

CIPOS™ Micro IPM: 600 V, 3 & 4 A

IM240 Series

Description

CIPOS™ Micro IM240 Series are three-phase Intelligent Power Modules (IPM) designed for advanced appliance motor drive applications such as energy efficient fans and pumps. These advanced IPMs offers a combination of low $V_{CE(sat)}$ RC-DF IGBT technology and the industry benchmark half-bridge high voltage, rugged driver in a familiar package.

Features

- 600V three-phase inverter including gate drivers & bootstrap function
- Based on low 2.1V $V_{CE(sat)}$ RC-DF IGBT
- Advanced input filter with shoot-through protection
- Optimized dV/dt for loss and EMI trade offs
- Open-emitter for single and leg-shunt current sensing
- 3.3V logic compatible
- Driver tolerant to negative voltage ($-V_s$)
- Undervoltage lockout for all channels
- Isolation 1900VRMS, 1min
- UL-certified

Potential Applications

- Air-conditioner fans
- Refrigerator compressors
- Ventilation fans & blower fans
- Low power motor drives

Product validation

Qualified for industrial applications according to the relevant tests of JEDEC47/20/22.

2.2 Pin Descriptions

HIN(1,2,3) and LIN(1,2,3) (Low side and high side control pins)

These pins are positive logic and they are responsible for the control of the integrated IGBT. The Schmitt-trigger input thresholds of them are such to guarantee LSTTL and CMOS compatibility down to 3.3V controller outputs. Pull-down resistor of about 800kΩ is internally provided to pre-bias inputs during supply start-up and an ESD diode is provided for pin protection purposes. Input Schmitt-trigger and noise filter provide beneficial noise rejection to short input pulses.

The noise filter suppresses control pulses which are below the filter time T_{FILIN} . The filter acts according to Figure 4.

Figure 3 Input pin structure

Figure 4 Input filter timing diagram

The integrated gate drive provides additionally a shoot through prevention capability which avoids the simultaneous on-state of the high-side and low-side switch of the same inverter phase. A minimum deadtime insertion of typically 300ns is also provided by driver IC, in order to reduce cross-conduction of the external power switches.

V_{DD}, COM (Low side control supply and reference)

V_{DD} is the control supply and it provides power both to input logic and to output power stage. Input logic is referenced to COM ground.

The under-voltage circuit enables the device to operate at power on when a supply voltage of at least a typical voltage of V_{DDUV+} = 11.1V is present.

The IC shuts down all the gate drivers power outputs, when the V_{DD} supply voltage is below V_{DDUV-} = 10.9V. This prevents the external power switches from critically low gate voltage levels during on-state and therefore from excessive power dissipation.

V_{B(1,2,3)} and V_{S(1,2,3)} (High side supplies)

V_B to V_S is the high side supply voltage. The high side circuit can float with respect to COM following the external high side power device emitter voltage.

Due to the low power consumption, the floating driver stage is supplied by integrated bootstrap circuit.

The under-voltage detection operates with a rising supply threshold of typical V_{BSUV+} = 11.1V and a falling threshold of V_{BSUV-} = 10.9V.

V_{S(1,2,3)} provide a high robustness against negative voltage in respect of COM. This ensures very stable designs even under rough conditions.

V_{R(1,2,3)} (Low side emitters)

The low side emitters are available for current measurements of each phase leg. It is recommended to keep the connection to pin COM as short as possible in order to avoid unnecessary inductive voltage drops.

Pin Configuration**VTH (Thermistor output)**

A UL certified NTC is integrated in the module with one terminal of the chip connected to COM and the other to VTH. When pulled up to a rail voltage such as V_{DD} or 3.3V by a resistor, the VTH pin provides an analog voltage signal corresponding to the temperature of the thermistor.

U/ V_{S1} , V/ V_{S2} , W/ V_{S3} (High side emitter and low side collector)

These pins are motor U, V, W input pins.

V+ (Positive bus input voltage, Pin 23)

The high side IGBTs are connected to the bus voltage. It is noted that the bus voltage does not exceed 450V.
