

Power Amplifier

FEATURES

- Optimized Solution to Drive Dynamic Capacitive Loads
- Drive Capability 0-540nF
- Short Term Output current >30A (within SOA)
- High Internal Power Dissipation of 130W
- Fixed Gain -15V/V or -20V/V
- Optimized for Achieving a -36V Output Voltage Swing
- Slew Rate of 50 V/ μ s

APPLICATIONS

- Piezoelectric Actuation for Inkjet Printers

DESCRIPTION

The MP106 is a high output power amplifier for driving capacitive loads such as piezo devices used in ink-jet printing applications. The MP106 utilizes Apex proprietary technology with discrete semiconductor and passive elements on a thermally highly conductive, but electrically isolated package, delivering high power in a very compact module.

The amplifier gain is fixed at -15V/V or -20V/V. It is optimized to achieve a -36V output voltage swing even at a small output voltage offset with a single 3V DAC. A combination of internal and external compensation provides optimum slew rate and insures stability while reducing the overall number of required components. Auxiliary voltages (+V_B and -V_B) for the amplifier stage are used to reduce the power loss in the output drivers.

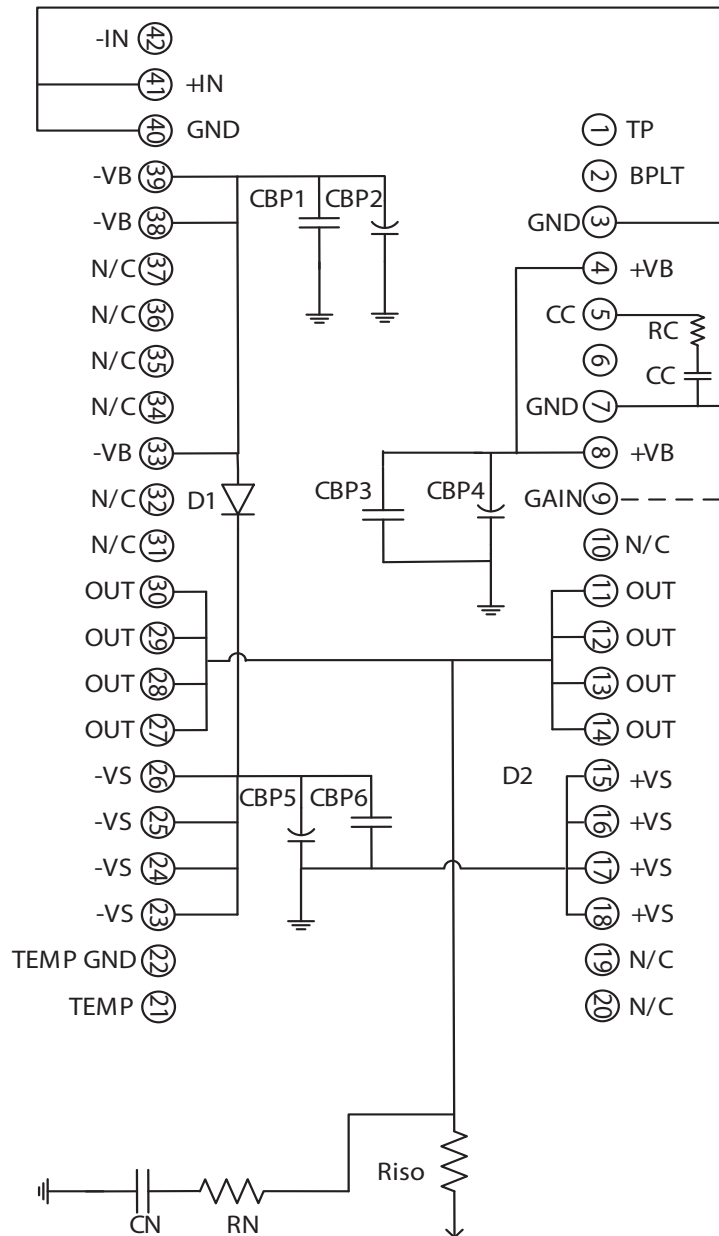

Figure 1: Typical Connection

PINOUT AND DESCRIPTION TABLE

The package of MP106 is designed to be mounted above the print head if desired. Therefore, the width of the amplifier is less than the width of the Samba print head. Please check the positioning of the connectors and the location of the components carefully to avoid any damage during mounting or any short to ground. All pins except those marked TP, N/C, TEMP or GAIN must be connected externally for proper operation. The diodes between $+V_S/+V_B$ and $-V_B/-V_S$ are recommended to prevent damage of the amplifier during power sequencing.

Figure 2: External Connections

| Pin Number | Name | Description |
|-------------|-----------------|---|
| 1 | TP | Do not connect |
| 2 | BPLT | Backplate. Connect to signal ground |
| 3 | GND | Signal Ground |
| 4 | +V _B | Positive amplifier operating voltage ("Boost" voltage) |
| 5 | CC | External compensation capacitor. Connect compensation capacitor and resistor in series between this pin and ground pin. |
| 6 | N/C | Not connected |
| 7 | GND | Signal Ground |
| 8 | +VB | Positive amplifier operating voltage ("Boost" voltage) |
| 9 | GAIN | Gain. Connect to pin 7 (GND) for a gain of 20. Leave open for a gain of 15. |
| 10 | N/C | Not connected |
| 11,12,13,14 | OUT | Amplifier output. Must be connected also to pins 27, 28, 29, 30 |
| 15,16,17,18 | +V _S | Positive supply pins. Connect these pins to power ground. |
| 19,20 | N/C | Not connected |
| 21 | TEMP | Temperature sensor output |
| 22 | TEMP GND | Signal Ground |
| 23,24,25,26 | -V _S | Negative amplifier output stage supply voltage |
| 27,28,29,30 | OUT | Amplifier output. Must be connected also to pins 11, 12, 13, 14 |
| 31,32 | N/C | Not connected |
| 33 | -V _B | Negative amplifier operating voltage ("Boost" voltage) |
| 34,35,36,37 | N/C | Not connected |
| 38, 39 | -V _B | Negative amplifier operating voltage ("Boost" voltage) |
| 40 | GND | Signal Ground |
| 41 | +IN | Non-inverting amplifier input |
| 42 | -IN | Inverting amplifier input |

SPECIFICATIONS

Unless notes otherwise, the electrical characteristics are based on T_C=25°C, +V_S=0V, -V_S=-48V, +V_B=15V, -V_B=-60V

ABSOLUTE MAXIMUM RATINGS

| Parameter | Symbol | Min | Max | Units |
|-----------------------|-----------------|---------------------|-----------------|-------|
| Supply Voltage | -V _S | -60 | -15 | V |
| Positive Boost Supply | +V _B | | +15 | V |
| Negative Boost Supply | -V _B | -V _S -15 | -V _S | V |
| Output Current, peak | I _o | | 32 | A |
| Power Dissipation | P _D | | 130 | W |
| Input Voltage | V _{IN} | -0.5 | +10 | V |

| | | | | |
|-----------------------------------|-------|-----|-----|----|
| Temperature, pin solder, 10s max | T_S | | 225 | °C |
| Operating Temperature Range, case | T_C | -25 | +85 | °C |

AMPLIFIER ELECTRICAL CHARACTERISTICS

| Parameter | Test Conditions | Min | Typ | Max | Units |
|--------------------------------|-----------------|-----|-----|-----|------------------|
| Input Voltage, V_{IN}^1 | | 0 | 0-3 | 5 | V |
| Offset Voltage, initial | | -7 | 3 | 7 | mV |
| Offset Voltage vs. Temperature | Full Temp Range | 7.2 | | | $\mu V/^\circ C$ |
| Offset Voltage vs. Supply | | 72 | | | $\mu V/V$ |
| Bias Current, initial | | | 300 | 550 | nA |
| Input Resistance, DC | | | 160 | | M Ω |
| Input Capacitance | | | 3 | | pF |
| Input Noise @ 10 kHz | | | 12 | | nV/ \sqrt{Hz} |

1. With $|A_V| \geq 15$ and the negative supply rail of -40V, a 5V input would drive the amplifier into the rail. The specification only indicates that an accidental 5V input signal does not cause any harm to the amplifier.

GAIN

| Parameter | Test Conditions | Min | Typ | Max | Units |
|-------------------------------|--------------------------|-------|-----|-------|-------|
| Amplifier Gain, A_V , | Pin 9 open | -14.7 | -15 | -15.3 | V/V |
| Amplifier Gain, A_V , | Pin 9 connected to pin 7 | -19.7 | -20 | -20.3 | V/V |
| Open Loop Gain (@15 Hz) | | | 96 | | dB |
| Gain Bandwidth Product, 1 MHz | | | 8.5 | | MHz |
| Power Bandwidth, 40 p-p | | | 280 | | kHz |

OUTPUT

| Parameter ¹ | Test Conditions | Min | Typ | Max | Units |
|------------------------|--|----------|-----|----------|------------|
| Voltage Swing, $+V_S$ | $+V_B=13V$, $-V_S=-14V$, $-V_B=-27$, $I_O=10A$ | $+V_S-1$ | | | V |
| Voltage Swing, $-V_S$ | $+V_B=13V$, $-V_S=-14V$, $-V_B=-27$, $I_O=10A$ | | | $-V_S+2$ | V |
| Voltage Swing, $-V_S$ | $+V_B=13V$, $-V_B=-V_S=-14V$, $I_O=10A$ | | | $-V_S+5$ | V |
| Current, continuous | | 10 | | | A |
| Current, peak | | | | 30 | A |
| Slew rate | $A_V=-15$, $CL=540nF$, $RL=0.1\Omega$, $V_{OUT} = 40V$ pulse | 45 | | | V/ μs |

1. $-V_S$ and GND are power supply lines that will carry currents of up to 32A peak (540nF load, 50V/ μs slew rate). Therefore proper dimensioning of PCB traces and the power supply itself need to be considered.

POWER SUPPLY

| Parameter ¹ | Test Conditions | Min | Typ | Max | Units |
|---------------------------------|---|-----|-----|-----|-------|
| Supply Voltage, $-V_S$ | | -60 | -48 | -15 | V |
| Positive Boost Supply, $+V_B$ | | | 15 | | V |
| Negative Boost Supply, $-V_B$ | | | -60 | | V |
| Quiescent current, $+V_B$ I_q | $-V_S = -48V$, $-V_B = -61V$, $+V_B = +13V$ | 20 | 24 | 28 | mA |
| Quiescent current, $-V_B$ I_q | $-V_S = -48V$, $-V_B = -61V$, $+V_B = +13V$ | 22 | 30 | 36 | mA |

1. $-V_S$ and GND are power supply lines that will carry currents of up to 32A peak (540nF load, 50V/ μ s slew rate). Therefore proper dimensioning of PCB traces and the power supply itself need to be considered.

THERMAL

| Parameter | Test Conditions | Min | Typ | Max | Units |

SAFE OPERATING AREA (SOA)

The MOSFET output stage of the MP106 is not limited by second breakdown considerations as in bipolar output stages. Only thermal considerations and current handling capabilities limit the SOA (see Safe Operating Area graph). The output stage is protected against transient fly back by the parasitic body diodes of the output stage MOSFET structure. However, for protection against sustained high energy fly back external fast recovery diodes must be used.

Figure 11: Safe Operating Area (SOA)

POWER SEQUENCING

A diode should be connected between $-V_S$ and $-V_B$ as shown in typical connections drawing in figure 1 to avoid damage to the MP106. If diode is not connected, the board should be powered on in the following sequence:

- $-V_S$
- $-V_B$
- $+V_B$

AMPLIFIER GAIN

The amplifier gain is set to an inverting gain of -15. When the gain pin is shorted to ground (pin 7), the amplifier gain increases to a gain of -20.

POWER SUPPLY BYPASSING

Bypass capacitors to power supply terminal $-V_S$ must be connected physically close to the pins to prevent local parasitic oscillation in the output stage of the MP106. Use electrolytic capacitors at least $10\mu\text{F}$ per output amp required. Bypass the electrolytic capacitors with high quality ceramic capacitors (X7R) $0.1\mu\text{F}$ or greater. A bypass capacitor of $0.1\mu\text{F}$ or greater is recommended for the $+V_B$ and $-V_B$ terminals.

SNUBBER CIRCUIT

When using the amplifier with a capacitive load up to 540nF , an output snubber circuit should be used to stabilize the output signal of the amplifier. A capacitor value of 22nF and a resistor value of 5Ω are recommended for a snubber circuit.

COMPENSATION

External compensation capacitor C_c and compensation resistor R_c are connected from pin 5 to pin 7 as shown in typical connection drawing in figure 1. For piezo loads up to 540nF , a compensation of 220pF and 750Ω are recommended.

SERIES ISOLATION RESISTOR, RS

To insure stability with all capacitive loads a series isolation resistor should be included between the output and the load as shown in the external connections drawing. A 0.1Ω resistor works well for capacitive loads up to 540nF . The resistor will affect the rise and fall time of the output pulse at the capacitive load. This can be compensated for on the input signal.

BACKPLATE GROUNDING

The substrate of the MP106 is an insulated metal substrate. It is required that it be connected to signal ground. This is accomplished when the ground pin (Pin 7) is properly connected to signal ground

TEMPERATURE SENSING

The MP106 consists of two IC temperature sensors, located near the two output MOSFETs. The scale factor of the sensor is $10\text{mV}/^\circ\text{C}$. The output voltage of the sensor is equal to approximately 2.98 V at room temperature ($T_c = 25^\circ\text{C}$). The sensor has an uncalibrated temperature error of $+1^\circ\text{C}$. The scale factor of the sensor can be adjusted by connecting an optional resistor “R” (refer Fig 13) to TMP pin using the following equation, where T is case temperature in $^\circ\text{C}$.

Figure 13: Temperature Sensor

$$V_T = \frac{R}{10000 + R}(0.01T + 2.73)$$

POWER SUPPLY PROTECTION

Unidirectional zener diode transient suppressors are recommended as protection on the supply pins. The zeners clamp transients to voltages within the power supply rating and also clamp power supply reversals to ground. Whether the zeners are used or not, the system power supply should be evaluated for transient performance including power-on overshoot and power-off polarity reversal as well as line regulation. Conditions which can cause open circuits or polarity reversals on either power supply rail should be avoided or protected against. Reversals or opens on the negative supply rail is known to induce input stage failure. Unidirectional TVS diodes prevent this, and it is desirable that they be both electrically and physically as close to the amplifier as possible.

PACKAGE STYLE FC

Figure 1: Mechanical drawing of the 16-pin DIP package. The drawing includes three views: a side profile, a top view, and a bottom view. Dimensions are provided in inches and millimeters. Key features include a .26 inch component clearance, a .650 inch body height, a 1.300 inch pin pitch, and a .150 inch pin thickness. The top view shows a 2.89 inch body width and a .670 inch pin spacing. The bottom view shows a .025 inch square pin and a .100 inch typical pin thickness.

1. Dimensions are inches; alternate units are [mm].
2. Recommended PCB hole diameter for pins: .050 [1.27].
3. 2oz. copper over 600V dielectric over aluminum substrate.
4. Tin over nickel plated phosphor bronze pins.
5. Package weight:
6. Mount with #4 or equivalent screws.
7. It is not recommended that mounting of the package rely on the pins for mechanical support.
