# 45Ω, SPDT Analog Switch in SOT23-8

#### **General Description**

The MAX4649 is a dual-supply, single-pole/doublethrow (SPDT) analog switch. On-resistance is  $45\Omega$  max and flat ( $7\Omega$  max) over the specified signal range. The MAX4649 can handle Rail-to-Rail<sup>®</sup> analog signals, and conducts analog or digital signals equally well in either direction. This switch operates from a single +9V to +36V supply, or from ±4.5V to ±20V dual supplies. The primary application areas are in the switching and routing of signals in telecommunications and test equipment.

The MAX4649 features a switch transition time of 130ns max at  $+25^{\circ}$ C, and a guaranteed break-before-make switching time of 5ns. Off-leakage current is only 2nA max at  $+25^{\circ}$ C.

The MAX4649 is available in a tiny 8-pin SOT23 package.

Rail-to-Rail is a registered trademark of Nippon Motorola, Inc.

#### **Applications**

#### Features

- ♦ Low On-Resistance 45Ω max ±15V Supplies
- 5Ω max Ron Match Between Channels
- Guaranteed R<sub>ON</sub> Flatness Over Specified Signal Range (7Ω max)
- ♦ V<sub>L</sub> Logic Supply Not Required
- Rail-to-Rail Signal Handling
- ♦ +9V to +36V Single Supply Operation
- ±4.5V to ±20V Dual Supply Operation
- Low Crosstalk: -92dB at 1MHz
- High Off-Isolation: -92dB at 1MHz
- TTL/CMOS-Compatible Control Inputs

# PARTTEMP.<br/>RANGEMAX4649EKA-T-40°C to +85°C

#### **ABSOLUTE MAXIMUM RATINGS**

(Voltages referenced to GND.)

V+	0.3V to +44.0V
V	44.0V to +0.3V
V+ to V	0.3V to +44.0V
All Other Pins (Note 1)	.(V 0.3V) to (V+ + 0.3V)
Continuous Current into any Terminal.	±10mA
Continuous Current (COM, NO, NC)	±30mA
Peak Current (COM, NO, NC)	
(pulsed at 1ms, 10% duty cycle)	±60mA

Continuous Power Dissipation ( $T_A = +70^{\circ}C$ )	
8-Pin SOT23 (derate 8.9mW/°C above +70°C)7	14mW
Operating Temperature Range	
MAX4649EKA40°C to -	+85°C
Storage Temperature Range65°C to +	150°C
Junction Temperature+	150°C
Lead Temperature (soldering, 10s)+3	300°C

Note 1: Signals on NO, NC, COM, or IN exceeding V+ or V- are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 2: The algebraic convention is used in this data sheet; the most negative value is shown in the minimum column.

Note 3: All parts are 100% tested at +25°C. Limits across the full temperature range are guaranteed by design and correlation.

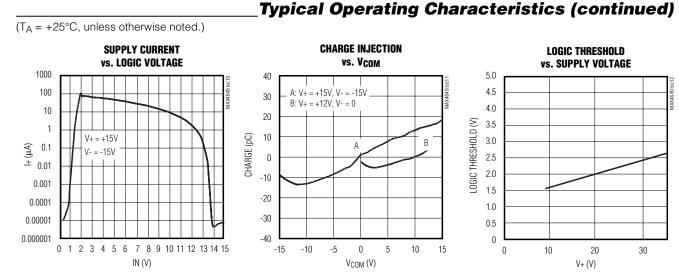

Note 4: Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal range.

**MAX4649** 

#### **Pin Description**

PIN	NAME	FUNCTION
1	COM	Analog Switch Common
2	NC	Normally Closed Switch Terminal. NC is connected to COM when IN is low.
3	GND	Ground
4	V+	Positive Supply Voltage Input
5	N.C.	No Connection
6	IN	Digital Control Input
7	V-	Negative Supply Voltage Input
8	NO	Normally Open Switch Terminal. NO is connected to COM when IN is high.

#### **Detailed Description**

The MAX4649 is a high-voltage, single-pole/doublethrow (SPDT) analog switch that operates from dual  $\pm 4.5$ V to  $\pm 20$ V supplies or from a single  $\pm 9$ V to  $\pm 36$ V supply. The MAX4649 has one normally closed (NC) switch and one normally open (NO) switch. CMOS switch construction allows bidirectional processing of rail-to-rail analog signals.

The MAX4649 has break-before-make switching. The transition time for switching from one input to the other is typically 90ns. The off-leakage is typically less than 10pA, and on-leakage is typically less than 20pA.

#### **Applications Information**

#### **Overvoltage Protection**

Proper power-supply sequencing is recommended for all CMOS devices. Do not exceed the absolute maximum ratings, because stresses beyond the listed ratings can cause permanent damage to the devices. Always sequence V+ on first, then V-, followed by the logic inputs, NO\_, or COM. If power-supply sequencing is not possible, add two small signal diodes (D1, D2) in series with supply pins (Figure 1). Adding diodes reduces the analog signal range to one diode drop below V+ and one diode drop above V-, but does not affect the device's low switch resistance and low

MAX4649

leakage characteristics. Device operation is unchanged, and the difference between V+ and V- should not exceed 44V. These protection diodes are not recommended when using a single supply.

**Off-Isolation at High Frequencies** 

In 50  $\Omega$  systems, the high-frequency on-response of these parts extends from DC to above 300MHz, with a typical loss of -3.6dB. When the switch is turned off,

however, it behaves like a capacitor, and off-isolation decreases with increasing frequency. This effect is more pronounced with higher source and load impedances. Above 5MHz, circuit board layout becomes critical. The graphs shown in the *Typical Operating Characteristics* were taken using a 50 $\Omega$  source and load connected with BNC connectors.
