

0.6 μ A Current Consumption Voltage Regulator

FEATURES

- Low Power Consumption at 0.6 μ A typical
- Operating Voltage Range 1.4 V – 6.0 V
- Output Voltage Range from 1.1 V to 5.0 V with 0.1 V increments
- Output Voltage Accuracy ± 0.02 V at $V_{OUT} < 2.0$ V, or $\pm 1\%$
- Temperature Stability ± 50 ppm/ $^{\circ}$ C
- Output Current up to 150 mA
- Dropout Voltage 500 mV @ 150 mA, $V_{OUT} = 3.0$ V
- Standby Current less than 0.01 μ A typical
- Load Capacitor Auto Discharge
- Current Limit and Short Circuit Protection
- Low ESR Ceramic Capacitor compatible
- Stable operations without load capacitor
- ON/OFF switch
- Operating Ambient Temperature - 40 + 85 $^{\circ}$ C
- Packages : SOT-25, SSOT-24, and USPN-4B02
- EU RoHS Compliant, Pb Free

APPLICATIONS

- Mobile phones
- Cameras, VCRs
- Various portable equipment

DESCRIPTION

The IXD1504 is a highly accurate CMOS voltage regulator with very low supply current of 0.6 μ A. It is able to provide very accurate output voltage even at load current as low as 1 μ A, which is ideally suited for battery-powered applications. The usage of super small package USPN-4B02 (0.75 x 0.95 mm) and the advantage of capacitor-less stable operations contribute to saving board space.

The IC consists of a reference voltage source, an error amplifier, a driver transistor, over-current protection circuit, and a phase compensation circuit.

Excellent internal phase compensation allows the IXD1504 to operate either with a low ESR ceramic output capacitor C_L , or even without it.

Output voltage is fixed internally by laser trimming technology and selectable in 0.1 V increments within the range from 1.1 V to 5.0 V.

The CE input allows set IXD1504 into standby mode reducing current consumption to less than 0.01 μ A.

If a C_L output capacitor is used, the internal switch discharges this capacitor in standby mode to return quickly V_{OUT} voltage to the V_{SS} level,

This regulator is available in SOT-25, SSOT-24, and USPN-4B02 packages.

TYPICAL APPLICATION CIRCUIT

PIN CONFIGURATION

PIN ASSIGNMENT

PIN NUMBER			PIN NAME	FUNCTIONS
SOT-25	SSOT-24	USPN-4B02		
5	3	1	V_{OUT}	Output Voltage
2	2	2	V_{SS}	Ground
3	1	3	CE	ON/OFF Control LOW– Standby mode, HIGH – Active ¹⁾
1	4	4	V_{IN}	Power Input
4			NC	No Connection

1) CE input does not have pull-down resistor and should not be in OPEN state. Connect it to the defined voltage source.

BLOCK DIAGRAM

IXD1504A

Diodes inside the circuits are ESD protection diodes and parasitic diodes.

BASIC OPERATION

The Error Amplifier of the IXD1504 series monitors output voltage divided by internal resistors R1 & R2 and compares it with the internal Reference Voltage (see Block Diagram above). The output signal from error amplifier drives gate of the P-channel MOSFET, which is connected to the V_{OUT} pin and operates as a series voltage regulator.

The Current Limit/Short Protection circuits monitor level of the output current. The CE pin allows shutdown internal circuitry to minimize power consumption.

Current Limiter, Short-Circuit Protection

The IXD1504 series include a combination of a fixed current limiter circuit & a foldback circuit, which aid the operations of the current limiter and circuit protection. When the load current reaches the current limit level, the fixed current limiter circuit activates and output voltage drops. Because of this drop, the foldback circuit activates too, and output voltage drops further decreasing output current. When the output pin is shorted, a current of about 80 mA flows.

CE Pin

The CE pin allows shutdown internal circuitry to minimize power consumption. In shutdown mode, output at the V_{OUT} pin is pulled down to the V_{SS} level by R_{DCH} resistor and N-channel switch, as well as resistors R1 and R2 connected in series.

Note that the IXD1504 CE input is active HIGH and has no pull down resistor. IC will be in unstable state, if CE pin is open. CE pin current consumption may increase, if voltage applied to this pin is ~ 0.5 of V_{IN} .

C_L High-speed Discharge Function

The N-channel transistor located between V_{OUT} and V_{SS} pins quickly discharge the output capacitor (C_L), when the CE pin does low. The discharge time of the output capacitor (C_L) is set by the C_L auto-discharge resistance $R_{DCH} = 450 \Omega$ (TYP.) and the output capacitance (C_L).

Time constant $\tau = C_L \times R_{DCH}$ determines the output voltage after discharge as

$$V = V_{OUT(E)} \times e^{-t/\tau}$$

where: $V_{OUT(E)}$ - Output voltage, and t - Discharge time

Discharge time can be calculated also by the next formula:

$$t = \tau \times \ln(V_{OUT(E)}/V)$$

Low ESR Capacitors

An internal phase compensation circuit guarantees stable IXD1504 operation without output capacitor, or with low ESR capacitors. However, connect the output capacitor C_L as close to the V_{OUT} and the V_{SS} pins as possible, if it is used. In addition, an input capacitor $C_{IN} \geq 0.1\mu F$ between the V_{IN} and V_{SS} pins should be used to ensure a stable input power.

TYPICAL APPLICATION CIRCUIT

LAYOUT AND USE CONSIDERATIONS

1. Mount external component as close to the IC as possible and use thick, short connecting traces to reduce the circuit impedance.
2. The IC may malfunction if absolute maximum ratings are exceeded.
3. If power source of this regulator is a high impedance device, an input capacitor $C_{IN} \geq 0.1\mu F$ should be used to prevent oscillations.
4. In case of high output current, increasing the input capacitor value can stabilize operations.
5. Please ensure that output current I_{OUT} is less than $P_D / (V_{IN} - V_{OUT})$, where P_D is a rated power dissipation value of the package shown at ABSOLUTE MAXIMUM RATING table to not exceed it.

PACKAGE POWER DISSIPATION (CONTINUED)

SSOT-24 Power Dissipation

The power dissipation varies with the mount board conditions.
Please use this data as a reference only.

1. Measurement Conditions:

Condition:	Mount on a board
Ambient:	Natural convection
Soldering:	Lead (Pb) free
Board:	Dimensions 40×40 mm (1600 mm ² in one side) Copper (Cu) traces occupy 50% of the board area on top and bottom layers Package heat sink tied to the copper traces. (Board of SOT-26 is used)
Material:	Glass Epoxy (FR-4)
Thickness:	1.6 mm
Through-hole:	4 x 0.8 Diameter

2. Power Dissipation vs. Ambient Temperature

Board Mount (T_{jmax} = 125 °C)

Ambient Temperature, °C	Power Dissipation Pd, mW	Thermal Resistance, °C/W
25	500	200.00
85	200	

Evaluation Board (Unit: mm)

PACKAGE POWER DISSIPATION (CONTINUED)

USPN-4B02 Power Dissipation

The power dissipation varies with the mount board conditions.
Please use this data as a reference only.

1. Measurement Conditions:

Condition:	Mount on a board
Ambient:	Natural convection
Soldering:	Lead (Pb) free
Board:	Dimensions 40×40 mm (1600 mm ² in one side) Copper (Cu) traces occupy 50% of the board area on top and bottom layers The copper area is divided into four identical blocks of 12.5% each. Each terminal of USPN-4B02 package connected to one of the blocks.
Material:	Glass Epoxy (FR-4)
Thickness:	1.6 mm
Through-hole:	4 x 0.8 Diameter

2. Power Dissipation vs. Ambient Temperature

Board Mount ($T_{jmax} = 125^{\circ}\text{C}$)

Evaluation Board (Unit: mm)

Ambient Temperature, $^{\circ}\text{C}$	Power Dissipation P_d , mW	Thermal Resistance, $^{\circ}\text{C/W}$
25	550	181.82
85	220	

MARKING

SOT-25

SOT-25 with the under-dot marking

① - represents product series

MARK	PRODUCT SERIES
9	IXD1504xxxxx-G

② - represents type of regulator

MARK		PRODUCT SERIES
V _{OUT}		
1.1 V – 3.9 V	4.0 V – 5.0 V	
A	B	IXD1504Axxxx-G

③ - represents output voltage

MARK	OUTPUT VOLTAGE, V	
0	-	4.0
1	1.1	4.1
2	1.2	4.2
3	1.3	4.3
4	1.4	4.4
5	1.5	4.5
6	1.6	4.6
7	1.7	4.7
8	1.8	4.8
9	1.9	4.9
A	2.0	5.0
B	2.1	
C	2.2	
D	2.3	
E	2.4	

MARK	OUTPUT VOLTAGE, V	
F	2.5	
H	2.6	
K	2.7	
L	2.8	
M	2.9	
N	3.0	
P	3.1	
R	3.2	
S	3.3	
T	3.4	
U	3.5	
V	3.6	
X	3.7	
Y	3.8	
Z	3.9	

④⑤ - represents production lot number

01~09, 0A~0Z, 11~9Z, A1~A9, AA~AZ, B1~ZZ in order, (G, I, J, O, Q, W excluded)

MARKING (Continued)

SSOT-24 (With an orientation bar at the bottom)

① - represents output voltage range

MARK	OUTPUT VOLTAGE, V	PRODUCT SERIES
P	1.1 – 3.9	IXD1504A111xx-G - IXD1504A391xx-G
R	4.0 – 5.0	IXD1504A401xx-G - IXD1504A501xx-G

② - represents output voltage

MARK	OUTPUT VOLTAGE, V	
0	-	4.0
1	1.1	4.1
2	1.2	4.2
3	1.3	4.3
4	1.4	4.4
5	1.5	4.5
6	1.6	4.6
7	1.7	4.7
8	1.8	4.8
9	1.9	4.9

Warning: DO NOT USE THIS PRODUCT IN LIFE SUPPORT SYSTEMS.

LIFE SUPPORT POLICY ZILOG'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF ZILOG CORPORATION.

As used herein Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.
