MAX14783E

High-Speed 3.3V/5V RS-485/RS-422 Transceiver with $\pm 35\text{kV}$ HBM ESD Protection

General Description

The MAX14783E is a half-duplex RS-485/422 transceiver that operates at either 3.3V or 5V rails with high $\pm 35\text{kV}$ ESD performance and up to 42Mbps data rate. The device is optimized for high speeds over extended cable runs while maximizing tolerance to noise.

The MAX14783E is available in 8-pin $\mu\text{MAX}^{\text{®}}$, 8-pin SO, and 8-pin TDFN-EP packages. The device in the TDFN-EP package operates over the -40°C to $+125^{\circ}\text{C}$ temperature range. The MAX14783E in the μMAX and SO packages operates over the -40°C to $+85^{\circ}\text{C}$ and -40°C to $+125^{\circ}\text{C}$ temperature ranges.

Applications

- Motion Controllers
- Field Bus Networks
- Encoder Interfaces
- Backplane Busses

Benefits and Features

- Integrated Protection Increases Robustness
 - High ESD Protection
 - $\pm 35\text{kV}$ HBM ESD per JEDEC JS-001-2012
 - $\pm 20\text{kV}$ Air Gap per IEC 61000-4-2
 - $\pm 12\text{kV}$ Contact ESD per IEC 61000-4-2
 - $\pm 4\text{kV}$ EFT per IEC 61000-4-4
- Short-Circuit Protected Outputs
- True Fail-Safe Receiver Prevents False Transition on Receiver Input Short or Open Events
- Hot-Swap Capability Eliminates False Transitions During Power-Up or Hot Insertion
- 3V to 5.5V Supply Voltage Range
- High-Speed Data Rates up to 42Mbps
- -40°C to $+125^{\circ}\text{C}$ Operating Temperature
- Allows Up to 32 Transceivers on the Bus
- Low $10\mu\text{A}$ (max) Shutdown Current for Lower Power Consumption

Ordering Information appears at end of data sheet.

Absolute Maximum Ratings

(Voltages referenced to GND.)

V_{CC}	-0.3V to +6.0V	Junction Temperature	+150°C
RO	-0.3V to ($V_{CC} + 0.3\text{V}$)	Storage Temperature Range	-65°C to +150°C
RE, DE, DI	-0.3V to +6.0V	Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)	
A, B ($V_{CC} \geq 3.6\text{V}$)	-8.0V to +13.0V	μMAX (derate at 4.8mW/°C above +70°C)	387mW
A, B ($V_{CC} < 3.6\text{V}$)	-9.0V to +13.0V	SO (derate at 7.6mW/°C above +70°C)	606mW
Short-Circuit Duration (RO, A, B) to GND	Continuous	TDFN-EP (derate at 24.4mW/°C above +70°C)	1951mW
Operating Temperature Range		Lead Temperature (soldering, 10s)	+300°C
MAX14783EE_	-40°C to +85°C	Soldering Temperature (reflow)	+260°C
MAX14783EA_	-40°C to +125°C		

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Information

PACKAGE TYPE: 8 SOIC	
Package Code	S8+4
Outline Number	21-0041
Land Pattern Number	90-0096
THERMAL RESISTANCE, FOUR-LAYER BOARD	
Junction to Ambient (θ_{JA})	132°C/W
Junction to Case (θ_{JC})	38°C/W

PACKAGE TYPE: 8 TDFN	
Package Code	T833+2
Outline Number	21-0137
Land Pattern Number	90-0059
THERMAL RESISTANCE, FOUR-LAYER BOARD	
Junction to Ambient (θ_{JA})	41°C/W
Junction to Case (θ_{JC})	8°C/W

PACKAGE TYPE: 8 μMAX	
Package Code	U8+1
Outline Number	21-0036
Land Pattern Number	90-0092
THERMAL RESISTANCE, FOUR-LAYER BOARD	
Junction to Ambient (θ_{JA})	206°C/W
Junction to Case (θ_{JC})	42°C/W

For the latest package outline information and land patterns (footprints), go to www.maximintegrated.com/packages. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

Electrical Characteristics

(V_{CC} = +3.0V to +5.5V, T_A = T_{MIN} to T_{MAX}, unless otherwise specified. Typical values are at V_{CC} = +5V and T_A = +25°C.) (Notes 1, 2)

Note 1: All devices 100% production tested at T_A = +25°C. Specifications over temperature are guaranteed by design.

Note 2: All currents into the device are positive; all currents out of the device are negative. All voltages are referenced to ground, unless otherwise noted.

Note 3: ΔV_{OD} and ΔV_{OC} are the changes in V_{OD} and V_{OC}, respectively, when the DI input changes state.

Note 4: Capacitive load includes test probe and fixture capacitance.

Note 5: Guaranteed by design; not production tested.

Note 6: The timing parameter refers to the driver or receiver enable delay, when the device has exited the initial hot-swap protect state and is in normal operating mode.

Note 7: Shutdown is enabled by driving RE high and DE low. The device is guaranteed to have entered shutdown after t_{SHDN} has elapsed.

The diagram shows a 74VHC14 inverter. The input pin is labeled 'DI' and is connected to a square wave pulse source. The output pin is labeled 'A' and is connected to a load resistor R_L and a load capacitor C_L in parallel. The supply voltage is V_{CC} and the ground is labeled 'DE'. The output voltage is labeled V_{OD} .

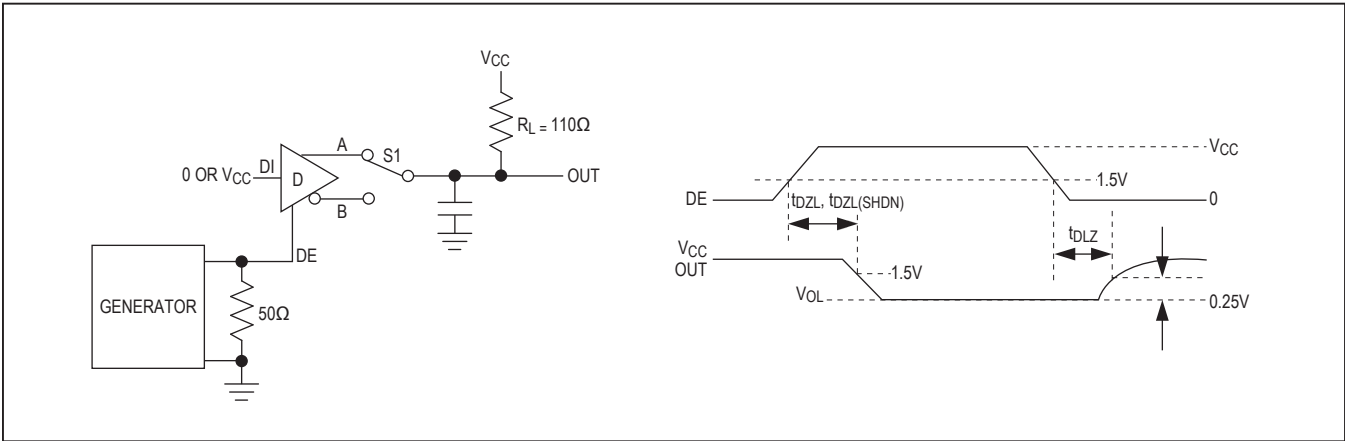

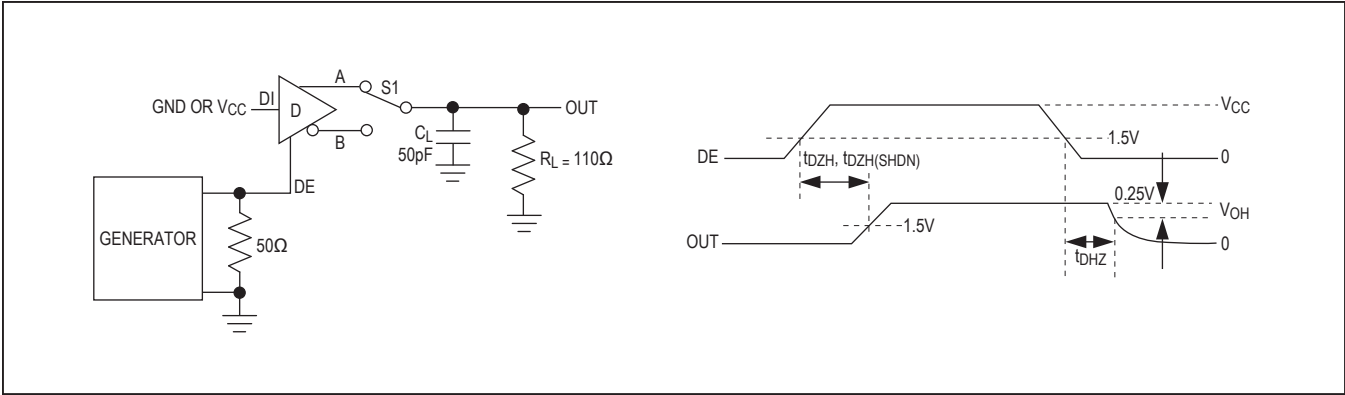

The diagram illustrates the timing characteristics of a differential signal. It shows five waveforms: V_{CC} , DI , B , A , and V_{OD} .

- V_{CC} is a square wave with a frequency $f = 1\text{MHz}$, high-level time $t_{LH} = 3\text{ns}$, and low-level time $t_{HL} = 3\text{ns}$. It transitions between 1.5V and 0 .
- DI is a square wave that transitions between 0 and 1.5V .
- B and A are differential signals that transition between 0 and V_{OD} . The transition time for B is t_{DPLH} and for A is t_{DPLH} .
- V_{OD} is a square wave that transitions between 0 and $-V_{OD}$. The transition time for V_{OD} is t_{LH} and t_{HL} . The voltage level V_{OD} is defined as $V_{OD} = [V_A - V_B]$.

The skew time t_{DSKEW} is defined as the absolute difference between the propagation delays of the two signals:

$$t_{DSKEW} = |t_{DPLH} - t_{DPLH}|$$

Typical Operating Characteristics

(V_{CC} = +5V, T_A = +25°C, unless otherwise specified.)

Typical Operating Characteristics (continued)

(V_{CC} = +3.0V to +5.5V, T_A = T_{MIN} to T_{MAX}, unless otherwise specified. Typical values are at V_{CC} = +5V and T_A = +25°C.) (Notes 1, 2)

MAX14783E

High-Speed 3.3V/5V RS-485/RS-422 Transceiver
with $\pm 35\text{kV}$ HBM ESD Protection

Pin Configuration

Pin Description

PIN	NAME	FUNCTION
1	RO	Receiver Output. See <i>Function Tables</i> .
2	$\overline{\text{RE}}$	Receiver Output Enable. Drive $\overline{\text{RE}}$ low to enable RO. Drive $\overline{\text{RE}}$ high to disable the receiver. RO is high impedance when $\overline{\text{RE}}$ is high. Drive $\overline{\text{RE}}$ high and pull DE low to enter low-power shutdown mode.
3	DE	Driver Output Enable. Drive DE high to enable the driver. Drive DE low to disable the driver. Driver outputs are high-impedance when the driver is disabled. Drive $\overline{\text{RE}}$ high and pull DE low to enter low-power shutdown mode.
4	DI	Driver Input. With DE high, a low on DI forces the A output low and the B output high. Similarly, a high on DI forces the A output high and B output low.
5	GND	Ground
6	A	Noninverting RS-485/RS-422 Receiver Input and Driver Output
7	B	Inverting RS-485/RS-422 Receiver Input and Driver Output
8	VCC	Positive Supply Voltage Input. Bypass VCC with a 0.1 μF ceramic capacitor to ground.
—	EP	Exposed Pad (TDFN only). Connect EP to GND.

1	0	X	High Impedance	Shutdown

X = Don't care

Detailed Description

The MAX14783E is a 3.3V/5V ESD-protected RS-485/RS-422 transceiver intended for high-speed, half-duplex communications. Integrated hot-swap functionality eliminates false transitions on the bus during power-up or hot insertion.

The device features fail-safe receiver inputs guaranteeing a logic-high receiver output when inputs are shorted or open. The IC has a 1-unit load receiver input impedance, allowing up to 32 transceivers on the bus.

True Fail Safe

The MAX14783E guarantees a logic-high receiver output when the receiver inputs are shorted or open, or when they are connected to a terminated transmission line with all drivers disabled. If the differential receiver input voltage (A–B) is greater than or equal to -10mV , RO is logic-high.

Driver Single-Ended Operation

The A and B outputs can either be used in the standard differential operating mode, or can be used as single-ended outputs. Since the A and B driver outputs swing rail-to-rail, they can individually be used as standard TTL logic outputs.

Hot-Swap Capability

Hot-Swap Inputs

When circuit boards are inserted in a hot or powered backplane, disturbances on the enable inputs and differential receiver inputs can lead to data errors. Upon initial circuit board insertion, the processor undergoes its power-up sequence. During this period, the processor output drivers are high impedance and are unable to drive the DE and RE inputs of the MAX14783E to a defined logic level. Leakage currents up to $10\mu\text{A}$ from the high-impedance outputs of a controller could cause DE and RE to drift to an incorrect logic state. Additionally, parasitic circuit board capacitance could cause coupling of V_{CC} or GND to DE and RE. These factors could improperly enable the driver or receiver. The MAX14783E features integrated hot-swap inputs that help to avoid these potential problems.

When V_{CC} rises, an internal pulldown circuit holds DE low and RE high. After the initial power-up sequence, the pulldown circuit becomes transparent, resetting the hot-swap-tolerable inputs.

Hot-Swap Input Circuitry

The DE and RE enable inputs feature hot-swap capability. At the input, there are two nMOS devices, M1 and M2 (Figure 9). When V_{CC} ramps from 0V, an internal $10\mu\text{s}$ timer turns on M2 and sets the SR latch that also turns

Figure 9. Simplified Structure of the Driver Enable (DE) Pin

on M1. Transistors M2 (a $500\mu\text{A}$ current sink) and M1 (a $100\mu\text{A}$ current sink) pull DE to GND through a $5\text{k}\Omega$ (typ) resistor. M2 is designed to pull DE to the disabled state against an external parasitic capacitance up to 100pF that can drive DE high. After $10\mu\text{s}$, the timer deactivates M2 while M1 remains on, holding DE low against three-state leakages that can drive DE high. M1 remains on until an external source overcomes the required input current. At this time, the SR latch resets and M1 turns off. When M1 turns off, DE reverts to a standard, high-impedance CMOS input. Whenever V_{CC} drops below 1V , the hot-swap input is reset.

A complementary circuit employing two pMOS devices pulls RE to V_{CC} .

$\pm 35\text{kV}$ ESD Protection

ESD protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The driver outputs and receiver inputs of the MAX14783E have extra protection against static electricity. The ESD structures withstand high ESD in all states: normal operation, shutdown, and powered down. After an ESD event, the MAX14783E keeps working without latch-up or damage.

ESD protection can be tested in various ways. The transmitter outputs and receiver inputs of the MAX14783E are characterized for protection to the following limits:

- $\pm 35\text{kV}$ HBM
- $\pm 20\text{kV}$ using the Air-Gap Discharge method specified in IEC 61000-4-2
- $\pm 12\text{kV}$ using the Contact Discharge method specified in IEC 61000-4-2

ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

Human Body Model (HBM)

Figure 10 shows the HBM, and Figure 11 shows the current waveform it generates when discharged into a low-impedance state. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a $1.5\text{k}\Omega$ resistor.

IEC 61000-4-2

The IEC 61000-4-2 standard covers ESD testing and performance of finished equipment. However, it does not specifically refer to integrated circuits. The MAX14783E helps in designing equipment to meet IEC 61000-4-2 without the need for additional ESD protection components.

The major difference between tests done using the HBM and IEC 61000-4-2 is higher peak current in IEC 61000-4-2 because series resistance is lower in the IEC 61000-4-2 model. Hence, the ESD withstand voltage measured to IEC 61000-4-2 is generally lower than that measured using the HBM.

Figure 10. Human Body ESD Test Model

Figure 11. Human Body Current Waveform

Figure 12 shows the IEC 61000-4-2 model, and Figure 13 shows the current waveform for IEC 61000-4-2 ESD Contact Discharge test.

Applications Information

Driver Output Protection

Two mechanisms prevent excessive output current and power dissipation caused by faults or by bus connection. The first, a current limit on the output stage provides immediate protection against short circuits over the whole common-mode voltage range. The second, a thermal-shutdown circuit, forces the driver outputs into a high-impedance state if the die temperature exceeds $+160^\circ\text{C}$ (typ).

Low-Power Shutdown Mode

Low-power shutdown mode is initiated by bringing $\overline{\text{RE}}$ high and DE low. In shutdown, the devices draw less than $10\mu\text{A}$ of supply current.

$\overline{\text{RE}}$ and DE can be connected together and driven simultaneously. The MAX14783E is guaranteed not to enter shutdown if $\overline{\text{RE}}$ is high and DE is low for less than 50ns . If the inputs are in this state for at least 800ns (max), the device is guaranteed to enter shutdown.

Typical Applications

The MAX14783E transceiver is designed for bidirectional data communications on multipoint bus transmission lines. Figure 14 shows a typical network application circuit. To minimize reflections, terminate the line at both ends with its characteristic impedance and keep stub lengths off the main line as short as possible.
