

IS31AP2111

2×20W STEREO/1×40W MONO DIGITAL (I2S) AUDIO AMPLIFIER WITH 20 BANDS EQ FUNCTIONS

August 2021

GENERAL DESCRIPTION

The IS31AP2111 is a digital I2S interface audio amplifier capable of driving a pair of 8Ω speakers at 20W when operating from a 24V supply. Due to its Class-D output drive stage; it can operate without an external heat-sink or fan.

The IS31AP2111 integrates advanced audio processing capabilities, such as volume control, 20 bands speaker EQ, audio mixing, 3D surround and Dynamic Range Control (DRC). These functions are fully programmable via a simple I2C control interface.

Robust protection circuits are provided to protect the IS31AP2111 from damage due to accidental or erroneous operating conditions. Because of its digital design, the IS31AP2111 is more tolerant to noise and PVT (Process, Voltage, and Temperature) variation than the analog Class-AB or Class-D audio amplifier counterpart. It has a robust anti-pop circuit for pop free operation during power ON. It integrates protection features for short circuit and over temperature.

The IS31AP2111 is available in a thermally enhanced eTSSOP-24 package.

APPLICATIONS

- TV audio
- Boom-box, CD and DVD receiver, docking system
- Powered speaker
- Wireless audio

FEATURES

- 16/18/20/24-bits input with I2S, Left-alignment and Right-alignment data format
- PSNR & DR (A-weighting)
speaker: 99dB (PSNR), 104dB (DR) @24V
- Multiple sampling frequencies (F_s)
 - 32kHz / 44.1kHz / 48kHz and
 - 64kHz / 88.2kHz / 96kHz and
 - 128kHz / 176.4kHz / 192kHz
- System clock = 64x, 128x, 192x, 256x, 384x, 512x, 576x, 768x, 1024x F_s
 - 64x~1024x F_s for 32kHz / 44.1kHz / 48kHz
 - 64x~512x F_s for 64kHz / 88.2kHz / 96kHz
 - 64x~256x F_s for 128kHz / 176.4kHz / 192kHz
- Supply voltage
 - 3.3V for digital circuit
 - 10V~26V for speaker driver
- speaker output power at 24V
 - 10W × 2CH into 8Ω @0.24% THD+N for stereo
 - 20W × 2CH into 8Ω @0.38% THD+N for stereo
 - 40W × 1CH into 4Ω @0.12% THD+N for mono
- Sound processing including:
 - 20 bands parametric speaker EQ
 - Volume control (+24dB ~ -103dB, 0.125dB/step),
 - Dynamic range control (DRC)
 - Dual band dynamic range control
 - Power clipping
 - 3D surround sound
 - Channel mixing
 - Noise gate with hysteresis window
 - Bass/Treble tone control
 - DC-blocking high-pass filter
- Anti-pop design
- Short circuit and over-temperature protection
- I2C control interface with selectable device address
- Support hardware and software reset
- Internal PLL
- LV Under-voltage shutdown and HV Under-voltage detection
- Power saving mode

TYPICAL APPLICATION CIRCUIT

Figure 1 Typical Application Circuit (for BTL Stereo, Single-ended Input)

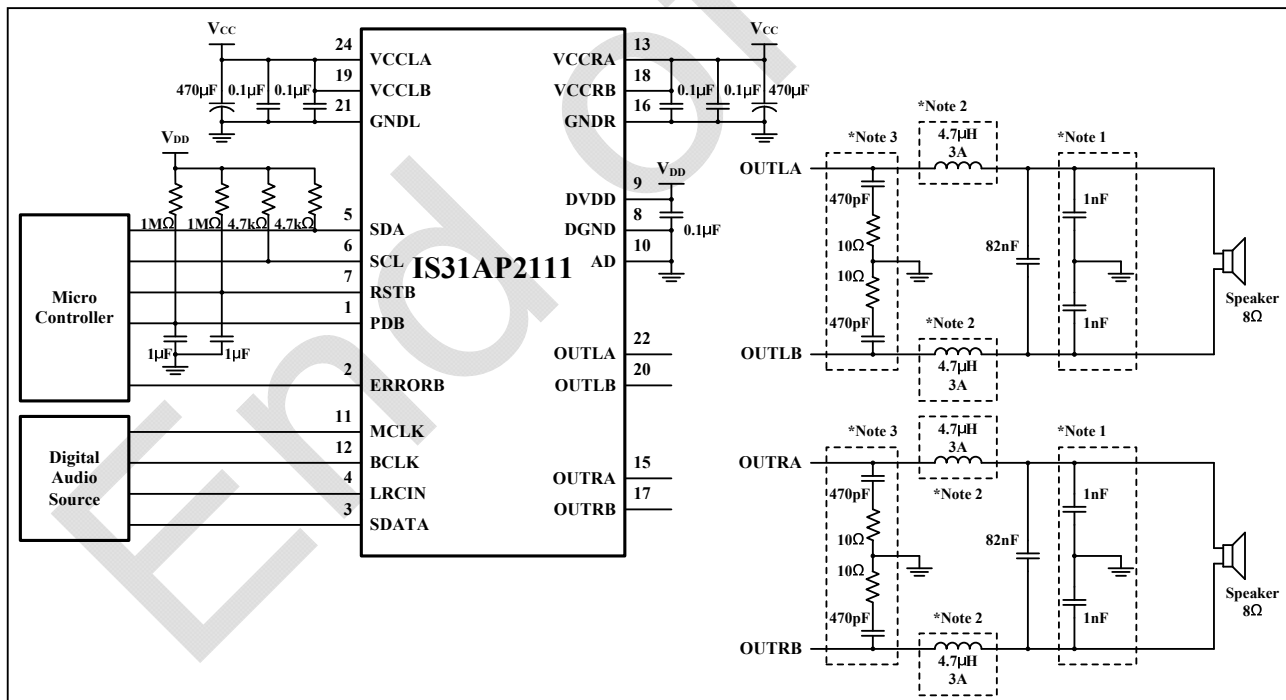

Figure 2 Typical Application Circuit (Economic Type, Moderate EMI Suppression)

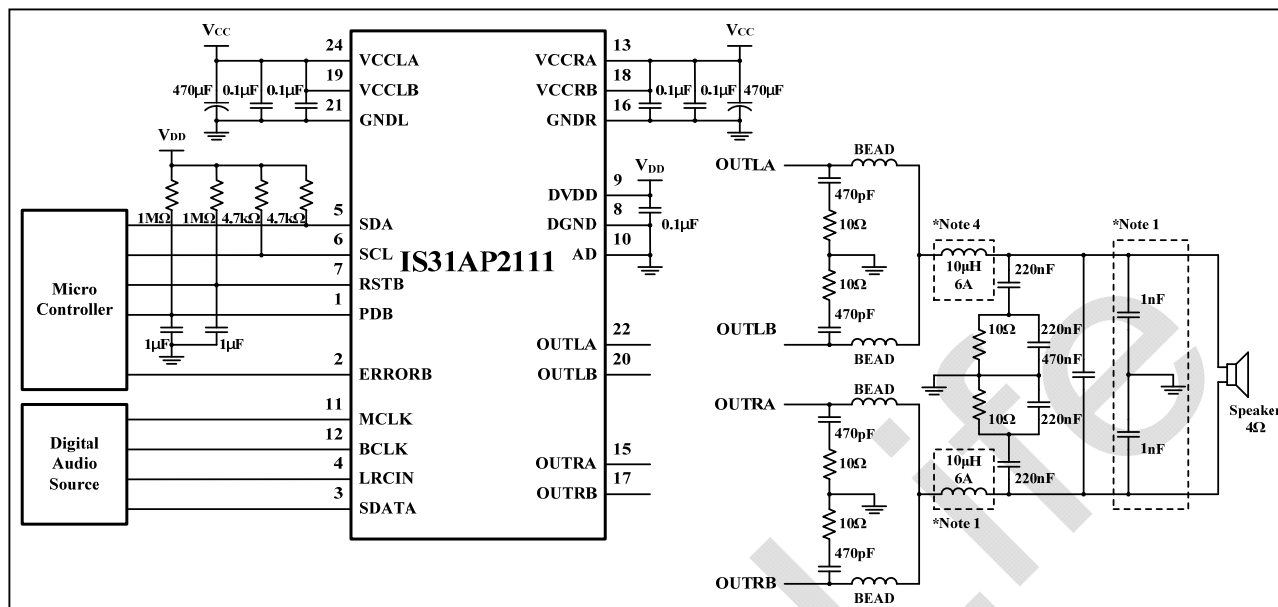

Figure 3 Typical Application Circuit (for Mono)

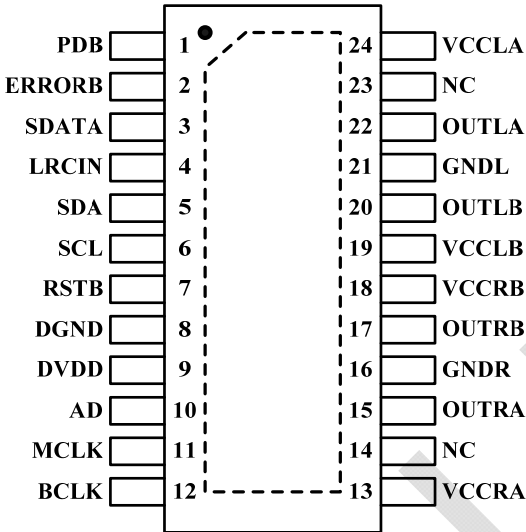

Note 1: These capacitors should be placed as close to speaker jack as possible, and their values should be determined according to EMI test results.

Note 2: When concerning about short-circuit protection, it is suggested using the choke with its I_{DC} larger than 5A.

Note 3: The snubber circuit can be removed while the $V_{CC} \leq 20V$.

Note 4: When concerning about short-circuit protection, it is suggested using the choke with its I_{DC} larger than 10A.

PIN DESCRIPTION

No.	Pin	Description	Characteristics
1	PDB	Power down, low active.	Schmitt trigger TTL input buffer
2	ERRORB	Error status, low active.	Open-drain output
3	SDATA	I2S serial audio data input.	Schmitt trigger TTL input buffer
4	LRCIN	Left/Right clock input (F_s).	Schmitt trigger TTL input buffer
5	SDA	I2C serial data.	Schmitt trigger TTL input buffer
6	SCL	I2C serial clock input.	Schmitt trigger TTL input buffer
7	RSTB	Reset, low active.	Schmitt trigger TTL input buffer
8	DGND	Digital ground.	
9	DVDD	Digital power.	
10	AD	I2C select address.	Schmitt trigger TTL input buffer
11	MCLK	Master clock input.	Schmitt trigger TTL input buffer
12	BCLK	Bit clock input ($64F_s$).	Schmitt trigger TTL input buffer
13	VCCRA	Right channel supply A.	
14, 23	NC	No connection.	
15	OUTRA	Right channel output A.	
16	GNDR	Right channel ground.	
17	OUTRB	Right channel output B.	
18	VCCRB	Right channel supply B.	
19	VCCLB	Left channel supply B.	
20	OUTLB	Left channel output B.	
21	GNDL	Left channel ground.	
22	OUTLA	Left channel output A.	
24	VCCLA	Left channel supply A.	
	Thermal Pad	Connect to GND.

IS31AP2111

ABSOLUTE MAXIMUM RATINGS

Supply for driver stage (VCCR, VCCL), V _{CC}	-0.3V ~ +30V
Supply for digital circuit (DVDD), V _{DD}	-0.3V ~ +3.6V
Input voltage (SDA,SCL,RSTB,PDB,ERRORB,MCLK, BCLK,LRCIN,SDATA), V _{IN}	-0.3V ~ +3.6V
Thermal resistance, θ_{JA}	32.8°C/W
Junction temperature range, T _J	0°C ~ 150°C
Storage temperature range, T _{STG}	-65°C ~ +150°C
ESD (HBM)	±2kV
ESD (CDM)	±1kV

Note: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
V _{CC}	Supply for driver stage to VCCR/L		7		26	V
V _{DD}	Supply for digital circuit		3.15		3.45	V
T _J	Junction operating temperature		0		125	°C
T _A	Ambient operating temperature		0		70	°C

DC ELECTRICAL CHARACTERISTICS

V_{CC}=24V, T_A=25°C, R_L=8Ω (unless otherwise noted).

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
I _{PDH}	VCC supply current during power down	V _{CC} = 24V		4	200	μA
I _{PDL}	DVDD supply current during power down	V _{DD} = 3.3V		3.6	10	μA
V _{UVH_HV}	Under voltage disabled (For VCC)			10.2		V
V _{UVL_HV}	Under voltage enabled (For VCC)			9.2		V
V _{UVH_LV}	Under voltage disabled (For DVDD)			2.9		V
V _{UVL_LV}	Under voltage enabled (For DVDD)			2.8		V
R _{DS(ON)}	Static drain-to-source ON-state resistor, PMOS	V _{CC} = 24V, I _D = 500mA		245		mΩ
	Static drain-to-source ON-state resistor, NMOS			150		
I _{SC}	L/R channel over-current protection	V _{CC} = 24V (Note 1)		5.1		A
	Mono channel over-current protection			10		
T _S	Junction temperature for driver shutdown			158		°C
	Temperature hysteresis for recovery from shutdown			33		°C

Logic Electrical Characteristics

V _{IH}	High level input voltage		2.0			V
V _{IL}	Low level input voltage				0.8	V
V _{OH}	High level output voltage		2.4			V
V _{OL}	Low level output voltage				0.4	V
C _{IN}	Input capacitance			6.4		pF

AC ELECTRICAL CHARACTERISTICS

$T_A = 25^\circ\text{C}$, $V_{CC} = 24\text{V}$, $V_{DD} = 3.3\text{V}$, $f_s = 48\text{kHz}$, $R_L = 8\Omega$ with passive LC lowpass filter ($L = 22\mu\text{H}$, $R_{DC} = 0.12\Omega$, $C = 470\text{nF}$), input is 1kHz sinewave, volume is 0dB unless otherwise specified.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
P_O	RMS output power	THD+N=0.38%, +8dB volume (Note 2)		20		W
THD+N	Total harmonic distortion + noise	$P_O = 10\text{W}$		0.24		%
V_{NO}	Output noise	20Hz ~ 20kHz (Note 3)		179		μV
SNR	Signal-to-noise ratio	+8dB volume, input level is -9dB (Note 3)		99		dB
DR	Dynamic range	+8dB volume, input level is -68dB (Note 3)		104		dB
PSRR	Power supply ripple rejection	$V_{RIPPLE} = 1V_{RMS}$ at 1kHz		-68		dB
	Channel separation	1W @1kHz		-85		dB

I2C DIGITAL INPUT SWITCHING CHARACTERISTICS (Note 4)

Symbol	Parameter	Standard Mode		Fast Mode		Unit
		Min.	Max.	Min.	Max.	
f_{SCL}	Serial-Clock frequency	0	100	0	400	kHz
t_{BUF}	Bus free time between a STOP and a START condition	4.7		1.3		μs
$t_{HD, STA}$	Hold time (repeated) START condition	4.0		0.6		μs
$t_{SU, STA}$	Repeated START condition setup time	4.7		0.6		μs
$t_{SU, STO}$	STOP condition setup time	4.0		0.6		μs
$t_{HD, DAT}$	Data hold time	0	3.45	0	0.9	μs
$t_{SU, DAT}$	Data setup time	250		100		ns
t_{LOW}	SCL clock low period	4.7		1.3		μs
t_{HIGH}	SCL clock high period	4.0		0.6		μs
t_R	Rise time of both SDA and SCL signals, receiving		1000	$20 + 0.1C_b$	300	ns
t_F	Fall time of both SDA and SCL signals, receiving		300	$20 + 0.1C_b$	300	ns
C_b	Capacitive load for each bus line		400		400	pF
V_{NL}	Noise margin at the low level for each connected device (including hysteresis)	$0.1V_{DD}$		$0.1V_{DD}$		V
V_{NH}	Noise margin at the high level for each connected device (including hysteresis)	$0.2V_{DD}$		$0.2V_{DD}$		V

IS31AP2111

I2S DIGITAL INPUT SWITCHING CHARACTERISTICS (Note 4)

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
t_{LR}	LRCIN period ($1/F_s$)		10.41		31.25	μs
t_{BL}	BCLK rising edge to LRCIN edge		50			ns
t_{LB}	LRCIN edge to BCLK rising edge		50			ns
t_{BCC}	BCLK period ($1/64F_s$)		162.76		488.3	ns
t_{BCH}	BCLK pulse width high		81.38		244	ns
t_{BCL}	BCLK pulse width low		81.38		244	ns
t_{DS}	SDATA set up time		50			ns
t_{DH}	SDATA hold time		50			ns

Note 1: Speaker over-current protection is only effective when speaker drivers are properly connected with external LC filters. Please refer to the application circuit example for recommended LC filter configuration.

Note 2: Thermal dissipation is limited by package type and PCB design. The external heat-sink or system cooling method should be adopted for maximum power output.

Note 3: Measured with A-weighting filter.

Note 4: Guaranteed by design.

FUNCTIONAL BLOCK DIAGRAM

APPLICATIONS INFORMATION

OPERATION MODES

Without I2C Control

The default settings, Bass, Treble, EQ, Volume, DRC are applied to register table content when using the IS31AP2111 without I2C control. For more information about default settings, please refer to the Default Column of Table 4 (Register Function).

As default state is mute, customers should send a de-mute command via I2C to enable the system.

With I2C Control

When using I2C control, user can program suitable parameters into the IS31AP2111 to enable or enhance specific operation features. Please refer to the register table section (Table 5 ~ Table 25) to get the more detail.

INTERNAL PLL

The IS31AP2111 has an integrated PLL to derive a synchronized internal clock (Fs) from the master clock (MCLK) input.

F _s	MCLK/FS Setting Ratio for PLL	MCLK Frequency	Multiple Edge Evaluation for Master Clock	PWM Carrier Frequency
48kHz	256x	12.288MHz	4x	384kHz
44.1kHz	256x	11.289MHz	4x	352.8kHz
32kHz	256x	8.192MHz	4x	256kHz

DEFAULT VOLUME

The default volume level of the IS31AP2111 is +2.0dB, and the default state is muted. Please give a de-mute command via I2C to enable the volume when the whole system is stable. For more detailed information, please refer to the register table section Table 7 (State Control 3 Register).

RESET

When a logic LOW is applied to the RSTB pin, the IS31AP2111 will clear the stored data and reset the register table to their default values. The IS31AP2111 will exit the reset state at the 256th MCLK cycle after the RSTB pin is raised to high.

POWER DOWN CONTROL

The IS31AP2111 has a built-in volume fade-in/fade-out design for power down and mute function. The relative power down timing diagrams for speakers are shown in Figure 29 and 30.

Figure 29 Power Down Timing Diagrams With Mute

Figure 30 Power Down Timing Diagrams

$$t_{FADE} = \left| 10^{\frac{T_{arget}(dB)}{20}} - 10^{\frac{Original(dB)}{20}} \right| \times 128 \times (1/96kHz)$$

The volume level will be decreased to -∞dB in several LRCIN (Left/Right clock) cycles. Once the fade-out procedure has completed, the IS31AP2111 will turn off the power stages, stop the clock signals (MCLK, BCLK) from feeding into the digital circuit and turn off the internal analog circuit current. When PDB pin is pulled low, the IS31AP2111 requires t_{FADE} time to finish the above procedures before entering the power down state. The IS31AP2111 will not accept programming commands while it is in the power down state. During power down, all the register table settings are kept until DVDD power is removed.

If cancel the power down function within fade-out procedure, the IC will enter into fade-in after few

delay time (Figure 30). In addition, the IS31AP2111 will power the internal analog circuit and pass the clock signals (MCLK, BCLK) to the digital circuits. Then, the IS31AP2111 will return to its normal operation without powering down.

SELF-PROTECTION CIRCUITS

The IS31AP2111 has built-in protection circuits including thermal, short-circuit and under-voltage detection circuits.

Thermal Protection

When the internal junction temperature increases to greater than 158°C, the power stages will be turned off. Normal operation will begin once the device temperature cools to 125°C. The temperature values may vary by +/- 10%.

Short-Circuit Protection

The short-circuit protection circuit protects the output stage when the speaker wires are shorted to each other or GND/VDD. During normal 24V stereo operation, the current flowing through the power stage should be less than 5.1A. If an over-temperature or short-circuit condition (current greater than 5.1A) occurs, the open-drain ERRORB pin will be pulled low and latched into ERROR state and the output stages are disabled.

Once the over-temperature or short-circuit condition is removed, the IS31AP2111 will exit the ERROR state when one of the following conditions are met: (1) RSTB pin is pulled low, (2) PDB pin is pulled low, or (3) Master mute is enabled through the I2C interface.

Under-Voltage Protection

If the V_{DD} voltage is lower than 2.8V, the IS31AP2111 will turn off its speaker power stages and disable the digital processing section. The IS31AP2111 will return to normal operation When the V_{DD} supply increases above 2.9V.

ANTI-POP DESIGN

The device generates control signals which suppresses pop sounds during initial power on/off, power down/up, mute, and volume level changes.

3D SURROUND SOUND

The IS31AP2111 includes virtual surround sound technology for stereo signals inputs.

POWER ON SEQUENCE

At power up, the IS31AP2111's default volume setting is muted, so a de-mute command needs to be sent via the I2C interface once the device has completely powered up and stable.

IS31AP2111

I2C-BUS TRANSFER PROTOCOL

I2C INTERFACE

The IS31AP2111 uses a serial bus, which conforms to the I2C protocol, to control the chip's functions with two wires: SCL and SDA. The IS31AP2111 has a 7-bit slave address (A7:A1), followed by the R/W bit, A0. Set A0 to "0" for a write command and set A0 to "1" for a read command. The value of bits A3 is decided by the connection of the AD pin.

The complete slave address is:

Table 1 Slave Address (Write only):

Bit	A7:A4	A3	A2:A1	A0
Value	0110	AD	00	0/1

AD connected to GND, AD = 0;

AD connected to VCC, AD = 1;

The SCL line is uni-directional. The SDA line is bi-directional (open-collector) with a pull-up resistor (typically 4.7kΩ). The maximum clock frequency specified by the I2C standard is 400kHz. In this discussion, the master is the microcontroller and the slave is the IS31AP2111.

The timing diagram for the I2C is shown in Figure 4. The SDA is latched in on the stable high level of the SCL. When there is no interface activity, the SDA line should be held high.

The "START" signal is generated by lowering the SDA signal while the SCL signal is high. The start signal will alert all devices attached to the I2C bus to check the incoming address against their own chip address.

The 8-bit chip address is sent next, most significant bit first. Each address bit must be stable while the

SCL level is high.

After the last bit of the chip address is sent, the master checks for the IS31AP2111's acknowledge. The master releases the SDA line high (through a pull-up resistor). Then the master sends an SCL pulse. If the IS31AP2111 has received the address correctly, then it holds the SDA line low during the SCL pulse. If the SDA line is not low, then the master should send a "STOP" signal (discussed later) and abort the transfer.

Following acknowledge of IS31AP2111, the register address byte is sent, most significant bit first. IS31AP2111 must generate another acknowledge indicating that the register address has been received.

Then 8-bit of data byte are sent next, most significant bit first. Each data bit should be valid while the SCL level is stable high. After the data byte is sent, the IS31AP2111 must generate another acknowledge to indicate that the data was received.

The "STOP" signal ends the transfer. To signal "STOP", the SDA signal goes high while the SCL signal is high.

READING PORT REGISTERS

To read the device data, the bus master must first send the IS31AP2111 address with the R/W bit set to "0", followed by the command byte, which determines which register is accessed. After a restart, the bus master must then send the IS31AP2111 address with the R/W bit set to "1". Data from the register defined by the command byte is then sent from the IS31AP2111 to the master (Figure 35).

Table 6 01h State Control 2 Register

Bit	D7:D6	D5:D4	D3:D0
Name	-	FS	PMF
Default	xx	00	0000

IS31AP2111 has a built-in PLL and multiple MCLK/Fs ratios are supported. Detail setting is shown in the following table.

FS Sampling Frequency

00	32/44.1/48kHz
01	64/88.2/96kHz
1x	128/176.4/192kHz

PMF Multiple MCLK/FS Ratio Setting

0000	1024x(FS=00)/ 512x(FS=01)/ 256x(FS=1x)
0001	64x
0010	128x
0011	192x
0100	256x
0101	384x (Not available when FS=1x)
0110	512x (Not available when FS=1x)
0111	576x (Not available when FS=01,1x)
1000	768x (Not available when FS=01,1x)
1001	1024x (Not available when FS=01,1x)

Others Not available

Note: The FS × PMF should be lower than 49.152MHz, or the system will be error.

Table 7 02h State Control 3 Register

Bit	D7:D4	D3	D2:D1	D0
Name	-	MUTE	CM1:CM2	-
Default	xxxx	1	11	x

IS31AP2111 has mute function including master mute and channel mute. When master mute is enabled, all 2 processing channels are muted. User can mute these 2 channels individually by channel mute. When the mute function is enabled or disabled, the fade-out or fade-in process will be initiated.

MUTE Master Mute

0	All channel not muted
1	All channel muted

CMx Channel x Mute

0	Channel x not muted
1	Channel x muted

Table 8 03h Master Volume Control Register

Bit	D7:D0
Name	MV
Default	0001 1000

IS31AP2111 supports both master-volume (03h Register) and channel-volume control (04h, 05h and 06h Registers) modes. Both volume control settings range from +12dB ~ -103dB and 0.5dB per step. Note that the master volume control is added to the individual channel volume control as the total volume control. For example, if the master volume level is set at, Level A (in dB unit) and the channel volume level is set at Level B (in dB unit), the total volume control setting is equal to Level A plus with Level B. $-103\text{dB} \leq \text{Total volume (Level A + Level B)} \leq +24\text{dB}$.

Table 17 14h Coefficient RAM Base Address Register

Bit	D7	D6:D0
Name	-	CFA
Default	x	000 0000

An on-chip RAM in IS31AP2111 stores user-defined EQ and mixing coefficients. The content of this coefficient RAM is indirectly accessed via coefficient registers, which consist of one base address register (14h), five sets of registers (15h ~ 23h) of three consecutive 8-bit entries for each 24-bit coefficient, and one control register (24h) to control access of the coefficients in the RAM.

CFA Coefficient RAM Base Address

Table 24 2Ah Power Saving Mode Switching Level Register

Bit	D7:D5	D4:D0
Name	QT_SW_WINDOW	QT_SW_LEVEL
Default	000	01101

If the PWM exceeds the programmed switching power level (default 26×40ns), the modulation algorithm will change from quaternary into power saving mode. It results in higher power efficiency during larger power output operations. If the PWM drops below the programmed switching power level - power saving mode hysteresis window, the modulation algorithm will change back to quaternary modulation.

10 -0.25dB
11 -0.375dB

RAM ACCESS

The procedure to read/write coefficient(s) from/to RAM is as followings:

Read A Single Coefficient From RAM:

1. Write 7-bit of address to I2C address-0X14
2. Write 1 to R1 bit in address-0X24
3. Read top 8-bits of coefficient in I2C address-0X15
4. Read middle 8-bits of coefficient in I2C address-0X16
5. Read bottom 8-bits of coefficient in I2C address-0X17

Read A Set Of Coefficients From RAM:

1. Write 7-bits of address to I2C address-0X14
2. Write 1 to RA bit in address-0X24
3. Read top 8-bits of coefficient A1 in I2C address-0X15
4. Read middle 8-bits of coefficient A1 in I2C address-0X16
5. Read bottom 8-bits of coefficient A1 in I2C address-0X17
6. Read top 8-bits of coefficient A2 in I2C address-0X18
7. Read middle 8-bits of coefficient A2 in I2C address-0X19
8. Read bottom 8-bits of coefficient A2 in I2C address-0X1A
9. Read top 8-bits of coefficient B1 in I2C address-0X1B
10. Read middle 8-bits of coefficient B1 in I2C address-0X1C

IS31AP2111

11. Read bottom 8-bits of coefficient B1 in I2C address-0X1D
12. Read top 8-bits of coefficient B2 in I2C address-0X1E
13. Read middle 8-bits of coefficient B2 in I2C address-0X1F
14. Read bottom 8-bits of coefficient B2 in I2C address-0X20
15. Read top 8-bits of coefficient A0 in I2C address-0X21
16. Read middle 8-bits of coefficient A0 in I2C address-0X22
17. Read bottom 8-bits of coefficient A0 in I2C address-0X23

Write A Single Coefficient From RAM:

1. Write 7-bits of address to I2C address-0X14
2. Write top 8-bits of coefficient in I2C address-0X15
3. Write middle 8-bits of coefficient in I2C address-0X16
4. Write bottom 8-bits of coefficient in I2C address-0X17
5. Write 1 to W1 bit in address-0X24

Write A Set Of Coefficients From RAM:

1. Write 7-bits of address to I2C address-0X14
2. Write top 8-bits of coefficient A1 in I2C address-0X15
3. Write middle 8-bits of coefficient A1 in I2C address-0X16
4. Write bottom 8-bits of coefficient A1 in I2C address-0X17
5. Write top 8-bits of coefficient A2 in I2C address-0X18
6. Write middle 8-bits of coefficient A2 in I2C address-0X19
7. Write bottom 8-bits of coefficient A2 in I2C address-0X1A
8. Write top 8-bits of coefficient B1 in I2C address-0X1B
9. Write middle 8-bits of coefficient B1 in I2C address-0X1C
10. Write bottom 8-bits of coefficient B1 in I2C address-0X1D
11. Write top 8-bits of coefficient B2 in I2C address-0X1E
12. Write middle 8-bits of coefficient B2 in I2C address-0X1F
13. Write bottom 8-bits of coefficient B2 in I2C address-0X20
14. Write top 8-bits of coefficient A0 in I2C address-0X21
15. Write middle 8-bits of coefficient A0 in I2C address-0X22
16. Write bottom 8-bits of coefficient A0 in I2C address-0X23
17. Write 1 to WA bit in address-0X24

Note: the read and write operation on RAM coefficients works only if LRCIN (Pin 15) switching on rising edge. And, before each writing operation, it is necessary to read the address-0X24 to confirm whether RAM is writable current in first. If the logic of W1 or WA is high, the coefficient writing is prohibited.

USER-DEFINED EQUALIZER

The IS31AP2111 provides 20 parametric Equalizer (EQ). Users can program suitable coefficients via I2C control interface to program the required audio band frequency response for every EQ. The transfer function

$$H(z) = \frac{A_0 + A_1 z^{-1} + A_2 z^{-2}}{1 + B_1 z^{-1} + B_2 z^{-2}}$$

The data format of 2's complement binary code for EQ coefficient is 3.21. i.e., 3-bits for integer (MSB is the sign bit) and 21-bits for mantissa. Each coefficient range is from 0x800000 (-4) to 0x7FFFFFFF (+3.999999523). These coefficients are stored in User Defined RAM and are referenced in following manner:

CHxEQyA0=A0

CHxEQyA1=A1

CHxEQyA2=A2

CHxEQyB1=-B1

CHxEQyB2=-B2

Where x and y represents the number of channel and the band number of EQ equalizer.

All user-defined filters are path-through, where all coefficients are defaulted to 0 after being powered up, except the A0 that is set to 0x200000 which represents 1.

MIXER

The IS31AP2111 provides mixers to generate the extra audio source from the input left and right channels. The coefficients of mixers are defined in range from 0x800000 (-1) to 0x7FFFFFFF (0.9999998808). The function block diagram is as following figure:

Figure 36 Mixer Function Block Diagram

IS31AP2111

PRE-SCALE

For each audio channel, IS31AP2111 can scale input signal level prior to EQ processing which is realized by a 24-bit signed fractional multiplier. The pre-scale factor, ranging from -1 (0x800000) to 0.9999998808 (0x7FFFFFFF), for this multiplier, can be loaded into RAM. The default values of the pre-scaling factors are set to 0x7FFFFFFF. Programming of RAM is described in RAM access.

POST-SCALE

The IS31AP2111 provides an additional multiplication after equalizing and before interpolation stage, which is realized by a 24-bit signed fractional multiplier. The post-scaling factor, ranging from -1 (0x800000) to 0.9999998808 (0x7FFFFFFF), for this multiplier, can be loaded into RAM. The default values of the post-scaling factors are set to 0x7FFFFFFF. All channels can use the channel-1 post-scale factor by setting the post-scale link. Programming of RAM is described in RAM access.

POWER CLIPPING

The IS31AP2111 provides power clipping function to avoid excessive signal that may destroy loud speaker. The power clipping level is defined by 24-bit representation and is stored in RAM address 0X6F. The following table shows the power clipping level's numerical representation.

Table 26 Sample Calculation For Power Clipping

Max. Amplitude	dB	Linear	Decimal	Hex (3.21 Format)
V_{CC}	0	1	2097152	200000
$V_{CC} \times 0.707$	-3	0.707	1484574	16A71E
$V_{CC} \times 0.5$	-6	0.5	1048576	100000
$V_{CC} \times L$	x	$L = 10^{(x/20)}$	$D = 2097152 \times L$	$H = \text{dec2hex}(D)$

ATTACK THRESHOLD FOR DYNAMIC RANGE CONTROL (DRC)

The IS31AP2111 provides dynamic range control (DRC) function. When the input exceeds the programmable attack threshold value, the output power will be limited by this threshold power level via gradual gain reduction. Attack threshold is defined by 24-bit representation and is stored in RAM address 0X71 and 0X72.

RELEASE THRESHOLD FOR DYNAMIC RANGE CONTROL (DRC)

After IS31AP2111 has reached the attack threshold, its output power will be limited to that level. The output power level will be gradually adjusted to the programmable release threshold level. Release threshold is defined by 24-bit representation and is stored in RAM address 0X73 and 0X74. The following table shows the attack and release threshold's numerical representation.

Table 27 Sample Calculation For Attack And Release Threshold

Power	dB	Linear	Decimal	Hex (3.21 Format)
$(V_{CC}^2)/R$	0	1	2097152	200000
$(V_{CC}^2)/2R$	-3	0.5	1048576	100000
$(V_{CC}^2)/4R$	-6	0.25	524288	80000
$(V_{CC}^2)/R \times L$	x	$L = 10^{(x/10)}$	$D = 2097152 \times L$	$H = \text{dec2hex}(D)$

To best illustrate the dynamic range control, please refer to the following figure.

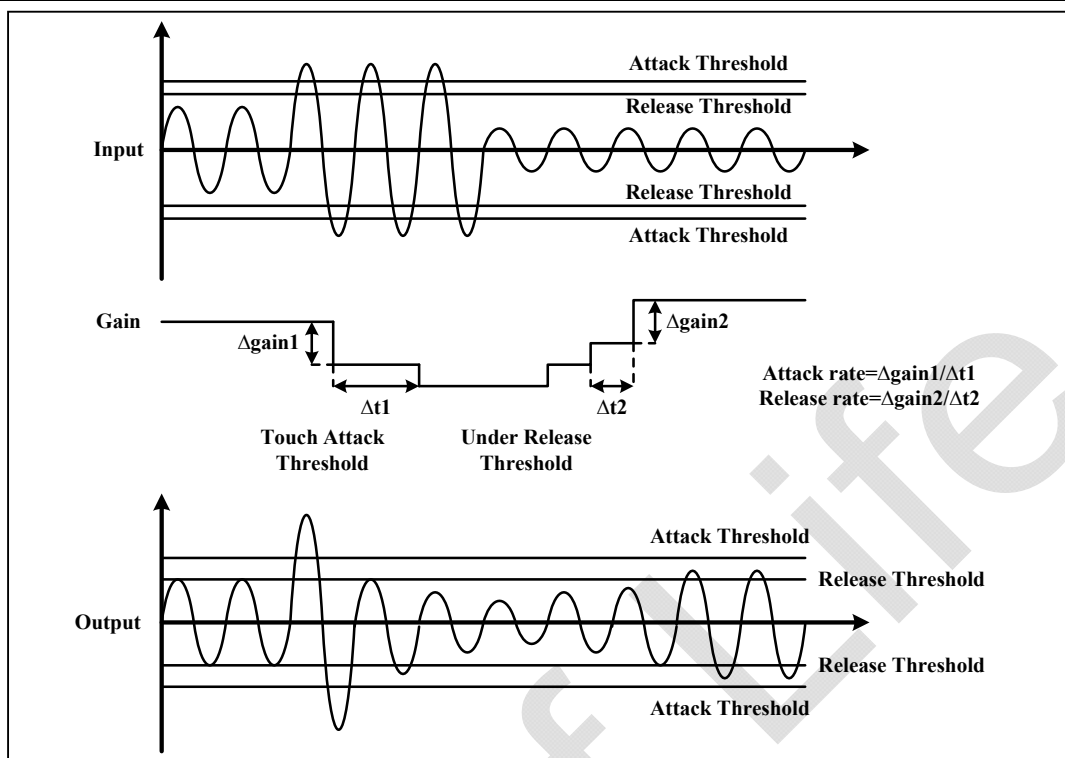

Figure 37 Attack And Release Threshold

NOISE GATE ATTACK LEVEL

When both left and right signals have 2048 consecutive sample points less than the programmable noise gate attack level, the audio signal will multiply noise gate gain, which can be set at $x1/8$, $x1/4$, $x1/2$, or zero if the noise gate function is enabled. Noise gate attack level is defined by 24-bit representation and is stored in RAM address 0X75.

NOISE GATE RELEASE LEVEL

After entering the noise gating status, the noise gain will be removed whenever IS31AP2111 receives any input signal that is more than the noise gate release level. Noise gate release level is defined by 24-bit representation and is stored in RAM address 0X76. The following table shows the noise gate attack and release threshold level's numerical representation.

Table 28 Sample Calculation For Noise Gate Attack And Release Level

Input Amplitude	Linear	Decimal	Hex (1.23 Format)
0dB	1	8388607	7FFFFFFF
-100dB	10^{-5}	83	53
-110dB	$10^{-5.5}$	26	1A
xdB	$L = 10^{(x/20)}$	$D = 2097152 \times L$	$H = \text{dec2hex}(D)$

DRC ENERGY COEFFICIENT

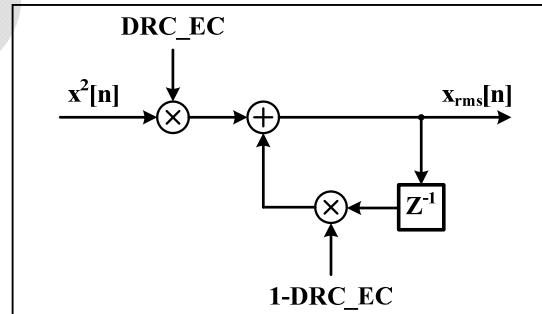

Figure 38 Digital Processing Of Calculating RMS Signal Power

The above figure illustrates the digital processing of calculating RMS signal power. In this processing, a DRC energy coefficient is required, which can be programmed for different frequency range. Energy coefficient is defined by 24-bit representation and is stored in RAM address 0X77 and 0X78. The following table shows the DRC energy coefficient numerical representation.

Table 29 Sample Calculation For DRC Energy Coefficient

DRC Energy Coefficient	dB	Linear	Decimal	Hex (1.23 Format)
1	0	1	8388607	7FFFFFFF
1/256	-48.2	1/256	524288	80000
1/1024	-60.2	1/1024	131072	20000
L	x	$L = 10^{(x/20)}$	$D = 2097152 \times L$	$H = \text{dec2hex}(D)$

THE USER DEFINED RAM

The contents of user defined RAM is represented in following table.

Table 30 User Defined RAM

Address	Name	Coefficient	Default	Address	Name	Coefficient	Default
0x00	Channel 1 EQ1	CH1EQ1A1	0x000000	0x32	Channel 2 EQ1	CH2EQ1A1	0x000000

CLASSIFICATION REFLOW PROFILES

Profile Feature	Pb-Free Assembly
Preheat & Soak Temperature min (T _{smin}) Temperature max (T _{smax}) Time (T _{smin} to T _{smax}) (t _s)	150°C 200°C 60-120 seconds
Average ramp-up rate (T _{smax} to T _p)	3°C/second max.
Liquidous temperature (T _L) Time at liquidous (t _L)	217°C 60-150 seconds
Peak package body temperature (T _p)*	Max 260°C
Time (t _p)** within 5°C of the specified classification temperature (T _c)	Max 30 seconds
Average ramp-down rate (T _p to T _{smax})	6°C/second max.
Time 25°C to peak temperature	8 minutes max.

Figure 39 Classification Profile

IS31AP2111

PACKAGE INFORMATION

eTSSOP-24

RECOMMENDED LAND PATTERN

Note:

1. Land pattern complies to IPC-7351.
2. All dimensions in MM.
3. This document (including dimensions, notes & specs) is a recommendation based on typical circuit board manufacturing parameters. Since land pattern design depends on many factors unknown (eg. user's board manufacturing specs), user must determine suitability for use.

REVISION HISTORY

Revision	Detail Information	Date
A	Initial release	2015.06.12
B	1. Add mono mode 2. Update EC table 3. Add performance figures	2015.10.20
C	Add "End of Life" watermark	2021.08.10
