

# 32 Mbit Concurrent SuperFlash + 16 Mbit PSRAM ComboMemory GLS34HF32A4

## Preliminary Specifications

### FEATURES:

- **Flash Organization: 2M x16 or 4M x8**
- **Dual-Bank Architecture for Concurrent Read/Write Operation**
  - 32 Mbit Top Sector Protection
  - 32 Mbit: 8 Mbit + 24Mbit
- **PSRAM Organization:**
  - 16 Mbit: 1024K x16
- **Single 2.7-3.3V Read and Write Operations**
- **Superior Reliability**
  - Endurance: 100,000 Cycles (typical)
  - Greater than 100 years Data Retention
- **Low Power Consumption:**
  - Active Current: 25 mA (typical)
  - Standby Current: 70  $\mu$ A (typical)
- **Hardware Sector Protection (WP#)**
  - Protects 8 KWord in the smaller bank by holding WP# low and unprotects by holding WP# high
- **Hardware Reset Pin (RST#)**
  - Resets the internal state machine to reading data array
- **Byte Selection for Flash (CIOF pin)**
  - Selects 8-bit or 16-bit mode (56-ball package only)
- **Sector-Erase Capability**
  - Uniform 2 KWord sectors
- **Flash Chip-Erase Capability**
- **Block-Erase Capability**
  - Uniform 32 KWord blocks
- **Erase-Suspend / Erase-Resume Capabilities**
- **Read Access Time**
  - Flash: 70 ns
  - PSRAM: 70 ns
- **Security ID Feature**
  - Greenliant: 128 bits
  - User: 256 Bytes
- **Latched Address and Data**
- **Fast Erase and Program (typical):**
  - Sector-Erase Time: 18 ms
  - Block-Erase Time: 18 ms
  - Chip-Erase Time: 35 ms
  - Word-Program Time: 7  $\mu$ s
- **Automatic Write Timing**
  - Internal  $V_{PP}$  Generation
- **End-of-Write Detection**
  - Toggle Bit
  - Data# Polling
  - Ready/Busy# pin
- **CMOS I/O Compatibility**
- **JEDEC Standard Command Set**
- **Packages Available**
  - 56-ball LFBGA (8mm x 10mm)
  - 62-ball LFBGA (8mm x 10mm)
- **All non-Pb (lead-free) devices are RoHS compliant**

### PRODUCT DESCRIPTION

The GLS34HF32A4 ComboMemory integrates either a 2M x16 or 4M x8 CMOS flash memory bank with 1024K x16 CMOS pseudo SRAM (PSRAM) memory bank in a multi-chip package (MCP). This device is fabricated using Greenliant proprietary, high-performance CMOS SuperFlash technology incorporating the split-gate cell design and thick-oxide tunneling injector to attain better reliability and manufacturability compared with alternate approaches. The GLS34HF32A4 is ideal for applications such as cellular phones, GPS devices, PDAs, and other portable electronic devices in a low power and small form factor system.

The GLS34HF32A4 features dual flash memory bank architecture allowing for concurrent operations between the two flash memory banks and the PSRAM. The device

can read data from either bank while an Erase or Program operation is in progress in the opposite bank. The two flash memory banks are partitioned into 8 Mbit and 24 Mbit with top sector protection options for storing boot code, program code, configuration/parameter data and user data.

The SuperFlash technology provides fixed Erase and Program times, independent of the number of Erase/Program cycles that have occurred. Therefore, the system software or hardware does not have to be modified or de-rated as is necessary with alternative flash technologies, whose Erase and Program times increase with accumulated Erase/Program cycles. The GLS34HF32A4 offers a guaranteed endurance of 10,000 cycles. Data retention is rated at greater than 100 years. With high-performance Program operations, the flash memory banks provide a typical

## Preliminary Specifications

Word-Program time of 7  $\mu$ sec. To protect against inadvertent flash write, the GLS34HF32A4 contains on-chip hardware and software data protection schemes.

The flash and PSRAM operate as two independent memory banks with respective bank enable signals. The memory bank selection is done by two bank enable signals. The PSRAM bank enable signals, BES1# and BES2, select the PSRAM bank. The flash memory bank enable signal, BEF#, has to be used with Software Data Protection (SDP) command sequence when controlling the Erase and Program operations in the flash memory bank. The memory banks are superimposed in the same memory address space where they share common address lines, data lines, WE# and OE# which minimize power consumption and area.

Designed, manufactured, and tested for applications requiring low power and small form factor, the GLS34HF32A4 is offered in both commercial and extended temperatures and a small footprint package to meet board space constraint requirements. See Figure 3 for pin assignments.

## Device Operation

The GLS34HF32A4 uses BES1#, BES2 and BEF# to control operation of either the flash or the PSRAM memory bank. When BEF# is low, the flash bank is activated for Read, Program or Erase operation. When BES1# is low, and BES2 is high the PSRAM is activated for Read and Write operation. BEF# and BES1# cannot be at low level, and BES2 cannot be at high level at the same time. **If all bank enable signals are asserted, bus contention will result and the device may suffer permanent damage.** All address, data, and control lines are shared by flash and PSRAM memory banks which minimizes power consumption and loading. The device goes into standby when BEF# and BES1# bank enables are raised to  $V_{IHC}$  (Logic High) or when BEF# is high and BES2 is low.

## Concurrent Read/Write Operation

Dual bank architecture of GLS34HF32A4 devices allows the Concurrent Read/Write operation whereby the user can read from one bank while programming or erasing in the other bank. This operation can be used when the user needs to read system code in one bank while updating data in the other bank. See Table 3 for dual-bank memory organization.

### Concurrent Read/Write States

Flash		PSRAM
Bank 1	Bank 2	
Read	Write	No Operation
Write	Read	No Operation
Write	No Operation	Read
No Operation	Write	Read
Write	No Operation	Write
No Operation	Write	Write

**Note:** For the purposes of this table, write means to perform Block-/Sector-Erase or Program operations as applicable to the appropriate bank.

## Flash Read Operation

The Read operation of the GLS34HF32A4 is controlled by BEF# and OE#, both have to be low for the system to obtain data from the outputs. BEF# is used for device selection. When BEF# is high, the chip is deselected and only standby power is consumed. OE# is the output control and is used to gate data from the output pins. The data bus is in high impedance state when either BEF# or OE# is high. Refer to the Read cycle timing diagram in Figure 8 for details.

## Flash Program Operation

These devices are programmed on a word-by-word or byte-by-byte basis depending on the state of the CIOF pin. Before programming, one must ensure that the sector being programmed is fully erased.

The Program operation is accomplished in three steps:

1. Software Data Protection is initiated using the three-byte load sequence.
2. Address and data are loaded.

During the Program operation, the addresses are latched on the falling edge of either BEF# or WE#, whichever occurs last. The data is latched on the rising edge of either BEF# or WE#, whichever occurs first.

3. The internal Program operation is initiated after the rising edge of the fourth WE# or BEF#, whichever occurs first. The Program operation, once initiated, will be completed typically within 7  $\mu$ s.

See Figures 9 and 10 for WE# and BEF# controlled Program operation timing diagrams and Figure 23 for flowcharts. During the Program operation, the only valid reads are Data# Polling and Toggle Bit. During the internal Program operation, the host is free to perform additional tasks. Any commands issued during an internal Program operation are ignored.

## Flash Sector- /Block-Erase Operation

These devices offer both Sector-Erase and Block-Erase operations. These operations allow the system to erase the devices on a sector-by-sector (or block-by-block) basis. The sector architecture is based on a uniform sector size of 2 KWord. The Block-Erase mode is based on a uniform block size of 32 KWord. The Sector-Erase operation is initiated by executing a six-byte command sequence with a Sector-Erase command (50H) and sector address (SA) in the last bus cycle. The Block-Erase operation is initiated by executing a six-byte command sequence with Block-Erase command (30H) and block address (BA) in the last bus cycle. The sector or block address is latched on the falling edge of the sixth WE# pulse, while the command (30H or 50H) is latched on the rising edge of the sixth WE# pulse. The internal Erase operation begins after the sixth WE# pulse. Any commands issued during the Block- or Sector-Erase operation are ignored except Erase-Suspend and Erase-Resume. See Figures 14 and 15 for timing waveforms.

## Flash Chip-Erase Operation

The GLS34HF32A4 provide a Chip-Erase operation, which allows the user to erase all flash sectors/blocks to the "1" state. This is useful when the device must be quickly erased.

The Chip-Erase operation is initiated by executing a six-byte command sequence with Chip-Erase command (10H) at address 555H in the last byte sequence. The Erase operation begins with the rising edge of the sixth WE# or BEF#, whichever occurs first. During the Erase operation, the only valid read is Toggle Bits or Data# Polling. See Table 6 for the command sequence, Figure 13 for timing diagram, and Figure 27 for the flowchart. Any commands issued during the Chip-Erase operation are ignored. When WP# is low, any attempt to Chip-Erase will be ignored.

## Flash Erase-Suspend/-Resume Operations

The Erase-Suspend operation temporarily suspends a Sector- or Block-Erase operation thus allowing data to be read from any memory location, or program data into any sector/block that is not suspended for an Erase operation. The operation is executed by issuing a one-byte command sequence with Erase-Suspend command (B0H). The device automatically enters read mode within 20  $\mu$ s after the Erase-Suspend command had been issued. Valid data can be read from any sector or block that is not suspended from an Erase operation. Reading at address location within erase-suspended sectors/blocks will output DQ<sub>2</sub> toggling and DQ<sub>6</sub> at "1". While in Erase-Suspend mode, a Program operation is allowed except for the sector or block selected for Erase-Suspend. To resume Sector-Erase or Block-Erase operation which has been suspended, the system must issue an Erase-Resume command. The operation is executed by issuing a one-byte command sequence with Erase Resume command (30H) at any address in the one-byte sequence.

## Preliminary Specifications

### Flash Write Operation Status Detection

The GLS34HF32A4 provide one hardware and two software means to detect the completion of a Write (Program or Erase) cycle, in order to optimize the system Write cycle time. The hardware detection uses the Ready/Busy# (RY/BY#) pin. The software detection includes two status bits: Data# Polling (DQ<sub>7</sub>) and Toggle Bit (DQ<sub>6</sub>). The End-of-Write detection mode is enabled after the rising edge of WE#, which initiates the internal Program or Erase operation.

The actual completion of the nonvolatile write is asynchronous with the system; therefore, either a Ready/Busy# (RY/BY#), Data# Polling (DQ<sub>7</sub>) or Toggle Bit (DQ<sub>6</sub>) read may be simultaneous with the completion of the Write cycle. If this occurs, the system may possibly get an erroneous result, i.e., valid data may appear to conflict with either DQ<sub>7</sub> or DQ<sub>6</sub>. In order to prevent spurious rejection, if an erroneous result occurs, the software routine should include a loop to read the accessed location an additional two (2) times. If both reads are valid, then the device has completed the Write cycle, otherwise the rejection is valid.

### Ready/Busy# (RY/BY#)

The GLS34HF32A4 include a Ready/Busy# (RY/BY#) output signal. RY/BY# is an open drain output pin that indicates whether an Erase or Program operation is in progress. Since RY/BY# is an open drain output, it allows several devices to be tied in parallel to V<sub>DD</sub> via an external pull-up resistor. After the rising edge of the final WE# pulse in the command sequence, the RY/BY# status is valid. When RY/BY# is actively pulled low, it indicates that an Erase or Program operation is in progress. When RY/BY# is high (Ready), the devices may be read or left in standby mode.

### Byte/Word (CIOF)

This function, found only on the 56-ball package, includes a CIOF pin to control whether the device data I/O pins operate x8 or x16. If the CIOF pin is at logic “1” (V<sub>IH</sub>) the device is in x16 data configuration: all data I/O pins DQ<sub>0</sub>-DQ<sub>15</sub> are active and controlled by BEF# and OE#.

If the CIOF pin is at logic “0”, the device is in x8 data configuration: only data I/O pins DQ<sub>0</sub>-DQ<sub>7</sub> are active and controlled by BEF# and OE#. The remaining data pins DQ<sub>8</sub>-DQ<sub>14</sub> are at Hi-Z, while pin DQ<sub>15</sub> is used as the address input A<sub>1</sub> for the Least Significant Bit of the address bus.

### Flash Data# Polling (DQ<sub>7</sub>)

When the devices are in an internal Program operation, any attempt to read DQ<sub>7</sub> will produce the complement of the true data. Once the Program operation is completed, DQ<sub>7</sub> will produce true data. During internal Erase operation, any attempt to read DQ<sub>7</sub> will produce a ‘0’. Once the internal Erase operation is completed, DQ<sub>7</sub> will produce a ‘1’. The Data# Polling is valid after the rising edge of fourth WE# (or BEF#) pulse for Program operation. For Sector-, Block-, or Chip-Erase, the Data# Polling is valid after the rising edge of sixth WE# (or BEF#) pulse. See Figure 11 for Data# Polling (DQ<sub>7</sub>) timing diagram and Figure 24 for a flowchart.

## Toggle Bits (DQ<sub>6</sub> and DQ<sub>2</sub>)

During the internal Program or Erase operation, any consecutive attempts to read DQ<sub>6</sub> will produce alternating “1”s and “0”s, i.e., toggling between 1 and 0. When the internal Program or Erase operation is completed, the DQ<sub>6</sub> bit will stop toggling. The device is then ready for the next operation. The toggle bit is valid after the rising edge of the fourth WE# (or BEF#) pulse for Program operations. For Sector-, Block-, or Chip-Erase, the toggle bit (DQ<sub>6</sub>) is valid after the rising edge of sixth WE# (or BEF#) pulse. DQ<sub>6</sub> will be set to “1” if a Read operation is attempted on an Erase-suspended Sector/Block. If Program operation is initiated in a sector/block not selected in Erase-Suspend mode, DQ<sub>6</sub> will toggle.

An additional Toggle Bit is available on DQ<sub>2</sub>, which can be used in conjunction with DQ<sub>6</sub> to check whether a particular sector is being actively erased or erase-suspended. Table 1 shows detailed status bit information. The Toggle Bit (DQ<sub>2</sub>) is valid after the rising edge of the last WE# (or BEF#) pulse of a Write operation. See Figure 12 for Toggle Bit timing diagram and Figure 24 for a flowchart.

**TABLE 1: Write Operation Status**

Status		DQ <sub>7</sub>	DQ <sub>6</sub>	DQ <sub>2</sub>	RY/BY#
Normal Operation	Standard Program	DQ7#	Toggle	No Toggle	0
	Standard Erase	0	Toggle	Toggle	0
Erase-Suspend Mode	Read From Erase Suspended Sector/Block	1	1	Toggle	1
	Read From Non-Erase Suspended Sector/Block	Data	Data	Data	1
	Program	DQ7#	Toggle	No Toggle	0

T1.1 1313

**Note:** DQ<sub>7</sub>, DQ<sub>6</sub>, and DQ<sub>2</sub> require a valid address when reading status information. The address must be in the bank where the operation is in progress in order to read the operation status. If the address is pointing to a different bank (not busy), the device will output array data.

## Data Protection

The GLS34HF32A4 provide both hardware and software features to protect nonvolatile data from inadvertent writes.

### Hardware Data Protection

**Noise/Glitch Protection:** A WE# or BEF# pulse of less than 5 ns will not initiate a Write cycle.

**V<sub>DD</sub> Power Up/Down Detection:** The Write operation is inhibited when V<sub>DD</sub> is less than 1.5V.

**Write Inhibit Mode:** Forcing OE# low, BEF# high, or WE# high will inhibit the Write operation. This prevents inadvertent writes during power-up or power-down.

### Hardware Block Protection

The GLS34HF32A4 provide a hardware block protection which protects the outermost 8 KWord in Bank 1. The block is protected when WP# is held low.

A user can disable block protection by driving WP# high thus allowing erase or program of data into the protected sectors. WP# must be held high prior to issuing the write command and remain stable until after the entire Write operation has completed.

### Hardware Reset (RST#)

The RST# pin provides a hardware method of resetting the device to read array data. When the RST# pin is held low for at least T<sub>RP</sub>, any in-progress operation will terminate and return to Read mode (see Figure 20). When no internal Program/Erase operation is in progress, a minimum period of T<sub>RHR</sub> is required after RST# is driven high before a valid Read can take place (see Figure 19).

The Erase operation that has been interrupted needs to be reinitiated after the device resumes normal operation mode to ensure data integrity. See Figures 19 and 20 for timing diagrams.

## Preliminary Specifications

### Software Data Protection (SDP)

The GLS34HF32A4 provide the JEDEC standard Software Data Protection scheme for all data alteration operations, i.e., Program and Erase. Any Program operation requires the inclusion of the three-byte sequence. The three-byte load sequence is used to initiate the Program operation, providing optimal protection from inadvertent Write operations, e.g., during the system power-up or power-down. Any Erase operation requires the inclusion of six-byte sequence. The GLS34HF32A4 are shipped with the Software Data Protection permanently enabled. See Table 6 for the specific software command codes. During SDP command sequence, invalid commands will abort the device to Read mode within  $T_{RC}$ . The contents of DQ<sub>15</sub>-DQ<sub>8</sub> are "Don't Care" during any SDP command sequence.

### Common Flash Memory Interface (CFI)

These devices also contain the CFI information to describe the characteristics of the devices. In order to enter the CFI Query mode, the system must write the three-byte sequence, same as the Software ID Entry command with 98H (CFI Query command) to address BK<sub>X</sub>555H in the last byte sequence. In order to enter the CFI Query mode, the system can also use the one-byte sequence with BK<sub>X</sub>55H on Address and 98H on Data Bus. See Figure 17 for CFI Entry and Read timing diagram. Once the device enters the CFI Query mode, the system can read CFI data at the addresses given in Tables 7 through 9. The system must write the CFI Exit command to return to Read mode from the CFI Query mode.

### Security ID

The GLS34HF32A4 devices offer a 136-word Security ID space. The Secure ID space is divided into two segments—one 128-bit factory programmed segment and one 128-word (256-byte) user-programmed segment. The first segment is programmed and locked at Greenliant with a unique, 128-bit number. The user segment is left un-programmed for the customer to program as desired.

To program the user segment of the Security ID, the user must use the Security ID Program command. End-of-Write status is checked by reading the toggle bits. Data# Polling is not used for Security ID End-of-Write detection. Once programming is complete, the Sec ID should be locked using the User-Sec-ID-Program-Lock-Out. This disables any future corruption of this space. Note that regardless of whether or not the Sec ID is locked, neither Sec ID segment can be erased. The Secure ID space can be queried

by executing a three-byte command sequence with Query-Sec-ID command (88H) at address 555H in the last byte sequence. To exit this mode, the Exit-Sec-ID command should be executed. Refer to Table 6 for more details.

### Product Identification

The Product Identification mode identifies the device as the GLS34HF32A4 and manufacturer as Greenliant. This mode may be accessed by software operations only. The hardware device ID Read operation, which is typically used by programmers cannot be used on this device because of the shared lines between flash and PSRAM in the multi-chip package. Therefore, application of high voltage to pin A<sub>9</sub> may damage this device. Users may use the software Product Identification operation to identify the part (i.e., using the device ID) when using multiple manufacturers in the same socket. For details, see Tables 5 and 6 for software operation, Figure 16 for the Software ID Entry and Read timing diagram and Figure 25 for the ID Entry command sequence flowchart.

**TABLE 2: Product Identification**

	ADDRESS	DATA
Manufacturer's ID	BK0000H	00BFH
Device ID GLS34HF32A4	BK0001H	7353H

T2.0 1313

**Note:** BK = Bank Address (A<sub>20</sub>-A<sub>18</sub>)

### Product Identification Mode Exit/CFI Mode Exit

In order to return to the standard Read mode, the Software Product Identification mode must be exited. Exit is accomplished by issuing the Software ID Exit command sequence, which returns the device to the Read mode. This command may also be used to reset the device to the Read mode after any inadvertent transient condition that apparently causes the device to behave abnormally, e.g., not read correctly. Please note that the Software ID Exit/CFI Exit command is ignored during an internal Program or Erase operation. See Table 6 for software command codes, Figure 16 for timing waveform and Figure 25 for a flowchart.

## PSRAM Operation

With BES1# low, BES2 and BEF# high, the GLS34HF32A4 operate as 1024K x16 CMOS PSRAM, with fully static operation requiring no external clocks or timing strobes. The GLS34HF32A4 PSRAM is mapped into the first 1024 KWord address space. When BES1#, BEF# are high and BES2 is low, all memory banks are deselected and the device enters standby. Read and Write cycle times are equal. The control signals UBS# and LBS# provide access to the upper data byte and lower data byte. See Table 5 for Read and Write data byte control modes of operation.

## PSRAM Deep Power-Down Mode

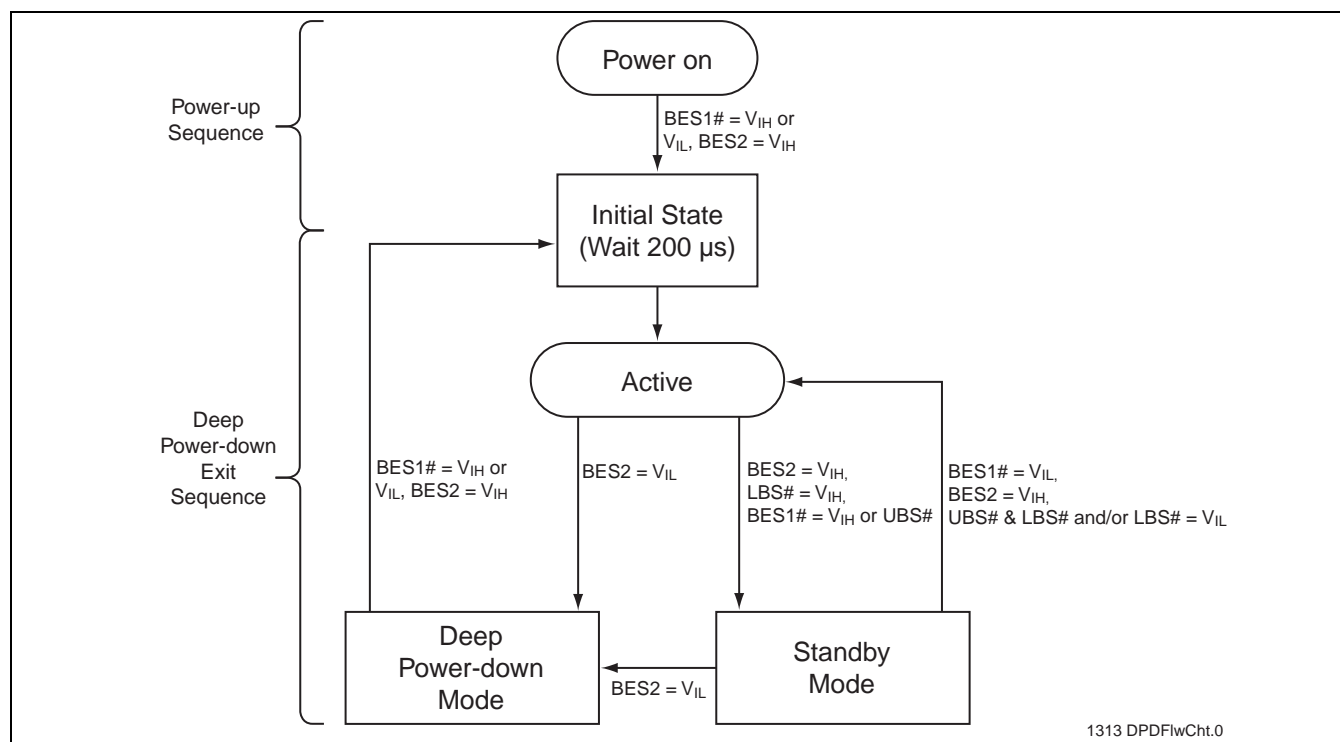

This mode can be used to lower the power consumption of the PSRAM in the GLS34HF32A4 device only. Deep power-down occurs 1 $\mu$ s after being enabled by driving BES2 low. Normal operation occurs 500 $\mu$ s after BES2 is driven high. In deep power-down mode, PSRAM data is lost. For details, see Figure 1.

## PSRAM Read

The PSRAM Read operation of the GLS34HF32A4 is controlled by OE# and BES1#, both have to be low with WE# and BES2 high for the system to obtain data from the outputs. BES1# and BES2 are used for PSRAM bank selection. OE# is the output control and is used to gate data from the output pins. The data bus is in high impedance state when OE# is high. Refer to the Read cycle timing diagram, Figure 5, for further details.

## PSRAM Write

The PSRAM Write operation of the GLS34HF32A4 is controlled by WE# and BES1#, both have to be low, BES2 must be high for the system to write to the PSRAM. During the Word-Write operation, the addresses and data are referenced to the rising edge of either BES1#, WE#, or the falling edge of BES2 whichever occurs first. The write time is measured from the last falling edge of BES1# or WE# or the rising edge of BES2 to the first rising edge of BES1#, or WE# or the falling edge of BES2. Refer to the Write cycle timing diagrams, Figures 6 and 7, for further details.

## Preliminary Specifications

### PIN DESCRIPTION

**FIGURE 3: Pin Assignments for 56-ball LFBGA (8mm x 10mm)**

**FIGURE 4: Pin Assignment for 62-Ball LFBGA (8mm x 10mm)**

# 32 Mbit Concurrent SuperFlash + 16 Mbit PSRAM ComboMemory GLS34HF32A4

Preliminary Specifications

**TABLE 4: Pin Description**

Symbol	Pin Name	Functions
A <sub>MS</sub> to A <sub>0</sub>	Address Inputs	To provide flash address, A <sub>20</sub> -A <sub>0</sub> . To provide PSRAM address, A <sub>19</sub> -A <sub>0</sub>
DQ <sub>14</sub> -DQ <sub>0</sub>	Data Inputs/Outputs	To output data during Read cycles and receive input data during Write cycles. Data is internally latched during a flash Erase/Program cycle. The outputs are in tri-state when OE# is high or BES1# is high or BES2 is low and BEF# is high.
DQ <sub>15</sub> /A <sub>-1</sub>	Data Input/Output and LBS Address	DQ <sub>15</sub> is used as data I/O pin when in x16 mode (CIOF = "1") A <sub>-1</sub> is used as the LBS address pin when in x8 mode (CIOF = "0")
BEF#	Flash Memory Bank Enable	To activate the Flash memory bank when BEF# is low
BES1#	PSRAM Memory Bank Enable	To activate the PSRAM memory bank when BES1# is low
BES2	PSRAM Deep Power-down Enable	To activate the PSRAM memory deep power-down mode when BES2 is low.
OE#	Output Enable	To gate the data output buffers
WE#	Write Enable	To control the Write operations
CIOF	Byte Selection for Flash	When low, select Byte mode. When high, select Word mode.
UBS#	Upper Byte Control (PSRAM)	To enable DQ <sub>15</sub> -DQ <sub>8</sub>
LBS#	Lower Byte Control (PSRAM)	To enable DQ <sub>7</sub> -DQ <sub>0</sub>
WP#	Write Protect	To protect and unprotect the bottom 8 KWord (4 sectors) from Erase or Program operation
RST#	Reset	To Reset and return the device to Read mode
RY/BY#	Ready/Busy#	To output the status of a Program or Erase Operation RY/BY# is a open drain output, so a 10K $\Omega$ - 100K $\Omega$ pull-up resistor is required to allow RY/BY# to transition high indicating the device is ready to read.
V <sub>SSF</sub> <sup>1</sup>	Ground	Flash only
V <sub>SSS</sub> <sup>1</sup>	Ground	PSRAM only
V <sub>SS</sub>	Ground	
V <sub>DDF</sub>	Power Supply (Flash)	2.7-3.3V Power Supply to Flash only
V <sub>DDs</sub>	Power Supply (PSRAM)	2.7-3.3V Power Supply to PSRAM only
NC	No Connection	Unconnected pins

T4.0 1313

1. LS package only

T5.0 1313

1. Do not apply BEF# = V<sub>IL</sub>, BES1# = V<sub>IL</sub> and BES2 = V<sub>IL</sub> at the same time.
2. X can be V<sub>IL</sub> or V<sub>IH</sub>, but no other value.
3. OE# = OEF# and OES#  
WE# = WEF# and WES# for LS package only
4. In PSRAM Deep power-down, PSRAM data is lost.
5. Software mode only
6. With A<sub>19</sub>-A<sub>18</sub> = V<sub>IL</sub>, Greenliant Manufacturer's ID = BFH, is read with A<sub>0</sub>=0,  
GLS32HF32A4 Device ID = 7353H, is read with A<sub>0</sub>=1,

T6.0 1313

- Address format A<sub>10</sub>-A<sub>0</sub> (Hex), Addresses A<sub>20</sub>-A<sub>11</sub> can be V<sub>IL</sub> or V<sub>IH</sub>, but no other value, for the command sequence when in x16 mode.  
When in x8 mode, Addresses A<sub>20</sub>-A<sub>12</sub>, Address A<sub>1</sub> and DQ<sub>14</sub>-DQ<sub>8</sub> can be V<sub>IL</sub> or V<sub>IH</sub>, but no other value, for the command sequence.
- DQ<sub>15</sub>-DQ<sub>8</sub> can be V<sub>IL</sub> or V<sub>IH</sub>, but no other value, for the command sequence
- WA = Program Word/Byte address
- SA<sub>X</sub> for Sector-Erase; uses A<sub>20</sub>-A<sub>11</sub> address lines  
BA<sub>X</sub> for Block-Erase; uses A<sub>20</sub>-A<sub>15</sub> address lines  
BK<sub>X</sub> for Bank Address; uses A<sub>20</sub>-A<sub>18</sub> address lines
- For GLS34HF32A4 the Security ID Address Range is:  
(x16 mode) = 0FF000H to 0FF087H, (x8 mode) = 000000H to 00010FH  
Greenliant ID is read at Address Range (x16 mode) = 000000H to 000007H (x8 mode) = 000000H to 0000FFH  
User ID is read at Address Range (x16 mode) = 000008H to 000087H (x8 mode) = 000100H to 00010FH  
Lock Status is read at Address 0000FFH (x16) or 0001FFH (x8). Unlocked: DQ<sub>3</sub> = 1 / Locked: DQ<sub>3</sub> = 0.
- SIWA = User Security ID Program Word/Byte address  
For GLS34HF32A4, valid Address Range is  
(x16 mode) = 000008H-000087H (x8 mode) = 000010H-00010FH.  
All 4 cycles of User Security ID Program and Program Lock-out must be completed before going back to Read-Array mode.
- The User Security ID Program Lock-out command must be executed in x16 mode (BYTE# = V<sub>IH</sub>).
- The device does not remain in Software Product Identification mode if powered down.
- A<sub>19</sub> and A<sub>18</sub> = V<sub>IL</sub>
- Both Software ID Exit operations are equivalent
- If users never lock after programming, User Sec ID can be programmed over the previously unprogrammed bits (data=1) using the User Sec ID mode again (the programmed "0" bits cannot be reversed to "1").

## Preliminary Specifications

**TABLE 7: CFI QUERY IDENTIFICATION STRING<sup>1</sup>**

Address x16 Mode	Address x8 Mode	Data <sup>2</sup>	Description
10H 11H 12H	20H 22H 24H	0051H 0052H 0059H	Query Unique ASCII string "QRY"
13H 14H	26H 28H	0002H 0000H	Primary OEM command set
15H 16H	2AH 2CH	0000H 0000H	Address for Primary Extended Table
17H 18H	2EH 30H	0000H 0000H	Alternate OEM command set (00H = none exists)
19H 1AH	32H 34H	0000H 0000H	Address for Alternate OEM extended Table (00H = none exists)

T7.1 1313

1. Refer to CFI publication 100 for more details.
2. In x8 mode, only the lower byte of data is output.

**TABLE 8: SYSTEM INTERFACE INFORMATION**

Address x16 Mode	Address x8 Mode	Data <sup>1</sup>	Description

T9.2 1313

1. In x8 mode, only the lower byte of data is output.

**Absolute Maximum Stress Ratings** (Applied conditions greater than those listed under “Absolute Maximum Stress Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these conditions or conditions greater than those defined in the operational sections of this data sheet is not implied. Exposure to absolute maximum stress rating conditions may affect device reliability.)

Operating Temperature . . . . . -20°C to +85°C  
Storage Temperature . . . . . -65°C to +125°C  
D. C. Voltage on Any Pin to Ground Potential . . . . . -0.5V to V<sub>DD</sub><sup>1</sup>+0.3V  
Transient Voltage (<20 ns) on Any Pin to Ground Potential. . . . . -1.0V to V<sub>DD</sub><sup>1</sup>+1.0V  
Package Power Dissipation Capability (T<sub>A</sub> = 25°C) . . . . . 1.0W  
Surface Mount Solder Reflow Temperature . . . . . 260°C for 10 seconds  
Output Short Circuit Current<sup>2</sup> . . . . . 50 mA

1. V<sub>DD</sub> = V<sub>DDF</sub> and V<sub>DDS</sub>

2. Outputs shorted for no more than one second. No more than one output shorted at a time.

## Operating Range

Range	Ambient Temp	V <sub>DD</sub>
Extended	-20°C to +85°C	2.7-3.3V

## AC Conditions of Test

Input Rise/Fall Time . . . . .	5 ns
Output Load . . . . .	C <sub>L</sub> = 30 pF
See Figures 21 and 22	

## Preliminary Specifications

**TABLE 10: DC Operating Characteristics ( $V_{DD} = V_{DDF}$  and  $V_{DDs} = 2.7-3.3V$ )**

Symbol	Parameter	Limits			Test Conditions
		Min	Max	Units	
$I_{DD}^1$	Active $V_{DD}$ Current				Address input = $V_{ILT}/V_{IHT}$ , at $f=5$ MHz, $V_{DD}=V_{DD}$ Max, all DQs open
	Read				$OE\#=V_{IL}$ , $WE\#=V_{IH}$

$T_{ODWS}$	Output Disable from WE# Low		30	ns
$T_{OEWS}$	Output Enable from WE# High	0		ns
$T_{DSS}$	Data Set-up Time	30		ns
$T_{DHS}$	Data Hold from Write Time	0		ns

T15.0 1313

**TABLE 16: Flash Read Cycle Timing Parameters  $V_{DD} = 2.7-3.3V$**

Symbol	Parameter	Min	Max	Units
$T_{RC}$	Read Cycle Time	70		ns
$T_{CE}$	Chip Enable Access Time		70	ns
$T_{AA}$	Address Access Time		70	ns
$T_{OE}$	Output Enable Access Time		35	ns
$T_{CLZ}^1$	BEF# Low to Active Output	0		ns
$T_{OLZ}^1$	OE# Low to Active Output	0		ns
$T_{CHZ}^1$	BEF# High to High-Z Output		16	ns
$T_{OHZ}^1$	OE# High to High-Z Output		16	ns
$T_{OH}^1$	Output Hold from Address Change	0		ns
$T_{RP}^1$	RST# Pulse Width	500		ns
$T_{RHR}^1$	RST# High Before Read	50		ns
$T_{RY}^{1,2}$	RST# Pin Low to Read		20	$\mu s$

T16.0 1313

1. This parameter is measured only for initial qualification and after the design or process change that could affect this parameter.
2. This parameter applies to Sector-Erase, Block-Erase and Program operations. This parameter does not apply to Chip-Erase.

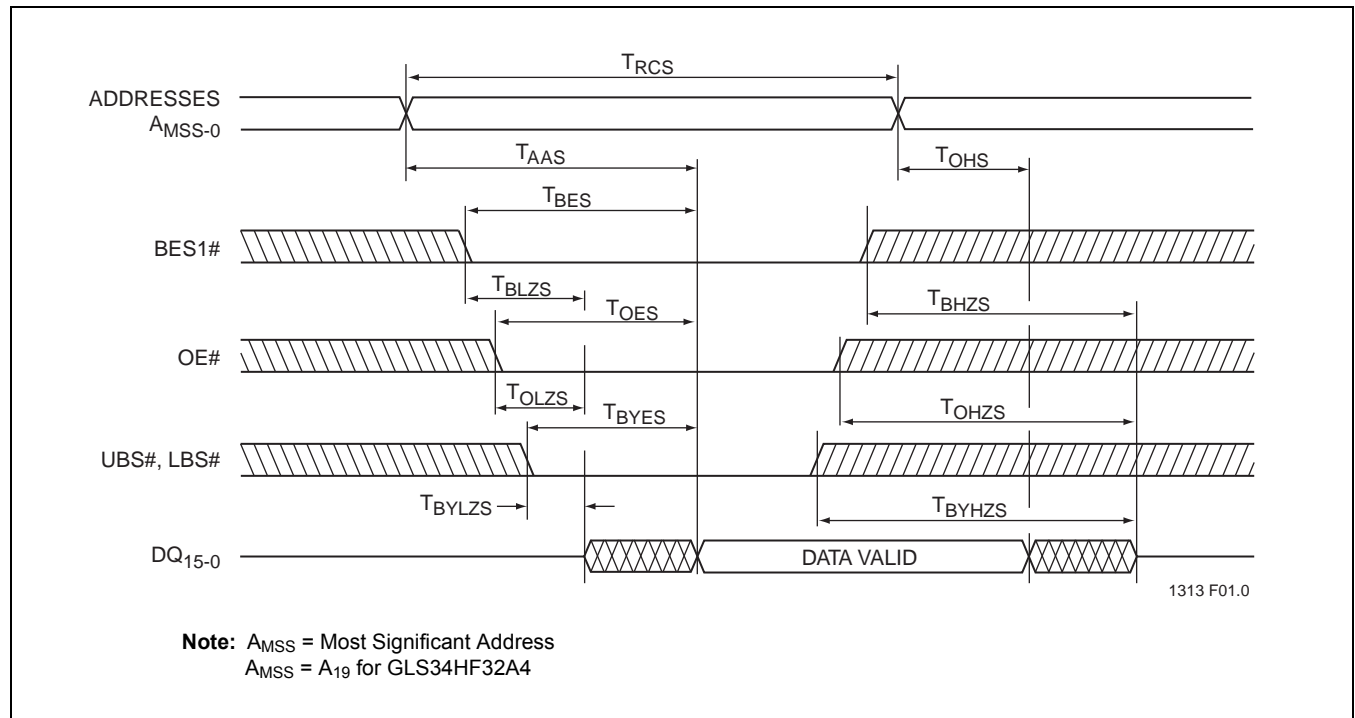

**TABLE 17: Flash Program/Erase Cycle Timing Parameters**

Symbol	Parameter	Min	Max	Units
$T_{BP}$	Program Time		10	$\mu s$
$T_{AS}$	Address Setup Time	0		ns
$T_{AH}$	Address Hold Time	40		ns
$T_{CS}$	WE# and BEF# Setup Time	0		ns
$T_{CH}$	WE# and BEF# Hold Time	0		ns
$T_{OES}$	OE# High Setup Time	0		ns
$T_{OEh}$	OE# High Hold Time	10		ns
$T_{CP}$	BEF# Pulse Width	40		ns
$T_{WP}$	WE# Pulse Width	40		ns
$T_{WPH}^1$	WE# Pulse Width High	30		ns
$T_{CPH}^1$	BEF# Pulse Width High	30		ns
$T_{DS}$	Data Setup Time	30		ns
$T_{DH}^1$	Data Hold Time	0		ns
$T_{IDA}^1$	Software ID Access and Exit Time		150	ns
$T_{ES}$	Erase-Suspend Latency		20	$\mu s$
$T_{BY}^{1,2}$	RY/BY# Delay Time		90	ns
$T_{BR}^1$	Bus Recovery Time		1	$\mu s$
$T_{SE}$	Sector-Erase		25	ms
$T_{BE}$	Block-Erase		25	ms
$T_{SCE}$	Chip-Erase		50	ms

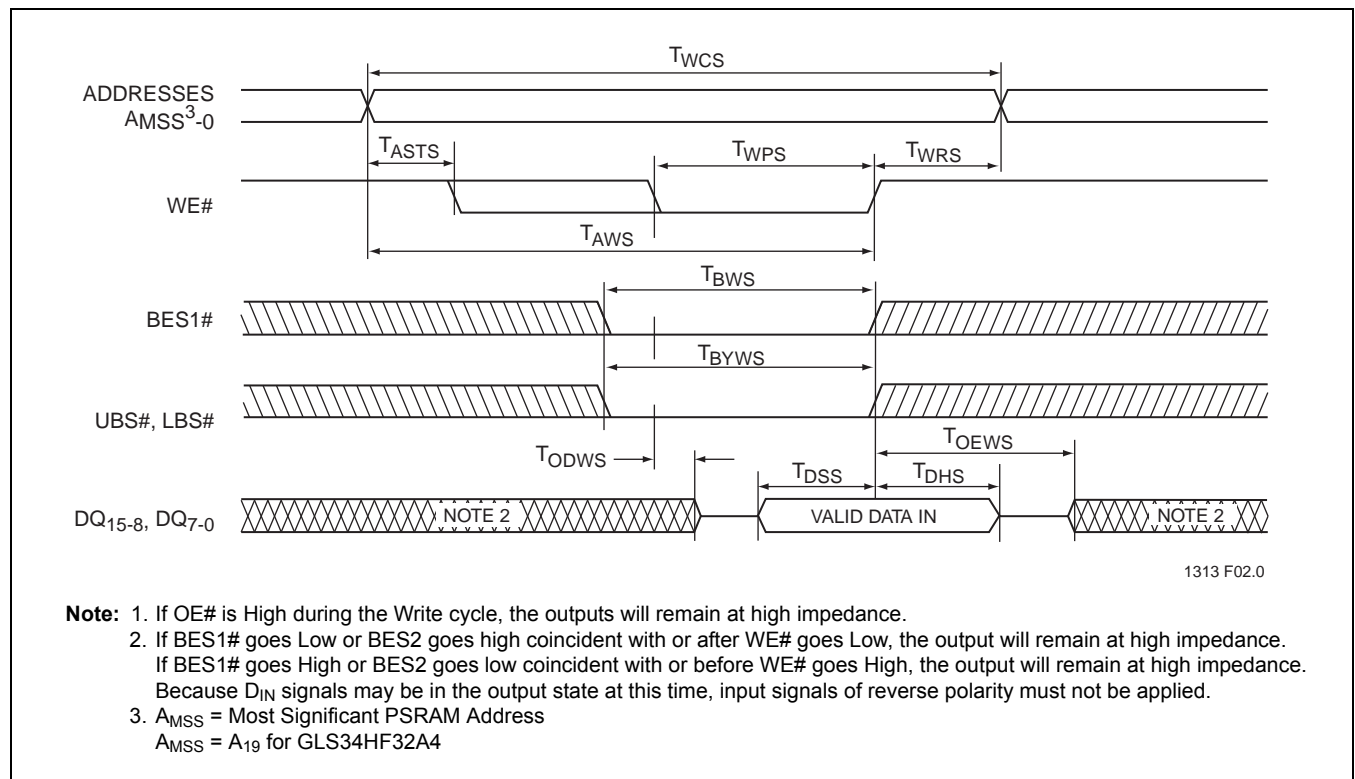

T17.1 1313

1. This parameter is measured only for initial qualification and after a design or process change that could affect this parameter.
2. This parameter applies to Sector-Erase, Block-Erase, and Program operations.  
This parameter does not apply to Chip-Erase operations.

## PRODUCT ORDERING INFORMATION

Device	Speed	Suffix1	Suffix2	
GLS34HF32x4X-XXX-XX-XXXX				
				<b>Environmental Attribute</b> E <sup>1</sup> = non-Pb
				<b>Package Modifier</b> P = 56 balls
				<b>Package Type</b> L1 = LFBGA (8mm x 10mm x 1.4mm, 0.45mm ball size)
				<b>Temperature Range</b> E = Extended = -20°C to +85°C
				<b>Minimum Endurance</b> 4 = 10,000 cycles
				<b>Read Access Speed</b> 70 = 70 ns
				<b>Version</b> blank = x16 PSRAM
				<b>Boot Block Protection</b> 4 = Top Boot Block
				<b>PSRAM Density</b> A = 16 Mbit
				<b>Flash Density</b> 32 = 32 Mbit
				<b>Voltage</b> H = 2.7-3.3V
				<b>Product Series</b> 34 = Concurrent SuperFlash + PSRAM ComboMemory

1. Environmental suffix "E" denotes non-Pb solder.  
Greenliant non-Pb solder devices are "RoHS Compliant".

### Valid combinations for GLS34HF32A4

GLS34HF32A4-70-4E-L1PE      GLS34HF32A4-70-4E-LSE

**Note:** Valid combinations are those products in mass production or will be in mass production. Consult your Greenliant sales representative to confirm availability of valid combinations and to determine availability of new combinations.

**TABLE 18: Revision History**

Number	Description	Date
00	• Initial Release	Feb 2006
01	• Made minor textual updates to “Features:” on page 1 and “Security ID” on page 6 • Updated $I_{SB}$ values in Table 10 on page 18. • Migrated document from “Advanced Information” to “Preliminary Specifications”	Aug 2006
02	• Updated $I_{SB}$ values in Table 10 on page 18.	Aug 2006
03	• Changed Heading “Product Identification Mode Exit” to “Product Identification Mode Exit/CFI Mode Exit” on page 6 • Added Figure 18 on page 28 • Changed $V_{IHT}$ ( $0.9V_{DD}$ ) to $V_{IHT}$ ( $V_{DD}-0.2V$ ) and $V_{ILT}$ ( $0.1V_{DD}$ ) to $V_{ILT}$ ( $0.2V$ ) in Figure 21 notes.	Aug 2007
04	• Changed ‘Program Time: 7 $\mu s$ ’ to ‘Word-Program Time: 7 $\mu s$ ’ on page 1, Features • Edited Product Description on page 1	Aug 2007
05	• Edited Tby TY/BY# Delay Time in Table 17 on page 21 from 90ns Min to 90ns Max	Nov 2009
06	• Transferred from SST to Greenliant	May 2010
