# Preliminary Datasheet MM3100 – 6 Channel SPST RF Micro Switch

### **Product Overview**

### **Description**

The MM3100 device is a high power, normally open (NO), six channel Single Pole Single Throw (SPST) micro-mechanical switch for RF and microwave switch applications. The MM3100 is based on Menlo's Ideal Switch<sup>TM</sup> technology and is capable of 25 W power transfer. Each channel provides ultra-low on-state insertion loss and high off-state isolation from DC to over 3.0 GHz with greater than 3 billion switching cycles. Each channel can be individually controlled by a serial-to-parallel interface that drives the gate lines of the switches. The flexibility of six SPST channels enable implementation of different signal topologies such as dual SP3T, triple SP2T or 2 x 3 matrix. Only an external logic supply and gate bias source are required for operation of the device.

### **Features**

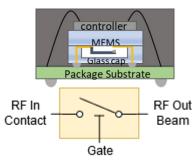

- DC to 3.0 GHz Frequency Range
- 25 W (CW), 200 W (Pulsed) Max Power Handling
- Low On-State Insertion Loss, typical 0.3 dB @ 3.0 GHz
- Low On-State Resistance < 1 Ω typical
- 25 dB Isolation @ 3 GHz
- Maximum Voltage (AC<sub>Peak</sub> or DC): +/-150 Volts on RF Input
- Switching Time < 10 us</li>
- High Reliability > 3 Billion Switching Operations
- Integrated driver eliminates requirement for an external gate driver
- 6 mm x 6 mm BGA Package

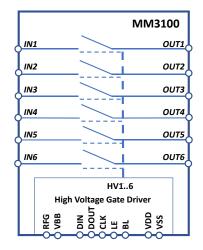

### **Applications**

- High-Power Tunable Resonators and Filters
- Broadband Power Amplifier Impedance Matching
- Electronically Steerable Antennas and Phase Shifters
- Automated Test and Measurement Systems

### **Markets**

- Defense and Aerospace
- Scientific and Medical
- Wireless Infrastructure

### **Electrical Characteristics**

### **Operating Characteristics**

### **Absolute Maximum Ratings**

Exceeding the maximum ratings as listed in Table 1 below may reduce the reliability of the device or cause permanent damage. Operation of the MM3100 should be restricted to the limits indicated in the recommended operating conditions listed in Tables 2 to 5.

### Electrostatic Discharge (ESD) Safeguards

The MM3100 is a Class 0 ESD device. When handling the MM3100, observe precautions as with any other ESD sensitive device. Do not exceed the voltage ratings specified in Table 1 below.

### **Power Sequencing**

The following power sequence is recommended:

- Power-Up: Apply VDD, set all inputs to known state, apply VBB
- Power-Down: Remove VBB, remove all inputs, remove VDD

The high voltage supply (VBB) may be applied and removed as required when VDD is present. VBB voltage should not drop below VDD or float during operation.

Table 1 Absolute Maximum Ratings<sup>1</sup>

Parameter	Minimum	Maximum	Unit
Driver Voltage Supply (VDD)		7.5	$V_{DC}$
High Voltage Gate Supply (VBB)		90	$V_{DC}$
Driver Logic Input Levels	-0.3	$V_{DD} + 0.3$	V
CW Input Power / Channel		25	W
DC Voltage VBB to OUTx pin (V <sub>VBB_OUT</sub> )	-100	100	V
Open State Voltage INx to OUTx <sup>23</sup>	-150	150	V

<sup>&</sup>lt;sup>3</sup> The voltage difference between RF Output (Beam) pin and Supply Voltage Return (VSS) pin must be within ±2.5V. Ideally the VSS pin is tied to a node with the same potential as signal ground. This ties the GATE to ground potential in the off state.

<sup>&</sup>lt;sup>1</sup> All parameters must be within recommended operating conditions. Maximum DC and RF power can only be applied during the on-state condition (cold-switched condition). CW Input Power Rating in 50  $\Omega$  environment, VSWR = 1.

<sup>&</sup>lt;sup>2</sup> This also applies to ESD events. This is a Class 0 device.

Open State Voltage OUT1-OUT6, IN1-IN6 to GND	-150	150	V
Hot Switching Voltage⁴	-0.5	0.5	V
DC Carry Current / Channel		1000	mA
Total Carry Current per Device		3000	mA
Operating Temperature Range	-40	+85	°C
Storage Temperature Range <sup>5</sup>	-65	+150	°C
ESD Rating HBM Driver Pins <sup>6</sup>		TBD	V
ESD Rating HBM RF I/O Pins <sup>7 8</sup>		150	V
Mechanical Shock <sup>9</sup>		500	G
Vibration <sup>10</sup>		500	Hz

<sup>4</sup> See section Hot Switch Restrictions for more information.

<sup>&</sup>lt;sup>10</sup> See JESD22-B103 for vibration test methodology at 3.1 G and 30min/cycle, 1 cycle/axis, 3 axis.

<sup>&</sup>lt;sup>5</sup> See section Storage and Shelf Life for more information on shelf and floor life.

<sup>&</sup>lt;sup>6</sup> Driver pins include: CLK, LE, DIN, DOUT, BL, VBB, VDD.

<sup>&</sup>lt;sup>7</sup> RF I/O pins include: IN1 to IN6, OUT1 to OUT6.

<sup>&</sup>lt;sup>8</sup> RF I/O pins must not be allowed to electrically float during switch operation. See section *Floating Node* Restrictions for details on avoiding floating nodes.

9 See JESD22-B104 for mechanical shock test methodology at 1.0 ms, half-sine, 5 shocks/axis, 6 axis.

### **Recommended Operating Conditions**

All specifications valid over full VBB range and operating temperature range unless otherwise noted.

**Table 2 RF Characteristics** 

Parameter	Minimum	Typical	Maximum	Unit
Operating Frequency Range	DC		3.0	GHz
CW Power / Channel <sup>11</sup>			25	W
Peak Power / Channel @ 10% Duty Cycle <sup>12</sup>			200	W
Insertion Loss @ 3.0 GHz		0.3		dB
Input / Output Return Loss @ 3.0 GHz		15		dB
Input to Output Isolation @ 3.0 GHz		18		dB
Adjacent Channel Isolation @ 3.0 GHz <sup>13</sup> Both Channels Closed One Channel Open		25 TBD		dB
Third-Order Output Intercept (IP3)		85		dBm
Second Harmonic (H2) <sup>14</sup>		TBD		dBc
Third Harmonic (H3) <sup>15</sup>		TBD		dBc

### **Table 3 DC and AC Electrical Characteristics**

Parameter	Minimum	Typical	Maximum	Unit
DC Carry Current / Channel			1000	mA
On / Closed State Output to VSS Voltage	TBD		TBD	V <sub>DC</sub>
On / Off Switching and Settling Time <sup>16</sup> Turn on time  Turn off time		8.5 2.5	16 6	μs

<sup>&</sup>lt;sup>16</sup> Includes any actuator bounce, settling time to within 0.05dB of final value, and measured with 20 V/us slew rate GATE pin voltage.

<sup>&</sup>lt;sup>11</sup> Maximum allowable Continuous Wave Power below 2.0 MHz is 1.0 W.

<sup>&</sup>lt;sup>12</sup> Duty Cycle based on 10 us period.

<sup>&</sup>lt;sup>13</sup> See section Adjacent Channel Isolation for more information regarding isolation measurements.

<sup>&</sup>lt;sup>14</sup> Measured at 1.0 GHz and 2.0 GHz fundamental frequency and 35 dBm input power.

<sup>&</sup>lt;sup>15</sup> Measured at 1.0 GHz and 2.0 GHz fundamental frequency and 35 dBm input power.

Full Cycle Frequency			10	kHz
On / Off Switch Operations (Cold Switched)	3 x 10 <sup>9</sup>	TBD		Cycle
Off-State Input-Output Leakage @ 150 V		25	TBD	pА
On-State Resistance		1.0	3.0	Ω
Off-State Capacitance (C <sub>Off</sub> ) 17		90		fF
High Voltage Gate Bias VBB (V <sub>BB</sub> )	78	79	80	V <sub>DC</sub>
High Voltage Gate Bias VBB Current (I <sub>BB</sub> )		0.05	0.1	mA

### **Table 4 Driver DC Electrical Characteristics**

Parameter	Minimum	Typical	Maximum	Unit
Driver Logic Supply VDD Voltage (V <sub>DD</sub> )	4.5	5.0	5.5	V <sub>DC</sub>
Driver Logic Supply VDD Current in standby (I <sub>DD</sub> )		10	50	uA
Driver Input (DIN) @ VDD=5.0V High-Level Logic Voltage V <sub>IH</sub> Low-Logic Input Voltage V <sub>IL</sub> High-Logic Input Current I <sub>IH</sub> Low-Logic Input Current I <sub>IL</sub>	3.5 -0.3	5.0	5.3 0.8 1 TBD	V V uA uA
Driver Output (DOUT) VDD=4.5V  High-Level Logic Output V <sub>OL</sub> <sup>18</sup> Low-Level Logic Output V <sub>OL</sub> <sup>19</sup>	4 -		- 1.0	V

<sup>&</sup>lt;sup>19</sup>  $V_{OL}$  measured at  $ID_{OUT} = -0.1$  mA.

<sup>&</sup>lt;sup>17</sup> Capacitance between input and output pins.

<sup>&</sup>lt;sup>18</sup> V<sub>OH</sub> measured at ID<sub>OUT</sub> = -0.1 mA.

### **Table 5 Driver Interface AC Electrical Specifications**

Parameter	Minimum	Typical	Maximum	Unit
Clock Frequency f <sub>CLK</sub>	0		5	MHz
Clock Width High and Low t <sub>WL</sub> ,t <sub>WH</sub>	100			ns
Data Setup Time before Clock Rises t <sub>SU</sub>	50			ns
Data Hold Time after Clock Rises t <sub>H</sub>	50			ns
Latch Enable Pulse Width twle	100			ns
Latch Enable Delay Time after Rising Edge of Clock t <sub>DLE</sub>	50			ns
All Logic Inputs t <sub>r</sub> , t <sub>f</sub>			5	ns

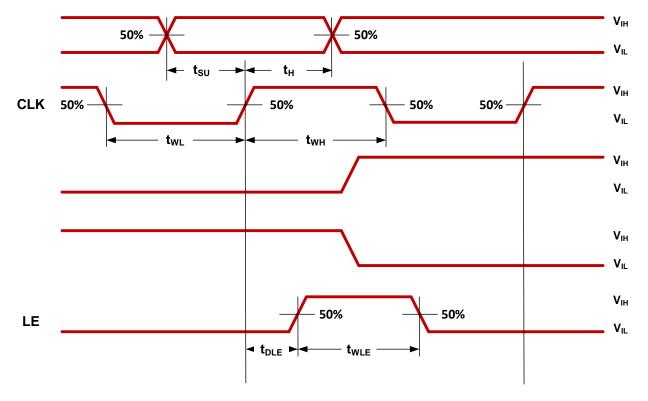

Figure 1: Driver Interface Timing Diagram

### **Hot Switch Restrictions**

The MM3100 is not intended for hot switching applications and care should be taken to insure that switching occurs at less than 0.5 V. Further, the voltage at the switch terminals must be within +/-0.5 V relative to RF ground.

### **Floating Node Restrictions**

RF I/O pins must not be allowed to electrically float during switch operation and therefore require some form of DC path to ground to prevent charge accumulation. DC paths can be an inductor or high value resistance which serves as a discharge path. Floating node examples are:

- Unconnected RF pins, resistively terminate or tie to ground.
- Series capacitance coupling which floats RF pin, shunt with DC path to ground.

See Menlo Micro application note **Avoiding Floating Nodes** for detailed explanation of the hazard conditions to avoid and recommended solutions.

### **RF Performance**

Typical device performance is measured on MM3100-EVK evaluation board.

### **Adjacent Channel Isolation**

Adjacent channel (Ch) isolation is defined for the MM3100 in two ways:

- 1. Both channels closed: measured between Ch 3 Output and Ch 4 input. This particular combination is the worst case for channel to channel isolation.
- 2. Second channel open: measured between Ch 3 Output and Ch 4 input, with Ch 3 Closed and Ch 4 open.

Measurements are done at 3.0 GHz with all ports terminated with 50 Ohm during measurement as shown in Figure 4 below. Increasing channel physical separation increases isolation for the two cases as follows:

### 1. Both channels closed:

- Second adjacent channel performance is typically 8 dB better than adjacent channel performance (example: Ch 2 Ch 4).
- Third adjacent channel performance is typically 15 dB better than adjacent channel performance (example: Ch 1 Ch 4).

### 2. Second channel open:

- Second adjacent channel performance is typically 13 dB better than adjacent channel performance (example: Ch 2 Ch 4).
- Third adjacent channel performance is typically 17 dB better than adjacent channel performance (example: Ch 1 Ch 4).

# **High Voltage Gate Driver Control**

### **Operating Description**

The integrated high voltage gate driver is controlled through a serial-to-parallel interface that drives the high voltage gate lines of the switches. Switch control data is shifted into a 10-bit shift register, latched, level translated, and applied as gate control signals as shown in block diagram Figure 5 below.

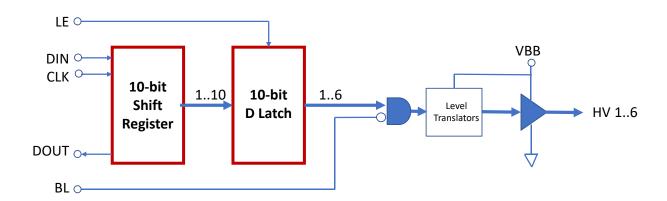

Figure 5: High Voltage Gate Driver Block Diagram

The gate driver is controlled by serial data input to DIN, sampled by CLK, latched by LE, and blanked by BL as follows:

- A 10-bit data byte is serially loaded into shift register bits 1-to-10 on the positive edge of CLK. Shift order is MSB first starting with bit 10.
- Parallel data from the shift register is transferred to the high voltage gate output buffers through a 10-bit D latch when the latch enable input LE is logically high.
- The MM3100 uses only six of the ten data bits latched for switch control. Bits 1 through 6 correspond to high voltage gate lines HV1 through HV6 respectively. Bits 7,8,9 and 10 are not used. Data bits set to logical "1" close the corresponding switch to On and "0" open the switch to Off.
- Shift register data output pin DOUT may be used to cascade multiple devices by connecting DOUT of the first device to DIN of the next device. Other control signals should be shared between all the devices. In this case it is recommended to load 10-bit words consisting of four dummy bits and six switch control bits so that each data packet controls one switch.
- There is no reset function. To clear register content, new data must be loaded.
- The blanking input BL will turn all gates off when logically high. The pin should be logically low for normal operation.

### **Table 6 Truth Function Table**

	Inputs			Shift	Register	High	_	
							Outp	out HVx
Function	Data	CLK	LE	BL	1	210	1	2310
All off (blank)	Х	Х	Χ	Н	*	* *	L	L L L
Load Shift	H/L	1	L	L	H/L	* *	*	* * *
Register								
Latched	Х	Х	L	L	*	* *	*	* * *
Transfer	H/L	Х	Н	L	H/L	*	H/L	* * *

### Note:

H = High logic level

L = Low logic level

X = Don't care logic level

↑ = Low to high logic transition

\* = Dependent on the previous stage's state before the last CLK or last LE high HVx corresponds to high voltage gate drivers where only HV1..6 are used

# **Package Drawing**

### 49 Lead Ball Grid Array 0.30mm Ball, 0.50mm Pitch

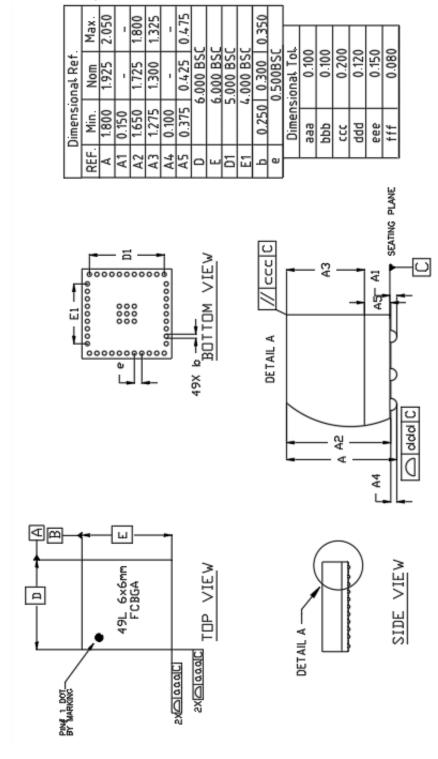

Figure 6 Package Drawing

# **Recommended PCB Layout and SMT Parameters**

- PCB lands should be as shown in the pad pattern diagram
- Connect RFG node (floating shield inside the package) to RF Signal Ground
- Open space around the package can have grounded thru holes
- ENIG (Electroless Nickel Immersion Gold) pad surface finish
- 20 micron (µm) thick solder mask
- Type 3 or higher solder paste with no clean flux
- Component placement force not to exceed 100 grams

### **Recommended PCB Pad Pattern**

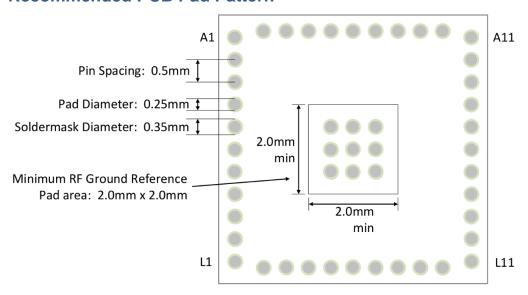

Figure 7: Recommended PCB Pad Pattern

### **Recommended Solder Reflow Profile**

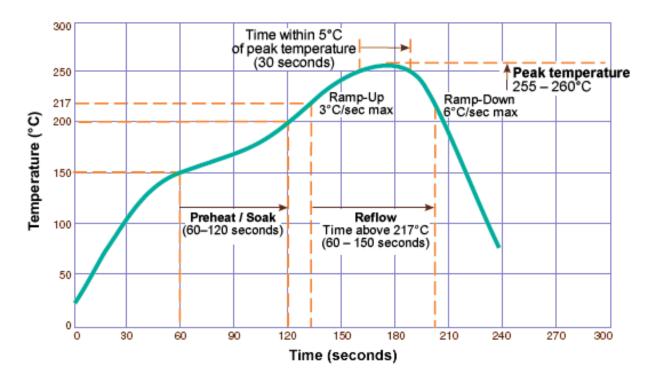

Figure 8: Reflow Profile

Follow Moisture Sensitivity Level (MSL) 3 handling precautions specified in IPC/JEDEC J-STD-020.

### **Storage and Shelf Life**

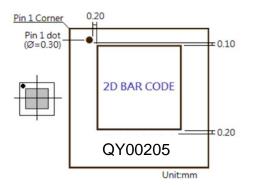

Under typical industry storage conditions ( ≤30 °C/60% RH) in Moisture Barrier Bags:

- Customer Shelf Life: 24 months from customer receipt date
- Extended Shelf Life: 60 months from customer receipt date if re-bagged every 32 months or less.
- Floor life: Moisture Sensitivity Level (MSL) testing is not required for Hermetic package as per JESD47K.

# **Package Options and Ordering Information**

The MM3100 package marking and nomenclature is illustrated in Figure 9 below.
