PSoC™ 4000S MCU

Based on Arm® Cortex®-M0+ CPU

General description

PSoC™ 4 is a scalable and reconfigurable platform architecture for a family of programmable embedded system controllers with an Arm® Cortex®-M0+ CPU. It combines programmable and reconfigurable analog and digital blocks with flexible automatic routing. The PSoC™ 4000S product family is a member of the PSoC™ 4 platform architecture. It is a combination of a microcontroller with standard communication and timing peripherals, a capacitive touch-sensing system (CAPSENSE™) with best-in-class performance, programmable general-purpose continuous-time and switched-capacitor analog blocks, and programmable connectivity. PSoC™ 4000S products are upward compatible with members of the PSoC™ 4 platform for new applications and design needs.

Features

- 32-bit MCU subsystem
  - 48-MHz Arm® Cortex®-M0+ CPU with single-cycle multiply
  - Up to 32 KB of flash with read accelerator
  - Up to 4 KB of SRAM
- Programmable analog
  - Single-slope 10-bit ADC function provided by Capacitance sensing block
  - Two current DACs (IDACs) for general-purpose or capacitive sensing applications on any pin
  - Two low-power comparators that operate in Deep Sleep low-power mode
- Programmable digital
  - Programmable logic blocks allowing boolean operations to be performed on port inputs and outputs
- Low-power 1.71-V to 5.5-V operation
  - Deep Sleep mode with operational analog and 2.5 µA digital system current
- Capacitive sensing
  - Capacitive sigma-delta provides best-in-class signal-to-noise ratio (SNR) (>5:1) and water tolerance
  - Infineon-supplied software component makes capacitive sensing design easy
  - Automatic hardware tuning (SmartSense)
- LCD drive capability
  - LCD segment drive capability on GPIOs
- Serial communication
  - Two independent run-time reconfigurable serial communication blocks (SCBs) with re-configurable I^2C, SPI, or UART functionality
- Timing and pulse-width modulation
  - Five 16-bit timer/counter/pulse-width modulator (TCPWM) blocks
  - Center-aligned, edge, and pseudo-random modes
  - Comparator-based triggering of kill signals for motor drive and other high-reliability digital logic applications
- Up to 36 programmable GPIO pins
  - 48-pin TQFP, 40-pin QFN, 32-pin QFN, 24-pin QFN, 32-pin TQFP, and 25-ball WLCSP packages
  - Any GPIO pin can be CAPSENSE™, analog, or digital
  - Drive modes, strengths, and slew rates are programmable

Features

- Clock sources
  - 32 kHz watch crystal oscillator (WCO)
  - ±2% internal main oscillator (IMO)
  - 32 kHz internal low-power oscillator (ILO)
- ModusToolbox™ software
  - Comprehensive collection of multi-platform tools and software libraries
  - Includes board support packages (BSPs), peripheral driver library (PDL), and middleware such as CAPSENSE™
- PSoC™ Creator design environment
  - Integrated development environment (IDE) provides schematic design entry and build, with analog and digital automatic routing
  - Application programming interface (API) components for all fixed-function and programmable peripherals
- Industry-standard tool compatibility
  - After schematic entry, development can be done with Arm®-based industry-standard development tools

1.1 PSoC™ 4 MCU resources

Infineon provides a wealth of data at **www.infineon.com** to help you select the right PSoC™ device and quickly and effectively integrate it into your design. The following is an abbreviated, hyperlinked list of resources for PSoC™ 4 MCU:

- **Overview: PSoC™ Portfolio**
- **Product selectors: PSoC™ 4 MCU**
- **Application notes** cover a broad range of topics, from basic to advanced level, and include the following:
  - **AN79953**: Getting started With PSoC™ 4 MCU. This application note has a convenient flow chart to help decide which IDE to use: **ModusToolbox™ software** or **PSoC™ Creator**.
  - **AN91184:** PSoC™ 4 Bluetooth® Low Energy - Designing Bluetooth® LE applications
  - **AN88619:** PSoC™ 4 Hardware design considerations
  - **AN73854:** PSoC™ - Introduction to bootloaders
  - **AN89610:** PSoC™ Arm® Cortex® code optimization
  - **AN86233:** PSoC™ 4 MCU low-power modes and power reduction techniques
  - **AN57821:** PSoC™ 3, PSOC™ 4, and PSOC™ 5LP mixed-signal circuit board layout considerations
  - **AN85951**: PSoC™ 4 and PSoC™ 6 MCU CAPSENSE™ design guide
- **Code examples** demonstrate product features and usage, and are also available on **Infineon GitHub repositories**.
- **Reference manuals** provide detailed descriptions of PSoC™ 4 MCU architecture and registers.
- **PSoC™ 4 MCU programming specification** provides the information necessary to program PSoC™ 4 MCU non-volatile memory.
- **Development tools**
  - **ModusToolbox™ software** enables cross platform code development with a robust suite of tools and software libraries.
  - **PSoC™ Creator** is a free Windows-based IDE. It enables concurrent hardware and firmware design of PSoC™ 3, PSoC™ 4, PSoC™ 5LP, and PSoC™ 6 MCU based systems. Applications are created using schematic capture and over 150 pre-verified, production-ready peripheral components.
  - **CY8CKIT-145-40XX** PSoC™ 4000S CAPSENSE™ prototyping kit, is a low-cost and easy-to-use evaluation platform. This kit provides easy access to all the device I/Os in a breadboard-compatible format.
  - **MiniProg4** and **MiniProg3** all-in-one development programmers and debuggers.
  - **PSoC™ 4 MCU CAD libraries** provide footprint and schematic support for common tools. **IBIS models** are also available.
- **Training Videos** are available on a wide range of topics including the **PSoC™ 101 series**.
- **Infineon developer community** enables connection with fellow PSoC™ developers around the world, 24 hours a day, 7 days a week, and hosts a dedicated **PSoC™ 4 MCU community**.

1.2 ModusToolbox™ software

ModusToolbox™ software is Infineon' comprehensive collection of multi-platform tools and software libraries that enable an immersive development experience for creating converged MCU and wireless systems. It is:

- Comprehensive - it has the resources you need
- Flexible - you can use the resources in your own workflow
- Atomic - you can get just the resources you want

Infineon provides a large collection of code **repositories on GitHub**, including:

- Board support packages (BSPs) aligned with Infineon kits
- Low-level resources, including a peripheral driver library (PDL)
- Middleware enabling industry-leading features such as CAPSENSE™
- An extensive set of thoroughly tested **code example applications**

ModusToolbox™ software is IDE-neutral and easily adaptable to your workflow and preferred development environment. It includes a project creator, peripheral and library configurators, a library manager, as well as the optional Eclipse IDE for ModusToolbox™, as **Figure 1** shows. For information on using Infineon tools, refer to the documentation delivered with ModusToolbox™ software, and **AN79953: Getting Started with PSoC™ 4**.

1.3 PSoC™ Creator

PSoC™ Creator is a free Windows-based IDE. It enables you to design hardware and firmware systems concurrently, based on PSoC™ 4 MCU. As **Figure 2** shows, with PSoC™ Creator you can:

1. Drag and drop component icons to build your hardware system design in the main design workspace
2. Co-design your application firmware with the PSoC™ hardware, using the PSoC™ Creator IDE C compiler
3. Configure components using the configuration tools
4. Explore the library of 100+ components
5. Review component datasheets
6. Prototype your solution with the PSoC™ 4 Pioneer kits. If a design change is needed, PSoC™ Creator and components enable you to make changes on-the-fly without the need for hardware revisions.

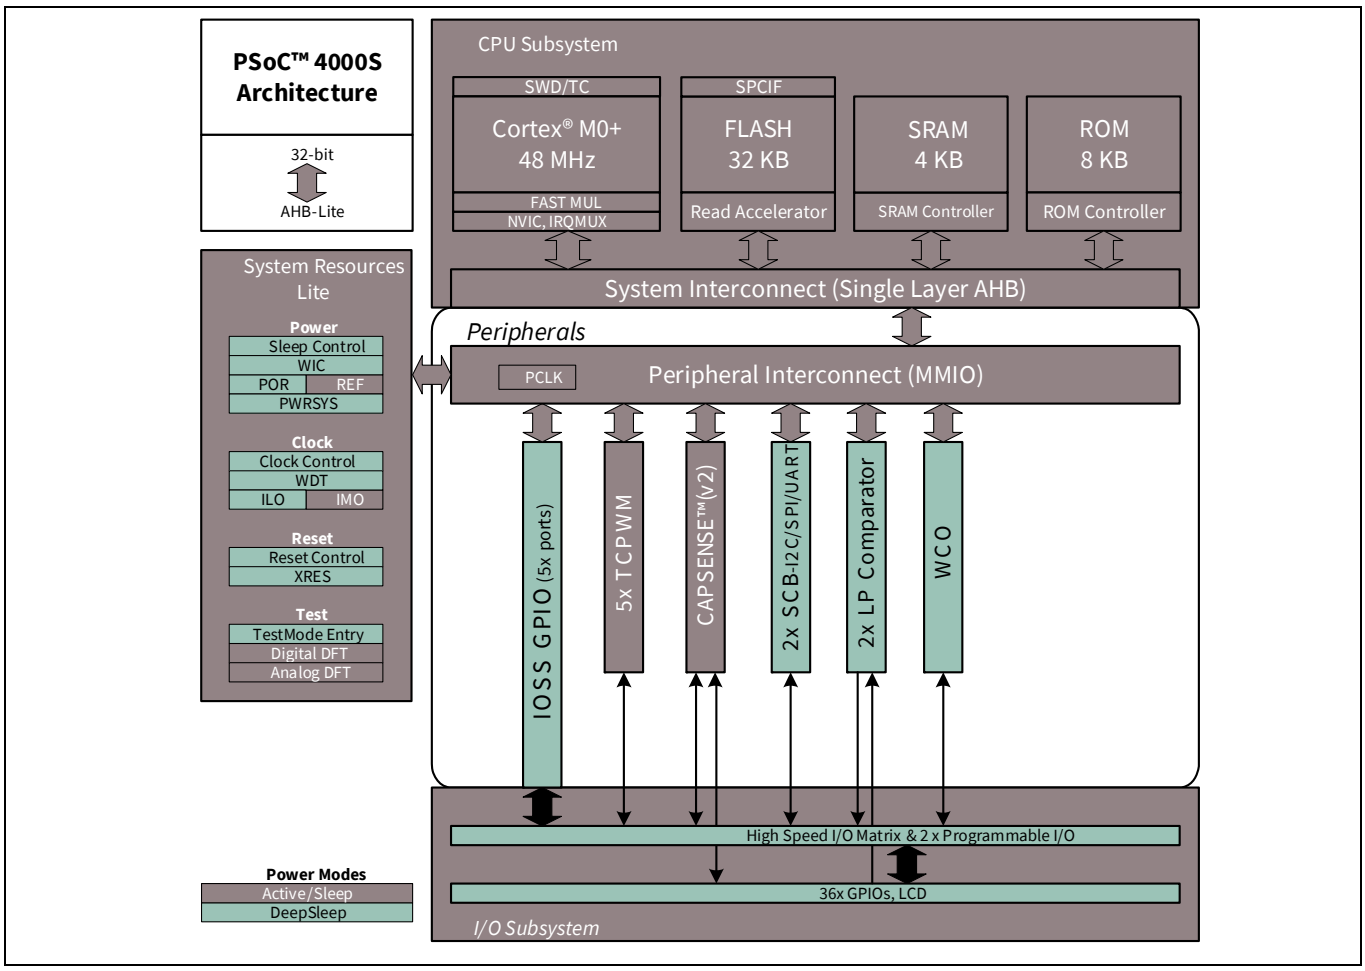
Block diagram



PSoC™ 4000S devices include extensive support for programming, testing, debugging, and tracing both hardware and firmware.

The Arm® serial-wire debug (SWD) interface supports all programming and debug features of the device.

Complete debug-on-chip functionality enables full-device debugging in the final system using the standard production device. It does not require special interfaces, debugging pods, simulators, or emulators. Only the standard programming connections are required to fully support debug.

The PSoC™ Creator IDE provides fully integrated programming and debug support for the PSoC™ 4000S devices. The SWD interface is fully compatible with industry-standard third-party tools. The PSoC™ 4000S provides a level of security not possible with multi-chip application solutions or with microcontrollers.

It has the following advantages:

- Allows disabling of debug features
- Robust flash protection
- Allows customer-proprietary functionality to be implemented in on-chip programmable blocks

The debug circuits are enabled by default and can be disabled in firmware. If they are not enabled, the only way to re-enable them is to erase the entire device, clear flash protection, and reprogram the device with new firmware that enables debugging. Thus firmware control of debugging cannot be over-ridden without erasing the firmware thus providing security.

Additionally, all device interfaces can be permanently disabled (device security) for applications concerned about phishing attacks due to a maliciously reprogrammed device or attempts to defeat security by starting and interrupting flash programming sequences. All programming, debug, and test interfaces are disabled when maximum device security is enabled. Therefore, PSoC™ 4000S, with device security enabled, may not be returned for failure analysis. This is a trade-off the PSoC™ 4000S allows the customer to make.

3 Functional definition

3.1 CPU and memory subsystem

3.1.1 CPU

The Cortex®-M0+ CPU in the PSoC™ 4000S is part of the 32-bit MCU subsystem, which is optimized for low-power operation with extensive clock gating. Most instructions are 16 bits in length and the CPU executes a subset of the thumb-2 instruction set. It includes a nested vectored interrupt controller (NVIC) block with eight interrupt inputs and also includes a wakeup interrupt controller (WIC). The WIC can wake the processor from Deep Sleep mode, allowing power to be switched off to the main processor when the chip is in Deep Sleep mode.

The CPU also includes a debug interface, the serial wire debug (SWD) interface, which is a two-wire form of JTAG. The debug configuration used for PSoC™ 4000S has four breakpoint (address) comparators and two watchpoint (data) comparators.

3.1.2 Flash

The PSoC™ 4000S device has a flash module with a flash accelerator, tightly coupled to the CPU to improve average access times from the flash block. The low-power flash block is designed to deliver two wait-state (WS) access time at 48 MHz. The flash accelerator delivers 85% of single-cycle SRAM access performance on average.

3.1.3 SRAM

Four KB of SRAM are provided with zero wait-state access at 48 MHz.

3.1.4 SROM

A supervisory ROM that contains boot and configuration routines is provided.

3.2 System resources

3.2.1 Power system

The power system is described in detail in the section **“Power”** on page 19. It provides assurance that voltage levels are as required for each respective mode and either delays mode entry (for example, on power-on reset (POR)) until voltage levels are as required for proper functionality, or generates resets (for example, on brown-out detection). The PSoC™ 4000S operates with a single external supply over the range of either 1.8 V ±5% (externally regulated) or 1.8 to 5.5 V (internally regulated) and has three different power modes, transitions between which are managed by the power system. The PSoC™ 4000S provides Active, Sleep, and Deep Sleep low-power modes.

All subsystems are operational in Active mode. The CPU subsystem (CPU, flash, and SRAM) is clock-gated off in Sleep mode, while all peripherals and interrupts are active with instantaneous wake-up on a wake-up event. In Deep Sleep mode, the high-speed clock and associated circuitry is switched off; wake-up from this mode takes 35 µs.

3.2.2 Clock system

The PSoC™ 4000S clock system is responsible for providing clocks to all subsystems that require clocks and for switching between different clock sources without glitching. In addition, the clock system ensures that there are no metastable conditions.

The clock system for the PSoC™ 4000S consists of the internal main oscillator (IMO), internal low-frequency oscillator (ILO), a 32 kHz watch crystal oscillator (WCO) and provision for an external clock. Clock dividers are provided to generate clocks for peripherals on a fine-grained basis. Fractional dividers are also provided to enable clocking of higher data rates for UARTs.

The HFCLK signal can be divided down to generate synchronous clocks for the analog and digital peripherals. There are eight clock dividers for the PSoC™ 4000S, two of those are fractional dividers. The 16-bit capability allows flexible generation of fine-grained frequency values, and is fully supported in PSoC™ Creator.

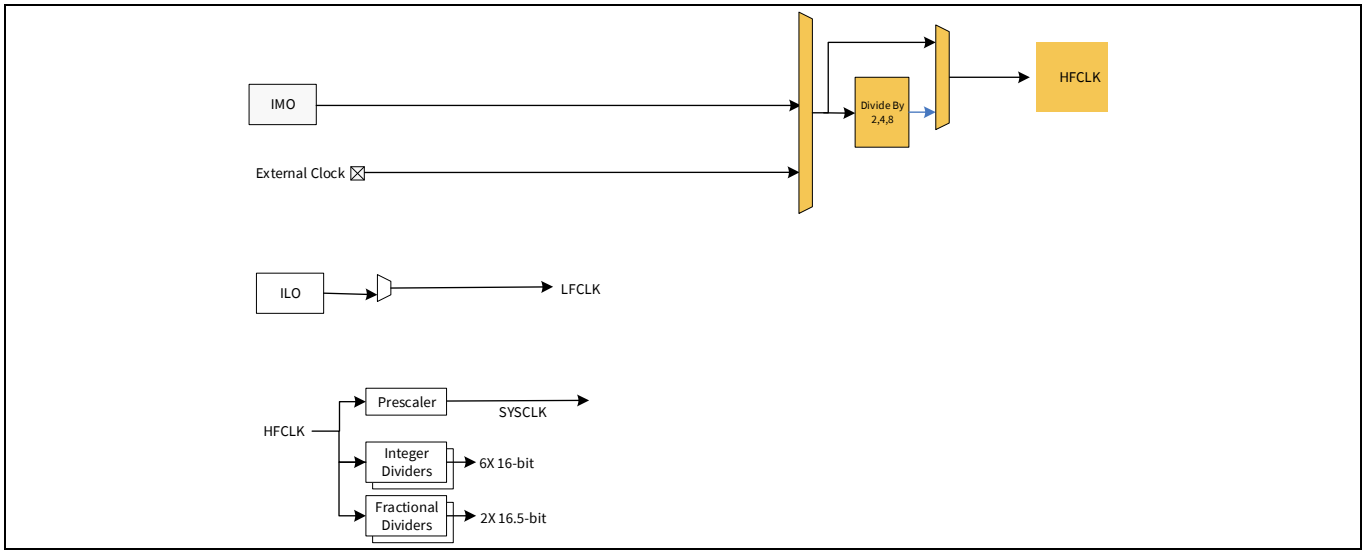

Figure 3 PSoC™ 4000S MCU clocking architecture

3.2.3 IMO clock source

The IMO is the primary source of internal clocking in the PSoC™ 4000S. It is trimmed during testing to achieve the specified accuracy. The IMO default frequency is 24 MHz and it can be adjusted from 24 to 48 MHz in steps of 4 MHz. The IMO tolerance with Infineon-provided calibration settings is ±2%.

3.2.4 ILO clock source

The ILO is a very low power, nominally 40-kHz oscillator, which is primarily used to generate clocks for the watchdog timer (WDT) and peripheral operation in Deep Sleep mode. ILO-driven counters can be calibrated to the IMO to improve accuracy. Infineon provides a software component, which does the calibration.

3.2.5 Watch crystal oscillator (WCO)

The PSoC™ 4000S clock subsystem also implements a low-frequency (32-kHz watch crystal) oscillator that can be used for precision timing applications. The WCO block allows locking the IMO to the 32-kHz oscillator. The WCO on PSoC™ 4000S series devices does not connect to the LFCLK or WDT. Due to this, RTC functionality is not supported.

3.2.6 Watchdog timer

A watchdog timer is implemented in the clock block running from the ILO; this allows watchdog operation during Deep Sleep and generates a watchdog reset if not serviced before the set timeout occurs. The watchdog reset is recorded in a Reset Cause Register, which is firmware readable.

3.2.7 Reset

The PSoC™ 4000S can be reset from a variety of sources including a software reset. Reset events are asynchronous and guarantee reversion to a known state. The reset cause is recorded in a register, which is sticky through reset and allows software to determine the cause of the reset. An XRES pin is reserved for external reset by asserting it active low. The XRES pin has an internal pull-up resistor that is always enabled.

3.2.8 Voltage reference

The PSoC™ 4000S reference system generates all internally required references. A 1.2-V voltage reference is provided for the comparator. The IDACs are based on a ±5% reference.

3.3 Analog blocks

3.3.1 Low-power comparators (LPC)

The PSoC™ 4000S has a pair of low-power comparators, which can also operate in Deep Sleep modes. This allows the analog system blocks to be disabled while retaining the ability to monitor external voltage levels during low-power modes. The comparator outputs are normally synchronized to avoid metastability unless operating in an asynchronous power mode where the system wake-up circuit is activated by a comparator switch event. The LPC outputs can be routed to pins.

3.3.2 Current DACs

The PSoC™ 4000S has two IDACs, which can drive any of the pins on the chip. These IDACs have programmable current ranges.

3.3.3 Analog multiplexed buses

The PSoC™ 4000S has two concentric independent buses that go around the periphery of the chip. These buses (called amux buses) are connected to firmware-programmable analog switches that allow the chip's internal resources (IDACs, comparator) to connect to any pin on the I/O Ports.

3.4 Programmable digital blocks

The programmable I/O (Smart I/O) block is a fabric of switches and LUTs that allows boolean functions to be performed in signals being routed to the pins of a GPIO port. The Smart I/O can perform logical operations on input pins to the chip and on signals going out as outputs.

3.5 Fixed function digital

3.5.1 Timer/Counter/PWM (TCPWM) block

The TCPWM block consists of a 16-bit counter with user-programmable period length. There is a capture register to record the count value at the time of an event (which may be an I/O event), a period register that is used to either stop or auto-reload the counter when its count is equal to the period register, and compare registers to generate compare value signals that are used as PWM duty cycle outputs. The block also provides true and complementary outputs with programmable offset between them to allow use as dead-band programmable complementary PWM outputs. It also has a kill input to force outputs to a predetermined state; for example, this is used in motor drive systems when an over-current state is indicated and the PWM driving the FETs needs to be shut off immediately with no time for software intervention. There are five TCPWM blocks in the PSoC™ 4000S.

3.5.2 Serial communication block (SCB)

The PSoC™ 4000S has two serial communication blocks, which can be programmed to have SPI, I2C, or UART functionality.

I^2C Mode: The hardware I^2C block implements a full multi-master and slave interface (it is capable of multi-master arbitration). This block is capable of operating at speeds of up to 1 Mbps (Fast Mode Plus) and has flexible buffering options to reduce interrupt overhead and latency for the CPU. It also supports EZI2C that creates a mailbox address range in the memory of the PSoC™ 4000S and effectively reduces I^2C communication to reading from and writing to an array in memory. In addition, the block supports an 8-deep FIFO for receive and transmit which, by increasing the time given for the CPU to read data, greatly reduces the need for clock stretching caused by the CPU not having read data on time.

The I^2C peripheral is compatible with the I^2C Standard-mode and Fast-mode devices as defined in the NXP I^2C-bus specification and user manual (UM10204). The I^2C bus I/O is implemented with GPIO in open-drain modes.

The PSoC™ 4000S is not completely compliant with the I^2C spec in the following respect:

- GPIO cells are not over-voltage tolerant and, therefore, cannot be hot-swapped or powered up independently of the rest of the I^2C system.

UART Mode: This is a full-feature UART operating at up to 1 Mbps. It supports automotive single-wire interface (LIN), infrared interface (IrDA), and SmartCard (ISO7816) protocols, all of which are minor variants of the basic UART protocol. In addition, it supports the 9-bit multiprocessor mode that allows addressing of peripherals connected over common RX and TX lines. Common UART functions such as parity error, break detect, and frame error are supported. An 8-deep FIFO allows much greater CPU service latencies to be tolerated.

SPI Mode: The SPI mode supports full Motorola SPI, TI SSP (adds a start pulse used to synchronize SPI Codecs), and National Microwire (half-duplex form of SPI). The SPI block can use the FIFO.

3.6 GPIO

The PSoC™ 4000S has up to 36 GPIOs. The GPIO block implements the following:

- Eight drive modes:
  - Analog input mode (input and output buffers disabled)
  - Input only
  - Weak pull-up with strong pull-down
  - Strong pull-up with weak pull-down
  - Open drain with strong pull-down
  - Open drain with strong pull-up
  - Strong pull-up with strong pull-down
  - Weak pull-up with weak pull-down
- Input threshold select (CMOS or LVTTL).
- Individual control of input and output buffer enabling/disabling in addition to the drive strength modes
- Selectable slew rates for dV/dt related noise control to improve EMI

The pins are organized in logical entities called ports, which are 8-bit in width (less for ports 2 and 3). During power-on and reset, the blocks are forced to the disable state so as not to crowbar any inputs and/or cause excess turn-on current. A multiplexing network known as a high-speed I/O matrix is used to multiplex between various signals that may connect to an I/O pin.

Data output and pin state registers store, respectively, the values to be driven on the pins and the states of the pins themselves.

Every I/O pin can generate an interrupt if so enabled and each I/O port has an interrupt request (IRQ) and interrupt service routine (ISR) vector associated with it (5 for PSoC™ 4000S).

3.7 Special function peripherals

3.7.1 CAPSENSE™

CAPSENSE™ is supported in the PSoC™ 4000S through a CAPSENSE™ Sigma-Delta (CSD) block that can be connected to any pins through an analog multiplex bus via analog switches. CAPSENSE™ function can thus be provided on any available pin or group of pins in a system under software control. A PSoC™ Creator component is provided for the CAPSENSE™ block to make it easy for the user.

Shield voltage can be driven on another analog multiplex bus to provide water-tolerance capability. Water tolerance is provided by driving the shield electrode in phase with the sense electrode to keep the shield capacitance from attenuating the sensed input. Proximity sensing can also be implemented.

The CAPSENSE™ block has two IDACs, which can be used for general purposes if CAPSENSE™ is not being used (both IDACs are available in that case) or if CAPSENSE™ is used without water tolerance (one IDAC is available).

The CAPSENSE™ block also provides a 10-bit slope ADC function, which can be used in conjunction with the CAPSENSE™ function.

The CAPSENSE™ block is an advanced, low-noise, programmable block with programmable voltage references and current source ranges for improved sensitivity and flexibility. It can also use an external reference voltage. It has a full-wave CSD mode that alternates sensing to VDDA and Ground to null out power-supply related noise.

3.7.2 LCD segment drive

The PSoC™ 4000S has an LCD controller, which can drive up to 8 commons and up to 28 segments. It uses full digital methods to drive the LCD segments requiring no generation of internal LCD voltages. The two methods used are referred to as digital correlation and PWM. Digital correlation pertains to modulating the frequency and drive levels of the common and segment signals to generate the highest RMS voltage across a segment to light it up or to keep the RMS signal to zero. This method is good for STN displays but may result in reduced contrast with TN (cheaper) displays. PWM pertains to driving the panel with PWM signals to effectively use the capacitance of the panel to provide the integration of the modulated pulse-width to generate the desired LCD voltage. This method results in higher power consumption but can result in better results when driving TN displays.

4 Pinouts

The following table provides the pin list for PSoC™ 4000S for the 48-pin TQFP, 40-pin QFN, 32-pin QFN, 24-pin QFN, 32-pin TQFP, and 25-ball CSP packages. All port pins support GPIO. Pin 11 is a No-Connect in the 48-TQFP.

Note: Pins 11, 15, 26, and 27 are No connects (NC) on the 48-pin TQFP.

Descriptions of the pin functions are as follows:

VDDD: Power supply for the digital section.

VDDA: Power supply for the analog section.

VSSD, VSSA: Ground pins for the digital and analog sections respectively.

VCCD: Regulated digital supply (1.8 V ± 5%)

VDD: Power supply to all sections of the chip

VSS: Ground for all sections of the chip

4.1 Alternate pin functions

Each port pin can be assigned to one of multiple functions; it can, for instance, be an analog I/O, a digital peripheral function, an LCD pin, or a CAPSENSE™ pin. The pin assignments are shown in the following table.

5 Power

The following power system diagram shows the set of power supply pins as implemented for the PSoC™ 4000S. The system has one regulator in Active mode for the digital circuitry. There is no analog regulator; the analog circuits run directly from the V_{DD} input.

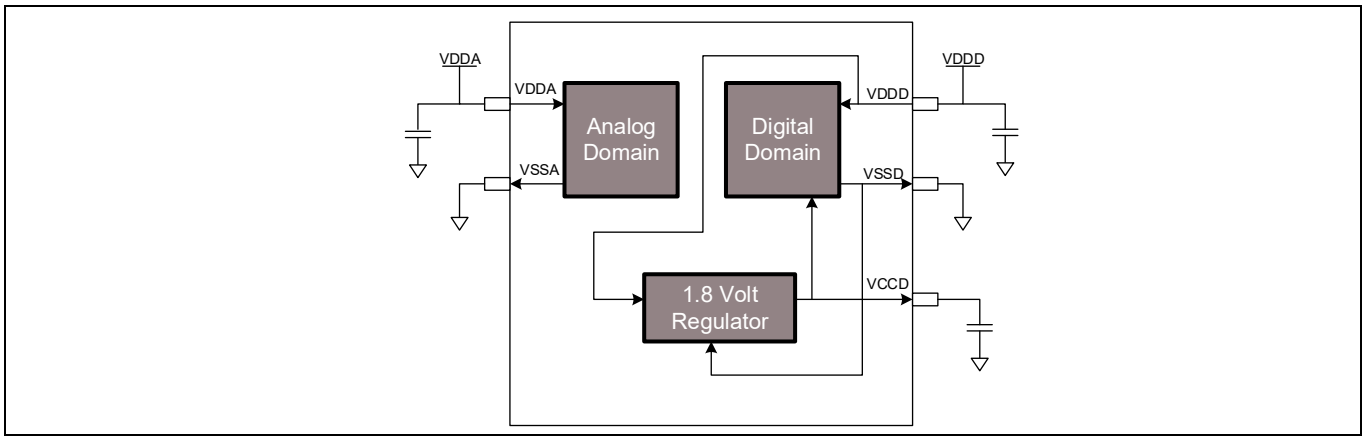

Figure 4 Power supply connections

There are two distinct modes of operation. In Mode 1, the supply voltage range is 1.8 V to 5.5 V (unregulated externally; internal regulator operational). In Mode 2, the supply range is1.8 V ± 5% (externally regulated; 1.71 V to 1.89 V, internal regulator bypassed).

5.1 Mode 1: 1.8 V to 5.5 V external supply

In this mode, the PSoC™ 4000S is powered by an external power supply that can be anywhere in the range of 1.8 V to 5.5 V. This range is also designed for battery-powered operation. For example, the chip can be powered from a battery system that starts at 3.5 V and works down to 1.8 V. In this mode, the internal regulator of the PSoC™ 4000S supplies the internal logic and its output is connected to the V_{CCD} pin. The VCCD pin must be bypassed to ground via an external capacitor (0.1 µF; X5R ceramic or better) and must not be connected to anything else.

5.2 Mode 2: 1.8 V ± 5% external supply

In this mode, the PSoC™ 4000S is powered by an external power supply that must be within the range of 1.71 V to 1.89 V; note that this range needs to include the power supply ripple too. In this mode, the VDD and VCCD pins are shorted together and bypassed. The internal regulator can be disabled in the firmware.

Bypass capacitors must be used from VDDD to ground. The typical practice for systems in this frequency range is to use a capacitor in the 1-µF range, in parallel with a smaller capacitor (0.1 µF, for example). Note that these are simply rules of thumb and that, for critical applications, the PCB layout, lead inductance, and the bypass capacitor parasitic should be simulated to design and obtain optimal bypassing.

An example of a bypass scheme is shown in the following diagram.

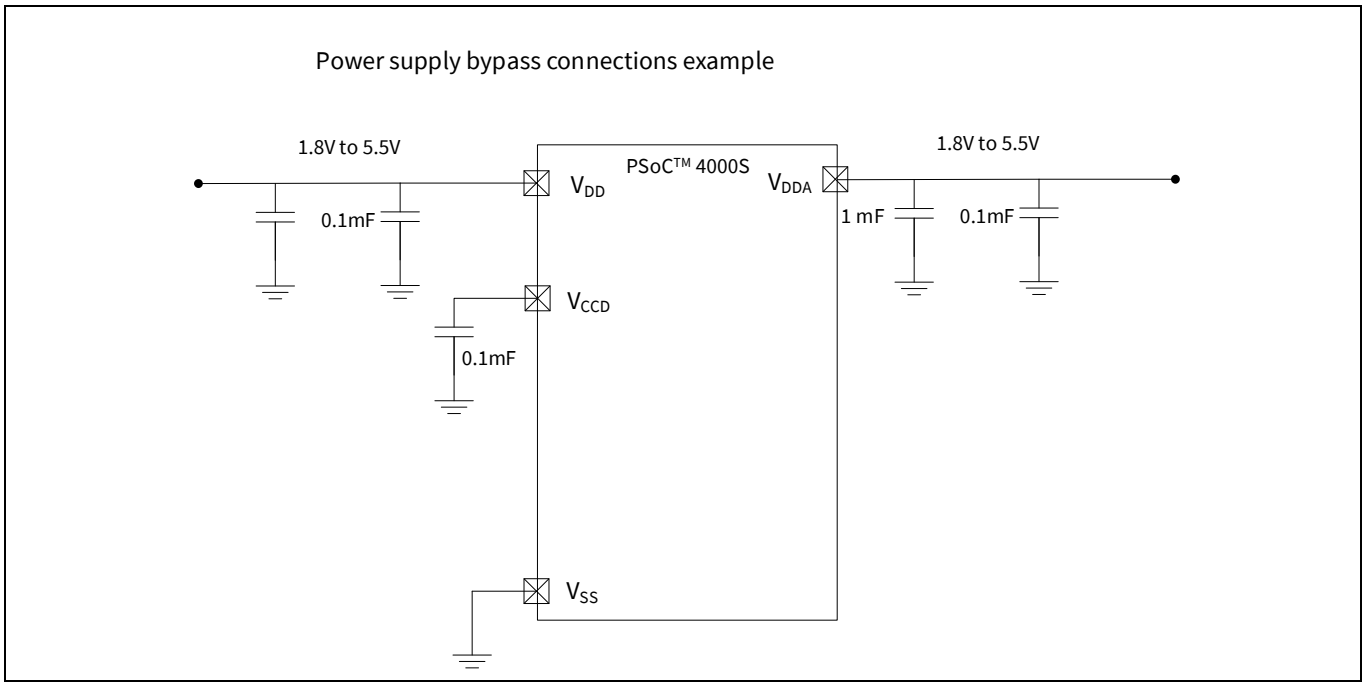

Figure 5 External supply range from 1.8 V to 5.5 V with internal regulator active

Note
1. Usage above the absolute maximum conditions listed in **Table 3** may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods of time may affect device reliability. The maximum storage temperature is 150°C in compliance with JEDEC Standard JESD22-A103, High Temperature Storage Life. When used below absolute maximum conditions but above normal operating conditions, the device may not operate to specification.

6.2 Device level specifications

All specifications are valid for –40°C ≤ T_A ≤ 105°C and T_J ≤ 125°C, except where noted. Specifications are valid for 1.71 V to 5.5 V, except where noted.

SID257	TWS24	Number of Wait states at 24 MHz	1	–	–	–	CPU execution from Flash

Notes
9. It can take as much as 20 milliseconds to write to flash. During this time the device should not be Reset, or Flash operations may be interrupted and cannot be relied on to have completed. Reset sources include the XRES pin, software resets, CPU lockup states and privilege violations, improper power supply levels, and watchdogs. Make certain that these are not inadvertently activated.

8 Packaging

The PSoC™ 4000S is offered in 48LD TQFP, 40L QFN, 32 LEAD QFN, 24L QFN, 32LD TQFP, and 25-ball WLCSP packages.

Package dimensions and Infineon drawing numbers are in the following table.

Table 37 Package list

Spec ID	Package	Description	Package drawing
BID20	48LD TQFP	7 × 7 × 1.4 mm height with 0.5-mm pitch	51-85135
BID27	40L QFN	6 × 6 × 0.6 mm height with 0.5-mm pitch	001-80659
BID34A	32 LEAD QFN	5 × 5 × 0.6 mm height with 0.5-mm pitch	001-42168
BID34	24L QFN	4 × 4 × 0.6 mm height with 0.5-mm pitch	001-13937
BID34G	32LD TQFP	7 × 7 × 1.4 mm height with 0.8-mm pitch	51-85088
BID34F	25-ball WLCSP	2.02 × 1.93 × 0.48 mm height with 0.35-mm pitch	002-09957

Acronym	Description
abus	analog local bus
ADC	analog-to-digital converter
AG	analog global
AHB	AMBA (advanced microcontroller bus architecture) high-performance bus, an Arm® data transfer bus
ALU	arithmetic logic unit
AMUXBUS	analog multiplexer bus
API	application programming interface
APSR	application program status register
Arm®	advanced RISC machine, a CPU architecture
ATM	automatic thump mode
BW	bandwidth
CAN	Controller Area Network, a communications protocol
CMRR	common-mode rejection ratio
CPU	central processing unit
CRC	cyclic redundancy check, an error-checking protocol
DAC	digital-to-analog converter, see also IDAC, VDAC
DFB	digital filter block
DIO	digital input/output, GPIO with only digital capabilities, no analog. See GPIO.
DMIPS	Dhrystone million instructions per second
DMA	direct memory access, see also TD
DNL	differential nonlinearity, see also INL
DNU	do not use
DR	port write data registers
DSI	digital system interconnect
DWT	data watchpoint and trace
ECC	error correcting code
ECO	external crystal oscillator
EEPROM	electrically erasable programmable read-only memory
EMI	electromagnetic interference
EMIF	external memory interface
EOC	end of conversion
EOF	end of frame
EPSR	Execution Program Status register
ESD	electrostatic discharge
ETM	embedded trace macrocell
FIR	finite impulse response, see also IIR

Acronym	Description
FPB	flash patch and breakpoint
FS	full-speed
GPIO	general-purpose input/output, applies to a PSoC™ pin
HVI	high-voltage interrupt, see also LVI, LVD
IC	integrated circuit
IDAC	current DAC, see also DAC, VDAC
IDE	integrated development environment
I^2C, or IIC	Inter-Integrated Circuit, a communications protocol
IIR	infinite impulse response, see also FIR
ILO	internal low-speed oscillator, see also IMO
IMO	internal main oscillator, see also ILO
INL	integral nonlinearity, see also DNL
I/O	input/output, see also GPIO, DIO, SIO, USBIO
IPOR	initial power-on reset
IPSR	interrupt program status register
IRQ	interrupt request
ITM	instrumentation trace macrocell
LCD	liquid crystal display
LIN	Local Interconnect Network, a communications protocol.
LR	link register
LUT	lookup table
LVD	low-voltage detect, see also LVI
LVI	low-voltage interrupt, see also HVI
LVTTL	low-voltage transistor-transistor logic
MAC	multiply-accumulate
MCU	microcontroller unit
MISO	master-in slave-out
NC	no connect
NMI	nonmaskable interrupt
NRZ	non-return-to-zero
NVIC	nested vectored interrupt controller
NVL	nonvolatile latch, see also WOL
opamp	operational amplifier
PAL	programmable array logic, see also PLD
PC	program counter
PCB	printed circuit board
PGA	programmable gain amplifier
PHUB	peripheral hub
PHY	physical layer
PICU	port interrupt control unit

Acronym	Description
PLA	programmable logic array
PLD	programmable logic device, see also PAL
PLL	phase-locked loop
PMDD	package material declaration datasheet
POR	power-on reset
PRES	precise power-on reset
PRS	pseudo random sequence
PS	port read data register
PSoC™	Programmable System-on-Chip™
PSRR	power supply rejection ratio
PWM	pulse-width modulator
RAM	random-access memory
RISC	reduced-instruction-set computing
RMS	root-mean-square
RTC	real-time clock
RTL	register transfer language
RTR	remote transmission request
RX	receive
SAR	successive approximation register
SC/CT	switched capacitor/continuous time
SCL	I^2C serial clock
SDA	I^2C serial data
S/H	sample and hold
SINAD	signal to noise and distortion ratio
SIO	special input/output, GPIO with advanced features. See GPIO.
SOC	start of conversion
SOF	start of frame
SPI	Serial Peripheral Interface, a communications protocol
SR	slew rate
SRAM	static random access memory
SRES	software reset
SWD	serial wire debug, a test protocol
SWV	single-wire viewer
TD	transaction descriptor, see also DMA
THD	total harmonic distortion
TIA	transimpedance amplifier
TRM	technical reference manual
TTL	transistor-transistor logic
TX	transmit
UART	Universal Asynchronous Transmitter Receiver, a communications protocol

Revision history

Document version	Date of release	Description of changes
*G	2016-07-27	Changed status from Preliminary to Final. Updated **Functional definition**: Updated **Special function peripherals**: Updated **LCD segment drive**: Updated description. Updated **Electrical specifications**: Updated **Device level specifications**: Updated **Table 4** (Updated details corresponding to I_{DD5}, I_{DD8}, I_{DD11}, I_{DD17}, I_{DD20}, I_{DD23}, I_{DD23A}, I_{DD26}, I_{DD29}, I_{DD32}, I_{DD_XR} parameters). Updated **GPIO**: Updated **Table 6** (Updated details in “Details/Conditions” column corresponding to V_{OH} parameter and spec ID SID60). Updated **Packaging**: Updated **Table 37** (Updated details in “Description” column corresponding to 25-Ball WLCSP package (Updated package dimensions)). Updated **Table 40** (Added 25-ball WLCSP package and its corresponding details). Completing Sunset Review.
*H	2016-09-14	Added 40-pin QFN package related information in all instances across the document. Updated **Electrical specifications**: Updated **Device level specifications**: Updated **Table 4** (Updated details corresponding to I_{DD5}, I_{DD8}, I_{DD11}, I_{DD17}, I_{DD20}, I_{DD23}, I_{DD23A}, I_{DD26}, I_{DD29}, I_{DD32}, I_{DD_XR} parameters). Updated **Packaging**: Updated **Package diagrams**: Added spec 001-80659 *A.
*I	2017-01-09	Updated **Electrical specifications**: Replaced PRGIO with Smart I/O in all instances.
*J	2017-04-26	Updated Cypress Logo and Copyright.
*K	2017-11-17	Updated Document Title to read as “PSoC® 4: PSoC 4000S Datasheet Programmable System-on-Chip (PSoC®)”. Added 32-pin TQFP Package related information in all instance across the document. Updated **Ordering information**: Updated part numbers. Updated **Packaging**: Updated **Package diagrams**: spec 001-42168 – Changed revision from *E to *F. Added spec 51-85088 *E.

Revision history

Document version	Date of release	Description of changes
*L	2019-07-31	Updated **Features**: Updated **32-bit MCU subsystem**: Updated description. Added **Development ecosystem**. Added **PSoC™ Creator**. Updated **Functional definition**: Updated **System resources**: Updated **Power system**: Updated description. Updated **Watch crystal oscillator (WCO)**: Updated description. Updated **Fixed function digital**: Updated **Serial communication block (SCB)**: Updated description. Updated **Special function peripherals**: Updated **LCD segment drive**: Updated description. Updated **Pinouts**: Added Note below **Table 1**. Updated **Electrical specifications**: Updated **Analog peripherals**: Updated **CSD and IDAC**: Updated **Table 12** (Updated details in “Details/Conditions” column corresponding to V_{REF}, V_{REF_EXT} and $V_{COMPIDAC}$ parameters). Updated **Digital peripherals**: Updated **SPI**: Updated **Table 18** (Updated all values corresponding to TSSELSSCK parameter). Updated **Ordering information**: Updated part numbers. Updated **Packaging**: Updated **Package diagrams**: spec 001-13937 – Changed revision from *F to *G. Updated to new template. Completing Sunset Review.
*M	2020-11-20	Updated **Features**: Added “Clock sources”. Added “ModusToolbox™ software”. Updated **Development ecosystem**: Replaced “More Information” with “Development ecosystem” in heading. Updated description. Added **ModusToolbox™ software**. Updated **Electrical specifications**: Updated **Device level specifications**: Updated temperature range in description below heading. Updated **System resources**: Updated **Power-on reset (POR)**: Updated **Table 25**. Updated **Ordering information**: Updated **Table 36**: Added Q-temp MPNs for the 48-pin TQFP package. Updated **Packaging**: Updated **Table 38**. Updated to new template.

Revision history

Document version	Date of release	Description of changes
*N	2020-12-23	Updated **Ordering information**: Updated Nomenclature: Updated details under Temperature Range to show “Extended Industrial”.
*O	2022-07-28	Updated **Table 29**: Updated spec SID223 and SID223A. Added specs SID223B through SID223D. Migrated to Infineon template.
*P	2023-01-23	Updated the footnotes in **IMO AC specifications**.
*Q	2024-03-14	Fixed broken links. Updated **Development ecosystem**. Updated product from CY8C4024FNI-S402 to CY8C4024FNI-S402T, CY8C4024FNI-S412 to CY8C4024FNI-S412T, CY8C4025FNI-S402 to CY8C4025FNI-S402T, CY8C4025FNI-S412 to CY8C4025FNI-S412T, and CY8C4045FNI-S412 to CY8C4045FNI-S412T in **Table 36** Updated packing diagram titles with IFX package code for **Figure 6**, **Figure 7**, **Figure 8**, **Figure 9**, **Figure 10** and **Figure 11** Updated **Packaging**.
