## Evaluate: MAX17501H in TDFN Package

### General Description

The MAX17501H EV kit provides a proven design to evaluate the MAX17501H high-efficiency, high-voltage, synchronous step-down DC-DC converter in a TDFN package. The EV kit uses the MAX17501H device to generate 2.5V at load currents up to 500mA from a 4.5V to 60V input supply. The MAX17501H features a forced-PWM control scheme that provides constant switching-frequency operation at all load and line conditions.

### Features

- ◆ Operates from a 4.5V to 60V Input Supply
- ◆ 2.5V Output Voltage
- ◆ 500mA Output Current
- ◆ 300kHz Switching Frequency
- ◆ Enable/UVLO Input
- ◆ Resistor-Programmable UVLO Threshold
- ◆ Open-Drain  $\overline{\text{RESET}}$  Output
- ◆ Overcurrent and Overtemperature Protection
- ◆ Proven PCB Layout
- ◆ Fully Assembled and Tested

### Quick Start

#### Recommended Equipment

- MAX17501H EV kit
- 4.5V to 60V, 1A DC input power supply
- Load capable of sinking 500mA
- Digital voltmeter (DVM)
- Function generator

#### Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify the board operation. **Caution: Do not turn on power supply until all connections are completed.**

- 1) Set the power supply at a voltage between 4.5V and 60V. Disable the power supply.
- 2) Connect the positive terminal of the power supply to the VIN PCB pad and the negative terminal to the nearest PGND PCB pad. Connect the positive terminal of the 500mA load to the VOUT PCB pad and the negative terminal to the nearest PGND PCB pad.
- 3) Connect the DVM across the VOUT PCB pad and the nearest PGND PCB pad.
- 4) Verify that a shunt is installed across pins 1-2 on jumper JU1.
- 5) Turn on the DC power supply.
- 6) Enable the load.
- 7) Verify that the DVM displays the expected voltage.

To turn-on/turn-off the part from EN/UVLO, follow the steps below:

- 1) Remove resistors R1 and R2 and the jumper connected across pins 1-2 on jumper JU1.
- 2) Connect the power supply to the EV kit and turn on the power supply. Set the power supply at a voltage between 4.5V and 60V.
- 3) Connect the function generator output to the EN/UVLO test loop.
- 4) EN/UVLO rising threshold is 1.24V and falling threshold is 1.11V. Make sure that the voltage-high and voltage-low levels of the function generator output are greater than 1.24V and less than 1.11V, respectively.
- 5) While powering down the EV kits, first disconnect the function generator output from the EN/UVLO test loop and then turn off the DC power supply.

### Detailed Description of Hardware

The MMAX17501H EV kit provides a proven design to evaluate the MAX17501H high-efficiency, high-voltage, synchronous step-down DC-DC converter in a TDFN package. The EV kit generates 2.5V at load currents up to 500mA from a 4.5V to 60V input supply. The EV kit features a 300kHz fixed switching frequency for optimum efficiency and component size. The EV kit features a forced-PWM control scheme that provides constant switching frequency operation at all load and line conditions.

The EV kit includes an EN/UVLO PCB pad and jumper JU1 to enable control of the converter output. An additional RESET PCB pad is available for monitoring the converter output. The VCC PCB pad helps measure the internal LDO voltage.

### Soft-Start Input (SS)

The device utilizes an adjustable soft-start function to limit inrush current during startup. The soft-start time is adjusted by the value of C3, the external capacitor from SS to GND. To adjust the soft-start time, determine C3 using the following formula:

$$C3 = 5.55 \times t_{SS}$$

where  $t_{SS}$  is the required soft-start time in milliseconds and C3 is in nanofarads.

### Regulator Enable/Undervoltage-Lockout Level (EN/UVLO)

The device features an EN/UVLO input. For normal operation, a shunt should be installed across pins 1-2 on jumper JU1. To disable the output, install a shunt across pins 2-3 on JU1 and the EN/UVLO pin is pulled to GND. See Table 1 for JU1 settings.

### Setting the Undervoltage-Lockout Level

The device offers an adjustable input undervoltage-lockout level. Set the voltage at which the device turns on, with a resistive voltage-divider connected from VIN to GND (see Figure 1). Connect the center node of the divider to EN/UVLO.

Choose R1 to be 3.3M $\Omega$  and then calculate R2 as follows:

$$R2 = \frac{R1 \times 1.218}{(V_{INU} - 1.218)}$$

where  $V_{INU}$  is the voltage at which the IC is required to turn on. Ensure that  $V_{INU}$  is higher than  $0.8 \times V_{OUT}$ .

### Adjusting the Output Voltage

The device offers an adjustable output voltage. Set the output voltage with a resistive voltage-divider connected from the positive terminal of the output capacitor ( $V_{OUT}$ ) to GND (see Figure 1). Connect the center node of the divider to FB/VO.

Select the parallel combination of R4 and R5,  $R_P$  to be less than 30k $\Omega$ . Once  $R_P$  is selected, calculate R4 as follows:

$$R4 = \frac{R_P \times V_{OUT}}{0.9}$$

Calculate R5 as follows:

$$R5 = \frac{R4 \times 0.9}{(V_{OUT} - 0.9)}$$

**Table 1. Regulator Enable (EN/UVLO) Jumper JU1 Description**

SHUNT POSITION	EN/UVLO PIN	MAX17501_ OUTPUT
1-2*	Connected to IN	Enabled
Not installed	Connected to the center node of resistor-divider R1 and R2	Enabled, UVLO level set through the R1 and R2 resistor-divider
2-3	Connected to GND	Disabled
