2.2.1. Background Operations Mode

The background operations mode grants the device time to execute Flash management operations such as wear leveling, bad block management, garbage collection and others.

These operations will only occur when Background Operations Mode is enabled and the command queue is empty.

2.3. Security Features

Table 2-3 Security Features

Features	Target Area	Description		
		Value of deallocated LBA	Erase of Physical Memory	
ERASE	Unmapped LBA	0	No	
DISCARD	Unmapped LBA	any data	No	
PURGE	Unmapped LBA	ERASE	0	Yes
		DISCARD	any data	Yes
WIPE Device (1)	All device	0	No	

Note 1: A FORMAT UNIT command is issued to a Device Well-Known logical unit will request the device to format all enabled logical units except the RPMB well known logical unit. If any logical unit is Write Protected when the FORMAT UNIT command is issued to Device Well-Known logical unit, the FORMAT UNIT command will fail and the content of the medium will not be altered.

2.4. Queue Priority

A Logical Unit contains a task queue that will support the processing of one or more Tasks, managed by the Logical Unit.

Below table describes the Task Attribute that defines the queue type.

Table 2-4 Command Queue – Task Attribute Description

Task Attribute	Bit 1	Bit 0	Support
Simple	0	0	Yes
Ordered	0	1	Yes
Head of Queue	1	0	Yes

2.5. Cache

The cache is a device level cache, applied to all LUs and is expected to be volatile. Data in the cache is not expected to remain valid over power cycles neither SW/HW reset cycles.

2.6. Power Off Notification

Power Off Notification is the mechanism utilized by the host to inform the storage device to get ready for power off. The device then will require time to complete ongoing operations and execute the NAND Flash management tasks required to prevent data loss and to optimize the device for a faster initialization upon the next power up.

3. Attributes

An Attribute is a parameter that represents a specific range of numeric values that can be written or read.
