MAX34565 Evaluation Kit
Evaluates: MAX34565

General Description

The MAX34565 evaluation kit (EV kit) simplifies evaluation of the MAX34565 12V hot-plug switch. The EV kit is shipped with a 15Ω current-limit resistor (R2) installed, but this value can be changed from 12Ω to 30Ω to match the application. The EV kit is also shipped with a Kelvin current-sense arrangement, but this can be changed to a direct current-sense arrangement by adding a 0Ω jumper in the R3 position.

Note: The PCB used for the MAX34565 EV kit also supports the MAX34564. The two devices share the same footprint. **The PCB silkscreen shows the MAX34564, but if a white label exists on the top side of the PCB, the MAX34565, not the MAX34564, is mounted on the board.**

Component List

DESIGNATION	QTY	DESCRIPTION
C1	1	0.1µF, 25V X7R ceramic capacitor (0805) Venkel C0805X7R250-104KNE
C2	1	2.2µF, 25V X5R ceramic capacitor (0805) Murata GRM21BR61E225K
C3	1	270pF X7R ceramic capacitor (0805) Venkel C0805X7R500-271KNE
J1	1	Red banana jack
J2	1	Black banana jack
J3	1	Blue banana jack
R1	1	0Ω ±1% resistor (0805) Venkel CR0805-10W-000T
R2	1	15Ω ±1% resistor (0805) Venkel CR0805-10W-15R0FT
R3	1	Resistor, do not populate
TP1–TP7	7	Test points
U1	1	12V hot-plug switch (10 TDFN-EP*) Maxim MAX34565ETB+

*EP = Exposed pad.

Features

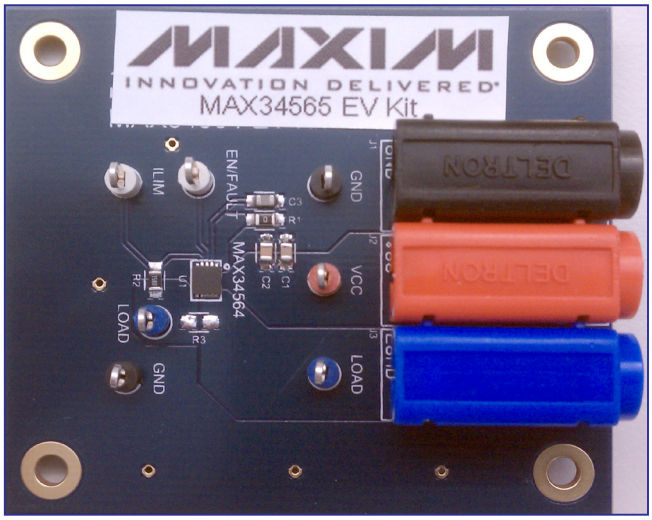
- **Quick Evaluation of the MAX34565**
- **Fully Assembled and Tested**
- **Ready for Operation Out of the Box**
- **Adjustable Current Threshold**
- **Supports Both Kelvin and Direct Current Sensing**
- **Labeled Test Points for Key Signals**
- **PCB Mounting Holes**

Equipment Needed

The following equipment is required to use the MAX34565 EV kit:

- 12V (6A) DC power supply
- Active or passive power load capable of sinking up to 6A

MAX34565 Evaluation Kit



Ordering Information appears at end of data sheet.

Getting Started

- Connect a high-power 12V (6A) DC power supply to the red (+) and black (-) banana jacks. Do not apply power.
- Connect a variable (0 to 6A) load between the blue (+) and black (-) banana jacks.
- Set the load to sink 1A.
- Turn on the 12V DC power supply.
- Check the DC voltage drop from VCC to LOAD. It should be approximately 70mV.
- Decrease the variable load value (increase the current flow) until current stops flowing. The trip point should be approximately 4.5A.
- The MAX34565 latches off and VCC must be powered cycled to reset the device.

Note: Use short leads to minimize inductance. Doing so helps protect the MAX34565 from being exposed to voltages greater that the maximum allowable.
