

MAX15157B Evaluation Kit

Evaluates: MAX15157B

General Description

The MAX15157B evaluation kit (EV kit) is a fully assembled and tested circuit board that contains all components necessary to evaluate the performance of the MAX15157B. The device is a high-efficiency step-down and/or step-up regulator. The EV kit is powered from a 15V to 60V DC supply. It is capable of delivering from 5V to 32V at 15A or 200W (max) and at a 600kHz switching frequency. Refer to the MAX15157B data sheet to set the switching frequency and input/output voltage ranges for the EV kit.

Features

- 15V to 60V Input-Voltage Range (Changeable from 8V to 60V)
- 5V to 32V Output-Voltage Range (Changeable from 3V to 52V)
- Adjustable Slope Compensation Ramp
- Precision High-Side Current Sense for Output Current Monitor
- Multiphase Operation Up to 4 Phases
- Adjustable Switching Frequency: 120kHz to 1MHz Range
- External Switching Frequency Clock Synchronization
- External REFIN Input for Output Adjustment
- Hiccup Fault Protection for Overcurrent
- Thermal Shutdown
- POW-OK Output (Power-Good Output)
- Adjustable Input UVLO, and Output OVP Voltage
- Adjustable Soft-Start, and Soft-Stop
- Monotonic Startup into Prebiased Output

[Ordering Information](#) appears at end of data sheet.

Quick Start

Recommended Equipment

- MAX15157B EV kit
- 8V to 60V, 10A DC power supply V1 (for VIN)
- 2V, 100mA DC power supply V2 (for external reference input connected to REFIN)
- Loads capable of sinking 10A
- Five digital voltmeters (DVM)
- Function generator, square wave 0V–5V at frequency range from 200kHz to 2MHz
- 100MHz dual-trace oscilloscope

Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation. **Caution: Do not turn on the power supply until all connections are completed.**

- 1) Install a shunt across pins 1-2 of jumper JU1 (external reference to REFIN for FB tracking mode).
- 2) Install shunts at jumpers JU10 and JU11 (DRV = 8.8V on board from VIN).
- 3) Leave the following jumpers open (no shunts): JU2 to JU9.
- 4) With power supplies off:
 - a) Connect the positive terminal of the power supply V1 to the VIN connector and the negative terminal of the power supply to the PGND connector, which is near the VIN connector.
 - b) Connect the positive terminal of the power supply V2 to REFINX, and the negative terminal to AGND, which is near REFINX.
- 5) Connect a 5A electronic load to the VOUT and PGND banana jack connectors and disable the load.
- 6) Reference to PGND, connect five voltmeters to VOUT, VDRV, ENABLE, TP11 (4V6_BIAS), and POW-OK (power good).

7) Power on:

- Turn both V1 (VIN) and V2 (REFINX) on at 0V.
- Ramp up VIN to 13V, check VDRV for 8.8V (powered by U2), and ENABLE > 0.7V (EN threshold).
- Ramp up VIN to 30V or higher, UVLO should exceed 1V (threshold), and 4V6 pin (TP11) is around 4.55V.
- Ramp REFINX from 0V to 1.05V, VOUT is approximately 16.8V, and POW-OK (power good) about 4.55V (same voltage level as TP11).

Detailed Description of Hardware

The MAX15157B EV kit is a fully assembled and tested board to evaluate the performance of the MAX15157B at 150W synchronous step-down and/or step-up regulator. With the wide range of input and output voltage (input from 8V to 60V, and output from 3V to 0.94% of input), the MAX15157B is well suited for telecommunication and industrial equipment applications.

Regulator Enable (EN)

The MAX15157B features a shutdown mode to minimize the IC quiescent current. To shut down the IC, pull EN below 0.55V or install a shunt on the jumper JU3.

Table 1. Default Setting of MAX15157B EV Kit

JUMPER	SHUNT POSITION	FUNCTION
JU1	1-2	Output tracking mode: set external voltage to REFINX
JU2 to JU9	Open	
JU10, JU11	1-2	Using U2 = MAX17552 on board to provide 8.8V for DRV

Reference Voltage (REFIN)

The MAX15157B uses an internal 2V reference or an external reference input. The IC regulates FB to the internal 2V or external voltage at REFINX, as shown at [Table 3](#).

Switching Frequencies (FREQ/CLK)

The controller supports 120kHz to 1MHz switching frequencies. The EV kit comes preset at a 600kHz switching frequency with the CLOCKIN (FREQ/CLK) unconnected. To adjust the switching frequency, either replace resistor R3 (connected from FREQ/CLK to GND) by using the following equation:

$$f_{SW} = (R_3/100k\Omega) \times 600kHz$$

or drive the FREQ/CLK (CLOCKIN) with an external clock at twice speed of the switching frequency (it is not necessary to remove R3 when applying the external clock).

Configuring the Output Voltage (VOUT)

VOUT voltage can be set between 3V to 0.94 x VIN, and externally programmed by using the following equation:

$$VOUT = V_{REFINX} \times (R7 + R8)/R8$$

where V_{REFINX} is the reference voltage in [Table 3](#) (2V for preset mode, 1.05V to 2V for tracking mode).

Table 2. Regulator Enable (JU3)

SHUNT POSITION	EN PIN CONNECTION	MAX15157B FUNCTION
Not installed	Pull up to DRV through R4	Enabled
Installed	GND	Disabled

Table 3. Reference Voltage (JU1)

SHUNT POSITION	REFIN PIN CONNECTION	REFERENCE VOLTAGE	VOUT RANGE
1-2 (Tracking mode)	To external Voltage (at REFINX)	User-supplied reference voltage Range: 1.05V to 2V	VOUT = 16.8V to 32V (Increase R7 to get the higher VOUT)
2-3 (Preset mode)	To BIAS 4V6 pin	Internal 2V reference	VOUT = 32V (Increase R7 to get the higher VOUT)

Soft-Start (SS)

The MAX15157B offers the SS pin to adjust soft-start time to limit inrush current during startup. Soft-start times are controlled by C13 for VOUT. An internal 5µA current source charges the capacitor at the SS pin to provide a linear ramping voltage for the output voltage reference. The soft-start time of VOUT is calculated based on the following equation:

$$t_{SS} = C13 \times V_{REFINX} / 5\mu A$$

where VREFINX is the reference voltage in [Table 3](#) (2V for preset mode, 1.05V to 2V for tracking mode).

Note that during the initialization, the SS pin is held low until UVLO exceeds its threshold voltage of 1V. The drivers start switching once SS exceeds 50mV, and the controller enables the fault-protection circuitry when SS exceeds 1V.

Current-Limit Thresholds and Current Monitor

The low- and high-side current sensing can be set by R1 and R2, respectively. R1 is used for cycle-by-cycle current limit threshold. R2 is used for current monitor at a slower control loop. Refer to the *Output Fault Protection* section of MAX15157B data sheet for calculating the resistor R1 value and the *Current Monitor* section for the R2 resistor value.

POW-OK (Power Good)

The MAX15157B EV kit provides the POW-OK output (power-good output) test point. The POW-OK signal is pulled up to the 4V6 BIAS by resistor R9, and POW-OK is high when VOUT is above 90% of its programmed output voltage. When VOUT is below 90% of its programmed output voltage, POW-OK is pulled low.

MAX15157B STANDARD EVKIT
VIN = 48V; VOUT = 12V, 300W

This is a detailed schematic diagram of the MAX15157B Standard Evaluation Kit (EVKIT). The circuit is designed for a 48V input voltage (VIN) and provides two output voltages: 12V and 300W. The diagram includes various components such as resistors, capacitors, inductors, and integrated circuits (ICs). Key components include the MAX15157B IC, which is the main power converter, and the MAX15157B-01 IC, which is a precision current sense amplifier. The circuit also features a precision current sense amplifier (MAX15157B-01) and a precision current sense amplifier (MAX15157B-01). The diagram shows the internal structure of the MAX15157B IC, including the power MOSFETs, the current sense amplifier, and the feedback control loop. The output stage is a full-bridge inverter with four MOSFETs (Q1, Q2, Q3, Q4) and four diodes (D1, D2, D3, D4). The output filter consists of an inductor (L1) and a capacitor (C1). The diagram also shows the input filter, which consists of a capacitor (C2) and a resistor (R1). The output voltage is regulated by a feedback loop that compares the output voltage with a reference voltage (VREF) and adjusts the duty cycle of the MOSFETs accordingly. The diagram includes various test points and measurement points, such as VOUT, VREF, and VFB. The overall layout is organized into functional blocks, including the input filter, the power MOSFETs, the current sense amplifier, the feedback control loop, and the output filter.
