Please note that GaN Systems is an Infineon Technologies Company

The document following this cover page is marked as “GaN Systems” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

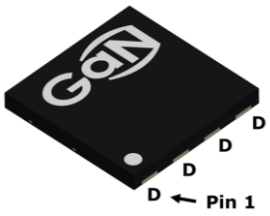
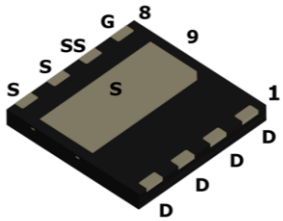
GS-065-014-6-LR
700 V E-mode GaN transistor
Datasheet

Features

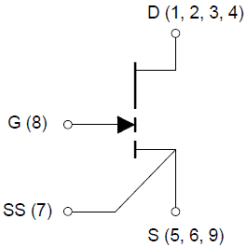
- 700 V enhancement mode power transistor
- 850 V transient drain-to-source voltage
- Bottom-cooled, small 8x8 mm PDFN package
- $R_{DS(on)}$ = 95 mΩ
- $I_{DSmax,DC}$ = 15.2 A / $I_{DSmax,Pulse}$ = 25 A
- Ultra-low FOM
- Simple gate drive requirements (0 V to 6 V)
- Transient tolerant gate drive (-20 V / +10 V)
- High switching frequency (> 1 MHz)
- Fast and controllable fall and rise times
- Reverse conduction capability
- Zero reverse recovery loss
- Source Sense (SS) pin for optimized gate drive
- RoHS 3 (6+4) compliant



Top View



Bottom View



Applications

- Power Adapters
- LED Lighting Drivers
- Fast Battery Charging
- Power Factor Correction
- Appliance Motor Drives
- Wireless Power Transfer
- Industrial Power Supplies

Description

The GS-065-014-6-LR is an enhancement mode GaN-on-Silicon power transistor. The properties of GaN allow for high current, high voltage breakdown and high switching frequency. GaN Systems innovates with industry leading advancements such as patented **Island Technology®** cell layout which realizes high-current die and high yield. The GS-065-014-6-LR is a bottom-side cooled transistor that offers very low junction-to-case thermal resistance for demanding high power applications. These features combine to provide very high efficiency power switching.

Absolute Maximum Ratings[1] (T_{case} = 25 °C except as noted)

Parameter	Symbol	Value	Unit
Operating Junction Temperature	T_J	-55 to +150	°C
Storage Temperature Range	T_S	-55 to +150	°C
Drain-to-Source Voltage	V_{DS}	700	V
Drain-to-Source Voltage – transient [2]	$V_{DS(transient)}$	850	V
Gate-to-Source Voltage	V_{GS}	-10 to +7	V
Gate-to-Source Voltage – transient [2]	$V_{GS(transient)}$	-20 to +10	V
Continuous Drain Current (T_{case} = 25 °C)	I_{DS}	15.2	A
Continuous Drain Current (T_{case} = 100 °C)	I_{DS}	10.1	A
Pulse Drain Current (Pulse width 10 µs, V_{GS} = 6 V) [3]	$I_{DS\ Pulse}$	25	A

(1) Stresses beyond max ratings may cause permanent damage to the device. For optimum lifetime and reliability, Infineon recommends operating conditions that do not continuously exceed 80% of the maximum ratings stated in this datasheet (unless otherwise explicitly stated). For further information, contact your local Infineon sales office.

(2) For ≤100 µs

(3) Defined by product design and characterization. Value is not tested to full current in production.

Thermal Characteristics (Typical values unless otherwise noted)

Parameter	Symbol	Value	Units
Thermal Resistance (junction-to-case) – bottom side	$R_{\Theta JC}$	1.2	°C /W
Thermal Resistance (junction-to-ambient) [4]	$R_{\Theta JA}$	34	°C /W
Maximum Soldering Temperature (MSL3 rated)	T_{SOLD}	260	°C

(4) Device mounted on 1.6 mm PCB thickness FR4, 4-layer PCB with 2 oz. copper on each layer. The recommendation for thermal vias under the thermal pad is 0.3 mm diameter (12 mil) with 0.635 mm pitch (25 mil). The copper layers under the thermal pad and drain pad are 25 x 25 mm2 each. The PCB is mounted in horizontal position without air stream cooling.

Ordering Information

Electrical Characteristics (Typical values at T_J = 25 °C, V_{GS} = 6 V unless otherwise noted)

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
Drain-to-Source Blocking Voltage	$V_{(BL)DSS}$	700			V	V_{GS} = 0 V, I_{DSS} ≤ 22 µA
Drain-to-Source On Resistance	$R_{DS(on)}$		95	138	mΩ	V_{GS} = 6 V, T_J = 25 °C I_{DS} = 4 A
Drain-to-Source On Resistance	$R_{DS(on)}$		245		mΩ	V_{GS} = 6 V, T_J = 150 °C I_{DS} = 4 A
Gate-to-Source Threshold	$V_{GS(th)}$	1.1	1.7	2.6	V	V_{DS} = V_{GS}, I_{DS} = 3 mA
Gate-to-Source Current	I_{GS}		72		µA	V_{GS} = 6 V, V_{DS} = 0 V
Gate Plateau Voltage	V_{plat}		3.5		V	V_{DS} = 400 V, I_{DS} = 14 A
Drain-to-Source Leakage Current	I_{DSS}		1	22	µA	V_{DS} = 700 V, V_{GS} = 0 V T_J = 25 °C
Drain-to-Source Leakage Current	I_{DSS}		42		µA	V_{DS} = 700 V, V_{GS} = 0 V T_J = 150 °C
Internal Gate Resistance	R_G		1		Ω	f = 5 MHz
Input Capacitance	C_{ISS}		85		pF	V_{DS} = 400 V V_{GS} = 0 V f = 100 kHz
Output Capacitance	C_{OSS}		25		pF	
Reverse Transfer Capacitance	C_{RSS}		0.9		pF	
Effective Output Capacitance, Energy Related (5)	$C_{O(ER)}$		39		pF	V_{GS} = 0 V V_{DS} = 0 to 400 V
Effective Output Capacitance, Time Related (6)	$C_{O(TR)}$		62		pF	
Total Gate Charge	Q_G		2.7		nC	V_{GS} = 0 to 6 V V_{DS} = 400 V
Gate-to-Source Charge	Q_{GS}		0.6		nC	
Gate-to-Drain Charge	Q_{GD}		1		nC	
Output Charge	Q_{OSS}		25		nC	V_{GS} = 0 V, V_{DS} = 400 V
Reverse Recovery Charge	Q_{RR}		0		nC	

(5) $C_{O(ER)}$ is the fixed capacitance that would give the same stored energy as C_{OSS} while V_{DS} is rising from 0 V to the stated V_{DS}.

(6) $C_{O(TR)}$ is the fixed capacitance that would give the same charging time as C_{OSS} while V_{DS} is rising from 0 V to the stated V_{DS}.

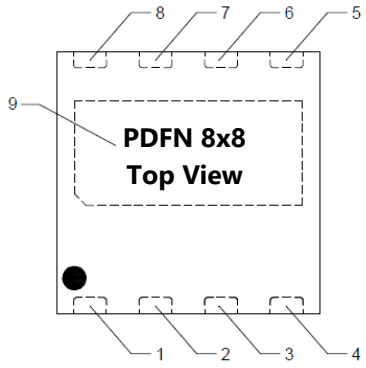
Application Information

Pin Configurations

Note that the Pin 1 (Drain) is located at the bottom left corner from the top view indicated by the pin 1 marking.

The package features a dedicated Source Sense (SS) pin (7) which enhances the switching performance by eliminating the common source inductance. Source Sensing (or Kelvin Source) can be implemented by using pin 7 (SS) as the gate driver signal ground return.

The thermal pad / Source (Pin 9) is designed to provide a low thermal resistance path to the external main circuit board for optimum heat dissipation. It is internally connected to the die substrate and the Source, which can be used for both thermal and electrical conduction. The Source pin 5 & 6 can also be used together to enhance thermal conductivity, but it is **NOT** recommended to carry main current with only Pin 5 & 6.



Pin	Name	Description
1-4	D	Drain
5-6	S	Source
7	SS	Source Sense pin. Used for gate driver kelvin source connection
8	G	Gate
9	S / TP	Source and thermal pad. Recommend to join pin 5, 6 and 9 together with large copper polygon for optimum thermal dissipation and source connection

Gate Drive

The recommended gate drive voltage range, V_{GS}, is 0 V to + 6 V for optimal $R_{DS(on)}$ performance. Also, the repetitive gate to source voltage, maximum rating, $V_{GS(AC)}$, is +7 V to -10 V. The gate can survive non-repetitive transients up to +10 V and – 20 V for pulses up to 100 µs. These specifications allow designers to easily use 6.0 V or 6.5 V gate drive settings. At 6 V gate drive voltage, the enhancement mode high electron mobility transistor (E-HEMT) is fully enhanced and reaches its optimal efficiency point. A 5 V gate drive can be used but may result in lower operating efficiency. Inherently, GaN Systems E-HEMT do not require negative gate bias to turn off. Negative gate bias, typically V_{GS} = -3 V, ensures safe operation against the voltage spike on the gate, however it may increase reverse conduction losses if not driven properly. For more details, please refer to the gate driver application note "Gate Driver Circuit Design with GaN E-HEMTs" at www.gansystems.com

Similar to a silicon MOSFET, an external gate resistor can be used to control the switching speed and slew rate. Adjusting the resistor to achieve the desired slew rate may be needed. Lower turn-off gate resistance, $R_{G(OFF)}$ is recommended for better immunity to cross conduction. Please see the gate driver application note for more details.

© 2009-2024 GaN Systems Inc.

A standard MOSFET driver can be used provided that it supports 6 V for gate drive and the UVLO is suitable for 6 V operation. Gate drivers with low impedance and high peak current are recommended for fast switching speed. GaN Systems E-HEMTs have significantly lower Q_G when compared to equally sized $R_{DS(on)}$ MOSFETs, so high speed can be reached with smaller and lower cost gate drivers.

Some non-isolated half bridge MOSFET drivers are not compatible with 6 V gate drive due to their high under-voltage lockout threshold. Also, a simple bootstrap method for high side gate drive may not be able to provide tight tolerance on the gate voltage. Therefore, special care should be taken when you select and use the half bridge drivers. Please see the gate driver application note for more details.

Parallel Operation

Design wide tracks or polygons on the PCB to distribute the gate drive signals to multiple devices. Keep the drive loop length to each device as short and equal length as possible.

GaN enhancement mode HEMTs have a positive temperature coefficient on-state resistance which helps to balance the current. However, special care should be taken in the driver circuit and PCB layout since the device switches at very fast speed. It is recommended to have a symmetric PCB layout and equal gate drive loop length (star connection if possible) on all parallel devices to ensure balanced dynamic current sharing. Adding a small gate resistor (1-2 Ω) on each gate is strongly recommended to minimize the gate parasitic oscillation.

Source Sensing

The package features a dedicated source sense pin which enhances the switching performance by eliminating the common source inductance if a dedicated gate drive signal kelvin connection is created. This can be achieved by connecting the gate drive signal from the driver to the gate pad and returning from the source sense pad to the driver ground reference.

Thermal

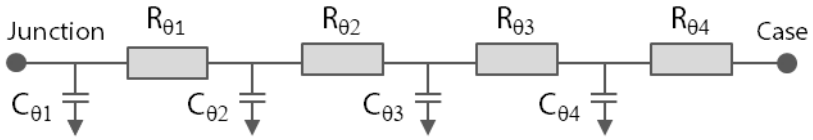
The substrate is internally connected to the source/thermal pad on the bottom-side of the package. The transistor is designed to be cooled using the printed circuit board. The Drain pad is not as thermally conductive as the thermal pad. However, adding more copper under this pad will improve thermal performance by reducing the package temperature.

Thermal Modeling

RC thermal models are available to support detailed thermal simulation using SPICE. The thermal models are created using the Cauer model, an RC network model that reflects the real physical property and packaging structure of our devices. This approach allows our customers to extend the thermal model to their system by adding extra R_θ and C_θ to simulate the Thermal Interface Material (TIM) or Heatsink.

© 2009-2024 GaN Systems Inc.

RC thermal model:



RC breakdown of $R_{\Theta JC}$

R_θ (°C/W)	C_θ (W·s/°C)
$R_{\theta 1}$ = 0.04	$C_{\theta 1}$ = 5.94E-05
$R_{\theta 2}$ = 0.15	$C_{\theta 2}$ = 2.13E-04
$R_{\theta 3}$ = 0.58	$C_{\theta 3}$ = 7.81E-04
$R_{\theta 4}$ = 0.41	$C_{\theta 4}$ = 5.91E-03

For more detail, please refer to Application Note entitled "Modeling Thermal Behavior of GaN Systems' GaN*PX*® Using RC Thermal SPICE Models" available at www.gansystems.com

Reverse Conduction

GaN Systems enhancement mode HEMTs do not have an intrinsic body diode and there is zero reverse recovery charge. The devices are naturally capable of reverse conduction and exhibit different characteristics depending on the gate voltage. Anti-parallel diodes are not required for GaN Systems transistors as is the case for IGBTs to achieve reverse conduction performance.

On-state condition (V_{GS} = +6 V): The reverse conduction characteristics of a GaN Systems enhancement mode HEMT in the on-state is similar to that of a silicon MOSFET, with the I-V curve symmetrical about the origin and it exhibits a channel resistance, $R_{DS(on)}$, similar to forward conduction operation.

Off-state condition ($V_{GS} \leq 0$ V): The reverse characteristics in the off-state are different from silicon MOSFETs as the GaN device has no body diode. In the reverse direction, the device starts to conduct when the gate voltage, with respect to the drain, V_{GD}, exceeds the gate threshold voltage. At this point the device exhibits a channel resistance. This condition can be modeled as a "body diode" with slightly higher V_F and no reverse recovery charge.

If negative gate voltage is used in the off-state, the source-drain voltage must be higher than $V_{GS(th)}+V_{GS(off)}$ in order to turn the device on. Therefore, a negative gate voltage will add to the reverse voltage drop "V_F" and hence increase the reverse conduction loss.

Blocking Voltage

The blocking voltage rating, $V_{(BL)DSS}$, is defined by the drain leakage current. The hard (unrecoverable) breakdown voltage is approximately 30 % higher than the rated $V_{(BL)DSS}$. As a general practice, the maximum drain voltage should be de-rated in a similar manner as IGBTs or silicon MOSFETs. All GaN E-HEMTs do not

© 2009-2024 GaN Systems Inc.

avalanche and thus do not have an avalanche breakdown rating. The maximum drain-to-source rating is 700 V and does not change with negative gate voltage. GaN Systems tests devices in production with a 850 V Drain-to-source voltage pulse to insure blocking voltage margin.

Packaging and Soldering

The package is a standard PDFN and it can withstand at least 3 reflow cycles.

It is recommended to use the reflow profile in IPC/JEDEC J-STD-020 REV D.1 (March 2008)

The basic temperature profiles for Pb-free (Sn-Ag-Cu) assembly are:

- Preheat/Soak: 60 – 120 seconds. T_{min} = 150 °C, T_{max} = 200 °C.
- Reflow: Ramp up rate 3 °C/sec, max. Peak temperature is 260 °C and time within 5 °C of peak temperature is 30 seconds.
- Cool down: Ramp down rate 6 °C/sec max.

Using "No-Clean" soldering paste and operating at high temperatures may cause a reactivation of the "No-Clean" flux residues. In extreme conditions, unwanted conduction paths may be created. Therefore, when the product operates at greater than 100 °C it is recommended to also clean the "No-Clean" paste residues.
