

SFP Copper-Cable Preemphasis Driver

MAX3982

General Description

The MAX3982 is a single-channel, copper-cable preemphasis driver that operates from 1Gbps to 4.25Gbps. It provides compensation for copper links, such as 4.25Gbps Fibre Channel, allowing spans of up to 15m with 24AWG. The cable driver provides four selectable preemphasis levels. The input compensates for up to 10in of FR4 circuit board material at 4.25Gbps.

The MAX3982 also features SFP-compliant loss-of-signal detection with selectable sensitivity and TX_DISABLE. Selectable output swing reduces EMI and power consumption. It is packaged in a 3mm x 3mm, 16-pin thin QFN and operates from 0°C to +85°C temperature range.

Applications

SFP Active Copper-Cable Assemblies
Backplanes
1.0625Gbps, 2.125Gbps, and 4.25Gbps Fibre Channel
1.25Gbps Ethernet
2.488Gbps STM16
InfiniBand
PCI Express

Features

- ◆ Drives Up to 15m with 24AWG Cable
- ◆ Drives Up to 30in of FR4
- ◆ 0.25W Total Power with +3.3V Supply
- ◆ Selectable 1600mVp-p or 1200mVp-p Differential Output Swing
- ◆ Selectable Output Preemphasis
- ◆ Fixed Input Equalization
- ◆ Loss-of-Signal Detection with Selectable Sensitivity
- ◆ Transmit Disable

		6 mil FR4 ≤ 10in	1m, 24AWG	0	0				
			5m, 24AWG	0	1				
			10m, 24AWG	1	0				
			15m, 24AWG	1	1				
Residual Output Deterministic Jitter at 4.25Gbps (Notes 1, 4, 5)		Source to IN	OUT to Load	PE1	PE0	0.15	0.20	UI _{P-P}	
		6 mil FR4 ≤ 10in	1m, 24AWG	0	0				
			5m, 24AWG	0	1				
			10m, 24AWG	1	0				
			15m, 24AWG	1	1				

Note 1: Guaranteed by design and characterization.

Note 2: PE1 = PE0 = 1 for maximum preemphasis, load is 50Ω ±1% at each side, and the pattern is 0000011111 at 1Gbps.

Note 3: Measured at point B in Figure 2 using 0000011111 at 1Gbps. PE1 = PE0 = 0 for minimum preemphasis. For transition time, the 0% reference level is the steady-state level after four zeros, just before the transition. The 100% reference level is the maximum voltage of the transition.

Note 4: Tested with CJTPAT, as well as this pattern: 19 zeros, 1, 10 zeros, 1010101010 (D21.5 character), 1100000101 (K28.5+ character), 19 ones, 0, 10 ones, 0101010101 (D10.2 character), 0011111010 (K28.5 character).

Note 5: Cables are unequalized, Amphenol Spectra-Strip 24AWG. Residual deterministic jitter is the difference between the source jitter at point A, and load jitter at point D in Figure 2. The deterministic jitter at the output of the transmission line must be from media-induced loss and not from clock-source modulation.

SFP Copper-Cable Preemphasis Driver

Pin Description

PIN	NAME	FUNCTION
1	VCC1	Power-Supply Connection for Input. Connect to +3.3V.
2	IN+	Positive Data Input, CML. This input is internally terminated with 50Ω to VCC1.
3	IN-	Negative Data Input, CML. This input is internally terminated with 50Ω to VCC1.
4, 8, 9	GND	Circuit Ground
5	OUTLEV	Output-Swing Control Input, LVTTTL with 40kΩ Internal Pullup. Set to TTL high or open for maximum output swing, or set to TTL low for reduced swing.
6	PE1	Output Preemphasis Control Input, LVTTTL with 10kΩ Internal Pullup. This pin is the most significant bit of the 2-bit preemphasis control. Set high or open to assert this bit.
7	PE0	Output Preemphasis Control Input, LVTTTL with 10kΩ Internal Pullup. This pin is the least significant bit of the 2-bit preemphasis control. Set high or open to assert this bit.
10	OUT-	Negative Data Output, CML. This output is terminated with 50Ω to VCC2.
11	OUT+	Positive Data Output, CML. This output is terminated with 50Ω to VCC2.
12, 13	VCC2	Power-Supply Connection for Output. Connect to +3.3V.
14	TX_DISABLE	Transmitter Disable Input, LVTTTL with 10kΩ Internal Pullup. When high or open, differential output is 40mVp-p. Set low for normal operation.
15	LOS	Loss-of-Signal Detect, TTL Output. This output is open-collector TTL, and therefore requires an external 4.7kΩ to 10kΩ pullup resistor (5.5V maximum). This output sinks current when the input signal level is valid.
16	LOSLEV	LOS Sensitivity Control Input, LVTTTL with 40kΩ Internal Pullup. Set to TTL high or open for less sensitivity (higher assert threshold). Set to TTL low for more sensitivity (lower assert threshold).
EP	EXPOSED PAD	Exposed Pad. For optimal thermal conductivity, this pad must be soldered to the circuit board ground.

Pin Configuration

SFP Copper-Cable Preemphasis Driver

MAX3982

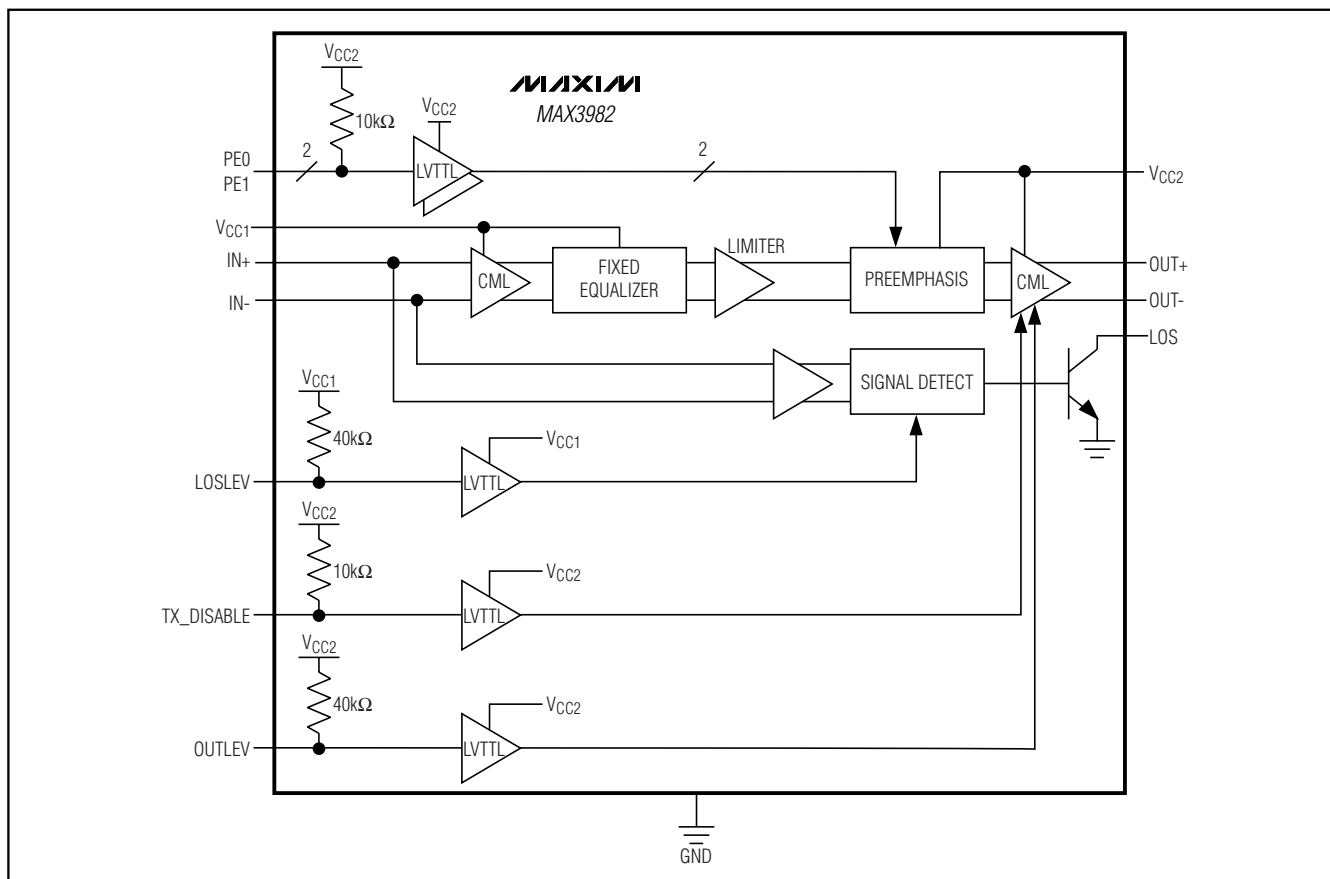

Figure 4. Functional Diagram

Detailed Description

The MAX3982 comprises a PC board receiver, a cable driver, and a loss-of-signal detector with adjustable threshold (Figure 4). Equalization is provided in the receiver. Selectable preemphasis and selectable output amplitude are included in the transmitter. The MAX3982 also includes transmit disable control for the output.

PC Board Receiver and Cable Driver

Data is fed into the MAX3982 through a CML input stage and fixed equalization stage. The fixed equalizer in the receiver corrects for up to 10in of PC board loss on FR4 material at 4.25Gbps.

The cable driver includes four-state preemphasis to compensate for up to 15m of 24AWG, 100Ω balanced cable. Table 1 is provided for easy translation between preemphasis expressions. The OUTLEV pin selects the output amplitude. When OUTLEV is low, the amplitude is 1200mVp-p. When OUTLEV is high, the amplitude is

1600mVp-p. Residual jitter of the MAX3982 is independent of up to 0.20UIp-p source jitter.

Loss-of-Signal (LOS) Output

Loss-of-signal detection is provided on the data input. Pullup resistors should be connected from LOS to a supply in the range of +3.0V to +5.5V. The LOS output is not valid until power-up is complete. Typical LOS response time is 100ns.

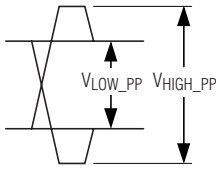

The LOS assert and deassert levels are set by the LOSLEV pin. When LOSLEV is LVTTTL high or open, the LOS assert threshold is 180mVp-p. When LOSLEV is LVTTTL low, the LOS assert threshold is 85mVp-p.

TX Disable

Transmit disable is provided to turn off the output when desired. The TX_DISABLE pin can be connected to LOS to automatically squelch the output when the incoming signal is below the threshold set by LOSLEV (see the Autodetect section).

Table 1. Preemphasis Translation

Ratio	α	10Gbase-CX4	IN dB	
$\frac{V_{HIGH_PP}}{V_{LOW_PP}}$	$\frac{V_{HIGH_PP} - V_{LOW_PP}}{V_{HIGH_PP} + V_{LOW_PP}}$	$1 - \frac{V_{LOW_PP}}{V_{HIGH_PP}}$	$20 \left[\log \left(\frac{V_{HIGH_PP}}{V_{LOW_PP}} \right) \right]$	
1.26	0.11	0.21	2	
1.58	0.23	0.37	4	
2.51	0.43	0.6	8	
5.01	0.67	0.8	14	

Applications Information

Autodetect

The MAX3982 can automatically detect an incoming signal and enable the data outputs. Autodetect can be accomplished by connecting the LOS pin to TX_DISABLE. TX_DISABLE has a 10k Ω internal pullup resistor. If a loss-of-signal is detected, the TX_DISABLE pin is forced high and disables the outputs. Leaving the inputs to the MAX3982 open (i.e., floating) is not recommended as noise amplification may occur and create undesirable output signals. Autodetect is recommended to eliminate noise amplification or possible oscillation. For periods much greater than 100ns without data transitions, autodetect disables the output.

Layout Considerations

Circuit board layout and design can significantly affect the performance of the MAX3982. Use good high-frequency design techniques, including minimizing ground inductance and using controlled-impedance transmission lines on the data signals. Power-supply decoupling should also be placed as close to the VCC pins as possible. This should be sufficient supply filtering. Always connect all VCC pins to a power plane. Take care to isolate the input from the output signals to reduce feedthrough.

Exposed Pad Package

The exposed-pad, 16-pin QFN package incorporates features that provide a very low thermal resistance path for heat removal from the IC. The exposed pad on the MAX3982 must be soldered to the circuit board for proper thermal performance. For more information on exposed-pad packages, refer to Maxim Application Note HFAN-08.1: *Thermal Considerations of QFN and Other Exposed-Paddle Packages*.
