

## MPR0854FP series front-end

### Input: 100-120/200-240V<sub>AC</sub>; Output: 54V<sub>DC</sub> @ 800W; 12V<sub>DC</sub> @ 0.8A

### **Applications**

- 48V<sub>DC</sub> distributed power architectures
- Datacom and Telecom applications
- Mid to high-end Servers
- Enterprise Networking

#### **Features**

- Output voltage set to 54V<sub>dc</sub>
- Universal input with PFC
- No power de-rating at low line input range
  - 2 front panel LEDs: LED1 input
    - LED2 [output, fault, over temp]
- Remote ON/OFF control of the 54V<sub>DC</sub> output
- Remote sense on the 54V<sub>DC</sub> output
- Meets Power-Over-Ethernet (IEEE802.3af)
- No minimum load requirements
- Droop load sharing
- Hot Plug-able
- Efficiency: typically 92.5% @ 50% load and 90.0% @ 20% load

#### FOOTNOTES:

### Description

The MPR0854FP series of front ends provide efficient isolated power from world-wide commercial AC mains. Offered in the industry standard compact 1U form factor, these front ends provide comprehensive solutions for systems connected to commercial ac mains.

This high-density front end can be ordered either as a front-to-back or back-to-front airflow product. It is designed for minimal space utilization and is highly expandable for future growth. The industry standard PMBus compliant I<sup>2</sup>C communications buss offers a full range of control and monitoring capabilities. on cost and PWB area.

- Network Attached Storage
- Telecom Access Nodes
- Routers/Switches
- ATE Equipment
- 12V<sub>DC</sub> for backup power
- Auto recoverable OC & OT protection
- Radiated emissions hardened enclosure
- Operating temperature: -10 70°C (de-rated above 50°C)
- Digital status & control: PMBus™ compliant serial bus
- EN/IEC/UL62368-1 2nd edition; UL, CSA and VDE
- EMI: class A FCC docket 20780 part 15, EN55032
- Meets EN6100 immunity and transient standards
- Shock & vibration: IEC-68-2
- Compliant to RoHS Directive 2011/65/EU and amended Directive (EU) 2015/863.

### **Technical Specifications**

### **Absolute Maximum Ratings**

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only, functional operation of the device is not implied at these or any other conditions in excess of those given in the operations sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect the device reliability.

Parameter	Symbol	Min	Max	Unit
Input Voltage: Continuous	V <sub>IN</sub>	0	264	VAC
Operating Ambient Temperature	T <sub>A</sub>	-10	70 <sup>1</sup>	°C
Storage Temperature	T <sub>stg</sub>	-40	85	°C
I/O Isolation voltage to Frame (100% factory Hi-Pot tested)			1500	V <sub>AC</sub>

<sup>1</sup> Derated above 50°C at 2.5%/°C

### **Electrical Specifications**

Unless otherwise indicated, specifications apply over all operating input voltage, resistive load, and temperature conditions.

#### INPUT

Parameter		Symbol	Min	Тур	Max	Unit
Operational Range		V <sub>IN</sub>	90	110/230	264	V <sub>AC</sub>
Frequency Range		FIN	47	50/60	63	Hz
Main Output Turn_OFF		V <sub>IN</sub>	68		75	V <sub>AC</sub>
Main Output Turn ON		V <sub>IN</sub>	76		84	V <sub>AC</sub>
Maximum Input Current	V <sub>IN</sub> = 100V <sub>AC</sub>	I <sub>IN</sub>			9.2	A <sub>AC</sub>
(V <sub>OUT</sub> = 54V <sub>DC</sub> , I <sub>OUT</sub> =14.8A)	$V_{IN}$ = 200 $V_{AC}$	UN			4.6	
Cold Start Inrush Current (Excluding x-caps, 25	°C)	l <sub>in</sub>			30	A <sub>PEAK</sub>
	duration				1/2	cycle
Efficiency ( $T_{AMB}$ =25°C, $V_{OUT}$ = 54 $V_{DC}$ , $I_{O}$ = 14.8A)	input			100-240		Vin

#### **Control and Status**

**Analog controls:** Details of analog controls are provided in this Technical Requirement under Signal Definitions.

Separate isolated grounds: The  $+54V_{DC}$  output is referenced to its own Output Return. The  $+12V_{DC}$  and  $+3.3V_{DC}$  are referenced to Signal return.

**POE isolation:** The main  $54V_{DC}$  output is fully isolated from the rest of the power supply, complying with the POE isolation requirements of IEEE802.3af.

#### **Control Signals**

**Module\_Enable\_L:** This is a short signal pin that controls the presence of the  $54V_{DC}$  main output. This pin should be connected to 'signal return' on the system side of the output connector. The purpose of this pin is to ensure that the output turns ON after engagement of the power blades and turns OFF prior to disengagement of the power blades.

#### **Status signals**

**AC\_OK\_L:** A TTL compatible status signal representing whether the input voltage is within the anticipated range. This signal needs to be pulled HI externally through a resistor. This signal asserts LO at least 5ms prior to the  $54V_{DC}$  output voltage decaying below  $43V_{DC}$ . The signal shall not assert for a minimum of 10ms after loss of AC power

**DC\_OK\_L:** A TTL compatible status signal representing whether the output voltage is present. This signal needs to be pulled HI externally through a resistor.

**TEMP\_OK\_L:** A TTL compatible status signal representing whether an over temperature exists. This signal needs to be pulled HI externally through a resistor. If an over temperature should occur, this signal would pull LO for approximately 10 seconds prior to shutting down the power supply. The unit would restart if internal temperatures recover within normal operational levels. At that time the signal reverts back to its open collector (HI) state.

**PS\_PRESENT\_L:** This pin is connected to 'Signal\_Return' within the power supply. Its intent is to indicate to the system that a power supply is present. This signal may need to be pulled HI externally through a resistor.

#### **Serial Bus Communications**

The I<sup>2</sup>C interface facilitates the monitoring and control Page 9 © 2023 OmniOn Power Inc. All rights reserved. of various operating parameters within the unit and transmits these on demand over an industry standard I<sup>2</sup>C Serial bus.

All signals are referenced to 'Signal\_Return'.

**Device addressing:** The microcontroller (MCU) and the EEPROM have the following addresses:

Device	Address	(Most to Least Significant)							
MCU	0xBx	1	0	1	1	A2	A1	A0	R/W
Broadcast	0x00	0	0	0	0	0	0	0	0

Address lines (A2, A1, A0): These signal pins allow up to eight (8) modules to be addressed on a single I<sup>2</sup>C bus. The pins are pulled HI internal to the power supply. For a logic LO these delay pins should be connected to 'Output Return'

Serial Clock (SCL): The clock pulses on this line are generated by the host that initiates communications across the I<sup>2</sup>C Serial bus. This signal is internally pulled -up to 3.3V via a  $1.2k\Omega$  resistor.

Serial Data (SDA): This line is a bi-directional data line. This signal is internally pulled-up to 3.3V via a  $1.2k\Omega$  resistor.

#### **Digital Feature Descriptions**

PMBus<sup>™</sup> compliance: The power supply is fully compliant to the Power Management Bus (PMBus<sup>™</sup>) rev1.2 require ments.

**Master/Slave:** The 'host controller' is always the MASTER. Power supplies are always SLAVES. SLAVES cannot initiate communications or toggle the Clock. SLAVES also must respond expeditiously at the command of the MASTER as required by the clock pulses generated by the MASTER.

**Clock stretching:** The 'slave' µController inside the power supply may initiate clock stretching if it is busy and it desires to delay the initiation of any further communications. During the clock stretch the 'slave' may keep the clock LO until it is ready to receive further instructions from the host controller. The maximum clock stretch interval is 25ms.

The host controller needs to recognize this clock stretching, and refrain from issuing the next clock signal, until the clock line is released, or it needs to delay the next clock pulse beyond the clock stretch interval of the power supply.

Note that clock stretching can only be performed after completion of transmission of the 9<sup>th</sup> ACK bit, the exception being the START command.

#### Clock stretching (continued)

Figure 1. Example waveforms showing clock stretching.

**I<sup>2</sup>C Bus Lock-Up detection:** The device will abort any transaction and drop off the bus if it detects the bus being held low for more than 35ms.

**Communications speed:** Both 100kHz and 400kHz clock rates are supported. The power supplies default to the 100kHz clock rate. The minimum clock speed specified by SMBus is 10 kHz.

Packet Error Checking (PEC): Although the power supply will respond to commands with or without the trailing PEC, it is highly recommended that PEC be used in all communications. The integrity of communications is compromised if packet error correction is not employed. There are many functional features, including turning OFF the main output, that should require validation to ensure that the correct command is executed.

PEC is a CRC-8 error-checking byte, based on the polynomial C (x) =  $x^8 + x^2 + x + 1$ , in compliance with PMBus<sup>TM</sup> requirements. The calculation is based in all message bytes, including the originating write address and command bytes preceding read instructions. The PEC is appended to the

**Global broadcast:** This is a powerful command because it can instruct all power supplies to respond simultaneously in one command. But it does have a serious disadvantage. Only a single power supply needs to pull down the ninth acknowledge bit. To be certain that each power supply responded to the global instruction, a READ instruction should be executed to each power supply to verify that the command properly executed. The GLOBAL BROADCAST command should only be executed for write instructions to slave devices.

**Read back delay:** The power supply needs at least 2 seconds to configure the status registers into their final state. For example, a 200 millisecond delay may Page 10 © 2023 OmniOn Power Inc. All rights reserved. be required prior to reading back status information after a clear\_faults has been issued to clear the status registers.

#### **PMBus<sup>™</sup> Commands**

**Standard instruction:** Up to two bytes of data may follow an instruction depending on the required data content. Analog data is always transmitted as LSB followed by MSB. PEC is optional and includes the address and data fields.

1	8				1	8				1
S	Slave add	ress		Wr	А	Command Code				А
	8	1			8		1	8	1	1
Lov	w data byte	А	High data byte			А	PEC	А	Ρ	
	Mastarta	10.10					1.0.0			

Master to Slave Slave to Master SMBUS annotations; S – Start , Wr – Write, Sr – re-Start, Rd – Read, A – Acknowledge, NA – not-acknowledged, P – Stop

**Standard READ:** Up to two bytes of data may follow a READ request depending on the required data content. Analog data is always transmitted as LSB followed by MSB. PEC is mandatory and includes the address and data fields. PEC is optional and includes the address and data fields.

1	7			1	1		8				1	
S	Slave address			Wr	А	٩.	Command Cod			de	А	
1		7	1			1		8			1	
Sr	Slave A	٩dd	ress	Rd A			LSB			А		
	8	1		8	8		1		1			
	MSB	А	F	PEC			No-ack		Ρ			

**Block instruction:** When writing or reading more than two bytes of data at a time BLOCK instructions for WRITE and READ commands must be used instead of the Standard Instructions.

#### Block write format:

1		7		1	1			8				1	
S	Slave address			Wr	А		Со	Command Code			de	А	
	6	3		1	8	3	1		8			1	
В	yte co	unt	= N	А	Da	ta 1	А	Ľ	Data	2		А	
	8	1	8	}	1		8		1	1	7		
		А	Data	a 48	А	Ρ	EC		А	Ρ			

Block instruction (continued)

1	7				1	1			8			1	
S	Slave address			s V	Vr	А		(	Con	nmano	d C	ode	А
1	1 7				1	1							
Sr	Slav	e A	ddres	s F	۶d	А							
	8	В		1		8		1		8		1	
By	te cc	ount	: = N	А	D	ata	1	А	D	ata 2		А	
8	3	1	8	8		1		8		1		1	
		А	Data	a 48	3	А		PEC	2	NoAc	:k	Ρ	

**Linear Data Format:** The definition is identical to Part II of the PMBus Specification. All standard PMBus values, with the exception of output voltage related functions, are represented by the linear format described below. Output voltage functions are represented by a 16 bit mantissa. Output voltage has a E=9 constant exponent.

The Linear Data Format is a two byte value with an Ilbit, two's complement mantissa and a 5-bit, two's complement exponent or scaling factor, its format is shown below.

	Data Byte High					Data Byte Low										
Bit	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
	Exponent (E)				Mantissa (M)											

The relationship between the Mantissa, Exponent, and Actual Value (V) is given by the following equation:

Where:

V is the value

M is the 11-bit, two's complement mantissa

E is the 5-bit, two's complement exponent

#### PMBus<sup>™</sup> Command set:

Hex Data

Code Byte

Register

#### **Command Descriptions**

**Operation (0x01) :** By default the Power supply is turned ON at power up as long as Power ON/OFF signal pin is active HI. The Operation command is used to turn the Power Supply ON or OFF via the PMBus. The data byte below follows the OPERATION command.

1 0

N/A

FUNCTION	DATA BYTE
Unit ON	80
Unit OFF	00

To RESET the power supply cycle the power supply OFF, wait at least 2 seconds, and then turn back ON. All alarms and shutdowns are cleared during a restart.

**Clear\_faults (0x03):** This command clears all STATUS and FAULT registers.

If a fault still persists after the issuance of the clear\_faults command the specific registers indicating the fault are reset again.

WRITE\_PROTECT register (0x10): Used to control writing to the PMBus device. The intent of this command is to provide protection against accidental changes. All supported command parameters may have their parameters read, regardless of the write\_protect settings. The contents of this register can be stored to non-volatile memory using the Store\_default\_code command. The default setting of this register is disable\_all\_writes except write\_protect 0x80h.

FUNCTION	DATA BYTE
Enable all writes	00
Disable all writes except write_protect	80
Disable all writes except write_protect and OPERATION	40

**Vout\_OV\_warn\_limit (0x42):** OV\_warning is extremely useful because it gives the system controller a heads up that the output voltage is drifting out of regulation and the power supply is close to shutting down. Preamative action may be taken before the power supply would shut down and potentially disable the system.

**Vout\_OV\_fault\_response (0x41):** The power supply can be programmed to latch at a level set by Vout\_OV\_fault\_limit by changing the response to 0x40.

**Vout\_UV\_fault\_response (0x45):** The power supply can be programmed to latch at a level set by Vout\_UV\_fault\_limit by changing the response to 0x40.

**OT\_fault\_ response (0x50):** The power supply can be programmed to either resume operation (0xC0) or latch (0x40) at a level set vy OT\_fault\_limit.

**Restart after a latch off:** Either of four restart possibilities are available. The hardware pin Remote ON/OFF may be turned OFF and then ON. The unit may be commanded to restart via i2c through the Operation command by first turning OFF then turning ON . The third way to restart is to remove and reinsert the unit. The fourth way is to turn OFF and then turn ON ac power to the unit. The fifth way is by changing firmware from latch off to restart. Each of these commands must keep the power supply in the OFF state for at least 2 seconds, with the exception of changing to restart. Page 13 A power system that is comprised of a number of power supplies could have difficulty restarting after a shutdown event because of the non-synchronized behavior of the individual power supplies. Implementing the latch-off mechanism permits a synchronized restart that guarantees the simultaneous restart of the entire system.

A synchronous restart can be implemented by;

- 1. Issuing a GLOBAL OFF and then ON command to all power supplies
- 2. Toggling Off and then ON the Remote ON/OFF signal
- 3. Removing and reapplying input commercial power to the entire system

The power supplies should be turned OFF for at least 20–30 seconds in order to discharge all internal bias supplies and reset the soft start circuitry of the individual power supplies.

Auto\_restart: Auto-restart is the default configuration for recovering from over-current and overtemperature shutdowns. An overvoltage shutdown is followed by three attempted restarts, each restart delayed 1 second, within a 1 minute window. If within the 1 minute window three attempted restarts failed, the unit will latch OFF. If less than 3 shutdowns occur within the 1 minute window then the count for latch OFF resets and the 1 minute window starts all over again.

**Status\_word (0x79):** returns two bytes of information. The upper byte bit functionality is tabulated in the Status\_word section. The lower byte bit functionality is identical to Status\_byte.

**Invalid commands or data:** The power supply notifies the MASTER if a non-supported command has been sent or inv lid data has been received. Notification is implemented by setting the appropriate STATUS and ALARM registers.

#### LEDs

Two LEDs are located on the front faceplate. The AC\_OK LED provides visual indication of the INPUT signal function. When the LED is ON GREEN the power supply input is within normal design limits. The second LED is the DC\_OK LED. When solid GREEN there are no faults and DC output is present. When blinking GREEN there is an apparent engagement problem with the output connector.

### Alarm Table

	Test Condition	LED In	dicator	Monitoring Signals			
	lest Condition	LED1 AC_OK LED2 DC_OK		DC_OK_L	AC_OK_L	TEMP_OK_L	
1	Normal Operation	Green	Green	Low	Low	Low	
2	Low or NO INPUT	Off	Off	High	High	High	
3	OVP	Green	Off	High	Low	Low	
4	Over Current	Green	Off	High	Low	Low	
5	Fault Over Temp	Green	Off	High	Low	High	
6	Engagement problem	Green	Blink	High	High	High
