

Eval-1ED3142MC12H-SiC

Evaluation board description and getting started guide

About this document

Scope and purpose

This user guide is intended to introduce and provide an overview of the gate driver evaluation board Eval-1ED3142MC12H-SiC with the [1ED3142MC12H](#) gate driver integrated circuits (IC), including the functionality and key features of the Infineon EiceDRIVER™ 1ED3142MC12H gate driver IC family.

The [Eval-1ED3142MC12H-SiC](#) board is designed to evaluate the functionality and capability of 1ED3142MC12H gate driver ICs.

This user guide presents only key features of the gate driver, and the datasheet should be consulted to ensure the full functionality and flexibility of the 1ED3142MC12H gate driver and Eval-1ED3142MC12H-SiC.

Intended audience

This document is intended for all technical specialists who want to evaluate the functionality, performance, and features of 1ED3142MC12H gate driver ICs. The evaluation board is intended to be used under laboratory conditions only by trained specialists.

It is a prerequisite to read the [datasheet](#) of the 1ED3142MC12H to become familiar with the parameters of the gate driver.

Evaluation Board

This board is to be used during the design-in process for evaluating and measuring characteristic curves, and for checking datasheet specifications.

Note: PCB and auxiliary circuits are NOT optimized for final customer design.

Important notice**Important notice**

“Evaluation Boards and Reference Boards” shall mean products embedded on a printed circuit board (PCB) for demonstration and/or evaluation purposes, which include, without limitation, demonstration, reference and evaluation boards, kits and design (collectively referred to as “Reference Board”).

Environmental conditions have been considered in the design of the Evaluation Boards and Reference Boards provided by Infineon Technologies. The design of the Evaluation Boards and Reference Boards has been tested by Infineon Technologies only as described in this document. The design is not qualified in terms of safety requirements, manufacturing and operation over the entire operating temperature range or lifetime.

The Evaluation Boards and Reference Boards provided by Infineon Technologies are subject to functional testing only under typical load conditions. Evaluation Boards and Reference Boards are not subject to the same procedures as regular products regarding returned material analysis (RMA), process change notification (PCN) and product discontinuation (PD).

Evaluation Boards and Reference Boards are not commercialized products and are solely intended for evaluation and testing purposes. In particular, they shall not be used for reliability testing or production. The Evaluation Boards and Reference Boards may therefore not comply with CE or similar standards (including but not limited to the EMC Directive 2004/EC/108 and the EMC Act) and may not fulfill other requirements of the country in which they are operated by the customer. The customer shall ensure that all Evaluation Boards and Reference Boards will be handled in a way which is compliant with the relevant requirements and standards of the country in which they are operated.

The Evaluation Boards and Reference Boards as well as the information provided in this document are addressed only to qualified and skilled technical staff, for laboratory usage, and shall be used and managed according to the terms and conditions set forth in this document and in other related documentation supplied with the respective Evaluation Board or Reference Board.

It is the responsibility of the customer’s technical departments to evaluate the suitability of the Evaluation Boards and Reference Boards for the intended application, and to evaluate the completeness and correctness of the information provided in this document with respect to such application.

The customer is obliged to ensure that the use of the Evaluation Boards and Reference Boards does not cause any harm to persons or third party property.

The Evaluation Boards and Reference Boards and any information in this document is provided "as is" and Infineon Technologies disclaims any warranties, express or implied, including but not limited to warranties of non-infringement of third-party rights and implied warranties of fitness for any purpose, or for merchantability.

Infineon Technologies shall not be responsible for any damages resulting from the use of the Evaluation Boards and Reference Boards and/or from any information provided in this document. The customer is obliged to defend, indemnify and hold Infineon Technologies harmless from and against any claims or damages arising out of or resulting from any use thereof.

Infineon Technologies reserves the right to modify this document and/or any information provided herein at any time without further notice.

Safety precautions

Safety precautions

Note: Please note the following warnings regarding the hazards associated with development systems.

Table 1 Safety precautions

	Warning: The DC link potential of this board is up to 900 VDC. When measuring voltage waveforms by oscilloscope, high voltage differential probes must be used. Failure to do so may result in personal injury or death.
	Warning: The evaluation board contains DC bus capacitors which take time to discharge after removal of the main supply. Before working on the drive system, wait five minutes for capacitors to discharge to safe voltage levels. Failure to do so may result in personal injury or death. Darkened display LEDs are not an indication that capacitors have discharged to safe voltage levels.
	Warning: Remove or disconnect power from the drive before you disconnect or reconnect wires, or perform maintenance work. Wait five minutes after removing power to discharge the bus capacitors. Do not attempt to service the drive until the bus capacitors have discharged to zero. Failure to do so may result in personal injury or death.
	Caution: Only personnel familiar with the drive, power electronics and associated machinery should plan, install, commission and subsequently service the system. Failure to comply may result in personal injury and/or equipment damage.
	Caution: The evaluation board contains parts and assemblies sensitive to electrostatic discharge (ESD). Electrostatic control precautions are required when installing, testing, servicing or repairing the assembly. Component damage may result if ESD control procedures are not followed. If you are not familiar with electrostatic control procedures, refer to the applicable ESD protection handbooks and guidelines.
	Caution: A drive that is incorrectly applied or installed can lead to component damage or reduction in product lifetime. Wiring or application errors such as undersizing the motor, supplying an incorrect or inadequate AC supply, or excessive ambient temperatures may result in system malfunction.
	Caution: The evaluation board is shipped with packing materials that need to be removed prior to installation. Failure to remove all packing materials that are unnecessary for system installation may result in overheating or abnormal operating conditions.

The board at a glance

1 The board at a glance

The Eval-1ED3142MC12H-SiC evaluation board is designed to be used by design engineers to evaluate the 1ED3142MC12H EiceDRIVER™ isolated gate driver IC in a half-bridge configuration. The evaluation board can be used to evaluate other pin-compatible ICs from the EiceDRIVER™ 1ED314xMC12H gate driver family by replacing the gate driver ICs.

The board comes with two unassembled Infineon [IMZA120R020M1H](#) CoolSiC™ 1200 V SiC Trench MOSFETs in a TO247-4 package, as seen in Figure 1. These switches can be substituted by any other desired switches, such as Infineon IGBTs, CoolSiC™ or CoolMOS™ transistors.

Details about the EiceDRIVER™ 1ED3142MC12H can be found on our product pages at <https://www.infineon.com/gdisolated> or by using the product search.

The board has a size of $85 \times 56 \times 28 \text{ mm}^3$ without any power switches assembled. As the board was designed for non-continuous evaluation, such as double-pulse testing, special consideration should be taken regarding the current capabilities of the power tracks and to ensure proper cooling of the power switches. It is also recommended to add additional high-voltage bulk capacitors at the high-voltage input.

The board has a galvanically isolated on-board power supply which generates the output side positive and negative power supply voltages for the high-side and low-side gate drivers. This power supply is designed with the transformer driver IC EiceDRIVER™ Power 2EP130R. Detailed information on the design of gate driver isolated power supply with the 2EP130R for SiC MOSFETs can be found in the user guide of the evaluation board EVAL-2EP130R-PR-SiC. The board is designed such that it is possible to deactivate the on-board power supply and the gate drivers can be supplied externally. Additionally, a linear regulator circuit generates the 3.3 V or 5 V for the input supply voltage for the gate drivers. Thus, all the supply voltages required for evaluation of the gate drivers are generated on the board.

Figure 1 Eval-1ED3142MC12H-SiC evaluation board

The board at a glance**1.1 Scope of supply**

The delivery contains:

- The evaluation board Eval-1ED3142MC12H-SiC
- Two IMZA120R020M1H CoolSiC™ 1200 V SiC Trench MOSFETs for assembly

1.2 Block diagram

Figure 2 shows the block diagram of the Eval-1ED3142MC12H-SiC evaluation board.

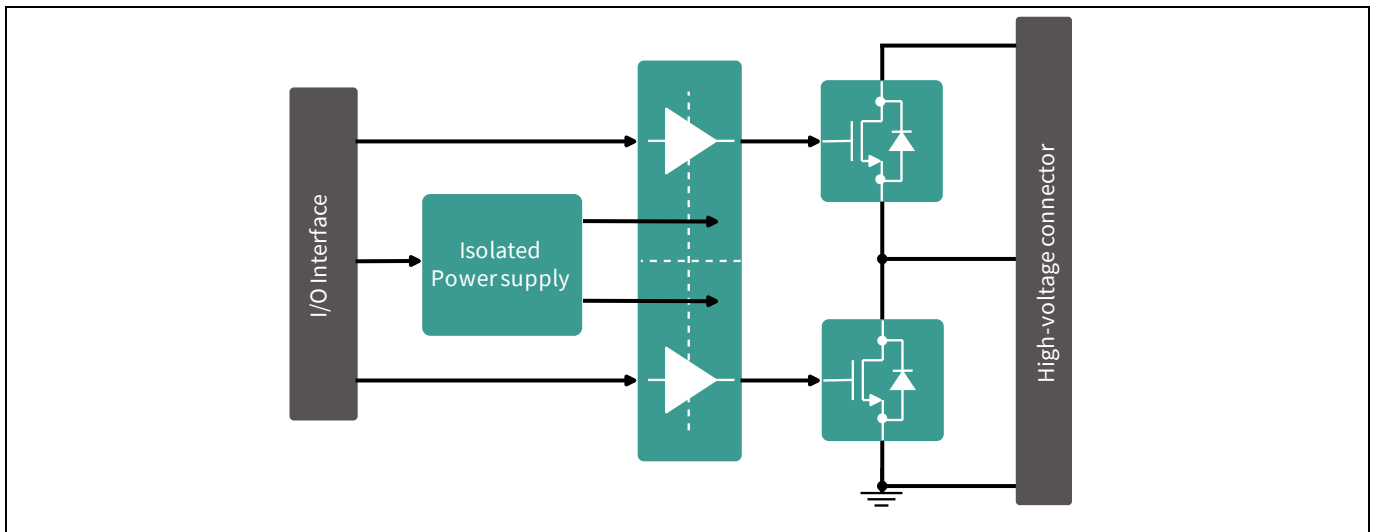

Figure 2 Eval-1ED3142MC12H-SiC evaluation board block diagram

1.3 Main features

The Eval-1ED3142MC12H-SiC is an evaluation board for the 1ED3142MC12H gate driver ICs. It is designed in a half-bridge configuration with a 900 V maximum blocking capability across the power terminals. The board is designed for easy measurement and configuration of the gate driver parameters, and the main features of the board and gate driver include:

- 35 V absolute maximum output supply voltage
- Up to ± 6.5 A typical output current
- Separate source and sink output for optimized gate driving
- Active shutdown
- Very high common-mode transient immunity CMTI > 300 kV/ μ s
- 40 ns typical propagation delay
- Tight IC-to-IC propagation delay matching
- 3.3 V and 5 V input supply voltage
- PG-LDSO-8 wide body package with >8 mm creepage
- Gate driver safety certification:
 - UL 1577 recognized with $V_{ISO, test} = 6840$ V (rms) for 1 s, $V_{ISO} = 5700$ V (rms) for 60 s
 - Reinforced isolation as per IEC 60747-17 with $V_{IORM} = 1767$ V (planned)
- Infineon IMZA120R020M1H CoolSiC™ 1200 V SiC Trench MOSFETs in PG-TO247-4 (unassembled)

The board at a glance

The on-board isolated power supply is designed with the 2EP130R transformer driver IC. The main features of 2EP130R are:

- Wide input voltage range 4.5 V to 20 V
- Wide range of switching frequency from 50 kHz to 695 kHz
- High accuracy duty cycle adjustment from 10% to 50%
- Peak-current controlled soft-start
- Over-current and over-temperature protection
- Ready signal to indicate successful completion of soft-start

1.4 Board parameters and technical data

The absolute maximum ratings are summarized in Table 2.

Table 2 Absolute maximum ratings

Parameter/Pin	Symbol	Conditions/Notes	Value	Unit
Diode protected isolated power supply input voltage	15V	Referenced to GND1	-0.3 ... 18	V
Input side supply voltage	VCC1	Referenced to GND1	-0.3 ... 7	V
Positive input for low-side gate driver	IN_LS	Referenced to GND1	-0.3 ... 7	V
Positive input for high-side gate driver	IN_HS	Referenced to GND1	-0.3 ... 7	V
Ready output for power supply	RDY	Ready state of the on-board power supply circuit	-0.3 ... 7	V
Clock signal for bypass mode of power supply	PWM_PSU	Referenced to GND1	-0.3 ... 7	V
Reserved	.res	Reserved for future use		
DC-link voltage	HV+	Referenced to HV- power terminal. Limited by component ratings and design clearances. For voltages above 42 V, special safety measures should be taken	-0.2 ... 900	V
Half-bridge mid-point connection	PHASE	Midpoint connection for the half-bridge	-0.2 ... 900	V
High power ground terminal without OCP	HV-	Ground connection for the high-power connection	-	-
Output side positive supply voltages	VCC2 / VCC2	Referenced to VEE2 / VEE2. Not to be used with on-board power supply	-0.3 ... 35	V
Output side negative supply voltages	VEE2 / VEE2	Referenced to GND2 / GND2. Not to be used with on-board power supply	-35 ... 0.3	V
Phase peak current	I_{out}	Pulse current	100	A
Pulse width	t_{pulse}	Maximum ON pulse length for double-pulse tests. Power dissipation should be considered	100	μ s
Switching frequency	f_{sw}	Maximum switching frequency for continuous operation. Power dissipation should be considered	100	kHz

The board at a glance

The recommended operating conditions are summarized in Table 3.

Table 3 Recommended operating conditions and supply for 3.3 V

Parameter/Pin	Symbol	Conditions/Notes	Value			Unit
			Min.	Typ.	Max	
Isolated power supply input voltage	15V	Referenced to GND1	14.5	15.3	16	V
Input side supply voltage	VCC1	Referenced to GND1	3.2	3.3	3.5	V
Positive input for low-side gate driver	IN_LS	Referenced to GND1	-0.1	VCC1	VCC1+0.1	V
Positive input for high-side gate driver	IN_HS	Referenced to GND1	-0.1	VCC1	VCC1+0.1	V
Reset input for over current protection circuit	RST	Referenced to GND1	-0.1	VCC1	VCC1+0.1	V
DC-link voltage	HV+	Referenced to HV- power terminal. Limited by component ratings and design clearances. For voltages above 42 V, special safety measures should be taken	25	-	800	V
Output side positive supply voltages	VCC2/ VCC2	Referenced to GND2/GND2. Not to be used with on-board power supply	15	18	20	V
Output side negative supply voltages	VEE2/ VEE2	Referenced to GND2/GND2. Not to be used with on-board power supply	-5	-3	0	V

2 System and functional description

2.1 Getting started

The Eval-1ED3142MC12H-SiC is optimized to be used with both 5 V and 3.3 V voltages for the input side supply of the gate drivers, VCC1. The board also has a linear power supply circuit that generates a 5 V or 3.3 V required for the input side voltage, VCC1. However, it is important to note that the threshold values for the primary-side input signals are independent of the VCC1 supply voltage.

It is recommended to use the board with the on-board isolated power supply for the output side supply voltages of the high-side and low-side gate drivers. For a nominal input voltage of +15.3 V, this power supply will provide a bipolar +18 V/-2.6 V supply voltage for the output sides for both the high-side and the low-side gate drivers.

2.1.1 Prerequisites

- Assembled external high-voltage decoupling capacitor ($>100\text{ }\mu\text{F}$) across the high-voltage power terminals: X99 (HV+) and X99 (HV-)
- Low voltage power supply for supplying the input-side power supply circuit, capable of supplying $>15\text{ V}$, 100 mA: X4 (15V) and X4 (GND1)
- Suitable function generator for double-pulse signal generation
- High-voltage power supply for supplying the power stage: X99 (HV+) and X99 (HV-)
- A suitable inductive load for double-pulse testing

2.1.2 Power-up sequence with the on-board power supply

1. Connect the double-pulse signal generator to the Eval-1ED3142MC12H-SiC input pins. For evaluating the low-side switching capability, connect the signal generator to the connector X2 (IN_LS) and X2 (GND1) and short the pins on the connector X3 (IN_HS) and X3 (GND1). For evaluation of the high-side switching capability, connect the signal generator to X3 (IN_HS) and X3 (GND1) and short X2 (IN_LS) to X2 (GND1).
2. Connect one end of the inductive load to terminal X99 (PHASE) and the other end, depending on the double-pulse test requirements, to either X99 (HV+) for the low-side testing or X99 (HV-) for the high-side testing.
3. Supply the isolated power supply input voltage at connector X4 (15V) and X4 (GND1) with 15.3 V.
4. The default input side supply voltage for the gate drivers is 3.3 V. This can be changed to 5 V by shorting the jumper J2 (5V_EN).
5. The default rail-to-rail output voltage of the on-board power supply is 20.5 V. This voltage is split into positive rail voltage of 18 V and negative rail voltage -2.6 V for the gate drivers. It is possible to change the ratio of the positive and negative rail voltages by changing the duty cycle resistor R8. Detailed information on splitting the rail voltage can be found in the datasheet of 2EP130R.
6. The rail-to-rail output voltage of the isolated power supply can be increased or decreased by changing the input voltage of the power supply.
7. The green LEDs D2 (15V), D3 (VCC1_ok), D4 (RDY), D10 (VCC2_ok), D11 (VCC2_ok) will turn on indicating that the power supply circuit is ready and all the supply voltages for the gate drivers are available.
8. Connect the high voltage power supply to the connector X99 (HV+) and X99 (HV-)
9. The board is now ready for double-pulse evaluation.

2.1.3 Power-up sequence with external supply voltages

1. Connect the double-pulse signal generator to the Eval-1ED3142MC12H-SiC input pins. For evaluating the low-side switching capability, connect the signal generator to the connector X2 (IN_LS) and X2 (GND1) and short the pins on the connector X3(IN_HS) and X3 (GND1). For evaluation of the high-side switching capability, connect the signal generator to X3 (IN_HS) and X3 (GND1) and short X2 (IN_LS) to X2 (GND1).
2. Connect one end of the inductive load to terminal X99 (PHASE) and the other end, depending on the double-pulse test requirements, to either X99 (HV+) for the low-side testing or X99 (HV-) for the high-side testing.
3. Deactivate the on-board power supply by shorting the solder jumper J1 and connecting pin X1 (PWM_PSU) to X1 (GND1).
4. Supply the isolated power supply input voltage at connector X4 (15V) and X4 (GND1) with 15 V. (This is required to generate the input supply voltage for the gate drivers).
5. The default input side supply voltage for the gate drivers is 3.3 V. This can be changed to 5 V by shorting the jumper J2 (5V_EN).
6. Supply the gate driver output supply voltages externally through the connector X6 (VCC2), X6 (GND2) and X6 (VEE2) for the high-side gate driver and through X7 (VCC2), X7 (GND2) and X7 (VEE2) for the low-side gate driver. Please note that the supply voltages for the high-side and the low-side gate drivers should be functionally isolated from each other.
7. The green LEDs D2 (15V), D3 (VCC1_ok), D10 (VCC2_ok), D11 (VCC2_ok) will turn on indicating that all the supply voltages for the gate drivers are available. The red LED D4 (RDY) will turn on to indicate that the on-board power supply is deactivated.
8. Connect the high-voltage power supply to the connector X99 (HV+) and X99 (HV-)
9. The board is now ready for double-pulse evaluation.

2.2 Example: Normal operation with on-board power supply

Figure 3 shows the ramp-up of the output supply voltages of the low-side gate driver at startup. The positive supply voltage and the negative supply voltage reach 18 V and -2.6 V, respectively after the soft-start.

Figure 3 Eval-1ED3142MC12H-SiC – Power supply voltages startup

Eval-1ED3142MC12H-SiC

Evaluation board description and getting started guide

System and functional description

Figure 4, Figure 5 and Figure 6 show the Eval-1ED3142MC12H-SiC in a typical double-pulse test of the low-side CoolSiC™ MOSFET. The board was supplied with 800 V between terminals X99 (HV+) and X99 (HV-). A 200 μ H load inductor was connected in parallel with the high-side CoolSiC™ MOSFET, between terminals X99 (HV+) and X99 (PHASE). The gate source signal of the low-side CoolSiC™ SiC MOSFET is shown with yellow on channel 1. Channel 3 with blue shows the drain source voltage, V_{DS} of the same MOSFET. Lastly, with green, the drain current I_D is shown on channel 4. At the end of first pulse, the drain current, I_D , is 60 A.

3.4 Connector details

General information about the connectors of the Eval-1ED3142MC12H-SiC evaluation board is provided in this section.

Table 5 shows the connection of the high-voltage connector X99.

Table 5 High-voltage connectors

Connector / Pin	Symbol	Function
X99 (1)	HV-	DC-link ground connection
X99 (2)	PHASE	Half-bridge midpoint connection
X99 (3)	HV+	DC-link high-side connection

Table 6 shows the connections of the low voltage, input side connectors. This includes all the connectors, X1, X2, X3, X4, X5 and X6.

Table 6 Input side connectors pinout

PIN	Symbol	Function
X1 (1)	N.C.	Not connected
X1 (2)	N.C.	Not connected
X1 (3)	VCC1	Supply voltage for the input side of the gate drivers
X1 (4)	GND1	Ground for the input side of the board
X1 (5)	RDY	RDY state of isolated power supply. Active low signal
X1 (6)	.res	Not used
X1 (7)	IN_HS	Non-inverting input for the high-side gate driver
X1 (8)	IN_LS	Non-inverting input for the low-side gate driver
X1 (9)	PWM_PSU	External PWM signal for bypass mode of isolated power supply
X1 (10)	+15V	Supply voltage for the isolated power supply. Not reverse polarity protected
X2 (1)	GND1	Ground for the input side of the board
X2 (2)	IN_LS	Non-inverting input for the low-side gate driver
X3 (1)	GND1	Ground for the input side of the board
X3 (2)	IN_HS	Non-inverting input for the high-side gate driver
X4 (1)	GND1	Ground for the input side of the board
X4 (2)	15V	Reverse polarity protected, supply voltage for the isolated power supply
X5 (1)	VCC1	Supply voltage for the input side of the gate drivers
X5 (2)	GND1	Ground for the input side of the board

Table 7 shows the connection of the low-side supply connectors X7. This is used to supply the low-side gate drive secondary side. If the on-board isolated power supply board is not used, VCC2, GND2, and VEE2 voltage can be supplied here by means of an isolated power supply that allows floating operation of the gate driver as per application.

Table 7 Low-side gate driver IC -isolated secondary power supply

PIN	Symbol	Function
X7 (1)	VCC2	Low-side gate driver positive output supply connection
X7 (2)	GND2	Low-side gate driver supply ground reference connection
X7 (3)	VEE2	Low-side gate driver negative output supply connection

Table 8 shows the connection of the high-side supply connectors X6. This is used to supply the high-side gate drive secondary side. If the on-board isolated power supply board is not used, VCC2, GND2, and VEE2 voltage can be supplied here by means of an isolated power supply that allows floating operation of the gate driver as per application.

Table 8 High-side gate driver IC -isolated secondary power supply

PIN	Symbol	Function
X6 (1)	VCC2	High-side gate driver positive output supply connection
X6 (2)	GND2	High-side gate driver supply ground reference connection
X6 (3)	VEE2	High-side gate driver negative output supply connection

3.5 Test points

The test points used on the board are summarized in the table below.

Table 9 Test points

Test point	Symbol	Signal measured	Ground reference for test point
TP1	INP	High-side non-inverting input	GND1
TP2	INN	High-side inverting input	GND1
TP3	GND1	Input side ground	-
TP4	OUTL	High-side sinking output	GND2
TP5	OUTH	High-side sourcing output	GND2
TP6	GATE	High-side gate voltage	GND2
TP7	GND2	High-side ground reference	-
TP8	GND2	High-side ground reference	-
TP9	GND1	Input side ground	-
TP11	INP	Low-side non-inverting input	GND1
TP12	INN	Low-side inverting input	GND1
TP13	GND1	Input side ground	-
TP14	OUTL	Low-side sinking output	GND2
TP15	OUTH	Low-side sourcing output	GND2
TP16	GATE	Low-side gate voltage	GND2
TP17	GND2	Low-side ground reference	-
TP18	GND2	Low-side ground reference	-
TP19	GND1	Input side ground	-
