TLD5542-1CHG_SHIELD

User guide

About this document

Product description

The TLD5542-1CHG_SHIELD it is a battery charger shield compatible with Arduino UNO. It can charge up to 6 lithium cells in series and up to 5 A of output current to a maximum of 65 W.
The shield can be powered either by a USB-PD adapter, or by a standard 12 V power supply, and it can be configured as:

- Battery charger
- Adjustable voltage regulator
- LED driver

A graphical OLED 128x64 and 4 push-buttons are present to set parameters and check charge status.
The TLD5542-1 is an LED driver, so the charge algorithm is implemented in the Arduino, therefore it is highly customizable.

Scope and purpose

The scope of this user manual is to provide the reader with instructions on the usage of the TLD5542-1CHG_SHIELD shield for Arduino.

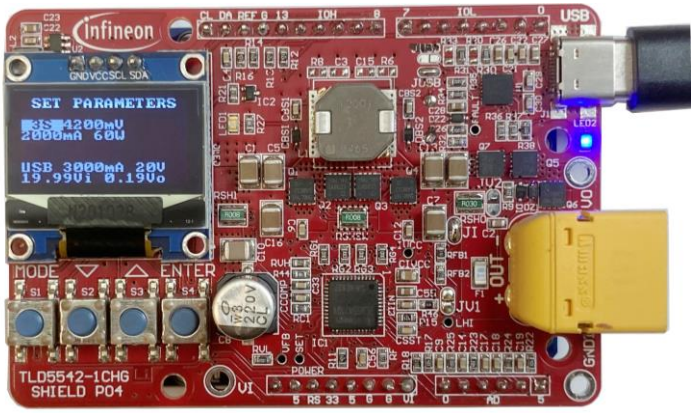

Figure 1 TLD5542-1CHG_SHIELD

Intended audience

Hardware engineers, software engineers, system architects, Makers

Evaluation Board

This board will be used during design-in, for evaluation and measurement of characteristics, and proof of data sheet specifications.

Note: PCB and auxiliary circuits are NOT optimized for final customer design.

Important notice

“Evaluation Boards and Reference Boards” shall mean products embedded on a printed circuit board (PCB) for demonstration and/or evaluation purposes, which include, without limitation, demonstration, reference and evaluation boards, kits and design (collectively referred to as “Reference Board”).

Environmental conditions have been considered in the design of the Evaluation Boards and Reference Boards provided by Infineon Technologies. The design of the Evaluation Boards and Reference Boards has been tested by Infineon Technologies only as described in this document. The design is not qualified in terms of safety requirements, manufacturing and operation over the entire operating temperature range or lifetime.

The Evaluation Boards and Reference Boards provided by Infineon Technologies are subject to functional testing only under typical load conditions. Evaluation Boards and Reference Boards are not subject to the same procedures as regular products regarding returned material analysis (RMA), process change notification (PCN) and product discontinuation (PD).

Evaluation Boards and Reference Boards are not commercialized products, and are solely intended for evaluation and testing purposes. In particular, they shall not be used for reliability testing or production. The Evaluation Boards and Reference Boards may therefore not comply with CE or similar standards (including but not limited to the EMC Directive 2004/EC/108 and the EMC Act) and may not fulfill other requirements of the country in which they are operated by the customer. The customer shall ensure that all Evaluation Boards and Reference Boards will be handled in a way which is compliant with the relevant requirements and standards of the country in which they are operated.

The Evaluation Boards and Reference Boards as well as the information provided in this document are addressed only to qualified and skilled technical staff, for laboratory usage, and shall be used and managed according to the terms and conditions set forth in this document and in other related documentation supplied with the respective Evaluation Board or Reference Board.

It is the responsibility of the customer’s technical departments to evaluate the suitability of the Evaluation Boards and Reference Boards for the intended application, and to evaluate the completeness and correctness of the information provided in this document with respect to such application.

The customer is obliged to ensure that the use of the Evaluation Boards and Reference Boards does not cause any harm to persons or third party property.
The Evaluation Boards and Reference Boards and any information in this document is provided "as is" and Infineon Technologies disclaims any warranties, express or implied, including but not limited to warranties of non-infringement of third party rights and implied warranties of fitness for any purpose, or for merchantability.

Infineon Technologies shall not be responsible for any damages resulting from the use of the Evaluation Boards and Reference Boards and/or from any information provided in this document. The customer is obliged to defend, indemnify and hold Infineon Technologies harmless from and against any claims or damages arising out of or resulting from any use thereof.

Infineon Technologies reserves the right to modify this document and/or any information provided herein at any time without further notice.

Safety precautions

Note: Please note the following warnings regarding the hazards associated with development systems.

Table 1 Safety precautions

	***Caution:** Lithium batteries may explode if not treated correctly. Special care has to be taken if the TLD5542-1CHG_SHIELD is used as battery charger for Lithium batteries*
	**Caution:** *The heat sink and device surfaces of the evaluation or reference board may become hot during testing. Hence, necessary precautions are required while handling the board. Failure to comply may cause injury.*
	**Caution:** *The evaluation or reference board contains parts and assemblies sensitive to electrostatic discharge (ESD). Electrostatic control precautions are required when installing, testing, servicing or repairing the assembly. Component damage may result if ESD control procedures are not followed. If you are not familiar with electrostatic control procedures, refer to the applicable ESD protection handbooks and guidelines.*

1 Table of contents

2 Description

Core of the shields is the TLD5542-1, a 4-switch buck-boost converter, which is among the most efficient buck-boost topologies for high current applications. The device has an SPI interface and an analog input current monitor, therefore it is suitable for an Arduino DC-DC application.

A CYPD3177 barrel cable replacement IC, which requests the maximum power profile available at the USB-PD adapter, is present on the board. The Arduino microcontroller can easily read the USB PDO (Power Data Objects) values via I2C from the CYPD3177.

The battery charger algorithm is implemented in the Arduino, therefore it is highly customizable. The output voltage is monitored by Arduino ADCs with an external reference voltage with 0.2% accuracy.

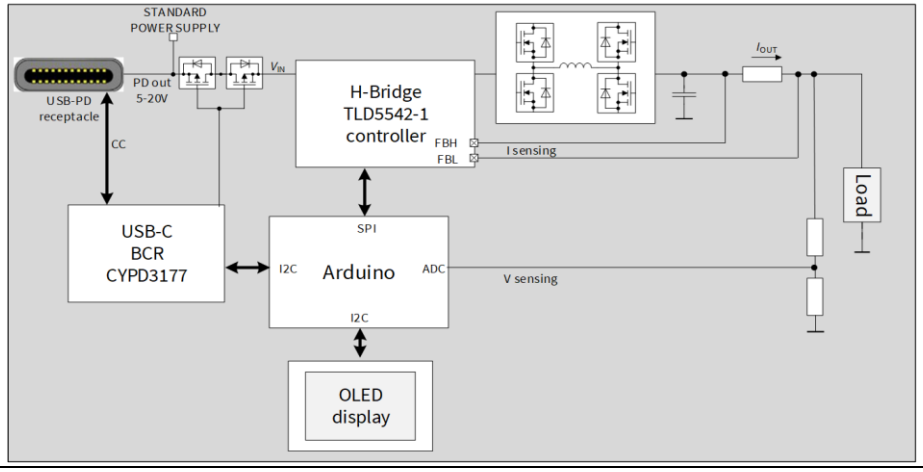

Figure 2 TLD5542-1CHG_SHIELD block diagram

The shield can be powered either by a USB-PD adapter, or by a standard 12 V power supply, and it can be configured as:

- Battery charger
- Adjustable voltage regulator
- LED driver

Upload the relevant sketch to the Arduino UNO board and apply the correct solder jump configuration.

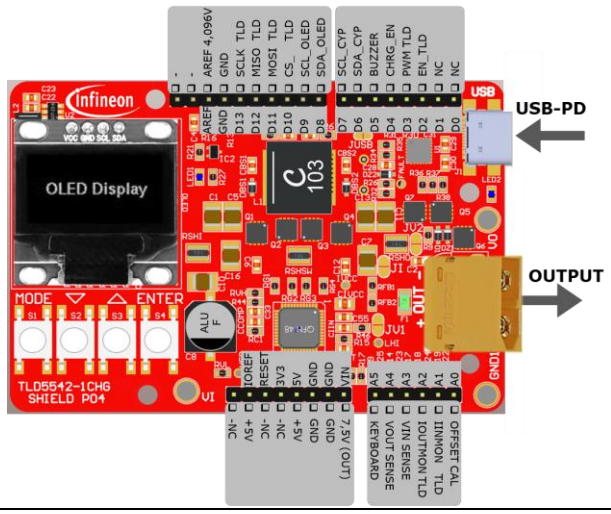

Figure 3 TLD5542-1CHG_SHIELD pinout configuration

2.1 Special attention when using as charger

Lithium batteries may explode if not treated correctly. Special care has to be taken if the TLD5542-1CHG_SHIELD is used as battery charger:

- Use only with a charger sketch specific for the battery chemistry installed
- Use only if the shield solder jumpers are set for battery charger and NOT for voltage regulator
- Use only to charge protected batteries[1)]
- Never charge batteries without supervision
- Set proper charging parameters before operating. Setting the parameters incorrectly will result in damage to the product, personal property and may cause serious injury as well.
- Check if the voltage/current values are read correctly by the shield, comparing the ADC readings with a multimeter

The user assumes all responsibility and liability for proper and safe handling of the materials. Furthermore, the user indemnifies Infineon from all claims arising from the handling or use of the materials. Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge. EXCEPT TO THE EXTENT OF THE INDEMNITY SET FORTH ABOVE, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

1) Even when using protected batteries, pay attention, output voltage may reach 32 V for a short time in case the battery is overcharged because the protection disconnects the battery from the charger. This could damage some protection PCBs making them ineffective. The safest approach would be to change the overvoltage setting (R_{VH} and R_{VL} resistor) to remain just few volts above the selected battery maximum voltage.

3 Quick start procedure

In the following paragraphs, step by step procedures are laid out for setting up and running the shield in all available configurations.

All through-hole components are provided but due to cost reduction, may not be attached to the shield for example, pin-headers, XT60 connector and buzzer, they have to be soldered by the end user.

Place the buzzer on the bottom-side of the PCB, see Figure 7.

Both battery charger and LED driver are current regulators, so they use the same hardware configuration. Please upload only the appropriate sketch for the desired functionality, see Chapter 4 for details on the 2 sketches.

3.1 Battery charger or LED driver - powered by USB-PD

1. Set solder jumpers for current regulator and USB-PD supply: see Figure 4
2. Upload the desired sketch (TLD5542-1CHARGER for battery charger or TLD5542-1LED_DRV for LED driver)
3. Plug the TLD5542-1CHG_SHIELD on the Arduino UNO board

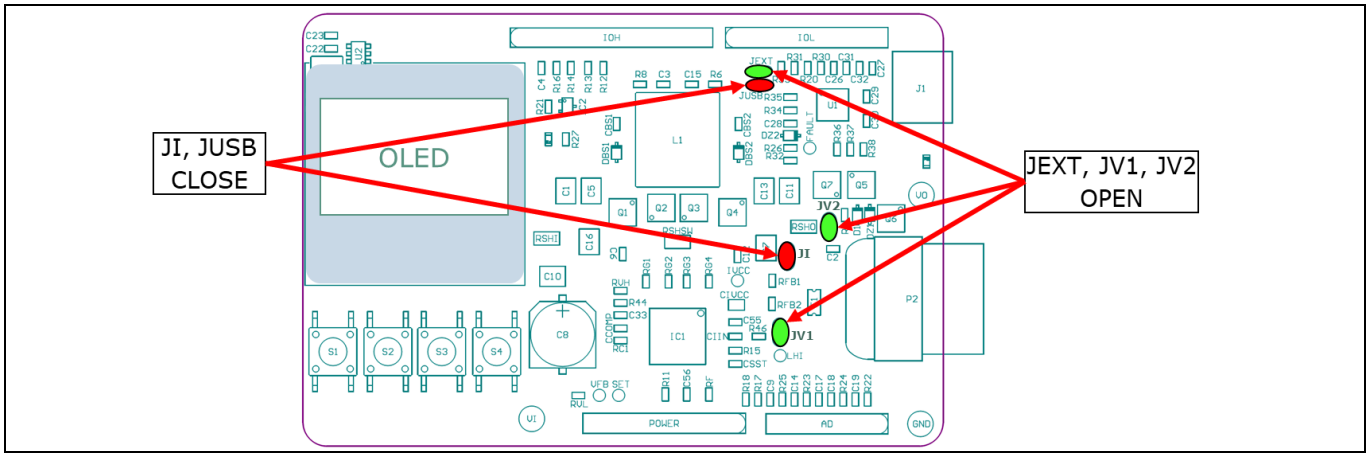

Figure 4 Set jumpers for charger mode powered by USB-PD

4. Connect a USB-PD adapter (recommended ≥ 18W) to J1 USB connector
5. Connect the load (LED or battery) depending on the installed sketch to the OUT connector P2

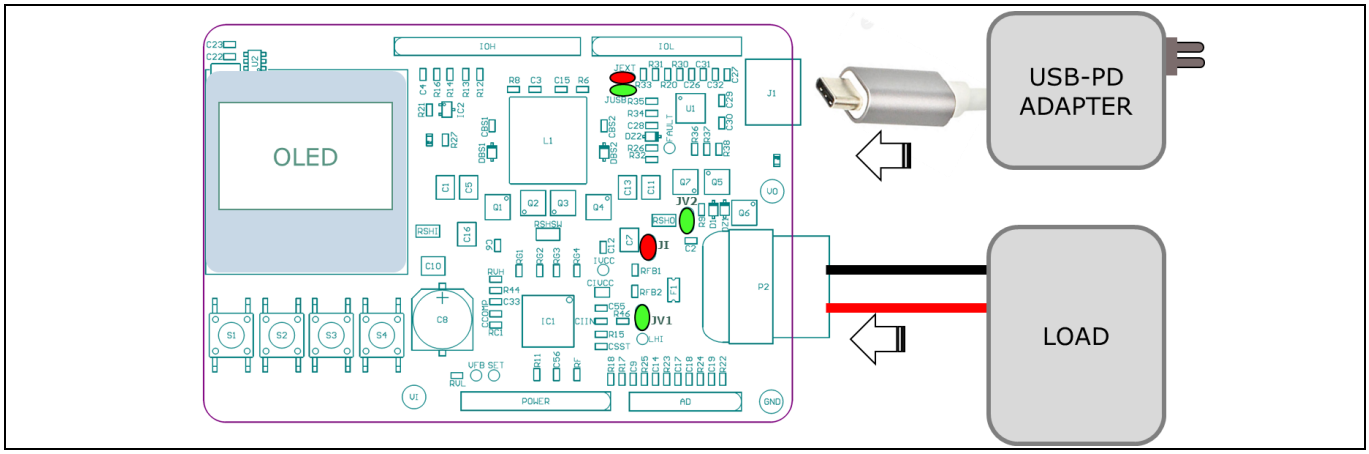

Figure 5 Connect power supply and the load (battery or LED depending on the installed sketch)

6. Set charge or LED driver parameters and start charging (see chapter 4)

3.2 Battery charger or LED driver - powered by standard power supply

1. Configure solder jumper for battery charger and external standard power supply: see Figure 6
2. Upload the desired sketch (TLD5542-1CHARGER for battery charger or TLD5542-1LED_DRV for LED driver)
3. Plug the TLD5542-1CHG_SHIELD on the Arduino UNO board

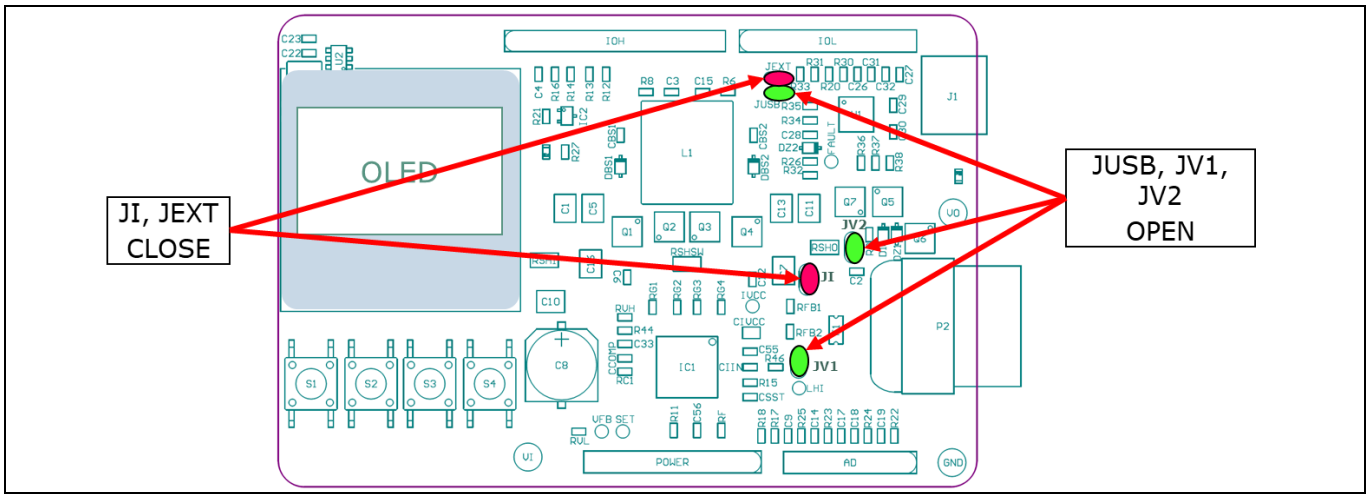

Figure 6 Set jumpers for charger mode powered by standard power supply

4. Solder 2 wires at the bottom of the PCB at the EXT power supply pads: see Figure 7
5. Connect a POWER supply 9 V to 30 V (see power derating profile): see Figure 15
6. Connect the load (LED or battery) depending on the installed sketch to the OUT connector P2
7. Set charge or LED driver parameters and start charging (see Chapter 4)

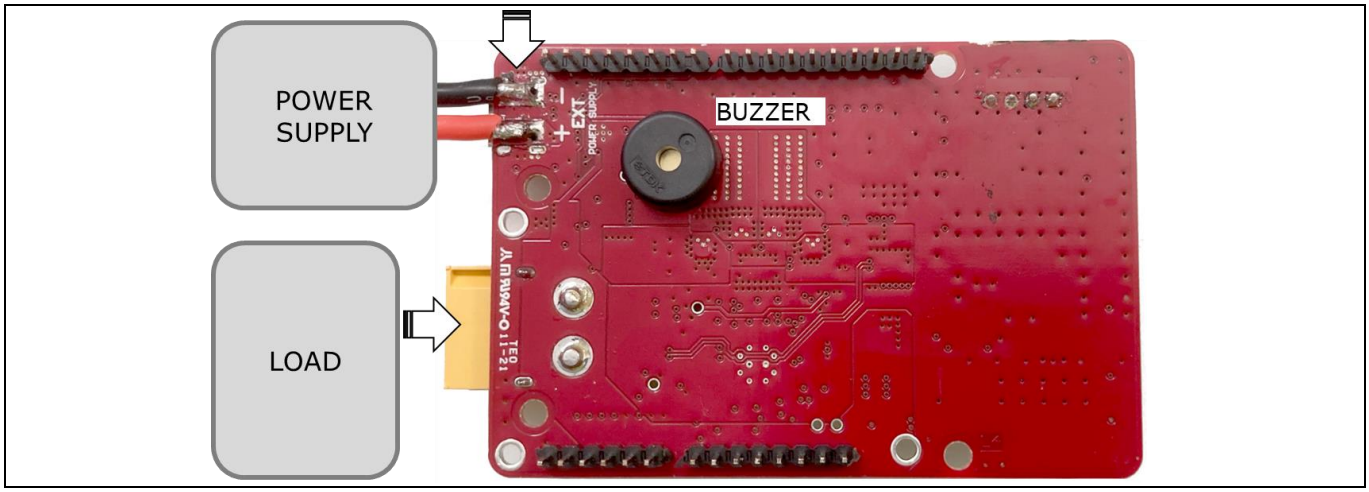

Figure 7 Solder power supply wires at the shield EXT pads

3.3 Voltage regulator - powered by USB-PD

1. Configure solder jumpers for voltage regulator and external standard power supply: Figure 8
   Upload the TLD5542-1VREG sketch to Arduino UNO board and plug in the TLD5542-1CHG_SHIELD

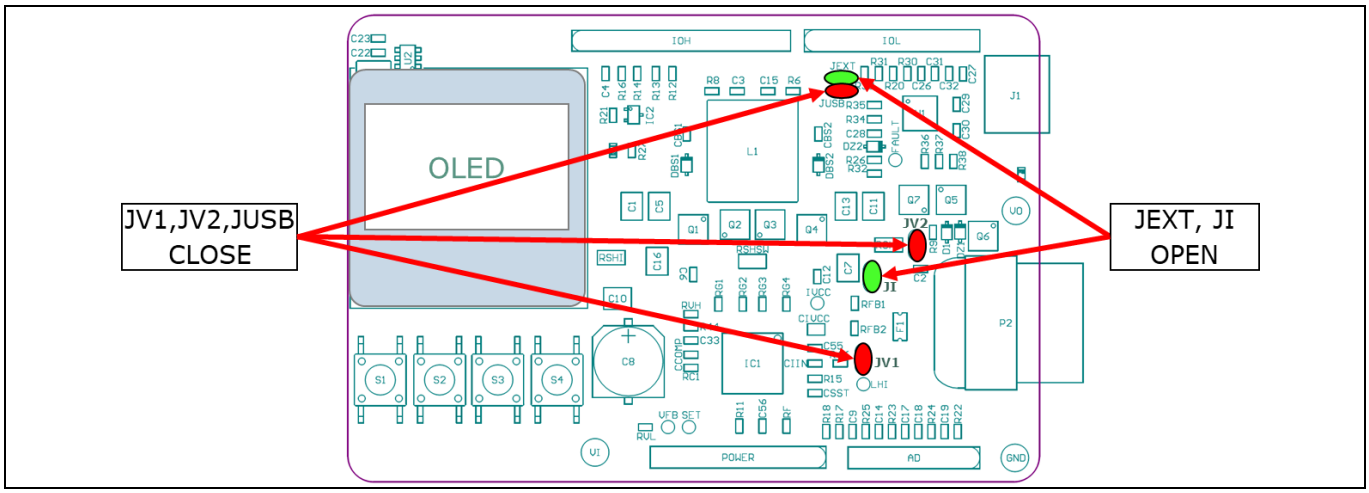

Figure 8 Jumpers set for voltage regulator mode powered by USB-PD

2. Connect a USB-PD adapter (recommended ≥ 18 W)
3. Connect the load
4. Set the desired voltage regulator parameters(see Chapter 4)

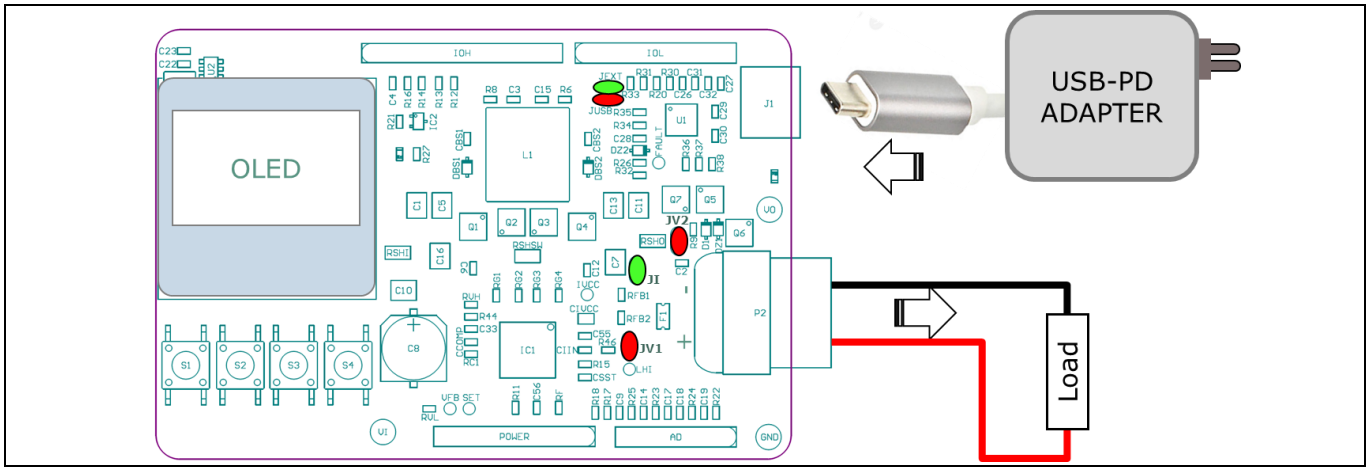

Figure 9 Connect power supply and the load

Note: *Load for the voltage regulator cannot be a battery because the shield could be damaged*

3.4 Voltage regulator - powered by standard power supply

1. Configure jumpers for voltage regulator and external standard power supply, see Figure 10

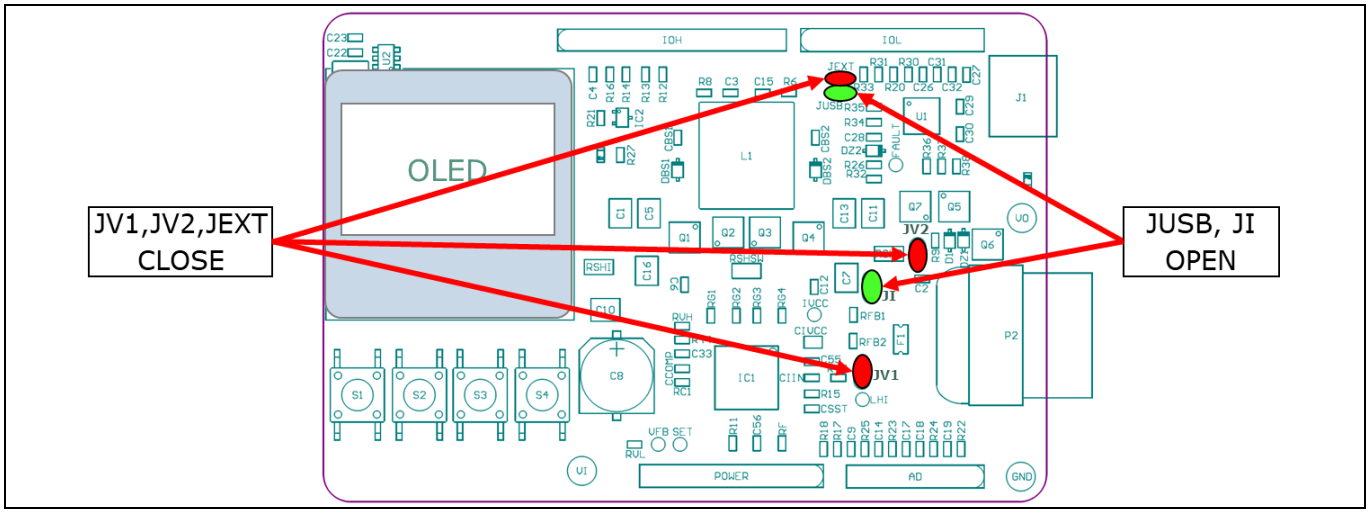

Figure 10 Jumper set for voltage regulator mode powered by standard power supply

2. Upload the TLD5542-1VREG sketch to Arduino UNO board and plug in the shield
3. Solder 2 wires at the bottom of the PCB at the EXT power supply pads: Figure 7
4. Connect the load.
5. Set the desired voltage regulator parameters(see Chapter 4)

Note: *Load for the voltage regulator cannot be a battery or the shield could be damaged*

4 Quick start procedure software

This section provides a short description of the 3 main sketches for the TLD5542-1CHG_SHIELD.

Every sketch implements basic protection functions such as:

- Short circuit protection
- Input maximum power limiter
- Input under voltage

The user can set the maximum input power sink by the shield, the sketch will automatically lower the output current/voltage with the aim of keeping the input power below the selected power.

4.1 Charger sketch

The TLD5542-1CHARGER sketch transforms the shield into a lithium battery charger.

The first displayed screen allows the user to set several battery charging parameters: cell count, final cell voltage, charge current, maximum input power limit. The charger algorithm will automatically lower the output current to remain below the selected maximum power.

The cell count can be set from 1 to 6 cells. Depleted cells below 3 V will not be charged and therefore it is important to set the correct cell count on the parameter. There is no balance plug, so the sketch cannot detect unbalanced cells.

The push-button functionalities are:

- MODE button: switch from a parameter to another one, the selected parameter is highlighted
- ARROW buttons: the selected parameter increases or decreases
- ENTER button: battery starts charging with the chosen values

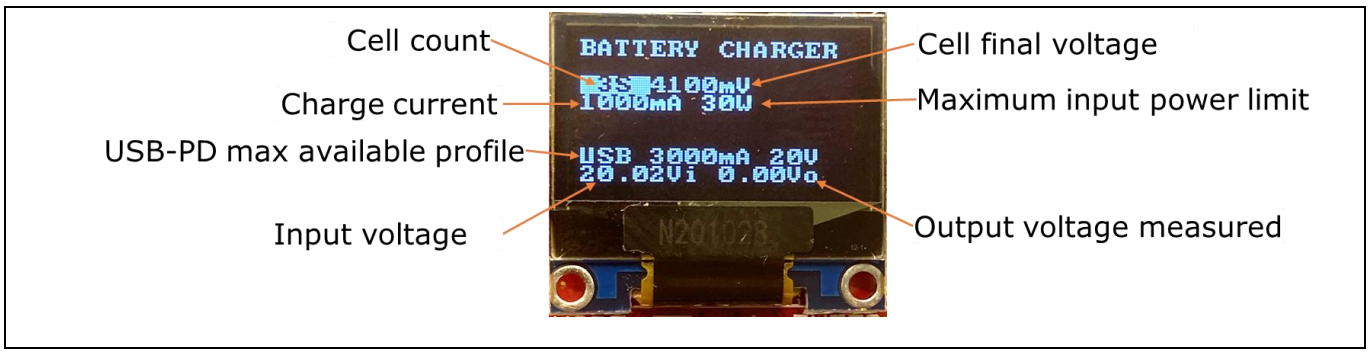

Figure 11 TLD5542-1CHARGER sketch, set parameters screen

The last 2 rows of the screen present measured parameters.

If a USB-PD adapter is connected to the shield, the software will request the highest available power profile, and this will be reported on the screen. While charging, the display shows charging variables as shown in Figure 12.

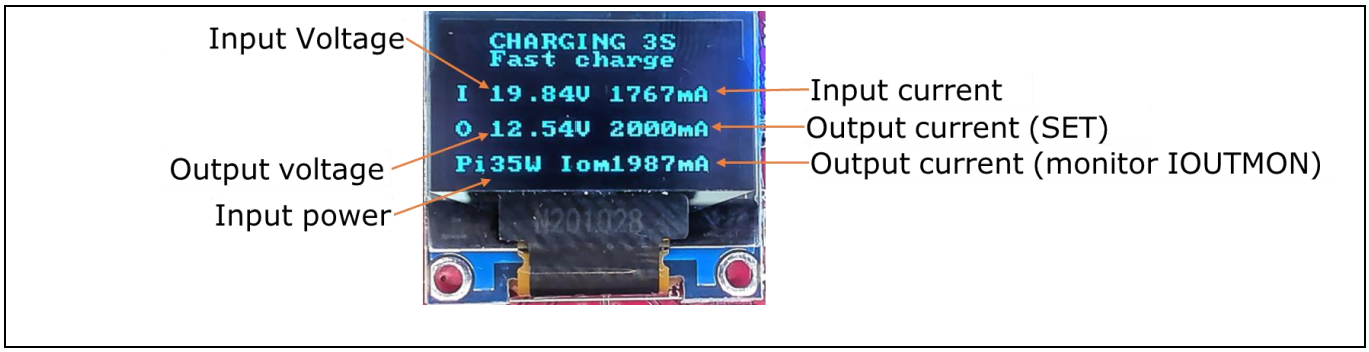

Figure 12 TLD5542-1CHARGER sketch, charging screen

Any button pressed during the charging phase interrupts the charging process.

4.2 Voltage regulator sketch

The TLD5542-1VREG sketch transforms the shield into an adjustable voltage regulator.

The first displayed screen allows the user to set several voltage regulator parameters: V_{OUT}, and maximum input power limit. The voltage regulator algorithm will automatically lower the output voltage to remain below the selected maximum power.

The push-button functionalities are:

- MODE button: switch from a parameter to another one, the selected parameter is highlighted
- ARROW buttons: the selected parameter increases or decreases
- ENTER button: turns ON/OFF the output voltage

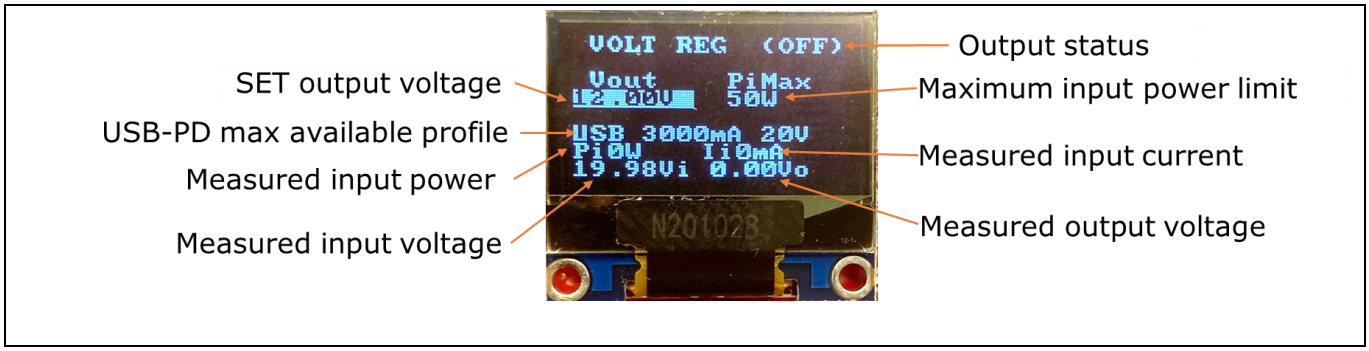

Figure 13 TLD5542-1VOLTAGE sketch, main screen

The last 3 rows of the screen present measured parameters.

If a USB-PD adapter is connected to the shield, the software will request the highest available power profile, and this will be reported on the screen.

4.3 LED driver sketch

The TLD5542-1LED sketch transforms the shield into an LED driver, where the user can set output current and PWMI duty cycle.

The shield has X7R ceramic capacitors for automotive applications, these capacitors have strong piezoelectric effect, so if a PWM, smaller than 100% is applied, a buzzing noise will be produced because of the V_{OUT} variations. For ambient lighting application, the best dimming method is the analog dimming, achieved by reducing the driving current while keeping PWM to 100%. This method is flicker free, and also good for video recording.

The first displayed screen allows the user to set several LED driver parameters: output current, maximum input power limit and PWM Duty cycle. The LED driver algorithm will automatically lower the output current to remain below the selected maximum power.

The push-button functionalities are:

- MODE button: switch from a parameter to another one, the selected parameter is highlighted
- ARROW buttons: the selected parameter increases or decreases
- ENTER button: turns ON/OFF the output current

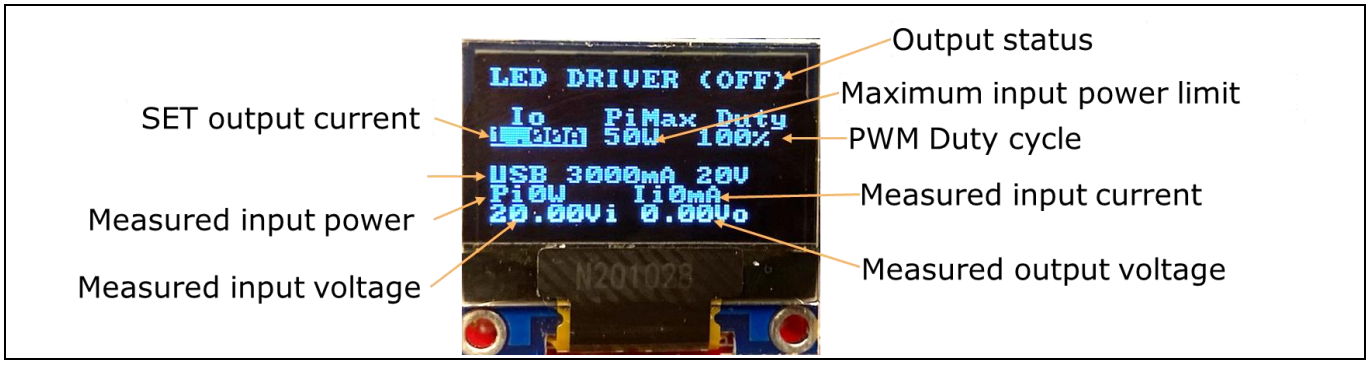

Figure 14 TLD5542-1LED sketch, main screen

The last 3 rows of the screen present measured parameters.

If a USB-PD adapter is connected to the shield, the software will request the highest available power profile, and this will be reported in the screen. The user can then limit the maximum input power sink by the shield to avoid exceeding the power capability of the adapter or the external power supply.

The LED driver sketch detects a short circuit at the output and shuts down the regulator if a voltage below 3 V is measured at the output.

5 Operating range and power derating

The TLD5542-1CHG_SHIELD has very high efficiency, so it can deliver up to 65 W at the output without a heat sink at T_A = 25°C, V_{IN} = 20 V (see Figure 15 for power-derating curve).

Note: *The module does not implement thermal protection, so ensure proper cooling or software power derating if an enclosure is applied, or if ambient temperature is higher than 25°C.*

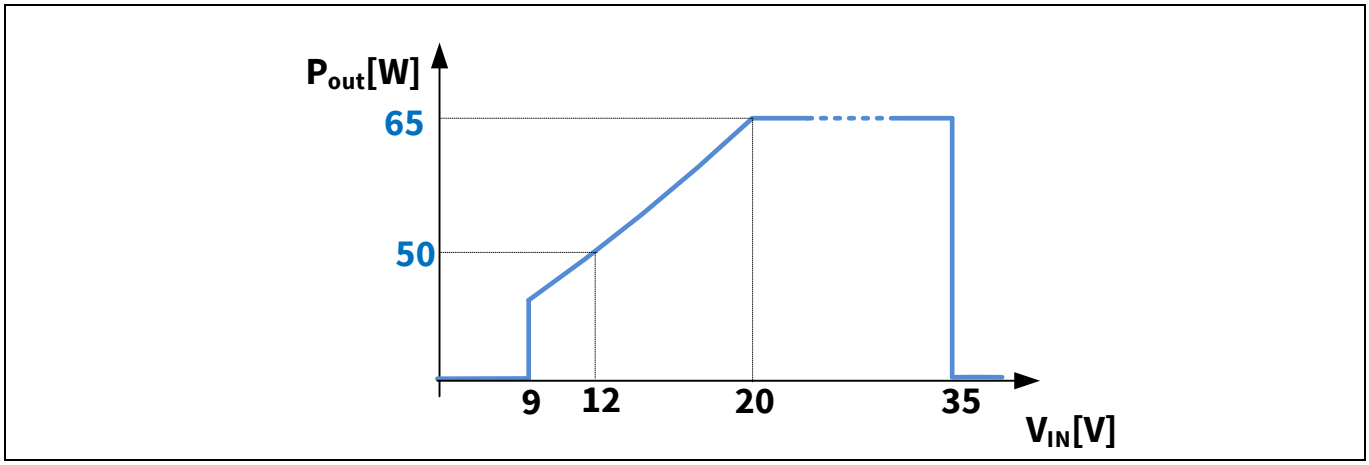

Figure 15 Output power derating curve (T_A = 25°C)

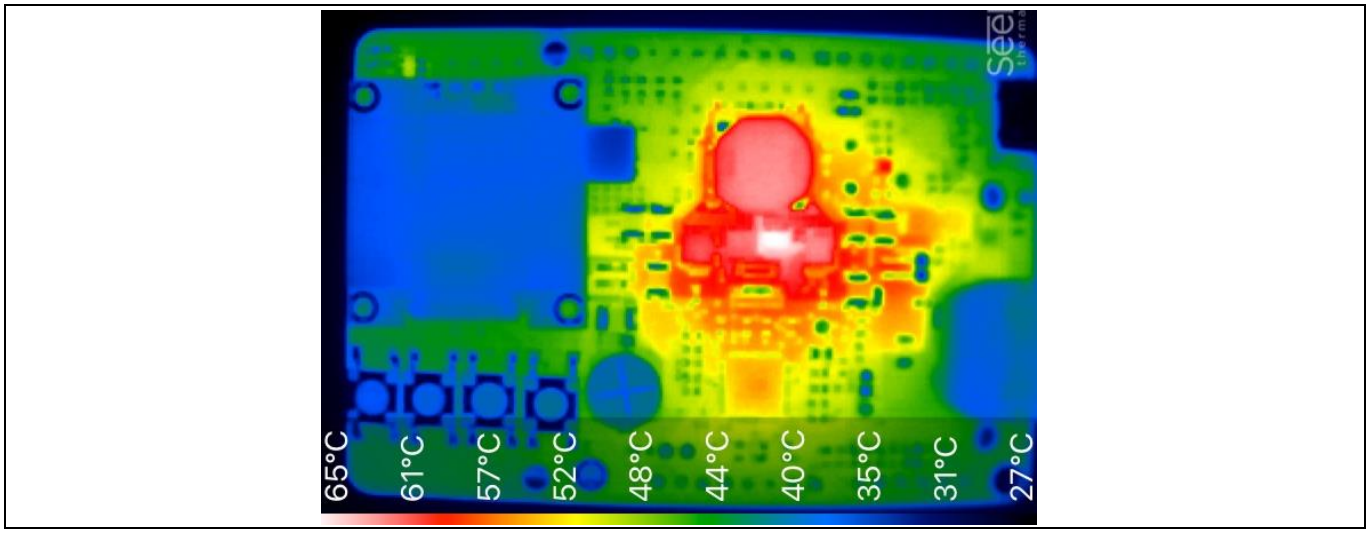

Figure 16 Thermal, P_{OUT} = 64 W, T_A = 25°C, V_{IN} = 20 V, V_{OUT} = 20 V, I_{OUT}= 3.2 A

6 Electrical characteristics

Table 2 TLD5542-1IVREG-EVAL version S01 P01 – electrical characteristics

Parameter	Symbol	Value			Unit	Note/Test Condition
		Min.	Typ.	Max.		
Input voltage	V_{IN}	7	–	35	V	Power derating may occur for V_{IN} < 9 V
Outout voltage	V_{OUT}	3.2 3.5	–	30 25	V	Current mode Voltage mode
Output current	I_{OUT}	0	–	5	A	
Output power	P_{OUT}	–	–	65	W	V_{IN} 20 V, T_A = 25°C No Enclosure
Switching frequency	Switching frequency	–	385	–	kHz	Spread spectrum deviation is present
System efficiency	η	–	95	–	%	
Accuracy voltage	Acc_V	1			%	V_{OUT} = 30 V
Accuracy current	Acc_I	3			%	I_{OUT} = 5 A
