MAX30105 Evaluation Kit

General Description

The MAX30105 evaluation kit (EV kit) provides a proven design to evaluate the MAX30105 particle-sensing module. The EV kit consist of two boards. USBOSMB is the mother board and MAX30105DBEVKIT is the daughter board that includes the MAX30105 and an accelerometer. The EV kit is powered using the USB supply to generate +1.8V for the sensor and +4.5V for the internal LEDs of the MAX30105, and +3.3V for the accelerometer. However, users do not need the accelerometer to evaluate the MAX30105.

The EV kit comes with a MAX30105EFD+ installed in a 14-pin OESIP package.

Features and Benefits

- Real-Time Monitoring
- Flexible PCB Design
- USB-Powered
- On-Board Accelerometer
- Proven PCB Layout
- Fully Assembled and Tested
- Windows® 7, and Windows 8/8.1-Compatible Software

Ordering Information appears at end of data sheet.

Quick Start

Required Equipment

 MAX30105 EV kit (MAX30105DBEVKIT#, USBOSMB#, 10-pin FFC cable, and micro-USB cable included)

Evaluates: MAX30105

Windows PC

Note: Text in **bold** refers to items directly from the EV kit software. Text in **bold and underlined** refers to items from the Windows operating system.

Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation:

- Visit <u>www.maximintegrated.com/evkit-software</u> to download the most recent version of the EV kit software, MAX30105EVKitSetupVx.x.ZIP. Save the EV kit software to a temporary folder and uncompress the ZIP file.
- 2) Open up MAX30105EVKitSetupVx.x.exe and follow the instructions from the pop-up windows.
- 3) Insert one end of the ribbon cable to the J3 connector of the USBOSMB and the other end of the ribbon cable to the J1 connector of the MAX30105DBEV-KIT. Make sure that both connectors and blue ends of the ribbon cable is facing the user.
- 4) Connect the USB cable from the PC to the EV kit board. Windows will automatically install all drivers.
- 5) Open the MAX30105EVKit.exe and verify that the EV kit is connected by observing the status bar at the lower left corner of the GUI. See Figure 1.
- 6) Press the **Start Monitor** button.
- Direct the LEDs of the MAX30105 (U4) of the EV kit towards the particles of interest and observe the Measurement graphs. See Figure 2.

Windows is a registered trademark and registered service mark of Microsoft Corporation.

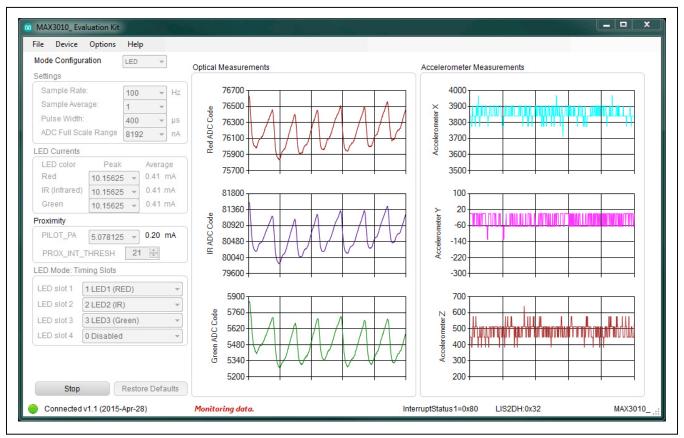

Figure 2. MAX30105 EV Kit Main Window (Sampling Data)

Detailed Description of Software

The main window of the MAX30105 EV kit software displays the mode configuration, settings, LED currents, proximity, timing slots of the LED mode, ADC code measurements, of both the MAX30105 and the accelerometer and example algorithms.

Mode Configuration

The **Mode Configuration** drop-down list allows for three options: 1 LED, 2 LEDs, and multi LEDs. When 1 LED mode is selected, only red ADC codes are plotted. When 2 LEDs mode is selected, only the Red and IR channels will be active when the GUI is operational. When Multi LED mode is selected, the user can select any combination of Red, IR, and Green channels to be active when the GUI is operational. Within LED mode, the **Led Mode Timing Slots** groupbox selections allow the user to enable the desired LEDs at each LED slot.

Settings

The **Settings** groupbox consist of controls to the sample rate and average, pulse width, and ADC full-scale range. The **Sample Rate** drop-down list is adjustable from 50Hz to 400Hz.

The **Sample Average** drop-down list is adjustable from 1 to 32.

The **Pulse Width** dropdown list is adjustable from $50\mu s$ to $400\mu s$.

The **ADC Full Scale Range** dropdown list is adjustable from 2048nA to 16384nA.

LED Currents

Within the **LED Currents** groupbox, the peak currents are adjustable from **0** to **50** mA for each LED. The average current based on the **Pulse Width** and **Sample Rate** is recalculated with each change in peak current.

Proximity

Under Proximity, **PILOT_PA** is adjustable from **0** to **50** mA.

Accelerometer

The accelerometer provides three degrees of freedom (3DOF). Moving the MAX30105DBEVKIT board will trigger changes in ADC data of the X, Y, and/or Z graphs.

Algorithms

Along with Maxim's sensor, customers will need smart algorithms to detect the particles of interest. Maxim is partnering with Valor Inc. to develop state-of-the-art algorithms for smoke detection application using MAX30105. Please contact Valor for licensing information at http://www.valorfiresafety.com/licensing/.

Evaluates: MAX30105

Data Logging

From the menu bar, select File | Log and ADC data can be logged to a .csv file with the option of collecting data for a specific time using the File | Timed Data Collection selection from 5 to 60 seconds. Once the desired configuration is set, press the Start Monitor button to capture data. The header for each data set includes the settings for sample rate, LED current, pulse width, and the mode. If the file name is not changed, subsequent data collection will append to the existing file and will include a new header.

Options

From the menu bar, **Options** allows the user to adjust the plot length and the x-axis, hide unused channels, show/hide the algorithm windows, and access registers from a bit level.

Detailed Description of Hardware

The MAX30105 EV kit provides a proven design to evaluate the MAX30105 integrated particle-sensing module. The EV kit is powered through the +5V from the USB port to generate the regulated +1.8V to V_{DD} supply and +4.5V to the +VLED supply of the MAX30105. Use Table 1 to change the R10 resistor to obtain the desired +VLED supply. The IC U1 of the USBOSMB is the on-board microcontroller that communicates with the MAX30105 through GPIO for the interrupt signal and I2C interface.

There is also a 3.3V supply on the EV board and is intended for the on-board MCU.

Table 1. Resistor Selection for +VLED Supply

+VLED	R10 (kΩ)
2.5V	14.3
3.3V	23.2
4.0V	31.6
4.5V	36.5*
