

CC2725AC34TZL Conduction-Cooled, Wide-Output Range Rectifier

200-240V_{AC} Input; 2,725W-Capable; 34V_{DC} Default Output; RoHS Compliant

The CC2725AC34TZL rectifier has an extremely wide programmable output voltage capability. Featuring high-density, fully enclosed, conduction-cooled packaging, it is designed for minimal space utilization and is highly expandable for future growth. This standard rectifier incorporates both RS485 and I²C communications buses that allow it to be used in a broad range of applications. Feature-set flexibility makes this rectifier an excellent choice for applications requiring operation over a wide output-voltage range and conduction cooling.

Application

Applications include: Wide Band Power Amplifier; Broadcast Systems; Lasers; Acoustic Noise Sensitive Systems; LED Signage.

Features

- Peak efficiency 94%
- Completely enclosed, conduction cooled
- Output constant power 2,725W from 36-32V_{DC}
- Output voltage programmable from 28V-36V_{DC}
- Remote ON/OFF control of the main output
- Comprehensive input, output and overtemp protection
- Power factor correction (meets EN/IEC 61000-3-2 and EN 60555-2 requirements)
- Redundant, parallel operation with active load sharing
- Redundant 5V Aux power
- Four front panel LED indicators
- Analog status signals
- Trim port to adjust V_o
- PMBus®-compliant I²C serial bus and RS485
- RoHS 6-compliant
- CB report
- CE mark meets 2014/30/EU directive
- NRTL Recognized

See endnotes on page 7

Technical Specifications

Absolute Maximum Ratings

Stresses over the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions over those given in the operations sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect the device reliability.

Parameter	Symbol	Min	Max	Unit
Input Voltage - Continuous Operation	V_{IN}	0	264	V_{AC}
Operating Case Temperature (sink side)	T_C	-40 ¹	40 ²	°C
Storage Temperature	T_{stg}	-40	85	°C

Electrical Specifications

Unless otherwise indicated, specifications apply overall operating input voltage, $V_o=34V_{DC}$, resistive load, and temperature conditions.

[†] Designated to start and work at an ambient as low as -40°C, but meet operational limits until above -5°C

² Refer to power curve (V_o vs I_o)

³ Refer to power curve on page 4

⁴ Allow to add ext Co bank

⁵ V_o undershoot around 2V may take longer time to recover

⁶ Designed to start and work at an ambient as low as -40°C, but meets operational limits until about -5°C

⁷ Test with external filter

⁸ Test with external filter

⁹ Criteria A: The product must maintain performance within specification limits. Criteria B: Temporary degradation which is self-recoverable. Criteria C: Temporary degradation which requires operator intervention.

Technical Specifications (continued)

Control and Status

The Rectifier provides three means for monitor/control: analog, PMBus®, or the ABB Galaxy-based RS485 protocol. Details of analog control are provided in this data sheet. GE will provide separate application notes on the Galaxy RS485 or PMBus® based protocol for users to interface to the rectifier. Contact your local ABB representative for details.

Factory default setting is Analog & PMBus® mode.

Analog Controls

Details of analog controls are provided in this data sheet under Feature Specifications. Note that some signals are ignored in RS485 mode.

Signal Reference

Unless otherwise noted, all signals are referenced to LGND (“Logic Ground”). See the Signal Definitions Table at the end of this document for further description of all the signals.

LGND is isolated from the main output of the rectifier for PMBus communications. Communications and the 5V standby output are not connected to main power return (Vout(-)) and can be tied to the system digital ground point selected by the user. (Note that RS485 communications is referenced to Vout(-), main power return of the rectifier).

LGND is capacitively coupled to Earth Ground inside the rectifier where Earth Ground is also wired to the metal case). The maximum voltage differential between LGND and Earth Ground should be less than 100VDC.

Delayed Overcurrent Shutdown During Startup

Rectifiers are programmed to stay in a constant current state for up to 20 seconds during power up. This delay has been introduced to permit the orderly application of input power to a subset of paralleled front-ends during power up. If the overload persists beyond the 20 second delay, rectifier will shut down and restart.

Auto Restart

Auto-restart is the default configuration for over-current and over-temperature shutdowns

An overvoltage shutdown is followed by three attempted restarts, each restart delayed 1 second, within a 1 minute window. If within the 1 minute window three attempted restarts failed, the unit will latch OFF. If within the 1 minute less than 3 shutdowns occurred then the count for latch OFF resets and the 1 minute window starts all over again.

To restart after a latch off either of five restart mechanisms are available.

1. The hardware pin ON/OFF or DIP switch on rear side may be cycled OFF and then ON.
2. Turn OFF and then turn ON AC power to the unit.
3. The unit may be commanded to restart via i2c through the Operation command by cycling the output OFF followed by ON.

Control Signals

There are two DIP switches and a port on rear side of rectifier, to provide way to adjust output voltage setpoint and remote on/off main power output.

A separated signal connector includes all the control and status signals.

Protocol

Establishes the communications mode of the rectifier, between analog/I2C and RS485 modes. For RS485, connect 10kΩ pull-down resistor to Vout (-). Default setting of signal interface is open.

Margining

There is a trim port on rear panel of rectifier to provide an easy to adjust output voltage set-point. A DIP switch in off disable this trim pot when need to use external analog signal to adjust Vo through margin pin.

Output voltage set-point will return to factory default set-point once DIP switch for trim pot is off.

Factory default setting is switch on.

The margining pin from signal interface can also be used to adjust the output voltage set-point once DIP is off.

The margining pin is connected to 3.3Vdc via a 8.87kΩ resistor

inside the Rectifier. Connecting a resistor or voltage source externally can change set-point.

Note that in RS485 mode the margining function include trim port and DIP switch is ignored.

Please contact your local representative for details about how to change output voltage set-point through RS485 communication.

Technical Specifications (continued)

ON/OFF

There is an on/off DIP switch on rear panel of rectifier to provide on/off main power output manually.

Factory default setting is switch on.

Enable pin from signal interface can be used to control main power on/off in case on/off DIP switch is off. This pin must be pulled low to turn ON the rectifier.

Note that in RS485 mode the ON/OFF pin is ignored.

Enable_RS485

This pin is used as main power on/off in RS485 mode. In I2C/ analog mode, this pin is ignored.

Status Signals

Power Good Warning (PG)

A TTL-compatible status signal representing whether main output is delivered. This signal needs to be pulled HI externally through a resistor.

This signal is HI when the main output is being delivered and goes LO when main power is shutdown. This signal deliver duty in case output current limit condition.

Fault

A TTL-compatible status signal representing whether a internal Fault occurred. This signal needs to be pulled HI externally through a resistor.

This signal goes LO for any failure that requires rectifier replacement. These faults may be due to:

- Over-temperature shutdown
- Over-voltage shutdown
- Internal Rectifier Fault

In RS485 mode, this pin is ignored.

Over Temp Warning (OTW)

A TTL-compatible status signal representing whether an over temperature exists. This signal needs to be pulled HI externally through a resistor.

If an over temperature should occur, this signal would pull LO for approximately 10 seconds prior to shutting down the rectifier. In its default configuration, the unit would restart if internal temperatures recover within normal operational levels. At that time the signal reverts back to its open collector (HI) state.

In RS485 mode, this pin ignored .

AC Input Wiring Diagram

Whether it's a push-in spring or a leg spring, the spring principle makes for quick, tool-free conductor connection. Simply insert the solid conductors and conductors with ferrules into the push-in terminal point and release using a screwdriver. When connecting and releasing finely stranded conductors without ferrules, the terminal point can also be opened using a screwdriver.

Mounting Dimensions

All dimensions are in mm

Technical Specifications (continued)

Mounting Diagram

Install the module to cold plate/heatsink with 6 M4 pan head screw as shown, the torque to be 1.5Nm.

Apply gap filler, Laird T-putty 504, or equivalent material (thermal conductivity better than 1.8 W/mK), between module and cold plate/heatsink. Amount of Gap filler is around 20.9 cubic cm, thickness is around 0.5mm.

Case Temperature Monitoring Location

Below diagram indicates the hot spots of CC2725AC34TZL rectifier, they are assumed as case temperature of coldplate/heatsink as well. In application, over temperature protection will be enabled if one of the hot spots the temperature is exceeded the operating temperature.
