## Features

- Powerful Harvard-architecture processor
  - M8C CPU with a max speed of 24 MHz
- Operating Range: 1.71 V to 5.5 V
  - Standby Mode 1.1  $\mu$ A (Typ)
  - Deep Sleep 0.1  $\mu$ A (Typ)
- Operating Temperature range: -40 °C to +85 °C
- Flexible on-chip memory
  - 8 KB flash, 1 KB SRAM
  - 16 KB flash, 2 KB SRAM
  - 32 KB flash, 2 KB SRAM
  - Read while Write with EEPROM emulation
  - 50,000 flash erase/write cycles
  - In-system programming simplifies manufacturing process
- Four Clock Sources
  - Internal main oscillator (IMO): 6/12/24 MHz
  - Internal low-speed oscillator (ILO) at 32 kHz for watchdog and sleep timers
  - External 32 KHz Crystal Oscillator
  - External Clock Input
- Programmable pin configurations
  - Up to 36 general purpose dual mode GPIO (Analog inputs and Digital I/O supported)
  - High sink current of 25 mA per GPIO
    - Max sink current 120 mA for all GPIOs
  - Source Current
    - 5 mA on ports 0 and 1
    - 1 mA on ports 2,3 and 4
  - Configurable internal pull-up, high-Z and open drain modes
  - Selectable, regulated digital I/O on port 1
  - Configurable input threshold on port 1
- Versatile Analog functions
  - Internal Low-Dropout voltage regulator for high power supply rejection ratio (PSRR)
- Full-Speed USB
  - 12 Mbps USB 2.0 compliant
  - Eight unidirectional endpoints
  - One bidirectional endpoint
  - Dedicated 512 byte SRAM
  - No external crystal required
- Additional system resources
  - I2C Slave:
    - Selectable to 50 kHz, 100 kHz, or 400 kHz
  - Configurable up to 12 MHz SPI master and slave
  - Three 16-bit timers
  - Watchdog and sleep timers
  - Integrated supervisory circuit
  - 10-bit incremental analog-to-digital converter (ADC) with internal voltage reference
  - Two general-purpose Comparators
    - 3 Voltage References (0.8 V, 1 V, 1.2 V)
    - Any pin to either comparator inputs
    - Low-power operation at 10  $\mu$ A
  - One 8-bit IDAC with full scale range of 512  $\mu$ A
  - One 8-bit Software PWM
- Development Platform
  - PSoC Designer™ IDE
- GPIOs and Package options
  - 13 GPIOs - QFN 16
  - 28 GPIOs - QFN 32
  - 34 GPIOs - QFN 48
  - 36 GPIOs - QFN 48

## PSoC<sup>®</sup> Functional Overview

The PSoC family consists of on-chip controller devices, which are designed to replace multiple traditional microcontroller unit (MCU)-based components with one, low cost single-chip programmable component. A PSoC device includes configurable analog and digital blocks, and programmable interconnect. This architecture allows the user to create customized peripheral configurations, to match the requirements of each individual application. Additionally, a fast CPU, Flash program memory, SRAM data memory, and configurable I/O are included in a range of convenient pinouts.

The architecture for this device family, as shown in the [Logic Block Diagram on page 2](#), consists of three main areas:

- The Core
- Analog System
- System Resources (including a full-speed USB port).

A common, versatile bus allows connection between I/O and the analog system.

Depending on the PSoC package, up to 36 GPIO are included in the CY8C24x93 PSoC device. The GPIO provides access to the MCU and analog mux.

### PSoC Core

The PSoC Core is a powerful engine that supports a rich instruction set. It encompasses SRAM for data storage, an interrupt controller, sleep and watchdog timers, and IMO and ILO. The CPU core, called the M8C, is a powerful processor with speeds up to 24 MHz. The M8C is a 4-MIPS, 8-bit Harvard-architecture microprocessor.

### Analog system

The analog system is composed of an ADC, two comparators and an IDAC. It has an internal 0.8 V, 1 V or 1.2 V analog reference. All the pins can be configured to connect to the analog system.

#### ADC

The ADC in the CY8C24x93 device is an incremental analog-to-digital converter with a range of 8 to 10 bits supporting signed and unsigned data formats. The input to the ADC can be from any pin.

#### IDAC

The IDAC can provide current source up to 512  $\mu$ A to any GPIO pin. In the CY8C24x93 family of devices 4 ranges of current source can be implemented that can vary in 255 steps, and are connected to analog mux bus.

**Table 1. IDAC Ranges**

Range	Full Scale Range in $\mu$ A
1x	64
2x	128
4x	256
8x	512

#### Comparator

The CY8C24x93 family has two high-speed, low-power comparators. The comparators have three voltage references, 0.8 V, 1.0 V and 1.2 V. Comparator inputs can be connected from any pin through the analog mux bus. The comparator output can be read in firmware for processing or routed out via specific pins (P1\_0 or P1\_4).

The output of the two comparators can be combined with 2-input logic functions. The combinatorial output can be optionally combined with a latched value and routed to a pin output or to the interrupt controller. The input multiplexers and the comparator are controller through the CMP User Module.

#### Analog Multiplexer System

The Analog Mux Bus can connect to every GPIO pin and can be internally connected to the ADC, Comparators or the IDAC.

Other multiplexer applications include:

- Chip-wide mux that allows analog input from any I/O pin.
- Crosspoint connection between any I/O pin combinations.

### Additional System Resources

System resources provide additional capability, such as configurable USB and I2C slave, SPI master/slave communication interface, three 16-bit programmable timers, software 8-bit PWM, low voltage detect, power on reset, and various system resets supported by the M8C.

The merits of each system resource are listed here:

- The I<sup>2</sup>C slave/SPI master-slave module provides 50/100/400 kHz communication over two wires. SPI communication over three or four wires runs at speeds of 46.9 kHz to 3 MHz (lower for a slower system clock).
- Low-voltage detection (LVD) interrupts can signal the application of falling voltage levels, while the advanced power-on-reset (POR) circuit eliminates the need for a system supervisor.
- A register-controlled bypass mode allows the user to disable the LDO regulator.
- An 8-bit Software PWM is provided for applications like buzzer control or lighting control. A 16-bit Timer acts as the input clock to the PWM. The ISR increments a software counter (8-bit), checks for PWM compare condition and toggles a GPIO accordingly. PWM Output is available on all GPIOs.

## Getting Started

The quickest way to understand PSoC silicon is to read this datasheet and then use the PSoC Designer Integrated Development Environment (IDE). This datasheet is an overview of the PSoC integrated circuit and presents specific pin, register, and electrical specifications.

For in depth information, along with detailed programming details, see the [Technical Reference Manual](#) for the PSoC devices.

For up-to-date ordering, packaging, and electrical specification information, see the latest PSoC device datasheets on the web at [www.cypress.com/psoc](http://www.cypress.com/psoc).

## Silicon Errata

Errata documents known issues with silicon including errata trigger conditions, scope of impact, available workarounds and silicon revision applicability.

## Development Kits

[PSoC Development Kits](#) are available online from and through a growing number of regional and global distributors, which include Arrow, Avnet, Digi-Key, Farnell, Future Electronics, and Newark.

## Training

[Free PSoC technical training](#) (on demand, webinars, and workshops), which is available online via [www.cypress.com](http://www.cypress.com), covers a wide variety of topics and skill levels to assist you in your designs.

## CYPros Consultants

Certified PSoC consultants offer everything from technical assistance to completed PSoC designs. To contact or become a PSoC consultant go to the [CYPros Consultants](#) web site.

## Solutions Library

Visit our growing [library of solution focused designs](#). Here you can find various application designs that include firmware and hardware design files that enable you to complete your designs quickly.

## Technical Support

[Technical support](#) – including a searchable Knowledge Base articles and technical forums – is also available online. If you cannot find an answer to your question, call our Technical Support hotline at 1-800-541-4736.

## Development Tools

PSoC Designer™ is the revolutionary integrated design environment (IDE) that you can use to customize PSoC to meet your specific application requirements. PSoC Designer software accelerates system design and time to market. Develop your applications using a library of precharacterized analog and digital peripherals (called user modules) in a drag-and-drop design environment. Then, customize your design by leveraging the dynamically generated application programming interface (API) libraries of code. Finally, debug and test your designs with the integrated debug environment, including in-circuit emulation and standard software debug features. PSoC Designer includes:

- Application editor graphical user interface (GUI) for device and user module configuration and dynamic reconfiguration
- Extensive user module catalog
- Integrated source-code editor (C and assembly)
- Free C compiler with no size restrictions or time limits
- Built-in debugger
- In-circuit emulation
- Built-in support for communication interfaces:
  - Hardware and software I<sup>2</sup>C slaves and masters
  - Full-speed USB 2.0
  - Up to four full-duplex universal asynchronous receiver/transmitters (UARTs), SPI master and slave, and wireless

PSoC Designer supports the entire library of PSoC 1 devices and runs on Windows XP, Windows Vista, and Windows 7.

## PSoC Designer Software Subsystems

### *Design Entry*

In the chip-level view, choose a base device to work with. Then select different onboard analog and digital components that use the PSoC blocks, which are called user modules. Examples of user modules are analog-to-digital converters (ADCs), digital-to-analog converters (DACs), amplifiers, and filters. Configure the user modules for your chosen application and connect them to each other and to the proper pins. Then generate your project. This prepopulates your project with APIs and libraries that you can use to program your application.

The tool also supports easy development of multiple configurations and dynamic reconfiguration. Dynamic reconfiguration makes it possible to change configurations at run time. In essence, this lets you to use more than 100 percent of PSoC's resources for an application.

### *Code Generation Tools*

The code generation tools work seamlessly within the PSoC Designer interface and have been tested with a full range of debugging tools. You can develop your design in C, assembly, or a combination of the two.

**Assemblers.** The assemblers allow you to merge assembly code seamlessly with C code. Link libraries automatically use absolute addressing or are compiled in relative mode, and linked with other software modules to get absolute addressing.

**C Language Compilers.** C language compilers are available that support the PSoC family of devices. The products allow you to create complete C programs for the PSoC family devices. The optimizing C compilers provide all of the features of C, tailored to the PSoC architecture. They come complete with embedded libraries providing port and bus operations, standard keypad and display support, and extended math functionality.

### *Debugger*

PSoC Designer has a debug environment that provides hardware in-circuit emulation, allowing you to test the program in a physical system while providing an internal view of the PSoC device. Debugger commands allow you to read and program and read and write data memory, and read and write I/O registers. You can read and write CPU registers, set and clear breakpoints, and provide program run, halt, and step control. The debugger also lets you to create a trace buffer of registers and memory locations of interest.

### *Online Help System*

The online help system displays online, context-sensitive help. Designed for procedural and quick reference, each functional subsystem has its own context-sensitive help. This system also provides tutorials and links to FAQs and an Online Support Forum to aid the designer.

### *In-Circuit Emulator*

A low-cost, high-functionality in-circuit emulator (ICE) is available for development support. This hardware can program single devices.

The emulator consists of a base unit that connects to the PC using a USB port. The base unit is universal and operates with all PSoC devices. Emulation pods for each device family are available separately. The emulation pod takes the place of the PSoC device in the target board and performs full-speed (24 MHz) operation.

## Designing with PSoC Designer

The development process for the PSoC device differs from that of a traditional fixed-function microprocessor. The configurable analog and digital hardware blocks give the PSoC architecture a unique flexibility that pays dividends in managing specification change during development and lowering inventory costs. These configurable resources, called PSoC blocks, have the ability to implement a wide variety of user-selectable functions. The PSoC development process is:

10. Select [user modules](#).
11. Configure user modules.
12. Organize and connect.
13. Generate, verify, and debug.

### Select User Modules

PSoC Designer provides a library of prebuilt, pretested hardware peripheral components called “user modules”. User modules make selecting and implementing peripheral devices, both analog and digital, simple.

### Configure User Modules

Each user module that you select establishes the basic register settings that implement the selected function. They also provide parameters and properties that allow you to tailor their precise configuration to your particular application. For example, a PWM User Module configures one or more digital PSoC blocks, one for each eight bits of resolution. Using these parameters, you can establish the pulse width and duty cycle. Configure the parameters and properties to correspond to your chosen application. Enter values directly or by selecting values from drop-down menus. All of the user modules are documented in datasheets that may be viewed directly in PSoC Designer or on the Cypress website. These [user module datasheets](#) explain the

internal operation of the user module and provide performance specifications. Each datasheet describes the use of each user module parameter, and other information that you may need to successfully implement your design.

### Organize and Connect

Build signal chains at the chip level by interconnecting user modules to each other and the I/O pins. Perform the selection, configuration, and routing so that you have complete control over all on-chip resources.

### Generate, Verify, and Debug

When you are ready to test the hardware configuration or move on to developing code for the project, perform the “Generate Configuration Files” step. This causes PSoC Designer to generate source code that automatically configures the device to your specification and provides the software for the system. The generated code provides APIs with high-level functions to control and respond to hardware events at run time, and interrupt service routines that you can adapt as needed.

A complete code development environment lets you to develop and customize your applications in C, assembly language, or both.

The last step in the development process takes place inside PSoC Designer's Debugger (accessed by clicking the Connect icon). PSoC Designer downloads the HEX image to the ICE where it runs at full-speed. PSoC Designer debugging capabilities rival those of systems costing many times more. In addition to traditional single-step, run-to-breakpoint, and watch-variable features, the debug interface provides a large trace buffer. It lets you to define complex breakpoint events that include monitoring address and data bus values, memory locations, and external signals.

#### Notes

- No center pad.
- 13 GPIOs.
- On power-up, the SDA(P1[0]) drives a strong high for 256 sleep clock cycles and drives resistive low for the next 256 sleep clock cycles. The SCL(P1[1]) line drives resistive low for 512 sleep clock cycles and both the pins transition to high impedance state. On reset, after XRES de-asserts, the SDA and the SCL lines drive resistive low for 8 sleep clock cycles and transition to high impedance state. Hence, during power-up or reset event, P1[1] and P1[0] may disturb the I<sup>2</sup>C bus. Use alternate pins if you encounter issues.
- Alternate SPI clock.

**Notes**

10. 28 GPIOs.

11. The center pad (CP) on the QFN package must be connected to ground (V<sub>SS</sub>) for best mechanical, thermal, and electrical performance. If not connected to ground, it must be electrically floated and not connected to any other signal.

12. On power-up, the SDA(P1[0]) drives a strong high for 256 sleep clock cycles and drives resistive low for the next 256 sleep clock cycles. The SCL(P1[1]) line drives resistive low for 512 sleep clock cycles and both the pins transition to high impedance state. On reset, after XRES de-asserts, the SDA and the SCL lines drive resistive low for 8 sleep clock cycles and transition to high impedance state. Hence, during power-up or reset event, P1[1] and P1[0] may disturb the I2C bus. Use alternate pins if you encounter issues.

## Electrical Specifications (CY8C24193/493)

This section presents the DC and AC electrical specifications of the CY8C24193/493 PSoC devices. For the latest electrical specifications, confirm that you have the most recent datasheet by visiting the web at <http://www.cypress.com/psoc>.

## Absolute Maximum Ratings (CY8C24193/493)

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

**Table 8. Absolute Maximum Ratings**

Symbol	Description	Conditions	Min	Typ	Max	Units
T <sub>STG</sub>	Storage temperature	Higher storage temperatures reduce data retention time. Recommended Storage Temperature is +25 °C ± 25 °C. Extended duration storage temperatures above 85 °C degrades reliability.	-55	+25	+125	°C
V <sub>DD</sub>	Supply voltage relative to V <sub>SS</sub>	—	-0.5	—	+6.0	V
V <sub>IO</sub>	DC input voltage	—	V <sub>SS</sub> - 0.5	—	V <sub>DD</sub> + 0.5	V
V <sub>IOZ</sub>	DC voltage applied to tristate	—	V <sub>SS</sub> - 0.5	—	V <sub>DD</sub> + 0.5	V
I <sub>MIO</sub>	Maximum current into any port pin	—	-25	—	+50	mA
ESD	Electro static discharge voltage	Human body model ESD	2000	—	—	V
LU	Latch up current	In accordance with JESD78 standard	—	—	200	mA

## Operating Temperature (CY8C24193/493)

**Table 9. Operating Temperature**

Symbol	Description	Conditions	Min	Typ	Max	Units
T <sub>A</sub>	Ambient temperature	—	-40	—	+85	°C
T <sub>C</sub>	Commercial temperature range	—	0	—	70	°C
T <sub>J</sub>	Operational die temperature	The temperature rise from ambient to junction is package specific. See the <a href="#">Thermal Impedances on page 49</a> . The user must limit the power consumption to comply with this requirement.	-40	—	+100	°C

## DC Chip-Level Specifications (CY8C24193/493)

The following table lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

**Table 10. DC Chip-Level Specifications**

Symbol	Description	Conditions	Min	Typ	Max	Units
$V_{DD}$ [29, 43]	Supply voltage	See table <a href="#">DC POR and LVD Specifications (CY8C24093/293/393/693)</a> on page 37	1.71	–	5.50	V
$I_{DD24}$	Supply current, IMO = 24 MHz	Conditions are $V_{DD} \leq 3.0$ V, $T_A = 25$ °C, CPU = 24 MHz.	–	2.88	4.00	mA
$I_{DD12}$	Supply current, IMO = 12 MHz	Conditions are $V_{DD} \leq 3.0$ V, $T_A = 25$ °C, CPU = 12 MHz.	–	1.71	2.60	mA
$I_{DD6}$	Supply current, IMO = 6 MHz	Conditions are $V_{DD} \leq 3.0$ V, $T_A = 25$ °C, CPU = 6 MHz.	–	1.16	1.80	mA
$I_{SB0}$	Deep sleep current	$V_{DD} \leq 3.0$ V, $T_A = 25$ °C, I/O regulator turned off	–	0.10	1.1	μA
$I_{SB1}$	Standby current with POR, LVD and sleep timer	$V_{DD} \leq 3.0$ V, $T_A = 25$ °C, I/O regulator turned off	–	1.07	1.50	μA
$I_{SBI2C}$	Standby current with I <sup>2</sup> C enabled	Conditions are $V_{DD} = 3.3$ V, $T_A = 25$ °C and CPU = 24 MHz	–	1.64	–	μA

### Notes

29. When  $V_{DD}$  remains in the range from 1.71 V to 1.9 V for more than 50 μs, the slew rate when moving from the 1.71 V to 1.9 V range to greater than 2 V must be slower than 1 V/500 μs to avoid triggering POR. The only other restriction on slew rates for any other voltage range or transition is the  $SR_{POWER\_UP}$  parameter.
30. If powering down in standby sleep mode, to properly detect and recover from a  $V_{DD}$  brown out condition any of the following actions must be taken:
  - a. Bring the device out of sleep before powering down.
  - b. Assure that  $V_{DD}$  falls below 100 mV before powering back up.
  - c. Set the No Buzz bit in the OSC\_CR0 register to keep the voltage monitoring circuit powered during sleep.
  - d. Increase the buzz rate to assure that the falling edge of  $V_{DD}$  is captured. The rate is configured through the PSSDC bits in the SLP\_CFG register. For the referenced registers, refer to the [Technical Reference Manual](#). In deep sleep/standby sleep mode, additional low power voltage monitoring circuitry allows  $V_{DD}$  brown out conditions to be detected and resets the device when  $V_{DD}$  goes lower than 1.1 V at edge rates slower than 1 V/ms.

## DC GPIO Specifications (CY8C24193/493)

The following tables list guaranteed maximum and minimum specifications for the voltage and temperature ranges: 3.0 V to 5.5 V and  $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$ , 2.4 V to 3.0 V and  $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$ , or 1.71 V to 2.4 V and  $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$ , respectively. Typical parameters apply to 5 V and 3.3 V at  $25^{\circ}\text{C}$  and are for design guidance only.

**Figure 11. Definition for Timing for Fast/Standard Mode on the I<sup>2</sup>C Bus**

### Notes

40. To wake up from sleep using I2C hardware address match event, I2C interface needs 20 ns hold time on SDA line with respect to falling edge of SCL. See the CY8C24x93 Silicon Errata document for more details.
41. A Fast-Mode I<sup>2</sup>C-bus device can be used in a standard mode I<sup>2</sup>C-bus system, but the requirement  $t_{SU;DAT} \geq 250$  ns must then be met. This automatically be the case if the device does not stretch the LOW period of the SCL signal. If such device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line  $t_{rmax} + t_{SU;DAT} = 1000 + 250 = 1250$  ns (according to the Standard-Mode I<sup>2</sup>C-bus specification) before the SCL line is released.

### Absolute Maximum Ratings (CY8C24093/293/393/693)

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

**Table 33. Absolute Maximum Ratings**

Symbol	Description	Conditions	Min	Typ	Max	Units
T <sub>STG</sub>	Storage temperature	Higher storage temperatures reduce data retention time. Recommended Storage Temperature is +25 °C ± 25 °C. Extended duration storage temperatures above 85 °C degrades reliability.	-55	+25	+125	°C
V <sub>DD</sub>	Supply voltage relative to V <sub>SS</sub>	—	-0.5	—	+6.0	V
V <sub>IO</sub>	DC input voltage	—	V <sub>SS</sub> - 0.5	—	V <sub>DD</sub> + 0.5	V
V <sub>IOZ</sub> <sup>[42]</sup>	DC voltage applied to tristate	—	V <sub>SS</sub> - 0.5	—	V <sub>DD</sub> + 0.5	V
I <sub>MIO</sub>	Maximum current into any port pin	—	-25	—	+50	mA
ESD	Electrostatic discharge voltage	Human body model ESD	2000	—	—	V
LU	Latch-up current	In accordance with JEDEC78 standard	—	—	200	mA

### Operating Temperature (CY8C24093/293/393/693)

**Table 34. Operating Temperature**

Symbol	Description	Conditions	Min	Typ	Max	Units
T <sub>A</sub>	Ambient temperature	—	-40	—	+85	°C
T <sub>C</sub>	Commercial temperature range	—	0	—	70	°C
T <sub>J</sub>	Operational die temperature	The temperature rise from ambient to junction is package specific. Refer the <a href="#">Thermal Impedances on page 49</a> . The user must limit the power consumption to comply with this requirement.	-40	—	+100	°C

**Note**

42. Port1 pins are hot-swap capable with I/O configured in High-Z mode, and pin input voltage above V<sub>DD</sub>.

## DC Chip-Level Specifications (CY8C24093/293/393/693)

The following table lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

**Table 35. DC Chip-Level Specifications**

Symbol	Description	Conditions	Min	Typ	Max	Units
$V_{DD}$ [43, 44, 45]	Supply voltage	No USB activity. Refer the table <a href="#">DC POR and LVD Specifications (CY8C24093/293/393/693)</a> on page 37	1.71	–	5.50	V
$V_{DDUSB}$ [43, 44, 45]	Operating voltage	USB activity, USB regulator enabled	4.35	–	5.25	V
		USB activity, USB regulator bypassed	3.15	3.3	3.60	V
$I_{DD24}$	Supply current, IMO = 24 MHz	Conditions are $V_{DD} \leq 3.0$ V, $T_A = 25$ °C, CPU = 24 MHz. No I/O sourcing current	–	–	4.00	mA
$I_{DD12}$	Supply current, IMO = 12 MHz	Conditions are $V_{DD} \leq 3.0$ V, $T_A = 25$ °C, CPU = 12 MHz. No I/O sourcing current	–	–	2.60	mA
$I_{DD6}$	Supply current, IMO = 6 MHz	Conditions are $V_{DD} \leq 3.0$ V, $T_A = 25$ °C, CPU = 6 MHz. No I/O sourcing current	–	–	1.80	mA
$I_{SB0}$	Deep sleep current	$V_{DD} \leq 3.0$ V, $T_A = 25$ °C, I/O regulator turned off	–	0.10	1.05	μA
$I_{SB1}$	Standby current with POR, LVD and sleep timer	$V_{DD} \leq 3.0$ V, $T_A = 25$ °C, I/O regulator turned off	–	1.07	1.50	μA
$I_{SB12C}$	Standby current with I <sup>2</sup> C enabled	Conditions are $V_{DD} = 3.3$ V, $T_A = 25$ °C and CPU = 24 MHz	–	1.64	–	μA

### Notes

43. When  $V_{DD}$  remains in the range from 1.71 V to 1.9 V for more than 50 μs, the slew rate when moving from the 1.71 V to 1.9 V range to greater than 2 V must be slower than 1 V/500 μs to avoid triggering POR. The only other restriction on slew rates for any other voltage range or transition is the  $SR_{POWER\_UP}$  parameter.
44. If powering down in standby sleep mode, to properly detect and recover from a  $V_{DD}$  brown out condition any of the following actions must be taken:
  - a. Bring the device out of sleep before powering down.
  - b. Assure that  $V_{DD}$  falls below 100 mV before powering back up.
  - c. Set the No Buzz bit in the OSC\_CR0 register to keep the voltage monitoring circuit powered during sleep.
  - d. Increase the buzz rate to assure that the falling edge of  $V_{DD}$  is captured. The rate is configured through the PSSDC bits in the SLP\_CFG register.
 For the referenced registers, refer to the CY8C24x93 *Technical Reference Manual*. In deep sleep mode, additional low power voltage monitoring circuitry allows  $V_{DD}$  brown out conditions to be detected for edge rates slower than 1V/ms.
45. For USB mode, the  $V_{DD}$  supply for bus-powered application should be limited to 4.35 V–5.35 V. For self-powered application,  $V_{DD}$  should be 3.15 V–3.45 V.

**DC GPIO Specifications (CY8C24093/293/393/693)**

The following tables list guaranteed maximum and minimum specifications for the voltage and temperature ranges: 3.0 V to 5.5 V and  $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$ , 2.4 V to 3.0 V and  $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$ , or 1.71 V to 2.4 V and  $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$ , respectively. Typical parameters apply to 5 V and 3.3 V at 25 °C and are for design guidance only.

**Figure 19. Definition for Timing for Fast/Standard Mode on the I<sup>2</sup>C Bus**

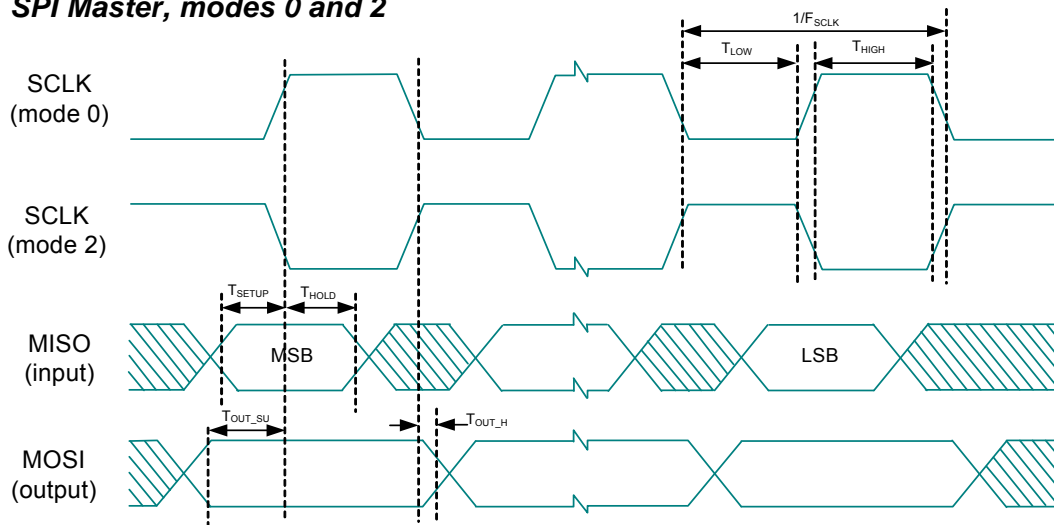

### Note

53. A Fast-Mode I<sup>2</sup>C-bus device can be used in a standard mode I<sup>2</sup>C-bus system, but the requirement t<sub>SU;DAT</sub> ≥ 250 ns must then be met. This automatically be the case if the device does not stretch the LOW period of the SCL signal. If such device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line t<sub>rmax</sub> + t<sub>SU;DAT</sub> = 1000 + 250 = 1250 ns (according to the Standard-Mode I<sup>2</sup>C-bus specification) before the SCL line is released.

## Packaging Information

This section illustrates the packaging specifications for the CY8C24X93 PSoC device, along with the thermal impedances for each package.

**Important Note** Emulation tools may require a larger area on the target PCB than the chip's footprint. For a detailed description of the emulation tools' dimensions, refer to the document titled *PSoC Emulator Pod Dimensions* at <http://www.cypress.com/design/MR10161>.

48-pin QFN	3.3 pF

## Solder Reflow Specifications

Table 61 shows the solder reflow temperature limits that must not be exceeded.

**Table 61. Solder Reflow Specifications**

Package	Maximum Peak Temperature ( $T_C$ )	Maximum Time above $T_C - 5$ °C
16-pin QFN	260 °C	30 seconds
32-pin QFN	260 °C	30 seconds
48-pin QFN (6 × 6 × 0.6 mm)	260 °C	30 seconds
48-pin QFN (7 × 7 × 1.0 mm)	260 °C	30 seconds

### Notes

54.  $T_J = T_A + \text{Power} \times \theta_{JA}$ .

55. To achieve the thermal impedance specified for the QFN package, the center thermal pad must be soldered to the PCB ground plane.

## Development Tool Selection

### Software

#### *PSoC Designer™*

At the core of the PSoC development software suite is PSoC Designer. Utilized by thousands of PSoC developers, this robust software has been facilitating PSoC designs for over half a decade. PSoC Designer is available free of charge at <http://www.cypress.com>.

#### *PSoC Programmer*

Flexible enough to be used on the bench in development, yet suitable for factory programming, PSoC Programmer works either as a standalone programming application or it can operate directly from PSoC Designer. PSoC Programmer software is compatible with both PSoC ICE-Cube In-Circuit Emulator and PSoC MiniProg. PSoC Programmer is available free of charge at <http://www.cypress.com>.

### Development Kits

All development kits are sold at the Cypress Online Store.

#### *CY3215-DK Basic Development Kit*

The CY3215-DK is for prototyping and development with PSoC Designer. This kit supports in-circuit emulation and the software interface enables users to run, halt, and single step the processor and view the content of specific memory locations.

PSoC Designer supports the advance emulation features also. The kit includes:

- PSoC Designer Software CD
- ICE-Cube In-Circuit Emulator
- ICE Flex-Pod for CY8C29X66A Family
- Cat-5 Adapter
- Mini-Eval Programming Board
- 110 ~ 240 V Power Supply, Euro-Plug Adapter
- iMAGEcraft C Compiler (Registration Required)
- ISSP Cable
- USB 2.0 Cable and Blue Cat-5 Cable
- 2 CY8C29466A-24PXI 28-PDIP Chip Samples

### Evaluation Tools

All evaluation tools are sold at the Cypress Online Store. For more information on PSoC 1 kits, visit the link <http://www.cypress.com/?rID=63754>

### Device Programmers

All device programmers are purchased from the Cypress Online Store.

## Numeric Naming

Hexadecimal numbers are represented with all letters in uppercase with an appended lowercase 'h' (for example, '14h' or '3Ah'). Hexadecimal numbers may also be represented by a '0x' prefix, the C coding convention. Binary numbers have an appended lowercase 'b' (for example, '01010100b' or '01000011b'). Numbers not indicated by an 'h', 'b', or 0x are decimal.

## Glossary

Crosspoint connection	Connection between any GPIO combination via analog multiplexer bus.
Differential non-linearity	Ideally, any two adjacent digital codes correspond to output analog voltages that are exactly one LSB apart. Differential non-linearity is a measure of the worst case deviation from the ideal 1 LSB step.
Hold time	Hold time is the time following a clock event during which the data input to a latch or flip-flop must remain stable in order to guarantee that the latched data is correct.
I <sup>2</sup> C	It is a serial multi-master bus used to connect low speed peripherals to MCU.
Integral nonlinearity	It is a term describing the maximum deviation between the ideal output of a DAC/ADC and the actual output level.
Latch-up current	Current at which the latch-up test is conducted according to JESD78 standard (at 125 degree Celsius)
Power supply rejection ratio (PSRR)	The PSRR is defined as the ratio of the change in supply voltage to the corresponding change in output voltage of the device.
Setup time	Period required to prepare a device, machine, process, or system for it to be ready to function.
SPI	Serial peripheral interface is a synchronous serial data link standard.

## Appendix A: Silicon Errata for the CY8C24093/293/393/693 Family

This section describes the errata for the CY8C24093/293/393/693 family. Details include errata trigger conditions, scope of impact, available workarounds, and silicon revision applicability.

### CY8C24093/293/393/693 Qualification Status

Product Status: Production released.

### CY8C24093/293/393/693 Errata Summary

The following Errata items apply to the CY8C24093/293/393/693 datasheet 001-86894.

#### 1. DoubleTimer0 ISR

##### ■ Problem Definition

When programmable timer 0 is used in “one-shot” mode by setting bit 1 of register 0,B0h (PT0\_CFG), and the timer interrupt is used to wake the device from sleep, the interrupt service routine (ISR) may be executed twice.

##### ■ Parameters Affected

No datasheet parameters are affected.

##### ■ Trigger Condition(S)

Triggered by enabling one-shot mode in the timer, and using the timer to wake from sleep mode.

##### ■ Scope of Impact

The ISR may be executed twice.

##### ■ Workaround

In the ISR, firmware should clear the one-shot bit with a statement such as “and reg[B0h], FDh”

##### ■ Fix Status

Will not be fixed

##### ■ Changes

None

## 2. Missed GPIO Interrupt

### ■ Problem Definition

When in sleep mode, if a GPIO interrupt happens simultaneously with a Timer0 or Sleep Timer interrupt, the GPIO interrupt may be missed, and the corresponding GPIO ISR not run.

### ■ Parameters Affected

No datasheet parameters are affected.

### ■ Trigger Condition(S)

Triggered by enabling sleep mode, then having GPIO interrupt occur simultaneously with a Timer 0 or Sleep Timer interrupt.

### ■ Scope of Impact

The GPIO interrupt service routine will not be run.

### ■ Workaround

The system should be architected such that a missed GPIO interrupt may be detected. For example, if a GPIO is used to wake the system to perform some function, the system should detect if the function is not performed, and re-issue the GPIO interrupt.

Alternatively, if a GPIO interrupt is required to wake the system, then firmware should disable the Sleep Timer and Timer0.

Alternatively, the ISR's for Sleep Timer and Timer0 should manually check the state of the GPIO to determine if the host system has attempted to generate a GPIO interrupt.

### ■ Fix Status

Will not be fixed

### ■ Changes

None

## 3. Missed Interrupt During Transition to Sleep

### ■ Problem Definition

If an interrupt is posted a short time (within 2.5 CPU cycles) before firmware commands the device to sleep, the interrupt will be missed.

### ■ Parameters Affected

No datasheet parameters are affected.

### ■ Trigger Condition(S)

Triggered by enabling sleep mode just prior to an interrupt.

### ■ Scope of Impact

The relevant interrupt service routine will not be run.

### ■ Workaround

None.

### ■ Fix Status

Will not be fixed

### ■ Changes

None

#### **4. Wakeup from sleep with analog interrupt**

##### **■ Problem Definition**

Device wakes up from sleep when an analog interrupt is trigger

##### **■ Parameters Affected**

No datasheet parameters are affected.

##### **■ Trigger Condition(S)**

Triggered by enabling analog interrupt during sleep mode when device operating temperature is 50 °C or above

##### **■ Scope of Impact**

Device unexpectedly wakes up from sleep

##### **■ Workaround**

Disable the analog interrupt before entering sleep and turn it back on upon wake-up.

##### **■ Fix Status**

Will not be fixed

##### **■ Changes**

None

## 5. Wake-up from Sleep with Hardware I2C Address match on Pins P1[0], P1[1]

### ■ Problem Definition

I2C interface needs 20 ns hold time on SDA line with respect to falling edge of SCL, to wake-up from sleep using I2C hardware address match event.

### ■ Parameters Affected

$t_{HD;DAT}$  increased to 20 ns from 0 ns

### ■ Trigger Condition(S)

This is an issue only when all these three conditions are met:

- 1) P1.0 and P1.1 are used as I2C pins,
- 2) Wakeup from sleep with hardware address match feature is enabled, and
- 3) I2C master does not provide 20 ns hold time on SDA with respect to falling edge of SCL.

### ■ Scope of Impact

These trigger conditions cause the device to never wake-up from sleep based on I2C address match event

### ■ Workaround

For a design that meets all of the trigger conditions, the following suggested circuit has to be implemented as a work-around. The R and C values proposed are 100 ohm and 200 pF respectively.

### ■ Fix Status

Will not be fixed

### ■ Changes

None

## 6. I2C Port Pin Pull-up Supply Voltage

### ■ Problem Definition

Pull-up resistor on I2C interface cannot be connected to a supply voltage that is greater than 0.7 V of CY8C24093/293/393/693  $V_{DD}$ .

### ■ Parameters Affected

None.

### ■ Trigger Condition(S)

This problem occurs only when the I2C master is powered at a higher voltage than CY8C24093/293/393/693.

### ■ Scope of Impact

This trigger condition will corrupt the I2C communication between the I2C host and the CY8C24093/293/393/693 controller.

### ■ Workaround

I2C master cannot be powered at a supply voltage that is greater than 0.7 V compared to CY8C24093/293/393/693 supply voltage.

### ■ Fix Status

Will not be fixed

### ■ Changes

None

## 7. Port1 Pin Voltage

### ■ Problem Definition

Pull-up resistor on port1 pins cannot be connected to a voltage that is greater than 0.7 V higher than CY8C24093/293/393/693  $V_{DD}$ .

### ■ Parameters Affected

None.

### ■ Trigger Condition(S)

This problem occurs only when port1 pins are at voltage 0.7 V higher than  $V_{DD}$  of CY8C24093/293/393/693.

### ■ Scope of Impact

This trigger condition will not allow CY8C24093/293/393/693 to drive the output signal on port1 pins, input path is unaffected by this condition.

### ■ Workaround

Port1 should not be connected to a higher voltage than  $V_{DD}$  of CY8C24093/293/393/693.

### ■ Fix Status

Will not be fixed

### ■ Changes

None

## Appendix B: Silicon Errata for the PSoC<sup>®</sup> CY8C24193/493 Families

### CY8C24193/493 Qualification Status

Product Status: Production released.

### CY8C24193/493 Errata Summary

The following Errata items apply to the CY8C24193/493 datasheet 001-86894.

#### 1. Wakeup from sleep may intermittently fail

##### ■ Problem Definition

When the device is put to sleep in Standby or I2C\_USB Mode and the bandgap circuit is refreshed less frequently than every 8 ms (default), the device may not come out of sleep when a sleep-ending input is received.

##### ■ Parameters Affected

None

##### ■ Trigger Condition(S)

By default, when the device is in the Standby or I2C\_USB sleep modes, the bandgap circuit is powered-up approximately every 8 ms to facilitate detection of POR or LVD events. This interval can be lengthened or the periodic power-up disabled to reduce sleep current by setting the ALT\_BUZZ bits in the SLP\_CFG2 register or the Disable Buzz bit in the OSC\_CR0 register respectively. If the bandgap circuit refresh interval is set longer than the default 8 ms, the device may fail to wakeup from sleep and enter a locked up state that can only be recovered by Watchdog Reset, XRES, or POR.

##### ■ Scope of Impact

The trigger conditions outlined above may cause the device to never wakeup.

##### ■ Workaround

Prior to entering Standby or I2C\_USB sleep modes, do not lengthen or disable the bandgap refresh interval by manipulating the ALT\_BUZZ bits in the SLP\_CFG2 register or the Disable Buzz bit in the OSC\_CR0 register respectively.

##### ■ Fix Status

This issue will not be corrected in the next silicon revision.

## 2. I<sup>2</sup>C Errors

### ■ Problem Definition

The I<sup>2</sup>C block exhibits occasional data and bus corruption errors when the I<sup>2</sup>C master initiates transactions while the device is transitioning in to or out of sleep mode.

### ■ Parameters Affected

Affects reliability of I<sup>2</sup>C communication to device, and between I<sup>2</sup>C master and third party I<sup>2</sup>C slaves.

### ■ Trigger Condition(S)

Triggered by transitions into and out of the device's sleep mode.

### ■ Scope of Impact

Data errors result in incorrect data reported to the I<sup>2</sup>C master, or incorrect data received from the master by the device. Bus corruption errors can corrupt data in transactions between the I<sup>2</sup>C master and third party I<sup>2</sup>C slaves.

### ■ Workaround

Firmware workarounds are available in firmware. Generally the workaround consists of disconnecting the I<sup>2</sup>C block from the bus prior to going to sleep modes. I<sup>2</sup>C transactions during sleep are supported by a protocol in which the master wakes the device prior to the I<sup>2</sup>C transaction.

### ■ Fix Status

To be fixed in future silicon.

### ■ Changes

None

## 3. DoubleTimer0 ISR

### ■ Problem Definition

When programmable timer 0 is used in "one-shot" mode by setting bit 1 of register 0.B0h (PT0\_CFG), and the timer interrupt is used to wake the device from sleep, the interrupt service routine (ISR) may be executed twice.

### ■ Parameters Affected

No datasheet parameters are affected.

### ■ Trigger Condition(S)

Triggered by enabling one-shot mode in the timer, and using the timer to wake from sleep mode.

### ■ Scope of Impact

The ISR may be executed twice.

### ■ Workaround

In the ISR, firmware should clear the one-shot bit with a statement such as `"and reg[B0h], FDh"`

### ■ Fix Status

Will not be fixed

### ■ Changes

None

#### 4. Missed GPIO Interrupt

##### ■ Problem Definition

When in sleep mode, if a GPIO interrupt happens simultaneously with a Timer0 or Sleep Timer interrupt, the GPIO interrupt may be missed, and the corresponding GPIO ISR not run.

##### ■ Parameters Affected

No datasheet parameters are affected.

##### ■ Trigger Condition(S)

Triggered by enabling sleep mode, then having GPIO interrupt occur simultaneously with a Timer 0 or Sleep Timer interrupt.

##### ■ Scope of Impact

The GPIO interrupt service routine will not be run.

##### ■ Workaround

The system should be architected such that a missed GPIO interrupt may be detected. For example, if a GPIO is used to wake the system to perform some function, the system should detect if the function is not performed, and re-issue the GPIO interrupt.

Alternatively, if a GPIO interrupt is required to wake the system, then firmware should disable the Sleep Timer and Timer0.

Alternatively, the ISR's for Sleep Timer and Timer0 should manually check the state of the GPIO to determine if the host system has attempted to generate a GPIO interrupt.

##### ■ Fix Status

Will not be fixed

##### ■ Changes

None

#### 5. Missed Interrupt During Transition to Sleep

##### ■ Problem Definition

If an interrupt is posted a short time (within 2.5 CPU cycles) before firmware commands the device to sleep, the interrupt will be missed.

##### ■ Parameters Affected

No datasheet parameters are affected.

##### ■ Trigger Condition(S)

Triggered by enabling sleep mode just prior to an interrupt.

##### ■ Scope of Impact

The relevant interrupt service routine will not be run.

##### ■ Workaround

None.

##### ■ Fix Status

Will not be fixed

##### ■ Changes

None

## 6. Wakeup from sleep with analog interrupt

### ■ Problem Definition

Device wakes up from sleep when an analog interrupt is trigger

### ■ Parameters Affected

No datasheet parameters are affected.

### ■ Trigger Condition(S)

Triggered by enabling analog interrupt during sleep mode when device operating temperature is 50 °C or above

### ■ Scope of Impact

Device unexpectedly wakes up from sleep

### ■ Workaround

Disable the analog interrupt before entering sleep and turn it back on upon wakeup.

### ■ Fix Status

Will not be fixed

### ■ Changes

None
