

IS31FL3236A

36-CHANNEL LED DRIVER; SELECTABLE PWM FREQUENCY

October 2024

GENERAL DESCRIPTION

IS31FL3236A is comprised of 36 constant current channels each with independent PWM control, designed for driving LEDs, PWM frequency can be 3kHz or 22kHz. The output current of each channel can be set at up to 38mA (Max.) by an external resistor and independently scaled by a factor of 1, 1/2, 1/3 and 1/4. The average LED current of each channel can be changed in 256 steps by changing the PWM duty cycle through an I2C interface.

The chip can be turned off by pulling the SDB pin low or by using the software shutdown feature to reduce power consumption.

IS31FL3236A is available in QFN-44 (5mm×5mm) and eTQFP-48 packages. It operates from 2.7V to 5.5V over the temperature range of -40°C to +85°C and -40°C to +125°C.

APPLICATIONS

- Hand-held devices for LED display
- LED in home appliances

FEATURES

- 2.7V to 5.5V supply
- I2C interface, automatic address increment function
- Four selectable I2C addresses
- SDB rising edge reset I2C module
- Internal reset register
- Modulate LED brightness with 256 steps PWM
- Each channel can be controlled independently
- Each channel can be scaled independently by 1, 1/2, 1/3 and 1/4
- PWM frequency selectable
 - 3kHz (default)
 - 22kHz
- -40°C to +85°C temperature range:
 - IS31FL3236A-QFLS2-TR, QFN-44 (5mm×5mm)
- -40°C to +125°C temperature range:
 - IS31FL3236A-QFLS4-TR, QFN-44 (5mm×5mm)
 - IS31FL3236A-TQLS4-TR, eTQFP-48
- RoHS & Halogen-Free Compliance
- TSCA Compliance

TYPICAL APPLICATION CIRCUIT

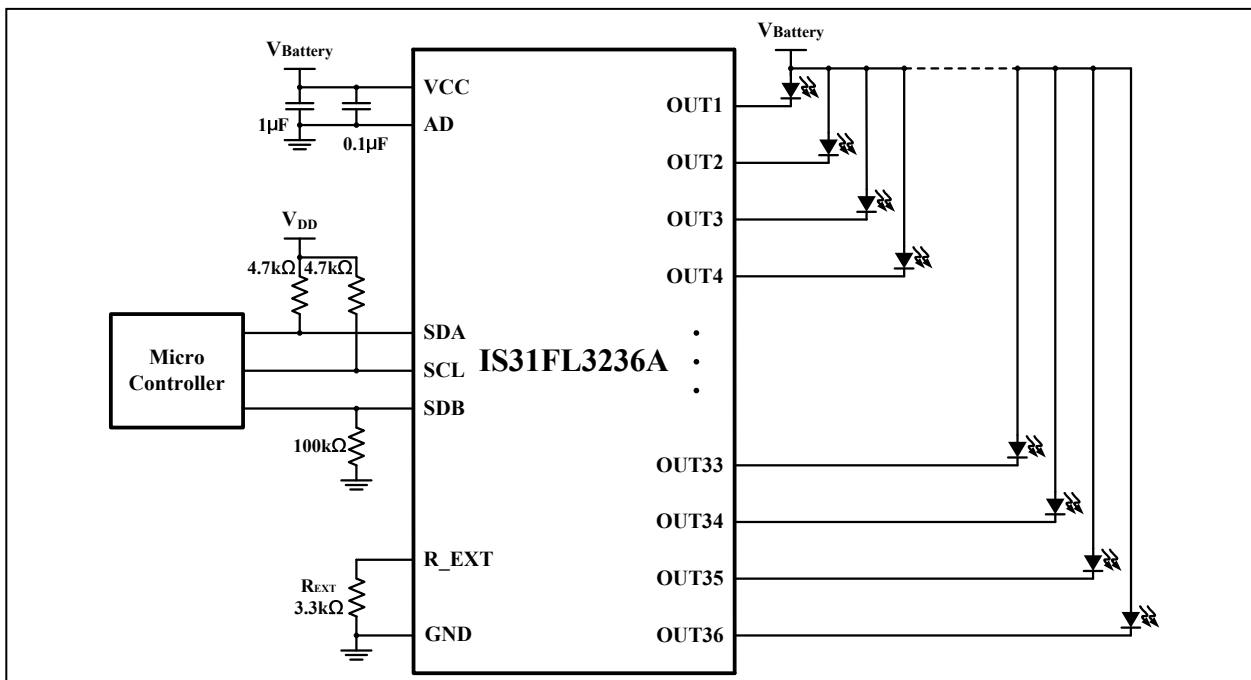

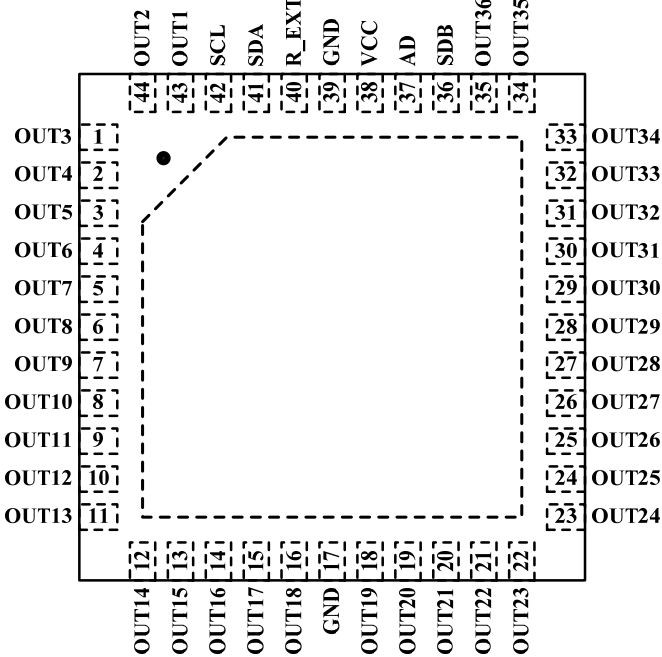

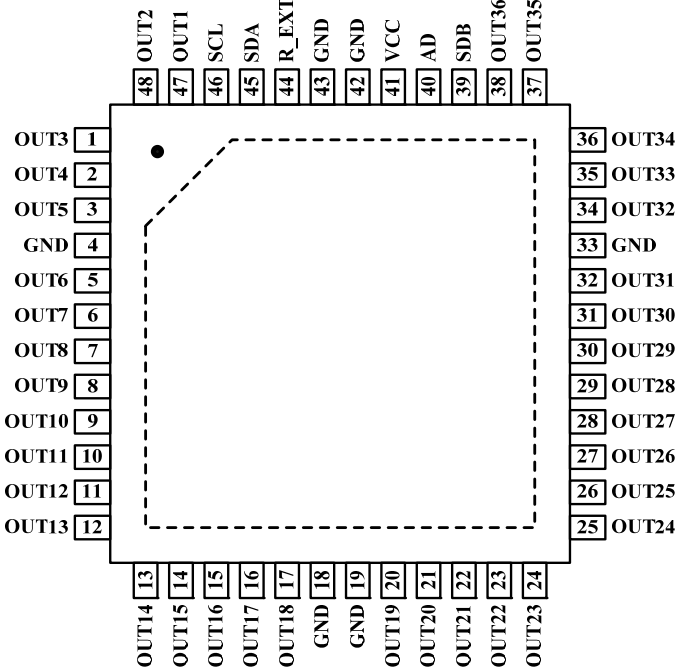

Figure 1 Typical Application Circuit

Note 1: The maximum global output current is set to 23mA when $R_{EXT} = 3.3k\Omega$. Please refer Page 11 for setting LED current.

PIN CONFIGURATION

Package	Pin Configuration (Top View)
QFN-44	
eTQFP-48	

PIN DESCRIPTION

No.		Pin	Description
QFN	eTQFP		
1~16	1~3,5~17	OUT3 ~ OUT18	Output channel 3~18 for LEDs.
17,39	4,18,19, 33,42,43	GND	Ground.
18~35	20~32, 34~38	OUT19 ~ OUT36	Output channel 19~36 for LEDs.
36	39	SDB	Shutdown the chip when pulled low.
37	40	AD	I2C address setting.
38	41	VCC	Power supply.
40	44	R_EXT	Input terminal used to connect an external resistor. This regulates the global output current.
41	45	SDA	I2C serial data.
42	46	SCL	I2C serial clock.
43,44	47,48	OUT1, OUT2	Output channel 1, 2 for LEDs.
		Thermal Pad	Connect to GND.

IS31FL3236A

ABSOLUTE MAXIMUM RATINGS

Supply voltage, V_{CC}	-0.3V ~ +6.0V
Voltage at SCL, SDA, SDB, AD, OUT1 to OUT36	-0.3V ~ $V_{CC}+0.3V$
Maximum junction temperature, T_{JMAX}	+150°C
Storage temperature range, T_{STG}	-65°C ~ +150°C
Operating temperature range, $T_A=T_J$	-40°C ~ +85°C -40°C ~ +125°C
Package thermal resistance, junction to ambient (4-layer standard test PCB based on JEDEC standard), θ_{JA}	32.65°C/W (QFN) 38.72°C/W (eTQFP)
ESD (HBM)	±8kV
ESD (CDM)	±1kV

Note: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

Typical values are $T_A = 25^\circ\text{C}$, $V_{CC} = 3.6V$.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
V_{CC}	Supply voltage		2.7		5.5	V
I_{MAX}	Maximum global output current	$V_{CC} = 4.2V$, $V_{OUT} = 0.8V$ $R_{EXT} = 2k\Omega$, $SL = "00"$ (Note 1)		38		mA
I_{OUT}	Output current	$V_{OUT} = 0.6V$, $R_{EXT} = 3.3k\Omega$, $SL = "00"$		23		mA
V_{HR}	Headroom voltage	$R_{EXT} = 3.3k\Omega$, $I_{OUT} = 20mA$		0.4	0.6	V
I_{CC}	Quiescent power supply current	$R_{EXT} = 3.3k\Omega$		9		mA
I_{SD}	Shutdown current	$V_{SDB} = 0V$ or software shutdown $T_A = 25^\circ\text{C}$, $V_{CC} = 3.6V$		3	5	μA
f_{OUT}	PWM frequency of output	$0x4B = 0x00$		2.9		kHz
		$0x4B = 0x01$		21.6		kHz
I_{OZ}	Output leakage current	$V_{SDB} = 0V$ or software shutdown, $V_{OUT} = V_{CC} = 5.5V$			0.2	μA
T_{SD}	Thermal shutdown	(Note 2)		160		°C
T_{SD_HYS}	Thermal shutdown hysteresis	(Note 2)		20		°C
V_{EXT}	Output voltage of R_{EXT} pin			1.3		V

Logic Electrical Characteristics (SDA, SCL, SDB, AD)

V_{IL}	Logic "0" input voltage	$V_{CC} = 2.7V \sim 5.5V$			0.4	V
V_{IH}	Logic "1" input voltage	$V_{CC} = 2.7V \sim 5.5V$	1.4			V
I_{IL}	Logic "0" input current	$V_{INPUT} = 0V$ (Note 2)		5		nA
I_{IH}	Logic "1" input current	$V_{INPUT} = V_{CC}$ (Note 2)		5		nA

DIGITAL INPUT SWITCHING CHARACTERISTICS (NOTE 2)

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
f_{SCL}	Serial-Clock frequency				400	kHz
t_{BUF}	Bus free time between a STOP and a START condition		1.3			μs
$t_{HD, STA}$	Hold time (repeated) START condition		0.6			μs
$t_{SU, STA}$	Repeated START condition setup time		0.6			μs
$t_{SU, STO}$	STOP condition setup time		0.6			μs
$t_{HD, DAT}$	Data hold time				-	μs
$t_{SU, DAT}$	Data setup time		100			ns
t_{LOW}	SCL clock low period		1.3			μs
t_{HIGH}	SCL clock high period		0.7			μs
t_R	Rise time of both SDA and SCL signals, receiving	(Note 3)		$20+0.1C_b$	300	ns
t_F	Fall time of both SDA and SCL signals, receiving	(Note 3)		$20+0.1C_b$	300	ns

Note 1: The recommended minimum value of R_{EXT} is 2k Ω , or it may cause a large current.

Note 2: Guaranteed by design.

Note 3: C_b = total capacitance of one bus line in pF. $I_{SINK} \leq 6mA$. t_R and t_F measured between $0.3 \times V_{IH}$ and $0.7 \times V_{IH}$.

IS31FL3236A

DETAILED DESCRIPTION

I2C INTERFACE

The IS31FL3236A uses a serial bus, which conforms to the I2C protocol, to control the chip's functions with two wires: SCL and SDA. The IS31FL3236A has a 7-bit slave address (A7:A1), followed by the R/W bit, A0. Since IS31FL3236A only supports write operations, A0 must always be "0". The value of bits A1 and A2 are decided by the connection of the AD pin.

The complete slave address is:

Table 1 Slave Address (Write Only):

Bit	A7:A3	A2:A1	A0
Value	01111	AD	0

AD connected to GND, AD = 00;
 AD connected to VCC, AD = 11;
 AD connected to SCL, AD = 01;
 AD connected to SDA, AD = 10;

The SCL line is uni-directional. The SDA line is bi-directional (open-drain) with a pull-up resistor (typically 4.7kΩ). The maximum clock frequency specified by the I2C standard is 400kHz. In this discussion, the master is the microcontroller and the slave is the IS31FL3236A.

The timing diagram for the I2C is shown in Figure 2. The SDA is latched in on the stable high level of the SCL. When there is no interface activity, the SDA line should be held high.

The "START" signal is generated by lowering the SDA signal while the SCL signal is high. The start signal will alert all devices attached to the I2C bus to check the incoming address against their own chip address.

The 8-bit chip address is sent next, most significant bit first. Each address bit must be stable while the SCL level is high.

After the last bit of the chip address is sent, the master checks for the IS31FL3236A's acknowledge. The master releases the SDA line high (through a pull-up resistor). Then the master sends an SCL pulse. If the IS31FL3236A has received the address correctly, then it holds the SDA line low during the SCL pulse. If the SDA line is not low, then the master should send a "STOP" signal (discussed later) and abort the transfer.

Following acknowledge of IS31FL3236A, the register address byte is sent, most significant bit first. IS31FL3236A must generate another acknowledge indicating that the register address has been received.

Then 8-bit of data byte are sent next, most significant bit first. Each data bit should be valid while the SCL level is stable high. After the data byte is sent, the IS31FL3236A must generate another acknowledge to indicate that the data was received.

The "STOP" signal ends the transfer. To signal "STOP", the SDA signal goes high while the SCL signal is high.

ADDRESS AUTO INCREMENT

To write multiple bytes of data into IS31FL3236A, load the address of the data register that the first data byte is intended for. During the IS31FL3236A acknowledge of receiving the data byte, the internal address pointer will increment by one. The next data byte sent to IS31FL3236A will be placed in the new address, and so on. The auto increment of the address will continue as long as data continues to be written to IS31FL3236A (Figure 5).

REGISTERS DEFINITIONS

Table 2 Register Function

Address	Name	Function	Table	Default
00h	Shutdown Register	Set software shutdown mode	3	0000 0000
01h~24h	PWM Register	36 channels PWM duty cycle data register	4	
25h	PWM Update Register	Load PWM Register and LED Control Register's data	-	xxxx xxxx
26h~49h	LED Control Register	Channel 1 to 36 enable bit and current setting	5	0000 0000
4Ah	Global Control Register	Set all channels enable	6	
4Bh	Output Frequency Setting Register	Set all channels operating frequency	7	0000 0000
4Fh	Reset Register	Reset all registers into default value	-	xxxx xxxx

Table 3 00h Shutdown Register

Bit	D7:D1	D0
Name	-	SSD
Default	0000 000	0

The Shutdown Register sets software shutdown mode of IS31FL3236A.

SSD	Software Shutdown Enable
0	Software shutdown mode
1	Normal operation

Table 4 01h~24h PWM Register (OUT1~OUT36)

Bit	D7:D0
Name	PWM
Default	0000 0000

The PWM Registers adjusts LED luminous intensity in 256 steps.

The value of a channel's PWM Register decides the average output current for each output, OUT1~OUT36. The average output current may be computed using the Formula (1):

$$I_{PWM} = \frac{I_{OUT}}{256} \cdot \sum_{n=0}^7 D[n] \cdot 2^n \quad (1)$$

IS31FL3236A

Where “n” indicates the bit location in the respective PWM register.

For example: D7:D0 = 10110101,

$$I_{PWM} = I_{OUT} (2^0 + 2^2 + 2^4 + 2^5 + 2^7) / 256$$

The I_{OUT} of each channel is set by the SL bit of LED Control Register (26h~49h). Please refer to the detailed information in Page 11.

25h PWM Update Register

The data sent to the PWM Registers, and the LED Control Registers will be stored in temporary registers. A write operation of “0000 0000” value to the Update Register is required to update the registers (01h~24h, 26h~49h).

Table 5 26h~49h LED Control Register (OUT1~OUT36)

Bit	D7:D3	D2:D1	D0
Name	-	SL	OUT
Default	00000	00	0

The LED Control Registers store the on or off state of each LED and set the output current.

SL Output Current Setting (I_{OUT})

00	I_{MAX}
01	$I_{MAX}/2$
10	$I_{MAX}/3$
11	$I_{MAX}/4$

OUT LED State

0	LED off
1	LED on

Table 6 4Ah Global Control Register

Bit	D7:D1	D0
Name	-	G_EN
Default	0000 000	0

The Global Control Register set all channels enable.

G_EN Global LED Enable

0	Normal operation
1	Shutdown all LEDs

Table 7 4Bh Output Frequency Setting Register

Bit	D7:D1	D0
Name	-	OFS
Default	0000 000	0

The Output Frequency Setting Register selects a fixed PWM operating frequency for all output channels.

OFS Output Frequency Setting

0	3kHz
1	22kHz

4Fh Reset Register

Once user writes “0000 0000” data to the Reset Register, IS31FL3236A will reset all registers to default value. On initial power-up, the IS31FL3236A registers are reset to their default values for a blank display.

IS31FL3236A

TYPICAL APPLICATION

PWM CONTROL

The PWM Registers (01h~24h) can modulate LED brightness of 36 channels with 256 steps. For example, if the data in PWM Register is “0000 0100”, then the PWM is the fourth step.

Writing new data continuously to the registers can modulate the brightness of the LEDs to achieve a breathing effect.

R_{EXT}

The maximum output current of OUT1~OUT36 can be adjusted by the external resistor, R_{EXT}, as described in Formula (2).

$$I_{MAX} = x \cdot \frac{V_{EXT}}{R_{EXT}} \quad (2)$$

x = 58.5, V_{OUT} = 0.8V, V_{EXT} = 1.3V.

The recommended minimum value of R_{EXT} is 2kΩ.

CURRENT SETTING

The current of each LED can be set independently by the SL bit of LED Control Register (26h~49h). The maximum global current is set by the external register R_{EXT}.

When channels drive different quantity of LEDs, adjust maximum output current according to quantity of LEDs to ensure average current of each LED is the same.

For example, set R_{EXT} = 3.3kΩ then I_{MAX} = 23mA. If OUT1 drives two LEDs and OUT2 drives four LEDs, set the SL bit of LED Control Register (26h) to “01” and SL bit of LED Control Register (27h) to “00”. So the current of OUT1 is I_{OUT1} = I_{MAX}/2 = 11.5mA and the current of OUT2 is I_{OUT2} = I_{MAX} = 23mA. The average current of each LED is the same.

GAMMA CORRECTION

In order to perform a better visual LED breathing effect we recommend using a gamma corrected PWM value to set the LED intensity. This results in a reduced number of steps for the LED intensity setting, but causes the change in intensity to appear more linear to the human eyes.

Gamma correction, also known as gamma compression or encoding, is used to encode linear luminance to match the non-linear characteristics of display. Since the IS31FL3236A can modulate the brightness of the LEDs with 256 steps, a gamma correction function can be applied when computing each subsequent LED intensity setting such that the changes in brightness matches the human eye's brightness curve.

Table 8 32 Gamma Steps With 256 PWM Steps

C(0)	C(1)	C(2)	C(3)	C(4)	C(5)	C(6)	C(7)
0	1	2	4	6	10	13	18
C(8)	C(9)	C(10)	C(11)	C(12)	C(13)	C(14)	C(15)
22	28	33	39	46	53	61	69
C(16)	C(17)	C(18)	C(19)	C(20)	C(21)	C(22)	C(23)
78	86	96	106	116	126	138	149
C(24)	C(25)	C(26)	C(27)	C(28)	C(29)	C(30)	C(31)
161	173	186	199	212	226	240	255

Figure 6 Gamma Correction (32 Steps)

Choosing more gamma steps provides for a more continuous looking breathing effect. This is useful for very long breathing cycles. The recommended configuration is defined by the breath cycle T. When T=1s, choose 32 gamma steps, when T=2s, choose 64 gamma steps. The user must decide the final number of gamma steps not only by the LED itself, but also based on the visual performance of the finished product.

Table 9 64 Gamma Steps With 256 PWM Steps

C(0)	C(1)	C(2)	C(3)	C(4)	C(5)	C(6)	C(7)
0	1	2	3	4	5	6	7

IS31FL3236A

Figure 7 Gamma Correction (64 Steps)

Note, the data of 32 gamma steps is the standard value and the data of 64 gamma steps is the recommended value.

SHUTDOWN MODE

Shutdown mode can be used as a means of reducing power consumption. During shutdown mode all registers retain their data.

Software Shutdown

By setting SSD bit of the Shutdown Register (00h) to "0", the IS31FL3236A will operate in software shutdown mode. When the IS31FL3236A is in software shutdown mode, all current sources are switched off.

Hardware Shutdown

The chip enters hardware shutdown when the SDB pin is pulled low. All analog circuits are disabled during hardware shutdown, typical the current consume is 3 μ A. The chip releases hardware shutdown when the SDB pin is pulled high. When set SDB high, the rising edge will reset the I2C module, but the register information retains. During hardware shutdown state Function Register can be operated.

PWM FREQUENCY SELECT

The IS31FL3236 output channels operate with a default PWM frequency of 3kHz. Because all the OUTx channels are synchronized, the DC supply will experience large instantaneous current surges when the OUTx channels turn ON. These current surges will generate an AC ripple on the power supply which cause stress to the decoupling capacitors.

When the AC ripple is applied to a monolithic ceramic capacitor chip (MLCC) it will expand and contract causing the PCB to flex and generate audible hum in the range of between 20Hz to 20kHz. To avoid this hum, there are many countermeasures, such as selecting the capacitor type and value which will not cause the PCB to flex and contract.

An additional option for avoiding audible hum is to set the IS31FL3236's output PWM frequency above the audible range. The Output Frequency Setting Register (4Bh)'s bit D0 can be used to set the switching frequency to 22kHz, which is beyond the audible range. Figure 8 below shows the variation of output PWM frequency across supply voltage and temperature.

Figure 8 V_{CC} vs. Output PWM Frequency

CLASSIFICATION REFLOW PROFILES

Profile Feature	Pb-Free Assembly
Preheat & Soak Temperature min (T _{smin}) Temperature max (T _{smax}) Time (T _{smin} to T _{smax}) (t _s)	150°C 200°C 60-120 seconds

QFN-44

Note:

1. Land pattern complies to IPC-7351.
2. All dimensions in MM.
3. This document (including dimensions, notes & specs) is a recommendation based on typical circuit board manufacturing parameters. Since land pattern design depends on many factors unknown (eg. user's board manufacturing specs), user must determine suitability for use.

REVISION HISTORY

Revision	Detail Information	Date
0A	Initial release	2016.09.06
A	Release to mass product	2016.11.15
B	Update Figure 1 and function block	2017.12.07
C	1. Add IS31FL3236A-QFLS4-TR (-40°C ~ +125°C) and IS31FL3236A-TQLS4 (eTQFP-48, -40°C ~ +125°C) 2. V_{IH} , V_{IL} condition revise to $V_{CC} = 2.7V \sim 5.5V$	2018.01.10
D	Add tape reel packing for eTQFP-48 package	2018.02.11
E	Update QFN-44 land pattern	2020.09.30
F	1. Update I_{OZ} condition in EC 2. Update QFN-44 land pattern thermal pad size	2022.02.21
G	1. Remove $t_{HD,DAT}$ max. value 2. Add RoHS information in Features	2022.09.21
H	1. Updated Lumissil Microsystem's Logo 2. Correct description of example of equation (1)	2024.04.10
I	Update CDM value to 1kV	2024.10.14
