

ESTW004A2C Stingray* Series; DC-DC Converter Power Modules

36 - 75V_{dc} Input; 15.0V_{dc}/4.2A_{dc} Output

Applications

- Wireless Networks
- Access and Optical Network Equipment
- Industrial Equipment

Options

- Negative Remote On/Off logic (preferred)
- Over current/Over voltage protections (Auto-restart) (preferred)
- Heat plate version (-H)

Features

- Compliant to RoHS Directive 2011/65/EU and amended Directive (EU) 2015/863 (-Z versions)
- Compliant to REACH Directive (EC) No 1907/2006
- Industry standard, DOSA compliant footprint 57.9mm x 22.8mm x 7.6mm (2.28 in x 0.9 in x 0.30 in)
- Low profile height and reduced component skyline
- Wide input voltage range: 36-75 V_{dc}
- Tightly regulated output
- Remote sense
- Output Voltage adjust: 80% to 110% of V_{o,nom}
- Constant switching frequency
- Positive remote On/Off logic
- Input under/over voltage protection
- Output overcurrent and overvoltage protection

Description

The ESTW004A2C Series, eighth-brick, low-height power modules are isolated dc-dc converters that provide a single, precisely regulated output voltage over a wide input voltage range of 36-75V_{dc}. The ESTW004A2C provides 15V_{dc} nominal output voltage rated for 4.2A_{dc} output current. The module incorporates OmniOn Power's vast heritage for reliability and quality, while also using the latest in technology, and component and process standardization to achieve highly competitive cost. The open frame module construction, available in through-hole packaging, enable designers to develop cost and space efficient solutions. The module achieves typical full load efficiency greater than 90% at V_{IN}=48V_{dc}. Standard features include remote On/Off, remote sense, output voltage adjustment, overvoltage, overcurrent and overtemperature protection. An optional heat plate allows for external standard, eighth-brick heat sink attachment to achieve higher output current in high temperature applications.

- Over-temperature protection
- No reverse current during output shutdown
- Wide operating temperature range (-40°C to 85°C)
- Suitable for cold wall cooling using suitable Gap Pad applied directly to top side of module
- ANSI/UL* 62368-1 and CAN/CSA† C22.2 No. 62368-1 Recognized, DIN VDE‡ 0868-1/A11:2017 (EN62368-1:2014/A11:2017)
- CE mark meets 2014/35/EU directive[§]
- Meets the voltage and current requirements for ETSI 300-132-2 and complies with and licensed for Basic insulation rating
- 2250 Vdc Isolation tested in compliance with IEEE 802.3af PoE standards
- ISO**9001 and ISO 14001 certified manufacturing facilities

TECHNICAL SPECIFICATION

Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only, functional operation of the device is not implied at these or any other conditions in excess of those given in the operations sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect the device reliability.

Parameter	Device	Symbol	Min	Max	Unit
Input Voltage					
Continuous	All	V_{IN}	-0.3	80	V_{dc}
Transient, operational (≤ 100 ms)	All	$V_{IN,trans}$	-0.3	100	V_{dc}
Operating Ambient Temperature (see Thermal Considerations section)	All	T_A	-40	85	$^{\circ}C$
Storage Temperature	All	T_{stg}	-55	125	$^{\circ}C$
I/O Isolation voltage (100% factory Hi-Pot tested)	All	—	—	2250	V_{dc}

Electrical Specifications

Unless otherwise indicated, specifications apply over all operating input voltage, resistive load, and temperature conditions.

Parameter	Device	Symbol	Min	Typ	Max	Unit
Operating Input Voltage	All	V_{IN}	36	48	75	V_{dc}
Maximum Input Current ($V_{IN} = V_{IN, min}$ to $V_{IN, max}$, $I_O = I_{O, max}$)	All	$I_{IN, max}$			2.0	A_{dc}
Input No Load Current ($V_{IN} = 48V$, $I_O = 0$, module enabled)	All	$I_{IN, No load}$		90		mA
Input Stand-by Current ($V_{IN} = 48V$, module disabled)	All	$I_{IN, stand-by}$		5	8	mA
Inrush Transient	All	I^2t			0.5	A^2s
Input Reflected Ripple Current, peak-to-peak (5Hz to 20MHz, $1\mu H$ source impedance; $V_{IN, min}$ to $V_{IN, max}$, $I_O = I_{O, max}$; See Test configuration section)	All			30		mA_{p-p}
Input Ripple Rejection (120Hz)	All			50		dB

CAUTION: This power module is not internally fused. An input line fuse must always be used.

This power module can be used in a wide variety of applications, ranging from simple standalone operation to an integrated part of sophisticated power architectures. To preserve maximum flexibility, internal fusing is not included, however, to achieve maximum safety and system protection, always use an input line fuse. The safety agencies require a fast-acting fuse with a maximum rating of 10 A (see Safety Considerations section). Based on the information provided in this data sheet on inrush energy and maximum dc input current, the same type of fuse with a lower rating can be used. Refer to the fuse manufacturer's data sheet for further information.

Test Configurations

Figure 6. Input Reflected Ripple Current Test Setup.

NOTE: Measure input reflected ripple current with a simulated source inductance (L_{TEST}) of $12\mu H$. Capacitor C_S offsets possible battery impedance. Measure current as shown above.

Figure 7. Output Ripple and Noise Test Setup.

NOTE: All voltage measurements to be taken at the module terminals, as shown above. If sockets are used then Kelvin connections are required at the module terminals to avoid measurement errors due to socket contact resistance.

Figure 8. Output Voltage and Efficiency Test Setup

NOTE: All voltage measurements to be taken at the module terminals, as shown above. If sockets are used then Kelvin connections are required at the module terminals to avoid measurement errors due to socket contact resistance.

$$\text{Efficiency } \eta = \frac{V_O \cdot I_O}{V_{IN} \cdot I_{IN}} \times 100 \%$$

Design Considerations

Input Filtering

The power module should be connected to a low ac-impedance source. Highly inductive source impedance can affect the stability of the power module. For the test configuration in Figure 6 a 33-100µF electrolytic capacitor (ESR < 0.7W at 100kHz), mounted close to the power module helps ensure the stability of the unit. Consult the factory for further application guidelines.

Safety Considerations

For safety agency approval the power module must be installed in compliance with the spacing and separation requirements of the end-use safety agency standards, i.e., UL ANSI/UL 62368-1 and CAN/CSA C22.2 No. 62368-1 Recognized, DIN VDE 0868-1/A11:2017 (EN62368-1:2014/A11:2017)

If the input source is non-SELV (ELV or a hazardous voltage greater than 60 Vdc and less than or equal to 75Vdc), for the module's output to be considered as meeting the requirements for safety extra-low voltage (SELV) or ES1, all of the following must be true:

- The input source is to be provided with reinforced insulation from any other hazardous voltages, including the ac mains.
- One V_{IN} pin and one V_{OUT} pin are to be grounded, or both the input and output pins are to be kept floating.
- The input pins of the module are not operator accessible.
- Another SELV or ES1 reliability test is conducted on the whole system (combination of supply source and subject module), as required by the safety agencies, to verify that under a single fault, hazardous voltages do not appear at the module's output.

TECHNICAL SPECIFICATION (continued)

Note: Do not ground either of the input pins of the module without grounding one of the output pins. This may allow a non-SELV/ES1 voltage to appear between the output pins and ground.

The power module has safety extra-low voltage (SELV) or ES1 outputs when all inputs are SELV or ES1.

All flammable materials used in the manufacturing of these modules are rated 94V-0, or tested to the UL 60950 A.2 for reduced thickness.

For input voltages exceeding $-60 V_{dc}$ but less than or equal to $-75 V_{dc}$, these converters have been evaluated to the applicable requirements of BASIC INSULATION between secondary DC MAINS DISTRIBUTION input (classified as TNV-2 in Europe) and unearthed SELV outputs.

The input to these units is to be provided with a maximum 10 A fast-acting fuse in the ungrounded lead.

Feature Description

Remote On/Off

Two remote on/off options are available. Positive logic turns the module on during a logic high voltage on the ON/OFF pin, and off during a logic low. Negative logic remote On/Off, device code suffix "1", turns the module off during a logic high and on during a logic low. Negative logic is the preferred option.

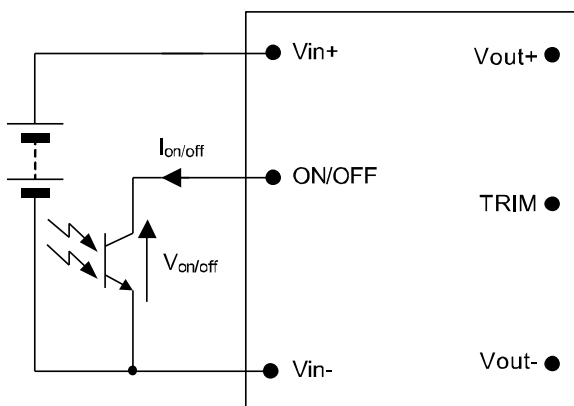

Figure 9. Remote On/Off Implementation.

To turn the power module on and off, the user must supply a switch (open collector or equivalent) to control the voltage ($V_{on/off}$) between the ON/OFF terminal and the $V_{IN(-)}$ terminal (see Figure 9). Logic low is $-0.7V_{dc} \leq V_{on/off} \leq 0.6V_{dc}$. The maximum $I_{on/off}$ during a logic low is 0.15mA; the switch should maintain a logic low level while sinking this current.

During a logic high, the typical maximum $V_{on/off}$ generated by the module is 6.7Vdc, and the maximum allowable leakage current is 25μA.

If not using the remote on/off feature:

For positive logic, leave the ON/OFF pin open. For negative logic, short the ON/OFF pin to $V_{IN(-)}$.

Remote Sense

Remote sense minimizes the effects of distribution losses by regulating the voltage at the remote-sense connections (See Figure 11). The voltage between the remote-sense pins and the output terminals must not exceed the output voltage sense range given in the Feature Specifications table:

$$[V_o(+) - V_o(-)] - [SENSE(+) - SENSE(-)] \leq 0.5 V$$

Although the output voltage can be increased by both the remote sense and by the trim, the maximum increase for the output voltage is not the sum of both. The maximum increase is the larger of either the remote sense or the trim.

The amount of power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. When using remote sense and trim, the output voltage of the module can be increased, which at the same output current would increase the power output of the module. Care should be taken to ensure that the maximum output power of the module remains at or below the maximum rated power (Maximum rated power = $V_{o,set} \times I_{o,max}$).

TECHNICAL SPECIFICATION (continued)

Feature Descriptions (continued)

Figure 10. Circuit Configuration for remote sense

Input Undervoltage Lockout

At input voltages below the input undervoltage lockout limit, the module operation is disabled. The module will only begin to operate once the input voltage is raised above the undervoltage lockout turn-on threshold, $V_{UV/ON}$.

Once operating, the module will continue to operate until the input voltage is taken below the undervoltage turn-off threshold, $V_{UV/OFF}$.

Overtemperature Protection

To provide protection under certain fault conditions, the unit is equipped with a thermal shutdown circuit. The unit will shutdown if the thermal reference point, T_{ref1} exceeds 135°C (Figure 12, typical), or T_{ref2} exceeds 120°C (Figure 13, typical), but the thermal shutdown is not intended as a guarantee that the unit will survive temperatures beyond its rating. The module will automatically restart upon cool-down to a safe temperature.

Output Overvoltage Protection

The output over voltage protection scheme of the modules has an independent over voltage loop to prevent single point of failure. This protection feature latches in the event of over voltage across the output. Cycling the on/off pin or input voltage resets the latching protection feature. If the auto-restart option (4) is ordered, the module will automatically restart upon an internally programmed time elapsing.

Overcurrent Protection

To provide protection in a fault (output overload) condition, the unit is equipped with internal current-limiting circuitry and can endure current limiting continuously. At the point of current-limit inception, the unit enters hiccup mode. If the unit is not configured with auto-restart, then it will latch off

following the over current condition. The module can be restarted by cycling the dc input power for at least one second or by toggling the remote on/off signal for at least one second.

If the unit is configured with the auto-restart option (4), it will remain in the hiccup mode as long as the overcurrent condition exists; it operates normally, once the output current is brought back into its specified range. The average output current during hiccup is 10% $I_{O, max}$.

Output Voltage Programming

Trimming allows the output voltage set point to be increased or decreased, this is accomplished by connecting an external resistor between the TRIM pin and either the $V_{O(+)}$ pin or the $V_{O(-)}$ pin.

Figure 11. Circuit Configuration to Trim Output Voltage.

Connecting an external resistor ($R_{trim-down}$) between the TRIM pin and the $V_{O(-)}$ (or Sense (-)) pin decreases the output voltage set point. To maintain set point accuracy, the trim resistor tolerance should be $\pm 1.0\%$. $I_{O, max}$ should not be exceeded even trimming to a lower output voltage. Output Current Limit Inception is independent of trimmed V_{out} .

The following equation determines the required external resistor value to obtain a percentage output voltage change of $\Delta\%$

$$R_{trim-down} = \left[\frac{511 - 10.22}{\Delta\%} \right] K\Omega$$

$$\text{Where } \Delta\% = \left[\frac{V_{O,set} - V_{desired}}{V_{O,set}} \times 100 \right]$$

For example, to trim-down the output voltage of the module by 8% to 13.8V, $R_{trim-down}$ is calculated as follows:

TECHNICAL SPECIFICATION (continued)

$$\Delta\% = 8$$

$$R_{\text{trim-down}} = \left[\frac{511}{\Delta\%} - 10.22 \right] \text{K}\Omega$$

$$R_{\text{trim-down}} = 53.655 \text{ K}\Omega$$

Connecting an external resistor ($R_{\text{trim-up}}$) between the TRIM pin and the $V_{O(+)}$ (or Sense (+)) pin increases the output voltage set point. The following equation determines the required external resistor value to obtain a percentage output voltage change of $\Delta\%$

$$R_{\text{trim-up}} = \left[\frac{5.11 \times V_{O,\text{set}} \times (100 + \Delta\%)}{1.225 \times \Delta\%} - \frac{511}{\Delta\%} - 10.22 \right] \text{K}\Omega$$

$$\text{Where } \Delta\% = \left[\frac{V_{O,\text{set}} - V_{\text{desired}}}{V_{O,\text{set}}} \right] \times 100$$

For example, to trim-down the output voltage of the module by 5% to 15.75V, $R_{\text{trim-up}}$ is calculated as follows:

$$R_{\text{trim-up}} = \left[\frac{5.11 \times 15.0 \times (100 + 5)}{1.225 \times 5} - \frac{511}{5} - 10.22 \right] \text{K}\Omega$$

$$R_{\text{trim-up}} = 1.20 \text{ M}\Omega$$

The voltage between the $V_{O(+)}$ and $V_{O(-)}$ terminals must not exceed the minimum output overvoltage protection value shown in the Feature Specifications table. This limit includes any increase in voltage due to remote-sense compensation and output voltage set-point adjustment trim.

Although the output voltage can be increased by both the remote sense and by the trim, the maximum increase for the output voltage is not the sum of both. The maximum increase is the larger of either the remote sense or the trim. The amount of power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. When using remote sense and trim, the output voltage of the module can be increased, which at the same output current would increase the power output of the module. Care should be taken to ensure that the maximum output power of the module remains at or below the maximum rated power (Maximum rated power = $V_{O,\text{set}} \times I_{O,\text{max}}$).

Thermal Considerations

The power modules operate in a variety of thermal environments; however, sufficient cooling should be provided to help ensure reliable operation.

Considerations include ambient temperature, airflow, module power dissipation, and the need for increased reliability. A reduction in the operating temperature of the module will result in an increase in reliability. The thermal data presented here is based on physical measurements taken in a wind tunnel. The thermal reference point, T_{ref1} , used in the specifications for open frame modules is shown in Figure 12. For reliable operation this temperature should not exceed 130°C.

Figure 12. Tref Temperature Measurement Location for Open Frame Module.

The thermal reference point, T_{ref2} , used in the specifications for modules with heat plate is shown in Figure 13. For reliable operation this temperature should not exceed 104°C.

Figure 13. Tref Temperature Measurement Location for Module with Heat plate.

Heat Transfer via Convection

Increased airflow over the module enhances the heat transfer via convection. Derating curves showing the maximum output current that can be delivered by each module versus local ambient temperature (T_A) for natural convection and up to 2m/s (400 ft./min) forced airflow are shown in Figure 14.

Please refer to the Application Note "Thermal

Characterization Process For Open-Frame Board-Mounted Power Modules" for a detailed discussion of thermal aspects including maximum device temperatures.

TECHNICAL SPECIFICATION (continued)

Thermal Considerations (continued)

Please refer to the Application Note “Thermal

Characterization Process For Open-Frame Board-Mounted Power Modules” for a detailed discussion of thermal aspects including maximum device temperatures.

Figure 14. Output Current Derating for the Open Frame Module; Airflow in the Transverse Direction from $V_{out}(+)$ to $V_{out}(-)$; $V_{IN}=48V$.

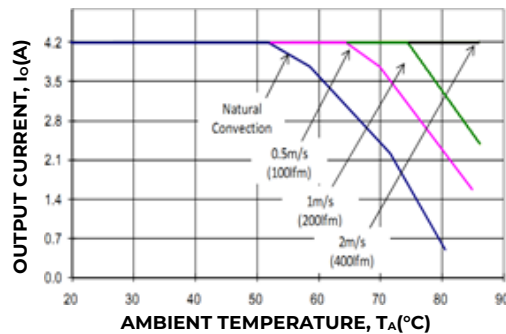

Figure 15. Output Current Derating for the Module with Heatplate; Airflow in the Transverse Direction from $V_{out}(+)$ to $V_{out}(-)$; $V_{IN}=48V$.

Heat Transfer via Conduction

The module can also be used in a sealed environment with cooling via conduction from the module's top surface through a gap pad material to a cold wall, as shown in Figure 16. This capability is achieved by insuring the top side component skyline profile achieves no more than 1mm height difference between the tallest and the shortest power train part that benefits from contact with the gap pad material. The output current derating versus cold wall

Figure 16. Cold Wall Mounting

temperature, when using a gap pad such as Bergquist GP2500S20, is shown in Figure 17.

Figure 17. Derated Output Current versus Cold Wall Temperature with local ambient temperature around module at 85°C; $V_{IN}=48V$

Through-Hole Lead-Free Soldering Information

The RoHS-compliant through-hole products use the SAC (Sn/Ag/Cu) Pb-free solder and RoHS-compliant components. They are designed to be processed through single or dual wave soldering machines. The pins have a RoHS-compliant finish that is compatible with both Pb and Pb-free wave soldering processes.

A maximum preheat rate of 3°C/s is suggested. The wave preheat process should be such that the temperature of the power module board is kept below 210°C. For Pb solder, the recommended pot temperature is 260°C, while the Pb-free solder pot is 270°C max. Not all RoHS-compliant through-hole products can be processed with paste- through-hole Pb or Pb-free reflow process. If additional information is needed, please consult with your OmniOn representative for more details.

Pick and Place

The ESTW004A2C modules use an open frame construction and are designed for a fully automated assembly process. The modules are fitted with a label designed to provide a large surface area for pick and place operations. The label meets all the requirements for surface mount processing, as well as safety standards, and is able to withstand reflow temperatures of up to 300°C. The label also carries

Figure 18. Pick and Place Location.

TECHNICAL SPECIFICATION (continued)

Through-Hole Lead-Free Soldering Information (continued)

Pick and Place (continued)

product information such as product code, serial number and the location of manufacture.

Nozzle Recommendations

The module weight has been kept to a minimum by using open frame construction. Even so, these modules have a relatively large mass when compared to conventional SMT components. Variables such as nozzle size, tip style, vacuum pressure and placement speed should be considered to optimize this process. The minimum recommended nozzle diameter for reliable operation is 6mm. The maximum nozzle outer diameter, which will safely fit within the allowable component spacing, is 9 mm.

Oblong or oval nozzles up to 11 x 9 mm may also be used within the space available.

Tin Lead Soldering

The ESTW004A2C power modules are lead free modules and can be soldered either in a lead-free solder process or in a conventional Tin/Lead (Sn/Pb) process. It is recommended that the customer review data sheets in order to customize the solder reflow profile for each application board assembly. The following instructions must be observed when soldering these units. Failure to observe these instructions may result in the failure of or cause damage to the modules, and can adversely affect long-term reliability.

In a conventional Tin/Lead (Sn/Pb) solder process peak reflow temperatures are limited to less than 235°C. Typically, the eutectic solder melts at 183°C, wets the land, and subsequently wicks the device connection. Sufficient time must be allowed to fuse the plating on the connection to ensure a reliable solder joint. There are several types of SMT reflow technologies currently used in the industry. These power modules can be reliably soldered using natural forced convection, IR (radiant infrared), or a combination of convection/IR. For reliable soldering the solder reflow profile should be established by accurately measuring the modules CP connector temperatures.

Lead Free Soldering

The -Z version of the ESTW004A2C modules are lead-

free (Pb-free) and RoHS compliant and are both forward and backward compatible in a Pb-free and a SnPb soldering process. Failure to observe the instructions below may result in the failure of or cause damage to the modules and can adversely affect long-term reliability.

Figure 19. Reflow Profile for Tin/Lead (Sn/Pb) process

Figure 20. Time Limit Curve Above 205°C for Tin/Lead (Sn/Pb) process

Pb-free Reflow Profile

Power Systems will comply with J-STD-020 Rev. C (Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices) for both Pb-free solder profiles and MSL classification procedures. This standard provides a recommended forced-air- convection reflow profile based on the volume and thickness of the package (table 4-2). The suggested Pb- free solder paste is Sn/Ag/Cu (SAC). The recommended linear reflow profile using Sn/Ag/Cu solder is shown in Figure 21.

TECHNICAL SPECIFICATION (continued)

Figure 21. Recommended linear reflow profile using Sn/Ag/Cu solder.

Post Solder Cleaning and Drying Considerations

Post solder cleaning is usually the final circuit-board assembly process prior to electrical board testing. The result of inadequate cleaning and drying can affect both the reliability of a power module and the testability of the finished circuit-board assembly. For guidance on appropriate soldering, cleaning and drying procedures, refer to OmniOn Board Mounted Power Modules: Soldering and Cleaning Application Note (AN04-001).

TECHNICAL SPECIFICATION (continued)

EMC Considerations

The circuit and plots in Figure 23 shows a suggested configuration to meet the conducted emission limits of EN55032 Class B.

Figure 23. EMC Considerations

For further information on designing for EMC compliance, please refer to the FLT007A0 data sheet (DS05-028).

TECHNICAL SPECIFICATION (continued)

Mechanical Outline for Through-Hole Module

Dimensions are in millimeters and [inches].

Tolerances: x.x mm ± 0.5 mm [x.xx in. ± 0.02 in.] (Unless otherwise indicated)

x.xx mm ± 0.25 mm [x.xxx in. ± 0.010 in.]

*Top side label includes OmniOn Power name, product designation and date code.

*For optional pin lengths, see Table 2, Device Coding Scheme and Options

Pin	Function
1	Vi(+)
2	ON/OFF
3	Vi(-)
4	Vo(-)
5	SENSE(-)
6	TRIM
7	SENSE(+)
8	Vo(+)

TECHNICAL SPECIFICATION (continued)

Mechanical Outline for Through-Hole Module (continued)

Mechanical Outline for Through-Hole Module with Heat Plate (-H Option)

Dimensions are in millimeters and [inches].

Tolerances: x.x mm ± 0.5 mm [x.xx in. ± 0.02 in.] (Unless otherwise indicated)

x.xx mm \pm 0.25 mm [x.xxx in \pm 0.010 in.]

*For optional pin lengths, see Table 2, Device Coding Scheme and Options

TECHNICAL SPECIFICATION (continued)

Mechanical Outline for Through-Hole Module with Heat Plate (-H Option) (continued)

*Bottom side label includes OmniOn Power name, product designation and date code.

*Side label contains product designation and date code.

Side View*

Pin	Function
1	Vi(+)
2	ON/OFF
3	Vi(-)
4	Vo(-)
5	SENSE(-)
6	TRIM
7	SENSE(+)
8	Vo(+)

TECHNICAL SPECIFICATION (continued)

Recommended Pad Layout

Dimensions are in millimeters and [inches].

Tolerances: x.x mm \pm 0.5 mm [x.xx in. \pm 0.02 in.] (Unless otherwise indicated)

x.xx mm \pm 0.25 mm [x.xxx in \pm 0.010 in.]

TH Recommended Pad Layout (Component Side View)

NOTES: FOR 0.030" X 0.025" RECTANGULAR PIN, USE 0.050" PLATED THROUGH HOLE DIAMETER

FOR 0.62 DIA" PIN, USE 0.076" PLATED THROUGH HOLE DIAMETER

Pin	Function
1	Vi(+)
2	ON/OFF
3	Vi(-)
4	Vo(-)
5	SENSE(-)
6	TRIM
7	SENSE(+)
8	Vo(+)

TECHNICAL SPECIFICATION (continued)

Ordering Information

Please contact your OmniOn Power Sales Representative for pricing, availability and optional features.

Product Codes	Input Voltage	Output Voltage	Output Current	On/Off Logic	Connector Type	MSL Rating	Ordering Codes
ESTW004A2C41Z	48V (36-75V _{dc})	15.0V	4.2A	Negative	Through hole	n/a	CC109170461
ESTW004A2C841Z	48V (36-75V _{dc})	15.0V	4.2A	Negative	Through hole	n/a	CC109170494
ESTW004A2C41-HZ	48V (36-75V _{dc})	15.0V	4.2A	Negative	Through hole	n/a	CC109170486

Table 1. Device Codes

	Characteristic	Character and position	Definition
Ratings	Form Factor	E	E = Eighth Brick
	Family Designator	ST	ST = STINGRAY Series
	Input Voltage	W	W = Wide Range, 36V-75V
	Output Power	004A2	004A2 = 4.2 Amps Maximum Output Current
	Output Voltage	C	C = 15.0V nominal
Options	Pin Length	6 8	Omit= Default Pin Length shown in mechanical Outline Figures 6 = Pin Length: 3.68 mm ±0.25mm (0.145 in.±0.010 in.) 8 = Pin Length: 2.97 mm ±0.25mm (0.110 in.±0.010 in.)
	Action following Protective Shutdown	4	Omit = Latching Mode 4 = Auto- restart following shutdown (Overcurrent/ Overvoltage)
	On/Off Logic	1	Omit = Positive Logic 1 = Negative Logic
		–	
	Customer Specific	XY	XY = Customer Specific Modified Code, Omit for Standard Code
	Features	H	Omit = Standard open Frame Module H = Heat plate, for use with heat sinks
	RoHS	Z	Omit = RoHS 5/6 Lead Based Solder Used Z = RoHS Compliant
