convention, CON_SEL(SC_CTL[5:4]) will be set to 00 automatically, otherwise if the TS is inverse convention, and CON_SEL (SC_CTL[5:4]) will be set to 11.</p> <p>If software enables auto convention function, the setting step must be done before Answer to Reset state and the first data must be 0x3B or 0x3F. After hardware received first data and stored it at buffer, hardware will decided the convention and change the CON_SEL (SC_CTL[5:4]) bits automatically. If the first data is not 0x3B or 0x3F, hardware will generate an interrupt INT_ACON_ERR (if ACON_ERR IE (SC_IER[10]) = 1 to CPU.</p>
[2]	DIS_TX	<p><b>TX Transition Disable Bit</b></p> <p>0 = The transceiver Enabled.</p> <p>1 = The transceiver Disabled.</p>
[1]	DIS_RX	<p><b>RX Transition Disable Bit</b></p> <p>0 = The receiver Enabled.</p> <p>1 = The receiver Disabled.</p> <p><b>Note:</b> If AUTO_CON_EN (SC_CTL[3]) is enabled, these fields must be ignored.</p>
[0]	SC_CEN	<p><b>SC Engine Enable Bit</b></p> <p>Set this bit to 1 to enable SC operation. If this bit is cleared, SC will force all transition to IDLE state.</p>

### SC Alternate Control Register (SC\_ALTCTL)

Register	Offset	R/W	Description	Reset Value
SC_ALTCTL	SCx_BA+0x08	R/W	SC Alternate Control Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							OUTSEL
15	14	13	12	11	10	9	8
TMR2_ATV	TMR1_ATV	TMR0_ATV	RX_BGT_EN	Reserved		INIT_SEL	
7	6	5	4	3	2	1	0
TMR2_SEN	TMR1_SEN	TMR0_SEN	WARST_EN	ACT_EN	DACT_EN	RX_RST	TX_RST

Bits	Description	
[31:17]	Reserved	Reserved.
[16]	OUTSEL	<b>Smartcard Data Pin Output Mode Selection</b> Use this bit to select smartcard data pin (SC_DATA) output mode 0 = Quasi mode. 1 = Open-drain mode.
[15]	TMR2_ATV	<b>Internal Timer2 Active State (Read Only)</b> This bit indicates the timer counter status of timer2. 0 = Timer2 is not active. 1 = Timer2 is active.
[14]	TMR1_ATV	<b>Internal Timer1 Active State (Read Only)</b> This bit indicates the timer counter status of timer1. 0 = Timer1 is not active. 1 = Timer1 is active.
[13]	TMR0_ATV	<b>Internal Timer0 Active State (Read Only)</b> This bit indicates the timer counter status of timer0. 0 = Timer0 is not active. 1 = Timer0 is active.
[12]	RX_BGT_EN	<b>Receiver Block Guard Time Function Enable Bit</b> 0 = Receiver block guard time function Disabled. 1 = Receiver block guard time function Enabled.
[11:10]	Reserved	Reserved.
[9:8]	INIT_SEL	<b>Initial Timing Selection</b> This fields indicates the timing of hardware initial state (activation or warm-reset or deactivation). Unit: SC clock Activation: refer to SC Activation Sequence in Figure 6-79.

		<p>Warm-reset: refer to Warm-Reset Sequence in Figure 6-80.</p> <p>Deactivation: refer to Deactivation Sequence in Figure 6-81.</p>
[7]	TMR2_SEN	<p><b>Internal Timer2 Start Enable Bit</b></p> <p>This bit enables Timer 2 to start counting. Software can fill 0 to stop it and set 1 to reload and count.</p> <p>0 = Stops counting.</p> <p>1 = Start counting.</p> <p><b>Note1:</b> This field is used for internal 8 bit timer when TMR_SEL(SC_CTL[14:13]) = 11. Don't filled TMR2_SEN when TMR_SEL(SC_CTL[14:13]) = 00 or TMR_SEL(SC_CTL[14:13]) = 01 or TMR_SEL(SC_CTL[14:13]) = 10.</p> <p><b>Note2:</b> If the operation mode is not in auto-reload mode (SC_TMR2[26] = 0), this bit will be auto-cleared by hardware.</p> <p><b>Note3:</b> This field will be cleared by TX_RST(SC_ALTCTL[0]) and RX_RST(SC_ALTCTL[1]). So don't fill this bit, TX_RST(SC_ALTCTL[0]), and RX_RST(SC_ALTCTL[1]) at the same time.</p> <p><b>Note4:</b> If SC_CEN(SC_CTL[0]) is not enabled, this filed cannot be programmed.</p>
[6]	TMR1_SEN	<p><b>Internal Timer1 Start Enable Bit</b></p> <p>This bit enables Timer 1 to start counting. Software can fill 0 to stop it and set 1 to reload and count.</p> <p>0 = Stops counting.</p> <p>1 = Start counting.</p> <p><b>Note1:</b> This field is used for internal 8 bit timer when TMR_SEL(SC_CTL[14:13]) = 10 or TMR_SEL(SC_CTL[14:13]) = 11. Don't filled TMR1_SEN when TMR_SEL(SC_CTL[14:13]) = 00 or TMR_SEL(SC_CTL[14:13]) = 01.</p> <p><b>Note2:</b> If the operation mode is not in auto-reload mode (SC_TMR1[26] = 0), this bit will be auto-cleared by hardware.</p> <p><b>Note3:</b> This field will be cleared by TX_RST(SC_ALTCTL[0]) and RX_RST(SC_ALTCTL[1]), so don't fill this bit, TX_RST(SC_ALTCTL[0]), and RX_RST(SC_ALTCTL[1]) at the same time.</p> <p><b>Note4:</b> If SC_CEN(SC_CTL[0]) is not enabled, this filed cannot be programmed.</p>
[5]	TMR0_SEN	<p><b>Internal Timer0 Start Enable Bit</b></p> <p>This bit enables Timer 0 to start counting. Software can fill 0 to stop it and set 1 to reload and count.</p> <p>0 = Stops counting.</p> <p>1 = Start counting.</p> <p><b>Note1:</b> This field is used for internal 24 bit timer when TMR_SEL (SC_CTL[14:13]) = 01.</p> <p><b>Note2:</b> If the operation mode is not in auto-reload mode (SC_TMR0[26] = 0), this bit will be auto-cleared by hardware.</p> <p><b>Note3:</b> This field will be cleared by TX_RST(SC_ALTCTL[0]) and RX_RST(SC_ALTCTL[1]). So don't fill this bit, TX_RST and RX_RST at the same time.</p> <p><b>Note4:</b> If SC_CEN(SC_CTL[0]) is not enabled, this filed cannot be programmed.</p>
[4]	WARST_EN	<p><b>Warm Reset Sequence Generator Enable Bit</b></p> <p>This bit enables SC controller to initiate the card by warm reset sequence</p> <p>0 = No effect.</p> <p>1 = Warm reset sequence generator Enabled.</p> <p><b>Note1:</b> When the warm reset sequence completed, this bit will be cleared automatically and the INIT_IS(SC_ISR[8]) will be set to 1.</p> <p><b>Note2:</b> This field will be cleared by TX_RST(SC_ALTCTL[0]) and RX_RST(SC_ALTCTL[1]), so don't fill this bit, TX_RST, and RX_RST at the same time.</p> <p><b>Note3:</b> If SC_CEN(SC_CTL[0]) is not enabled, this filed cannot be programmed.</p>
[3]	ACT_EN	<p><b>Activation Sequence Generator Enable Bit</b></p> <p>This bit enables SC controller to initiate the card by activation sequence</p>

		<p>0 = No effect. 1 = Activation sequence generator Enabled.</p> <p><b>Note1:</b> When the activation sequence completed, this bit will be cleared automatically and the INIT_IS(SC_ISR[8]) will be set to 1.</p> <p><b>Note2:</b> This field will be cleared by TX_RST(SC_ALTCTL[0]) and RX_RST(SC_ALTCTL[1]), so don't fill this bit, TX_RST(SC_ALTCTL[0]), and RX_RST(SC_ALTCTL[1]) at the same time.</p> <p><b>Note3:</b> If SC_CEN(SC_CTL[0]) is not enabled, this filed cannot be programmed.</p>
[2]	DACT_EN	<p><b>Deactivation Sequence Generator Enable Bit</b></p> <p>This bit enables SC controller to initiate the card by deactivation sequence</p> <p>0 = No effect. 1 = Deactivation sequence generator Enabled.</p> <p><b>Note1:</b> When the deactivation sequence completed, this bit will be cleared automatically and the INIT_IS(SC_ISR[8]) will be set to 1.</p> <p><b>Note2:</b> This field will be cleared by TX_RST (SC_ALTCTL[0]) and RX_RST(SC_ALTCTL[1]). So don't fill this bit, TX_RST, and RX_RST at the same time.</p> <p><b>Note3:</b> If SC_CEN (SC_CTL[0]) is not enabled, this filed cannot be programmed.</p>
[1]	RX_RST	<p><b>Rx Software Reset</b></p> <p>When RX_RST is set, all the bytes in the receiver buffer and Rx internal state machine will be cleared.</p> <p>0 = No effect. 1 = Reset the Rx internal state machine and pointers.</p> <p><b>Note:</b> This bit will be auto cleared after reset is complete.</p>
[0]	TX_RST	<p><b>TX Software Reset</b></p> <p>When TX_RST is set, all the bytes in the transmit buffer and TX internal state machine will be cleared.</p> <p>0 = No effect. 1 = Reset the TX internal state machine and pointers.</p> <p><b>Note:</b> This bit will be auto cleared after reset is complete.</p>

**SC Extend Guard Time Register (SC\_EGTR)**

Bits	Description
[31:11]	<b>Reserved</b> Reserved.
[10]	<b>ACON_ERR_IE</b> <b>Auto Convention Error Interrupt Enable Bit</b> This field is used for auto-convention error interrupt enable. 0 = Auto-convention error interrupt Disabled. 1 = Auto-convention error interrupt Enabled.
[9]	<b>RTMR_IE</b> <b>Receiver Buffer Time-Out Interrupt Enable Bit</b> This field is used for receiver buffer time-out interrupt enable. 0 = Receiver buffer time-out interrupt Disabled. 1 = Receiver buffer time-out interrupt Enabled.
[8]	<b>INIT_IE</b> <b>Initial End Interrupt Enable Bit</b> This field is used for activation (ACT_EN(SC_ALTCTL[3] = 1)), deactivation ((DACT_EN(SC_ALTCTL[2]) = 1) and warm reset (WARST_EN(SC_ALTCTL[4])) sequence interrupt enable. 0 = Initial end interrupt Disabled. 1 = Initial end interrupt Enabled.
[7]	<b>CD_IE</b> <b>Card Detect Interrupt Enable Bit</b> This field is used for card detect interrupt enable. The card detect status is CD_INS_F(SC_SR[12]) 0 = Card detect interrupt Disabled. 1 = Card detect interrupt Enabled.
[6]	<b>BGT_IE</b> <b>Block Guard Time Interrupt Enable Bit</b> This field is used for block guard time interrupt enable. 0 = Block guard time Disabled. 1 = Block guard time Enabled.
[5]	<b>TMR2_IE</b> <b>Timer2 Interrupt Enable Bit</b> This field is used for TMR2 interrupt enable.

		0 = Timer2 interrupt Disabled. 1 = Timer2 interrupt Enabled.
[4]	TMR1_IE	<b>Timer1 Interrupt Enable Bit</b> This field is used to enable the TMR1 interrupt. 0 = Timer1 interrupt Disabled. 1 = Timer1 interrupt Enabled.
[3]	TMR0_IE	<b>Timer0 Interrupt Enable Bit</b> This field is used to enable TMR0 interrupt enable. 0 = Timer0 interrupt Disabled. 1 = Timer0 interrupt Enabled.
[2]	TERR_IE	<b>Transfer Error Interrupt Enable Bit</b> This field is used for transfer error interrupt enable. The transfer error states is at SC_SR register which includes receiver break error RX_EBR_F(SC_SR[6]), frame error RX_EFR_F(SC_SR[5]), parity error RX_EPA_F(SC_SR[4]), receiver buffer overflow error RX_OVER_F(SC_SR[0]), transmit buffer overflow error TX_OVER_F(SC_SR[8]), receiver retry over limit error RX_OVER_REERR(SC_SR[22]) and transmitter retry over limit error TX_OVER_REERR(SC_SR[30]). 0 = Transfer error interrupt Disabled. 1 = Transfer error interrupt Enabled.
[1]	TXBE_IE	<b>Transmit Buffer Empty Interrupt Enable Bit</b> This field is used for transmit buffer empty interrupt enable. 0 = Transmit buffer empty interrupt Disabled. 1 = Transmit buffer empty interrupt Enabled.
[0]	RDA_IE	<b>Receive Data Reach Interrupt Enable Bit</b> This field is used for received data reaching trigger level RX_FTRI_LEV (SC_CTL[7:6]) interrupt enable. 0 = Receive data reach trigger level interrupt Disabled. 1 = Receive data reach trigger level interrupt Enabled.

### SC Interrupt Status Register (SC\_ISR)

Register	Offset	R/W	Description	Reset Value
SC_ISR	SCx_BA+0x1C	R/W	SC Interrupt Status Register	0x0000_0002

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved					ACON_ERR_IS	RTMR_IS	INIT_IS
7	6	5	4	3	2	1	0
CD_IS	BGT_IS	TMR2_IS	TMR1_IS	TMR0_IS	TERR_IS	TBE_IS	RDA_IS

Bits	Description
[31:11]	<b>Reserved</b> Reserved.
[10]	<b>ACON_ERR_IS</b> <b>Auto Convention Error Interrupt Status Flag (Read Only)</b> This field indicates auto convention sequence error. If the received TS at ATR state is neither 0x3B nor 0x3F, this bit will be set. <b>Note:</b> This bit is read only, but it can be cleared by writing 1 to it.
[9]	<b>RTMR_IS</b> <b>Receiver Buffer Time-Out Interrupt Status Flag (Read Only)</b> This field is used for receiver buffer time-out interrupt status flag. <b>Note:</b> This field is the status flag of receiver buffer time-out state. If software wants to clear this bit, software must read all receiver buffer remaining data by reading SC_RBR buffer,
[8]	<b>INIT_IS</b> <b>Initial End Interrupt Status Flag (Read Only)</b> This field is used for activation (ACT_EN(SC_ALTCTL[3])), deactivation (DACT_EN(SC_ALTCTL[2])) and warm reset (WARST_EN(SC_ALTCTL[4])) sequence interrupt status flag. <b>Note:</b> This bit is read only, but it can be cleared by writing 1 to it.
[7]	<b>CD_IS</b> <b>Card Detect Interrupt Status Flag (Read Only)</b> This field is used for card detect interrupt status flag. The card detect status is CD_INS_F(SC_SR[12]) and CD_REM_F(SC_SR[11]). <b>Note:</b> This field is the status flag of CD_INS_F(SC_SR[12]) or CD_REM_F(SC_TRSR[11]). So if software wants to clear this bit, software must write 1 to this field.
[6]	<b>BGT_IS</b> <b>Block Guard Time Interrupt Status Flag (Read Only)</b> This field is used for block guard time interrupt status flag. <b>Note1:</b> This bit is valid when RX_BGT_EN(SC_ALTCTL[12]) is enabled. <b>Note2:</b> This bit is read only, but it can be cleared by writing "1" to it.
[5]	<b>TMR2_IS</b> <b>Timer2 Interrupt Status Flag (Read Only)</b> This field is used for TMR2 interrupt status flag. <b>Note:</b> This bit is read only, but it can be cleared by writing 1 to it.

[4]	TMR1_IS	<b>Timer1 Interrupt Status Flag (Read Only)</b> This field is used for TMR1 interrupt status flag. <b>Note:</b> This bit is read only, but it can be cleared by writing 1 to it.
[3]	TMR0_IS	<b>Timer0 Interrupt Status Flag (Read Only)</b> This field is used for TMR0 interrupt status flag. <b>Note:</b> This bit is read only, but it can be cleared by writing 1 to it.
[2]	TERR_IS	<b>Transfer Error Interrupt Status Flag (Read Only)</b> This field is used for transfer error interrupt status flag. The transfer error states is at SC_SR register which includes receiver break error RX_EBR_F(SC_SR[6]), frame error RX_EFR_F(SC_TRSR[5]), parity error RX_EPA_F(SC_TRSR[4]) and receiver buffer overflow error RX_OVER_F(SC_TRSR[0]), transmit buffer overflow error TX_OVER_F(SC_TRSR[8]), receiver retry over limit error RX_OVER_REERR(SC_TRSR[22]) and transmitter retry over limit error TX_OVER_REERR(SC_TRSR[30]). <b>Note:</b> This field is the status flag of RX_EBR_F(SC_TRSR[6]), RX_EFR_F(SC_TRSR[5]), RX_EPA_F(SC_TRSR[4]), RX_OVER_F(SC_TRSR[0]), TX_OVER_F(SC_TRSR[8]), RX_OVER_REERR(SC_TRSR[22]) or TX_OVER_REERR(SC_TRSR[30]). So, if software wants to clear this bit, software must write 1 to each field.
[1]	TBE_IS	<b>Transmit Buffer Empty Interrupt Status Flag (Read Only)</b> This field is used for transmit buffer empty interrupt status flag. <b>Note:</b> This field is the status flag of transmit buffer empty state. If software wants to clear this bit, software must write data to THR(SC_THR[7:0]) buffer and then this bit will be cleared automatically.
[0]	RDA_IS	<b>Receive Data Reach Interrupt Status Flag (Read Only)</b> This field is used for received data reaching trigger level RX_FTRI_LEV (SC_CTL[7:6]) interrupt status flag. <b>Note:</b> This field is the status flag of received data reaching RX_FTRI_LEV (SC_CTL[7:6]). If software reads data from SC_RBR and receiver buffer data byte number is less than RX_FTRI_LEV (SC_CTL[7:6]), this bit will be cleared automatically.

### SC Transfer Status Register (SC\_TRSR)

Register	Offset	R/W	Description	Reset Value
SC_TRSR	SCx_BA+0x20	R/W	SC Status Register	0x0000_0202

31	30	29	28	27	26	25	24
TX_ATV	TX_OVER_REERR	TX_REERR	Reserved		TX_POINT_F		
23	22	21	20	19	18	17	16
RX_ATV	RX_OVER_REERR	RX_REERR	Reserved		RX_POINT_F		
15	14	13	12	11	10	9	8
Reserved					TX_FULL_F	TX_EMPTY_F	TX_OVER_F
7	6	5	4	3	2	1	0
Reserved	RX_EBR_F	RX_EFR_F	RX_EPA_F	Reserved	RX_FULL_F	RX_EMPTY_F	RX_OVER_F

Bits	Description
[31]	<b>TX_ATV</b> <b>Transmit In Active Status Flag (Read Only)</b> 0 = This bit is cleared automatically when TX transfer is finished or the last byte transmission has completed. 1 = This bit is set by hardware when TX transfer is in active and the STOP bit of the last byte has been transmitted.
[30]	<b>TX_OVER_REERR</b> <b>Transmitter Over Retry Error (Read Only)</b> This bit is set by hardware when transmitter re-transmits over retry number limitation. <b>Note:</b> This bit is read only, but it can be cleared by writing 1 to it.
[29]	<b>TX_REERR</b> <b>Transmitter Retry Error (Read Only)</b> This bit is set by hardware when transmitter re-transmits. <b>Note1:</b> This bit is read only, but it can be cleared by writing 1 to it. <b>Note2:</b> This bit is a flag and cannot generate any interrupt to CPU.
[28:26]	<b>Reserved</b> Reserved.
[25:24]	<b>TX_POINT_F</b> <b>Transmit Buffer Pointer Status Flag (Read Only)</b> This field indicates the TX buffer pointer status flag. When CPU writes data into SC_THR, TX_POINT_F increases one. When one byte of TX Buffer is transferred to transmitter shift register, TX_POINT_F decreases one.
[23]	<b>RX_ATV</b> <b>Receiver In Active Status Flag (Read Only)</b> This bit is set by hardware when RX transfer is in active. This bit is cleared automatically when RX transfer is finished.
[22]	<b>RX_OVER_REERR</b> <b>Receiver Over Retry Error (Read Only)</b> This bit is set by hardware when RX transfer error retry over retry number limit. <b>Note1:</b> This bit is read only, but it can be cleared by writing 1 to it. <b>Note2:</b> If CPU enables receiver retries function by setting RX_ERETRY_EN (SC_CTL[19]), the RX_EPA_F(SC_TRSR[4]) flag will be ignored (hardware will not set RX_EPA_F(SC_TRSR[4])).

[21]	RX_REERR	<b>Receiver Retry Error (Read Only)</b> This bit is set by hardware when RX has any error and retries transfer. <b>Note1:</b> This bit is read only, but it can be cleared by writing 1 to it. <b>Note2:</b> This bit is a flag and cannot generate any interrupt to CPU. <b>Note3:</b> If CPU enables receiver retry function by setting RX_ERETRY_EN (SC_CTL[19]) , the RX_EPA_F(SC_TRSR[4]) flag will be ignored (hardware will not set RX_EPA_F(SC_TRSR[4])).
[20:18]	Reserved	Reserved.
[17:16]	RX_POINT_F	<b>Receiver Buffer Pointer Status Flag (Read Only)</b> This field indicates the RX buffer pointer status flag. When SC receives one byte from external device, RX_POINT_F(SC_SR[17:16]) increases one. When one byte of RX buffer is read by CPU, RX_POINT_F(SC_SR[17:16]) decreases one.
[15:11]	Reserved	Reserved.
[10]	TX_FULL_F	<b>Transmit Buffer Full Status Flag (Read Only)</b> This bit indicates TX buffer full or not. This bit is set when TX pointer is equal to 4, otherwise is cleared by hardware.
[9]	TX_EMPTY_F	<b>Transmit Buffer Empty Status Flag (Read Only)</b> This bit indicates TX buffer empty or not. When the last byte of TX buffer has been transferred to Transmitter Shift Register, hardware sets this bit high. It will be cleared when writing data into THR(SC_THR[7:0]) (TX buffer not empty).
[8]	TX_OVER_F	<b>TX Overflow Error Interrupt Status Flag (Read Only)</b> If TX buffer is full, an additional write to THR(SC_THR[7:0]) will cause this bit be set to "1" by hardware. <b>Note:</b> This bit is read only, but it can be cleared by writing 1 to it.
[7]	Reserved	Reserved.
[6]	RX_EBR_F	<b>Receiver Break Error Status Flag (Read Only)</b> This bit is set to logic 1 whenever the received data input (RX) held in the "spacing state" (logic 0) is longer than a full word transmission time (that is, the total time of "start bit" + data bits + parity + stop bits). <b>Note1:</b> This bit is read only, but it can be cleared by writing 1 to it. <b>Note2:</b> If CPU sets receiver retries function by setting RX_ERETRY_EN(SC_CTL[19]) , hardware will not set this flag.
[5]	RX_EFR_F	<b>Receiver Frame Error Status Flag (Read Only)</b> This bit is set to logic 1 whenever the received character does not have a valid "stop bit" (that is, the stop bit following the last data bit or parity bit is detected as logic 0). <b>Note1:</b> This bit is read only, but it can be cleared by writing 1 to it. <b>Note2:</b> If CPU sets receiver retries function by setting RX_ERETRY_EN(SC_CTL[19]) , hardware will not set this flag.
[4]	RX_EPA_F	<b>Receiver Parity Error Status Flag (Read Only)</b> This bit is set to logic 1 whenever the received character does not have a valid "parity bit". <b>Note1:</b> This bit is read only, but it can be cleared by writing 1 to it. <b>Note2:</b> If CPU sets receiver retries function by setting RX_ERETRY_EN(SC_CTL[19]) , hardware will not set this flag.
[3]	Reserved	Reserved.
[2]	RX_FULL_F	<b>Receiver Buffer Full Status Flag (Read Only)</b> This bit indicates RX buffer full or not. This bit is set when RX pointer is equal to 4, otherwise it is cleared by hardware.

[1]	<b>RX_EMPTY_F</b>	<b>Receiver Buffer Empty Status Flag(Read Only)</b> This bit indicates RX buffer empty or not. When the last byte of Rx buffer has been read by CPU, hardware sets this bit high. It will be cleared when SC receives any new data.
[0]	<b>RX_OVER_F</b>	<b>RX Overflow Error Status Flag (Read Only)</b> This bit is set when RX buffer overflow. If the number of received bytes is greater than Rx Buffer size (4 bytes), this bit will be set. <b>Note:</b> This bit is read only, but it can be cleared by writing 1 to it.

### SC PIN Control State Register (SC\_PINCSR)

Register	Offset	R/W	Description	Reset Value
SC_PINCSR	SCx_BA+0x24	R/W	SC Pin Control State Register	0x0000_00x0

31	30	29	28	27	26	25	24
Reserved	SYNC	Reserved					
23	22	21	20	19	18	17	16
Reserved							SC_DATA_I_ST
15	14	13	12	11	10	9	8
Reserved				POW_INV	CD_LEV	SC_DATA_O	SC_OEN_ST
7	6	5	4	3	2	1	0
ADAC_CD_EN	CLK_KEEP	Reserved	CD_PIN_ST	CD_INS_F	CD_REM_F	SC_RST	POW_EN

Bits	Description	
[31]	Reserved	Reserved.
[30]	SYNC	<b>SYNC Flag Indicator</b> Due to synchronization, software should check this bit when writing a new value to SC_PINCSR register. 0 = Synchronizing is completion, user can write new data to SC_PINCSR register. 1 = Last value is synchronizing. <b>Note:</b> This bit is read only.
[29:17]	Reserved	Reserved.
[16]	SC_DATA_I_ST	<b>SC Data Pin Status (Read Only)</b> This bit is the pin status of SC_DATA 0 = The SC_DATA pin is low. 1 = The SC_DATA pin is high.
[15:12]	Reserved	Reserved.
[11]	POW_INV	<b>SC_POW Pin Inverse</b> This bit is used for inverse the SC_POW pin. There are four kinds of combination for SC_POW pin setting by POW_INV(SC_PINCSR[11]) and POW_EN(SC_PINCSR[0]). POW_INV(SC_PINCSR[11]) is bit 1 and POW_EN(SC_PINCSR[0]) is bit 0 for SC_POW_Pin as high or low voltage selection. 00 = SC_POW_Pin is 0. 01 = SC_POW_Pin is 1. 10 = SC_POW_Pin is 1. 11 = SC_POW_Pin is 0. <b>Note:</b> Software must select POW_INV (SC_PINCSR[11]) before Smart Card is enabled by SC_CEN (SC_CTL[0]).
[10]	CD_LEV	<b>Card Detect Level</b> 0 = When hardware detects the card detect pin from high to low, it indicates a card is

		<p>detected. 1 = When hardware detects the card detect pin from low to high, it indicates a card is detected.</p>  <p><b>Note:</b> Software must select card detect level before Smart Card engine is enabled</p>
[9]	SC_DATA_O	<p><b>SC Data Output Pin</b> This bit is the pin status of SC_DATA_O but user can drive SC_DATA_O pin to high or low by setting this bit. 0 = Drive SC_DATA_O pin to low. 1 = Drive SC_DATA_O pin to high. <b>Note:</b> When SC is at activation, warm reset or deactivation mode, this bit will be changed automatically. So don't fill this field when SC is in these modes.</p>
[8]	SC_OEN_ST	<p><b>SC Data Output Enable Pin Status (Read Only)</b> This bit is the pin status of SC_DATA_OEN 0 = The SC_DATA_OEN pin state at low. 1 = The SC_DATA_OEN pin state at high.</p>
[7]	ADAC_CD_EN	<p><b>Auto Deactivation When Card Removal</b> 0 = Auto deactivation Disabled when hardware detected the card removal. 1 = Auto deactivation Enabled when hardware detected the card removal. <b>Note:</b> When the card is removed, hardware will stop any process and then do deactivation sequence (if this bit be setting). If this process completes. Hardware will generate an initial end interrupt to CPU.</p>
[6]	CLK_KEEP	<p><b>SC Clock Enable Bit</b> 0 = SC clock generation Disabled. 1 = SC clock always keeps free running. <b>Note:</b> When operating in activation, warm reset or deactivation mode, this bit will be changed automatically. So don't fill this field when operating in these modes.</p>
[5]	Reserved	Reserved.
[4]	CD_PIN_ST	<p><b>Card Detect Status Of SC_CD Pin Status (Read Only)</b> This bit is the pin status flag of SC_CD 0 = The SC_CD pin state at low. 1 = The SC_CD pin state at high.</p>
[3]	CD_INS_F	<p><b>Card Detect Insert Status Of SC_CD Pin (Read Only)</b> This bit is set whenever card has been inserted. 0 = No effect. 1 = Card insert. <b>Note1:</b> This bit is read only, but it can be cleared by writing "1" to it. <b>Note2:</b> The card detect engine will start after SC_CEN (SC_CTL[0]) set.</p>
[2]	CD_REM_F	<p><b>Card Detect Removal Status Of SC_CD Pin (Read Only)</b> This bit is set whenever a card has been removed. 0 = No effect. 1 = Card removed. <b>Note1:</b> This bit is read only, but it can be cleared by writing "1" to it. <b>Note2:</b> Card detect engine will start after SC_CEN (SC_CTL[0]) set.</p>

[1]	SC_RST	<p><b>SC_RST Pin Signal</b></p> <p>This bit is the pin status of SC_RST but user can drive SC_RST pin to high or low by setting this bit.</p> <p>Write this field to drive SC_RST pin.</p> <p>0 = Drive SC_RST pin to low.</p> <p>1 = Drive SC_RST pin to high.</p> <p>Read this field to get SC_RST pin status.</p> <p>0 = SC_RST pin status is low.</p> <p>1 = SC_RST pin status is high.</p> <p><b>Note:</b> When operating at activation, warm reset or deactivation mode, this bit will be changed automatically. So don't fill this field when operating in these modes.</p>
[0]	POW_EN	<p><b>SC_POW_EN Pin Signal</b></p> <p>Software can set POW_EN (SC_PINCSR[0]) and POW_INV (SC_PINCSR[11]) to decide SC_PWR pin is in high or low level.</p> <p>Write this field to drive SC_PWR pin</p> <p>Refer POW_INV (SC_PINCSR[11]) description for programming SC_PWR pin voltage level.</p> <p>Read this field to get SC_PWR pin status.</p> <p>0 = SC_PWR pin status is low.</p> <p>1 = SC_PWR pin status is high.</p> <p><b>Note:</b> When operating at activation, warm reset or deactivation mode, this bit will be changed automatically. So don't fill this field when operating in these modes.</p>

## 6.15 PS/2 Device Controller (PS2D)

### 6.15.1 Overview

PS/2 device controller provides a basic timing control for PS/2 communication. All communication between the device and the host is managed through the PS2\_CLK and PS2\_DATA pins. Unlike PS/2 keyboard or mouse device controller, the receive/transmit code needs to be translated as meaningful code by firmware. The device controller generates the PS2\_CLK signal after receiving a "Request to Send" state, but host has ultimate control over communication. Data of PS2\_DATA line sent from the host to the device is read on the rising edge and sent from the device to the host is change after rising edge. A 16 bytes FIFO is used to reduce CPU intervention. Software can select 1 to 16 bytes for a continuous transmission.

### 6.15.2 Features

- Host communication inhibit and "Request-to-Send" state detection
- Reception frame error detection
- Programmable 1 to 16 bytes transmit buffer to reduce CPU intervention
- Double buffer for data reception
- Software override bus

### 6.15.3 Block Diagram

The PS/2 device controller consists of APB bus interface and timing control logic for PS2\_DATA and PS2\_CLK lines.

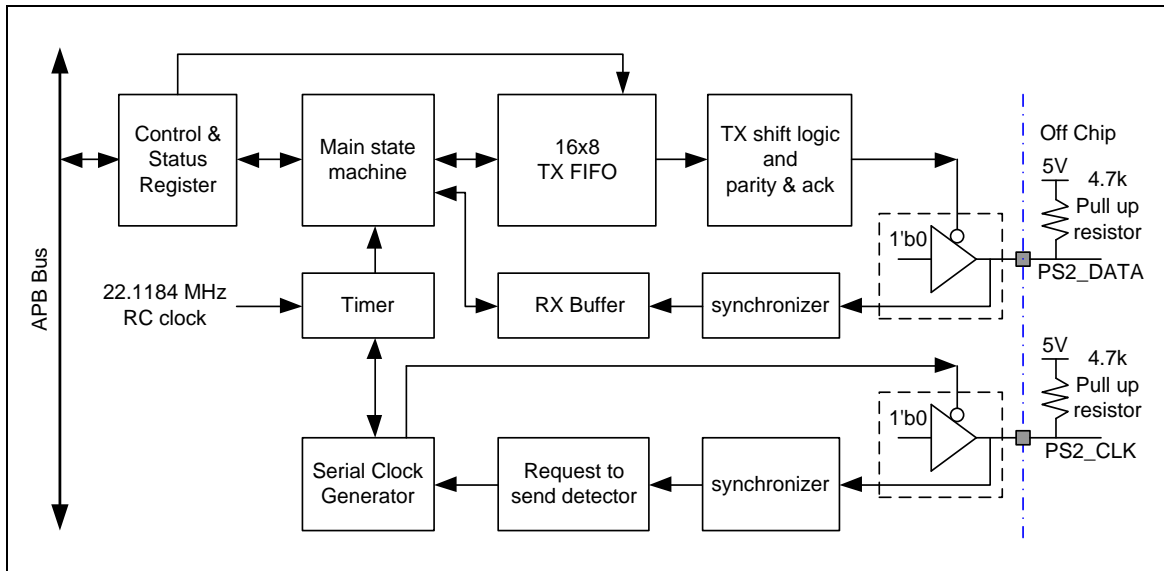

Figure 6-89 PS/2 Device Block Diagram

#### 6.15.4 Basic Configuration

The basic configurations of PS/2 device controller are as follows:

- PS2\_CLK and PS2\_DATA pins are configured on GPF\_MFP[3:2] register.
- Enable PS/2 device bus clock PS2\_EN on APBCLK[31] register.
- Reset PS/2 Device PS2\_RST on IPRSTC2[23] register.

#### 6.15.5 Functional Description

##### 6.15.5.1 Communication

The PS/2 device implements a bidirectional synchronous serial protocol. The bus is "Idle" when both lines are high (open-collector). This is the only state where the device is allowed start to transmit PS/2 data. The host has ultimate control over the bus and may inhibit communication at any time by pulling the PS2\_CLK line low.

The PS2\_CLK signal is generated by PS/2 device. If the host wants to send PS/2 data, it must first inhibit communication from the device by pulling PS2\_CLK low. The host then pulls PS2\_DATA low and releases PS2\_CLK. This is the "Request-to-Send" state and signals the device to start generating PS2\_CLK pulses.

PS2_DATA	PS2_CLK	Bus State
High	High	Idle
High	Low	Communication Inhibit
Low	High	Host Request to Send

All data is transmitted one byte at a time and each byte is sent in a frame consisting of 11 or 12 bits. These bits are:

- 1 start bit, which is always 0
- 8 data bits, least significant bit first
- 1 parity bit (odd parity)
- 1 stop bit, which is always 1
- 1 acknowledge bit (host-to-device communication only)

The parity bit is set if there is an even number of 1's in the data bits and cleared to 0 if there is an odd number of 1's in the data bits. This is used for parity error detection that is the number of 1's in the data bits plus the parity bit should always add up to an odd number. The device must check this bit and if incorrect it should respond as if it had received an invalid command.

The host may inhibit communication at any time by pulling the PS2\_CLK line low for at least 100 us. If a transmission is inhibited before the 11th clock pulse, the device must abort the current transmission and prepare to resend the current data when host releases PS2\_CLK. In order to reserve enough time for software to decode host command, the transmit logic is blocked by RXINT(PS2INTID[0]) bit, software must clear the RXINT bit to start resend. Software can write CLR\_FIFO(PS2CON[8]) to 1 to reset FIFO pointer if needed.

#### Device-to-Host

The device uses a serial protocol with 11-bit frames. These bits are:

- 1 start bit, which is always 0
- 8 data bits, least significant bit first
- 1 parity bit (odd parity)
- 1 stop bit, which is always 1

The device writes a bit on the PS2\_DATA line when PS2\_CLK is high, and it is read by the host when PS2\_CLK is low, which is illustrated in Figure 6-90.

Figure 6-90 Data Format of Device-to-Host

#### Host-to-Device:

First, the PS/2 device always generates the PS2\_CLK signal. If the host wants to send PS/2 data, it must first put the PS2\_CLK and PS2\_DATA lines in a "Request-to-send" state as follows:

- Inhibit communication by pulling PS2\_CLK low for at least 100 us
- Apply "Request-to-send" by pulling PS2\_DATA low, then release PS2\_CLK

The device should check for this state at intervals not to exceed 10 ms. When the device detects this state, it will begin generating PS2\_CLK signals and PS2\_CLK in eight PS2\_DATA bits, one parity bit and one stop bit. The host changes the PS2\_DATA line status only when the PS2\_CLK line status is low, and PS2\_DATA is read by the device when PS2\_CLK is high.

After the stop bit is received, the device will acknowledge the received byte by bringing the PS2\_DATA line low and generating one last PS2\_CLK pulse. If the host does not release the PS2\_DATA line after the 11th CLK pulse, the device will continue to generate PS2\_CLK pulses until the PS2\_DATA line is released.

Figure 6-91 Data Format of Host-to-Device

The host and the detailed timing of the PS2\_DATA and PS2\_CLK for communication are shown below:

Figure 6-92 PS/2 Bit Data Format

6.15.5.2 PS/2 Bus Timing Specification

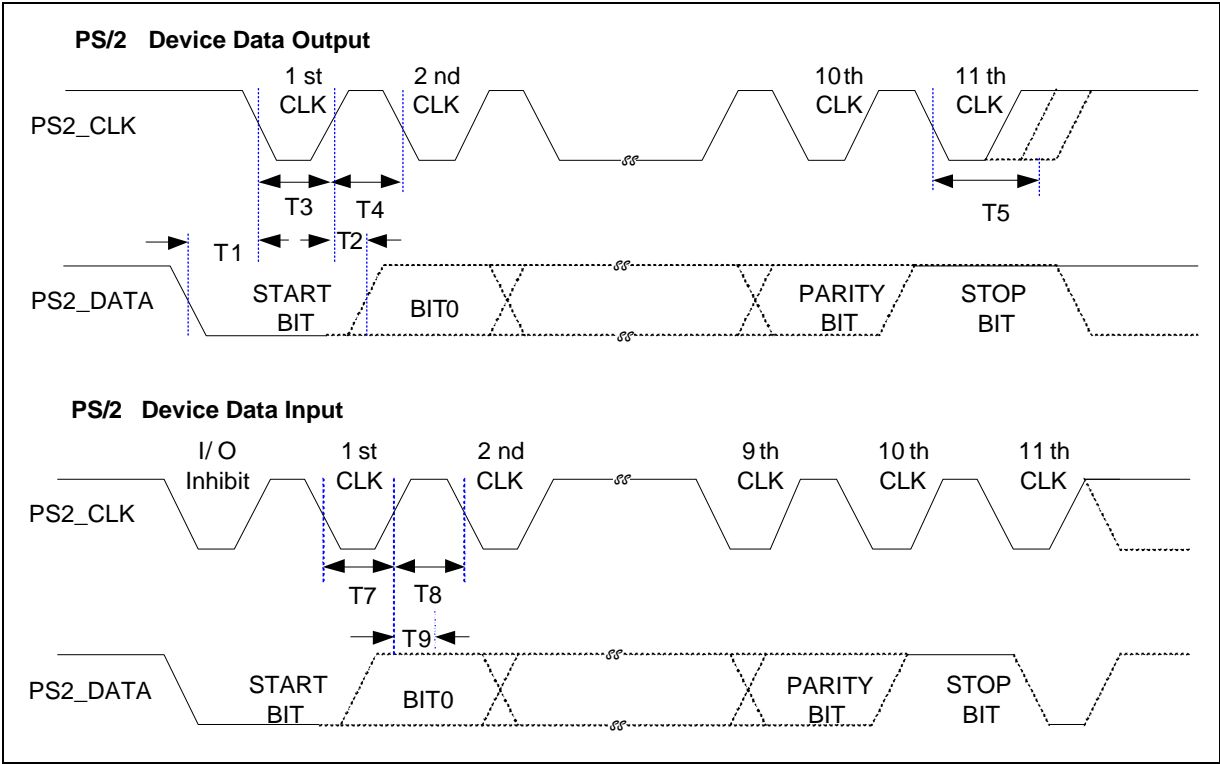

Figure 6-93 PS/2 Bus Timing

Symbol	Timing Parameter	Min.	Max.
T1	PS2_DATA transition to the falling edge of PS2_CLK	5us	25us
T2	Rising edge of PS2_CLK to PS2_DATA transition	5us	T4-5us
T3	Duration of PS2_CLK inactive	30us	50us
T4	Duration of PS2_CLK active	30us	50us
T5	Time to auxiliary device inhibit after 11 <sup>th</sup> clock to ensure auxiliary device does not start another transmission	>0	50us
T7	Duration of PS2_CLK inactive	30us	50us
T8	Duration of PS2_CLK active	30us	50us
T9	Time from inactive to active PS2_CLK transition, use to time auxiliary device sample PS2_DATA	5us	25us

6.15.5.3TX FIFO Operation

Writing data to PS2TXDATA0 register starts device to host communication. Software is required to define the TXFIFO depth before writing transmission data to TX FIFO. The first START bit is sent to PS/2 bus when software writes TX FIFO and delays 100us. If there are more than 4 bytes data need to send, software can write residual data to PS2TXDATA1-3 before 4th byte transmit complete. A time delay 100us is added between two consecutive bytes.

Figure 6-94 PS/2 Data Format

Reserved				BYTEIDX[3:0]			
7	6	5	4	3	2	1	0
TXEMPTY	RXOVF	TXBUSY	RXBUSY	RXPARTY	FRAMERR	PS2DATA	PS2CLK

Bits	Description
[31:12]	<b>Reserved</b> Reserved.
[11:8]	<b>BYTEIDX</b> <b>Byte Index</b> It indicates which data byte in transmit data shift register. When all data in FIFO is transmitted and it will be cleared to 0. This bit is read only. 0000 = PS2TXDATA0[7:0]. 0001 = PS2TXDATA0[15:8]. 0010 = PS2TXDATA0[23:16]. 0011 = PS2TXDATA0[31:24]. 0100 = PS2TXDATA1[7:0]. 0101 = PS2TXDATA1[15:8]. 0110 = PS2TXDATA1[23:16]. 0111 = PS2TXDATA1[31:24]. 1000 = PS2TXDATA2[7:0]. 1001 = PS2TXDATA2[15:8]. 1010 = PS2TXDATA2[23:16]. 1011 = PS2TXDATA2[31:24]. 1100 = PS2TXDATA3[7:0]. 1101 = PS2TXDATA3[15:8]. 1110 = PS2TXDATA3[23:16]. 1111 = PS2TXDATA3[31:24].
[7]	<b>TXEMPTY</b> <b>TX FIFO Empty</b> When software writes data to PS2TXDATA0-3, the TXEMPTY bit is cleared to 0 immediately if PS2EN(PS2CON[0]) is enabled. When transmitted data byte number is equal to TXFIFO_DEPTH (PS2CON[6:3]) then TXEMPTY bit is set to 1. 0 = There is data to be transmitted. 1 = FIFO is empty. This bit is read only.

[6]	<b>RXOVF</b>	<b>RX Buffer Overwrite</b> 0 = No overwrite. 1 = Data in PS2RXDATA register is overwritten by new received data. Write 1 to clear this bit.
[5]	<b>TXBUSY</b>	<b>Transmit Busy</b> This bit indicates that the PS/2 device is currently sending data. 0 = Idle. 1 = Currently sending data. This bit is read only.
[4]	<b>RXBUSY</b>	<b>Receive Busy</b> This bit indicates that the PS/2 device is currently receiving data. 0 = Idle. 1 = Currently receiving data. This bit is read only.
[3]	<b>RXPARTY</b>	<b>Received Parity</b> This bit reflects the parity bit for the last received data byte (odd parity). This bit is read only.
[2]	<b>FRAMERR</b>	<b>Frame Error</b> For host to device communication, this bit sets to 1 if STOP bit (logic 1) is not received. If frame error occurs, the PS2_DATA line may keep at low state after 12th clock. At this moment, software overrides PS2_CLK to send clock till PS2_DATA release to high state. After that, device sends a "Resend" command to host. 0 = No frame error. 1 = Frame error occur. Write 1 to clear this bit.
[1]	<b>PS2DATA</b>	<b>DATA Pin State</b> This bit reflects the status of the PS2_DATA line after synchronizing and sampling.
[0]	<b>PS2CLK</b>	<b>CLK Pin State</b> This bit reflects the status of the PS2_CLK line after synchronizing.

### PS/2 Interrupt Identification Register (PS2INTID)

Bits	Description	
[31:3]	Reserved	Reserved.
[1]	TXINT	<b>Transmit Interrupt</b> This bit is set to 1 after STOP bit is transmitted. Interrupt occur if TXINTEN(PS2CON[1]) bit is set to 1. 0 = No interrupt. 1 = Transmit interrupt occurs. Write 1 to clear this bit to 0.
[0]	RXINT	<b>Receive Interrupt</b> This bit is set to 1 when acknowledge bit is sent for Host to device communication. Interrupt occurs if RXINTEN(PS2CON[2]) bit is set to 1. 0 = No interrupt. 1 = Receive interrupt occurs. Write 1 to clear this bit to 0.

## 6.16 I<sup>2</sup>C Serial Interface Controller (I<sup>2</sup>C)

### 6.16.1 Overview

I<sup>2</sup>C is a two-wire, bi-directional serial bus that provides a simple and efficient method of data exchange between devices. The I<sup>2</sup>C standard is a true multi-master bus including collision detection and arbitration that prevents data corruption if two or more masters attempt to control the bus simultaneously.

### 6.16.2 Features

The I<sup>2</sup>C bus uses two wires (I2Cn\_SDA and I2Cn\_SCL) to transfer information between devices connected to the bus. The main features of the I<sup>2</sup>C bus include:

- Supports up to two I<sup>2</sup>C serial interface controller
- Master/Slave mode
- Bidirectional data transfer between masters and slaves
- Multi-master bus (no central master)
- Arbitration between simultaneously transmitting masters without corruption of serial data on the bus
- Serial clock synchronization allow devices with different bit rates to communicate via one serial bus
- Built-in a 14-bit time-out counter requesting the I<sup>2</sup>C interrupt if the I<sup>2</sup>C bus hangs up and timer-out counter overflows.
- Programmable clocks allow for versatile rate control
- Supports 7-bit addressing mode
- Supports multiple address recognition ( four slave address with mask option)
- Supports Power-down wake-up function

### 6.16.3 Basic Configuration

The basic configurations of I<sup>2</sup>C0 are as follows:

- I<sup>2</sup>C0 pins are configured on GPA\_MFP [9:8] register
- Enable I<sup>2</sup>C0 clock by setting I2C0\_EN (APBCLK [8])
- Reset I<sup>2</sup>C0 controller by setting I2C0\_RST(IPRSTC2 [8])

The basic configurations of I<sup>2</sup>C1 are as follows:

- I<sup>2</sup>C1 pins are configured on GPE\_MFP [11:10] register
- Enable I<sup>2</sup>C1 clock by setting I2C1\_EN( APBCLK [9])

- Reset I<sup>2</sup>C1 controller by setting I2C1\_RST (IPRSTC2 [9])

### 6.16.4 Block Diagram

The basic configurations of I<sup>2</sup>C are as follows:

Figure 6-95 I<sup>2</sup>C Controller Block Diagram

### 6.16.5 Functional Description

On I<sup>2</sup>C bus, data is transferred between a Master and a Slave. Data bits transfer on the I2Cn\_SCL and I2Cn\_SDA lines are synchronously on a byte-by-byte basis. Each data byte is 8-bit long. There is one I2Cn\_SCL pulse for each data bit with the MSB being transmitted first, and an acknowledge bit follows each transferred byte. Each bit is sampled during the high period of I2Cn\_SCL; therefore, the I2Cn\_SDA line may be changed only during the low period of I2Cn\_SCL and must be held stable during the high period of I2Cn\_SCL. A transition on the I2Cn\_SDA line while I2Cn\_SCL is high is interpreted as a command (START or STOP). Please refer to the following figure for more detailed I<sup>2</sup>C bus timing.

Figure 6-96 I<sup>2</sup>C Bus Timing

The device's on-chip I<sup>2</sup>C provides the serial interface that meets the I<sup>2</sup>C bus standard mode specification. The I<sup>2</sup>C port handles byte transfers autonomously. To enable this port, ENS1

(I2CON[6]) should be set to '1'. The I<sup>2</sup>C hardware interfaces to the I<sup>2</sup>C bus via two pins: I2Cn\_SDA and I2Cn\_SCL. When I/O pins are used as I<sup>2</sup>C ports, user must set the pins function to I<sup>2</sup>C in advance.

**Note:** Pull-up resistor is needed for I<sup>2</sup>C operation as the I2Cn\_SDA and I2Cn\_SCL are open-drain pins.

#### 6.16.5.1 I<sup>2</sup>C Protocol

The following figure shows the typical I<sup>2</sup>C protocol. Normally, a standard communication consists of four parts:

- START or Repeated START signal generation
- Slave address and R/W bit transfer
- Data transfer
- STOP signal generation

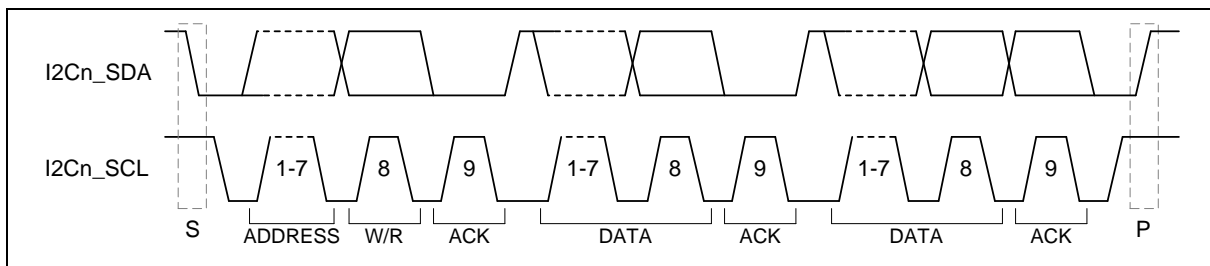

Figure 6-97 I<sup>2</sup>C Protocol

##### 6.16.5.1.1 START or Repeated START signal

When the bus is free or idle, meaning no master device is engaging the bus (both I2Cn\_SCL and I2Cn\_SDA lines are high), a master can initiate a transfer by sending a START signal. A START signal, usually referred to as the “S” bit, is defined as a HIGH to LOW transition on the I2Cn\_SDA line while I2Cn\_SCL is HIGH. The START signal denotes the beginning of a new data transmission.

After having sent the address byte (address and read/write bit) the master may send any number of bytes followed by a stop condition. Instead of sending the stop condition it is also allowed to send another start condition again followed by an address (and of course including a read/write bit) and more data. The start condition is called as Repeat START (Sr). This is defined recursively allowing any number of start conditions to be sent. The purpose of this is to allow combined write/read operations to one or more devices without releasing the bus and thus with the guarantee that the operation is not interrupted. The controller uses this method to communicate with another slave or the same slave in a different transfer direction (e.g. from writing to a device to reading from a device) without releasing the bus.

##### 6.16.5.1.2 STOP signal

The master can terminate the communication by generating a STOP signal. A STOP signal, usually referred to as the “P” bit, is defined as a LOW to HIGH transition on the I2Cn\_SDA line while I2Cn\_SCL is HIGH.

The following figure shows the waveform of START, Repeat START and STOP.

Figure 6-98 START and STOP Conditions

#### 6.16.5.1.3 Slave Address Transfer

The first byte of data transferred by the master immediately after the START signal is the Slave address (SLA). This is a 7-bit calling address followed by a Read/Write (R/W) bit. The R/W bit signals of the slave indicate the data transfer direction. No two slaves in the system can have the same address. Only the slave with an address that matches the one transmitted by the master will respond by returning an acknowledge bit by pulling the I2Cn\_SDA low at the 9th I2Cn\_SCL clock cycle.

#### 6.16.5.1.4 Data Transfer

When a slave receives a correct address with an R/W bit, the data will follow R/W bit specified to transfer. Each transferred byte is followed by an acknowledge bit on the 9th I2Cn\_SCL clock cycle. If the slave signals a Not Acknowledge (NACK), the master can generate a STOP signal to abort the data transfer or generate a Repeated START signal and start a new transfer cycle.

If the master, as a receiving device, does Not Acknowledge (NACK) the slave, the slave releases the I2Cn\_SDA line for the master to generate a STOP or Repeated START signal.

Figure 6-99 Bit Transfer on the I<sup>2</sup>C Bus

Figure 6-100 Acknowledge on the I<sup>2</sup>C Bus

6.16.5.1.5 Data transfer on the I<sup>2</sup>C bus

The following figure shows a master transmits data to slave. A master addresses a slave with a 7-bit address and 1-bit write index to denote that the master wants to transmit data to the slave. The master keeps transmitting data after the slave returns acknowledge to the master.

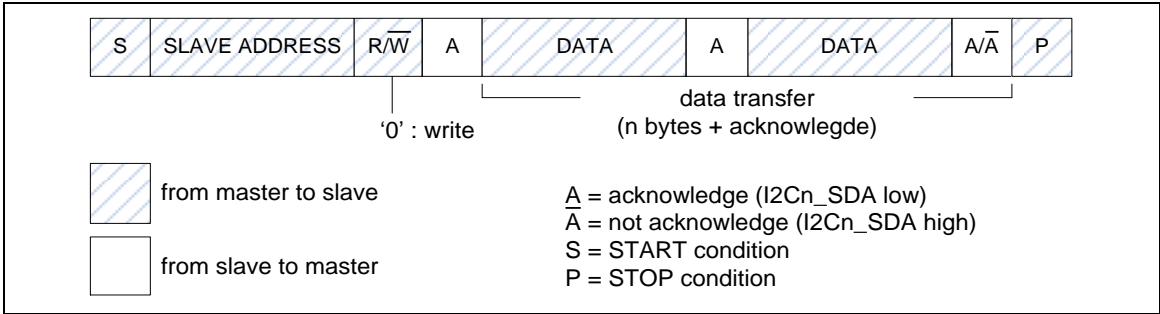

Figure 6-101 Master Transmits Data to Slave

The following figure shows a master read data from slave. A master addresses a slave with a 7-bit address and 1-bit read index to denote that the master wants to read data from the slave. The slave will start transmitting data after the slave returns acknowledge to the master.

Figure 6-102 Master Reads Data from Slave

6.16.5.2 Operation Modes

The on-chip I<sup>2</sup>C ports support three operation modes, Master, Slave, and General Call Mode.

In a given application, I<sup>2</sup>C port may operate as a master or as a slave. In Slave mode, the I<sup>2</sup>C port

hardware looks for its own slave address and the general call address. If one of these addresses is detected, and if the slave is willing to receive or transmit data from/to master (by setting the AA bit), acknowledge pulse will be transmitted out on the 9th clock, hence an interrupt is requested on both master and slave devices if interrupt is enabled. When the microcontroller wishes to become the bus master, hardware waits until the bus is free before entering Master mode so that a possible slave action is not interrupted. If bus arbitration is lost in Master mode, I<sup>2</sup>C port switches to Slave mode immediately and can detect its own slave address in the same serial transfer.

To control the I<sup>2</sup>C bus transfer in each mode, user needs to set I2CON, I2CDAT registers according to current status code of I2CSTATUS register. In other words, for each I<sup>2</sup>C bus action, user needs to check current status by I2CSTATUS register, and then set I2CON, I2CDAT registers to take bus action. Finally, check the response status by I2CSTATUS.

The bits, STA(I2CON[5]), STO(I2CON[4]) and AA(I2CON[2]) are used to control the next state of the I<sup>2</sup>C hardware after SI (I2CON[3]) flag is cleared. Upon completion of the new action, a new status code will be updated in I2CSTATUS register and the SI flag will be set. If the I<sup>2</sup>C interrupt control bit EI (I2CON [7]) is set, appropriate action or software branch of the new status code can be performed in the Interrupt service routine.

The following figure shows the current I<sup>2</sup>C status code is 0x08, and then set I2CDATA=SLA+W and (STA,STO,SI,AA) = (0,0,1,x) to send the address to I<sup>2</sup>C bus. If a slave on the bus matches the address and response ACK, the I2CSTATUS will be updated by status code 0x18.

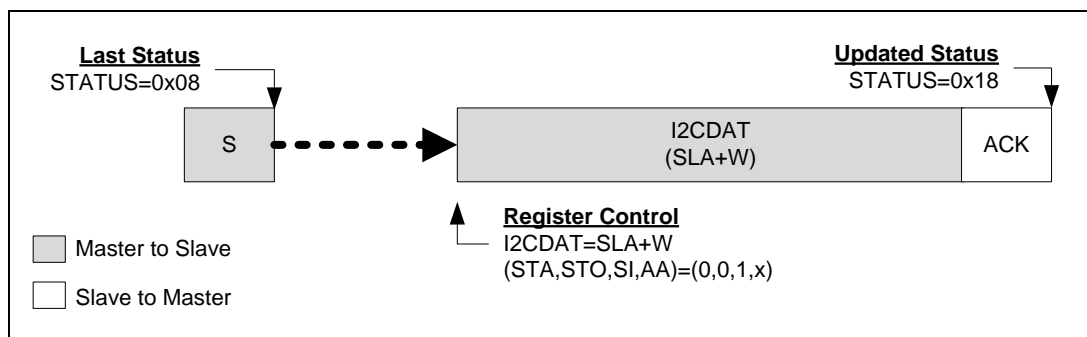

Figure 6-103 Control I<sup>2</sup>C Bus according to Current I<sup>2</sup>C Status

### 6.16.5.2.1 Master Mode

In below figures, all possible protocols for I<sup>2</sup>C master are shown. User needs to follow proper path of the flow to implement required I<sup>2</sup>C protocol.

In other words, user can send a START signal to bus and I<sup>2</sup>C will be in Master Transmitter mode (Figure 6-104 ) or Master receiver mode (Figure 6-106 ) after START signal has been sent successfully and new status code would be 0x08. Followed by START signal, user can send slave address, read/write bit, data and Repeat START, STOP to perform I<sup>2</sup>C protocol.

Figure 6-104 Master Transmitter Mode Control Flow

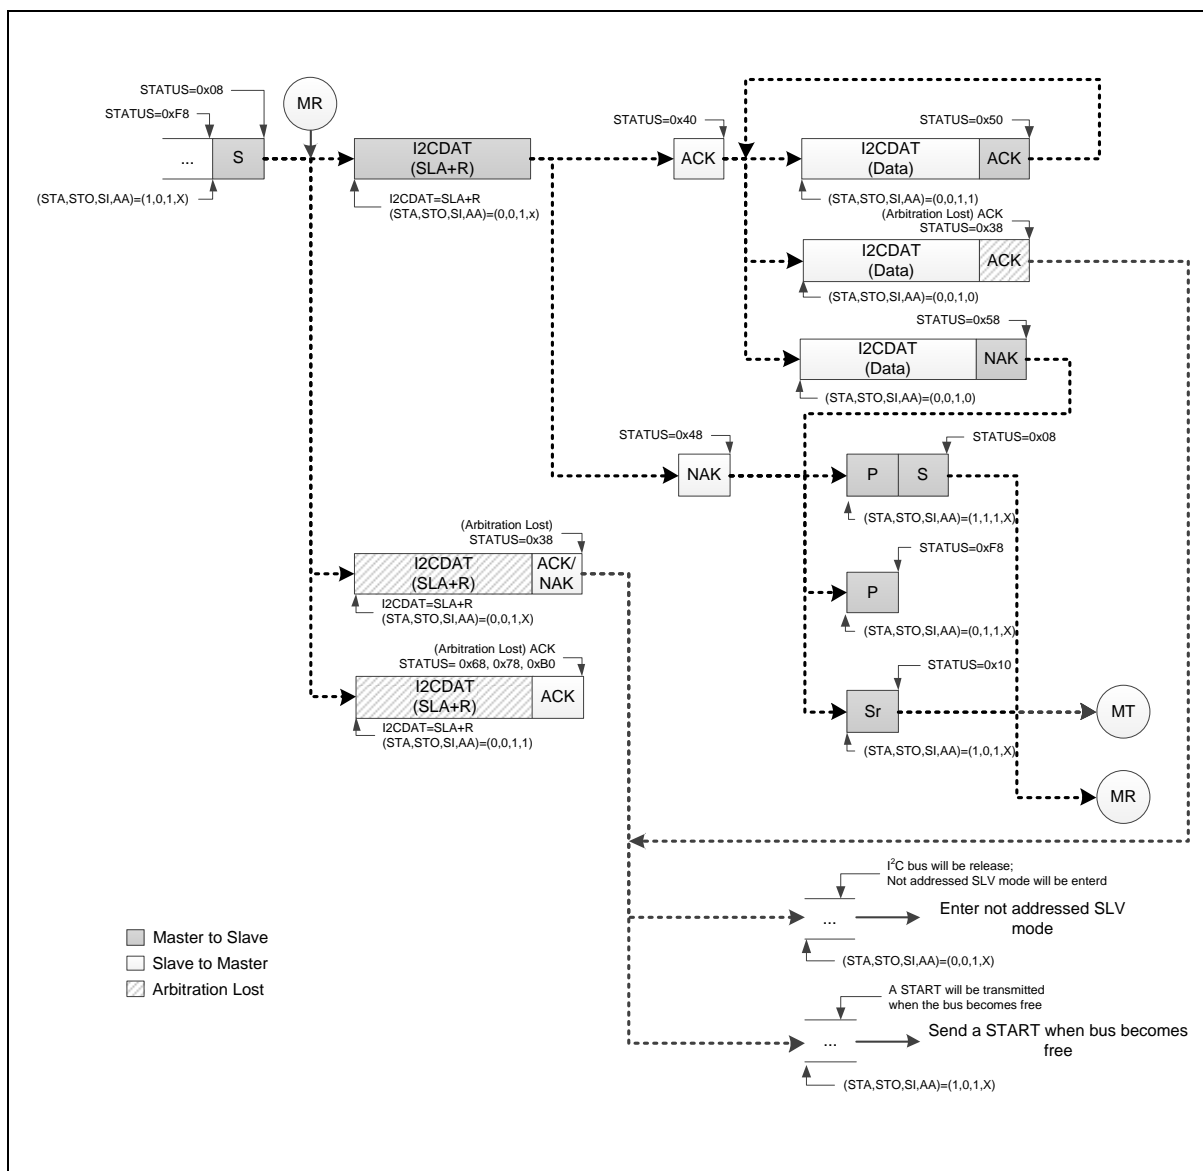

Figure 6-105 Master Receiver Mode Control Flow

If the I<sup>2</sup>C is in Master mode and gets arbitration lost, the status code will be 0x38. In status 0x38, user may set (STA, STO, SI, AA) = (1, 0, 1, X) to send START to re-start Master operation when bus become free. Otherwise, user may set (STA, STO, SI, AA) = (0, 0, 1, X) to release I<sup>2</sup>C bus and enter not addressed Slave mode.

#### 6.16.5.2.2 *Slave Mode*

When reset default, I<sup>2</sup>C is not addressed and will not recognize the address on I<sup>2</sup>C bus. User can set slave address by I2CADDRx and set (STA, STO, SI, AA) = (0, 0, 1, 1) to let I<sup>2</sup>C recognize the address sent by master. Figure 6-106 shows all the possible flow for I<sup>2</sup>C in Slave mode. Users need to follow a proper flow (as shown in Figure 6-106) to implement their own I<sup>2</sup>C protocol.

If bus arbitration is lost in Master mode, I<sup>2</sup>C port switches to Slave mode immediately and can

detect its own slave address in the same serial transfer. If the detected address is SLA+W (Master want to write data to Slave) after arbitration lost, the status code is 0x68. If the detected address is SLA+R (Master want to read data from Slave) after arbitration lost, the status code is 0xB0.

**Note:** During I<sup>2</sup>C communication, the I2Cn\_SCL clock will be released when writing '1' to clear SI flag in Slave mode.

Figure 6-106 Save Mode Control Flow

If I<sup>2</sup>C is still receiving data in addressed Slave mode but got a STOP or Repeat START, the status code will be 0xA0. User could follow the action for status code 0x88 as shown in the above figure when getting 0xA0 status.

If I<sup>2</sup>C is still transmitting data in addressed Slave mode but got a STOP or Repeat START, the status code will be 0xA0. User could follow the action for status code 0xC8 as shown in the above figure when getting 0xA0 status.

**Note:** After slave gets status of 0x88, 0xC8, 0xC0 and 0xA0, slave can switch to not address mode and own SLA will not be recognized. If entering this status, slave will not receive any I<sup>2</sup>C signal or address from master. At this status, I<sup>2</sup>C should be reset to leave this status.

#### 6.16.5.2.3 General Call (GC) Mode

If the GC(I2CADDRn [0]) bit is set, the I<sup>2</sup>C port hardware will respond to General Call address (0x00). User can clear GC bit to disable general call function. When the GC bit is set and the I<sup>2</sup>C in Slave mode, it can receive the general call address by 0x00 after master send general call address to I<sup>2</sup>C bus, then it will follow status of GC mode.

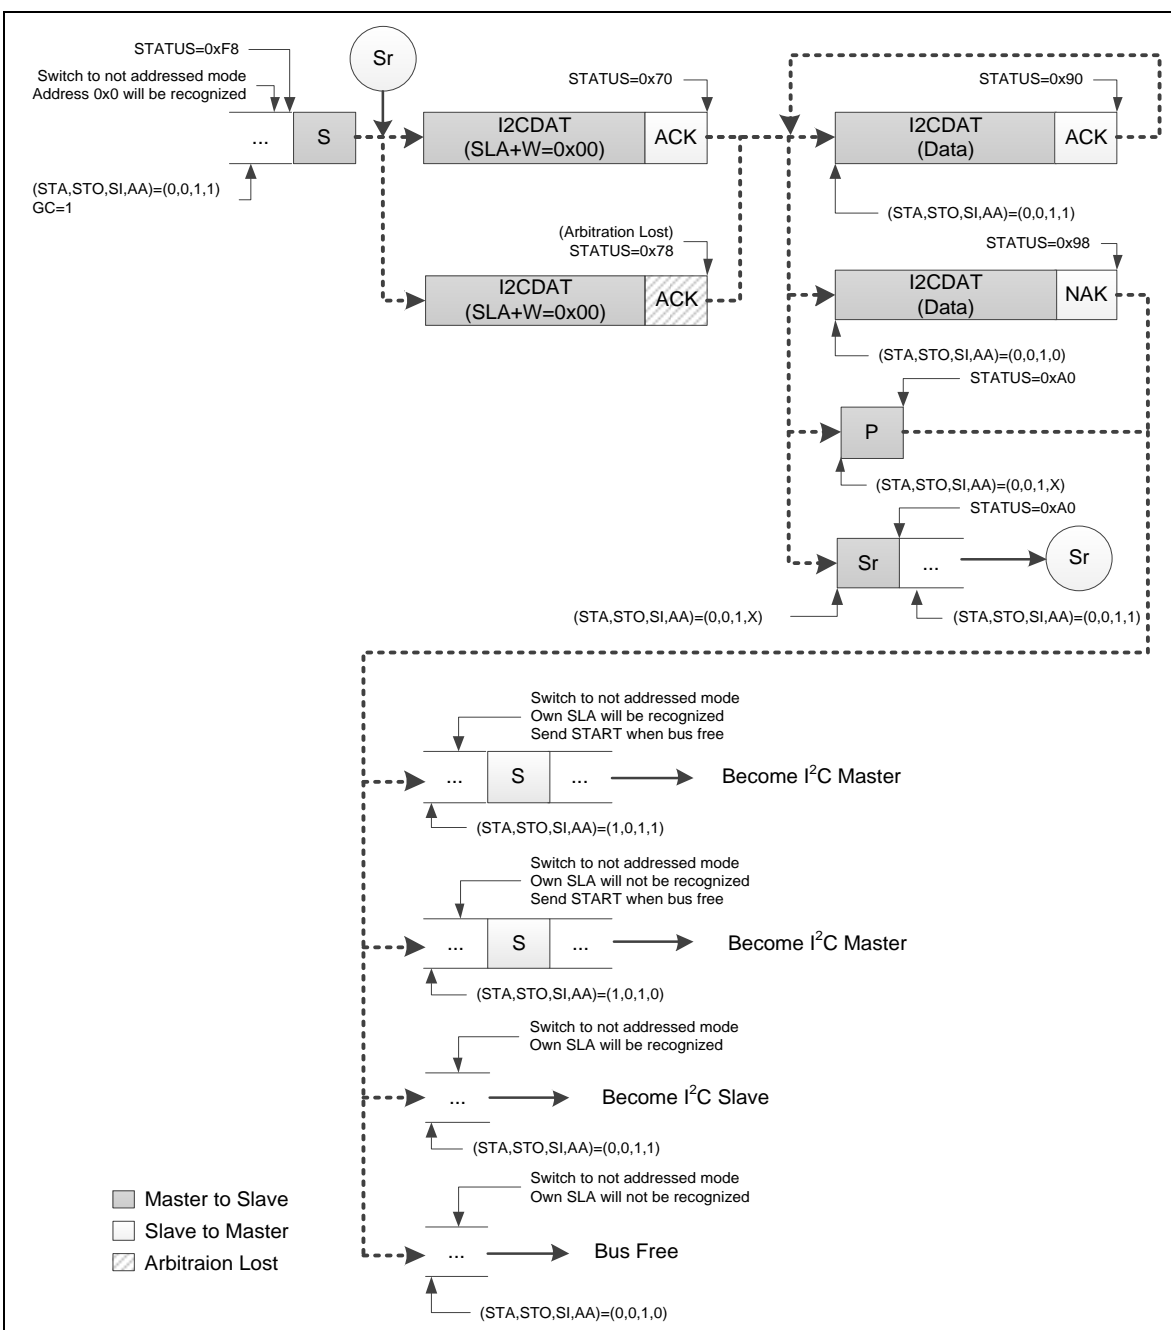

Figure 6-107 GC Mode

If I<sup>2</sup>C is still receiving data in GC mode but got a STOP or Repeat START, the status code will be 0xA0. User could follow the action for status code 0x98 in above figure when getting 0xA0 status.

**Note:** After slave gets status of 0x98 and 0xA0, slave can switch to not address mode and own SLA will not be recognized. If entering this status, slave will not receive any I<sup>2</sup>C signal or address from master. At this time, I<sup>2</sup>C controller should be reset to leave this status.

#### 6.16.5.2.4 Multi-Master

In some applications, there are two or more masters on the same I<sup>2</sup>C bus to access slaves, and the masters may transmit data simultaneously. The I<sup>2</sup>C supports multi-master by including collision detection and arbitration to prevent data corruption.

If for some reason two masters initiate command at the same time, the arbitration procedure determines which master wins and can continue with the command. Arbitration is performed on the I2Cn\_SDA signal while the I2Cn\_SCL signal is high. Each master checks if the I2Cn\_SDA signal on the bus corresponds to the generated I2Cn\_SDA signal. If the I2Cn\_SDA signal on the bus is low but it should be high, then this master has lost arbitration. The device that has lost arbitration can generate I2Cn\_SCL pulses until the byte ends. The arbitration procedure can continue until all the data is transferred. This means that in multi-master system each master must monitor the bus for collisions and act accordingly.

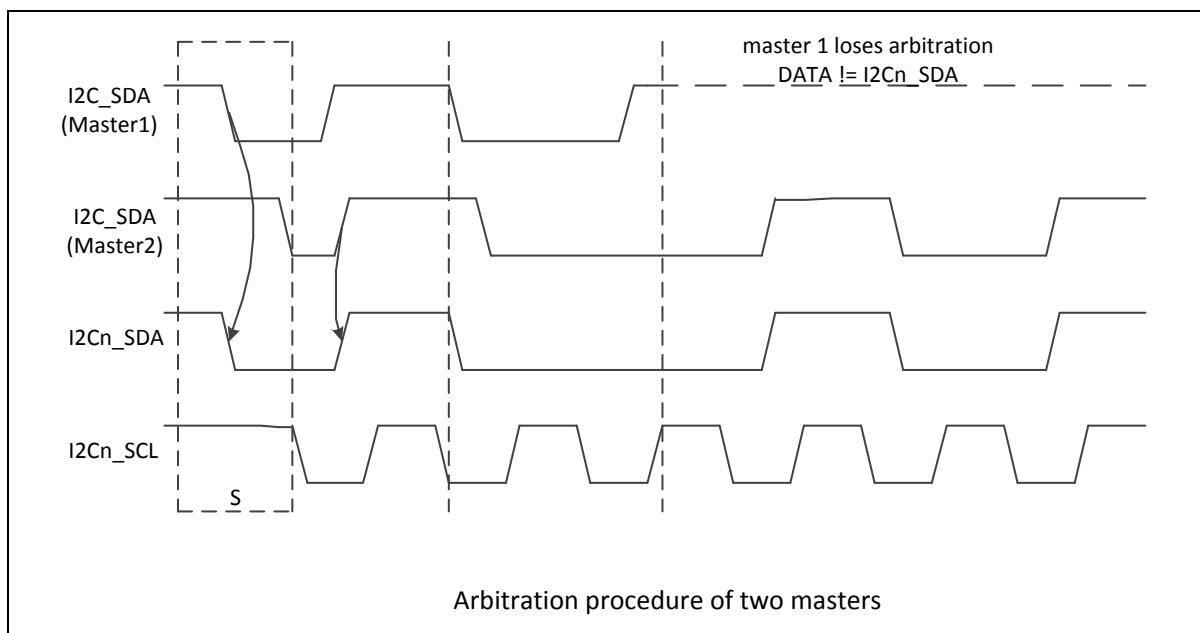

Figure 6-108 Arbitration Lost

- When I2CSTATUS = 0x38, an “Arbitration Lost” is received. Arbitration lost event maybe occur during the send START bit, data bits or STOP bit. User could set (STA, STO, SI, AA) = (1, 0, 1, X) to send START again when bus free, or set (STA, STO, SI, AA) = (0, 0, 1, X) back to not addressed Slave mode.
- When I2CSTATUS = 0x00, a “Bus Error” is received. To recover I<sup>2</sup>C bus from a bus error, STO(I2CON[4]) should be set and SI(I2CON[3]) should be cleared, and then STO(I2CON[4]) is cleared to release bus.
  - Set (STA, STO, SI, AA) = (0, 1, 1, X) to stop current transfer

- Set (STA, STO, SI, AA) = (0, 0, 1, X) to release bus

#### 6.16.5.3 I<sup>2</sup>C Protocol Registers

To control I<sup>2</sup>C port through the following fifteen special function registers: I2CON (Control register), I2CSTATUS (Status register), I2CDAT (Data register), I2CADDRn (Address registers, n=0~3), I2CADMn (Address mask registers, n=0~3), I2CLK (Clock rate register), I2CTOC (Time-out counter register), I2CWKCON (Wake up control register), I2CWKSTS (Wake up status register).

##### 6.16.5.3.1 Address Registers (I2CADDR)

The I<sup>2</sup>C port is equipped with four slave address registers, I2CADDRn (n=0~3). The contents of the register are irrelevant when I<sup>2</sup>C is in Master mode. In Slave mode, the bit field I2CADDRn[7:1] must be loaded with the chip's own slave address. The I<sup>2</sup>C hardware will react if the contents of I2CADDRn are matched with the received slave address.

The I<sup>2</sup>C ports support the "General Call" function. If the GC (I2CADDRn [0]) bit is set the I<sup>2</sup>C port hardware will respond to General Call address (0x00). Clear GC bit to disable general call function.

When the GC bit is set and the I<sup>2</sup>C is in Slave mode, it can receive the general call address by 0x00 after Master send general call address to I<sup>2</sup>C bus, then it will follow status of GC mode.

##### 6.16.5.3.2 Slave Address Mask Registers (I2CADM)

The I<sup>2</sup>C bus controller supports multiple address recognition with four address mask registers I2CADMn (n=0~3). When the bit in the address mask register is set to 1, it means the received corresponding address bit is "Don't care". If the bit is set to 0, it means the received corresponding register bit should be exactly the same as address register.

##### 6.16.5.3.3 Data Register (I2CDAT)

This register contains a byte of serial data to be transmitted or a byte which just has been received. The CPU can be read from or written to the 8-bit (I2CDAT [7:0]) directly while it is not in the process of shifting a byte. When I<sup>2</sup>C is in a defined state and the SI (I2CON[3]) is set, data in I2CDAT [7:0] remains stable. While data is being shifted out, data on the bus is simultaneously being shifted in; I2CDAT [7:0] always contains the last data byte presented on the bus.

The acknowledge bit is controlled by the I<sup>2</sup>C hardware and cannot be accessed by the CPU. Serial data is shifted into I2CDAT [7:0] on the rising edges of serial clock pulses on the I2Cn\_SCL line. When a byte has been shifted into I2CDAT [7:0], the serial data is available in I2CDAT [7:0], and the acknowledge bit (ACK or NACK) is returned by the control logic during the ninth clock pulse. In order to monitor bus status while sending data, the bus data will be shifted to I2CDAT[7:0] when sending I2CDAT[7:0] to bus. In the case of sending data, serial data bits are shifted out from I2CDAT [7:0] on the falling edge of I2Cn\_SCL clocks, and is shifted to I2CDAT [7:0] on the rising edge of I2Cn\_SCL clocks.

Figure 6-109 I<sup>2</sup>C Data Shifting Direction

6.16.5.3.4 Control Register (I2CON)

The CPU can be read from and written to I2CON register directly. When the I<sup>2</sup>C port is enabled by setting ENS1 (I2CON [6]) to high, the internal states will be controlled by I2CON and I<sup>2</sup>C logic hardware.

There are two bits are affected by hardware: the SI(I2CON[3]) bit is set when the I<sup>2</sup>C hardware requests a serial interrupt, and the STO bit is cleared when a STOP condition is present on the bus. The STO(I2CON[4]) bit is also cleared when ENS1(I2CON[6]) = 0.

Once a new status code is generated and stored in I2CSTATUS, the I<sup>2</sup>C Interrupt Flag bit SI will be set automatically. If the Enable Interrupt bit EI (I2CON [7]) is set at this time, the I<sup>2</sup>C interrupt will be generated. These bit fields I2CSTATUS[7:0] stores the internal state code, the content keeps stable until SI(I2CON[3]) is cleared by software.

6.16.5.3.5 Status Register (I2CSTATUS)

I2CSTATUS [7:0] is an 8-bit read-only register. The bit fields I2CSTATUS [7:0] contains the status code and there are 26 possible status codes. All states are listed in 0 when I2CSTATUS [7:0] is 0xF8, no serial interrupt is requested. All other I2CSTATUS [7:0] values correspond to the defined I<sup>2</sup>C states. When each of these states is entered, a status interrupt is requested (SI (I2CON[3]) = 1). A valid status code is present in I2CSTATUS[7:0] one cycle after SI set by hardware and is still present one cycle after SI reset by software.

In addition, the state 0x00 stands for a Bus Error, which occurs when a START or STOP condition is present at an incorrect position in the I<sup>2</sup>C format frame. A Bus Error may occur during the serial transfer of an address byte, a data byte or an acknowledge bit. To recover I<sup>2</sup>C from bus error, STO (I2CON[4]) should be set and SI(I2CON[3]) should be cleared to enter Not Addressed Slave mode. Then STO(I2CON[4]) is cleared to release bus and to wait for a new communication. The I<sup>2</sup>C bus cannot recognize stop condition during this action when a bus error occurs.

Master Mode		Slave Mode	
STATUS	Description	STATUS	Description
0x08	Start	0xA0	Slave Transmit Repeat Start or Stop
0x10	Master Repeat Start	0xA8	Slave Transmit Address ACK
0x18	Master Transmit Address ACK	0xB0	Slave Transmit Arbitration Lost
0x20	Master Transmit Address NACK	0xB8	Slave Transmit Data ACK
0x28	Master Transmit Data ACK	0xC0	Slave Transmit Data NACK
0x30	Master Transmit Data NACK	0xC8	Slave Transmit Last Data ACK

0x38	Master Arbitration Lost	0x60	Slave Receive Address ACK
0x40	Master Receive Address ACK	0x68	Slave Receive Arbitration Lost
0x48	Master Receive Address NACK	0x80	Slave Receive Data ACK
0x50	Master Receive Data ACK	0x88	Slave Receive Data NACK
0x58	Master Receive Data NACK	0x70	GC mode Address ACK
0x00	Bus error	0x78	GC mode Arbitration Lost
		0x90	GC mode Data ACK
		0x98	GC mode Data NACK
0xF8	Bus Released <b>Note:</b> Status "0xF8" exists in both master/slave modes, and it won't raise interrupt.		

Table 6-24 I<sup>2</sup>C Status Code Description

#### 6.16.5.3.6 Clock Baud Rate Bits (I2CLK)

The data baud rate of I<sup>2</sup>C is determined by I2CLK (I2CLK[7:0]) when I<sup>2</sup>C is in Master Mode, and it is not necessary in a Slave mode. In the Slave mode, I<sup>2</sup>C will automatically synchronize it with any clock frequency from master I<sup>2</sup>C device.

The data baud rate of I<sup>2</sup>C setting is Data Baud Rate of I<sup>2</sup>C = (system clock) / (4x (I2CLK [7:0] + 1)). If system clock = 16 MHz, the I2CLK [7:0] = 40 (0x28), the data baud rate of I<sup>2</sup>C = 16 MHz / (4x (40 + 1)) = 97.5 Kbits/sec.

#### 6.16.5.3.7 Time-out Counter Register (I2CTOC)

There is a 14-bit time-out counter which can be used to deal with the I<sup>2</sup>C bus hang-up. If the time-out counter is enabled, the counter starts up counting until it overflows (TIF (I2CTOC[0]) = 1) and generates I<sup>2</sup>C interrupt to CPU or stops counting by clearing ENTI(I2CTOC[2]) to 0. When time-out counter is enabled, writing 1 to the SI (I2CON[3]) flag will reset counter and re-start up counting after SI is cleared. If I<sup>2</sup>C bus hangs up, it causes the I2CSTATUS and flag SI (I2CON[3]) are not updated for a period, the 14-bit time-out counter may overflow and acknowledge CPU the I<sup>2</sup>C interrupt. Refer to the following figure for the 14-bit time-out counter. User may write 1 to clear TIF(I2C\_TOC[0]) to 0.

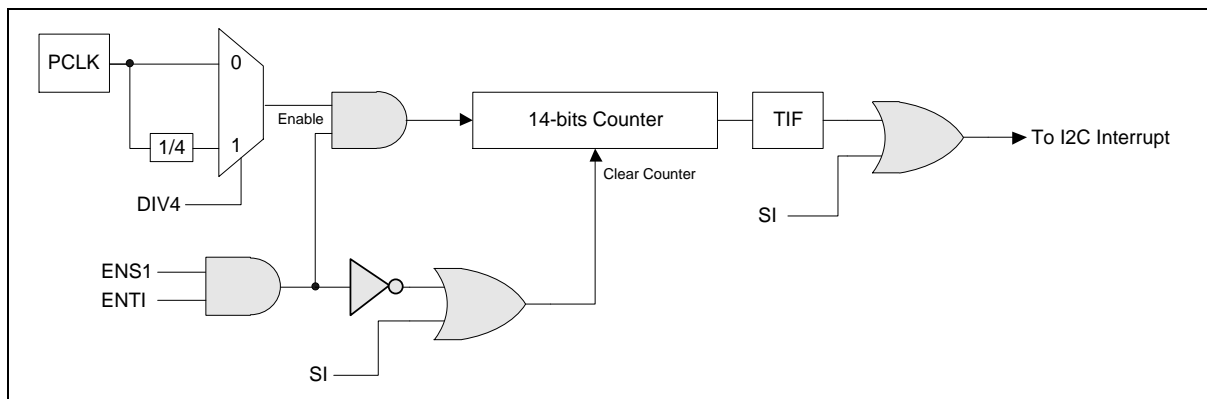

Figure 6-110 I<sup>2</sup>C Time-out Count Block Diagram

#### 6.16.5.3.8 Wake-up Control Register (I2CWKUPCON)

When chip enters Power-down mode, other I<sup>2</sup>C master can wake up our chip by addressing our I<sup>2</sup>C device, user must configure the related setting before entering Sleep mode. When the chip is woken-up by address match with one of the four address register, the following data will be abandoned at this time.

#### 6.16.5.3.9 Wake-up Status Register (I2CWKUPSTS)

When system is woken up by other I<sup>2</sup>C master device, WKUPIF(I2CWKUPSTS[0]) is set to indicate this event. User needs write "1" to clear this bit.

### 6.16.6 Example for Random Read on EEPROM

The following steps are used to configure the I<sup>2</sup>C0 related registers when using I<sup>2</sup>C to read data from EEPROM.

1. Set the multi-function pin in the “GPA\_MFP” registers as I2C0\_SCL and I2C0\_SDA pins.
2. Enable I<sup>2</sup>C APB clock by setting I2C0\_EN(APBCLK[8]).
3. Set I2C0\_RST (IPRSTC2 [8]) = 1 to reset I<sup>2</sup>C controller then set I<sup>2</sup>C controller to normal operation by setting I2C0\_RST(IPRSTC2 [8]) = 0;
4. Set ENS1(I2CON[6])=1 to enable I<sup>2</sup>C0 controller.
5. Write a divided value by setting I2CLK register for I<sup>2</sup>C clock rate.
6. Set SETENA(NVIC\_ISER[31:0])=0x00040000 in the “NVIC\_ISER” register to set I<sup>2</sup>C0 IRQ.
7. Set EI(I2CON[7])=1 to enable I<sup>2</sup>C0 Interrupt.
8. Set I<sup>2</sup>C0 address registers which are “I2CADDR0~I2CADDR3”.

Random read operation is one of the methods of access EEPROM. The method allows the master to access any address of EEPROM space. The following figure shows the EEPROM random read operation.

Figure 6-111 EEPROM Random Read

The following figure shows how to use I<sup>2</sup>C controller to implement the protocol of EEPROM random read.

Figure 6-112 Protocol of EEPROM Random Read

The I<sup>2</sup>C controller sends START to bus to be a master. Then it sends a SLA+W (Slave address + Write bit) to EEPROM followed by two bytes data address to set the EEPROM address to read. Finally, a Repeat START followed by SLA+R is sent to read the data from EEPROM.

### 6.16.7 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
<b>I<sup>2</sup>C Base Address:</b> <b>I2C0_BA = 0x4002_0000</b> <b>I2C1_BA = 0x4001_2000</b>

15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
EI	ENS1	STA	STO	SI	AA	Reserved	

Bits	Description	
[31:8]	Reserved	Reserved.
[7]	EI	<b>Interrupt Enable Bit</b> 0 = I <sup>2</sup> C interrupt Disabled. 1 = I <sup>2</sup> C interrupt Enabled.
[6]	ENS1	<b>I<sup>2</sup>C Controller Enable Bit</b> 0 = Disabled. 1 = Enabled. Set to enable I <sup>2</sup> C serial function controller. When ENS1=1 the I <sup>2</sup> C serial function enables. The multi-function pin function of I2Cn_SDA and I2Cn_SCL must set to I <sup>2</sup> C function first.
[5]	STA	<b>I<sup>2</sup>C START Control</b> Setting STA to logic 1 to enter Master mode, the I <sup>2</sup> C hardware sends a START or repeat START condition to bus when the bus is free.
[4]	STO	<b>I<sup>2</sup>C STOP Control</b> In Master mode, setting STO to transmit a STOP condition to bus then I <sup>2</sup> C hardware will check the bus condition if a STOP condition is detected this bit will be cleared by hardware automatically. In a slave mode, setting STO resets I <sup>2</sup> C hardware to the defined "not addressed" slave mode. This means it is NO LONGER in the slave receiver mode to receive data from the master transmit device.
[3]	SI	<b>I<sup>2</sup>C Interrupt Flag</b> When a new I <sup>2</sup> C state is present in the I2CSTATUS register, the SI flag is set by hardware, and if bit EI (I2CON [7]) is set, the I <sup>2</sup> C interrupt is requested. SI must be cleared by software. Clear SI by writing 1 to this bit.
[2]	AA	<b>Assert Acknowledge Control</b> When AA =1 prior to address or data received, an acknowledged (low level to I2Cn_SDA) will be returned during the acknowledge clock pulse on the I2Cn_SCL line when 1.) A slave is acknowledging the address sent from master, 2.) The receiver devices are acknowledging the data sent by transmitter. When AA=0 prior to address or data received, a Not acknowledged (high level to I2Cn_SDA) will be returned during the acknowledge

		clock pulse on the I2Cn_SCL line.
[1:0]	Reserved	Reserved.

## 6.17 Serial Peripheral Interface (SPI)

### 6.17.1 Overview

The Serial Peripheral Interface (SPI) is a synchronous serial data communication protocol that operates in full duplex mode. Devices communicate in Master/Slave mode with the 4-wire bi-direction interface. The NuMicro™ NUC230/240 series contains up to four sets of SPI controllers performing a serial-to-parallel conversion on data received from a peripheral device, and a parallel-to-serial conversion on data transmitted to a peripheral device. Each set of SPI controller can be configured as a master or a slave device.

The SPI controller supports the variable bus clock function for special applications and 2-bit Transfer mode to connect 2 off-chip slave devices at the same time. This controller also supports the PDMA function to access the data buffer and also supports Dual I/O Transfer mode.

### 6.17.2 Features

- Up to four sets of SPI controllers
- Supports Master or Slave mode operation
- Supports 2-bit Transfer mode
- Supports Dual I/O Transfer mode
- Configurable bit length of a transaction word from 8 to 32 bits
- Provides separate 8-layer depth transmit and receive FIFO buffers
- Supports MSB first or LSB first transfer sequence
- Two slave select lines in Master mode
- Supports the Byte Reorder function
- Supports Byte or Word Suspend mode
- Variable output bus clock frequency in Master mode
- Supports PDMA transfer
- Supports 3-wire, no slave select signal, bi-direction interface

### 6.17.3 Block Diagram

Figure 6-113 SPI Block Diagram

### 6.17.4 Basic Configuration

The basic configurations of SPI0 are as follows:

- SPI0 pin functions are configured in ALT\_MFP, GPB\_MFP and GPC\_MFP registers.
- Select the source of SPI0 peripheral clock on SPI0\_S (CLKSEL1[4]).
- Enable SPI0 peripheral clock on SPI0\_EN (APBCLK[12]).
- Reset SPI0 controller on SPI0\_RST (IPRSC2[12]).

The basic configurations of SPI1 are as follows:

- SPI1 pin functions are configured in ALT\_MFP, GPB\_MFP and GPC\_MFP registers.
- Select the source of SPI1 peripheral clock on SPI1\_S (CLKSEL1[5]).
- Enable SPI1 peripheral clock on SPI1\_EN (APBCLK[13]).
- Reset SPI1 controller on SPI1\_RST (IPRSC2[13]).

The basic configurations of SPI2 are as follows:

- SPI2 pin functions are configured in ALT\_MFP, ALT\_MFP1, GPA\_MFP and GPD\_MFP registers.
- Select the source of SPI2 peripheral clock on SPI2\_S (CLKSEL1[6]).
- Enable SPI2 peripheral clock on SPI2\_EN (APBCLK[14]).

- Reset SPI2 controller on SPI2\_RST (IPRSC2[14]).

The basic configurations of SPI3 are as follows:

- SPI3 pin functions are configured in ALT\_MFP, GPB\_MFP and GPD\_MFP registers.
- Select the source of SPI3 peripheral clock on SPI3\_S (CLKSEL1[7]).
- Enable SPI3 peripheral clock on SPI3\_EN (APBCLK[15]).
- Reset SPI3 controller on SPI3\_RST (IPRSC2[15]).

## 6.17.5 Functional Description

### 6.17.5.1 Terminology

#### SPI Peripheral Clock and SPI Bus Clock

The SPI controller needs the SPI peripheral clock to drive the SPI logic unit to perform the data transfer. The SPI bus clock is the clock presented on SPIn\_CLK pin.

The SPI peripheral clock rate is determined by the settings of clock source, BCn option and clock divisor. The SPIn\_S bit of CLKSEL1 register determines the clock source of the SPI peripheral clock. The clock source can be HCLK or PLL output clock. Set the BCn bit of SPI\_CNTRL2 register to 0 for the compatible SPI clock rate calculation of previous products. DIVIDER (SPI\_DIVIDER[7:0]) setting determines the divisor of the clock rate calculation.

In Master mode, if the variable clock function is disabled, the output frequency of the SPI bus clock output pin is equal to the SPI peripheral clock rate. In general, the SPI bus clock is denoted as SPI clock. In Slave mode, the SPI bus clock is provided by an off-chip master device. The SPI peripheral clock rate of slave device must be faster than the SPI bus clock rate of the master device connected together. The frequency of SPI peripheral clock cannot be faster than the APB clock rate regardless of Master or Slave mode.

#### Master/Slave Mode

The SPI controller can be set as Master or Slave mode by setting SLAVE (SPI\_CNTRL[18]) to communicate with the off-chip SPI Slave or Master device. The application block diagrams in Master and Slave mode are shown below.

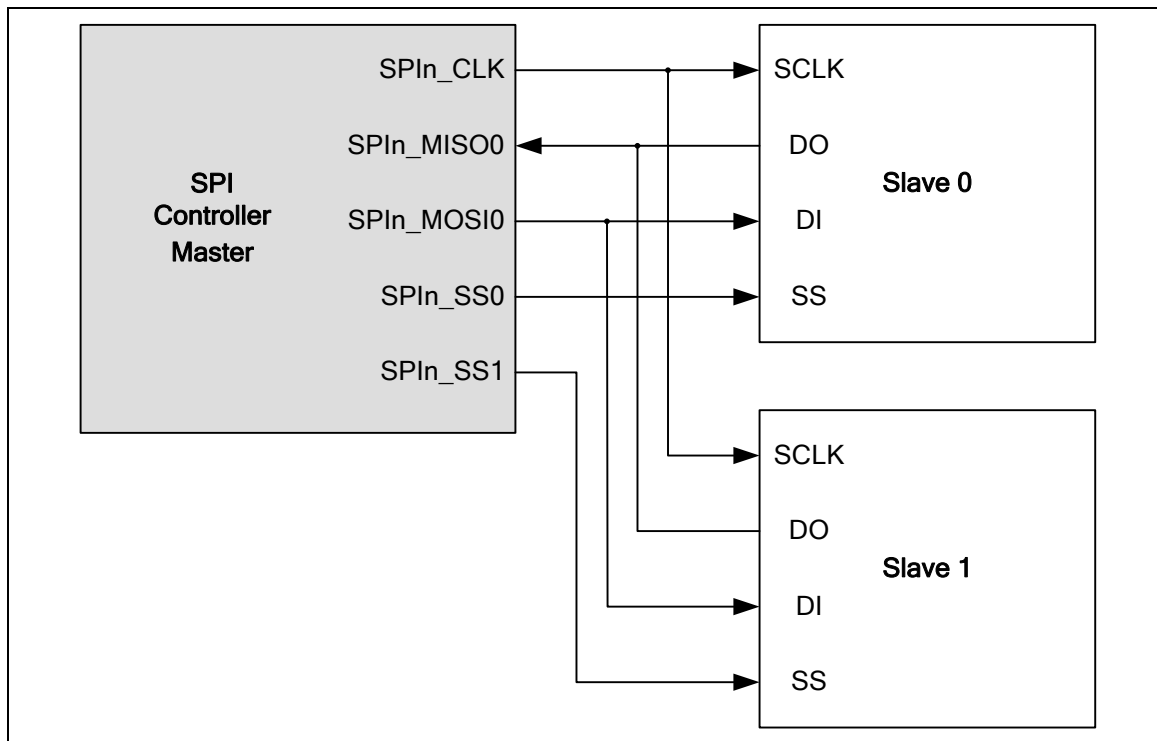

Figure 6-114 SPI Master Mode Application Block Diagram

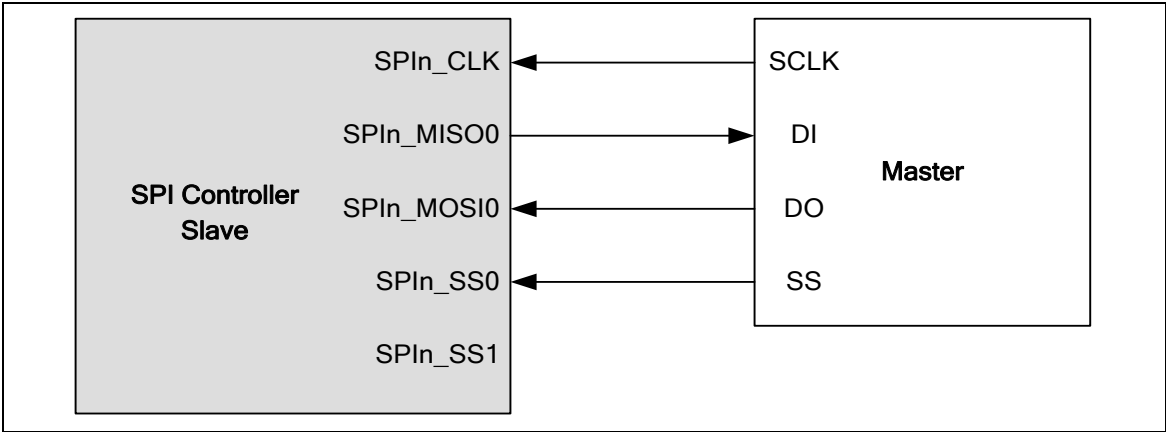

Figure 6-115 SPI Slave Mode Application Block Diagram

**Clock Polarity**

The CLKP (SPI\_CTL[11]) defines the bus clock idle state. If CLKP = 1, the SPIIn\_CLK output is idle at high state, otherwise it is at low state if CLKP = 0.

**Transmit/Receive Bit Length**

The bit length of a transaction word is defined in TX\_BIT\_LEN bit field (SPI\_CNTRL[7:3]). It can be configured up to 32-bit length in a transaction word for transmitting and receiving.

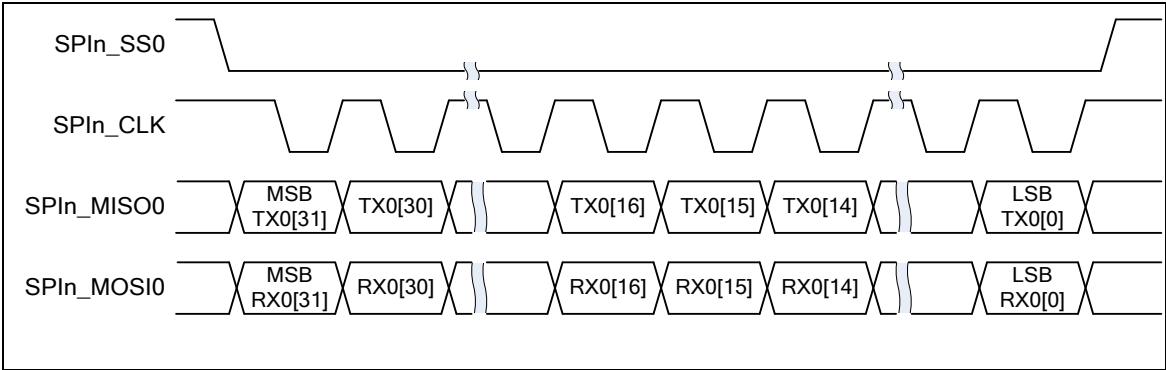

Figure 6-116 32-Bit in One Transaction

**LSB/MSB First**

LSB (SPI\_CNTRL[10]) defines the bit transfer sequence in a transaction. If the LSB bit is set to 1, the transfer sequence is LSB first. The bit 0 will be transferred firstly. If the LSB bit is cleared to 0, the transfer sequence is MSB first.

**Transmit Edge**

TX\_NEG (SPI\_CNTRL[2]) defines the data transmitted out either on negative edge or on positive edge of SPI bus clock.

**Receive Edge**

RX\_NEG (SPI\_CNTRL[1]) defines the data received either on negative edge or on positive edge

of SPI clock.

**Note:** The settings of TX\_NEG and RX\_NEG are mutual exclusive. In other words, do not transmit and receive data on the same clock edge.

### Word Suspend

SP\_CYCLE (SPI\_CNTRL[15:12]) provide a configurable suspend interval, 0.5 ~ 15.5 SPI clock periods, between two successive transaction words in Master mode. The definition of the suspend interval is the duration between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value of SP\_CYCLE is 0x3 (3.5 SPI bus clock cycles). This SP\_CYCLE setting will not take effect to the word suspend interval if FIFO mode is disabled by software.

If both VARCLK\_EN (SPI\_CNTRL[23]) and FIFO (SPI\_CNTRL[21]) bits are set to 1, the minimum word suspend period is  $(6.5 + \text{SP\_CYCLE}) \times \text{SPI clock period}$ .

### Slave Selection

In Master mode, this SPI controller can drive up to two off-chip slave devices through the slave select output pins SPIn\_SS0 and SPIn\_SS1. In Slave mode, the off-chip master device drives the slave select signal from the SPIn\_SS0 input pin to this SPI controller. In Master and Slave mode, the active state of slave select signal can be programmed to low or high active in SS\_LVL (SPI\_SSR[2]), and SS\_LTRIG (SPI\_SSR[4]) defines the slave select signal SPIn\_SS0/1 is level-triggered or edge-triggered. The selection of trigger conditions depends on what type of peripheral slave/master device is connected.

In Slave mode, if the SS\_LTRIG bit is configured as level trigger, the LTRIG\_FLAG (SPI\_SSR[5]) is used to indicate if the received bits among one transaction meets the requirement defined in TX\_BIT\_LEN (SPI\_CNTRL[7:3]).

### Level-trigger/Edge-trigger

In Slave mode, the slave select signal can be configured as level-trigger or edge-trigger. In edge-trigger, the data transfer starts from an active edge and ends on an inactive edge of the slave select signal. The unit-transfer interrupt flag (SPI\_CNTRL[16]) will be set to 1 as an inactive edge is detected. If the master does not send an inactive edge to slave, the transfer procedure will not be completed and the unit transfer interrupt flag of slave will not be set. In level-trigger, the unit-transfer interrupt flag of slave will be set when one of the following two conditions occurs. The first condition is that if the number of transferred bits matches the settings of TX\_BIT\_LEN, the unit transfer interrupt flag of slave will be set. As to the second condition, if the master set the slave select pin to inactive level during the transfer is in progress, it will force slave device to terminate the current transfer no matter how many bits have been transferred and the unit transfer interrupt flag will be set. User can read the status of LTRIG\_FLAG bit to check if the data has been completely transferred.

#### 6.17.5.2 Automatic Slave Selection

In Master mode, if AUTOSS (SPI\_SSR[3]) is set to 1, the slave select signals will be generated automatically and output to the SPIn\_SS0 and SPIn\_SS1 pins according to whether SSR[0] (SPI\_SSR[0]) and SSR[1] (SPI\_SSR[1]) are enabled or not. This means that the slave select signals, which are selected in SSR[1:0], will be asserted by the SPI controller when the SPI data transfer is started by setting the GO\_BUSY bit (SPI\_CNTRL[0]) and will be de-asserted after the data transfer is finished. If the AUTOSS bit is cleared, the slave select output signals will be asserted/de-asserted by setting/clearing the related bits of SPI\_SSR[1:0]. The active state of the slave select output signals is specified in SS\_LVL (SPI\_SSR[2]).

In Master mode, if the value of SP\_CYCLE[3:0] is less than 3 and the AUTOSS is set as 1, the slave select signal will be kept in active state between two successive transactions.

In Slave mode, to recognize the inactive state of the slave select signal, the inactive period of the slave select signal must be larger than or equal to 6 peripheral clock periods between two successive transactions.

6.17.5.3Variable Bus Clock Frequency

In Master mode, if VARCLK\_EN (SPI\_CNTRL[23]) is set to 1, the output of SPI clock can be programmed as variable frequency pattern. The SPI clock period of each cycle depends on the setting of the SPI\_VARCLK register. When the variable clock function is enabled, the TX\_BIT\_LEN setting must be set as 0x10 to configure the data transfer as 16-bit transfer mode. The VARCLK[31] determines the clock period of the first clock cycle. If VARCLK[31] is 0, the first clock cycle depends on the DIVIDER setting; if it is 1, the first clock cycle depends on the DIVIDER2 setting. Two successive bits in VARCLK[30:1] defines one clock cycle. If the two successive bits are 00, the clock cycle depends on the DIVIDER setting; if they are 11, the clock cycle depends on the DIVIDER2 setting. The bit field VARCLK[30:29] defines the second clock cycle of SPI clock of a transaction, and the bit field VARCLK[28:27] defines the third clock cycle, and so on. The VARCLK[0] has no meaning. The following figure shows the timing relationship among the SPI bus clock, the VARCLK setting, the DIVIDER setting and the DIVIDER2 setting.

Figure 6-117 Variable Bus Clock Frequency

6.17.5.4Byte Reorder Function

When the transfer is set as MSB first (LSB = 0) and the REORDER bit is set to 1, the data stored in the TX buffer and RX buffer will be rearranged in the order as [Byte0, Byte1, Byte2, Byte3] in 32-bit Transfer mode (TX\_BIT\_LEN = 0). The sequence of transmitted/received data will be Byte0, Byte1, Byte2, and then Byte3. If the TX\_BIT\_LEN is set as 24-bit transfer mode, the data in TX buffer and RX buffer will be rearranged as [unknown byte, Byte0, Byte1, Byte2]. The SPI controller will transmit/receive data with the sequence of Byte0, Byte1 and then Byte2. Each byte will be transmitted/received with MSB first. The rule of 16-bit mode is the same as above. Byte Reorder function is only available when TX\_BIT\_LEN is configured as 16, 24, and 32 bits.

**Note:** The Byte Reorder function is not supported when the variable bus clock function is enabled.

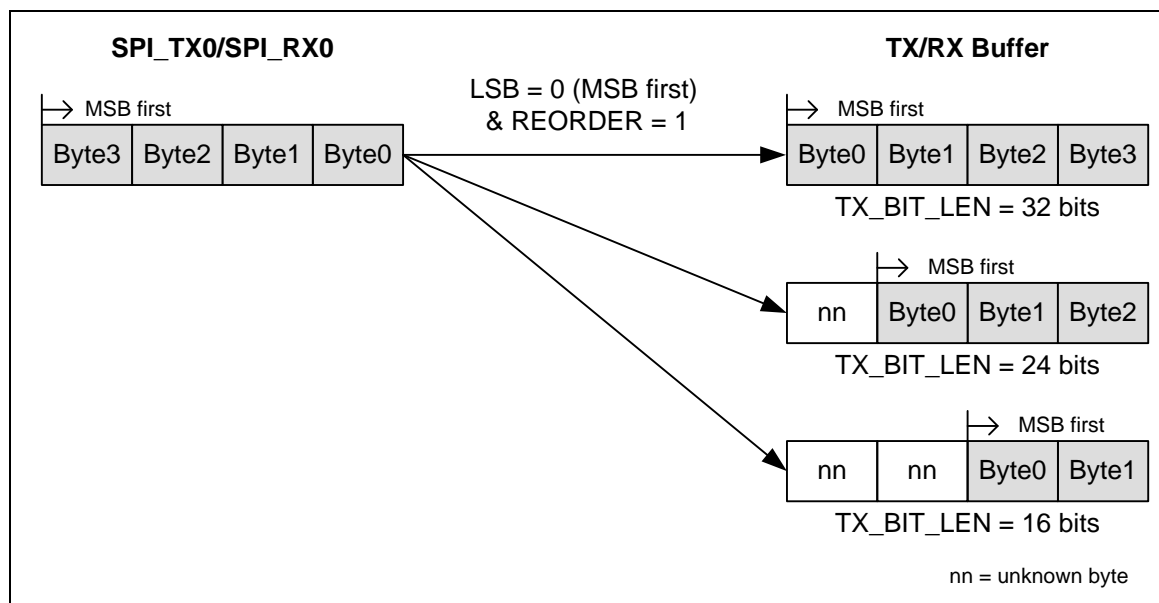

Figure 6-118 Byte Reorder Function

#### 6.17.5.5 Byte Suspend Function

In Master mode, if REORDER (SPI\_CNTRL[19]) is set to 1, a suspend interval of 0.5 ~ 15.5 SPI clock periods will be inserted by hardware between two successive bytes in a transaction word. Both settings of byte suspend interval and word suspend interval are configured in SP\_CYCLE (SPI\_CNTRL[15:12]).

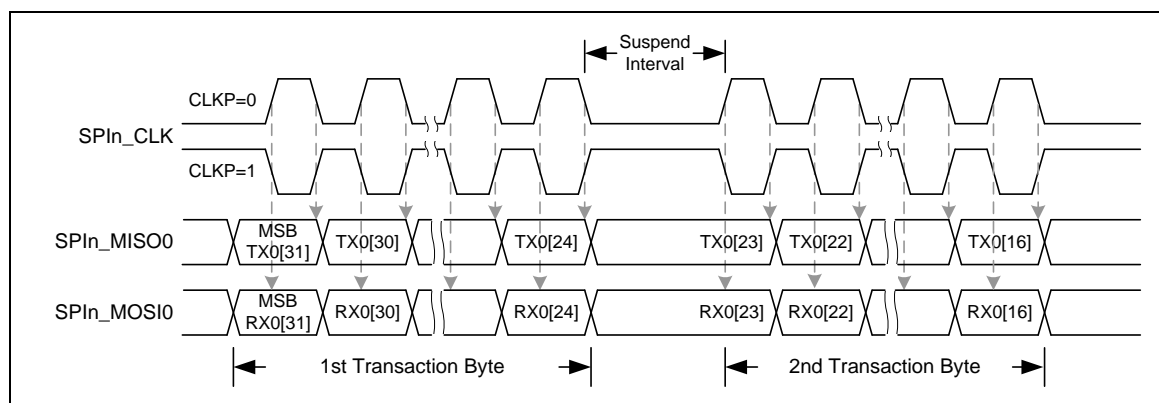

Figure 6-119 Timing Waveform for Byte Suspend

#### 6.17.5.6 Slave 3-wire Mode

When NOSLVSEL (SPI\_CNTRL2[8]) is set by software to enable the Slave 3-wire mode, the SPI controller can work with no slave select signal in Slave mode. The NOSLVSEL bit only takes effect in Slave mode. Only three pins, SPIn\_CLK, SPIn\_MISO0, and SPIn\_MOSI0, are required to communicate with a SPI master. The SPIn\_SS pin can be configured as a GPIO. When the NOSLVSEL bit is set to 1, the SPI slave will be ready to transmit/receive data after the GO\_BUSY bit is set to 1. As the number of received bits meets the requirement which defined in TX\_BIT\_LEN (SPI\_CNTRL[7:3]), the unit-transfer interrupt flag, IF (SPI\_CNTRL[16]), will be set to 1.

**Note:** In Slave 3-wire mode, the SS\_LTRIG (SPI\_SSR[4]) should be set as 1.

#### 6.17.5.72-bit Transfer Mode

The SPI controller also supports 2-bit Transfer mode when setting TWOB (SPI\_CNTRL[22]) to 1. In 2-bit Transfer mode, the SPI controller performs full duplex data transfer. In other words, the 2-bit serial data can be transmitted and received simultaneously.

For example, in Master mode, the data stored in the SPI\_TX0 and SPI\_TX1 register will be transmitted through the SPIn\_MOSI0 and SPIn\_MOSI1 pin respectively. In the meanwhile, the SPI\_RX0 and SPI\_RX1 will store the data received from SPIn\_MISO0 pin and SPIn\_MISO1 pin respectively.

In Slave mode, the data stored in the SPI\_TX0 and SPI\_TX1 register will be transmitted through the SPIn\_MISO0 and SPIn\_MISO1 pin respectively. In the meanwhile, the SPI\_RX0 and SPI\_RX1 will store the data received from the SPIn\_MOSI0 and SPIn\_MOSI1 pin respectively.

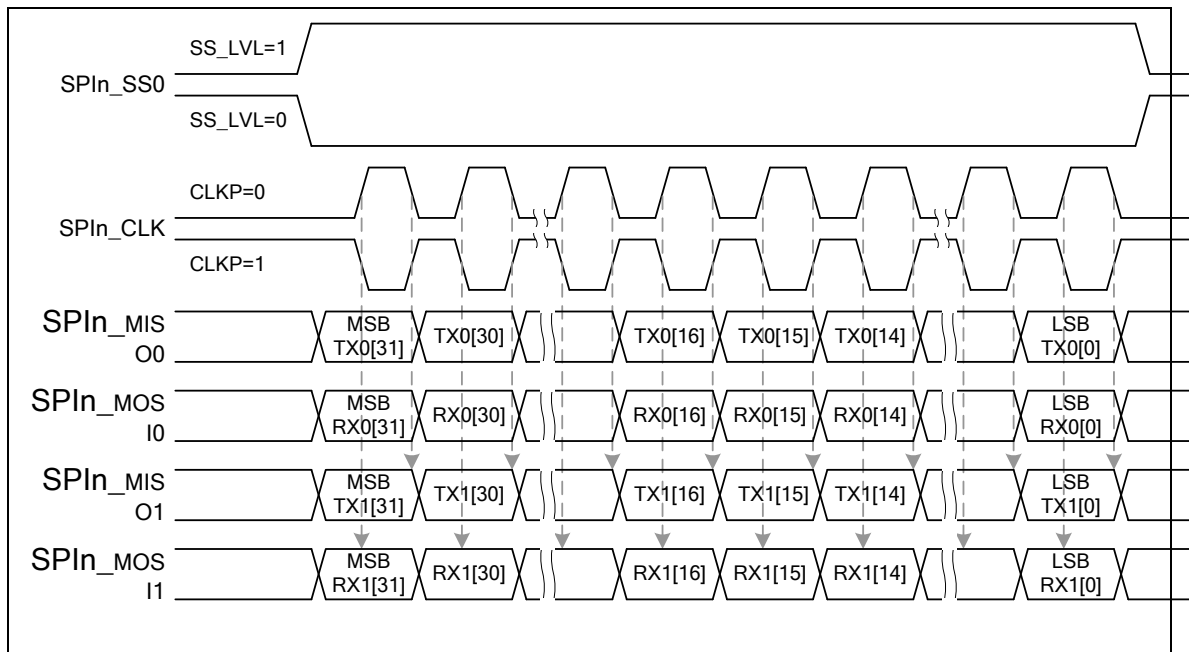

Figure 6-120 2-bit Transfer Mode (Slave Mode)

#### 6.17.5.8Dual I/O Mode

The SPI controller also supports Dual I/O transfer when setting the DUAL\_IO\_EN (SPI\_CNTRL2[13]) to 1. Many general SPI flashes support Dual I/O transfer. The DUAL\_IO\_DIR (SPI\_CNTRL2[12]) is used to define the direction of the transfer data. When the DUAL\_IO\_DIR bit is set to 1, the controller will send the data to external device. When the DUAL\_IO\_DIR bit is set to 0, the controller will read the data from the external device. This function supports 8, 16, 24, and 32-bit data transfer.

The Dual I/O mode is not supported when the Slave 3-wire mode or the Byte Reorder function is enabled.

If both the DUAL\_IO\_EN and DUAL\_IO\_DIR bits are set as 1, the SPIn\_MOSI0 is the even bit data output and the SPIn\_MISO0 will be set as the odd bit data output. If the DUAL\_IO\_EN is set as 1 and DUAL\_IO\_DIR is set as 0, both the SPIn\_MISO0 and SPIn\_MOSI0 will be set as data input ports.

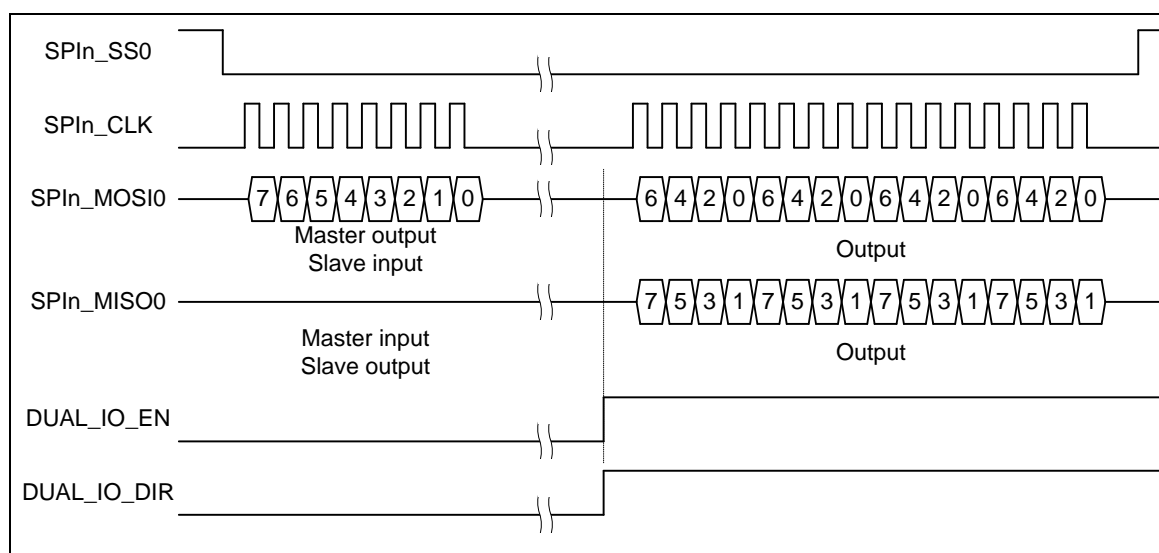

Figure 6-121 Bit Sequence of Dual Output Mode

Figure 6-122 Bit Sequence of Dual Input Mode

#### 6.17.5.9 FIFO Mode

The SPI controller supports FIFO mode when the FIFO bit in SPI\_CNTRL[21] is set as 1. The SPI controllers equip with eight 32-bit wide transmit and receive FIFO buffers.

The transmit FIFO buffer is an 8-layer depth, 32-bit wide, first-in, first-out register buffer. Data can be written to the transmit FIFO buffer through software by writing the SPI\_TX0 register. The data stored in the transmit FIFO buffer will be read and sent out by the transmission control logic. If the 8-layer transmit FIFO buffer is full, the TX\_FULL bit will be set to 1. When the SPI transmission logic unit draws out the last datum of the transmit FIFO buffer, so that the 8-layer transmit FIFO buffer is empty, the TX\_EMPTY bit will be set to 1. Notice that the TX\_EMPTY flag is set to 1 while the last transaction is still in progress. In Master mode, both the GO\_BUSY bit and TX\_EMPTY bit should be checked by software to make sure whether the SPI is in idle or not.

The received FIFO buffer is also an 8-layer depth, 32-bit wide, first-in, first-out register buffer. The

receive control logic will store the received data to this buffer. The FIFO buffer data can be read from SPI\_RX0 register by software. There are FIFO related status bits, like RX\_EMPTY and RX\_FULL, to indicate the current status of FIFO buffer.

In FIFO mode, the transmitting and receiving threshold can be set through software by setting the TX\_THRESHOLD and RX\_THRESHOLD settings. When the count of valid data stored in transmit FIFO buffer is less than or equal to TX\_THRESHOLD setting, the TX\_INTSTS bit will be set to 1. When the count of valid data stored in receive FIFO buffer is larger than RX\_THRESHOLD setting, the RX\_INTSTS bit will be set to 1.

In FIFO mode, 8 data can be written to the SPI transmit FIFO buffer by software in advance. When the SPI controller operates with FIFO mode, the GO\_BUSY bit of SPI\_CNTRL register will be controlled by hardware, and the content of SPI\_CNTRL register should not be modified by software unless the FIFO bit is cleared to disable FIFO mode.

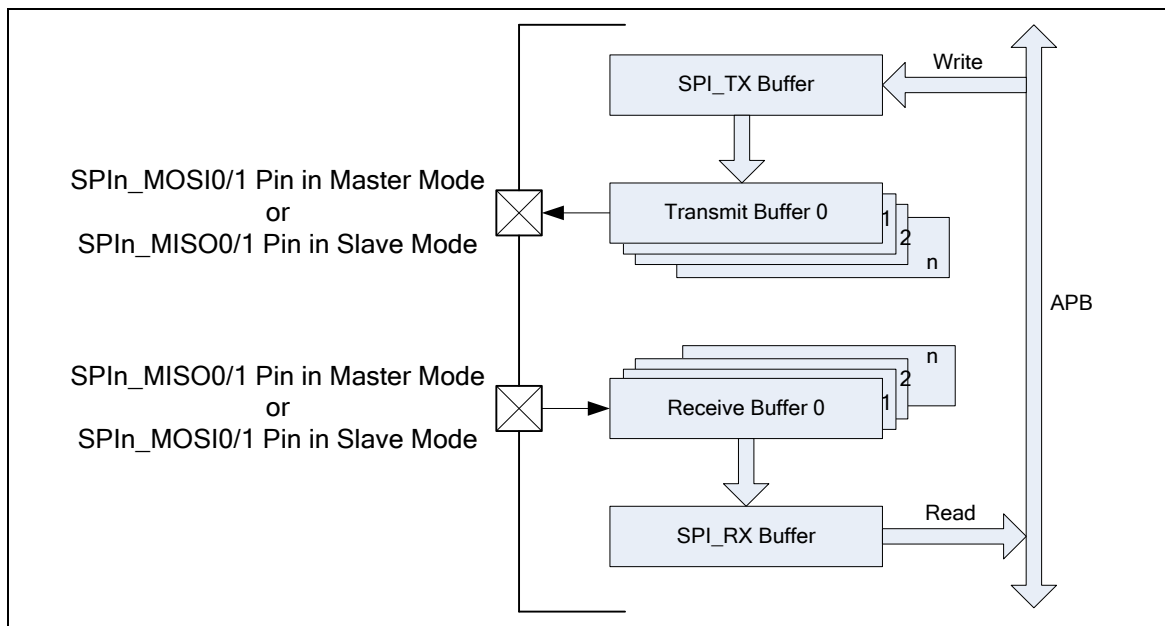

Figure 6-123 FIFO Mode Block Diagram

In Master mode, when the FIFO bit is set to 1 and the first datum is written to the SPI\_TX0 register, the TX\_EMPTY flag will be cleared to 0. The transmission immediately starts as long as the transmit FIFO buffer is not empty. User can write the next data into SPI\_TX0 register immediately. The SPI controller will insert a suspend interval between two successive transactions in FIFO mode and the period of suspend interval is decided by the setting of SP\_CYCLE (SPI\_CNTRL [15:12]). User can write data into SPI\_TX0 register as long as the TX\_FULL flag is 0.

The subsequent transactions will be triggered automatically if the transmitted data are updated in time. If the SPI\_TX0 register does not be updated after all data transfer are done, the transfer will stop.

In Master mode, during receiving operation, the serial data are received from SPIn\_MISO0/1 pin and stored to receive FIFO buffer. The RX\_EMPTY flag will be cleared to 0 while the receive FIFO buffer contains unread data. The received data can be read by software from SPI\_RX0 register as long as the RX\_EMPTY flag is 0. If the receive FIFO buffer contains 8 unread data, the RX\_FULL flag will be set to 1. The SPI controller will stop receiving data until the SPI\_RX0

register is read by software.

In Slave mode, when the FIFO bit is set as 1, the GO\_BUSY bit will be set as 1 by hardware automatically.

In Slave mode, during transmission operation, when data is written to the SPI\_TX0 register by software, the data will be loaded into transmit FIFO buffer and the TX\_EMPTY flag will be set to 0. The transmission will start when the slave device receives clock signal from master. Data can be written to SPI\_TX0 register as long as the TX\_FULL flag is 0. After all data have been drawn out by the SPI transmission logic unit and the SPI\_TX0 register is not updated by software, the TX\_EMPTY flag will be set to 1.

In Slave mode, during receiving operation, the serial data is received from SPIn\_MOSI0/1 pin and stored to SPI\_RX0 register. The reception mechanism is similar to Master mode reception operation.

#### 6.17.5.10 Interrupt

- SPI unit transfer interrupt

As the SPI controller finishes a unit transfer, the unit transfer interrupt flag IF (SPI\_CNTRL[16]) will be set to 1. The unit transfer interrupt event will generate an interrupt to CPU if the unit transfer interrupt enable bit IE (SPI\_CNTRL[17]) is set. The unit transfer interrupt flag can be cleared only by writing 1 to it.

- SPI Slave 3-wire mode start interrupt

In 3-wire mode, the slave 3-wire mode start interrupt flag, SLV\_START\_INTSTS, will be set to 1 when the slave senses the SPI clock signal. The SPI controller will issue an interrupt if the SSTA\_INTEN is set to 1. If the count of the received bits is less than the setting of TX\_BIT\_LEN and there is no more SPI clock input over the expected time period which is defined by the user, the user can set the SLV\_ABORT bit to abort the current transfer. The unit transfer interrupt flag, IF, will be set to 1 if the software set the SLV\_ABORT bit.

- Receive FIFO time-out interrupt

In FIFO mode, there is a time-out function to inform user. If there is a received data in the FIFO and it is not read by software over 64 SPI peripheral clock periods in Master mode or over 576 SPI peripheral clock periods in Slave mode, it will send a time-out interrupt to the system if the time-out interrupt enable bit, FIFO\_CTL[21], is set to 1.

- Transmit FIFO interrupt

In FIFO mode, if the valid data count of the transmit FIFO buffer is less than or equal to the setting value of TX\_THRESHOLD, the transmit FIFO interrupt flag will be set to 1. The SPI controller will generate a transmit FIFO interrupt to the system if the transmit FIFO interrupt enable bit, SPI\_FIFO\_CTL[3], is set to 1.

- Receive FIFO interrupt

In FIFO mode, if the valid data count of the receive FIFO buffer is larger than the setting value of RX\_THRESHOLD, the receive FIFO interrupt flag will be set to 1. The SPI controller will generate a receive FIFO interrupt to the system if the receive FIFO interrupt enable bit, SPI\_FIFO\_CTL[2], is set to 1.

#### 6.17.6 Timing Diagram

The active state of slave select signal can be defined by setting the SS\_LVL (SPI\_SSR[2]) and SS\_LTRIG (SPI\_SSR[4]). The SPI clock which is in idle state can be configured as high or low state by setting the CLKP (SPI\_CNTRL[11]). It also provides the bit length of a transaction word in TX\_BIT\_LEN (SPI\_CNTRL[7:3]), and transmitting/receiving data from MSB or LSB first in LSB (SPI\_CNTRL[10]). User can also select which edge of SPI clock to transmit/receive data in TX\_NEG/RX\_NEG (SPI\_CNTRL[2:1]). Four SPI timing diagrams for master/slave operations and the related settings are shown below.

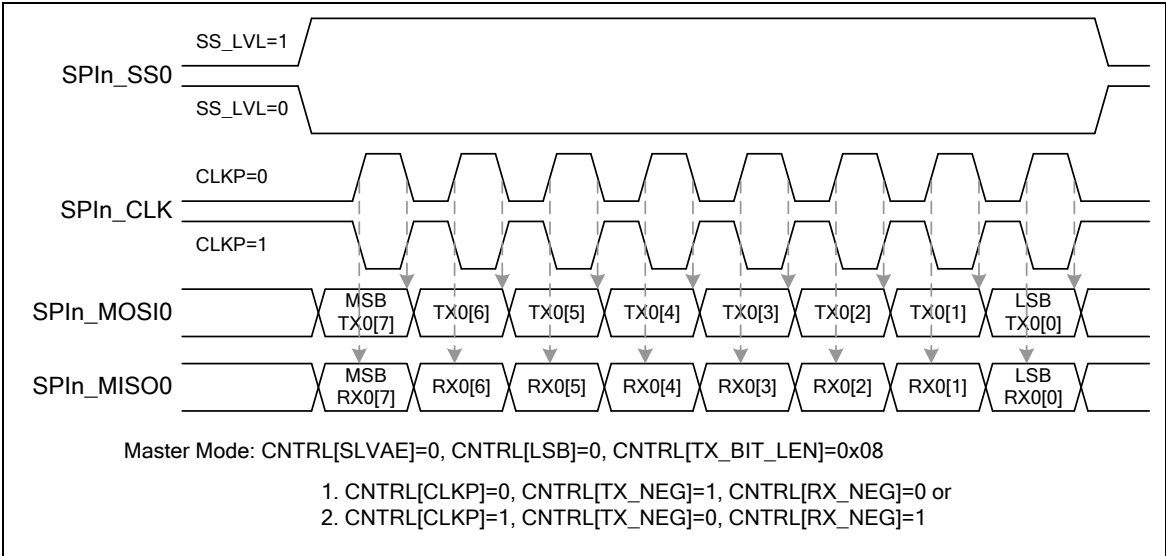

Figure 6-124 SPI Timing in Master Mode

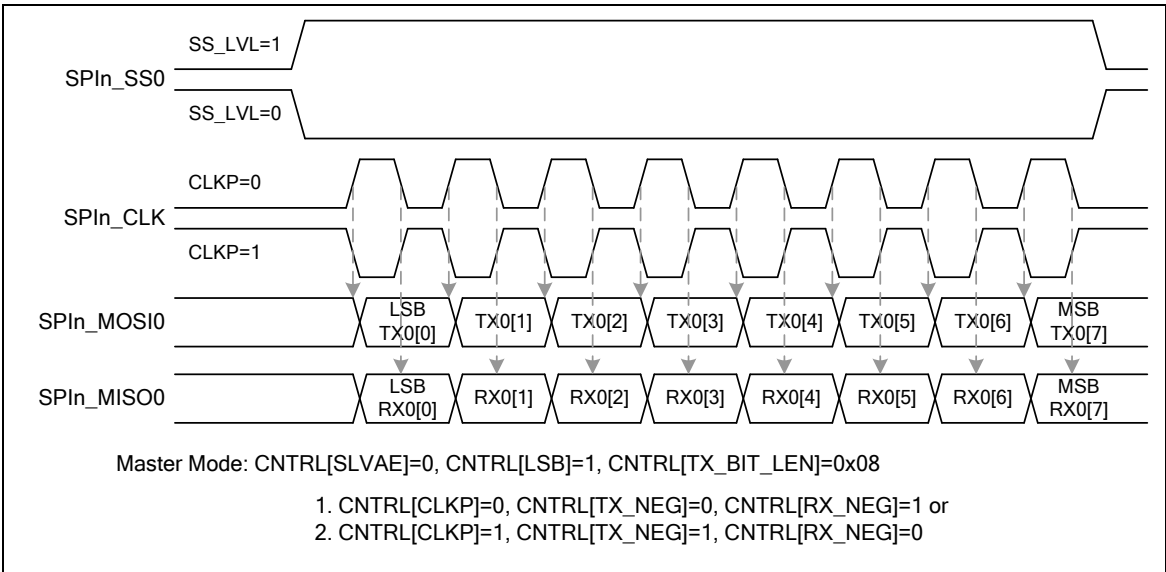

Figure 6-125 SPI Timing in Master Mode (Alternate Phase of SPI Bus Clock)

Figure 6-126 SPI Timing in Slave Mode

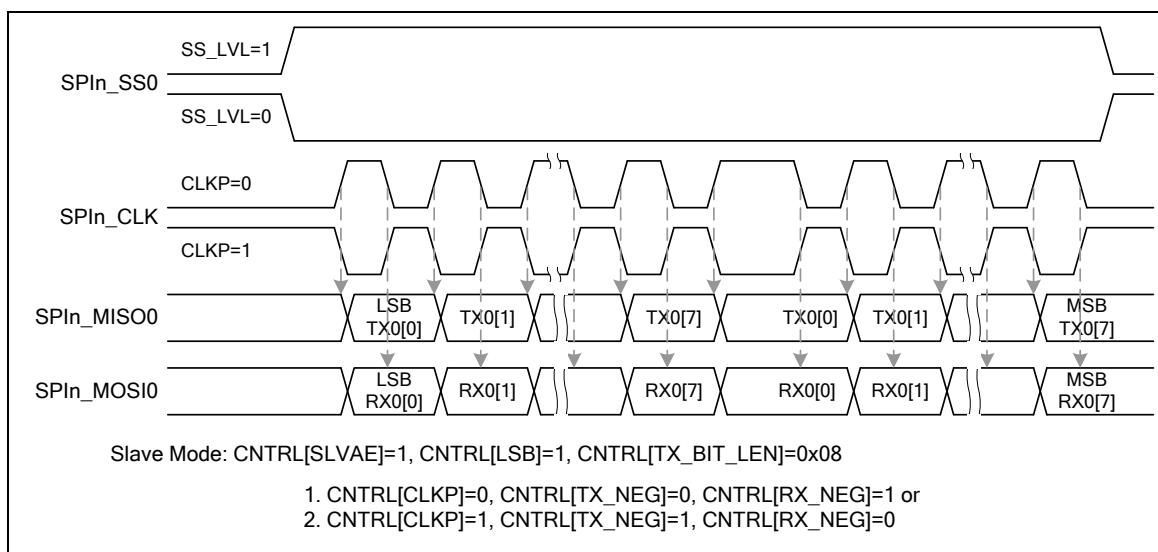

Figure 6-127 SPI Timing in Slave Mode (Alternate Phase of SPI Bus Clock)

### 6.17.7 Programming Examples

**Example 1:** The SPI controller is set as a master to access an off-chip slave device with the following specifications:

- Data bit is latched on positive edge of SPI clock.
- Data bit is driven on negative edge of SPI clock.
- Data is transferred from MSB first.
- SPI bus clock is idle at low state.
- Only one byte of data to be transmitted/received in a transaction.
- Uses the first SPI slave select pin to connect with an off-chip slave device. The slave select signal is active low.

The operation flow is as follows.

- 1) Set the DIVIDER (SPI\_DIVIDER [7:0]) register to determine the output frequency of SPI clock.
- 2) Write the SPI\_SSR register a proper value for the related settings of Master mode:
  1. Clear the Automatic Slave Selection bit, AUTOSS (SPI\_SSR[3]), to 0.
  2. Select low level trigger output of slave select signal in the Slave Select Active Level bit, SS\_LVL (SPI\_SSR[2]), and Slave Select Level Trigger bit, SS\_LTRIG (SPI\_SSR[4]).
  3. Select slave select signal to be output active at the I/O pin by setting the Slave Select Register bit SSR[0] (SPI\_SSR[0]) to active the off-chip slave device.
- 3) Write the related settings into the SPI\_CNTRL register to control the SPI master actions
  1. Set this SPI controller as master device in SLAVE bit (SPI\_CNTRL[18] = 0).
  2. Force the SPI clock idle state at low in CLKP bit (SPI\_CNTRL[11] = 0).
  3. Select data transmitted at negative edge of SPI clock in TX\_NEG bit (SPI\_CNTRL[2] = 1).
  4. Select data latched at positive edge of SPI clock in RX\_NEG bit (SPI\_CNTRL[1] = 0).
  5. Set the bit length of word transfer as 8-bit in TX\_BIT\_LEN bit field. (SPI\_CNTRL[7:3] = 0x08).
  6. Set MSB transfer first in MSB bit (SPI\_CNTRL[10] = 0).
- 4) If this SPI master attempts to transmit (write) one byte data to the off-chip slave device, write the byte data that will be transmitted into the SPI\_TX0 register.
- 5) If this SPI master just only attempts to receive (read) one byte data from the off-chip slave device and does not care what data will be transmitted, the SPI\_TX0 register does not need to be updated by software.
- 6) Enable the GO\_BUSY bit (SPI\_CNTRL [0] = 1) to start the data transfer with the SPI interface.
- 7) Waiting for SPI interrupt (if the Interrupt Enable IE bit is set) or just polling the GO\_BUSY bit till it is cleared to 0 by hardware automatically.
- 8) Read out the received one byte data from SPI\_RX0[7:0].

- 9) Go to 4) to continue another data transfer or set SSR [0] to 0 to inactivate the off-chip slave device.

**Example 2:** The SPI controller is set as a slave device and connects with an off-chip master device. The off-chip master device communicates with the on-chip SPI slave controller through the SPI interface with the following specifications:

- Data bit is latched on positive edge of SPI clock.
- Data bit is driven on negative edge of SPI clock.
- Data is transferred from LSB first.
- SPI bus clock is idle at high state.
- Only one byte of data to be transmitted/received in a transaction.
- Slave select signal is high level trigger.

The operation flow is as follows.

- 1) Write the SPI\_SSR register a proper value for the related settings of Slave mode:  
Select high level and level trigger for the input of slave select signal by setting the Slave Select Active Level bit SS\_LVL (SPI\_SSR[2] = 1) and the Slave Select Level Trigger bit SS\_LTRIG (SPI\_SSR[4] = 1).
- 2) Write the related settings into the SPI\_CNTRL register to control this SPI slave actions
  1. Set the SPI controller as slave device in SLAVE bit (SPI\_CNTRL[18] = 1).
  2. Select the SPI clock idle state at high in CLKP bit (SPI\_CNTRL[11] = 1).
  3. Select data transmitted at negative edge of SPI clock in TX\_NEG bit (SPI\_CNTRL[2] = 1).
  4. Select data latched at positive edge of SPI clock in RX\_NEG bit (SPI\_CNTRL[1] = 0).
  5. Set the bit length of word transfer as 8-bit in TX\_BIT\_LEN bit field (SPI\_CNTRL[7:3] = 0x08).
  6. Set LSB transfer first in LSB bit (SPI\_CNTRL[10] = 1).
- 3) If this SPI slave attempts to transmit (be read) one byte data to the off-chip master device, write the byte data that will be transmitted into the SPI\_TX0 register.
- 4) If this SPI slave just only attempts to receive (be written) one byte data from the off-chip master device and does not care what data will be transmitted, the SPI\_TX0 register does not need to be updated by software.
- 5) Enable the GO\_BUSY bit (SPI\_CNTRL[0] = 1) to wait for the slave select trigger input and SPI clock input from the off-chip master device to start the data transfer at the SPI interface.
- 6) Waiting for SPI interrupt (if the Interrupt Enable IE bit is set), or just polling the GO\_BUSY bit till it is cleared to 0 by hardware automatically.
- 7) Read out the received one byte data from SPI\_RX0[7:0].
- 8) Go to 3) to continue another data transfer or stop data transfer.

### 6.17.8 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

### 6.17.9 Register Description

#### SPI Control and Status Register (SPI\_CNTRL)

Register	Offset	R/W	Description	Reset Value
SPI_CNTRL	SPIn_BA+0x00	R/W	Control and Status Register	0x0500_3004

31	30	29	28	27	26	25	24
Reserved				TX_FULL	TX_EMPTY	RX_FULL	RX_EMPTY
23	22	21	20	19	18	17	16
VARCLK_EN	TWOB	FIFO	Reserved	REORDER	SLAVE	IE	IF
15	14	13	12	11	10	9	8
SP_CYCLE				CLKP	LSB	Reserved	
7	6	5	4	3	2	1	0
TX_BIT_LEN					TX_NEG	RX_NEG	GO_BUSY

Bits	Description
[31:28]	<b>Reserved</b> Reserved.
[27]	<b>TX_FULL</b> <b>Transmit FIFO Buffer Full Indicator (Read Only)</b> It is a mutual mirror bit of SPI_STATUS[27]. 0 = Transmit FIFO buffer is not full. 1 = Transmit FIFO buffer is full.
[26]	<b>TX_EMPTY</b> <b>Transmit FIFO Buffer Empty Indicator (Read Only)</b> It is a mutual mirror bit of SPI_STATUS[26]. 0 = Transmit FIFO buffer is not empty. 1 = Transmit FIFO buffer is empty.
[25]	<b>RX_FULL</b> <b>Receive FIFO Buffer Full Indicator (Read Only)</b> It is a mutual mirror bit of SPI_STATUS[25]. 0 = Receive FIFO buffer is not full. 1 = Receive FIFO buffer is full.
[24]	<b>RX_EMPTY</b> <b>Receive FIFO Buffer Empty Indicator (Read Only)</b> It is a mutual mirror bit of SPI_CNTRL[24]. 0 = Receive FIFO buffer is not empty. 1 = Receive FIFO buffer is empty.
[23]	<b>VARCLK_EN</b> <b>Variable Clock Enable Bit (Master Only)</b> 0 = SPI clock output frequency is fixed and decided only by the value of DIVIDER. 1 = SPI clock output frequency is variable. The output frequency is decided by the value of VARCLK, DIVIDER, and DIVIDER2. <b>Note:</b> When this VARCLK_EN bit is set to 1, the setting of TX_BIT_LEN must be programmed as 0x10 (16-bit mode).
[22]	<b>TWOB</b> <b>2-Bit Transfer Mode Enable Bit</b> 0 = 2-bit Transfer mode Disabled.

		<p>1 = 2-bit Transfer mode Enabled.</p> <p><b>Note:</b> When 2-bit Transfer mode is enabled, the serial transmitted 2-bit data are from SPI_TX1/0, and the received 2-bit data input are put in SPI_RX1/0.</p>
[21]	FIFO	<p><b>FIFO Mode EnableBit</b></p> <p>0 = FIFO mode Disabled.</p> <p>1 = FIFO mode Enabled.</p> <p><b>Note:</b></p> <ol style="list-style-type: none"> <li>Before enabling FIFO mode, the other related settings should be set in advance.</li> <li>In Master mode, if the FIFO mode is enabled, the GO_BUSY bit will be set to 1 automatically after writing data to the transmit FIFO buffer; the GO_BUSY bit will be cleared to 0 automatically when the SPI controller is in idle. If all data stored at transmit FIFO buffer are sent out, the TX_EMPTY bit will be set to 1 and the GO_BUSY bit will be cleared to 0.</li> <li>After clearing this bit to 0, user must wait for at least 2 peripheral clock periods before setting this bit to 1 again.</li> </ol>
[20]	Reserved	Reserved.
[19]	REORDER	<p><b>Byte Reorder Function EnableBit</b></p> <p>0 = Byte Reorder function Disabled.</p> <p>1 = Byte Reorder function Enabled. A byte suspend interval will be inserted among each byte. The period of the byte suspend interval depends on the setting of SP_CYCLE.</p> <p><b>Note:</b></p> <ol style="list-style-type: none"> <li>Byte Reorder function is only available if TX_BIT_LEN is defined as 16, 24, and 32 bits.</li> <li>In Slave mode with level-trigger configuration, the slave select pin must be kept at active state during the byte suspend interval.</li> <li>The Byte Reorder function is not supported when the variable bus clock function or Dual I/O mode is enabled.</li> </ol>
[18]	SLAVE	<p><b>Slave Mode EnableBit</b></p> <p>0 = Master mode.</p> <p>1 = Slave mode.</p>
[17]	IE	<p><b>Unit Transfer Interrupt EnableBit</b></p> <p>0 = SPI unit transfer interrupt Disabled.</p> <p>1 = SPI unit transfer interrupt Enabled.</p>
[16]	IF	<p><b>Unit Transfer Interrupt Flag</b></p> <p>0 = No transaction has been finished since this bit was cleared to 0.</p> <p>1 = SPI controller has finished one unit transfer.</p> <p><b>Note:</b> This bit will be cleared by writing 1 to itself.</p>
[15:12]	SP_CYCLE	<p><b>Suspend Interval (Master Only)</b></p> <p>The four bits provide configurable suspend interval between two successive transmit/receive transaction in a transfer. The definition of the suspend interval is the interval between the last clock edge of the preceding transaction word and the first clock edge of the following transaction word. The default value is 0x3. The period of the suspend interval is obtained according to the following equation.</p> $(SP\_CYCLE[3:0] + 0.5) * \text{period of SPI bus clock cycle}$ <p>Example:</p> <p>SP_CYCLE = 0x0 .... 0.5 SPI bus clock cycle.</p> <p>SP_CYCLE = 0x1 .... 1.5 SPI bus clock cycles.</p> <p>.....</p> <p>SP_CYCLE = 0xE .... 14.5 SPI bus clock cycles.</p> <p>SP_CYCLE = 0xF .... 15.5 SPI bus clock cycles.</p> <p>If the variable clock function is enabled and the transmit FIFO buffer is not empty, the</p>

		minimum period of suspend interval between the successive transactions is (6.5 + SP_CYCLE) * SPI bus clock cycle.
[11]	CLKP	<b>Clock Polarity</b> 0 = SPI bus clock is idle low. 1 = SPI bus clock is idle high.
[10]	LSB	<b>Send LSB First</b> 0 = The MSB, which bit of transmit/receive register depends on the setting of TX_BIT_LEN, is transmitted/received first. 1 = The LSB, bit 0 of the SPI TX0/1 register, is sent first to the SPI data output pin, and the first bit received from the SPI data input pin will be put in the LSB position of the RX register (bit 0 of SPI_RX0/1).
[9:8]	Reserved	Reserved.
[7:3]	TX_BIT_LEN	<b>Transmit Bit Length</b> This field specifies how many bits can be transmitted / received in one transaction. The minimum bit length is 8 bits and can up to 32 bits. TX_BIT_LEN = 0x08 .... 8 bits. TX_BIT_LEN = 0x09 .... 9 bits. ..... TX_BIT_LEN = 0x1F .... 31 bits. TX_BIT_LEN = 0x00 .... 32 bits.
[2]	TX_NEG	<b>Transmit On Negative Edge</b> 0 = Transmitted data output signal is changed on the rising edge of SPI bus clock. 1 = Transmitted data output signal is changed on the falling edge of SPI bus clock.
[1]	RX_NEG	<b>Receive On Negative Edge</b> 0 = Received data input signal is latched on the rising edge of SPI bus clock. 1 = Received data input signal is latched on the falling edge of SPI bus clock.
[0]	GO_BUSY	<b>SPI Transfer Control Bit And Busy Status</b> 0 = Data transfer stopped. 1 = In Master mode, writing 1 to this bit to start the SPI data transfer; in Slave mode, writing 1 to this bit indicates that the slave is ready to communicate with a master. If FIFO mode is disabled, during the data transfer, this bit keeps the value of 1. As the transfer is finished, this bit will be cleared automatically. Software can read this bit to check if the SPI is in busy status. In FIFO mode, this bit will be controlled by hardware. Software should not modify this bit. In Slave mode, this bit always returns 1 when this register is read by software. In Master mode, this bit reflects the busy or idle status of SPI. <b>Note:</b> 1. When FIFO mode is disabled, all configurations should be set before writing 1 to this GO_BUSY bit. 2. When FIFO mode is disabled and the software uses TX or RX PDMA function to transfer data, this bit will be cleared after the PDMA finishes the data transfer.

**SPI Divider Register (SPI\_DIVIDER)**

Register	Offset	R/W	Description	Reset Value
SPI_DIVIDER	SPIn_BA+0x04	R/W	Clock Divider Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
DIVIDER2[7:0]							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
DIVIDER[7:0]							

Bits	Description	
[31:24]	Reserved	Reserved.
[23:16]	DIVIDER2	<p><b>Clock Divider 2 Register (Master Only)</b></p> <p>The value in this field is the 2<sup>nd</sup> frequency divider for generating the second clock of the variable clock function. The frequency is obtained according to the following equation:</p> $f_{clock2} = \frac{f_{spi\_clk}}{(DIVIDER2 + 1) * 2}$ <p>If the VARCLK_EN bit is cleared to 0, this setting is unmeaning.</p>
[15:8]	Reserved	Reserved.
[7:0]	DIVIDER	<p><b>Clock Divider 1 Register</b></p> <p>The value in this field is the frequency divider for generating the SPI peripheral clock, <math>f_{spi\_clk}</math>, and the SPI bus clock of SPI master. The frequency is obtained according to the following equation.</p> <p>If the bit of BCn, SPI_CNTRL2[31], is set to 0,</p> $f_{spi\_clk} = \frac{f_{system\_clock}}{(DIVIDER + 1) * 2}$ <p>else if BCn is set to 1,</p> $f_{spi\_clk} = \frac{f_{spi\_clock\_src}}{(DIVIDER + 1)}$ <p>where</p> <p><math>f_{spi\_clock\_src}</math> is the SPI peripheral clock source, which is defined in the CLKSEL1 register.</p>

# SPI Slave Select Register (SPI\_SSR)

Register	Offset	R/W	Description	Reset Value
SPI_SSR	SPIn_BA+0x08	R/W	Slave Select Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved		LTRIG_FLAG	SS_LTRIG	AUTOSS	SS_LVL	SSR	

Bits	Description
[31:6]	<b>Reserved</b> Reserved.
[5]	<b>LTRIG_FLAG</b> <b>Level Trigger Accomplish Flag</b> In Slave mode, this bit indicates whether the received bit number meets the requirement or not after the current transaction done. 0 = Transferred bit length of one transaction does not meet the specified requirement. 1 = Transferred bit length meets the specified requirement which defined in TX_BIT_LEN. <b>Note:</b> This bit is READ only. As the GO_BUSY bit is set to 1 by software, the LTRIG_FLAG will be cleared to 0 after 4 SPI peripheral clock periods plus 1 system clock period. In FIFO mode, this bit has no meaning.
[4]	<b>SS_LTRIG</b> <b>Slave Select Level Trigger Enable Bit (Slave Only)</b> 0 = Slave select signal is edge-trigger. This is the default value. The SS_LVL bit decides the signal is active after a falling-edge or rising-edge. 1 = Slave select signal is level-trigger. The SS_LVL bit decides the signal is active low or active high.
[3]	<b>AUTOSS</b> <b>Automatic Slave Select Function Enable Bit (Master Only)</b> 0 = If this bit is cleared, slave select signals will be asserted/de-asserted by setting /clearing the corresponding bits of SPI_SSR[1:0]. 1 = If this bit is set, SPIn_SPISS0/1 signals will be generated automatically. It means that device/slave select signal, which is set in SPI_SSR[1:0], will be asserted by the SPI controller when transmit/receive is started, and will be de-asserted after each transmit/receive is finished.
[2]	<b>SS_LVL</b> <b>Slave Select Active Level</b> This bit defines the active status of slave select signal (SPIn_SPISS0/1). 0 = The slave select signal SPIn_SPISS0/1 is active on low-level/falling-edge. 1 = The slave select signal SPIn_SPISS0/1 is active on high-level/rising-edge.
[1:0]	<b>SSR</b> <b>Slave Select Control Bits (Master Only)</b> If AUTOSS bit is cleared, writing 1 to any bit of this field sets the proper SPIn_SPISS0/1 line to an active state and writing 0 sets the line back to inactive state. If the AUTOSS bit is set, writing 0 to any bit location of this field will keep the corresponding SPIn_SPISS0/1 line at inactive state; writing 1 to any bit location of this field will select appropriate SPIn_SPISS0/1 line to be automatically driven to active state for the

		duration of the transmit/receive, and will be driven to inactive state for the rest of the time. The active state of SPIn_SPISS0/1 is specified in SS_LVL. <b>Note:</b> SPIn_SPISS0 is defined as the slave select input in Slave mode.
--	--	---

**SPI Data Receive Register (SPI\_RX)**

Register	Offset	R/W	Description	Reset Value
SPI_RX0	SPIn_BA+0x10	R	Data Receive Register 0	0x0000_0000
SPI_RX1	SPIn_BA+0x14	R	Data Receive Register 1	0x0000_0000

31	30	29	28	27	26	25	24
RX[31:24]							
23	22	21	20	19	18	17	16
RX[23:16]							
15	14	13	12	11	10	9	8
RX[15:8]							
7	6	5	4	3	2	1	0
RX[7:0]							

Bits	Description
[31:0]	<p><b>Data Receive Register</b></p> <p>The data receive register holds the datum received from SPI data input pin. If FIFO mode is disabled, the last received data can be accessed through software by reading this register. If the FIFO bit is set as 1 and the RX_EMPTY bit, SPI_CNTRL[24] or SPI_STATUS[24], is not set to 1, the receive FIFO buffer can be accessed through software by reading this register. This is a read-only register.</p>

**SPI Data Transmit Register (SPI\_TX)**

Register	Offset	R/W	Description	Reset Value
SPI_TX0	SPIn_BA+0x20	W	Data Transmit Register 0	0x0000_0000
SPI_TX1	SPIn_BA+0x24	W	Data Transmit Register 1	0x0000_0000

23	22	21	20	19	18	17	16
TX[23:16]							
15	14	13	12	11	10	9	8
TX[15:8]							
7	6	5	4	3	2	1	0
TX[7:0]							

Bits	Description
[31:0]	<p><b>Data Transmit Register</b></p> <p>The data transmit registers hold the data to be transmitted in the next transfer. The number of valid bits depends on the setting of transmit bit length field of the SPI_CNTRL register.</p> <p>For example, if TX_BIT_LEN is set to 0x08, the bits TX[7:0] will be transmitted in next transfer. If TX_BIT_LEN is set to 0x00, the SPI controller will perform a 32-bit transfer.</p> <p><b>Note 1:</b> When the SPI controller is configured as a slave device and FIFO mode is disabled, if the SPI controller attempts to transmit data to a master, the transmit data register should be updated by software before setting the GO_BUSY bit to 1.</p> <p><b>Note 2:</b> In Master mode, SPI controller will start to transfer after 5 peripheral clock cycles since user wrote to this register.</p>

**SPI Variable Clock Pattern Register (SPI\_VARCLK)**

Register	Offset	R/W	Description	Reset Value
SPI_VARCLK	SPIn_BA+0x34	R/W	Variable Clock Pattern Register	0x007F_FF87

31	30	29	28	27	26	25	24
VARCLK[31:24]							
23	22	21	20	19	18	17	16
VARCLK[23:16]							
15	14	13	12	11	10	9	8
VARCLK[15:8]							
7	6	5	4	3	2	1	0
VARCLK[7:0]							

Bits	Description	
[31:0]	VARCLK	<b>Variable Clock Pattern</b> This register defines the clock pattern of the SPI transfer. If the variable clock function is disabled, this setting is unmeaning. Refer to the "Variable Clock Function" paragraph for more detail description.

**SPI DMA Control Register (SPI\_DMA)**

Register	Offset	R/W	Description	Reset Value
SPI_DMA	SPIn_BA+0x38	R/W	SPI DMA Control Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved					PDMA_RST	RX_DMA_GO	TX_DMA_GO

Bits	Description	
[31:2]	Reserved	Reserved.
[2]	PDMA_RST	<b>PDMA Reset</b> 0 = No effect. 1 = Reset the PDMA control logic of the SPI controller. This bit will be cleared to 0 automatically.
[1]	RX_DMA_GO	<b>Receive DMA Start</b> Setting this bit to 1 will start the receive PDMA process. The SPI controller will issue request to PDMA controller automatically when the SPI receive buffer is not empty. This bit will be cleared to 0 by hardware automatically after PDMA transfer is done. If the software uses the receive PDMA function to access the received data of SPI and does not use the transmit PDMA function, the GO_BUSY bit should be set by software. Enabling FIFO mode is recommended if the software uses more than one PDMA channel to transfer data. In Slave mode and when FIFO mode is disabled, if the software only uses one PDMA channel for SPI receive PDMA function and the other PDMA channels are not in use, the minimal suspend interval between two successive transactions must be larger than (9 SPI slave peripheral clock periods + 4 APB clock periods) for Edge-trigger mode or (9.5 SPI slave peripheral clock periods + 4 APB clock periods) for Level-trigger mode.
[0]	TX_DMA_GO	<b>Transmit DMA Start</b> Setting this bit to 1 will start the transmit PDMA process. SPI controller will issue request to PDMA controller automatically. Hardware will clear this bit to 0 automatically after PDMA transfer done. If the SPI transmit PDMA function is used to transfer data, the GO_BUSY bit should not be set to 1 by software. The PDMA control logic of SPI controller will set it automatically whenever necessary. In Slave mode and when FIFO mode is disabled, the minimal suspend interval between two successive transactions must be larger than (8 SPI clock periods + 14 APB clock periods) for edge-trigger mode or (9.5 SPI clock periods + 14 APB clock periods) for level-trigger mode. If the 2-bit Transfer mode is enabled, additional 18 APB clock periods for the above conditions is required.

### SPI Control and Status Register 2 (SPI\_CNTRL2)

Register	Offset	R/W	Description	Reset Value
SPI_CNTRL2	SPIn_BA+0x3C	R/W	Control and Status Register 2	0x0000_1000

31	30	29	28	27	26	25	24
BCn	Reserved						
23	22	21	20	19	18	17	16
Reserved							SS_INT_OPT
15	14	13	12	11	10	9	8
Reserved		DUAL_IO_EN	DUAL_IO_DIR	SLV_START_INTSTS	SSTA_INTEN	SLV_ABORT	NOSLVSEL
7	6	5	4	3	2	1	0
Reserved							

Bits	Description
[31]	<b>BCn</b> <b>SPI Peripheral Clock Backward Compatible Option</b> 0 = Backward compatible clock configuration. 1 = Clock configuration is not backward compatible. Refer to the description of SPI_DIVIDER register for details.
[30:17]	<b>Reserved</b> Reserved.
[16]	<b>SS_INT_OPT</b> <b>Slave Select Inactive Interrupt Option</b> This setting is only available if the SPI controller is configured as level trigger slave device. 0 = As the slave select signal goes to inactive level, the IF bit will NOT be set to 1. 1 = As the slave select signal goes to inactive level, the IF bit will be set to 1.
[15:14]	<b>Reserved</b> Reserved.
[13]	<b>DUAL_IO_EN</b> <b>Dual I/O Mode EnableBit</b> 0 = Dual I/O mode Disabled. 1 = Dual I/O mode Enabled.
[12]	<b>DUAL_IO_DIR</b> <b>Dual I/O Mode Direction Control</b> 0 = Dual Input mode. 1 = Dual Output mode.
[11]	<b>SLV_START_INTSTS</b> <b>Slave 3-Wire Mode Start Interrupt Status</b> This bit indicates if a transaction has started in Slave 3-wire mode. It is a mutual mirror bit of SPI_STATUS[11]. 0 = Slave has not detected any SPI clock transition since the SSTA_INTEN bit was set to 1. 1 = A transaction has started in Slave 3-wire mode. It will be cleared automatically when a transaction is done or by writing 1 to this bit.
[10]	<b>SSTA_INTEN</b> <b>Slave 3-Wire Mode Start Interrupt EnableBit</b> Used to enable interrupt when the transfer has started in Slave 3-wire mode. If there is no transfer done interrupt over the time period which is defined by user

		<p>after the transfer start, the user can set the SLV_ABORT bit to force the transfer done.</p> <p>0 = Transaction start interrupt Disabled.</p> <p>1 = Transaction start interrupt Enabled. It will be cleared to 0 as the current transfer is done or the SLV_START_INTSTS bit is cleared.</p>
[9]	SLV_ABORT	<p><b>Slave 3-Wire Mode Abort Control</b></p> <p>In normal operation, there is an interrupt event when the received data meet the required bits which defined in TX_BIT_LEN.</p> <p>If the received bits are less than the requirement and there is no more SPI clock input over the one transfer time in Slave 3-wire mode, the user can set this bit to force the current transfer done and then the user can get a transfer done interrupt event.</p> <p><b>Note:</b> This bit will be cleared to 0 automatically by hardware after it is set to 1 by software.</p>
[8]	NOSLVSEL	<p><b>Slave 3-Wire Mode Enable Bit</b></p> <p>This is used to ignore the slave select signal in Slave mode. The SPI controller can work with 3-wire interface including SPIn_CLK, SPIn_MISO, and SPIn_MOSI.</p> <p>0 = 4-wire bi-direction interface.</p> <p>1 = 3-wire bi-direction interface.</p> <p><b>Note:</b> In Slave 3-wire mode, the SS_LTRIG, SPI_SSR[4] will be set as 1 automatically.</p>
[7:0]	Reserved	Reserved.

### SPI FIFO Control Register (SPI\_FIFO\_CTL)

Register	Offset	R/W	Description	Reset Value
SPI_FIFO_CTL	SPIn_BA+0x40	R/W	SPI FIFO Control Register	0x4400_0000

31	30	29	28	27	26	25	24

Reserved							
7	6	5	4	3	2	1	0
Reserved	RXOV_INTEN	Reserved		TX_INTEN	RX_INTEN	TX_CLR	RX_CLR

Bits	Description
[31]	Reserved
[30:28]	<b>TX_THRESHOLD</b> Transmit FIFO Threshold If the valid data count of the transmit FIFO buffer is less than or equal to the TX_THRESHOLD setting, the TX_INTSTS bit will be set to 1, else the TX_INTSTS bit will be cleared to 0.
[27]	Reserved
[26:24]	<b>RX_THRESHOLD</b> Receive FIFO Threshold If the valid data count of the receive FIFO buffer is larger than the RX_THRESHOLD setting, the RX_INTSTS bit will be set to 1, else the RX_INTSTS bit will be cleared to 0.
[23:22]	Reserved
[21]	<b>TIMEOUT_INTEN</b> Receive FIFO Time-Out Interrupt Enable Bit 0 = Time-out interrupt Disabled. 1 = Time-out interrupt Enabled.
[20:7]	Reserved
[6]	<b>RXOV_INTEN</b> Receive FIFO Overrun Interrupt Enable Bit 0 = Receive FIFO overrun interrupt Disabled. 1 = Receive FIFO overrun interrupt Enabled.
[5:4]	Reserved
[3]	<b>TX_INTEN</b> Transmit Threshold Interrupt Enable Bit 0 = TX threshold interrupt Disabled. 1 = TX threshold interrupt Enabled.
[2]	<b>RX_INTEN</b> Receive Threshold Interrupt Enable Bit 0 = RX threshold interrupt Disabled. 1 = RX threshold interrupt Enabled.

[1]	TX_CLR	<b>Clear Transmit FIFO Buffer</b> 0 = No effect. 1 = Clear transmit FIFO buffer. The TX_FULL flag will be cleared to 0 and the TX_EMPTY flag will be set to 1. This bit will be cleared to 0 by hardware after it is set to 1 by software.
[0]	RX_CLR	<b>Clear Receive FIFO Buffer</b> 0 = No effect. 1 = Clear receive FIFO buffer. The RX_FULL flag will be cleared to 0 and the RX_EMPTY flag will be set to 1. This bit will be cleared to 0 by hardware after it is set to 1 by software.

### SPI Status Register (SPI\_STATUS)

Register	Offset	R/W	Description	Reset Value
SPI_STATUS	SPIn_BA+0x44	R/W	SPI Status Register	0x0500_0000

31	30	29	28	27	26	25	24
TX_FIFO_COUNT				TX_FULL	TX_EMPTY	RX_FULL	RX_EMPTY
23	22	21	20	19	18	17	16
Reserved			TIMEOUT	Reserved			IF
15	14	13	12	11	10	9	8
RX_FIFO_COUNT				SLV_START_INTSTS	Reserved		
7	6	5	4	3	2	1	0
Reserved			TX_INTSTS	Reserved	RX_OVERRUN	Reserved	RX_INTSTS

Bits	Description
[31:28]	<b>TX_FIFO_COUNT</b> <b>Transmit FIFO Data Count (Read Only)</b> This bit field indicates the valid data count of transmit FIFO buffer.
[27]	<b>TX_FULL</b> <b>Transmit FIFO Buffer Full Indicator (Read Only)</b> It is a mutual mirror bit of SPI_CNTRL[27]. 0 = Transmit FIFO buffer is not full. 1 = Transmit FIFO buffer is full.
[26]	<b>TX_EMPTY</b> <b>Transmit FIFO Buffer Empty Indicator (Read Only)</b> It is a mutual mirror bit of SPI_CNTRL[26]. 0 = Transmit FIFO buffer is not empty. 1 = Transmit FIFO buffer is empty.
[25]	<b>RX_FULL</b> <b>Receive FIFO Buffer Empty Indicator (Read Only)</b> It is a mutual mirror bit of SPI_CNTRL[24]. 0 = Receive FIFO buffer is not empty. 1 = Receive FIFO buffer is empty.
[24]	<b>RX_EMPTY</b> <b>Receive FIFO Buffer Empty Indicator (Read Only)</b> It is a mutual mirror bit of SPI_CNTRL[24]. 0 = Receive FIFO buffer is not empty. 1 = Receive FIFO buffer is empty.
[23:21]	<b>Reserved</b> Reserved.
[20]	<b>TIMEOUT</b> <b>Time-Out Interrupt Flag</b> 0 = No receive FIFO time-out event. 1 = Receive FIFO buffer is not empty and no read operation on receive FIFO buffer over 64 SPI clock period in Master mode or over 576 SPI peripheral clock period in Slave mode. When the received FIFO buffer is read by software, the time-out status will be cleared automatically. <b>Note:</b> This bit will be cleared by writing 1 to itself.

[19:17]	Reserved	Reserved.
[16]	IF	<b>SPI Unit Transfer Interrupt Flag</b> It is a mutual mirror bit of SPI_CNTRL[16]. 0 = No transaction has been finished since this bit was cleared to 0. 1 = SPI controller has finished one unit transfer. <b>Note:</b> This bit will be cleared by writing 1 to itself.
[15:12]	RX_FIFO_COUNT	<b>Receive FIFO Data Count (Read Only)</b> This bit field indicates the valid data count of receive FIFO buffer.
[11]	SLV_START_INTSTS	<b>Slave Start Interrupt Status</b> It is used to dedicate if a transaction has started in Slave 3-wire mode. It is a mutual mirror bit of SPI_CNTRL2[11]. 0 = Slave has not detected any SPI clock transition since the SSTA_INTEN bit was set to 1. 1 = A transaction has started in Slave 3-wire mode. It will be cleared as a transaction is done or by writing 1 to this bit.
[10:5]	Reserved	Reserved.
[4]	TX_INTSTS	<b>Transmit FIFO Threshold Interrupt Status (Read Only)</b> 0 = The valid data count within the transmit FIFO buffer is larger than the setting value of TX_THRESHOLD. 1 = The valid data count within the transmit FIFO buffer is less than or equal to the setting value of TX_THRESHOLD. <b>Note:</b> If TX_INTEN = 1 and TX_INTSTS = 1, the SPI controller will generate a SPI interrupt request.
[3]	Reserved	Reserved.
[2]	RX_OVERRUN	<b>Receive FIFO Overrun Status</b> When the receive FIFO buffer is full, the follow-up data will be dropped and this bit will be set to 1. <b>Note:</b> This bit will be cleared by writing 1 to itself.
[1]	Reserved	Reserved.
[0]	RX_INTSTS	<b>Receive FIFO Threshold Interrupt Status (Read Only)</b> 0 = The valid data count within the Rx FIFO buffer is smaller than or equal to the setting value of RX_THRESHOLD. 1 = The valid data count within the receive FIFO buffer is larger than the setting value of RX_THRESHOLD. <b>Note:</b> If RX_INTEN = 1 and RX_INTSTS = 1, the SPI controller will generate a SPI interrupt request.

## 6.18 I<sup>2</sup>S Controller (I<sup>2</sup>S)

### 6.18.1 Overview

The I<sup>2</sup>S controller consists of I<sup>2</sup>S protocol to interface with external audio CODEC. Two 8-word depth FIFO for reading path and writing path respectively and is capable of handling 8-, 16-, 24- and 32-bit word sizes. PDMA controller handles the data movement between FIFO and memory.

### 6.18.2 Features

- Supports Master mode and Slave mode
- Capable of handling 8-, 16-, 24- and 32-bit word sizes
- Supports monaural and stereo audio data
- Supports I<sup>2</sup>S and MSB justified data format
- Provides two 8-word FIFO data buffers, one for transmitting and the other for receiving
- Supports PDMA transfer

### 6.18.3 Block Diagram

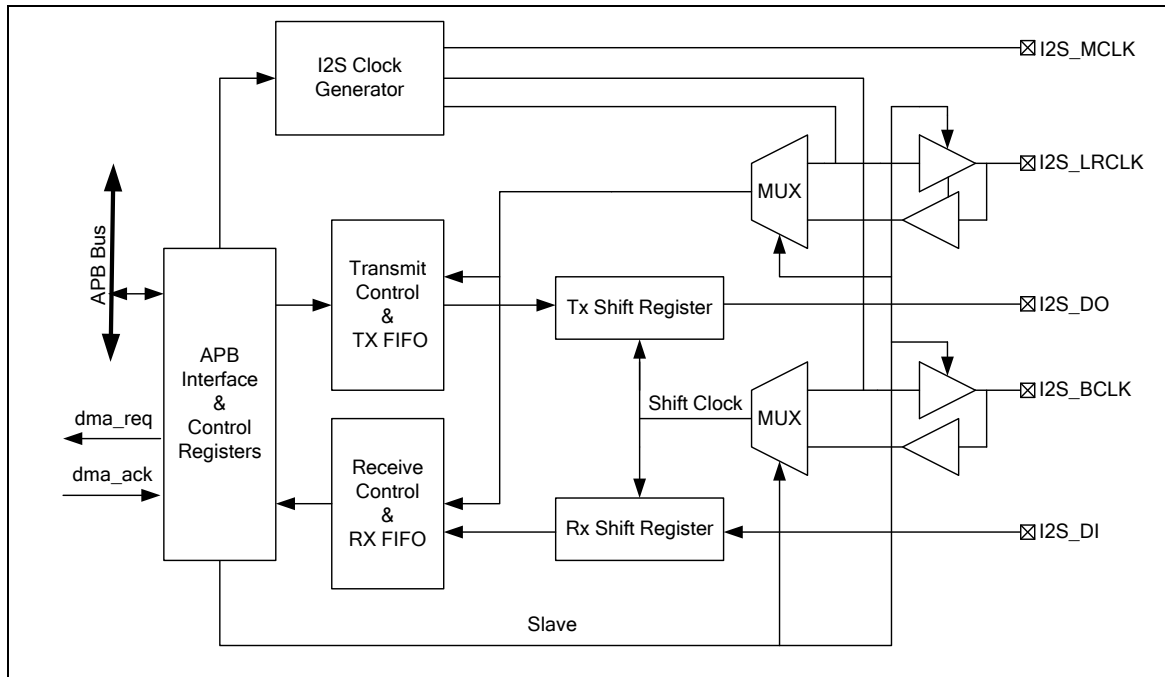

Figure 6-128 I²S Controller Block Diagram

### 6.18.4 Basic Configuration

The I²S pin functions are configured in GPA\_MFP, GPC\_MFP, ALT\_MFP and ALT\_MFP1 registers. The I²S peripheral clock can be enabled in I2S\_EN (APBCLK[29]). The clock source is determined in I2S\_S (CLKSEL2[1:0]).

## 6.18.5 Functional Description

### 6.18.5.1 I<sup>2</sup>S Clock

The I<sup>2</sup>S controller has four clock sources selected by I2S\_S (CLKSEL2[1:0]). The I<sup>2</sup>S clock rate must be slower than or equal to system clock rate.

Figure 6-129 I<sup>2</sup>S Clock Control Diagram

6.18.5.2 I<sup>2</sup>S Operation

The I<sup>2</sup>S controller supports MSB justified and I<sup>2</sup>S data format. The I2SLRCLK signal indicates which audio channel is in transferring. The bit count of an audio channel is determined by WORDWIDTH (I2SCON[5:4]). The transfer sequence is always first from the most significance bit, MSB. Data are read on rising clock edge and are driven on falling clock edge.

In I<sup>2</sup>S data format, the MSB is sent and latched on the second clock of an audio channel.

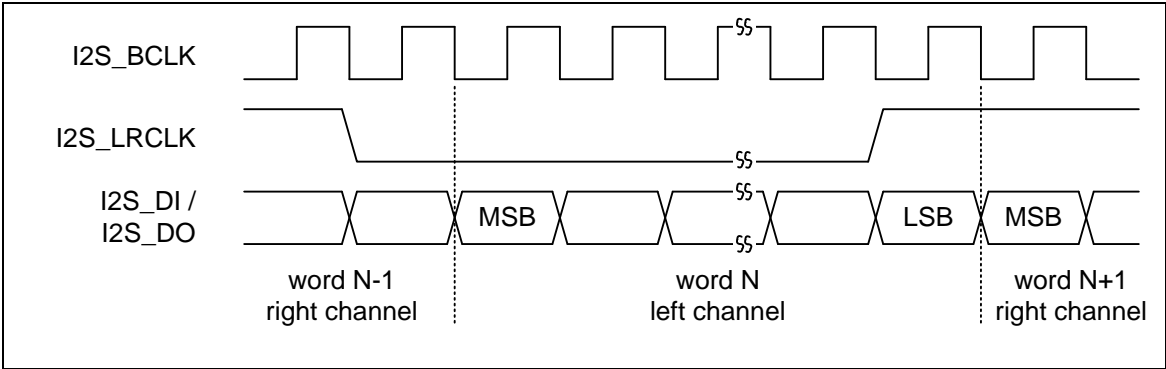

Figure 6-130 I<sup>2</sup>S Data Format Timing Diagram

In MSB justified data format, the MSB is sent and latched on the first clock of an audio channel.

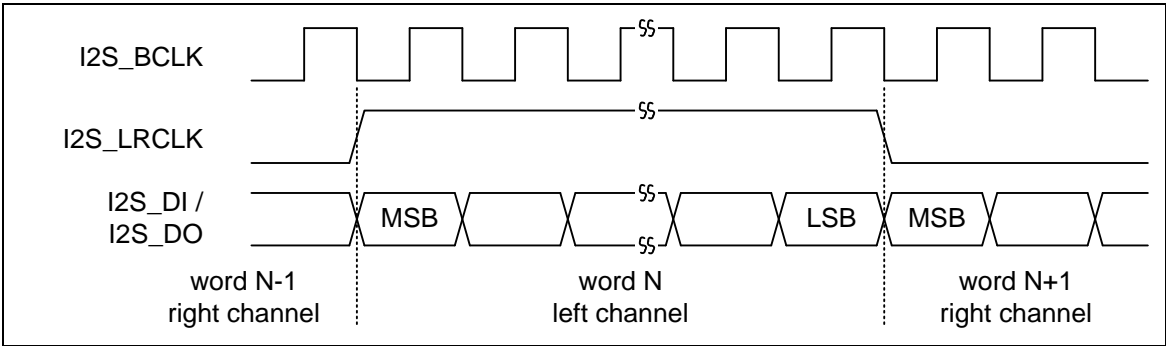

Figure 6-131 MSB Justified Data Format Timing Diagram

### 6.18.5.3 I<sup>2</sup>S Interrupt Sources

The I<sup>2</sup>S controller supports left channel zero-cross interrupt, right channel zero-cross interrupt, transmit FIFO threshold level interrupt, transmit FIFO overflow interrupt and transmit FIFO underflow interrupt in transmit operation. In receive operation, it supports receive FIFO threshold level interrupt, receive FIFO overflow interrupt and receive FIFO underflow interrupt. When I<sup>2</sup>S interrupt occurs, user can check I2STXINT (I2SSTATUS[2]) and I2SRXINT (I2SSTATUS[1]) flags to recognize the interrupt sources.

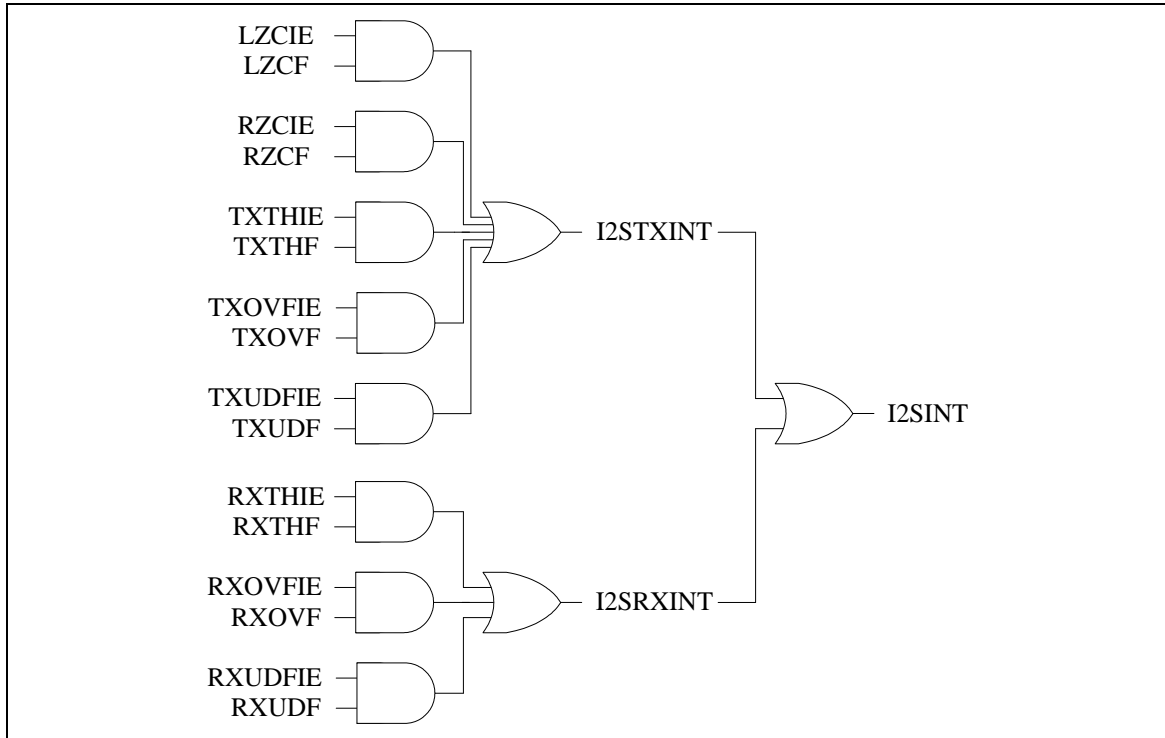

Figure 6-132 I<sup>2</sup>S Interrupts

6.18.5.4FIFO Operation

The word width of an audio channel can be 8, 16, 24 or 32 bits. The memory arrangements for various settings are shown below.

Figure 6-133 FIFO Contents for Various I<sup>2</sup>S Modes

6.18.5.5Zero Cross Detection

When playing audio by I<sup>2</sup>S function, the output data comes from the memory by PDMA or by CPU. However, it may result some pop noise if the playing gain level is changed by user at any time. Because, the output data is not zero, and the output data cross the gain change will generate a sharp pop noise. Therefore, the zero-cross flag will help to reduce this situation. If enable the zero cross detection function, hardware will detect the next transfer data is zero or sign change. If the next data is zero or sign change, zero-cross flag will be set to high, and the output data will be mute automatically, until the flag is cleared by software.

6.18.5.6PDMA Mode

The I<sup>2</sup>S function can use PDMA function to access the data. In transmit mode, when PDMA function is enabled, if TX FIFO is not full, the I<sup>2</sup>S will generate the request signal and get a data from memory by PDMA automatically, until the TX FIFO is full. However, in receive mode, when PDMA function is enabled, if the RX FIFO is not empty, the I<sup>2</sup>S will generate the request signal and move a receive data to memory by PDMA automatically, until the RX FIFO is empty. User can enable PDMA function to ease CPU's' loading.

6.18.5.7Master/Slave Interface

If I<sup>2</sup>S controller is configured as Master mode, it drives I2S\_MCLK, I2S\_BCLK and I2S\_LRCLK for a device slave, such as an audio CODEC.

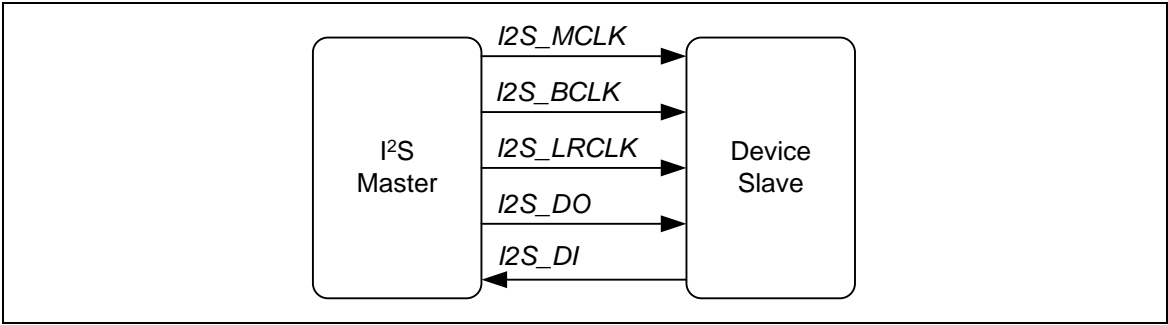

Figure 6-134 Master Mode Interface

If I<sup>2</sup>S controller is configured as Slave mode, I2S\_MCLK, I2S\_BCLK and I2S\_LRCLK are driven by a device master, such as an audio CODEC.

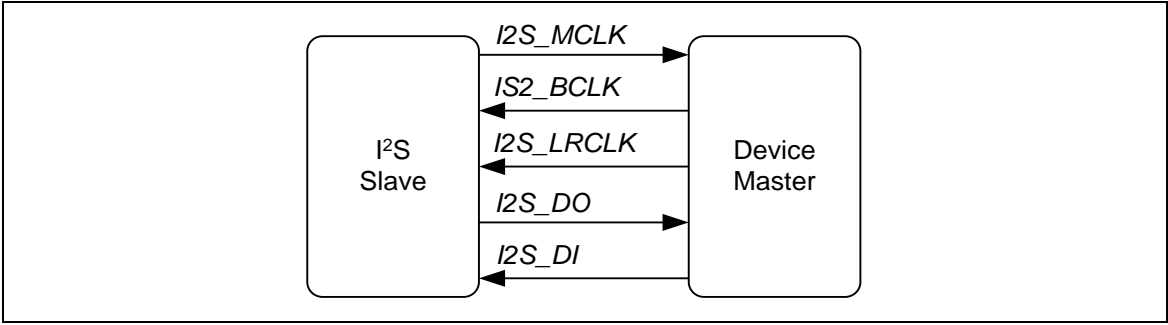

Figure 6-135 Slave Mode Interface

### 6.18.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value

### 6.18.7 Register Description

#### I<sup>2</sup>S Control Register (I2SCON)

Register	Offset	R/W	Description	Reset Value
I2SCON	I2S_BA+0x00	R/W	I <sup>2</sup> S Control Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
RXLCH	Reserved	RXDMA	TXDMA	CLR_RXFIFO	CLR_TXFIFO	LCHZCEN	RCHZCEN
15	14	13	12	11	10	9	8
MCLKEN	RXTH			TXTH			SLAVE
7	6	5	4	3	2	1	0
FORMAT	MONO	WORDWIDTH		MUTE	RXEN	TXEN	I2SEN

Bits	Description	
[31:22]	Reserved	Reserved.
[23]	RXLCH	<b>Receive Left Channel Enable Bit</b> When monaural format is selected (MONO = 1), I <sup>2</sup> S controller will receive right channel data if RXLCH is set to 0, and receive left channel data if RXLCH is set to 1. 0 = Receive right channel data in Mono mode. 1 = Receive left channel data in Mono mode.
[22]	Reserved	Reserved.
[21]	RXDMA	<b>Receive DMA Enable Bit</b> When RX DMA is enabled, I <sup>2</sup> S requests DMA to transfer data from receive FIFO to SRAM if FIFO is not empty. 0 = RX DMA Disabled. 1 = RX DMA Enabled.
[20]	TXDMA	<b>Transmit DMA Enable Bit</b> When TX DMA is enabled, I <sup>2</sup> S request DMA to transfer data from SRAM to transmit FIFO if FIFO is not full. 0 = TX DMA Disabled. 1 = TX DMA Enabled.
[19]	CLR_RXFIFO	<b>Clear Receive FIFO</b> Write 1 to clear receive FIFO, internal pointer is reset to FIFO start point, and RX_LEVEL[3:0] returns 0 and receive FIFO becomes empty. This bit is cleared by hardware automatically. Returns 0 on read.
[18]	CLR_TXFIFO	<b>Clear Transmit FIFO</b> Write 1 to clear transmit FIFO, internal pointer is reset to FIFO start point, and TX_LEVEL[3:0] returns to 0 and transmit FIFO becomes empty but data in transmit FIFO is not changed. This bit is cleared by hardware automatically. Returns 0 on read.

[17]	LCHZCEN	<b>Left Channel Zero Cross Detection Enable Bit</b> If this bit is set to 1, when left channel data sign bit changes or next shift data bits are all 0 then LZCF flag in I2SSTATUS register is set to 1. This function is only available in transmit operation. 0 = Left channel zero cross detection Disabled. 1 = Left channel zero cross detection Enabled.
[16]	RCHZCEN	<b>Right Channel Zero Cross Detection Enable Bit</b> If this bit is set to 1, when right channel data sign bit change or next shift data bits are all 0 then RZCF flag in I2SSTATUS register is set to 1. This function is only available in transmit operation. 0 = Right channel zero cross detection Disabled. 1 = Right channel zero cross detection Enabled.
[15]	MCLKEN	<b>Master Clock Enable Bit</b> If MCLKEN is set to 1, I <sup>2</sup> S controller will generate master clock on I2S_MCLK pin for external audio devices. 0 = Master clock Disabled. 1 = Master clock Enabled.
[14:12]	RXTH	<b>Receive FIFO Threshold Level</b> When the count of received data word(s) in buffer is equal to or higher than threshold level, RXTHF (I2SSTATUS[10]) will be set. 000 = 1 word data in receive FIFO. 001 = 2 word data in receive FIFO. 010 = 3 word data in receive FIFO. 011 = 4 word data in receive FIFO. 100 = 5 word data in receive FIFO. 101 = 6 word data in receive FIFO. 110 = 7 word data in receive FIFO. 111 = 8 word data in receive FIFO.
[11:9]	TXTH	<b>Transmit FIFO Threshold Level</b> If the count of remaining data word (32 bits) in transmit FIFO is equal to or less than threshold level then TXTHF (I2SSTATUS[18]) is set. 000 = 0 word data in transmit FIFO. 001 = 1 word data in transmit FIFO. 010 = 2 words data in transmit FIFO. 011 = 3 words data in transmit FIFO. 100 = 4 words data in transmit FIFO. 101 = 5 words data in transmit FIFO. 110 = 6 words data in transmit FIFO. 111 = 7 words data in transmit FIFO.
[8]	SLAVE	<b>Slave Mode</b> I <sup>2</sup> S can operate as master or slave. For Master mode, I2S_BCLK and I2S_LRCLK pins are output mode and send bit clock from NuMicro™ NUC230/240 series to Audio CODEC chip. In Slave mode, I2S_BCLK and I2S_LRCLK pins are input mode and I2S_BCLK and I2S_LRCLK signals are received from outer Audio CODEC chip. 0 = Master mode. 1 = Slave mode.
[7]	FORMAT	<b>Data Format</b> 0 = I <sup>2</sup> S data format. 1 = MSB justified data format.

[6]	<b>MONO</b>	<b>Monaural Data</b> 0 = Data is stereo format. 1 = Data is monaural format.
[5:4]	<b>WORDWIDTH</b>	<b>Word Width</b> 00 = data is 8-bit word. 01 = data is 16-bit word. 10 = data is 24-bit word. 11 = data is 32-bit word.
[3]	<b>MUTE</b>	<b>Transmit Mute Enable Bit</b> 0 = Transmit data is shifted from buffer. 1 = Send zero on transmit channel.
[2]	<b>RXEN</b>	<b>Receive Enable Bit</b> 0 = Data receiving Disabled. 1 = Data receiving Enabled.
[1]	<b>TXEN</b>	<b>Transmit Enable Bit</b> 0 = Data transmit Disabled. 1 = Data transmit Enabled.
[0]	<b>I2SEN</b>	<b>I<sup>2</sup>S Controller Enable Bit</b> 0 = Disabled. 1 = Enabled.

### I<sup>2</sup>S Clock Divider Register (I2SCLKDIV)

Register	Offset	R/W	Description	Reset Value
I2SCLKDIV	I2S_BA+0x04	R/W	I <sup>2</sup> S Clock Divider Control Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
BCLK_DIV							
7	6	5	4	3	2	1	0
Reserved					MCLK_DIV		

Bits	Description	
[31:16]	Reserved	Reserved.
[15:8]	BCLK_DIV	<b>Bit Clock Divider</b> The I <sup>2</sup> S controller will generate bit clock in Master mode. The bit clock rate, F_BCLK, is determined by the following expression. $F\_BCLK = F\_I2SCLK / (2 \times (BCLK\_DIV + 1))$ , where F_I2SCLK is the frequency of I <sup>2</sup> S peripheral clock.
[7:3]	Reserved	Reserved.
[2:0]	MCLK_DIV	<b>Master Clock Divider</b> If MCLKEN is set to 1, I <sup>2</sup> S controller will generate master clock for external audio devices. The master clock rate, F_MCLK, is determined by the following expressions. If MCLK_DIV >= 1, $F\_MCLK = F\_I2SCLK / (2 \times (MCLK\_DIV))$ . If MCLK_DIV = 0, $F\_MCLK = F\_I2SCLK$ . F_I2SCLK is the frequency of I <sup>2</sup> S peripheral clock. In general, the master clock rate is 256 times sampling clock rate.

## I<sup>2</sup>S Interrupt Enable Register (I2SIE)

Register	Offset	R/W	Description	Reset Value
I2SIE	I2S_BA+0x08	R/W	I <sup>2</sup> S Interrupt Enable Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved			LZCIE	RZCIE	TXTHIE	TXOVFIE	TXUDFIE
7	6	5	4	3	2	1	0
Reserved					RXTHIE	RXOVFIE	RXUDFIE

Bits	Description
[31:13]	<b>Reserved</b> Reserved.
[12]	<b>LZCIE</b> <b>Left Channel Zero-Cross Interrupt Enable Bit</b> Interrupt occurs if this bit is set to 1 and left channel zero-cross event is detected. 0 = Interrupt Disabled. 1 = Interrupt Enabled.
[11]	<b>RZCIE</b> <b>Right Channel Zero-Cross Interrupt Enable Bit</b> Interrupt occurs if this bit is set to 1 and right channel zero-cross event is detected. 0 = Interrupt Disabled. 1 = Interrupt Enabled.
[10]	<b>TXTHIE</b> <b>Transmit FIFO Threshold Level Interrupt Enable Bit</b> Interrupt occurs if this bit is set to 1 and the count of data words in transmit FIFO is less than TXTH (I2SCON[11:9]). 0 = Interrupt Disabled. 1 = Interrupt Enabled.
[9]	<b>TXOVFIE</b> <b>Transmit FIFO Overflow Interrupt Enable Bit</b> Interrupt occurs if this bit is set to 1 and the transmit FIFO overflow flag is set to 1 0 = Interrupt Disabled. 1 = Interrupt Enabled.
[8]	<b>TXUDFIE</b> <b>Transmit FIFO Underflow Interrupt Enable Bit</b> Interrupt occurs if this bit is set to 1 and the transmit FIFO underflow flag is set to 1. 0 = Interrupt Disabled. 1 = Interrupt Enabled.
[7:3]	<b>Reserved</b> Reserved.

[2]	RXTHIE	<b>Receive FIFO Threshold Level Interrupt Enable Bit</b> When the count of data words in receive FIFO is equal to or higher than RXTH (I2SCON[14:12]) and this bit is set to 1, receive FIFO threshold level interrupt will be asserted. 0 = Interrupt Disabled. 1 = Interrupt Enabled.
[1]	RXOVFIE	<b>Receive FIFO Overflow Interrupt Enable Bit</b> 0 = Interrupt Disabled. 1 = Interrupt Enabled.
[0]	RXUDFIE	<b>Receive FIFO Underflow Interrupt Enable Bit</b> 0 = Interrupt Disabled. 1 = Interrupt Enabled.

### I<sup>2</sup>S Status Register (I2SSTATUS)

Register	Offset	R/W	Description	Reset Value
I2SSTATUS	I2S_BA+0x0C	R/W	I <sup>2</sup> S Status Register	0x0014_1000

31	30	29	28	27	26	25	24
TX_LEVEL				RX_LEVEL			
23	22	21	20	19	18	17	16
LZCF	RZCF	TXBUSY	TXEMPTY	TXFULL	TXTHF	TXOVF	TXUDF
15	14	13	12	11	10	9	8
Reserved			RXEMPTY	RXFULL	RXTHF	RXOVF	RXUDF
7	6	5	4	3	2	1	0
Reserved				RIGHT	I2STXINT	I2SRXINT	I2SINT

Bits	Description
[31:28]	<b>TX_LEVEL</b> <b>Transmit FIFO Level</b> These bits indicate word number in transmit FIFO 0000 = No data. 0001 = 1 word in transmit FIFO. .... 1000 = 8 words in transmit FIFO.
[27:24]	<b>RX_LEVEL</b> <b>Receive FIFO Level</b> These bits indicate word number in receive FIFO 0000 = No data. 0001 = 1 word in receive FIFO. .... 1000 = 8 words in receive FIFO.
[23]	<b>LZCF</b> <b>Left Channel Zero-Cross Flag</b> It indicates the sign bit of left channel sample data is changed or all data bits are 0. 0 = No zero-cross. 1 = Left channel zero-cross event is detected. <b>Note:</b> Write 1 to clear this bit to 0.
[22]	<b>RZCF</b> <b>Right Channel Zero-Cross Flag</b> It indicates the sign bit of right channel sample data is changed or all data bits are 0. 0 = No zero-cross. 1 = Right channel zero-cross event is detected. <b>Note:</b> Write 1 to clear this bit to 0.

[21]	TXBUSY	<b>Transmit Busy</b> This bit is cleared to 0 when all data in transmit FIFO and shift buffer is shifted out. And set to 1 when 1st data is load to shift buffer. 0 = Transmit shift buffer is empty. 1 = Transmit shift buffer is not empty. <b>Note:</b> This bit is read only.
[20]	TXEMPTY	<b>Transmit FIFO Empty</b> This bit reflects data word number in transmit FIFO is 0 0 = Not empty. 1 = Empty. <b>Note:</b> This bit is read only.
[19]	TXFULL	<b>Transmit FIFO Full</b> This bit reflects data word number in transmit FIFO is 8 0 = Not full. 1 = Full. <b>Note:</b> This bit is read only.
[18]	TXTHF	<b>Transmit FIFO Threshold Flag</b> When the count of data stored in transmit-FIFO is equal to or less than threshold value set in TXTH (I2SCON[11:9]). The TXTHF bit becomes to 1. It keeps at 1 till TX_LEVEL (I2SSTATUS[31:28]) is larger than TXTH. 0 = Data word(s) in FIFO is larger than threshold level. 1 = Data word(s) in FIFO is equal to or less than threshold level. <b>Note:</b> This bit is read only.
[17]	TXOVF	<b>Transmit FIFO Overflow Flag</b> This bit will be set to 1 if writes data to transmit FIFO when transmit FIFO is full. 0 = No overflow. 1 = Overflow. <b>Note:</b> Write 1 to clear this bit to 0.
[16]	TXUDF	<b>Transmit FIFO Underflow Flag</b> If transmit FIFO is empty and hardware reads data from transmit FIFO. This bit will be set to 1. 0 = No underflow. 1 = Underflow. <b>Note:</b> Software can write 1 to clear this bit to 0.
[15:13]	Reserved	Reserved.
[12]	RXEMPTY	<b>Receive FIFO Empty</b> This bit reflects the count of data in receive FIFO is 0 0 = Not empty. 1 = Empty. <b>Note:</b> This bit is read only.
[11]	RXFULL	<b>Receive FIFO Full</b> This bit reflects the count of data in receive FIFO is 8 0 = Not full. 1 = Full. <b>Note:</b> This bit is read only.

[10]	RXTHF	<b>Receive FIFO Threshold Flag</b> When data word(s) in receive FIFO is equal to or larger than threshold value set in RXTH (I2SCON[14:12]). The RXTHF bit becomes to 1. It keeps at 1 till RX_LEVEL (I2SSTATUS[27:24]) is less than RXTH. 0 = Data word(s) in FIFO is less than threshold level. 1 = Data word(s) in FIFO is equal to or larger than threshold level. <b>Note:</b> This bit is read only.
[9]	RXOVF	<b>Receive FIFO Overflow Flag</b> When receive FIFO is full and hardware attempt to write data to receive FIFO, this bit will be set to 1, data in 1st buffer will be overwrote. 0 = No overflow. 1 = Overflow. <b>Note:</b> Write 1 to clear this bit to 0.
[8]	RXUDF	<b>Receive FIFO Underflow Flag</b> Underflow event will occur if read the empty receive FIFO. 0 = No underflow event occurred. 1 = Underflow. <b>Note:</b> Write 1 to clear this bit to 0.
[7:4]	Reserved	Reserved.
[3]	RIGHT	<b>Right Channel</b> This bit indicates current transmit data is belong to which channel 0 = Left channel. 1 = Right channel. <b>Note:</b> This bit is read only.
[2]	I2STXINT	<b>I<sup>2</sup>S Transmit Interrupt</b> 0 = No transmit interrupt. 1 = Transmit interrupt. <b>Note:</b> This bit is read only.
[1]	I2SRXINT	<b>I<sup>2</sup>S Receive Interrupt</b> 0 = No receive interrupt. 1 = Receive interrupt. <b>Note:</b> This bit is read only.
[0]	I2SINT	<b>I<sup>2</sup>S Interrupt Flag</b> This bit is wire-OR of I2STXINT and I2SRXINT bits. 0 = No I <sup>2</sup> S interrupt. 1 = I <sup>2</sup> S interrupt. <b>Note:</b> This bit is read only.

**I<sup>2</sup>S Transmit FIFO Register (I2STXFIFO)**

7	6	5	4	3	2	1	0
RXFIFO[7:0]							

Bits	Description	
[31:0]	RXFIFO	<b>Receive FIFO Register</b> I <sup>2</sup> S contains 8 words (8x32 bits) data buffer for data receive. Read this register to get data of receive FIFO. The remaining data word number is indicated by RX_LEVEL (I2SSTATUS[27:24]).

## 6.19 USB Device Controller (USBD)

### 6.19.1 Overview

There is one set of USB 2.0 full-speed device controller and transceiver in this device. It is compliant with USB 2.0 full-speed device specification and supports control/bulk/interrupt/isochronous transfer types.

In this device controller, there are two main interfaces: the APB bus and USB bus which comes from the USB PHY transceiver. For the APB bus, the CPU can program control registers through it. There are 512 bytes internal SRAM as data buffer in this controller. For IN or OUT transfer, it is necessary to write data to SRAM or read data from SRAM through the APB interface or SIE. User needs to set the effective starting address of SRAM for each endpoint buffer through “buffer segmentation register (USB\_BUFSEGx)”.

There are 8 endpoints in this controller. Each of the endpoint can be configured as IN or OUT endpoint. All the operations including Control, Bulk, Interrupt and Isochronous transfer are implemented in this block. The block of “Endpoint Control” is also used to manage the data sequential synchronization, endpoint states, current start address, transaction status, and data buffer status for each endpoint.

There are four different interrupt events in this controller. They are the wake-up function, device plug-in or plug-out event, USB events, and BUS events. Any event will cause an interrupt, and users just need to check the related event flags in interrupt event status register (USB\_INTSTS) to acknowledge what kind of interrupt occurring, and then check the related USB Endpoint Status Register (USB\_EPSTS) to acknowledge what kind of event occurring in this endpoint.

A software-disconnect function is also supported for this USB controller. It is used to simulate the disconnection of this device from the host. If DRVSE0 (USB\_DRVSE0[0]) is set to 1, the USB controller will force the output of USB\_D+ and USB\_D- to level low. After DRVSE0 bit is cleared to 0, host will enumerate the USB device again.

Please refer to *Universal Serial Bus Specification Revision 1.1* for details.

### 6.19.2 Features

- Compliant with USB 2.0 Full-Speed specification
- Provides 1 interrupt vector with 4 different interrupt events (WAKEUP, FLDET, USB and BUS)
- Supports Control/Bulk/Interrupt/Isochronous transfer type
- Supports suspend function when no bus activity existing for 3 ms
- Provides 8 endpoints for configurable Control/Bulk/Interrupt/Isochronous transfer types and maximum 512 bytes buffer size
- Provides remote wake-up capability

### 6.19.3 Block Diagram

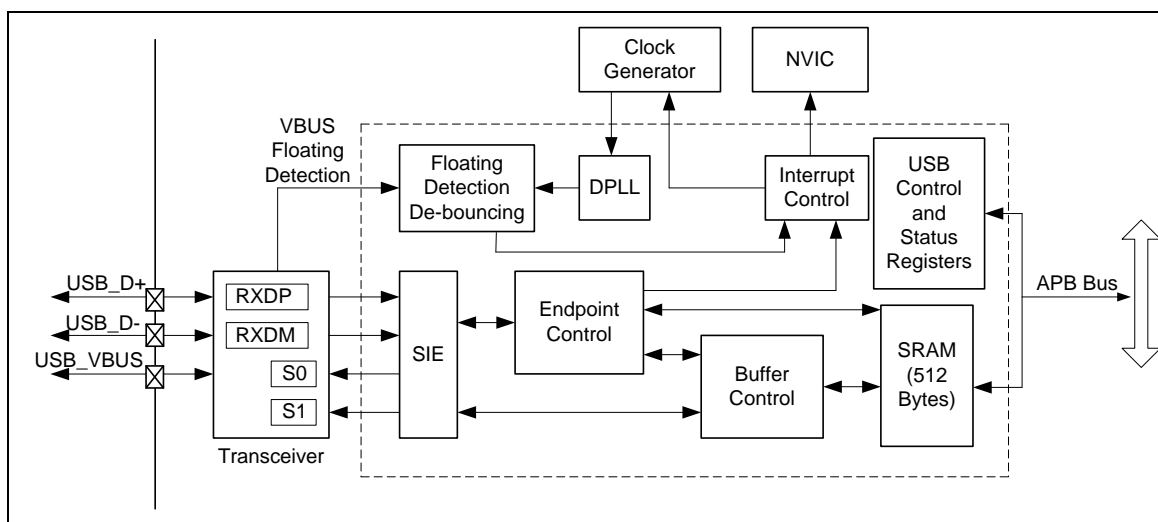

Figure 6-136 USB Device Block Diagram

### 6.19.4 Basic Configuration

USBD clock source is derived from PLL. User has to set the PLL related configurations before USB device controller is enabled. Set the USBD\_EN (APBCLK[27]) bit to enable USBD clock and 4-bit pre-scaler USB\_N (CLKDIV[7:4]) to generate the proper USBD clock rate.

## 6.19.5 Functional Description

### 6.19.5.1 SIE (Serial Interface Engine)

The SIE is the front-end of the device controller and handles most of the USB packet protocol. The SIE typically comprehends signaling up to the transaction level. The functions that it handles could include:

- Packet recognition, transaction sequencing
- SOF, EOP, RESET, RESUME signal detection/generation
- Clock/Data separation
- NRZI Data encoding/decoding and bit-stuffing
- CRC generation and checking (for Token and Data)
- Packet ID (PID) generation and checking/ decoding
- Serial-Parallel/ Parallel-Serial conversion

### 6.19.5.2 Endpoint Control

There are 8 endpoints in this controller. Each of the endpoint can be configured as Control, Bulk, Interrupt, or Isochronous transfer type. All the operations including Control, Bulk, Interrupt and Isochronous transfer are implemented in this block. It is also used to manage the data sequential synchronization, endpoint state control, current endpoint start address, current transaction status, and data buffer status in each endpoint.

### 6.19.5.3 Digital Phase Lock Loop (DPLL)

The bit rate of USB data is 12 MHz. The DPLL uses the 48 MHz which comes from the clock controller to lock the input data RXDP and RXDM. The 12 MHz bit rate clock is also converted from DPLL.

### 6.19.5.4 Floating Detection De-bouncing

A USB device may be plugged-in or plugged-out from the USB host. To monitor the state of a USB device when it is detached from the USB host, the device controller provides hardware de-bouncing for USB floating detection interrupt to avoid bounce problems on USB plug-in or unplug. Floating detection interrupt appears about 10 ms later than USB plug-in or plug-out. User can acknowledge USB plug-in/plug-out by reading USB\_FLDET register. The FLDET flag represents the current state of USB\_VBUS without de-bouncing. If the FLDET flag is 1, it means the USB cable is plugged-in. If user polls the flag to check USB state, software de-bouncing must be added if needed.

#### 6.19.5.5 Interrupt

This USB provides 1 interrupt vector with 4 interrupt events (WAKE-UP, FLDET, USB and BUS). The WAKE-UP event is used to wake-up the system clock when Power-down mode is enabled. (The power mode function is defined in system Power-down control register, PWRCON). The FLDET event is used for USB plug-in or unplug. The USB event notifies users of some USB requests, such as IN ACK, OUT ACK., and the BUS event notifies users of some bus events, such as suspend and, resume. The related bits must be set in the interrupt enable register (USB\_INTEN) of USB Device Controller to enable USB interrupts.

Wake-up interrupt is only present when the chip enters Power-down mode and then wake-up event had happened. After the chip enters Power-down mode, any change on USB\_VBUS, USB\_D+ and USB\_D- can wake up this chip if the USB wake-up function is enabled. If this change is not intentionally, no interrupt but wake-up interrupt will occur. After USB wake-up, this interrupt will occur when no other USB interrupt events are presented for more than 20ms. The following figure is the control flow of wake-up interrupt.

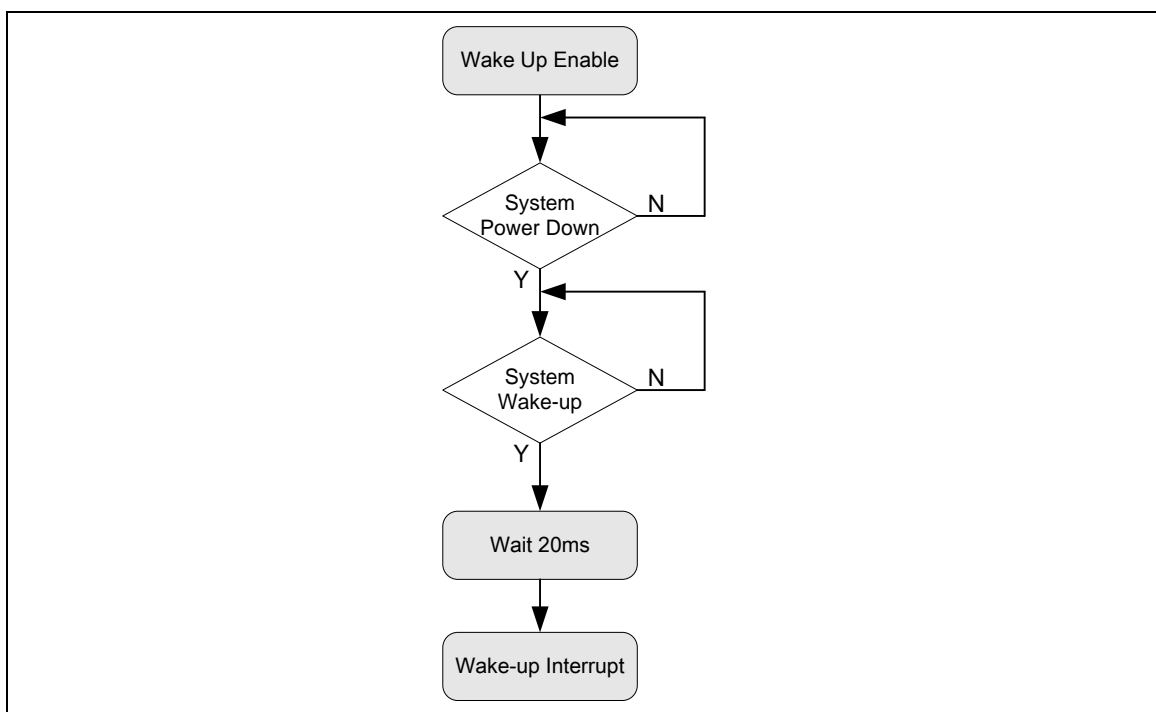

Figure 6-137 Wake-up Interrupt Operation Flow

USB interrupt is used to notify users of any USB event on the bus, and user can read EPSTS (USB\_EPSTS[31:8]) and EPEVT7~0 (USB\_INTSTS[23:16]) to take necessary responses.

Same as USB interrupt, BUS interrupt notifies users of some bus events, like USB reset, suspend, time-out, and resume. A user can read USB\_ATTR to acknowledge bus events.

#### 6.19.5.6 Power Saving

The USB turns off PHY transceiver automatically to save power while this chip enters Power-down mode. User can write 0 into USB\_ATTR[4] to disable PHY under special circumstances like suspend to save power.

6.19.5.7 Buffer Control

There is 512 bytes SRAM in the controller and the 8 endpoints share this buffer. User shall configure each endpoint's effective starting address in the buffer segmentation register before the USB function active. The "Buffer Control" block is used to control each endpoint's effective starting address and its SRAM size is defined in the USB\_MXPLDx register.

Figure 6-138 depicts the starting address for each endpoint according the content of USB\_BUFSEGx and USB\_MXPLDx registers. If the USB\_BUFSEG0 is programmed as 0x08h and USB\_MXPLD0 is set as 0x40h, the SRAM size of endpoint 0 is start from USBD\_BA+0x108h and end in USBD\_BA+0x148h. (**Note:** The USB SRAM base is USBD\_BA+0x100h).

Figure 6-138 Endpoint SRAM Structure

### 6.19.5.8 Handling Transactions with USB Device Peripheral

User can use interrupt or poll USB\_INTSTS to monitor the USB transactions. When transactions occur, USB\_INTSTS will be set by hardware and send an interrupt request to CPU (if related interrupt enabled), or user can poll USB\_INTSTS to get these events without interrupt. The following is the control flow with interrupt enabled.

When USB host has requested data from a device controller, user needs to prepare related data in the specified endpoint buffer in advance. After buffering the required data, user needs to write the actual data length in the specified USB\_MXPLDx register. Once this register is written, the internal signal "In\_Rdy" will be asserted and the buffering data will be transmitted immediately after receiving associated IN token from Host. Note that after transferring the specified data, the signal "In\_Rdy" will be de-asserted automatically by hardware.

Figure 6-139 Setup Transaction Followed by Data IN Transaction

Alternatively, when USB host wants to transmit data to the OUT endpoint in the device controller, hardware will buffer these data to the specified endpoint buffer. After this transaction is completed, hardware will record the data length in specified USB\_MXPLDx register and de-assert the internal signal "Out\_Rdy". This will avoid hardware accepting next transaction until user moves out the current data in the related endpoint buffer. Once users have processed this transaction, the specified USB\_MXPLDx register needs to be written by firmware to assert the signal "Out\_Rdy" again to accept the next transaction.

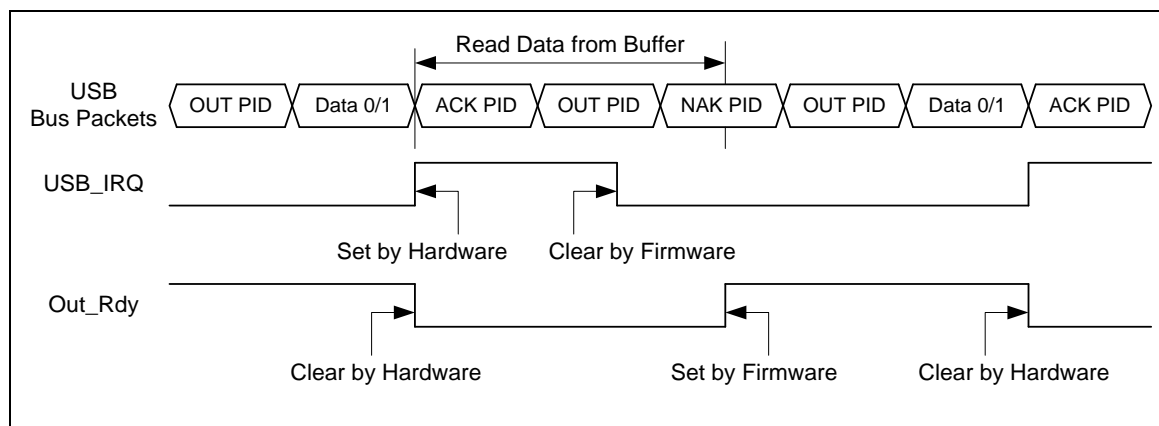

Figure 6-140 Data Out Transfer

### 6.19.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
USB Base Address: USBD_BA = 0x4006_0000

## 6.20 Controller Area Network (CAN)

### 6.20.1 Overview

The C\_CAN consists of the CAN Core, Message RAM, Message Handler, Control Registers and Module Interface (Refer Figure 6-141). The CAN Core performs communication according to the CAN protocol version 2.0 part A and B. The bit rate can be programmed to values up to 1MBit/s. For the connection to the physical layer, additional transceiver hardware is required.

For communication on a CAN network, individual Message Objects are configured. The Message Objects and Identifier Masks for acceptance filtering of received messages are stored in the Message RAM. All functions concerning the handling of messages are implemented in the Message Handler. These functions include acceptance filtering, the transfer of messages between the CAN Core and the Message RAM, and the handling of transmission requests as well as the generation of the module interrupt.

The register set of the C\_CAN can be accessed directly by the software through the module interface. These registers are used to control/configure the CAN Core and the Message Handler and to access the Message RAM.

### 6.20.2 Features

- Supports CAN protocol version 2.0 part A and B.
- Bit rates up to 1 MBit/s.
- 32 Message Objects.
- Each Message Object has its own identifier mask.
- Programmable FIFO mode (concatenation of Message Objects).
- Maskable interrupt.
- Disabled Automatic Re-transmission mode for Time Triggered CAN applications.
- Programmable loop-back mode for self-test operation.
- 16-bit module interfaces to the AMBA APB bus.
- Supports wake-up function

### 6.20.3 Block Diagram

The C\_CAN interfaces with the AMBA APB bus. The following figure shows the block diagram of the C\_CAN.

#### **CAN Core**

CAN Protocol Controller and Rx/Tx Shift Register for serial/parallel conversion of messages.

#### **Message RAM**

Stores Message Objects and Identifier Masks

#### **Registers**

All registers used to control and to configure the C\_CAN.

#### **Message Handler**

State Machine that controls the data transfer between the Rx/Tx Shift Register of the CAN Core and the Message RAM as well as the generation of interrupts as programmed in the Control and Configuration Registers.

#### Module Interface

C\_CAN interfaces to the AMBA APB 16-bit bus from ARM.

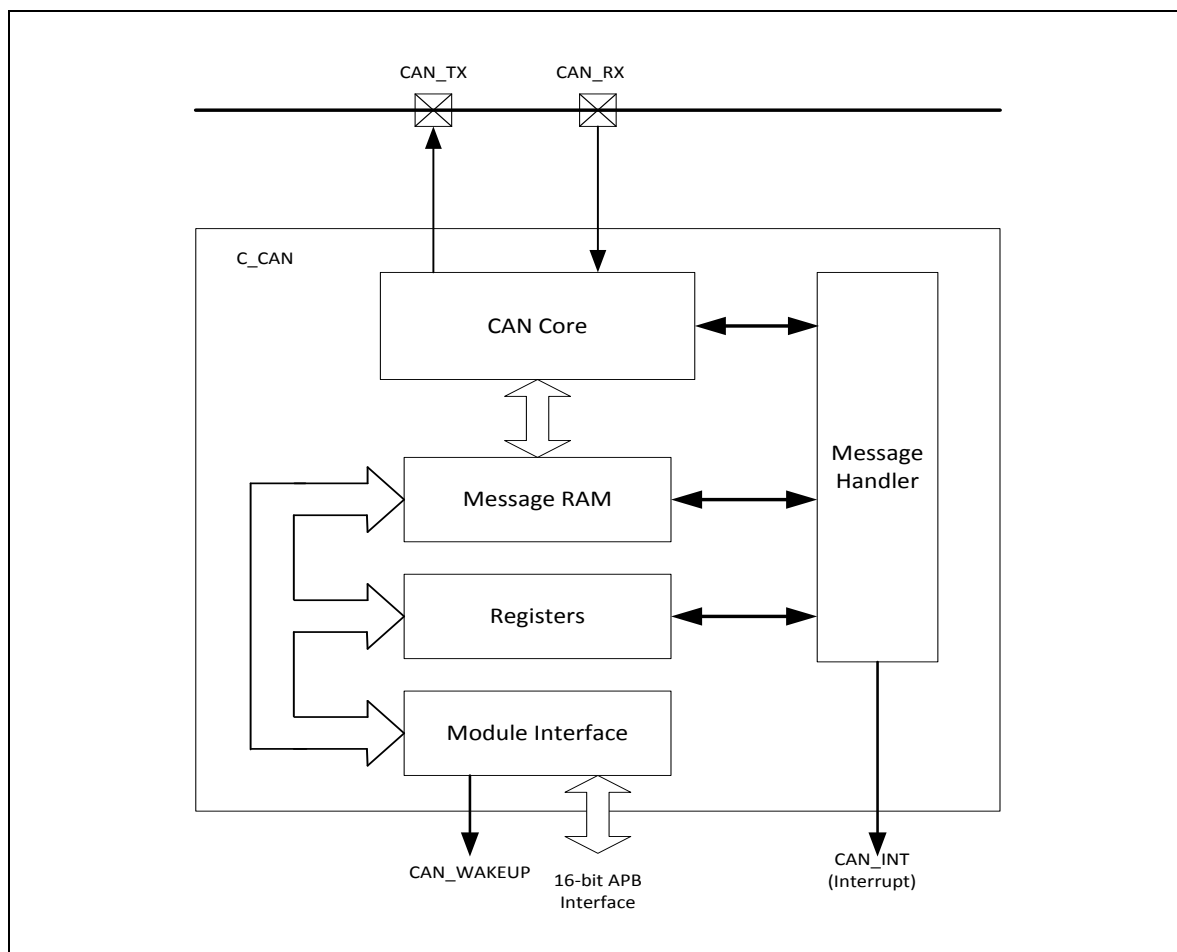

Figure 6-141 CAN Peripheral Block Diagram

#### 6.20.4 Basic Configuration

The basic configurations of CAN are as follows.

- CAN pins are configured on GPA\_MFP and GPC\_MFP registers.
- Enable CAN clock (CAN0\_EN (APBCLK[24]) and CAN1\_EN (APBCLK[25]) ).
- Reset CAN controller (CAN0\_RST (IPRSTC2[24]) and CAN1\_RST (IPRSTC2[25])).

## 6.20.5 Functional Description

### 6.20.5.1 Software Initialization

The software initialization is started by setting the Init bit (CAN\_CON[0]), either by a software or a hardware reset, or by going to bus-off state.

While the Init bit is set, all messages transfer to and from the CAN bus are stopped and the status of the CAN\_TX output pin is recessive (HIGH). The Error Management Logic (EML) counters are unchanged. Setting the Init bit does not change any configuration register.

To initialize the CAN Controller, software has to set up the Bit Timing Register and each Message Object. If a Message Object is not required, the corresponding MsgVal bit (CAN\_IFn\_ARB2[15]) should be cleared. Otherwise, the entire Message Object has to be initialized.

Access to the Bit Timing Register and to the Baud Rate Prescaler Extension Register for configuring bit timing is enabled when both the Init and CCE (CAN\_CON[6]) bits are set.

Resetting the Init bit (by software only) finishes the software initialization. Later, the Bit Stream Processor (BSP) (see Section 5.13.6.10: Configuring the Bit Timing) synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits ( $\equiv$  Bus Idle) before it can take part in bus activities and start the message transfer.

The initialization of the Message Objects is independent of Init and can be done on the fly, but the Message Objects should all be configured to particular identifiers or set to not valid before the BSP starts the message transfer.

To change the configuration of a Message Object during normal operation, the software has to start by resetting the corresponding MsgVal bit. When the configuration is completed, MsgVal bit is set again.

### 6.20.5.2 CAN Message Transfer

Once the C\_CAN is initialized and Init bit (CAN\_CON[0]) is reset to zero, the C\_CAN Core synchronizes itself to the CAN bus and starts the message transfer.

Received messages are stored in their appropriate Message Objects if they pass the Message Handler's acceptance filtering. The whole message including all arbitration bits, DLC (CAN\_IFn\_MCON[3:0]) and eight data bytes (CAN\_IFn\_DAT\_A1/2; CAN\_IFn\_DAT\_B1/2) are stored in the Message Object. If the Identifier Mask is used, the arbitration bits which are masked to "don't care" may be overwritten in the Message Object.

Software can read or write each message any time through the Interface Registers and the Message Handler guarantees data consistency in case of concurrent accesses.

Messages to be transmitted are updated by the application software. If a permanent Message Object (arbitration and control bits are set during configuration) exists for the message, only the data bytes are updated and the TxRqst bit (CAN\_IFn\_MCON[8]) with NewDat bit (CAN\_IFn\_MCON[15]) are set to start the transmission. If several transmit messages are assigned to the same Message Object (when the number of Message Objects is not sufficient), the whole Message Object has to be configured before the transmission of this message is requested.

The transmission of any number of Message Objects may be requested at the same time. Message objects are transmitted subsequently according to their internal priority. Messages may be updated or set to not valid any time, even when their requested transmission is still pending. The old data will be discarded when a message is updated before its pending transmission has started.

Depending on the configuration of the Message Object, the transmission of a message may be requested autonomously by the reception of a remote frame with a matching identifier.

### 6.20.5.3 Disabled Automatic Retransmission

In accordance with the CAN Specification (see ISO11898, 6.3.3 Recovery Management), the C\_CAN provides means for automatic retransmission of frames that have lost arbitration or have been disturbed by errors during transmission. The frame transmission service will not be confirmed to the user before the transmission is successfully completed. This means that, by default, automatic retransmission is enabled. It can be disabled to enable the C\_CAN to work within a Time Triggered CAN (TTCAN, see ISO11898-1) environment.

The Disabled Automatic Retransmission mode is enabled by setting the Disable Automatic Retransmission (DAR bit (CAN\_CON[5])) to one. In this operation mode, the programmer has to consider the different behavior of bits TxRqst (CAN\_IFn\_MCON[8]) and NewDat (CAN\_IFn\_MCON[15]) of the Message Buffers:

- When a transmission starts, bit TxRqst of the respective Message Buffer is cleared, while bit NewDat remains set.
- When the transmission completed successfully, bit NewDat is cleared.
- When a transmission fails (lost arbitration or error), bit NewDat remains set.
- To restart the transmission, the software should set the bit TxRqst again.

### 6.20.6 Test Mode

Test Mode is entered by setting the Test bit (CAN\_CON[7]). In Test Mode, bits Tx1 (CAN\_TEST[6]), Tx0 (CAN\_TEST[5]), LBack (CAN\_TEST[4]), Silent (CAN\_TEST[3]) and Basic (CAN\_TEST[2]) are writeable. Bit Rx monitors the state of the CAN\_RX pin and therefore is only readable. All Test Register functions are disabled when the Test bit is cleared.

#### 6.20.6.1 Silent Mode

The CAN Core can be set in Silent Mode by programming the Silent bit (CAN\_TEST[3]) to one. In Silent Mode, the C\_CAN is able to receive valid data frames and valid remote frames, but it sends only recessive bits on the CAN bus and it cannot start a transmission. If the CAN Core is required to send a dominant bit (ACK bit, Error Frames), the bit is rerouted internally so that the CAN Core monitors this dominant bit, although the CAN bus may remain in recessive state. The Silent Mode can be used to analysis the traffic on a CAN bus without affecting it by the transmission of dominant bits. The following figure shows the connection of signals CAN\_TX and CAN\_RX to the CAN Core in Silent Mode.

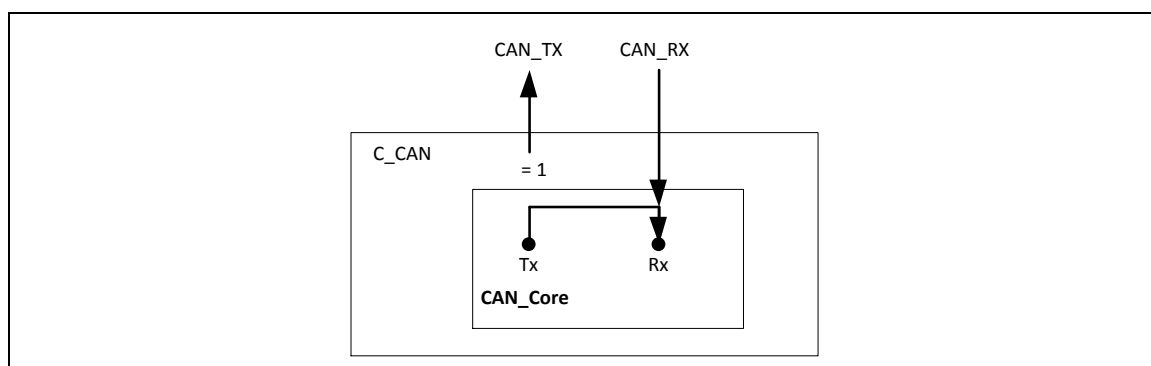

Figure 6-142 CAN Core in Silent Mode

### 6.20.6.2 Loop Back Mode

The CAN Core can be set in Loop Back Mode by programming the Test Register bit LBack (CAN\_TEST[4]) to one. In Loop Back Mode, the CAN Core treats its own transmitted messages as received messages and stores them in a Receive Buffer (if they pass acceptance filtering). The following figure shows the connection of signals, CAN\_TX and CAN\_RX, to the CAN Core in Loop Back Mode.

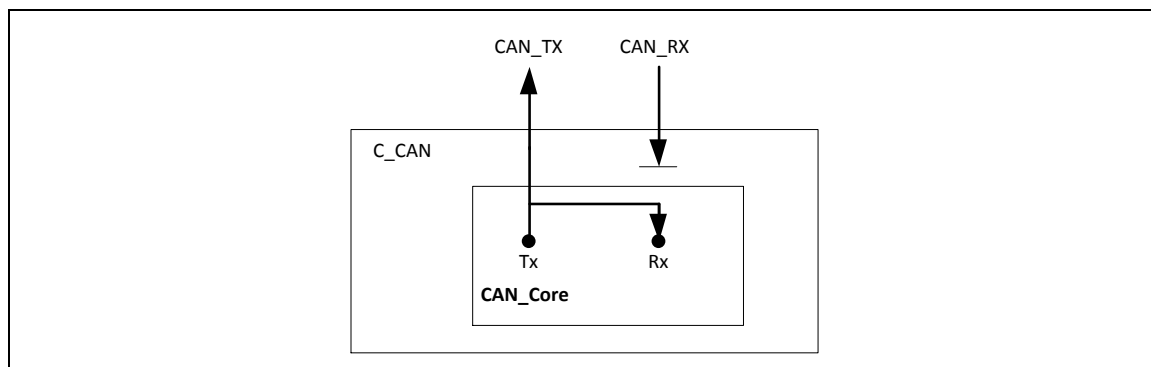

Figure 6-143 CAN Core in Loop Back Mode

This mode is provided for self-test functions. To be independent from external stimulation, the CAN Core ignores acknowledge errors (recessive bit sampled in the acknowledge slot of a data/remote frame) in Loop Back Mode. In this mode, the CAN Core performs an internal feedback from its Tx output to its Rx input. The actual value of the CAN\_RX input pin is disregarded by the CAN Core. The transmitted messages can be monitored on the CAN\_TX pin.

### 6.20.6.3 Loop Back Combined with Silent Mode

It is also possible to combine Loop Back Mode and Silent Mode by programming bits LBack (CAN\_TEST[4]) and Silent (CAN\_TEST[3]) to one at the same time. This mode can be used for a “Hot Selftest”, which means that C\_CAN can be tested without affecting a running CAN system connected to the CAN\_TX and CAN\_RX pins. In this mode, the CAN\_RX pin is disconnected from the CAN Core and the CAN\_TX pin is held recessive. The following figure shows the connection of signals CAN\_TX and CAN\_RX to the CAN Core in case of the combination of Loop Back Mode with Silent Mode.

Figure 6-144 CAN Core in Loop Back Mode Combined with Silent Mode

#### 6.20.6.4 Basic Mode

The CAN Core can be set in Basic Mode by programming the Basic bit (CAN\_TEST[2]) to one. In this mode, the C\_CAN runs without the Message RAM.

The IF1 Registers are used as Transmit Buffer. The transmission of the contents of the IF1 Registers is requested by writing the Busy bit (CAN\_IFn\_CREQ[15]) of the IF1 Command Request Register to one. The IF1 Registers are locked while the Busy bit is set. The Busy bit indicates that the transmission is pending.

As soon the CAN bus is idle, the IF1 Registers are loaded into the shift register of the CAN Core and the transmission is started. When the transmission has been completed, the Busy bit is reset and the locked IF1 Registers are released.

A pending transmission can be aborted at any time by resetting the Busy bit in the IF1 Command Request Register while the IF1 Registers are locked. If the software has reset the Busy bit, a possible retransmission in case of lost arbitration or in case of an error is disabled.

The IF2 Registers are used as a Receive Buffer. After the reception of a message the contents of the shift register is stored into the IF2 Registers, without any acceptance filtering.

Additionally, the actual contents of the shift register can be monitored during the message transfer. Each time a read Message Object is initiated by writing the Busy bit of the IF2 Command Request Register to one, the contents of the shift register are stored into the IF2 Registers.

In Basic Mode, the evaluation of all Message Object related control and status bits and the control bits of the IFn Command Mask Registers are turned off. The message number of the Command request registers is not evaluated. The NewDat (CAN\_IFn\_MCON[15]) and MsgLst (CAN\_IFn\_MCON[14]) bits retain their function, DLC3-0 indicates the received DLC (CAN\_IFn\_MCON[[3:0]]), and the other control bits are read as '0'.

#### 6.20.6.5 Software Control of CAN\_TX Pin

Four output functions are available for the CAN transmit pin, CAN\_TX. In addition to its default function (serial data output), the CAN transmit pin can drive the CAN Sample Point signal to monitor CAN\_Core's bit timing and it can drive constant dominant or recessive values. The latter two functions, combined with the readable CAN receive pin CAN\_RX, can be used to check the physical layer of the CAN bus.

The output mode for the CAN\_TX pin is selected by programming the Tx1 (CAN\_TEST[6]) and Tx0 (CAN\_TEST[5]) bits.

The three test functions of the CAN\_TX pin interfere with all CAN protocol functions. CAN\_TX must be left in its default function when CAN message transfer or any of the test modes (Loop Back Mode, Silent Mode, or Basic Mode) are selected.

### 6.20.7 CAN Communications

#### 6.20.7.1 Managing Message Objects

The configuration of the Message Objects in the Message RAM (with the exception of the bits MsgVal, NewDat, IntPnd, and TxRqst) will not be affected by resetting the chip. All the Message Objects must be initialized by the application software or they must be "not valid" (MsgVal bit = '0') and the bit timing must be configured before the application software clears the Init bit (CAN\_CON[0]).

The configuration of a Message Object is done by programming Mask, Arbitration, Control and Data fields of one of the two interface registers to the desired values. By writing to the

corresponding IFn Command Request Register, the IFn Message Buffer Registers are loaded into the addressed Message Object in the Message RAM.

When the Init bit is cleared, the CAN Protocol Controller state machine of the CAN\_Core and the state machine of the Message Handler control the internal data flow of the C\_CAN. Received messages that pass the acceptance filtering are stored into the Message RAM, messages with pending transmission request are loaded into the CAN\_Core's Shift Register and are transmitted through the CAN bus.

The application software reads received messages and updates messages to be transmitted through the IFn Interface Registers. Depending on the configuration, the application software is interrupted on certain CAN message and CAN error events.

#### 6.20.7.2 Message Handler State Machine

The Message Handler controls the data transfer between the Rx/Tx Shift Register of the CAN Core, the Message RAM and the IFn Registers.

The Message Handler FSM controls the following functions:

- Data Transfer from IFn Registers to the Message RAM
- Data Transfer from Message RAM to the IFn Registers
- Data Transfer from Shift Register to the Message RAM
- Data Transfer from Message RAM to Shift Register
- Data Transfer from Shift Register to the Acceptance Filtering unit
- Scanning of Message RAM for a matching Message Object
- Handling of TxRqst flags
- Handling of interrupts.

#### 6.20.7.3 Data Transfer from/to Message RAM

When the application software initiates a data transfer between the IFn Registers and Message RAM, the Message Handler sets the Busy bit (CAN\_IFn\_CREQ[15]) to '1'. After the transfer has completed, the Busy bit is again cleared (see the following figure).

The respective Command Mask Register specifies whether a complete Message Object or only parts of it will be transferred. Due to the structure of the Message RAM, it is not possible to write single bits/bytes of one Message Object. It is always necessary to write a complete Message Object into the Message RAM. Therefore, the data transfer from the IFn Registers to the Message RAM requires a read-modify-write cycle. First, those parts of the Message Object that are not to be changed are read from the Message RAM and then the complete contents of the Message Buffer Registers are written into the Message Object.

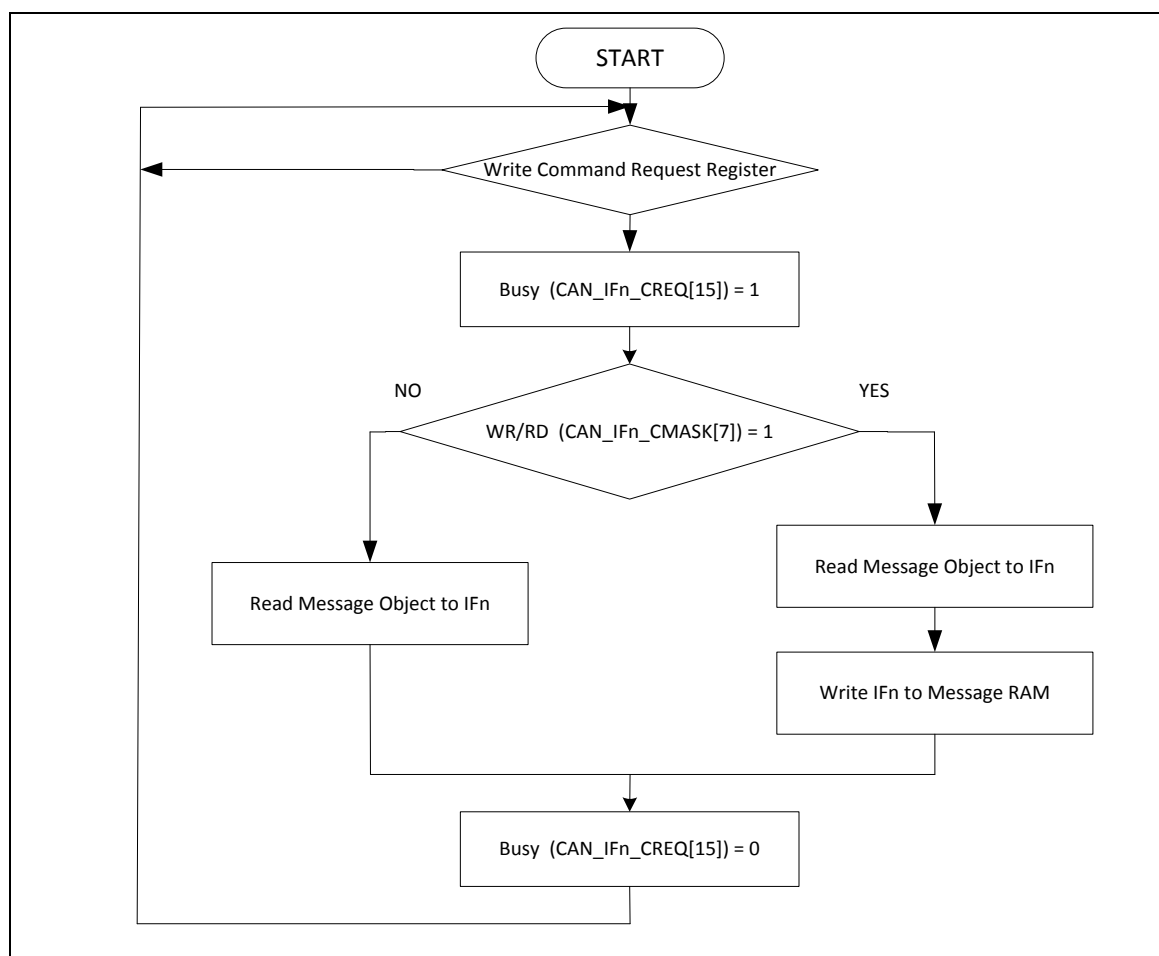

Figure 6-145 Data Transfer between IFn Registers and Message

After a partial write of a Message Object, the Message Buffer Registers that are not selected in the Command Mask Register will set the actual contents of the selected Message Object.

After a partial read of a Message Object, the Message Buffer Registers that are not selected in the Command Mask Register will be left unchanged.

#### 6.20.7.4 Message Transmission

If the shift register of the CAN Core cell is ready for loading and if there is no data transfer between the IFn Registers and Message RAM, the MsgVal bit (CAN\_IFn\_ARB2[15]) bits and TxRqst bits (CAN\_TXREQ1/2) are evaluated. The valid Message Object with the highest priority pending transmission request is loaded into the shift register by the Message Handler and the transmission is started. The NewDat (CAN\_IFn\_MCON[15]) bit of the Message Object is reset.

After a successful transmission and also if no new data was written to the Message Object (NewDat = '0') since the start of the transmission, the TxRqst bit of the Message Control register (CAN\_IFn\_MCON[8]) will be reset. If TxIE bit (CAN\_IFn\_MCON[11]) is set, IntPnd bit (CAN\_IFn\_MCON[13]) of the Interrupt Identifier register will be set after a successful transmission. If the C\_CAN has lost the arbitration or if an error occurred during the transmission, the message will be retransmitted as soon as the CAN bus is free again. Meanwhile, if the transmission of a message with higher priority has been requested, the messages will be transmitted in the order of their priority.

#### 6.20.7.5 Acceptance Filtering of Received Messages

When the arbitration and control field (Identifier + IDE + RTR + DLC) of an incoming message is completely shifted into the Rx/Tx Shift Register of the CAN Core, the Message Handler FSM starts the scanning of the Message RAM for a matching valid Message Object.

To scan the Message RAM for a matching Message Object, the Acceptance Filtering unit is loaded with the arbitration bits from the CAN Core shift register. The arbitration and mask fields (including MsgVal (CAN\_IFn\_ARB2[15]), UMask (CAN\_IFn\_MCON[12]), NewDat (CAN\_IFn\_MCON[15]), and EoB (CAN\_IFn\_MCON[7]) ) of Message Object 1 are then loaded into the Acceptance Filtering unit and compared with the arbitration field from the shift register. This is repeated with each following Message Object until a matching Message Object is found or until the end of the Message RAM is reached.

If a match occurs, the scan is stopped and the Message Handler FSM proceeds depending on the type of frame (Data Frame or Remote Frame) received.

#### **Reception of Data Frame**

The Message Handler FSM stores the message from the CAN Core shift register into the respective Message Object in the Message RAM. Not only the data bytes, but all arbitration bits and the Data Length Code are stored into the corresponding Message Object. This is done to keep the data bytes connected with the identifier even if arbitration mask registers are used.

The NewDat bit (CAN\_IFn\_MCON[15]) is set to indicate that new data (not yet seen by the software) has been received. The application software should reset NewDat bit when the Message Object has been read. If at the time of reception, the NewDat bit was already set, MsgLst (CAN\_IFn\_MCON[14]) is set to indicate that the previous data (supposedly not seen by the software) is lost. If the RxIE bit (CAN\_IFn\_MCON[10]) is set, the IntPnd bit (CAN\_IFn\_MCON[13]) is set, causing the Interrupt Register to point to this Message Object.

The TxRqst bit (CAN\_IFn\_MCON[8]) of this Message Object is reset to prevent the transmission of a Remote Frame, while the requested Data Frame has just been received.

#### **Reception of Remote Frame**

When a Remote Frame is received, three different configurations of the matching Message Object have to be considered:

1) Dir (CAN\_IFn\_ARB2[13]) = '1' (direction = transmit), RmtEn (CAN\_IFn\_MCON[9]) = '1', UMask (CAN\_IFn\_MCON[12]) = '1' or '0'

At the reception of a matching Remote Frame, the TxRqst bit of this Message Object is set. The rest of the Message Object remains unchanged.

2) Dir = '1' (direction = transmit), RmtEn = '0', UMask = '0'

At the reception of a matching Remote Frame, the TxRqst bit of this Message Object remains unchanged; the Remote Frame is ignored.

3) Dir = '1' (direction = transmit), RmtEn = '0', UMask = '1'

At the reception of a matching Remote Frame, the TxRqst bit of this Message Object is reset. The arbitration and control field (Identifier + IDE + RTR + DLC) from the shift register is stored in the Message Object of the Message RAM and the NewDat bit (CAN\_IFn\_MCON[15]) of this Message Object is set. The data field of the Message Object remains unchanged; the Remote Frame is treated similar to a received Data Frame.

#### 6.20.7.6 Receive/Transmit Priority

The receive/transmit priority for the Message Objects is attached to the message number. Message Object 1 has the highest priority, while Message Object 32 has the lowest priority. If more than one transmission request is pending, they are serviced due to the priority of the corresponding Message Object

#### 6.20.7.7 Configuring a Transmit Object

The following table shows how a Transmit Object should be initialized.

Ms	Arb	Data	Mask	EoB	Dir	NewDat	MsgLst	RxIE	TxIE	IntPnd	RmtEn	TxRqst
1	appl.	appl.	appl.	1	1	0	0	0	appl.	0	appl.	0

Table 6-25 Initialization of a Transmit Object

**Note:** appl. = application software.

The Arbitration Register values (ID28-0 (CAN\_IFn\_ARB1/2) and Xtd bit (CAN\_IFn\_ARB2[14])) are provided by the application. They define the identifier and type of the outgoing message. If an 11-bit Identifier ("Standard Frame") is used, it is programmed to ID28 - ID18. The ID17 - ID0 can then be disregarded.

If the TxIE bit (CAN\_IFn\_MCON[11]) is set, the IntPnd bit (CAN\_IFn\_MCON[13]) will be set after a successful transmission of the Message Object.

If the RmtEn bit (CAN\_IFn\_MCON[9]) is set, a matching received Remote Frame will cause the TxRqst bit (CAN\_IFn\_MCON[8]) to be set; the Remote Frame will autonomously be answered by a Data Frame.

The Data Register values (DLC3-0 (CAN\_IFn\_MCON[3:0]) , Data0-7) are provided by the application, TxRqst and RmtEn may not be set before the data is valid.

The Mask Registers (Msk28-0, UMask, MXtd, and MDir bits) may be used (UMask (CAN\_IFn\_MCON[12]) = '1') to allow groups of Remote Frames with similar identifiers to set the TxRqst bit. The Dir bit (CAN\_IFn\_ARB2[13]) should not be masked.

#### 6.20.7.8 Updating a Transmit Object

The software may update the data bytes of a Transmit Object any time through the IFn Interface registers, neither MsgVal bit (CAN\_IFn\_ARB2[15]) nor TxRqst (CAN\_IFn\_MCON[8]) have to be reset before the update.

Even if only a part of the data bytes are to be updated, all four bytes of the corresponding IFn Data A Register or IFn Data B Register have to be valid before the contents of that register are transferred to the Message Object. Either the application software has to write all four bytes into the IFn Data Register or the Message Object is transferred to the IFn Data Register before the software writes the new data bytes.

When only the (eight) data bytes are updated, first 0x0087 is written to the Command Mask Register and then the number of the Message Object is written to the Command Request Register, concurrently updating the data bytes and setting TxRqst.

To prevent the reset of TxRqst at the end of a transmission that may already be in progress while the data is updated, NewDat (CAN\_IFn\_MCON[15]) has to be set together with TxRqst.

When NewDat is set together with TxRqst, NewDat will be reset as soon as the new transmission has started.

#### 6.20.7.9 Configuring a Receive Object

The following table shows how a Receive Object should be initialized.

MsgVal	Arb	Data	Mask	EoB	Dir	NewDat	MsgLst	RxIE	TxIE	IntPnd	RmtEn	TxRqst
1	appl.	appl.	appl.	1	0	0	0	appl.	0	0	0	0

Table 6-26 Initialization of a Receive Object

The Arbitration Registers values (ID28-0 (CAN\_IFn\_ARB1/2) and Xtd bit (CAN\_IFn\_ARB2[14])) are provided by the application. They define the identifier and type of accepted received messages. If an 11-bit Identifier ("Standard Frame") is used, it is programmed to ID28 - ID18. Then ID17 - ID0 can be disregarded. When a Data Frame with an 11-bit Identifier is received, ID17 - ID0 will be set to '0'.

If the RxIE bit (CAN\_IFn\_MCON[10]) is set, the IntPnd bit (CAN\_IFn\_MCON[13]) will be set when a received Data Frame is accepted and stored in the Message Object.

The Data Length Code (DLC3-0 (CAN\_IFn\_MCON[3:0]) ) is provided by the application. When the Message Handler stores a Data Frame in the Message Object, it will store the received Data Length Code and eight data bytes. If the Data Length Code is less than 8, the remaining bytes of the Message Object will be overwritten by unspecified values.

The Mask Registers (Msk28-0, UMask, MXtd, and MDir bits) may be used (UMask (CAN\_IFn\_MCON[12]) = '1') to allow groups of Data Frames with similar identifiers to be accepted. The Dir bit (CAN\_IFn\_ARB2[13]) should not be masked in typical applications.

#### 6.20.7.10 Handling Received Messages

The application software may read a received message any time through the IFn Interface registers. The data consistency is guaranteed by the Message Handler state machine.

Typically, the software will write first 0x007F to the Command Mask Register and then the number of the Message Object to the Command Request Register. This combination will transfer the whole received message from the Message RAM into the Message Buffer Register. Additionally, the bits NewDat (CAN\_IFn\_MCON[15]) and IntPnd (CAN\_IFn\_MCON[13]) are cleared in the Message RAM (not in the Message Buffer).

If the Message Object uses masks for acceptance filtering, the arbitration bits shows which of the matching messages have been received.

The actual value of NewDat shows whether a new message has been received since the last time this Message Object was read. The actual value of MsgLst (CAN\_IFn\_MCON[14]) shows whether more than one message has been received since the last time this Message Object was read. MsgLst will not be automatically reset.

By means of a Remote Frame, the software may request another CAN node to provide new data for a receive object. Setting the TxRqst bit (CAN\_IFn\_MCON[8]) of a receive object will cause the transmission of a Remote Frame with the receive object's identifier. This Remote Frame triggers the other CAN node to start the transmission of the matching Data Frame. If the matching Data

Frame is received before the Remote Frame could be transmitted, the TxRqst bit is automatically reset.

#### 6.20.7.11 *Configuring a FIFO Buffer*

With the exception of the EoB bit (CAN\_IFn\_MCON[7]), the configuration of Receive Objects belonging to a FIFO Buffer is the same as the configuration of a (single) Receive Object, see Section 5.13.6.5: Configuring a Receive Object.

To concatenate two or more Message Objects into a FIFO Buffer, the identifiers and masks (if used) of these Message Objects have to be programmed to matching values. Due to the implicit priority of the Message Objects, the Message Object with the lowest number will be the first Message Object of the FIFO Buffer. The EoB bit of all Message Objects of a FIFO Buffer except the last have to be programmed to zero. The EoB bits of the last Message Object of a FIFO Buffer is set to one, configuring it as the End of the Block.

#### 6.20.7.12 *Receiving Messages with FIFO Buffers*

Received messages with identifiers matching to a FIFO Buffer are stored into a Message Object of this FIFO Buffer starting with the Message Object with the lowest message number.

When a message is stored into a Message Object of a FIFO Buffer, the NewDat bit (CAN\_IFn\_MCON[15]) of this Message Object is set. By setting NewDat while EoB (CAN\_IFn\_MCON[7]) is zero, the Message Object is locked for further write access by the Message Handler until the application software has written the NewDat bit back to zero.

Messages are stored into a FIFO Buffer until the last Message Object of this FIFO Buffer is reached. If none of the preceding Message Objects is released by writing NewDat to zero, all further messages for this FIFO Buffer will be written into the last Message Object of the FIFO Buffer and therefore overwrite previous messages.

#### 6.20.7.13 *Reading from a FIFO Buffer*

When the application software transfers the contents of a Message Object to the IFn Message Buffer register by writing its number to the IFn Command Request Register, the corresponding Command Mask Register should be programmed in such a way that bits NewDat (CAN\_IFn\_MCON[15]) and IntPnd (CAN\_IFn\_MCON[13]) are reset to zero (TxRqst/NewDat (CAN\_IFn\_CMASK[2]) = '1' and CrlntPnd (CAN\_IFn\_CMASK[3]) = '1'). The values of these bits in the Message Control Register always reflect the status before resetting the bits.

To assure the correct function of a FIFO Buffer, the application software should read the Message Objects starting at the FIFO Object with the lowest message number.

The following figure shows how a set of Message Objects which are concatenated to a FIFO Buffer can be handled by the application software.

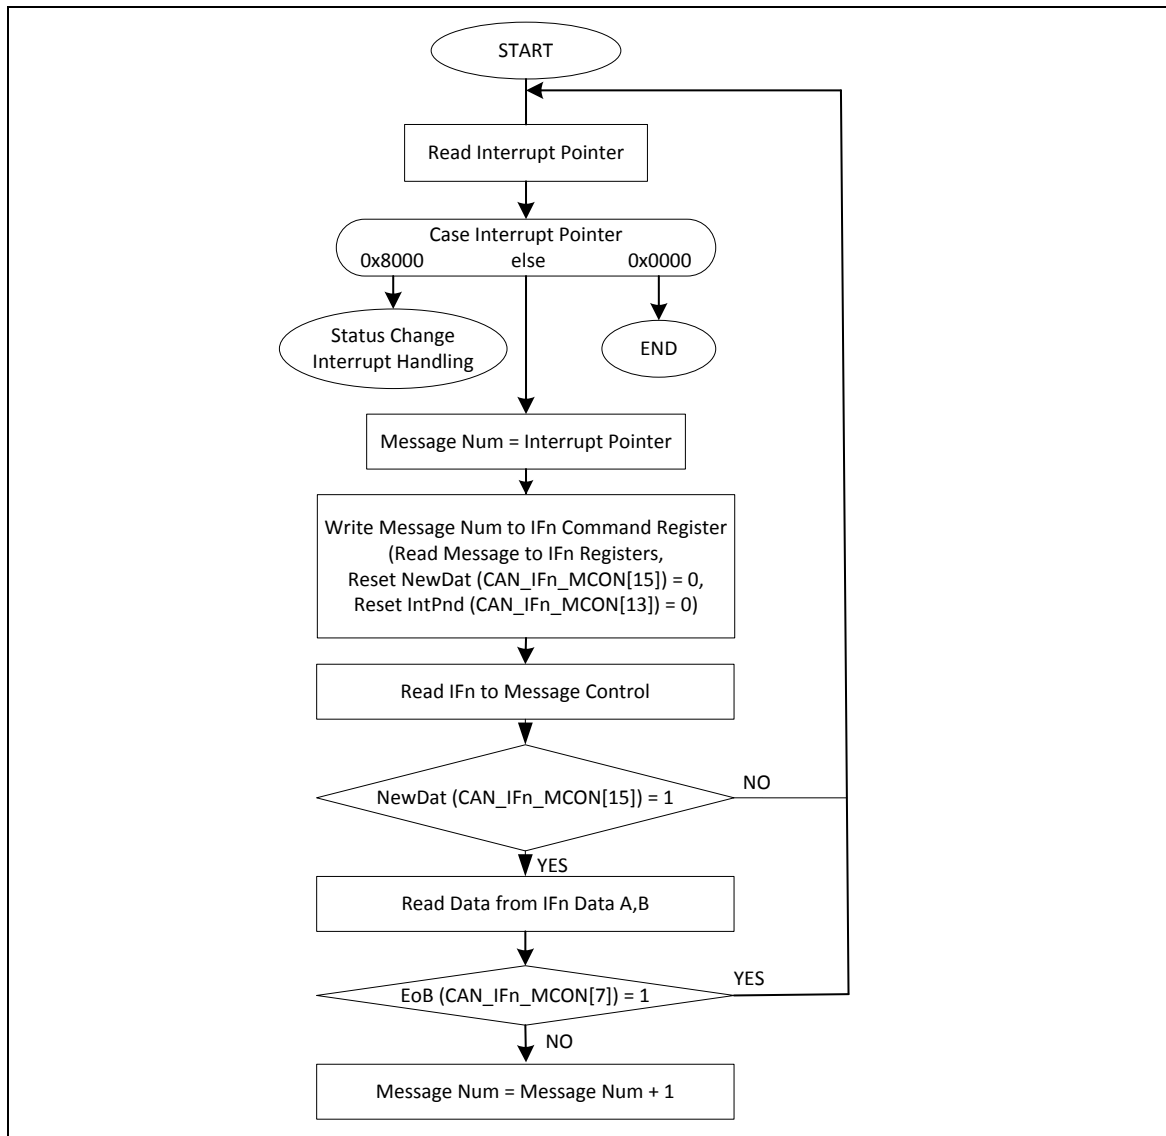

Figure 6-146 Application Software Handling of a FIFO Buffer

#### 6.20.7.14 Handling Interrupts

If several interrupts are pending, the CAN Interrupt Register will point to the pending interrupt with the highest priority, disregarding their chronological order. An interrupt remains pending until the application software has cleared it.

The Status Interrupt has the highest priority. Among the message interrupts, interrupt priority of the Message Object decreases with increasing message number.

A message interrupt is cleared by clearing the IntPnd bit (CAN\_IFn\_MCON[13]) of the Message Object. The Status Interrupt is cleared by reading the Status Register.

The interrupt identifier, IntId, in the Interrupt Register, indicates the cause of the interrupt. When no interrupt is pending, the register will hold the value zero. If the value of the Interrupt Register is different from zero, then there is an interrupt pending and, if IE (CAN\_IFn\_CON[1]) is set, the CAN\_INT interrupt signal is active. The interrupt remains active until the Interrupt Register is back to value zero (the cause of the interrupt is reset) or until IE is reset.

The value 0x8000 indicates that an interrupt is pending because the CAN Core has updated (not necessarily changed) the Status Register (Error Interrupt or Status Interrupt). This interrupt has the highest priority. The application software can update (reset) the status bits RxOk (CAN\_STATUS[4]), TxOk (CAN\_STATUS[3]) and LEC (CAN\_STATUS[2:0]), but a write access of the software to the Status Register can never generate or reset an interrupt.

All other values indicate that the source of the interrupt is one of the Message Objects. IntId points to the pending message interrupt with the highest interrupt priority.

The application software controls whether a change of the Status Register may cause an interrupt (bits EIE (CAN\_IFn\_MCON[3]) and SIE (CAN\_IFn\_MCON[2])) and whether the interrupt line becomes active when the Interrupt Register is different from zero (bit IE in the CAN Control Register). The Interrupt Register will be updated even when IE is reset.

The application software has two possibilities to follow the source of a message interrupt. First, it can follow the IntId in the Interrupt Register and second it can poll the Interrupt Pending Register.

An interrupt service routine that is reading the message that is the source of the interrupt may read the message and reset the Message Object's IntPnd at the same time (bit ClrIntPnd (CAN\_IFn\_CMASK[3])). When IntPnd is cleared, the Interrupt Register will point to the next Message Object with a pending interrupt.

#### 6.20.7.15 Configuring the Bit Timing

Even if minor errors in the configuration of the CAN bit timing do not result in immediate failure, the performance of a CAN network can be reduced significantly.

In many cases, the CAN bit synchronization will amend a faulty configuration of the CAN bit timing to such a degree that only occasionally an error frame is generated. However, in the case of arbitration, when two or more CAN nodes simultaneously try to transmit a frame, a misplaced sample point may cause one of the transmitters to become error passive.

The analysis of such sporadic errors requires a detailed knowledge of the CAN bit synchronization inside a CAN node and interaction of the CAN nodes on the CAN bus.

#### 6.20.7.16 Bit Time and Bit Rate

CAN supports bit rates in the range of lower than 1 Kbit/s up to 1000 Kbit/s. Each member of the CAN network has its own clock generator, usually a quartz oscillator. The timing parameter of the bit time (i.e. the reciprocal of the bit rate) can be configured individually for each CAN node, creating a common bit rate even though the oscillator periods of the CAN nodes ( $f_{osc}$ ) may be different.

The frequencies of these oscillators are not absolutely stable, small variations are caused by changes in temperature or voltage and by deteriorating components. As long as the variations remain inside a specific oscillator tolerance range ( $d_f$ ), the CAN nodes are able to compensate for the different bit rates by re-synchronizing to the bit stream.

According to the CAN specification, the bit time is divided into four segments (see the following figure). The Synchronization Segment, the Propagation Time Segment, the Phase Buffer Segment 1 and the Phase Buffer Segment 2. Each segment consists of a specific, programmable number of time quanta (see the following table). The length of the time quantum ( $t_q$ ), which is the basic time unit of the bit time, is defined by the CAN controller's APB clock  $f_{APB}$  and the BRP bit (CAN\_BT[5:0]) :  $t_q = BRP / f_{APB}$ .

The Synchronization Segment, Sync\_Seg, is that part of the bit time where edges of the CAN bus level are expected to occur. The distance between an edge that occurs outside of Sync\_Seg, and the Sync\_Seg is called the phase error of that edge. The Propagation Time Segment, Prop\_Seg, is intended to compensate for the physical delay times within the CAN network. The Phase Buffer Segments Phase\_Seg1 and Phase\_Seg2 surround the Sample Point. The (Re-)Synchronization Jump Width (SJW) defines how far a re-synchronization may move the Sample Point inside the limits defined by the Phase Buffer Segments to compensate for edge phase errors.

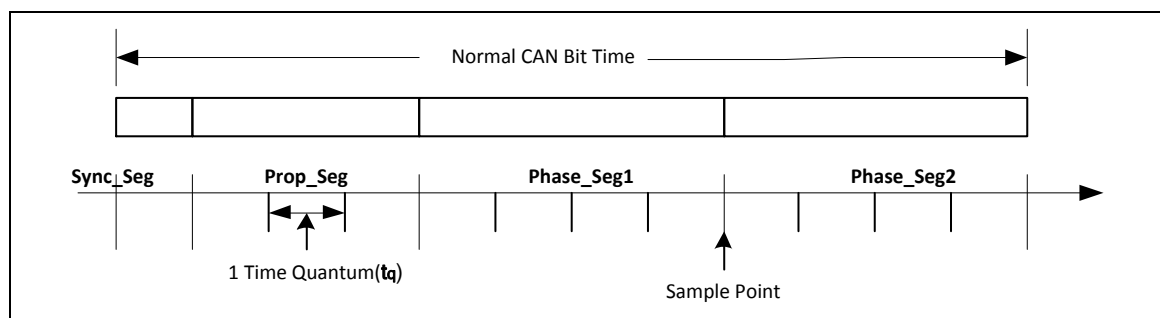

Figure 6-147 Bit Timing

Parameter	Range	Remark
BRP	[1 .. 32]	Defines the length of the time quantum $t_q$
Sync_Seg	1 $t_q$	Fixed length, synchronization of bus input to APB clock
Prop_Seg	[1.. 8] $t_q$	Compensates for the physical delay times
Phase_Seg1	[1..8] $t_q$	Which may be lengthened temporarily by synchronization
Phase_Seg2	[1.. 8] $t_q$	Which may be shortened temporarily by synchronization
SJW	[1 .. 4] $t_q$	Which may not be longer than either Phase Buffer Segment
This table describes the minimum programmable ranges required by the CAN protocol		

Table 6-27 CAN Bit Time Parameters

A given bit rate may be met by different bit time configurations, but for the proper function of the CAN network the physical delay times and the oscillator's tolerance range have to be

considered.

#### 6.20.7.17 Propagation Time Segment

This part of the bit time is used to compensate physical delay times within the network. These delay times consist of the signal propagation time on the bus and the internal delay time of the CAN nodes.

Any CAN node synchronized to the bit stream on the CAN bus will be out of phase with the transmitter of that bit stream, caused by the signal propagation time between the two nodes. The CAN protocol's non-destructive bitwise arbitration and the dominant acknowledge bit provided by receivers of CAN messages requires that a CAN node transmitting a bit stream must also be able to receive dominant bits transmitted by other CAN nodes that are synchronized to that bit stream. The example in the following figure shows the phase shift and propagation times between two CAN nodes.

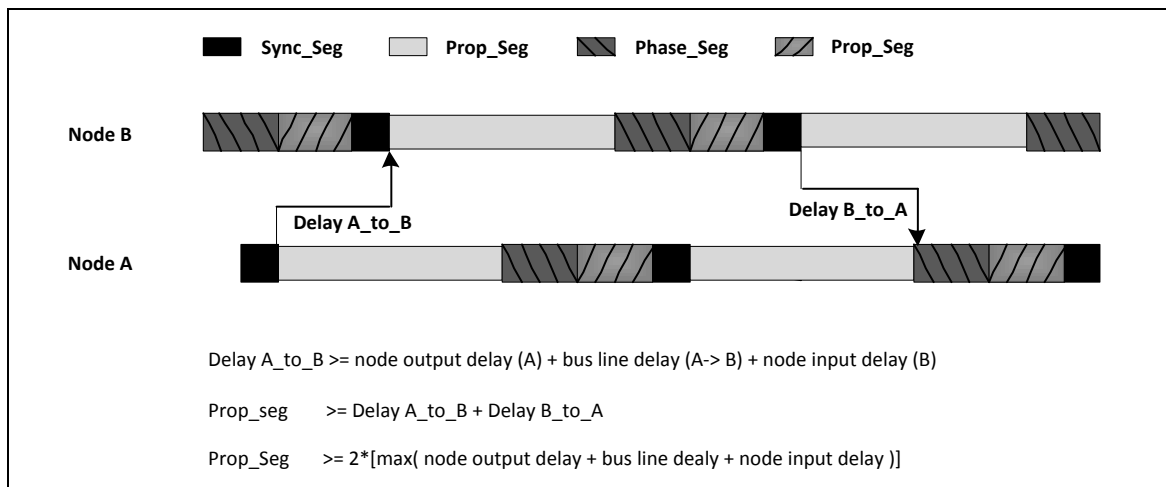

Figure 6-148 Propagation Time Segment

In this example, both nodes A and B are transmitters, performing an arbitration for the CAN bus. Node A has sent its Start of Frame bit less than one bit time earlier than node B, therefore node B has synchronized itself to the received edge from recessive to dominant. Since node B has received this edge delay (A\_to\_B) after it has been transmitted, B's bit timing segments are shifted with respect to A. Node B sends an identifier with higher priority and so it will win the arbitration at a specific identifier bit when it transmits a dominant bit while node A transmits a recessive bit. The dominant bit transmitted by node B will arrive at node A after the delay (B\_to\_A).

Due to oscillator tolerances, the actual position of node A's Sample Point can be anywhere inside the nominal range of node A's Phase Buffer Segments, so the bit transmitted by node B must arrive at node A before the start of Phase\_Seg1. This condition defines the length of Prop\_Seg.

If the edge from recessive to dominant transmitted by node B arrives at node A after the start of Phase\_Seg1, it can happen that node A samples a recessive bit instead of a dominant bit, resulting in a bit error and the destruction of the current frame by an error flag.

The error occurs only when two nodes arbitrate for the CAN bus that have oscillators of opposite ends of the tolerance range and that are separated by a long bus line. This is an example of a minor error in the bit timing configuration (Prop\_Seg too short) that causes sporadic bus errors.

Some CAN implementations provide an optional 3 Sample Mode but the C\_CAN does not. In this mode, the CAN bus input signal passes a digital low-pass filter, using three samples and a majority logic to determine the valid bit value. This results in an additional input delay of  $1 t_q$ , requiring a longer Prop\_Seg.

#### 6.20.7.18 Phase Buffer Segments and Synchronization

The Phase Buffer Segments (Phase\_Seg1 and Phase\_Seg2) and the Synchronization Jump Width (SJW) are used to compensate for the oscillator tolerance. The Phase Buffer Segments may be lengthened or shortened by synchronization.

Synchronizations occur on edges from recessive to dominant, their purpose is to control the distance between edges and Sample Points.

Edges are detected by sampling the actual bus level in each time quantum and comparing it with the bus level at the previous Sample Point. A synchronization may be done only if a recessive bit was sampled at the previous Sample Point and if the bus level at the actual time quantum is dominant.

An edge is synchronous if it occurs inside of Sync\_Seg, otherwise the distance between edge and the end of Sync\_Seg is the edge phase error, measured in time quanta. If the edge occurs before Sync\_Seg, the phase error is negative, else it is positive.

Two types of synchronization exist, Hard Synchronization and Re-synchronization.

A Hard Synchronization is done once at the start of a frame and inside a frame only when Re-synchronizations occur.

- **Hard Synchronization**

After a hard synchronization, the bit time is restarted with the end of Sync\_Seg, regardless of the edge phase error. Thus hard synchronization forces the edge, which has caused the hard synchronization to lie within the synchronization segment of the restarted bit time.

- **Bit Re-synchronization**

Re-synchronization leads to a shortening or lengthening of the bit time such that the position of the sample point is shifted with regard to the edge.

When the phase error of the edge which causes Re-synchronization is positive, Phase\_Seg1 is lengthened. If the magnitude of the phase error is less than SJW, Phase\_Seg1 is lengthened by the magnitude of the phase error, else it is lengthened by SJW.

When the phase error of the edge, which causes Re-synchronization is negative, Phase\_Seg2 is shortened. If the magnitude of the phase error is less than SJW, Phase\_Seg2 is shortened by the magnitude of the phase error, else it is shortened by SJW.

When the magnitude of the phase error of the edge is less than or equal to the programmed value of SJW, the results of Hard Synchronization and Re-synchronization are the same. If the magnitude of the phase error is larger than SJW, the Re-synchronization cannot compensate the phase error completely, an error (phase error - SJW) remains.

Only one synchronization may be done between two Sample Points. The Synchronizations maintain a minimum distance between edges and Sample Points, giving the bus level time to stabilize and filtering out spikes that are shorter than (Prop\_Seg + Phase\_Seg1).

Apart from noise spikes, most synchronizations are caused by arbitration. All nodes synchronize

“hard” on the edge transmitted by the “leading” transceiver that started transmitting first, but due to propagation delay times, they cannot become ideally synchronized. The “leading” transmitter does not necessarily win the arbitration, therefore the receivers have to synchronize themselves to different transmitters that subsequently “take the lead” and that are differently synchronized to the previously “leading” transmitter. The same happens at the acknowledge field, where the transmitter and some of the receivers will have to synchronize to that receiver that “takes the lead” in the transmission of the dominant acknowledge bit.

Synchronizations after the end of the arbitration will be caused by oscillator tolerance, when the differences in the oscillator’s clock periods of transmitter and receivers sum up during the time between synchronizations (at most ten bits). These summarized differences may not be longer than the SJW, limiting the oscillator’s tolerance range.

The examples in the following figure show how the Phase Buffer Segments are used to compensate for phase errors. There are three drawings of each two consecutive bit timings. The upper drawing shows the synchronization on a “late” edge, the lower drawing shows the synchronization on an “early” edge, and the middle drawing is the reference without synchronization.

Figure 6-149 Synchronization on “late” and “early” Edges

In the first example an edge from recessive to dominant occurs at the end of Prop\_Seg. The edge is “late” since it occurs after the Sync\_Seg. Reacting to the “late” edge, Phase\_Seg1 is lengthened so that the distance from the edge to the Sample Point is the same as it would have been from the Sync\_Seg to the Sample Point if no edge had occurred. The phase error of this “late” edge is less than SJW, so it is fully compensated and the edge from dominant to recessive at the end of the bit, which is one nominal bit time long, occurs in the Sync\_Seg.

In the second example an edge from recessive to dominant occurs during Phase\_Seg2. The edge is “early” since it occurs before a Sync\_Seg. Reacting to the “early” edge, Phase\_Seg2 is shortened and Sync\_Seg is omitted, so that the distance from the edge to the Sample Point is the same as it would have been from an Sync\_Seg to the Sample Point if no edge had occurred. As in the previous example, the magnitude of this “early” edge’s phase error is less than SJW, so it is fully compensated.

The Phase Buffer Segments are lengthened or shortened temporarily only; at the next bit time,

the segments return to their nominal programmed values.

In these examples, the bit timing is seen from the point of view of the CAN implementation's state machine, where the bit time starts and ends at the Sample Points. The state machine omits Sync\_Seg when synchronising on an "early" edge because it cannot subsequently redefine that time quantum of Phase\_Seg2 where the edge occurs to be the Sync\_Seg.

The examples in the following figure show how short dominant noise spikes are filtered by synchronisations. In both examples the spike starts at the end of Prop\_Seg and has the length of (Prop\_Seg + Phase\_Seg1).

In the first example, the Synchronization Jump Width is greater than or equal to the phase error of the spike's edge from recessive to dominant. Therefore the Sample Point is shifted after the end of the spike; a recessive bus level is sampled.

In the second example, SJW is shorter than the phase error, so the Sample Point cannot be shifted far enough; the dominant spike is sampled as actual bus level.

Figure 6-150 Filtering of Short Dominant Spikes

#### 6.20.7.19 Oscillator Tolerance Range

The oscillator tolerance range was increased when the CAN protocol was developed from version 1.1 to version 1.2 (version 1.0 was never implemented in silicon). The option to synchronize on edges from dominant to recessive became obsolete, only edges from recessive to dominant are considered for synchronization. The protocol update to version 2.0 (A and B) had no influence on the oscillator tolerance.

The tolerance range  $d_f$  for an oscillator frequency  $f_{osc}$  around the nominal frequency  $f_{nom}$  is:

$$(1 - d_f) \cdot f_{nom} \leq f_{osc} \leq (1 + d_f) \cdot f_{nom}$$

It depends on the proportions of Phase\_Seg1, Phase\_Seg2, SJW, and the bit time. The maximum tolerance  $d_f$  is the defined by two conditions (both shall be met):

$$I: d_f \leq \frac{\min(\text{Phase\_Seg1}, \text{Phase\_Seg2})}{2 * (13 * \text{bit\_time} - \text{Phase\_Seg2})}$$

$$II: d_f \leq \frac{\text{SJW}}{20 * \text{bit\_time}}$$

**Note:** These conditions base on the APB clock =  $f_{osc}$ .

It has to be considered that SJW may not be larger than the smaller of the Phase Buffer Segments and that the Propagation Time Segment limits that part of the bit time that may be used for the Phase Buffer Segments.

The combination Prop\_Seg = 1 and Phase\_Seg1 = Phase\_Seg2 = SJW = 4 allows the largest possible oscillator tolerance of 1.58%. This combination with a Propagation Time Segment of only 10% of the bit time is not suitable for short bit times; it can be used for bit rates of up to 125 Kbit/s (bit time = 8us) with a bus length of 40 m.

#### 6.20.7.20 *Configuring the CAN Protocol Controller*

In most CAN implementations and also in the C\_CAN, the bit timing configuration is programmed in two register bytes. The sum of Prop\_Seg and Phase\_Seg1 (as TSEG1 (CAN\_BT[11:8])) is combined with Phase\_Seg2 (as TSEG2 (CAN\_BT[14:12])) in one byte, SJW (CAN\_BT[7:6]) and BRP (CAN\_BT[5:0]) are combined in the other byte.

In these bit timing registers, the four components TSEG1, TSEG2, SJW, and BRP have to be programmed to a numerical value that is one less than its functional value. Therefore, instead of values in the range of [1..n], values in the range of [0..n-1] are programmed. That way, e.g. SJW (functional range of [1..4]) is represented by only two bits.

Therefore the length of the bit time is (programmed values)  $[TSEG1 + TSEG2 + 3] t_q$  or (functional values)  $[\text{Sync\_Seg} + \text{Prop\_Seg} + \text{Phase\_Seg1} + \text{Phase\_Seg2}] t_q$ .

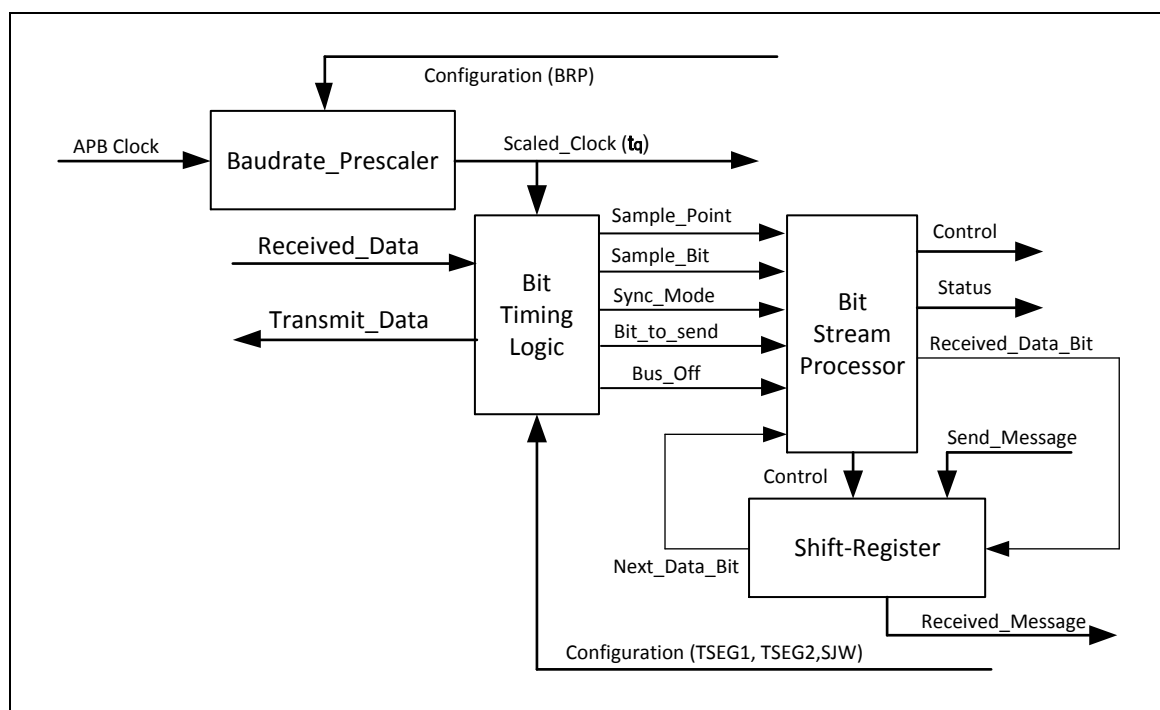

Figure 6-151 Structure of the CAN Core's CAN Protocol Controller

The data in the bit timing registers is the configuration input of the CAN protocol controller. The Baud Rate Prescaler (configured by BRP) defines the length of the time quantum, the basic time unit of the bit time; the Bit Timing Logic (configured by TSEG1, TSEG2, and SJW) defines the number of time quanta in the bit time.

The processing of the bit time, the calculation of the position of the Sample Point, and occasional synchronizations are controlled by the BTL (Bit Timing Logic) state machine, which is evaluated once each time quantum. The rest of the CAN protocol controller, the BSP (Bit Stream Processor) state machine is evaluated once each bit time, at the Sample Point.

The Shift Register sends the messages serially and parallelizes received messages. Its loading and shifting is controlled by the BSP.

The BSP translates messages into frames and vice versa. It generates and discards the enclosing fixed format bits, inserts and extracts stuff bits, calculates and checks the CRC code, performs the error management, and decides which type of synchronization is to be used. It is evaluated at the Sample Point and processes the sampled bus input bit. The time that is needed to calculate the next bit to be sent after the Sample point (e.g. data bit, CRC (Cyclic Redundancy Check) bit, stuff bit, error flag, or idle) is called the Information Processing Time (IPT).

The IPT is application specific but may not be longer than  $2 t_q$ ; the IPT for the C\_CAN is  $0 t_q$ . Its length is the lower limit of the programmed length of Phase\_Seg2. In case of a synchronization, Phase\_Seg2 may be shortened to a value less than IPT, which does not affect bus timing.

#### 6.20.7.21 Calculating Bit Timing Parameters

Usually, the calculation of the bit timing configuration starts with a desired bit rate or bit time. The resulting bit time ( $1/\text{bit rate}$ ) must be an integer multiple of the APB clock period.

The bit time may consist of 4 to 25 time quanta, the length of the time quantum  $t_q$  is defined by the Baud Rate Prescaler with  $t_q = (\text{Baud Rate Prescaler})/f_{\text{apb\_clk}}$ . Several combinations may lead to the desired bit time, allowing iterations of the following steps.

First part of the bit time to be defined is the Prop\_Seg. Its length depends on the delay times measured in the APB clock. A maximum bus length as well as a maximum node delay has to be defined for expandible CAN bus systems. The resulting time for Prop\_Seg is converted into time quanta (rounded up to the nearest integer multiple of  $t_q$ ).

The Sync\_Seg is 1  $t_q$  long (fixed), leaving  $(\text{bit time} - \text{Prop\_Seg} - 1) t_q$  for the two Phase Buffer Segments. If the number of remaining  $t_q$  is even, the Phase Buffer Segments have the same length,  $\text{Phase\_Seg2} = \text{Phase\_Seg1}$ , else  $\text{Phase\_Seg2} = \text{Phase\_Seg1} + 1$ .

The minimum nominal length of Phase\_Seg2 has to be regarded as well. Phase\_Seg2 may not be shorter than the IPT of the CAN controller, which, depending on the actual implementation, is in the range of  $[0..2] t_q$ .

The length of the Synchronization Jump Width is set to its maximum value, which is the minimum of 4 and Phase\_Seg1.

The oscillator tolerance range necessary for the resulting configuration is calculated by the formulas given in Section "Oscillator Tolerance Range"

If more than one configuration is possible, that configuration allowing the highest oscillator tolerance range should be chosen.

CAN nodes with different system clocks require different configurations to come to the same bit rate. The calculation of the propagation time in the CAN network, based on the nodes with the longest delay times, is done once for the whole network.

The oscillator tolerance range of the CAN systems is limited by that node with the lowest tolerance range.

The calculation may show that bus length or bit rate have to be decreased or that the stability of the oscillator frequency has to be increased in order to find a protocol compliant configuration of the CAN bit timing. The resulting configuration is written into the Bit Timing Register:  $(\text{Phase\_Seg2}-1)$  &  $(\text{Phase\_Seg1}+\text{Prop\_Seg}-1)$  &  $(\text{SynchronisationJumpWidth}-1)$  &  $(\text{Prescaler}-1)$

Example for Bit Timing at High Baud rate

In this example, the frequency of APB\_CLK is 10 MHz, BRP is 0, the bit rate is 1 MBit/s.

$T_q$	100	ns	$= t_{APB\_CLK}$
delay of bus driver	50	ns	
delay of receiver circuit	30	ns	
delay of bus line (40m)	220	ns	
$t_{Prop}$	600	ns	$= 6 \cdot t_q$
$t_{SJW}$	100	ns	$= 1 \cdot t_q$
$t_{TSeg1}$	700	ns	$= t_{Prop} + t_{SJW}$
$t_{TSeg2}$	200	ns	$= \text{Information Processing Time} + 1 \cdot t_q$
$t_{Sync-Seg}$	100	ns	$= 1 \cdot t_q$
bit time	1000	ns	$= t_{Sync-Seg} + t_{TSeg1} + t_{TSeg2}$
tolerance for APB_CLK	0.39	%	$= \frac{Min(PB1, PB2)}{2 \times 13 \times (bit\ time - PB2)}$ $= \frac{0.1us}{2 \times 13 \times (1us - 0.2us)}$

In this example, the CAN\_BTTIME register is programmed to= 0x1600.

## Example for Bit Timing at Low Baudrate

In this example, the frequency of APB\_CLK is 2 MHz, BRP is 1, the bit rate is 100 KBit/s.

$t_q$	1us	$= 2 \cdot t_{APB\_CLK}$
delay of bus driver	200ns	
delay of receiver circuit	80ns	
delay of bus line (40m)	220ns	
$t_{Prop}$	1us	$= 1 \cdot t_q$
$t_{SJW}$	4us	$= 4 \cdot t_q$
$t_{TSeg1}$	5us	$= t_{Prop} + t_{SJW}$
$t_{TSeg2}$	4us	$= \text{Information Processing Time} + 3 \cdot t_q$
$t_{Sync-Seg}$	1us	$= 1 \cdot t_q$
bit time	10us	$= t_{Sync-Seg} + t_{TSeg1} + t_{TSeg2}$
tolerance for APB_CLK	1.58 %	$= \frac{\text{Min}(PB1, PB2)}{2 \times 13 \times (\text{bit time} - PB2)}$ $= \frac{4us}{2 \times 13 \times (10us - 4us)}$

In this example, the CAN\_BTME register is programmed to= 0x34C1.

### 6.20.8 CAN Interface Reset State

After the hardware reset, the C\_CAN registers hold the reset values which are given in the register description in *CAN register map*.

Additionally the bus-off state is reset and the output CAN\_TX is set to recessive (HIGH). The value 0x0001 (Init = '1') in the CAN Control Register enables the software initialization. The C\_CAN does not influence the CAN bus until the application software resets the Init bit (CAN\_CON[0]) to '0'.

The data stored in the Message RAM is not affected by a hardware reset. After powered on, the contents of the Message RAM are undefined.

Table 6-28 CAN Register Map for Each Bit Function

**Note:** Reserved bits are read as 0' except for IFn Mask 2 Register where they are read as '1'.

Res. = Reserved

### 6.20.9 Register Description

The C\_CAN allocates an address space of 256 bytes. The registers are organized as 16-bit registers.

The two sets of interface registers (IF1 and IF2) control the software access to the Message RAM. They buffer the data to be transferred to and from the RAM, avoiding conflicts between software accesses and message reception/transmission.

### 6.20.10 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
CAN Base Address: CAN0_BA = 0x4018_0000 CAN1_BA = 0x4018_4000				
CAN_CON x=0,1	CANx_BA+0x00	R/W	Control Register	0x0000_0001
CAN_STATUS x=0,1	CANx_BA+0x04	R/W	Status Register	0x0000_0000
CAN_ERR x=0,1	CANx_BA+0x08	R	Error Counter Register	0x0000_0000

<b>CAN_IF2_DAT_A1</b> x=0,1	CANx_BA+0x9C	R/W	IFn Data A1 Register (Register Map Note 3)	0x0000_0000
<b>CAN_IF2_DAT_A2</b> x=0,1	CANx_BA+0xA0	R/W	IFn Data A2 Register (Register Map Note 3)	0x0000_0000
<b>CAN_IF2_DAT_B1</b> x=0,1	CANx_BA+0xA4	R/W	IFn Data B1 Register (Register Map Note 3)	0x0000_0000
<b>CAN_IF2_DAT_B2</b> x=0,1	CANx_BA+0xA8	R/W	IFn Data B2 Register (Register Map Note 3)	0x0000_0000
<b>CAN_TXREQ1</b> x=0,1	CANx_BA+0x100	R	Transmission Request Register 1	0x0000_0000
<b>CAN_TXREQ2</b> x=0,1	CANx_BA+0x104	R	Transmission Request Register 2	0x0000_0000
<b>CAN_NDAT1</b> x=0,1	CANx_BA+0x120	R	New Data Register 1	0x0000_0000
<b>CAN_NDAT2</b> x=0,1	CANx_BA+0x124	R	New Data Register 2	0x0000_0000

<b>CAN_IPND1</b> x=0,1	CANx_BA+0x140	R	Interrupt Pending Register 1	0x0000_0000
<b>CAN_IPND2</b> x=0,1	CANx_BA+0x144	R	Interrupt Pending Register 2	0x0000_0000
<b>CAN_MVLD1</b> x=0,1	CANx_BA+0x160	R	Message Valid Register 1	0x0000_0000
<b>CAN_MVLD2</b> x=0,1	CANx_BA+0x164	R	Message Valid Register 2	0x0000_0000
<b>CAN_WU_EN</b> x=0,1	CANx_BA+0x168	R/W	Wake-up Enable Register	0x0000_0000
<b>CAN_WU_STATUS</b> x=0,1	CANx_BA+0x16C	R/W	Wake-up Status Register	0x0000_0000

- Note:** 1. 0x00 & 0br0000000, where r signifies the actual value of the CAN\_RX
2. IFn: The two sets of Message Interface Registers – IF1 and IF2, have identical function
3. An/Bn: The two sets of data registers – A1, A2 and B1, B2.
4. CAN\_BA, where x = 0 or 1.

**CAN Control Register (CAN\_CON)**

Register	Offset	R/W	Description	Reset Value
<b>CAN_CON</b> x=0, 1	CANx_BA+0x00	R/W	Control Register	0x0000_0001

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Test	CCE	DAR	Reserved	EIE	SIE	IE	Init

Bits	Description	
[31:8]	Reserved	Reserved.
[7]	Test	<b>Test Mode Enable Bit</b> 0 = Normal Operation. 1 = Test Mode.
[6]	CCE	<b>Configuration Change Enable Bit</b> 0 = No write access to the Bit Timing Register. 1 = Write access to the Bit Timing Register (CAN_BTME) allowed. (while Init bit (CAN_CON[0]) = 1).
[5]	DAR	<b>Automatic Re-Transmission Disable Bit</b> 0 = Automatic Retransmission of disturbed messages enabled. 1 = Automatic Retransmission disabled.
[4]	Reserved	Reserved.
[3]	EIE	<b>Error Interrupt Enable Bit</b> 0 = Disabled - No Error Status Interrupt will be generated. 1 = Enabled - A change in the bits BOff (CAN_STATUS[7]) or EWarn (CAN_STATUS[6]) in the Status Register will generate an interrupt.
[2]	SIE	<b>Status Change Interrupt Enable Bit</b> 0 = Disabled - No Status Change Interrupt will be generated. 1 = Enabled - An interrupt will be generated when a message transfer is successfully completed or a CAN bus error is detected.
[1]	IE	<b>Module Interrupt Enable Bit</b> 0 = Disabled. 1 = Enabled.
[0]	Init	<b>Init Initialization</b> 0 = Normal Operation. 1 = Initialization is started.

**Note:** The bus-off recovery sequence (see CAN Specification Rev. 2.0) cannot be shortened by setting or resetting the Init bit (CAN\_CON[0]). If the device goes in the bus-off state, it will set Init of its own accord, stopping all bus activities. Once Init has been cleared by the CPU, the device will then wait for 129 occurrences of Bus Idle (129 \* 11 consecutive recessive bits) before resuming normal operations. At the end of the bus-off recovery sequence, the Error Management Counters will be reset.

During the waiting time after resetting Init, each time a sequence of 11 recessive bits has been monitored, a Bit0Error code is written to the Status Register, enabling the CPU to readily check up whether the CAN bus is stuck at dominant or continuously disturbed and to monitor the proceeding of the bus-off recovery sequence.

### CAN Status Register (CAN STATUS)

Register	Offset	R/W	Description	Reset Value
<b>CAN_STATUS</b> x=0, 1	CANx_BA+0x04	R/W	Status Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
BOFF	EWarn	EPass	RxOK	TxOK	LEC		

Bits	Description	
[31:8]	Reserved	Reserved.
[7]	BOff	<b>Bus-Off Status (Read Only)</b> 0 = The CAN module is not in bus-off state. 1 = The CAN module is in bus-off state.
[6]	EWarn	<b>Error Warning Status (Read Only)</b> 0 = Both error counters are below the error warning limit of 96. 1 = At least one of the error counters in the EML has reached the error warning limit of 96.
[5]	EPass	<b>Error Passive (Read Only)</b> 0 = The CAN Core is error active. 1 = The CAN Core is in the error passive state as defined in the CAN Specification.
[4]	RxOK	<b>Received A Message Successfully</b> 0 = No message has been successfully received since this bit was last reset by the CPU. This bit is never reset by the CAN Core. 1 = A message has been successfully received since this bit was last reset by the CPU (independent of the result of acceptance filtering).
[3]	TxOK	<b>Transmitted A Message Successfully</b> 0 = Since this bit was reset by the CPU, no message has been successfully transmitted. This bit is never reset by the CAN Core. 1 = Since this bit was last reset by the CPU, a message has been successfully (error free and acknowledged by at least one other node) transmitted.
[2:0]	LEC	<b>Last Error Code (Type Of The Last Error To Occur On The CAN Bus)</b> The LEC field holds a code, which indicates the type of the last error to occur on the CAN bus. This field will be cleared to '0' when a message has been transferred (reception or transmission) without error. The unused code '7' may be written by the CPU to check for updates. The following table describes the error code.

Error Code	Meanings
0	No Error
1	Stuff Error: More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed.
2	Form Error: A fixed format part of a received frame has the wrong format.
3	AckError: The message this CAN Core transmitted was not acknowledged by another node.
4	Bit1Error: During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant.
5	Bit0Error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), though the device wanted to send a dominant level (data or identifier bit logical value '0'), but the monitored Bus value was recessive. During bus-off recovery, this status is set each time a sequence of 11 recessive bits has been monitored. This enables the CPU to monitor the proceedings of the bus-off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed).
6	CRCErrror: The CRC check sum was incorrect in the message received, the CRC received for an incoming message does not match with the calculated CRC for the received data.
7	Unused: When the LEC shows the value '7', no CAN bus event was detected since the CPU wrote this value to the LEC.

Table 6-29 Error Codes

### **Status Interrupts**

A Status Interrupt is generated by bits BOff (CAN\_STATUS[7]) and EWarn (CAN\_STATUS[6]) (Error Interrupt) or by RxOk (CAN\_STATUS[4]), TxOk (CAN\_STATUS[3]), and LEC (CAN\_STATUS[2:0]) (Status Change Interrupt) assumed that the corresponding enable bits in the CAN Control Register are set. A change of bit EPass (CAN\_STATUS[5]) or a write to RxOk, TxOk, or LEC will never generate a Status Interrupt.

Reading the Status Register will clear the Status Interrupt value (8000h) in the Interrupt Register, if it is pending.

**CAN Error Counter Register (CAN\_ERR)**

Register	Offset	R/W	Description	Reset Value
<b>CAN_ERR</b> x=0, 1	CANx_BA+0x08	R	Error Counter Register	0x0000_0000

31	30	29	28	27	26	25	24

23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
RP	REC[6:0]						
7	6	5	4	3	2	1	0
TEC[7:0]							

Bits	Description	
[31:16]	Reserved	Reserved.
[15]	RP	<b>Receive Error Passive</b> 0 = The Receive Error Counter is below the error passive level. 1 = The Receive Error Counter has reached the error passive level as defined in the CAN Specification.
[14:8]	REC	<b>Receive Error Counter</b> Actual state of the Receive Error Counter. Values between 0 and 127.
[7:0]	TEC	<b>Transmit Error Counter</b> Actual state of the Transmit Error Counter. Values between 0 and 255.

Bit Timing Register (CAN\_BTME)

Register	Offset	R/W	Description	Reset Value
CAN_BTME x=0, 1	CANx_BA+0x0C	R/W	Bit Timing Register	0x0000_2301

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved	TSeg2			TSeg1			
7	6	5	4	3	2	1	0
SJW		BRP					

Bits	Description
[31:15]	<b>Reserved</b> Reserved.
[14:12]	<b>TSeg2</b> <b>Time Segment After Sample Point</b> 0x0-0x7: Valid values for TSeg2 are [0 ... 7]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
[11:8]	<b>TSeg1</b> <b>Time Segment Before The Sample Point Minus Sync_Seg</b> 0x01-0x0F: valid values for TSeg1 are [1 ... 15]. The actual interpretation by the hardware of this value is such that one more than the value programmed is used.
[7:6]	<b>SJW</b> <b>(Re)Synchronization Jump Width</b> 0x0-0x3: Valid programmed values are [0 ... 3]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
[5:0]	<b>BRP</b> <b>Baud Rate Prescaler</b> 0x01-0x3F: The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Baud Rate Prescaler are [ 0 ... 63 ]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

**Note:** With a module clock APB\_CLK of 8 MHz, the reset value of 0x2301 configures the C\_CAN for a bit rate of 500 Kbit/s. The registers are only writable if bits CCE (CAN\_CON[6]) and Init (CAN\_CON[0]) are set.

### Interrupt Identify Register (CAN\_IIDR)

Register	Offset	R/W	Description	Reset Value
CAN_IIDR x=0, 1	CANx_BA+0x10	R	Interrupt Identifier Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
IntId[15:8]							
7	6	5	4	3	2	1	0
IntId[7:0]							

Bits	Description
[15:0]	<p><b>IntId</b></p> <p><b>Interrupt Identifier (Indicates The Source Of The Interrupt)</b></p> <p>If several interrupts are pending, the CAN Interrupt Register will point to the pending interrupt with the highest priority, disregarding their chronological order. An interrupt remains pending until the application software has cleared it. If IntId is different from 0x0000 and IE (CAN_IFn_MCON[1]) is set, the IRQ interrupt signal to the EIC is active. The interrupt remains active until IntId is back to value 0x0000 (the cause of the interrupt is reset) or until IE is reset.</p> <p>The Status Interrupt has the highest priority. Among the message interrupts, the Message Object's interrupt priority decreases with increasing message number.</p> <p>A message interrupt is cleared by clearing the Message Object's IntPnd bit (CAN_IFn_MCON[13]). The Status Interrupt is cleared by reading the Status Register.</p>

IntId Value	Meanings
0x0000	No Interrupt is Pending
0x0001-0x0020	Number of Message Object which caused the interrupt.
0x0021-0x7FFF	Unused
0x8000	Status Interrupt
0x8001-0xFFFF	Unused

Table 6-30 Source of Interrupts

### Test Register (CAN\_TEST)

Register	Offset	R/W	Description	Reset Value
CAN_TEST x=0, 1	CANx_BA+0x14	R/W	Test Register (Register Map Note 1)	0x0000_0080

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Rx	Tx[1:0]		LBack	Silent	Basic	Res	

Bits	Description	
[31:8]	Reserved	Reserved.
[7]	Rx	<b>Monitors The Actual Value Of CAN_RX Pin (Read Only)</b> 0 = The CAN bus is dominant (CAN_RX = '0'). 1 = The CAN bus is recessive (CAN_RX = '1').
[6:5]	Tx[1:0]	<b>Tx[1:0]: Control Of CAN_TX Pin</b> 00 = Reset value, CAN_TX pin is controlled by the CAN Core. 01 = Sample Point can be monitored at CAN_TX pin. 10 = CAN_TX pin drives a dominant ('0') value. 11 = CAN_TX pin drives a recessive ('1') value.
[4]	LBack	<b>Loop Back Mode Enable Bit</b> 0 = Loop Back Mode is disabled. 1 = Loop Back Mode is enabled.
[3]	Silent	<b>Silent Mode</b> 0 = Normal operation. 1 = The module is in Silent Mode.
[2]	Basic	<b>Basic Mode</b> 0 = Basic Mode disabled. 1 = IF1 Registers used as Tx Buffer, IF2 Registers used as Rx Buffer.
[1:0]	Res	<b>Reserved</b> There are reserved bits. These bits are always read as '0' and must always be written with '0'.

Reset value: 0000 0000 R000 0000 b (R:current value of RX pin)

**Note:** Write access to the Test Register is enabled by setting the Test bit (CAN\_CON[7]). The different test functions may be combined, but Tx[1-0] "00" (CAN\_TEST[6:5]) disturbs message transfer.

### Baud Rate Prescaler Extension REGISTER (CAN\_BRPE)

Register	Offset	R/W	Description	Reset Value
<b>CAN_BRPE</b> x=0, 1	CANx_BA+0x18	R/W	Baud Rate Prescaler Extension Register	0x0000_0000

Reserved				BRPE			

Bits	Description	
[31:4]	Reserved	Reserved.
[3:0]	BRPE	<b>BRPE: Baud Rate Prescaler Extension</b> 0x00-0x0F: By programming BRPE, the Baud Rate Prescaler can be extended to values up to 1023. The actual interpretation by the hardware is that one more than the value programmed by BRPE (MSBs) and BTIME (LSBs) is used.

## Message Interface Register Sets

There are two sets of Interface Registers, which are used to control the CPU access to the Message RAM. The Interface Registers avoid conflict between the CPU accesses to the Message RAM and CAN message reception and transmission by buffering the data to be transferred. A complete Message Object or parts of the Message Object may be transferred between the Message RAM and the IFn Message Buffer registers in one single transfer.

The function of the two interface register sets is identical except for the Basic test mode. They can be used the way one set of registers is used for data transfer to the Message RAM while the other set of registers is used for the data transfer from the Message RAM, allowing both processes to be interrupted by each other. The following table provides an overview of the two Interface Register sets.

Each set of Interface Registers consists of Message Buffer Registers controlled by their own Command Registers. The Command Mask Register specifies the direction of the data transfer and which parts of a Message Object will be transferred. The Command Request Register is used to select a Message Object in the Message RAM as target or source for the transfer and to start the action specified in the Command Mask Register.

Address	IF1 Register Set	Address	IF2 Register Set
CANx_BA+0x20; x=0,1	IF1 Command Request	CANx_BA+0x80; x=0,1	IF2 Command Request
CANx_BA+0x24; x=0,1	IF1 Command Mask	CANx_BA+0x84; x=0,1	IF2 Command Mask
CANx_BA+0x28; x=0,1	IF1 Mask 1	CANx_BA+0x88; x=0,1	IF2 Mask 1
CANx_BA+0x2C; x=0,1	IF1 Mask 2	CANx_BA+0x8C; x=0,1	IF2 Mask 2
CANx_BA+0x30; x=0,1	IF1 Arbitration 1	CANx_BA+0x90; x=0,1	IF2 Arbitration 1
CANx_BA+0x34; x=0,1	IF1 Arbitration 2	CANx_BA+0x94; x=0,1	IF2 Arbitration 2
CANx_BA+0x38; x=0,1	IF1 Message Control	CANx_BA+0x98; x=0,1	IF2 Message Control
CANx_BA+0x3C; x=0,1	IF1 Data A 1	CANx_BA+0x9C; x=0,1	IF2 Data A 1
CANx_BA+0x40; x=0,1	IF1 Data A 2	CANx_BA+0xA0; x=0,1	IF2 Data A 2
CANx_BA+0x44; x=0,1	IF1 Data B 1	CANx_BA+0xA4; x=0,1	IF2 Data B 1
CANx_BA+0x48; x=0,1	IF1 Data B 2	CANx_BA+0xA8; x=0,1	IF2 Data B 2

Table 6-31 IF1 and IF2 Message Interface Register

### IFn Command Request Register (CAN IFn\_CREQ)

Register	Offset	R/W	Description	Reset Value
CAN_IF1_CREQ x=0,1	CANx_BA+0x20	R/W	IFn (Register Map Note 2) Command Request Registers	0x0000_0001
CAN_IF2_CREQ x=0,1	CANx_BA+0x80	R/W	IFn (Register Map Note 2) Command Request Registers	0x0000_0001

31	30	29	28	27	26	25	24
Reserved

Reserved							
15	14	13	12	11	10	9	8
Busy	Res						
7	6	5	4	3	2	1	0
Res		Message Number					

Bits	Description	
[31:16]	Reserved	Reserved.
[15]	Busy	<b>Busy Flag</b> 0 = Read/write action has finished. 1 = Writing to the IFn Command Request Register is in progress. This bit can only be read by the software.
[14:6]	Reserved	Reserved.
[5:0]	Message Number	<b>Message Number</b> 0x01-0x20: Valid Message Number, the Message Object in the Message RAM is selected for data transfer. 0x00: Not a valid Message Number, interpreted as 0x20. 0x21-0x3F: Not a valid Message Number, interpreted as 0x01-0x1F.

A message transfer is started as soon as the application software has written the message number to the Command Request Register. With this write operation, the Busy bit (CAN\_IFn\_CREQ[15]) is automatically set to notify the CPU that a transfer is in progress. After a waiting time of 3 to 6 APB\_CLK periods, the transfer between the Interface Register and the Message RAM is completed. The Busy bit is cleared.

**Note:** When a Message Number that is not valid is written into the Command Request Register, the Message Number will be transformed into a valid value and that Message Object will be transferred.

### IFn Command Mask Register (CAN\_IFn\_CMASK)

The control bits of the IFn Command Mask Register specify the transfer direction and select which of the IFn Message Buffer Registers are source or target of the data transfer.

Register	Offset	R/W	Description	Reset Value
CAN_IF1_CMASK x=0,1	CANx_BA+0x24	R/W	IFn Command Mask Register	0x0000_0000
CAN_IF2_CMASK x=0,1	CANx_BA+0x84	R/W	IFn Command Mask Register	0x0000_0000

Bits	Description
[31:16]	<b>Reserved</b> Reserved.
[15]	<b>NewDat</b> <b>New Data</b> 0 = No new data has been written into the data portion of this Message Object by the Message Handler since last time this flag was cleared by the application software. 1 = The Message Handler or the application software has written new data into the data portion of this Message Object.
[14]	<b>MsgLst</b> <b>Message Lost (only valid for Message Objects with direction = receive).</b> 0 = No message lost since last time this bit was reset by the CPU. 1 = The Message Handler stored a new message into this object when NewDat was still set, the CPU has lost a message.
[13]	<b>IntPnd</b> <b>Interrupt Pending</b> 0 = This message object is not the source of an interrupt. 1 = This message object is the source of an interrupt. The Interrupt Identifier in the Interrupt Register will point to this message object if there is no other interrupt source with higher priority.
[12]	<b>UMask</b> <b>Use Acceptance Mask</b> 0 = Mask ignored. 1 = Use Mask (Msk28-0, MXtd, and MDir) for acceptance filtering. <b>Note:</b> If the UMask bit is set to one, the Message Object's mask bits have to be programmed during initialization of the Message Object before MsgVal bit (CAN_IFn_ARB2[15]) is set to one.
[11]	<b>TxIE</b> <b>Transmit Interrupt Enable Bit</b> 0 = IntPnd (CAN_IFn_MCON[13]) will be left unchanged after the successful transmission of a frame. 1 = IntPnd will be set after a successful transmission of a frame.
[10]	<b>RxIE</b> <b>Receive Interrupt Enable Bit</b>

		0 = IntPnd (CAN_IFn_MCON[13]) will be left unchanged after a successful reception of a frame. 1 = IntPnd will be set after a successful reception of a frame.
[9]	RmtEn	<b>Remote Enable Bit</b> 0 = At the reception of a Remote Frame, TxRqst (CAN_IFn_MCON[8]) is left unchanged. 1 = At the reception of a Remote Frame, TxRqst is set.
[8]	TxRqst	<b>Transmit Request</b> 0 = This Message Object is not waiting for transmission. 1 = The transmission of this Message Object is requested and is not yet done.
[7]	EoB	<b>End Of Buffer</b> 0 = Message Object belongs to a FIFO Buffer and is not the last Message Object of that FIFO Buffer. 1 = Single Message Object or last Message Object of a FIFO Buffer. <b>Note:</b> This bit is used to concatenate two or more Message Objects (up to 32) to build a FIFO Buffer. For single Message Objects (not belonging to a FIFO Buffer), this bit must always be set to one.
[6:4]	Reserved	Reserved.
[3:0]	DLC	<b>Data Length Code</b> 0-8: Data Frame has 0-8 data bytes. 9-15: Data Frame has 8 data bytes <b>Note:</b> The Data Length Code of a Message Object must be defined the same as in all the corresponding objects with the same identifier at other nodes. When the Message Handler stores a data frame, it will write the DLC to the value given by the received message. Data 0: 1st data byte of a CAN Data Frame Data 1: 2nd data byte of a CAN Data Frame Data 2: 3rd data byte of a CAN Data Frame Data 3: 4th data byte of a CAN Data Frame Data 4: 5th data byte of a CAN Data Frame Data 5: 6th data byte of a CAN Data Frame Data 6: 7th data byte of a CAN Data Frame Data 7 : 8th data byte of a CAN Data Frame <b>Note:</b> The Data 0 Byte is the first data byte shifted into the shift register of the CAN Core during a reception while the Data 7 byte is the last. When the Message Handler stores a Data Frame, it will write all the eight data bytes into a Message Object. If the Data Length Code is less than 8, the remaining bytes of the Message Object will be overwritten by unspecified values.

Data[7]							
7	6	5	4	3	2	1	0
Data[6]							

Bits	Description	
[31:16]	Reserved	Reserved.
[15:8]	Data [7]	<b>Data Byte 7</b> 8th data byte of CAN Data Frame.
[7:0]	Data [6]	<b>Data Byte 6</b> 7th data byte of CAN Data Frame.

In a CAN Data Frame, Data [0] is the first, Data [7] is the last byte to be transmitted or received. In CAN's serial bit stream, the MSB of each byte will be transmitted first.

### Message Object in the Message Memory

There are 32 Message Objects in the Message RAM. To avoid conflicts between application software access to the Message RAM and CAN message reception and transmission, the CPU cannot directly access the Message Objects, these accesses are handled through the IF $n$  Interface Registers. The following table provides an overview of the structures of a Message Object.

Message Object												
UMask	Msk [28:0]	MXtd	MDir	EoB	NewDat		MsgLst	RxIE	TxIE	IntPnd	RmtEn	TxRqst
MsgVal	ID [28:0]	Xtd	Dir	DLC [3:0]	Data0	Data1	Data2	Data3	Data4	Data5	Data6	Data7

Table 6-32 Structure of a Message Object in the Message Memory

The Arbitration Registers ID28-0 (CAN\_IF $n$ \_ARB1/2), Xtd (CAN\_IF $n$ \_ARB2[14]), and Dir (CAN\_IF $n$ \_ARB2[13]) are used to define the identifier and type of outgoing messages and are used (together with the mask registers Msk28-0 (CAN\_IF $n$ \_MASK1/2), MXtd (CAN\_IF $n$ \_MASK2[15]), and MDir (CAN\_IF $n$ \_MASK2[14])) for acceptance filtering of incoming messages. A received message is stored in the valid Message Object with matching identifier and Direction = receive (Data Frame) or Direction = transmit (Remote Frame). Extended frames can be stored only in Message Objects with Xtd = one, standard frames in Message Objects with Xtd = zero. If a received message (Data Frame or Remote Frame) matches with more than one valid Message Object, it is stored into that with the lowest message number.

### Message Handler Registers

All Message Handler registers are read only. Their contents (TxRqst(CAN\_IF $n$ \_MCON[8]), NewDat (CAN\_IF $n$ \_MCON[15]), IntPnd(CAN\_IF $n$ \_MCON[13]), and MsgVal (CAN\_IF $n$ \_ARB2[15]) bits of each Message Object and the Interrupt Identifier) are status information provided by the Message Handler FSM.

### Transmission Request Register 1 (CAN\_TXREQ1)

These registers hold the TxRqst bits of the 32 Message Objects. By reading the TxRqst bits, the software can check which Message Object in a Transmission Request is pending. The TxRqst bit of a specific Message Object can be set/reset by the application software through the IFn Message Interface Registers or by the Message Handler after reception of a Remote Frame or after a successful transmission.

Register	Offset	R/W	Description	Reset Value

### New Data Register 1 (CAN\_NDAT1)

These registers hold the NewDat bits of the 32 Message Objects. By reading out the NewDat bits, the software can check for which Message Object the data portion was updated. The NewDat bit of a specific Message Object can be set/reset by the software through the IFn Message Interface Registers or by the Message Handler after reception of a Data Frame or after a successful transmission.

Register	Offset	R/W	Description	Reset Value

### Interrupt Pending Register 1 (CAN\_IPND1)

These registers contain the IntPnd bits of the 32 Message Objects. By reading the IntPnd bits, the software can check for which Message Object an interrupt is pending. The IntPnd bit of a specific Message Object can be set/reset by the application software through the IFn Message Interface Registers or by the Message Handler after reception or after a successful transmission of a frame. This will also affect the value of IntId in the Interrupt Register.

Register	Offset	R/W	Description	Reset Value
CAN_IPND1 x=0, 1	CANx_BA+0x140	R	Interrupt Pending Register 1	0x0000_0000

[15:0]	IntPnd 32-17	<b>Interrupt Pending Bits 32-17(Of All Message Objects)</b> 0 = This message object is not the source of an interrupt. 1 = This message object is the source of an interrupt.

### Message Valid Register 1 (CAN\_MVLD1)

These registers hold the MsgVal bits of the 32 Message Objects. By reading the MsgVal bits, the application software can check which Message Object is valid. The MsgVal bit of a specific Message Object can be set/reset by the application software via the IFn Message Interface Registers.

Register	Offset	R/W	Description	Reset Value
CAN_MVLD1 x=0, 1	CANx_BA+0x160	R	Message Valid Register 1	0x0000_0000

31	30	29	28	27	26	25	24

## 6.21 Analog-to-Digital Converter (ADC)

### 6.21.1 Overview

The NuMicro™ NUC230/240 series contains one 12-bit successive approximation analog-to-digital converters (SAR A/D converter) with 8 input channels. The A/D converter supports three operation modes: single, single-cycle scan and continuous scan mode. The A/D converter can be started by software, PWM Center-aligned trigger and external STADC pin.

### 6.21.2 Features

- Analog input voltage range: 0~VREF
- 12-bit resolution and 10-bit accuracy is guaranteed
- Up to 8 single-end analog input channels or 4 differential analog input channels
- Up to 1 MSPS conversion rate (chip working at 5V)
- Three operating modes
  - Single mode: A/D conversion is performed one time on a specified channel
  - Single-cycle scan mode: A/D conversion is performed one cycle on all specified channels with the sequence from the smallest numbered channel to the largest numbered channel
  - Continuous scan mode: A/D converter continuously performs Single-cycle scan mode until software stops A/D conversion
- An A/D conversion can be started by:
  - Writing 1 to ADST bit (ADCR[11]) through software
  - PWM Center-aligned trigger
  - External pin STADC
- Conversion results are held in data registers for each channel with valid and overrun indicators
- Supports two set digital comparators. The conversion result can be compared with specify value and user can select whether to generate an interrupt when conversion result matches the compare register setting
- Channel 7 supports 3 input sources: external analog voltage, internal Band-gap voltage, and internal temperature sensor output

### 6.21.3 Block Diagram

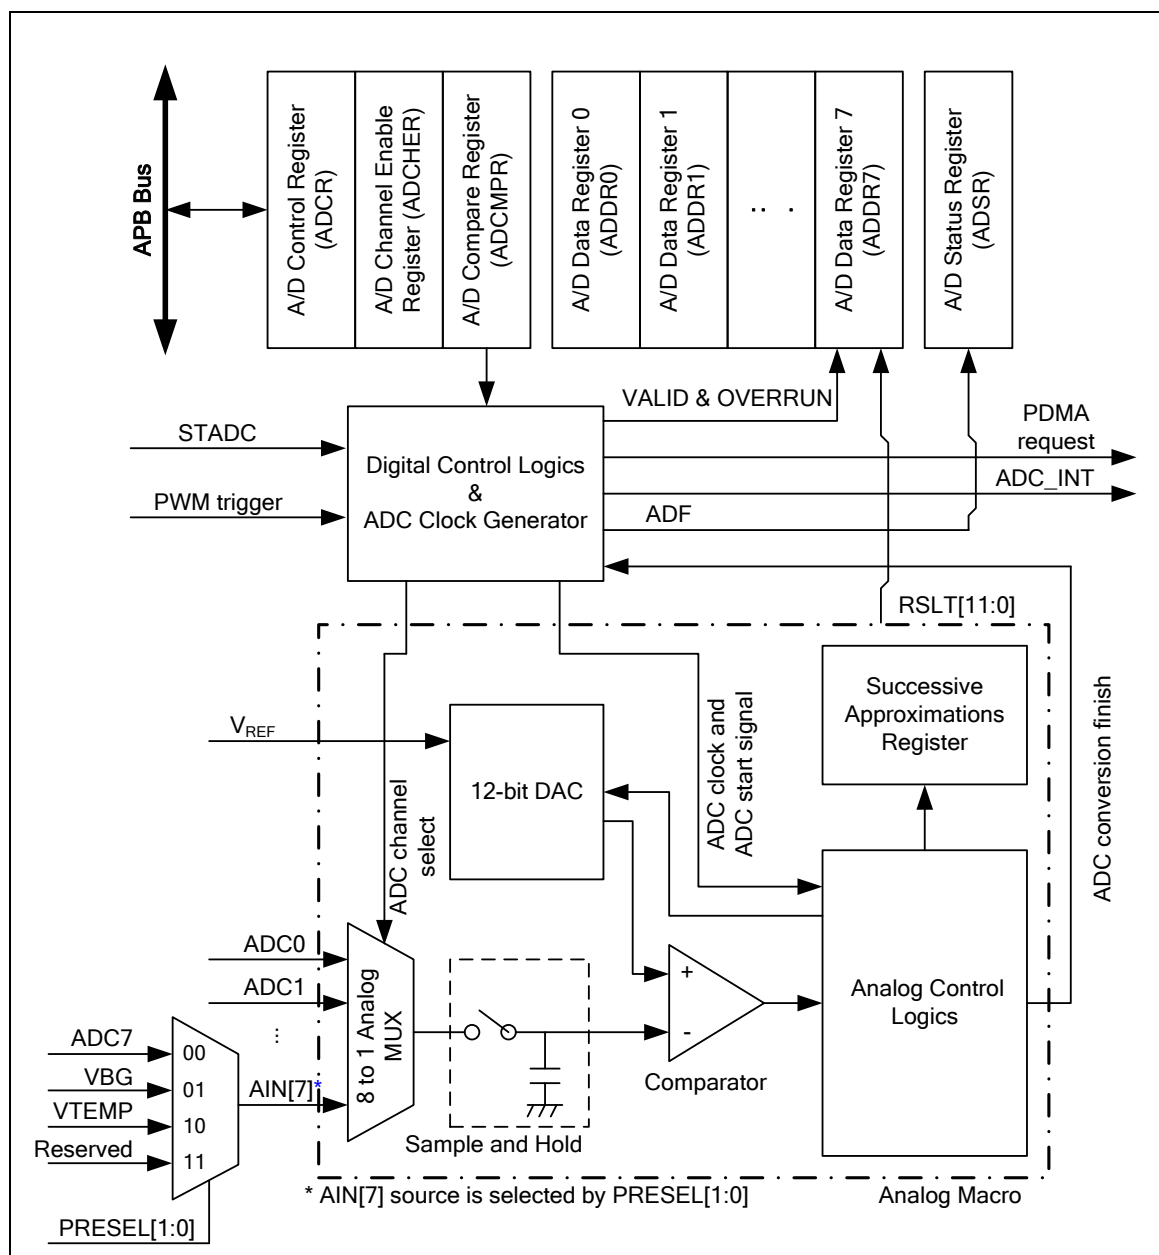

Figure 6-152 ADC Controller Block Diagram

### 6.21.4 Basic Configuration

The ADC Controller clock source is enabled by ADC\_EN bit (CLK\_APBCLK[28]). After user change the GPA\_MFP register to ADC analog input, user need set OFFD (GPIOA\_OFFD [23:16]) = 1 to disable digital input path.

### 6.21.5 Functional Description

The A/D converter operates by successive approximation with 12-bit resolution. The ADC has three operation modes: Single mode, Single-cycle Scan mode and Continuous Scan mode. When changing the operating mode or analog input channel, to prevent incorrect operation, software must clear ADST bit (ADCR[11]) to 0.

#### 6.21.5.1 ADC Clock Generator

The maximum sampling rate is up to 1 MSPS. The ADC engine has four clock sources selected by 2-bit ADC\_S (CLKSEL1[3:2]), the ADC clock frequency is divided by an 8-bit prescaler with the formula:

The ADC clock frequency = (ADC clock source frequency) / (ADC\_N (CLKDIV[23:16])+1);

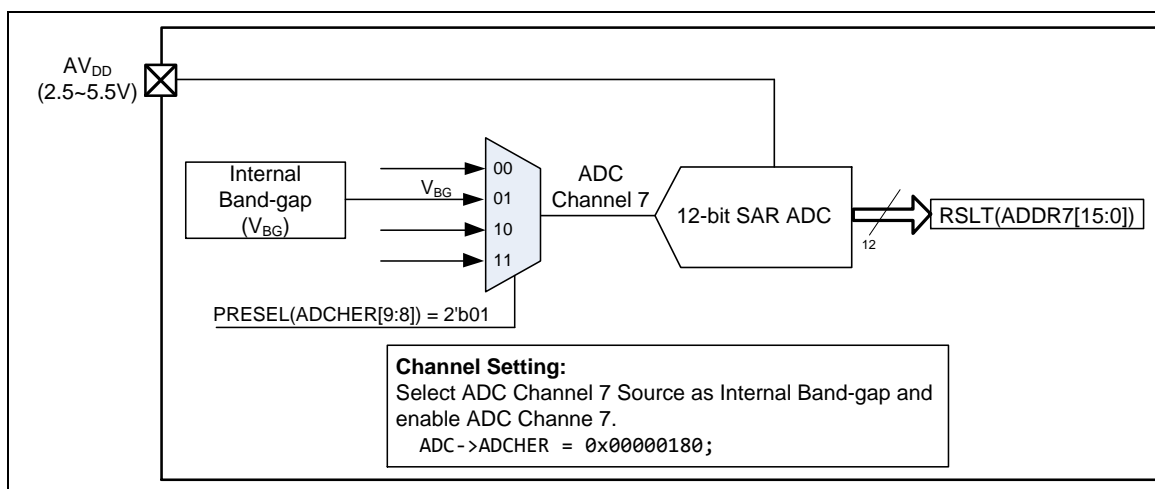

Figure 6-153 ADC Clock Control

### 6.21.5.2 Single Mode

In single mode, A/D conversion is performed only once on the specified single channel. The operations are as follows:

1. A/D conversion will be started when the ADST bit (ADCR[11]) is set to 1 by software.
2. When A/D conversion is finished, the result is stored in the A/D data register corresponding to the channel.
3. The ADF bit (ADSR[0]) will be set to 1. If the ADIE bit (ADCR[1]) is set to 1, the ADC interrupt will be asserted.
4. The ADST bit remains 1 during A/D conversion. When A/D conversion ends, the ADST bit is automatically cleared to 0 and the A/D converter enters idle state.

**Note:** If software enables more than one channel in single mode, the channel with the smallest number will be selected and the other enabled channels will be ignored.

Figure 6-154 Single Mode Conversion Timing Diagram

### 6.21.5.3 Single-Cycle Scan Mode

In single-cycle scan mode, A/D conversion will sample and convert the specified channels once in the sequence from the smallest number enabled channel to the largest number enabled channel.

1. When the ADST bit (ADCR[11]) is set to 1 by software or external trigger input, A/D conversion starts on the channel with the smallest number.
2. When A/D conversion for each enabled channel is completed, the result is sequentially transferred to the A/D data register corresponding to each channel.
3. When the conversions of all the enabled channels are completed, the ADF bit (ADSR[0]) is set to 1. If the ADC interrupt function is enabled, the ADC interrupt occurs.
4. After A/D conversion ends, the ADST bit is automatically cleared to 0 and the A/D converter enters idle state. If ADST is cleared to 0 before all enabled ADC channels conversion done, ADC controller will finish current conversion and save the result to the ADDR<sub>x</sub> of the current conversion channel.

An example timing diagram for single-cycle scan on enabled channels (0, 2, 3 and 7) is shown below:

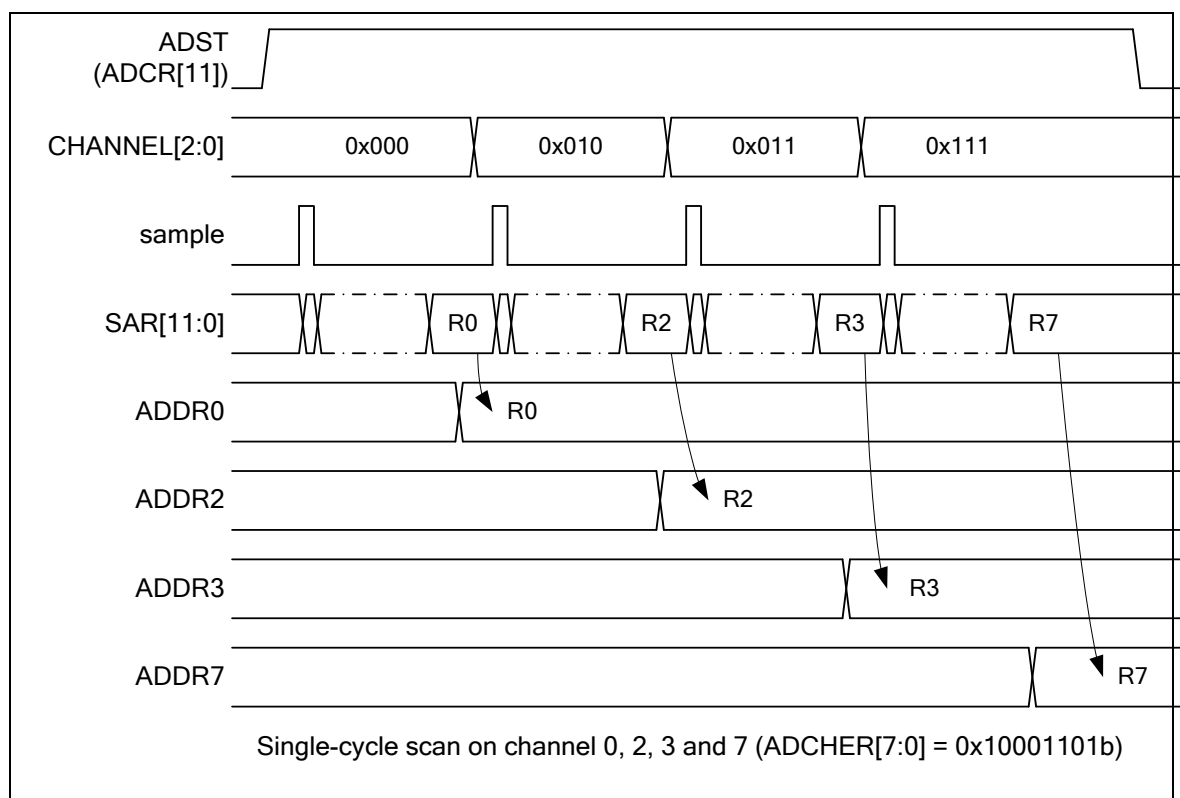

Figure 6-155 Single-Cycle Scan on Enabled Channels Timing Diagram

### 6.21.5.4 Continuous Scan Mode

In continuous scan mode, A/D conversion is performed sequentially on the specified channels that enabled by CHEN bits (ADCHER[7:0]). The operations are as follows:

1. When the ADST bit (ADCR[11]) is set to 1 by software, A/D conversion starts on the channel with the smallest number.
2. When A/D conversion for each enabled channel is completed, the result of each enabled

- channel is stored in the A/D data register corresponding to each enabled channel.
- 3. When A/D converter completes the conversions of all enabled channels sequentially, the ADF bit (ADSR[0]) will be set to 1. If the ADC interrupt function is enabled, the ADC interrupt occurs. The conversion of the enabled channel with the smallest number will start again if software has not cleared the ADST bit.
  - 4. As long as the ADST bit remains at 1, the step 2 ~ 3 will be repeated. When ADST is cleared to 0, ADC controller will stop conversion.

An example timing diagram for continuous scan on enabled channels (0, 2, 3 and 7) is shown below:

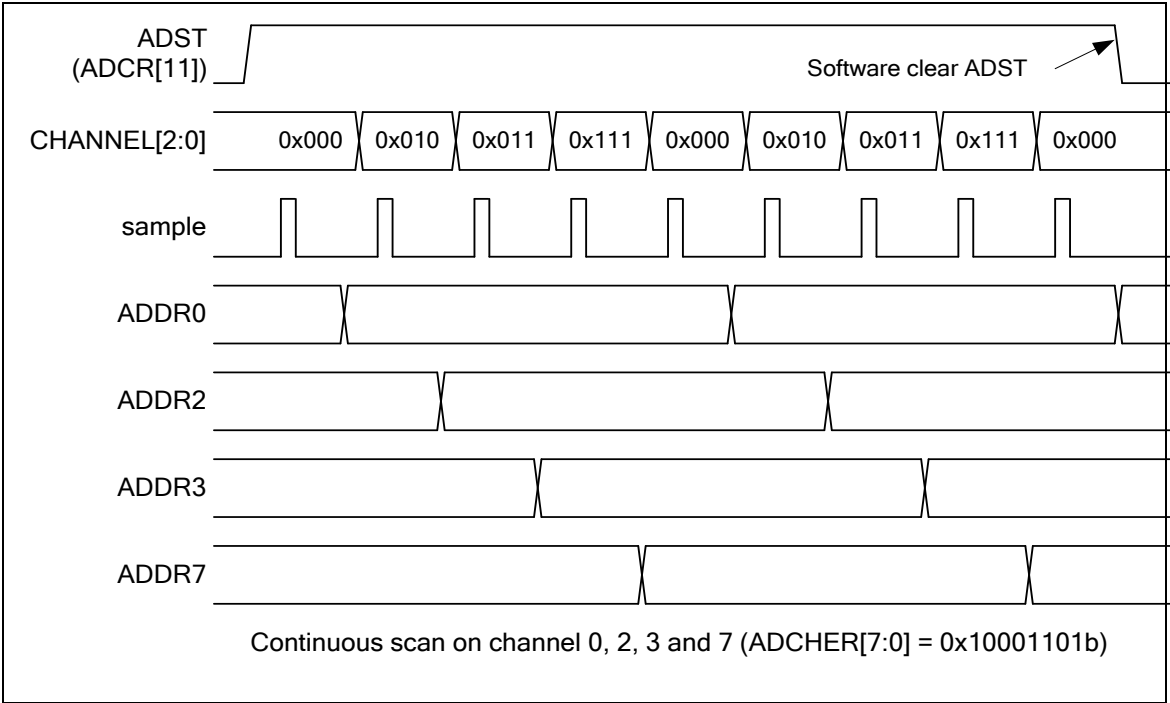

Figure 6-156 Continuous Scan on Enabled Channels Timing Diagram

### 6.2.1.5 Internal Reference Voltage

The band-gap voltage reference ( $V_{BG}$ ) is an internal fixed reference voltage regardless of power supply variations. The  $V_{BG}$  output is internally connected to ADC channel 7 source multiplexer and Analog Comparators's (ACMP) negative input side.

For battery power detection application, user can use the  $V_{BG}$  as ADC input channel such that user can convert the A/D conversion result to calculate  $AV_{DD}$  with following formula.

$$AV_{DD} = ((2^N) / R) * V_{BG}$$

N: ADC resolution

R: A/D conversion result

$V_{BG}$ : Band-gap voltage

The block diagram is shown as Figure 6-157.

Figure 6-157  $V_{BG}$  for Measuring  $AV_{DD}$  Application Block Diagram

For example, the  $V_{BG}$  typical value is 1.25 V, the ADC is 12-bit resolution, select  $V_{BG}$  as ADC channel 7 input source, and enable ADC channel 7. Then trigger ADC to converse.

If the A/D conversion result is 1707:

$$N = 12$$

$$R = 1707$$

$$V_{BG} = 1.25 \text{ V}$$

$$AV_{DD} = ((2^{12}) / 1707) * 1.25 = (4096 / 1707) * 1.25 = 3 \text{ V}$$

If the A/D conversion result is 2048:

$$AV_{DD} = ((2^{12}) / 2048) * 1.25 = (4096 / 2048) * 1.25 = 2.5 \text{ V}$$

#### 6.21.5.6 External trigger Input Sampling and A/D Conversion Time

In single-cycle scan mode, A/D conversion can be triggered by external pin request. When the TRGEN (ADCR[8]) is set to high to enable ADC external trigger function, setting the TRGS bits (ADCR[5:4]) to 00b is to select external trigger input from the STADC pin. Software can set TRGCOND (ADCR[7:6]) to select trigger condition is falling/rising edge or low/high level. If level trigger condition is selected, the STADC pin must be kept at defined state at least 8 PCLKs. The ADST bit will be set to 1 at the 9th PCLK and start to conversion. Conversion is continuous if external trigger input is kept at active state in level trigger mode. It is stopped only when external condition trigger condition disappears. If edge trigger condition is selected, the high and low state must be kept at least 4 PCLKs. Pulse that is shorter than this specification will be ignored.

#### 6.21.5.7 PWM Center-aligned trigger

In single-cycle scan mode, the PWM can be the trigger source of ADC by setting the TRGEN (ADCR[8]) to 1 and the TRGS (ADCR[5:4]) to 11b.

When PWM enables trigger ADC function, the PWM will generate a trigger signal to ADC when PWM counter is running to PWM center point.

#### 6.21.5.8 Conversion Result Monitor by Compare Function

The ADC controller provide two sets of compare register ADCMPR0 and ADCMPR1, to monitor maximum two specified channels conversion result from A/D conversion controller, refer to Figure 6-158. Software can select which channel to be monitored by set CMPCH (ADCMPR0/1[5:3]) and CMPCOND bit (ADCMPR0/1[2]) is used to check conversion result is less than specify value or greater than (equal to) value specified in CMPD (ADCMPR0/1 [27:16]). When the conversion of the channel specified by CMPCH is completed, the comparing action will be triggered one time automatically. When the compare result meets the setting, compare match counter will increase 1, otherwise, the compare match counter will be cleared to 0. It means the comparing data must be successively matched with the compare condition. Once any comparing data does not match during the comparing, the compare match counter will clear to 0. When counter value reach the setting of (CMPMATCNT (ADCMPR0/1 [11:8])+1) then CMPF0/1 bit (ADSR[1]/[2]) will be set to 1, if CMPIE bit (ADCMPR0/1 [1]) is set then an ADC\_INT interrupt request is generated. Software can use it to monitor the external analog input pin voltage transition in scan mode without imposing a load on software. Detailed logics diagram is shown below:

Figure 6-158 A/D Conversion Result Monitor Logics Diagram

#### 6.21.5.9 Interrupt Sources

There are three interrupt sources of ADC interrupt. When an ADC operation mode finishes its conversion, the A/D conversion end flag, ADF, will be set to 1. The CMPF0 (ADSR[1]) and CMPF1 (ADSR[2]) are the compare flags of compare function. When the conversion result meets the settings of ADCMPR0/1, the corresponding flag will be set to 1. When one of the flags, ADF (ADSR[0]), CMPF0 and CMPF1, is set to 1 and the corresponding interrupt enable bit, ADIE (ADCR[1]) and CMPIE (ADCMPR0/1[1]), is set to 1, the ADC interrupt will be asserted. Software can clear the flag to revoke the interrupt request.

Figure 6-159 A/D Controller Interrupt

#### 6.21.5.10 Peripheral DMA Request

When A/D conversion is finished, the conversion result will be loaded into ADDR register and VALID bit will be set to 1. If the PTEN bit (ADCR[9]) is set, ADC controller will generate a request to PDMA. User can use PDMA to transfer the conversion results to a user-specified memory space without CPU's intervention. The source address of PDMA operation is fixed at ADPDMA, no matter what channels was selected. When PDMA is transferring the conversion result, ADC will continue converting the next selected channel if the operation mode of ADC is single scan mode or continuous scan mode. User can monitor current PDMA transfer data through reading ADPDMA register. If ADC completes the conversion of a selected channel and the last conversion

result of the same channel has not been transferred by PDMA, OVERRUN bit (ADC\_ADDRx[16], x=0~7) of the corresponding channel will be set and the last ADC conversion result will be overwritten by the new ADC conversion result. PDMA will transfer the latest data of selected channels to the user-specified destination address.

### 6.21.6 Register Map

R: read only, W: write only, R/W: both read and write

1	ADC2	ADC3																	
2	ADC4	ADC5																	
3	ADC6	ADC7																	

[9]	PTEN	<b>PDMA Transfer Enable Bit</b> 0 = PDMA data transfer Disabled. 1 = PDMA data transfer in ADDR 0~7 Enabled. When A/D conversion is completed, the converted data is loaded into ADDR 0~7, software can enable this bit to generate a PDMA data transfer request. When PTEN=1, software must set ADIE=0 (ADCR[1]) to disable interrupt.
[8]	TRGEN	<b>Hardware Trigger Enable Bit</b> Enable or disable triggering of A/D conversion by hardware (external STADC pin or PWM Center-aligned trigger). 0 = Disabled. 1 = Enabled. ADC hardware trigger function is only supported in single-cycle scan mode. If hardware trigger mode, the ADST bit (ADCR[11]) can be set to 1 by the selected hardware trigger source.
[7:6]	TRGCOND	<b>External Trigger Condition</b> These two bits decide external pin STADC trigger event is level or edge. The signal must be kept at stable state at least 8 PCLKs for level trigger and 4 PCLKs at high and low state for edge trigger. 00 = Low level. 01 = High level. 10 = Falling edge. 11 = Rising edge.
[5:4]	TRGS	<b>Hardware Trigger Source</b> 00 = A/D conversion is started by external STADC pin. 11 = A/D conversion is started by PWM Center-aligned trigger. Others = Reserved. Software should disable TRGEN (ADCR[8]) and ADST (ADCR[11]) before change TRGS.
[3:2]	ADMD	<b>A/D Converter Operation Mode</b> 00 = Single conversion. 01 = Reserved. 10 = Single-cycle scan. 11 = Continuous scan. When changing the operation mode, software should disable ADST bit (ADCR[11]) firstly.
[1]	ADIE	<b>A/D Interrupt Enable Bit</b> 0 = A/D interrupt function Disabled. 1 = A/D interrupt function Enabled. A/D conversion end interrupt request is generated if ADIE bit (ADCR[1]) is set to 1.
[0]	ADEN	<b>A/D Converter Enable Bit</b> 0 = Disabled. 1 = Enabled. Before starting A/D conversion function, this bit should be set to 1. Clear it to 0 to disable A/D converter analog circuit for saving power consumption.

**ADC Channel Enable Register (ADCHER)**

Register	Offset	R/W	Description	Reset Value
ADCHER	ADC_BA+0x24	R/W	ADC Channel Enable Register	0x0000_0000

31	30	29	28	27	26	25	24

23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved						PRESEL[1:0]	
7	6	5	4	3	2	1	0
CHEN							

Bits	Description	
[31:10]	Reserved	Reserved.
[9:8]	PRESEL	<b>Analog Input Channel 7 Selection</b> 00 = External analog input. 01 = Internal band-gap voltage. 10 = Internal temperature sensor. 11 = Reserved.
[7:0]	CHEN	<b>Analog Input Channel Enable Bit</b> Set CHEN[7:0] to enable the corresponding analog input channel 7 ~ 0. If DIFFEN bit (ADCR[10]) is set to 1, only the even number channels need to be enabled. 0 = ADC input channel Disabled. 1 = ADC input channel Enabled.

### ADC Compare Register 0/1 (ADCMR0/1)

Register	Offset	R/W	Description	Reset Value
ADCMR0	ADC_BA+0x28	R/W	ADC Compare Register 0	0x0000_0000
ADCMR1	ADC_BA+0x2C	R/W	ADC Compare Register 1	0x0000_0000

31	30	29	28	27	26	25	24
Reserved				CMPD[11:8]			
23	22	21	20	19	18	17	16
CMPD[7:0]							
15	14	13	12	11	10	9	8
Reserved				CMPMATCNT			
7	6	5	4	3	2	1	0
Reserved		CMPCH			CMPCOND	CMPIE	CMPEN

Bits	Description
[31:28]	<b>Reserved</b> Reserved.
[27:16]	<b>CMPD</b> <b>Comparison Data</b> The 12-bit data is used to compare with conversion result of specified channel. When DMOF bit (ADCR[31]) is set to 0, ADC comparator compares CMPD with conversion result with unsigned format. CMPD should be filled in unsigned format. When DMOF bit (ADCR[31]) is set to 1, ADC comparator compares CMPD with conversion result with 2's complement format. CMPD should be filled in 2's complement format.
[15:12]	<b>Reserved</b> Reserved.
[11:8]	<b>CMPMATCNT</b> <b>Compare Match Count</b> When the specified A/D channel analog conversion result matches the compare condition defined by CMPCOND (ADCMR0/1[2]), the internal match counter will increase 1. The comparing data must successively matched with the compare condition. Once any comparing data does not match during the comparing, the internal counter will clear to 0. When the internal counter reaches the value to (CMPMATCNT (ADCMR0/1[11:8]) + 1), the CMPF0/1 bit (ADSR[1]/[2]) will be set.
[7:6]	<b>Reserved</b> Reserved.
[5:3]	<b>CMPCH</b> <b>Compare Channel Selection</b> 000 = Channel 0 conversion result is selected to be compared. 001 = Channel 1 conversion result is selected to be compared. 010 = Channel 2 conversion result is selected to be compared. 011 = Channel 3 conversion result is selected to be compared. 100 = Channel 4 conversion result is selected to be compared. 101 = Channel 5 conversion result is selected to be compared. 110 = Channel 6 conversion result is selected to be compared. 111 = Channel 7 conversion result is selected to be compared.

[2]	<b>CMPCOND</b>	<p><b>Compare Condition</b></p> <p>0 = Set the compare condition as that when a 12-bit A/D conversion result is less than the 12-bit CMPD (ADCMPR0/1[27:16]), the internal match counter will increase one.</p> <p>1 = Set the compare condition as that when a 12-bit A/D conversion result is greater or equal to the 12-bit CMPD (ADCMPR0/1[27:16]), the internal match counter will increase one.</p> <p><b>Note:</b> When the internal counter reaches the value to (CMPMATCNT (ADCMPR0/1[11:8])+1), the CMPF0/1 bit (ADSR[1]/[2]) will be set.</p>
[1]	<b>CMPIE</b>	<p><b>Compare Interrupt Enable Bit</b></p> <p>0 = Compare function interrupt Disabled.</p> <p>1 = Compare function interrupt Enabled.</p> <p>If the compare function is enabled and the compare condition matches the setting of CMPCOND (ADCMPR0/1[2]) and CMPMATCNT (ADCMPR0/1[11:8]), CMPF0/1 bit (ADSR[1]/[2]) will be asserted, in the meanwhile, if CMPIE (ADCMPR0/1[1]) is set to 1, a compare interrupt request is generated.</p>
[0]	<b>CMPEN</b>	<p><b>Compare Enable Bit</b></p> <p>0 = Compare function Disabled.</p> <p>1 = Compare function Enabled.</p> <p>Set this bit to 1 to enable ADC controller to compare CMPD (ADCMPR0/1[27:16]) with specified channel conversion result when converted data is loaded into ADDR register.</p>

### ADC Status Register (ADSR)

Register	Offset	R/W	Description	Reset Value
ADSR	ADC_BA+0x30	R/W	ADC Status Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
OVERRUN							
15	14	13	12	11	10	9	8
VALID							
7	6	5	4	3	2	1	0
Reserved	CHANNEL			BUSY	CMPF1	CMPF0	ADF

Bits	Description	
[31:24]	Reserved	Reserved.
[23:16]	OVERRUN	<b>Overrun Flag</b> It is a mirror to OVERRUN bit (ADDR0~7[16]). It is read only.
[15:8]	VALID	<b>Data Valid Flag</b> It is a mirror of VALID bit (ADDR0~7[17]). It is read only.
[7]	Reserved	Reserved.
[6:4]	CHANNEL	<b>Current Conversion Channel</b> This field reflects the current conversion channel when BUSY = 1 (ADSR[3]). When BUSY = 0, it shows the number of the next converted channel. It is read only.
[3]	BUSY	<b>BUSY/IDLE</b> 0 = A/D converter is in idle state. 1 = A/D converter is busy at conversion. This bit is mirror of as ADST bit (ADCR[11]). It is read only.
[2]	CMPF1	<b>Compare Flag</b> When the selected channel A/D conversion result meets setting condition in ADCMPR1 then this bit is set to 1. And it is cleared by writing 1 to self. 0 = Conversion result in ADDR does not meet ADCMPR1 setting. 1 = Conversion result in ADDR meets ADCMPR1 setting.
[1]	CMPF0	<b>Compare Flag</b> When the selected channel A/D conversion result meets setting condition in ADCMPR0 then this bit is set to 1. And it is cleared by writing 1 to self. 0 = Conversion result in ADDR does not meet ADCMPR0 setting. 1 = Conversion result in ADDR meets ADCMPR0 setting.

[0]	ADF	<p><b>A/D Conversion End Flag</b></p> <p>A status flag that indicates the end of A/D conversion.</p> <p>ADF is set to 1 at these two conditions:</p> <ol style="list-style-type: none"><li>1. When A/D conversion ends in Single mode.</li><li>2. When A/D conversion ends on all specified channels in Scan mode.</li></ol> <p>This flag can be cleared by writing 1 to itself.</p>
-----	-----	--

**ADC PDMA Current Transfer Data Register (ADPDMA)**

Register	Offset	R/W	Description	Reset Value
ADPDMA	ADC_BA+0x40	R	ADC PDMA Current Transfer Data Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved						AD_PDMA[17:16]	
15	14	13	12	11	10	9	8
AD_PDMA[15:8]							
7	6	5	4	3	2	1	0
AD_PDMA[7:0]							

Bits	Description	
[31:18]	Reserved	Reserved.
[17:0]	AD_PDMA	<b>ADC PDMA Current Transfer Data Register</b> When PDMA transferring, read this register can monitor current PDMA transfer data. Current PDMA transfer data is the content of ADDR0 ~ ADDR7. This is a read only register.

## 6.22 Analog Comparator (ACMP)

### 6.22.1 Overview

The NuMicro™ NUC230/240 series contains two comparators which can be used in a number of different configurations. The comparator output is logic 1 when positive input voltage is greater than negative input voltage; otherwise the output is logic 0. Each comparator can be configured to generate interrupt request when the comparator output value changes. The block diagram is shown in Figure 6-162.

### 6.22.2 Features

- Analog input voltage range: 0~  $V_{DDA}$  (Voltage of  $AV_{DD}$  pin)
- Supports Hysteresis function
- Optional internal reference voltage source for each comparator negative input

### 6.22.3 Block Diagram

Figure 6-162 Analog Comparator Block Diagram

## 6.22.4 Basic Configuration

The ACMP pin functions are configured in GPB\_MFP, GPC\_MFP, ALT\_MFP, ALT\_MFP1 and ALT\_MFP2 registers. It is recommended to disable the digital input path of the analog input pins to avoid the leakage current. The digital input path can be disabled by configuring GPIOC\_OFFD register.

The ACMP peripheral clock can be enabled in APBCLK[30].

## 6.22.5 Functional Description

### 6.22.5.1 Interrupt Sources

The output of comparators are sampled by PCLK and reflected at CO1 and CO2 of CMPSR register. If CMPIE of CMPCRn register is set to 1, the comparator interrupt will be enabled. As the output state of comparator is changed, the comparator interrupt will be asserted and the corresponding flag, CMPF0 or CMPF1, will be set. Software can clear the flag to 0 by writing 1 to it.

Figure 6-163 Comparator Controller Interrupt Sources

### 6.22.5.2 Hysteresis Function

The analog comparator provides hysteresis function to make the comparator output transition more stable. If comparator output is 0, it will not change to 1 until the positive input voltage exceeds the negative input voltage by a positive hysteresis voltage. Similarly, if comparator output is 1, it will not change to 0 until the positive input voltage drops below the negative input voltage by a negative hysteresis voltage.

Figure 6-164 Comparator Hysteresis Function

### 6.22.6 Register Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value
ACMP Base Address: ACMP_BA = 0x400D_0000				
CMPCR0	ACMP_BA+0x00	R/W	Analog Comparator 0 Control Register	0x0000_0000
CMPCR1	ACMP_BA+0x04	R/W	Analog Comparator 1 Control Register	0x0000_0000
CMPSR	ACMP_BA+0x08	R/W	Analog Comparator Status Register	0x0000_0000

## 6.22.7 Register Description

### CMP Control Register 0/1 (CMPCR0/1)

Register	Offset	R/W	Description	Reset Value
CMPCR0	ACMP_BA+0x00	R/W	Analog Comparator 0 Control Register	0x0000_0000
CMPCR1	ACMP_BA+0x04	R/W	Analog Comparator 1 Control Register	0x0000_0000

7	6	5	4	3	2	1	0
Reserved	CMPINV	Reserved	CMPCN	Reserved	CMP_HYSEN	CMPIE	CMPEN

Bits	Description
[31:5]	<b>Reserved</b> Reserved.
[6]	<b>CMPINV</b> <b>Comparator Output Inverse Enable Bit</b> 0 = Comparator analog output inverse is Disabled. 1 = Comparator analog output inverse is Enabled.
[5]	<b>Reserved</b> Reserved.
[4]	<b>CMPCN</b> <b>Comparator Negative Input Selection</b> 0 = The source of the negative comparator input is from ACMPn_N pin (n = 0, 1). 1 = Internal band-gap reference voltage is selected as the source of negative comparator input.
[3]	<b>Reserved</b> Reserved.
[2]	<b>CMP_HYSEN</b> <b>Comparator Hysteresis Enable Bit</b> 0 = Hysteresis function Disabled (Default). 1 = Hysteresis function Enabled.
[1]	<b>CMPIE</b> <b>Comparator Interrupt Enable Bit</b> 0 = Interrupt function Disabled. 1 = Interrupt function Enabled.
[0]	<b>CMPEN</b> <b>Comparator Enable Bit</b> 0 = Comparator Disabled. 1 = Comparator Enabled.

### CMP Status Register (CMPSR)

Register	Offset	R/W	Description	Reset Value
CMPSR	ACMP_BA+0x08	R/W	Analog Comparator Status Register	0x0000_0000

31	30	29	28	27	26	25	24
Reserved							
23	22	21	20	19	18	17	16
Reserved							
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved				CO1	CO0	CMPF1	CMPF0

Bits	Description
[31:4]	<b>Reserved</b> Reserved.
[3]	<b>CO1</b> <b>Comparator 1 Output</b> Synchronized to the APB clock to allow reading by software. Cleared when the comparator 1 is disabled (CMPCR1[0] = 0).
[2]	<b>CO0</b> <b>Comparator 0 Output</b> Synchronized to the APB clock to allow reading by software. Cleared when the comparator 0 is disabled (CMPCR0[0] = 0).
[1]	<b>CMPF1</b> <b>Comparator 1 Interrupt Flag</b> This bit is set by hardware whenever the comparator 1 output changes state. This will cause an interrupt if CMPCR1[1] is set to 1. Write 1 to clear this bit to 0.
[0]	<b>CMPF0</b> <b>Comparator 0 Interrupt Flag</b> This bit is set by hardware whenever the comparator 0 output changes state. This will cause an interrupt if CMPCR0[1] is set to 1. Write 1 to clear this bit to 0.

## 7 ELECTRICAL CHARACTERISTICS

For information on NuMicro™ NUC230/240 series electrical characteristics, please refer to NuMicro™ NUC230/240 Series Datasheet.

8 PACKAGE DIMENSIONS

8.1 100-pin LQFP (14x14x1.4 mm footprint 2.0 mm)

8.2 64-pin LQFP (7x7x1.4 mm footprint 2.0 mm)

8.3 48-pin LQFP (7x7x1.4 mm footprint 2.0 mm)

## 9 REVISION HISTORY

Date	Revision	Description
2014.05.12	1.00	1. Preliminary version
2014.12.30	1.01	1. Added EBI function 2. Reorganize the chepter sequence
2015.05.08	1.02	1. Modified I2C basic address, I2C0, I2C1 base address should be 0x40020000, 0x40120000 in page 503 2. Updated note for each IP clock source select condition
2016.04.26	1.03	1. Added Section Register Protection 2. Added Section Internal Reference Voltage
2020.04.8	1.04	1. Update Figure 9-1 Frequency Divider Block Diagram 2. Added Table 6-8 Timer Multifunction Pin List 3, Added notes about the hardware reference design for ICE_DAT, ICE_CLK and nRESET pins in section 4.3

### Important Notice

**Nuvoton Products are neither intended nor warranted for usage in systems or equipment, any malfunction or failure of which may cause loss of human life, bodily injury or severe property damage. Such applications are deemed, "Insecure Usage".**

**Insecure usage includes, but is not limited to: equipment for surgical implementation, atomic energy control instruments, airplane or spaceship instruments, the control or operation of dynamic, brake or safety systems designed for vehicular use, traffic signal instruments, all types of safety devices, and other applications intended to support or sustain life.**

**All Insecure Usage shall be made at customer's risk, and in the event that third parties lay claims to Nuvoton as a result of customer's Insecure Usage, customer shall indemnify the damages and liabilities thus incurred by Nuvoton.**
