

The S-13A1 Series is a positive voltage regulator with a low dropout voltage, high-accuracy output voltage, and low current consumption developed based on CMOS technology.

A 2.2  $\mu$ F small ceramic capacitor can be used, and the very small dropout voltage and the large output current due to the built-in transistor with low on-resistance are provided. The S-13A1 Series includes a load current protection circuit that prevents the output current from exceeding the current capacity of the output transistor and a thermal shutdown circuit that prevents damage due to overheating. In addition to the types in which output voltage is set inside the IC, a type for which output voltage can be set via an external resistor is added to a lineup. Also, the S-13A1 Series includes an inrush current limit circuit to limit the excess inrush current generated at power-on or at the time when the ON / OFF pin is set to ON. High heat radiation HSOP-8A and HSOP-6 or small SOT-89-5 packages realize high-density mounting.

## ■ Features

- Output voltage (internally set): 1.0 V to 3.5 V, selectable in 0.05 V step
- Output voltage (externally set): 1.05 V to 5.0 V, settable via external resistor
- Input voltage: 1.5 V to 5.5 V
- Output voltage accuracy:  $\pm 1.0\%$  (internally set, 1.0 V to 1.45 V output product:  $\pm 15$  mV)
- Dropout voltage: 70 mV typ. (3.0 V output product,  $I_{OUT} = 300$  mA)
- Current consumption: During operation: 60  $\mu$ A typ., 90  $\mu$ A max.  
During power-off: 0.1  $\mu$ A typ., 1.0  $\mu$ A max.
- Output current: Possible to output 1000 mA ( $V_{IN} \geq V_{OUT(S)} + 1.0$  V)\*1
- Input and output capacitors: A ceramic capacitor of 2.2  $\mu$ F or more can be used.
- Ripple rejection: 70 dB typ. ( $f = 1.0$  kHz)
- Built-in overcurrent protection circuit: Limits overcurrent of output transistor.
- Built-in thermal shutdown circuit: Prevents damage caused by heat.
- Built-in inrush current limit circuit: Limits excessive inrush current generated at power-on or at the time when the ON / OFF pin is set to ON.  
For types in which output voltage is internally set, the inrush current limit time can be changed via an external capacitor ( $C_{SS}$ ).  
Inrush current limit time 0.7 ms typ.  
(Types in which output voltage is internally set,  $C_{SS} = 1.0$  nF)  
Inrush current limit time 0.4 ms typ.  
(Types in which output voltage is internally set, SSC pin = open)  
Inrush current limit time 0.4 ms typ.  
(Types in which output voltage is externally set)
- Built-in ON / OFF circuit: Ensures long battery life.  
Discharge shunt function "available" / "unavailable" is selectable.  
Pull-down function "available" / "unavailable" is selectable.
- Operation temperature range:  $T_a = -40^\circ\text{C}$  to  $+85^\circ\text{C}$
- Lead-free (Sn 100%), halogen-free

\*1. Please make sure that the loss of the IC will not exceed the power dissipation when the output current is large.

## ■ Applications

- Constant-voltage power supply for battery-powered device
- Constant-voltage power supply for TV, notebook PC and home electric appliance
- Constant-voltage power supply for portable equipment

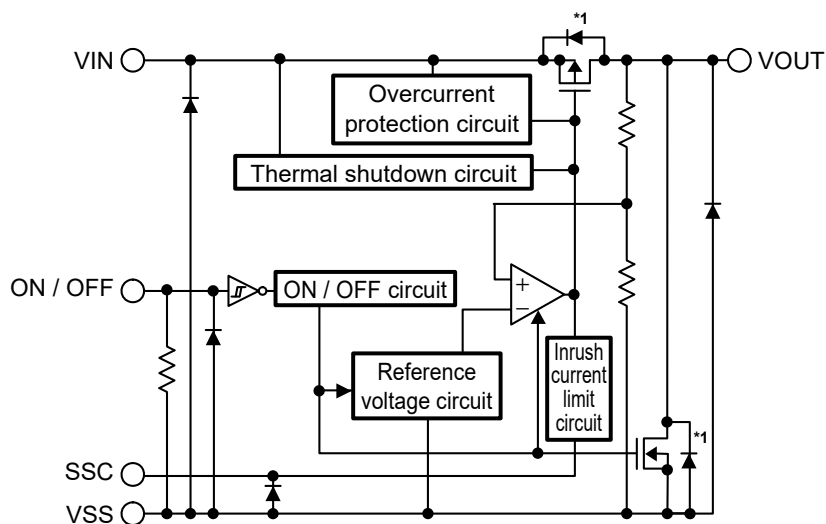

## ■ Packages

- HSOP-8A

\*1. Connect the heat sink of backside at shadowed area to the board, and set electric potential GND. However, do not use it as the function of electrode.

\*2. The NC pin is electrically open. The NC pin can be connected to the VIN pin or the VSS pin.

\*3. Connect a capacitor between the SSC pin and the VSS pin.

The inrush current limit time of the VOUT pin at power-on or at the time when the ON / OFF pin is set to ON can be adjusted according to the capacitance.

Moreover, the SSC pin is available even when it is open.

## ■ Standard Circuits

### 1. Types in which output voltage is internally set (S-13A1x10 to S-13A1x35)

- \*1.  $C_{IN}$  is a capacitor for stabilizing the input.
- \*2. A ceramic capacitor of 2.2  $\mu\text{F}$  or more can be used as  $C_L$ .
- \*3. A ceramic capacitor of 22 nF or less can be used as  $C_{SS}$ .

Figure 25

### 2. Types in which output voltage is externally set (S-13A1x00)

- \*1.  $C_{IN}$  is a capacitor for stabilizing the input.
- \*2. A ceramic capacitor of 2.2  $\mu\text{F}$  or more can be used as  $C_L$ .
- \*3. Resistor of 0.1 k $\Omega$  to 606 k $\Omega$  as  $R_a$ , 2 k $\Omega$  to 200 k $\Omega$  as  $R_b$  can be used.

Figure 26

**Caution** The above connection diagram and constant will not guarantee successful operation. Perform thorough evaluation using the actual application to set the constant.

## ■ Condition of Application

Input capacitor ( $C_{IN}$ ): 2.2  $\mu$ F or more  
Output capacitor ( $C_L$ ): 2.2  $\mu$ F or more

- Caution**
1. Set input capacitor ( $C_{IN}$ ) and output capacitor ( $C_L$ ) as  $C_{IN} = C_L$ .
  2. Generally a series regulator may cause oscillation, depending on the selection of external parts. Confirm that no oscillation occurs in the application for which the above capacitors are used.

## ■ Selection of Input and Output Capacitors ( $C_{IN}$ , $C_L$ )

The S-13A1 Series requires an output capacitor between the VOUT pin and the VSS pin for phase compensation. Operation is stabilized by a ceramic capacitor with an output capacitance of 2.2  $\mu$ F or more over the entire temperature range. When using an OS capacitor, a tantalum capacitor, or an aluminum electrolytic capacitor, the capacitance must be 2.2  $\mu$ F or more.

The values of output overshoot and undershoot, which are transient response characteristics, vary depending on the value of the output capacitor.

The required capacitance for the input capacitor differs depending on the application.

Set the capacitance for input capacitor ( $C_{IN}$ ) and output capacitor ( $C_L$ ) as follows.

- $C_{IN} \geq 2.2 \mu\text{F}$
- $C_L \geq 2.2 \mu\text{F}$
- $C_{IN} = C_L$

**Caution** The S-13A1 Series may oscillate if setting the capacitance as  $C_{IN} \geq 2.2 \mu\text{F}$ ,  $C_L \geq 2.2 \mu\text{F}$ ,  $C_{IN} < C_L$ . Define the values by sufficient evaluation including the temperature characteristics under the usage condition.

## ■ Selection of Capacitor for Inrush Current Limit ( $C_{SS}$ ) (Types in Which Output Voltage is Internally Set)

In the S-13A1 Series, the inrush current limit time ( $t_{RUSH}$ ) is adjustable by connecting a capacitor for inrush current limit ( $C_{SS}$ ) between the SSC pin and the VSS pin. The time that the output voltage rises to 99% is 0.7 ms typ. when  $C_{SS} = 1.0$  nF. The S-13A1 Series operates stably even with no  $C_{SS}$  connection (in the state the SSC pin is leaved open).

The recommended value for  $C_{SS}$  is  $0 \text{ nF}^{*1} \leq C_{SS} \leq 22 \text{ nF}$ , however, define the values by sufficient evaluation including the temperature characteristics under the usage condition.

- \*1. In case the S-13A1 Series is used without  $C_{SS}$  connection ( $C_{SS} = 0 \text{ nF}$ ), be sure to leave the SSC pin open and do not connect it to the VIN pin and the VSS pin.

## ■ Explanation of Terms

### 1. Low dropout voltage regulator

This voltage regulator has the low dropout voltage due to its built-in low on-resistance transistor.

### 2. Output voltage ( $V_{OUT}$ )

The accuracy of the output voltage is ensured at  $\pm 1.0\%$  or  $\pm 15 \text{ mV}^*1$  under the specified conditions of fixed input voltage<sup>\*2</sup>, fixed output current, and fixed temperature.

\*1. When  $V_{OUT} < 1.5 \text{ V}$ :  $\pm 15 \text{ mV}$ , when  $V_{OUT} \geq 1.5 \text{ V}$ :  $\pm 1.0\%$

\*2. Differs depending on the product.

**Caution** If the above conditions change, the output voltage value may vary and exceed the accuracy range of the output voltage. Refer to "■ Electrical Characteristics" and "■ Characteristics (Typical Data)" for details.

### 3. Line regulation $\left( \frac{\Delta V_{OUT1}}{\Delta V_{IN} \bullet V_{OUT}} \right)$

Indicates the dependency of the output voltage on the input voltage. That is, the values show how much the output voltage changes due to a change in the input voltage with the output current remaining unchanged.

### 4. Load regulation ( $\Delta V_{OUT2}$ )

Indicates the dependency of the output voltage on the output current. That is, the values show how much the output voltage changes due to a change in the output current with the input voltage remaining unchanged.

### 5. Dropout voltage ( $V_{drop}$ )

Indicates the difference between input voltage ( $V_{IN1}$ ) and the output voltage when; decreasing input voltage ( $V_{IN}$ ) gradually until the output voltage has dropped out to the value of 98% of output voltage ( $V_{OUT3}$ ), which is at  $V_{IN} = V_{OUT(S)} + 1.0 \text{ V}$ .

$$V_{drop} = V_{IN1} - (V_{OUT3} \times 0.98)$$

## 6. Output voltage temperature coefficient $\left( \frac{\Delta V_{OUT}}{\Delta T_a \bullet V_{OUT}} \right)$

The shaded area in **Figure 27** is the range where  $V_{OUT}$  varies in the operation temperature range when the output voltage temperature coefficient is  $\pm 100$  ppm/ $^{\circ}\text{C}$ .

\*1.  $V_{OUT(E)}$  is the value of the output voltage measured at  $T_a = +25^{\circ}\text{C}$ .

**Figure 27**

A change in the temperature of the output voltage [ $\text{mV}/^{\circ}\text{C}$ ] is calculated using the following equation.

$$\frac{\Delta V_{OUT}}{\Delta T_a} [\text{mV}/^{\circ}\text{C}]^{*1} = V_{OUT(S)} [\text{V}]^{*2} \times \frac{\Delta V_{OUT}}{\Delta T_a \bullet V_{OUT}} [\text{ppm}/^{\circ}\text{C}]^{*3} \div 1000$$

- \*1. Change in temperature of output voltage
- \*2. Set output voltage
- \*3. Output voltage temperature coefficient

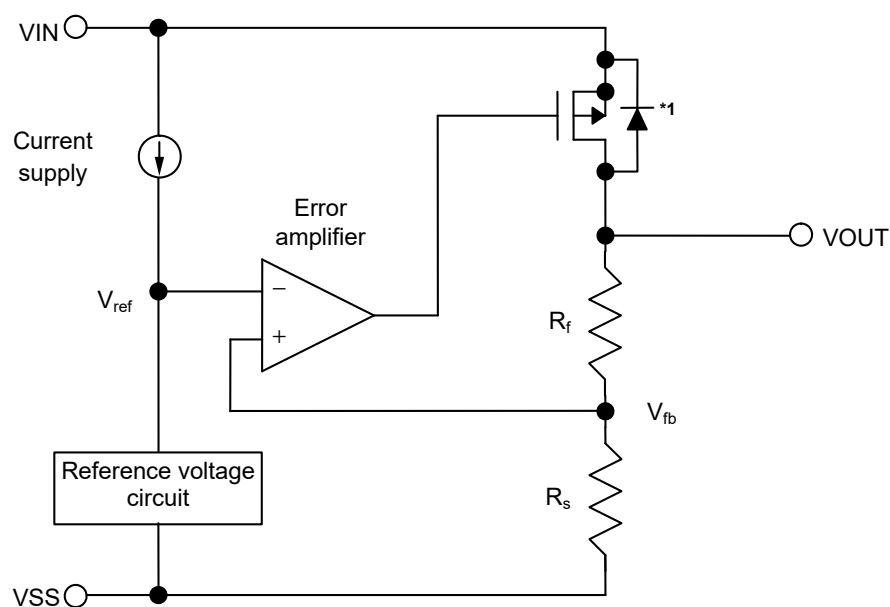

## ■ Operation

### 1. Basic operation

Figure 28 shows the block diagram of the S-13A1 Series.

The error amplifier compares the reference voltage ( $V_{ref}$ ) with feedback voltage ( $V_{fb}$ ), which is the output voltage resistance-divided by feedback resistors ( $R_s$  and  $R_f$ ). It supplies the gate voltage necessary to maintain the constant output voltage which is not influenced by the input voltage and temperature change, to the output transistor.

\*1. Parasitic diode

Figure 28

### 2. Output transistor

In the S-13A1 Series, a low on-resistance P-channel MOS FET is used as the output transistor.

Be sure that  $V_{OUT}$  does not exceed  $V_{IN} + 0.3$  V to prevent the voltage regulator from being damaged due to reverse current flowing from the  $V_{OUT}$  pin through a parasitic diode to the  $V_{IN}$  pin, when the potential of  $V_{OUT}$  became higher than  $V_{IN}$ .

### 3. ON / OFF pin

This pin starts and stops the regulator.

When the ON / OFF pin is set to OFF level, the entire internal circuit stops operating, and the built-in P-channel MOS FET output transistor between the VIN pin and the VOUT pin is turned off, reducing current consumption significantly. Note that the current consumption increases when a voltage of 0.3 V to  $V_{IN} - 0.3$  V is applied to the ON / OFF pin. The ON / OFF pin is configured as shown in **Figure 29** and **Figure 30**.

#### 3.1 S-13A1 Series A / C type

The ON / OFF pin is internally pulled down to the VSS pin in the floating status, so the VOUT pin is set to the  $V_{SS}$  level.

#### 3.2 S-13A1 Series B / D type

The ON / OFF pin is not internally pulled down to the VSS pin, so do not use these types with the ON / OFF pin in the floating status. When not using the ON / OFF pin, connect the pin to the VIN pin.

**Table 17**

Product Type	ON / OFF Pin	Internal Circuit	VOUT Pin Voltage	Current Consumption
A / B / C / D	"H": ON	Operate	Set value	$I_{SS1}$ *1
A / B / C / D	"L": OFF	Stop	$V_{SS}$ level	$I_{SS2}$

\*1. Note that the IC's current consumption increases as much as current flows into the pull-down resistor of 2.5 M $\Omega$  typ. when the ON / OFF pin is connected to the VIN pin and the S-13A1 Series A / C type is operating (refer to **Figure 29**).

**Figure 29 S-13A1 Series A / C type**

**Figure 30 S-13A1 Series B / D type**

#### 4. Discharge shunt function (S-13A1 Series A / B type)

The S-13A1 Series A / B type has a built-in discharge shunt circuit to discharge the output capacitance. The output capacitance is discharged as follows so that the VOUT pin reaches the  $V_{SS}$  level.

- (1) The ON / OFF pin is set to OFF level.
- (2) The output transistor is turned off.
- (3) The discharge shunt circuit is turned on.
- (4) The output capacitor discharges.

Since the S-13A1 Series C / D type does not have a discharge shunt circuit, the VOUT pin is set to the  $V_{SS}$  level through several hundred  $k\Omega$  internal divided resistors between the VOUT pin and the  $V_{SS}$  pin. The S-13A1 Series A / B type allows the VOUT pin to reach the  $V_{SS}$  level rapidly due to the discharge shunt circuit.

Figure 31

#### 5. Pull-down resistor (S-13A1 Series A / C type)

The ON / OFF pin is internally pulled down to the  $V_{SS}$  pin in the floating status, so the VOUT pin is set to the  $V_{SS}$  level.

Note that the IC's current consumption increases as much as current flows into the pull-down resistor of 2.5  $M\Omega$  typ. when the ON / OFF pin is connected to the VIN pin and the S-13A1 Series A / C type is operating.

## 6. Overcurrent protection circuit

The S-13A1 Series includes an overcurrent protection circuit having the characteristics shown in "1. Output Voltage vs. Output Current (When load current increases) ( $T_a = +25^{\circ}\text{C}$ )" in "■ Characteristics (Typical Data)", in order to protect the output transistor against an excessive output current and short circuiting between the VOUT pin and the VSS pin. The current when the output pin is short-circuited ( $I_{\text{short}}$ ) is internally set at approx. 200 mA typ., and the normal value is restored for the output voltage, if releasing a short circuit once.

**Caution** This overcurrent protection circuit does not work as for thermal protection. If this IC long keeps short circuiting inside, pay attention to the conditions of input voltage and load current so that, under the usage conditions including short circuit, the loss of the IC will not exceed power dissipation.

## 7. Thermal shutdown circuit

The S-13A1 Series has a thermal shutdown circuit to protect the device from damage due to overheat. When the junction temperature rises to  $150^{\circ}\text{C}$  typ., the thermal shutdown circuit operates to stop regulating. When the junction temperature drops to  $120^{\circ}\text{C}$  typ., the thermal shutdown circuit is released to restart regulating.

Due to self-heating of the S-13A1 Series, if the thermal shutdown circuit starts operating, it stops regulating so that the output voltage drops. When regulation stops, the S-13A1 does not itself generate heat so that the IC's temperature drops. When the temperature drops, the thermal shutdown circuit is released to restart regulating, thus the S-13A1 Series generates heat again. Repeating this procedure makes waveform of the output voltage pulse-like form. Stop or restart of regulation continues unless decreasing either or both of the input voltage and the output voltage in order to reduce the internal power consumption, or decreasing the ambient temperature.

**Table 18**

Thermal Shutdown Circuit	VOUT Pin Voltage
Operation: $150^{\circ}\text{C}$ typ.*1	$V_{\text{SS}}$ level
Release: $120^{\circ}\text{C}$ typ.*1	Set value

\*1. Junction temperature

## 8. Inrush current limit circuit

The S-13A1 Series has a built-in inrush current limit circuit to limit the inrush current and the overshoot of the output voltage generated at power-on or at the time when the ON / OFF pin is set to ON. The inrush current is limited to 500 mA typ. The inrush current limit circuit starts to operate from the following times.

- Immediately after power-on
- At the time when the ON / OFF pin is set to ON

**Figure 32** shows the relation between the inrush current limit time ( $t_{RUSH}$ ) and the inrush current limit capacitor ( $C_{SS}$ ).

**Figure 32**

### (1) $C_{SS} = 0 \text{ nF}$

$t_{RUSH}$  is determined by the internal capacitor (about 20 pF) and the time constant of the built-in constant current (about 0.04  $\mu\text{A}$ ).  $t_{RUSH}$  value is 0.28 ms min., 0.40 ms typ., 0.52 ms max.

### (2) $C_{SS} \geq 1 \text{ nF}$

$t_{RUSH}$  can be adjusted by the  $C_{SS}$  which is connected externally between the SSC pin and the VSS pin. It is calculated by the following formula depending on the built-in constant (about 1  $\mu\text{A}$ ) and the  $C_{SS}$  time constant. The inrush current limit coefficient is 0.49 min., 0.7 typ., 0.91 max. at  $T_a = +25^\circ\text{C}$ .

$$t_{RUSH} [\text{ms}] = \text{the inrush current limit coefficient} \times C_{SS} [\text{nF}]$$

### (3) $0 \text{ nF} < C_{SS} < 1 \text{ nF}$

Since the internal capacitor, the built-in constant current and  $C_{SS}$  have a variation each,  $t_{RUSH}$  is the one of following (a) and (b) in which the time is longer.

- The time determined by the internal capacitor (about 20 pF) and the time constant of the built-in constant current (about 0.04  $\mu\text{A}$ ).
- The time determined by  $C_{SS}$  connected externally between the SSC pin and the VSS pin and the built-in constant current (about 1  $\mu\text{A}$ ).

When  $0 \text{ nF} < C_{SS} < 1 \text{ nF}$ ,  $t_{RUSH}$  is the range of the shaded area shown in **Figure 32**.

## 9. Externally setting output voltage

The S-13A1 Series provides the types in which output voltage can be set via the external resistor. The output voltage can be set by connecting a resistor ( $R_a$ ) between the VOUT pin and the VADJ pin, and a resistor ( $R_b$ ) between the VADJ pin and the VSS pin.

The output voltage is determined by the following formulas.

$$V_{OUT} = 1.0 + R_a \times I_a \quad \dots\dots\dots (1)$$

By substituting  $I_a = I_{VADJ} + 1.0 / R_b$  to above formula (1),

$$V_{OUT} = 1.0 + R_a \times (I_{VADJ} + 1.0 / R_b) = 1.0 \times (1.0 + R_a / R_b) + R_a \times I_{VADJ} \quad \dots\dots\dots (2)$$

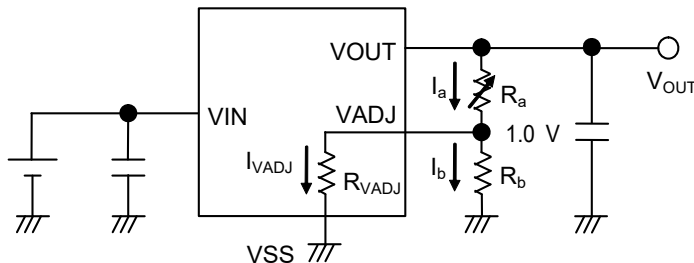

In above formula (2),  $R_a \times I_{VADJ}$  is a factor for the output voltage error.

Whether the output voltage error is minute is judged depending on the following (3) formula.

By substituting  $I_{VADJ} = 1.0 / R_{VADJ}$  to  $R_a \times I_{VADJ}$

$$V_{OUT} = 1.0 \times (1.0 + R_a / R_b) + 1.0 \times R_a / R_{VADJ} \quad \dots\dots\dots (3)$$

If  $R_{VADJ}$  is sufficiently larger than  $R_a$ , the error is judged as minute.

**Figure 33**

The following expression is in order to determine output voltage  $V_{OUT} = 3.0$  V.

If resistance  $R_b = 2$  k $\Omega$ , substitute  $R_{VADJ} = 400$  k $\Omega$  typ. into (3),

Resistance  $R_a = (3.0 / 1.0 - 1) \times ((2$  k  $\times$  400 k) / (2 k + 400 k))  $\cong$  4.0 k $\Omega$

**Caution** The above connection diagrams and constants will not guarantee successful operation. Perform thorough evaluation using the actual application to set the constants.

## ■ Precautions

- Wiring patterns for the VIN pin, the VOUT pin and GND should be designed so that the impedance is low. When mounting an output capacitor between the VOUT pin and the VSS pin ( $C_L$ ), a capacitor for stabilizing the input between the VIN pin and the VSS pin ( $C_{IN}$ ), and a capacitor for limiting the inrush current between the SSC pin and the VSS pin ( $C_{SS}$ ), the distance from the capacitors to these pins should be as short as possible.
- Note that generally the output voltage may increase when a series regulator is used at low load current (1.0 mA or less).
- Note that generally the output voltage may increase due to the leakage current from an output driver when a series regulator is used at high temperature.
- Note that the output voltage may increase due to the leakage current from an output driver even if the ON / OFF pin is at OFF level when a series regulator is used at high temperature.
- Generally a series regulator may cause oscillation, depending on the selection of external parts. The following conditions are recommended for the S-13A1 Series. However, be sure to perform sufficient evaluation under the actual usage conditions for selection, including evaluation of temperature characteristics. Refer to "6. Example of equivalent series resistance vs. Output current characteristics ( $T_a = +25^\circ\text{C}$ )" in "■ Reference Data" for the equivalent series resistance ( $R_{ESR}$ ) of the output capacitor.

Input capacitor ( $C_{IN}$ ):	2.2 $\mu\text{F}$ or more
Output capacitor ( $C_L$ ):	2.2 $\mu\text{F}$ or more

- The voltage regulator may oscillate when the impedance of the power supply is high and the input capacitance is small or an input capacitor is not connected.
- If the output capacitance is small, power supply's fluctuation and the characteristics of load fluctuation become worse. Sufficiently evaluate the output voltage's fluctuation with the actual device.
- Overshoot may occur in the output voltage momentarily if the voltage is rapidly raised at power-on or when the power supply fluctuates. Sufficiently evaluate the output voltage at power-on with the actual device.
- The application conditions for the input voltage, the output voltage, and the load current should not exceed the power dissipation.
- Do not apply an electrostatic discharge to this IC that exceeds the performance ratings of the built-in electrostatic protection circuit.
- In determining the output current, attention should be paid to the output current value specified in **Table 15** and **Table 16** in "■ Electrical Characteristics" and footnote \*5 of the table.
- ABLIC Inc. claims no responsibility for any disputes arising out of or in connection with any infringement by products including this IC of patents owned by a third party.

### 1. Transient response characteristics when input ( $T_a = +25^\circ\text{C}$ )

#### 1.1 $V_{\text{OUT}} = 1.0 \text{ V}$

$I_{\text{OUT}} = 100 \text{ mA}$ ,  $C_{\text{IN}} = C_{\text{L}} = 2.2 \mu\text{F}$ ,  
 $V_{\text{IN}} = 2.0 \text{ V} \leftrightarrow 3.0 \text{ V}$ ,  $t_r = t_f = 5.0 \mu\text{s}$

#### 1.2 $V_{\text{OUT}} = 2.5 \text{ V}$

$I_{\text{OUT}} = 100 \text{ mA}$ ,  $C_{\text{IN}} = C_{\text{L}} = 2.2 \mu\text{F}$ ,  
 $V_{\text{IN}} = 3.5 \text{ V} \leftrightarrow 4.5 \text{ V}$ ,  $t_r = t_f = 5.0 \mu\text{s}$

#### 1.3 $V_{\text{OUT}} = 3.5 \text{ V}$

$I_{\text{OUT}} = 100 \text{ mA}$ ,  $C_{\text{IN}} = C_{\text{L}} = 2.2 \mu\text{F}$ ,  
 $V_{\text{IN}} = 4.5 \text{ V} \leftrightarrow 5.5 \text{ V}$ ,  $t_r = t_f = 5.0 \mu\text{s}$

## 2. Transient response characteristics of load ( $T_a = +25^\circ\text{C}$ )

### 2.1 $V_{\text{OUT}} = 1.0 \text{ V}$

$V_{\text{IN}} = 2.0 \text{ V}$ ,  $C_{\text{IN}} = C_{\text{L}} = 2.2 \mu\text{F}$ ,  $I_{\text{OUT}} = 50 \text{ mA} \leftrightarrow 100 \text{ mA}$

$V_{\text{IN}} = 2.0 \text{ V}$ ,  $C_{\text{IN}} = C_{\text{L}} = 2.2 \mu\text{F}$ ,  $I_{\text{OUT}} = 100 \text{ mA} \leftrightarrow 500 \text{ mA}$

### 2.2 $V_{\text{OUT}} = 2.5 \text{ V}$

$V_{\text{IN}} = 3.5 \text{ V}$ ,  $C_{\text{IN}} = C_{\text{L}} = 2.2 \mu\text{F}$ ,  $I_{\text{OUT}} = 50 \text{ mA} \leftrightarrow 100 \text{ mA}$

## Disclaimers (Handling Precautions)

1. All the information described herein (product data, specifications, figures, tables, programs, algorithms and application circuit examples, etc.) is current as of publishing date of this document and is subject to change without notice.
2. The circuit examples and the usages described herein are for reference only, and do not guarantee the success of any specific mass-production design.  
ABLIC Inc. is not liable for any losses, damages, claims or demands caused by the reasons other than the products described herein (hereinafter "the products") or infringement of third-party intellectual property right and any other right due to the use of the information described herein.
3. ABLIC Inc. is not liable for any losses, damages, claims or demands caused by the incorrect information described herein.
4. Be careful to use the products within their ranges described herein. Pay special attention for use to the absolute maximum ratings, operation voltage range and electrical characteristics, etc.  
ABLIC Inc. is not liable for any losses, damages, claims or demands caused by failures and / or accidents, etc. due to the use of the products outside their specified ranges.
5. Before using the products, confirm their applications, and the laws and regulations of the region or country where they are used and verify suitability, safety and other factors for the intended use.
6. When exporting the products, comply with the Foreign Exchange and Foreign Trade Act and all other export-related laws, and follow the required procedures.
7. The products are strictly prohibited from using, providing or exporting for the purposes of the development of weapons of mass destruction or military use. ABLIC Inc. is not liable for any losses, damages, claims or demands caused by any provision or export to the person or entity who intends to develop, manufacture, use or store nuclear, biological or chemical weapons or missiles, or use any other military purposes.
8. The products are not designed to be used as part of any device or equipment that may affect the human body, human life, or assets (such as medical equipment, disaster prevention systems, security systems, combustion control systems, infrastructure control systems, vehicle equipment, traffic systems, in-vehicle equipment, aviation equipment, aerospace equipment, and nuclear-related equipment), excluding when specified for in-vehicle use or other uses by ABLIC, Inc. Do not apply the products to the above listed devices and equipments.  
ABLIC Inc. is not liable for any losses, damages, claims or demands caused by unauthorized or unspecified use of the products.
9. In general, semiconductor products may fail or malfunction with some probability. The user of the products should therefore take responsibility to give thorough consideration to safety design including redundancy, fire spread prevention measures, and malfunction prevention to prevent accidents causing injury or death, fires and social damage, etc. that may ensue from the products' failure or malfunction.  
The entire system in which the products are used must be sufficiently evaluated and judged whether the products are allowed to apply for the system on customer's own responsibility.
10. The products are not designed to be radiation-proof. The necessary radiation measures should be taken in the product design by the customer depending on the intended use.
11. The products do not affect human health under normal use. However, they contain chemical substances and heavy metals and should therefore not be put in the mouth. The fracture surfaces of wafers and chips may be sharp. Be careful when handling these with the bare hands to prevent injuries, etc.
12. When disposing of the products, comply with the laws and ordinances of the country or region where they are used.
13. The information described herein contains copyright information and know-how of ABLIC Inc. The information described herein does not convey any license under any intellectual property rights or any other rights belonging to ABLIC Inc. or a third party. Reproduction or copying of the information from this document or any part of this document described herein for the purpose of disclosing it to a third-party is strictly prohibited without the express permission of ABLIC Inc.
14. For more details on the information described herein or any other questions, please contact ABLIC Inc.'s sales representative.
