Description

The [XR77103-G1R2](#) universal PMIC features three 2A capable⁽¹⁾, high-efficiency synchronous buck regulators with integrated power switches. They can operate in 5V, 9V and 12V powered systems with minimal required external components, thus providing the smallest size solution possible.

The output voltages are pre-programmed to 1.1V, 1.5V, and 3.3V. With a nominal switching frequency of 1.14MHz, the regulators can also be synchronized to an external clock in applications where EMI control is critical.

XR77103-G1R2 features a supervisor circuit that monitors each converter output. The PGOOD pin is asserted once sequencing is done, outputs are reported in regulation, and the reset timer expires. The polarity of the signal is active high.

1. Subject to OCP setting.

FEATURES

- 4.5V to 14V wide input supply voltage range
- Built-in MOSFET and synchronous rectifier
- High accuracy 0.8V reference (1%)
- Current-mode control with simple compensation circuit
- External synchronization
- Power good
- Protection
 - Thermal shutdown
 - Overvoltage transient protection
 - Overcurrent protection
- 32-pin 4mm x 4mm TQFN package

APPLICATIONS

- MaxLinear G.hn

Ordering Information - [back page](#)

Typical Application

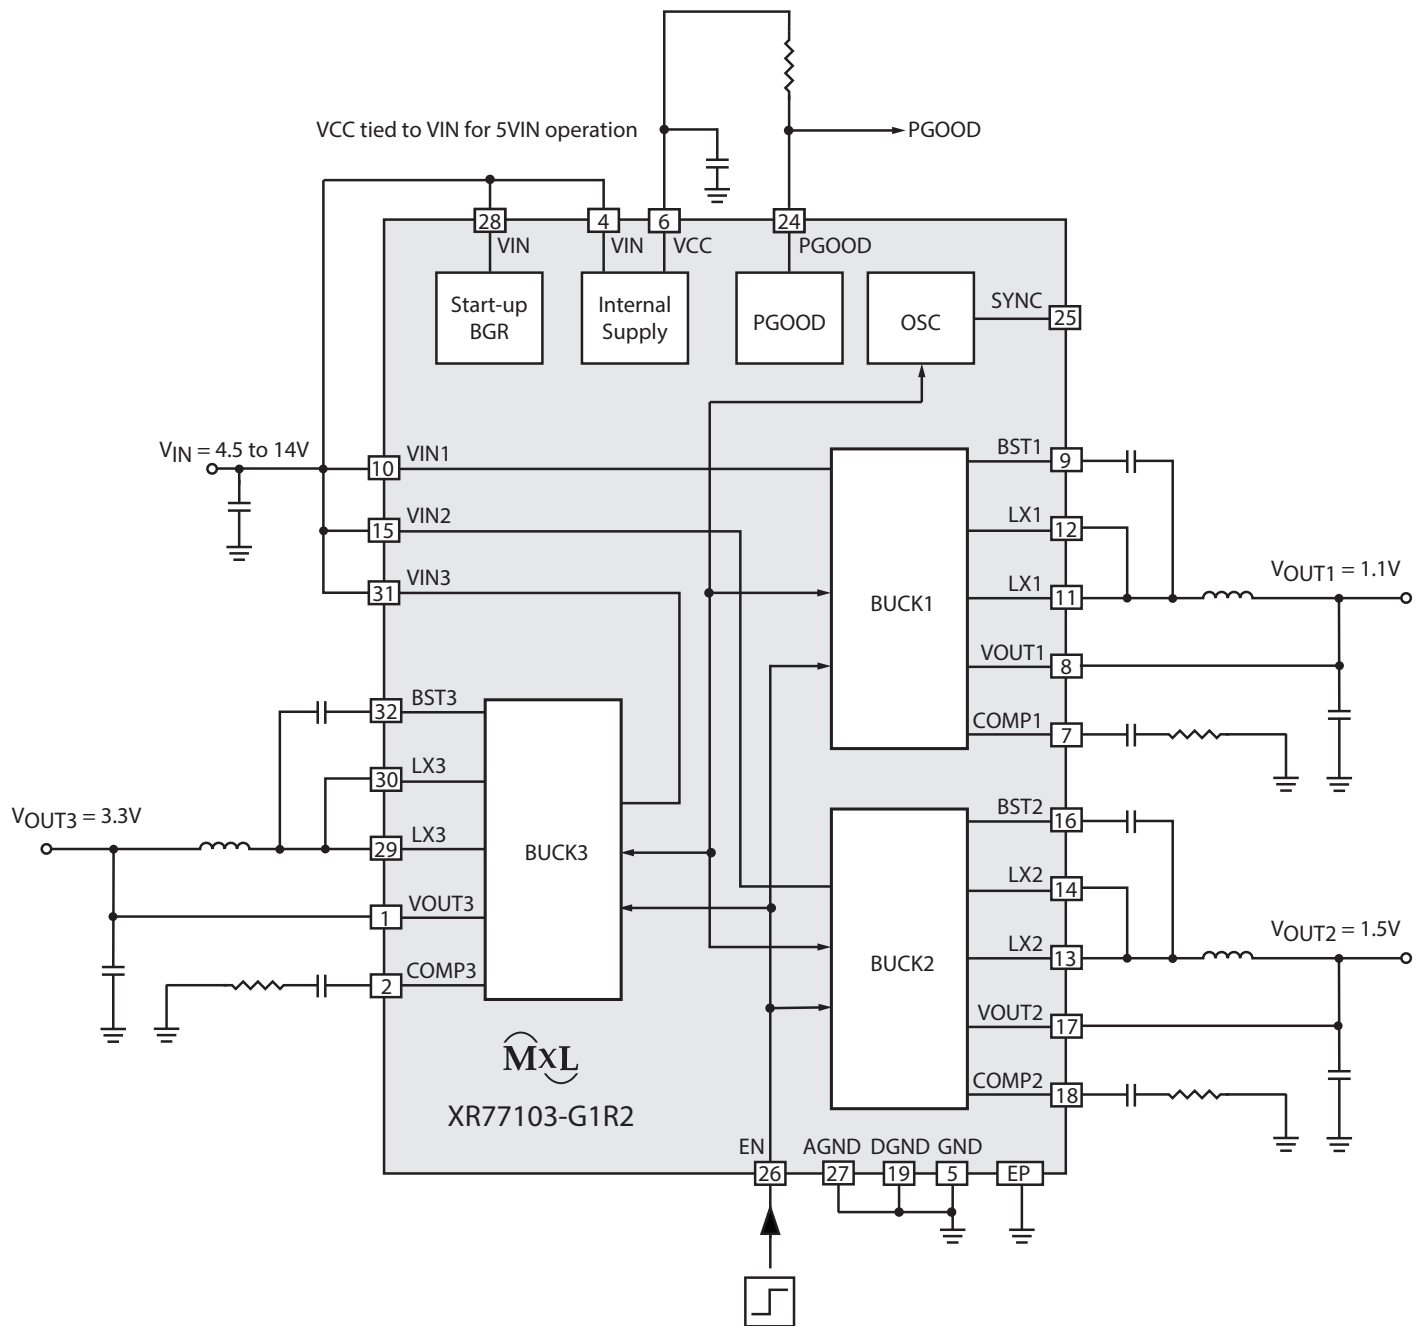

Figure 1. Typical Application

Absolute Maximum Ratings

These are stress ratings only and functional operation of the device at these ratings or any other above those indicated in the operation sections of the specifications below is not implied. Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. Exposure to any absolute maximum rating condition for extended periods may affect device reliability and lifetime.

V_{IN1} , V_{IN2} , V_{IN3} , $LX1$, $LX2$, $LX3$	-0.3V to 18V
EN , V_{CC}	-0.3V to 7V
$PGOOD$, $SYNC$, $VOUT\#$	-0.3V to 7V
$BST\#$ to $LX\#$	-0.3V to 7V
$AGND$, $DGND$ to GND	-0.3V to 0.3V
Storage temperature.....	-65°C to 150°C
Junction temperature.....	150°C
Power dissipation	Internally Limited
Lead temperature (soldering, 10 seconds).....	260°C
CDM	700V
ESD rating (HBM – human body model)	2kV

Operating Conditions

V_{IN}	4.5V to 14V
V_{CC}	4.5V to 5.5V
$LX\#$	-0.3V to 14V ⁽¹⁾
Junction temperature range (T_J).....	-40°C to 125°C
XR77103 package power dissipation max at 25°C	3.4W
XR77103 thermal resistance θ_{JA}	30°C/W

NOTE:

1. $LX\#$ pins' DC range is from -0.3V, transient -1V for less than 10ns.

Electrical Characteristics

$T_A = 25^\circ\text{C}$, $V_{IN} = 12\text{V}$, $EN = V_{CC}$, $f_{SW} = 1\text{MHz}$, unless otherwise specified. Limits applying over the full operating temperature range are denoted by a •.

Symbol	Parameter	Conditions	•	Min	Typ	Max	Units
Power Supply Characteristics

Pin Functions

Pin Number	Pin Name	Description
1	VOUT3	Buck 3 feedback pin.
2	COMP3	Compensation pin for Buck 3. Connect a series RC circuit to this pin for compensation.
3	NC	No connect.
4	VIN	IC supply pin. Connect a capacitor as close as possible to this pin.
5	GND	Ground.
6	VCC	Internal supply. Connect a ceramic capacitor from this pin to ground.
7	COMP1	Compensation pin for Buck 1. Connect a series RC circuit to this pin for compensation.
8	VOUT1	Buck 1 feedback pin.
9	BST1	Bootstrap capacitor for Buck 1. Connect a bootstrap capacitor from this pin to LX1.
10	VIN1	Input supply for Buck 1. Connect a capacitor as close as possible to this pin.
11	LX1	Switching node for Buck 1.
12	LX1	Switching node for Buck 1.
13	LX2	Switching node for Buck 2.
14	LX2	Switching node for Buck 2.
15	VIN2	Input supply for Buck 2. Connect a capacitor as close as possible to this pin.
16	BST2	Bootstrap capacitor for Buck 2. Connect a bootstrap capacitor from this pin to LX2.
17	VOUT2	Buck 2 feedback pin.
18	COMP2	Compensation pin for Buck 2. Connect a series RC circuit to this pin for compensation.
19	DGND	Digital ground.
20	NC	No connect.

Pin Functions (Continued)

Pin Number	Pin Name	Description
21	NC	No connect.
22	NC	No connect.
23	NC	No connect.
24	PGOOD	Power good output. Open drain output asserted after all converters are sequenced and within regulation.
25	SYNC	External clock input pin. Connect to signal ground when unused.
26	EN	Enable control input. Set EN high to enable converters.
27	AGND	Analog ground.
28	VIN	IC supply pin. Connect a capacitor as close as possible to this pin.
29	LX3	Switching node for Buck 3.
30	LX3	Switching node for Buck 3.
31	VIN3	Input supply for Buck 3. Connect a capacitor as close as possible to this pin.
32	BST3	Bootstrap capacitor for Buck 3. Connect a bootstrap capacitor from this pin to LX3.
-	E-PAD	Connect to power ground.

Applications Information

Operation

XR77103-G1R2 is a power management IC with three step-down buck converters. Both high-side and low-side MOSFETs are integrated to provide fully synchronous conversion with higher efficiency. XR77103-G1R2 can support a 4.5V to 14V input supply, high load current, and 1.14MHz clocking. The SYNC pin also provides a means to synchronize the power converter to an external signal. Input ripple is reduced by operation 180 degrees out-of-phase among converters. All three buck converters have peak current mode control which simplifies external frequency compensation. Buck converters 1, 2, and 3 have nominal peak inductor current limit of 2.5A, 2A, and 2A respectively. The device has a power good comparator monitoring the output voltage. Soft-start for each converter is 0.83ms. All outputs start up once the EN pin is set high.

Minimum On-Time $t_{ON(min)}$ Considerations

The XR77103 can regulate with pulse widths as low as 95ns. However, to ensure sufficient control range, the design must use 120ns as the minimum on-time as stated in the electrical table. Failure to meet this condition can result in overcharging of the output and V_{OUT} not meeting specification.

Output Voltage Setting

Output voltage is pre-programmed to $V_{OUT1} = 1.1V$, $V_{OUT2} = 1.5V$, and $V_{OUT3} = 3.3V$.

Frequency Compensation

In order to properly frequency compensate the device, the following component selection is recommended:

V_{IN} (V)	V_{OUT} (V)	L (μH)	C_{OUT} (μF)	R_{COMP} (k Ω)	C_{COMP} (nF)
5.0	1.0	1.5	22 x 3	20	2.2
5.0	1.2	1.5	22 x 3	20	2.2
5.0	1.5	1.5	22 x 2	20	4.7
12/5.0	1.8	1.5	22 x 2	20	4.7
12/5.0	2.5	3.3	22 x 1	20	4.7
12/5.0	3.3	3.3	22 x 1	20	4.7
12	5.0	3.3	22 x 1	20	4.7

Synchronization

The status of the SYNC pin will be ignored during start-up and the XR77103-G1R2's control will only synchronize to an external signal after the PGOOD signal is asserted. When synchronization is applied, the sync pulse frequency must be higher than the PWM oscillator frequency (1.2MHz) to allow the external signal to trump the oscillator pulse reliably. When synchronization is not applied, the SYNC pin should be connected to the signal ground.

Although the device can lock to an external clock running up to 2.31MHz, doing this will alter the timing characteristics and degrade thermal performance.

Out-of-Phase Operation

Channels 1 and 3 operate in phase while channel 2 operates 180 degrees out-of-phase with the other two converters (see Figure 28). This enables the system, having less input ripple, to lower component cost, save board space, and reduce EMI.

Figure 18. Out-of-Phase Operation

Power Good

The PGOOD pin is an open drain output. The PGOOD pin is pulled low when any buck converter is pulled below 85% of the nominal output voltage. The PGOOD is pulled up when all three buck converters' outputs are more than 90% of their nominal output voltage and the PGOOD reset timer expires. The polarity of the PGOOD is active high. The PGOOD reset time is 1s.

Thermal Design

Proper thermal design is critical in controlling device temperatures and in achieving robust designs. There are a number of factors that affect the thermal performance. One key factor is the temperature rise of the devices in the package, which is a function of the thermal resistances of the devices inside the package and the power being dissipated.

The thermal resistance of the XR77103-G1R2 (30°C/W) is specified in the Operating Conditions section of this datasheet. The θ_{JA} thermal resistance specification is based on the XR77103-G1R2 evaluation board operating without forced airflow. Since the actual board design in the final application will be different, the thermal resistances in the final design may be different from those specified.

The package thermal derating and power loss curves are shown in Figures 20 through 26. These correspond to input voltages of 12V and 5V.

Applications Information (Continued)

Layout Guidelines

Proper PCB layout is crucial in order to obtain good thermal and electrical performance.

For thermal considerations, it is essential to use a number of thermal vias to connect the central thermal pad to the ground layer(s).

In order to achieve good electrical and noise performance, the following steps are recommended:

- Place the output inductor close to the LX pins and minimize the area of the connection. Doing this on the top layer is advisable.
- Connect the central thermal pad to the power ground connections to as many layers as possible.
- The output filtering capacitor and the input filtering capacitor shall share the same power ground connection. Connection to the signal ground plane shall be done with vias placed at the output filtering capacitors.
- Minimize AC current loops formed by input filtering capacitors, output filtering capacitors, output inductors, and the regulator pins.
- Connect the GND, AGND, DGND pins to the signal ground plane.
- Place compensation networks close to the pins and reference them to the signal ground.
- Place the V_{CC} bypass capacitor close to the pin.
