

General Description

The MAX2612–MAX2616 evaluation kits (EV kits) simplify the evaluation of the MAX2612–MAX2616 high-performance broadband gain blocks. They enable testing of the device's RF performance and require no additional supporting circuitry. The EV kits provide 50Ω SMA connectors for inputs and outputs.

Features

- Easy Evaluation of MAX2612–MAX2616 IC
- 3.0V to 5.25V Single-Supply Operation
- RF Input and Output Matched to 50Ω
- Fully Assembled and Tested

[Ordering Information](#) appears at end of data sheet.

Quick Start

The MAX2612–MAX2616 EV kits are fully assembled and factory tested. Follow the instructions in the [Connections and Setup](#) section to test the devices.

Required Equipment

This section lists the recommended test equipment to verify the operation of the MAX2612–MAX2616. The equipment's listed are intended as suggestions and substitutions are possible:

- MAX2612-MAX2616 EV kit
- One DC power supply capable of delivering +5.0V and 100mA of current
- One RF signal generator capable of delivering RF power as high as 0dBm at 1000MHz (E4433B or equivalent)
- One RF spectrum analyzer that covers the MAX2612-MAX2616 operating frequency range (FSEB20 or equivalent)
- One power meter capable of measuring up to 0dBm at 1000MHz (Agilent E4419B or equivalent)
- Two 50Ω SMA cables
- One ammeter (optional)
- One noise figure meter (optional)
- One network analyzer (optional)

Connections and Setup

This section is a step-by-step guide to operating the EV kits and their function. **Caution: Do not turn on the DC power or RF signal generators until all connections are completed.**

Checking Power Gain

- 1) With the DC supply output disabled, connect a +5.0V power supply to the VCC header and the power supply ground the GND header of the EV kit. (Route the positive terminal of the power supply through an ammeter, if desired)
- 2) Remove the jumper between on JU1 for normal operation.
- 3) With the RF signal generator output disabled, connect the generator output to the RFIN SMA connector on the EV kit through an SMA cable. Set the output of the RF signal generator frequency to 1000MHz and power level to -20dBm.

- 4) Connect a spectrum analyzer to the RFOUT SMA connector on the EV kit through an SMA cable. Set the spectrum analyzer center frequency to 1000MHz, reference level to 0dBm, and span to 1MHz.
- 5) Enable the DC supply output. The supply current should read approximately the current specified in the datasheet.
- 6) Enable the RF signal generator output. The spectrum analyzer should displays a tone at 1000MHz with power level at approximately -1.5dBm.

Layout Issues

A good printed-circuit board (PCB) is an essential part of RF circuit design. The EV kit PCB can serve as a guide for laying out a board using the MAX2612–MAX2616. Use controlled impedance lines on all high-frequency inputs and outputs. Bypass V_{CC} with decoupling capacitors located close to the device. For long V_{CC} lines, it may be necessary to add decoupling capacitors. Locate these additional capacitors farther away from the device package. This minimizes supply coupling. Proper grounding of the GND pins is essential. Connect the GND pins to the ground plane either directly, or through vias, or both.
