

# Smart high-side NMOS-power switch

**ITS4060S-SJ-N**

## Features

- CMOS compatible input
- Switching all types of resistive, inductive and capacitive loads
- Fast demagnetization of inductive loads
- Very low standby current
- Optimized Electromagnetic Compatibility (EMC)
- Overload protection
- Current limitation
- Short circuit protection
- Thermal shutdown with restart
- Overvoltage protection (including load dump)
- Reverse battery protection with external resistor
- Loss of GND and loss of Vbb protection
- Electrostatic Discharge Protection (ESD)
- Green Product (RoHS compliant)

## Applications

- All types of resistive, inductive and capacitive loads
- Power switch for 12V and 24V DC applications with CMOS compatible control interface
- Driver for electromagnetic relays
- Power management for high-side-switching with low current consumption in OFF-mode

## Product validation

Qualified for industrial applications according to the relevant tests of JEDEC.

## Description

The ITS4060S-SJ-N is a protected single channel smart high-side NMOS power switch in a PG-DSO-8 package with charge pump and CMOS compatible input. The device is monolithically integrated in Smart technology.

1) Not subject to production test, specified by design

2) Device on 50mm\*50mm\*1.5mm epoxy PCB FR4 with 6 cm<sup>2</sup> (one layer, 70mm thick) copper area for Vbb connection. PCB is vertical without blown air

3) Not subject to production test, specified by design

4) ESD susceptibility HBM according to ANSI/ESDA/JEDEC JS001 (1.5 kΩ, 100 pF)

**Note:** Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as “outside” the normal operating range. Protection functions are neither designed for continuous nor repetitive operation.

- 1) Device on 50mm x 50mm x 1,5mm epoxy FR4 PCB with 6cm<sup>2</sup> (one layer copper 70um thick) copper area for supply voltage connection. PCB in vertical position without blown air.
- 2) Timing values only with high slewrates input signal; otherwise slower.
- 3) Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as “outside” normal operating range. Protection functions are not designed for continuous repetitive operation.
- 4) Requires a 150  $\Omega$  resistor in GND connection. The reverse load current through the intrinsic drain-source diode of the power-MOS has to be limited by the connected load. Power dissipation is higher compared to normal operation due to the voltage drop across the drain-source diode. The temperature protection is not functional during reverse current operation! Input current has to be limited (see max ratings).

## 6 Application information

**Note:** The following information is given as a hint for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition or quality of the device.

**Figure 4** Application diagram

The ITS4060S-SJ-N can be connected directly to a supply network. It is recommended to place a ceramic capacitor (e.g.  $C_S = 220\text{nF}$ ) between supply and GND of the ECU to avoid line disturbances. Wire harness inductors/resistors are sketched in the application circuit above.

The complex load (resistive, capacitive or inductive) must be connected to the output pin OUT.

A built-in current limit protects the device against destruction.

The ITS4060S-SJ-N can be switched on and off with standard logic ground related logic signal at pin IN.

In standby mode ( $IN=L$ ) the ITS4060S-SJ-N is deactivated with very low current consumption.

The output voltage slope is controlled during on and off transition to minimize emissions. Only a small ceramic capacitor  $C_{OUT}=1\text{nF}$  is recommended to attenuate RF noise.

In the following chapters the main features, some typical waveforms and the protection behavior of the ITS4060S-SJ-N is shown. For further details please refer to application notes on the Infineon homepage.

**Note:** This is a very simplified example of an application circuit. The function must be verified in the real application.

## 6.1 Special feature description

### Supply over voltage:

If over-voltage is applied to the  $V_S$ -Pin:  
Voltage is limited to  $V_{DSAZ}$ ; current can be calculated:  
 $I_{ZDSAZ} = (V_S - V_{DSAZ}) / R_{GND}$   
A typical value for  $R_{GND}$  is  $150\Omega$ .  
In case of ESD pulse on the input pin there is in both polarities a peak current  $I_{INpeak} \sim V_{ESD} / R_{IN}$

### Supply reverse voltage:

If reverse voltage is applied to the device:  
1.) Current via load resistance  $R_L$ :  
 $I_{Rev1} = (V_{Rev} - V_{FDS}) / R_L$   
2.) Current via Input pin IN and diagnostic pin ST:  
 $I_{Rev2} = I_{ST} + I_{IN} \sim (V_{Rev} - V_{CC}) / R_{IN} + (V_{Rev} - V_{CC}) / R_{ST1,2}$   
Current  $I_{ST}$  must be limited with the external series resistor  $R_{STS}$ . Both currents will sum up to:  
 $I_{Rev} = I_{Rev1} + I_{Rev2}$

### Drain-Source power stage clamper $V_{DSCL}$ :

When an inductive load is switched off a current path must be established until the current is sloped down to zero (all energy removed from the inductive load). For that purpose the series combination  $Z_{DSCL}$  is connected between Gate and Drain of the power DMOS acting as an active clamp.  
When the device is switched off, the voltage at OUT turns negative until  $V_{DSCL}$  is reached.  
The voltage on the inductive load is the difference between  $V_{DSCL}$  and  $V_S$ .

### Energy calculation:

Energy stored in the load inductance is given by:  
 $E_L = I_L^2 * L / 2$   
While demagnetizing the load inductance the energy dissipated by the Power-DMOS is:  
 $E_{AS} = E_S + E_L - E_R$   
With an approximate solution for  $R_L = 0\Omega$ :  
 $E_{AS} = \frac{1}{2} * L * I_L^2 * \{ (1 - V_S / (V_S - V_{DSCL})) \}$
